# REPORT OF THE COMMISSIONER OF EDUCATION.

DEPARTMENT OF THE INTERIOR,  
BUREAU OF EDUCATION,  
*Washington, D. C., October 1, 1899.*

SIR: I have the honor to submit herewith the Annual Report of this Office for the year ending June 30, 1899.

*Total enrollment in schools and colleges.*—There were enrolled in the schools and colleges, public and private, during the year 1898-99, 16,738,362 pupils, the same being an increase of 50,719 pupils over the previous year.

Of this number the enrollment in public institutions was 15,234,435 and that in private and incorporated institutions was 1,503,927.

Besides the enrollment in public and private institutions of all grades included in the above summary, there were pupils enrolled in special institutions as follows:

*Enrollment in special schools, 1898-99.*

City evening schools.....	185,000
Business schools.....	70,686
Indian schools.....	23,500
Schools for defectives.....	23,691
Reform schools.....	24,925
Orphan asylums and other benevolent institutions.....	14,000
Schools in Alaska.....	1,369
Kindergartens.....	93,737
Miscellaneous.....	50,000
Total.....	486,908

The miscellaneous in the above table includes such institutions as schools of music, oratory, elocution, cookery, and of various special arts.

This gives 17,225,270 as the grand total.

## THE COMMON SCHOOLS.

Under this designation we include public schools of elementary and secondary grades, the former containing all pupils in the first eight years of the course of study and the latter the pupils in the next four years of the course usually conducted in high schools or academies. The State universities and professional schools are not counted in the "common schools," although, by reason of their receiving support from public funds, they might be thus classified correctly.

The average length of the school term is 143.2 days. It had never reached 140 days until the year 1895-96. The increase in urban population is accompanied by increase in the length of the school year.

TABLE I.—Total number of pupils and students of all grades in both public and private schools and colleges, 1898-99.

NOTE.—The classification of States made use of in the following table is the same as that adopted by the United States census, and is as follows: *North Atlantic Division:* Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, and Pennsylvania. *South Atlantic Division:* Delaware, Maryland, District of Columbia, Virginia, West Virginia, North Carolina, South Carolina, Georgia, and Florida. *South Central Division:* Kentucky, Tennessee, Alabama, Mississippi, Louisiana, Texas, Arkansas, and Oklahoma. *North Central Division:* Ohio, Indiana, Illinois, Michigan, Wisconsin, Minnesota, Iowa, Missouri, North Dakota, South Dakota, Nebraska, and Kansas. *Western Division:* Montana, Wyoming, Colorado, New Mexico, Arizona, Utah, Nevada, Idaho, Washington, Oregon, and California.

Division.	Pupils receiving elementary instruction (primary and grammar grades).					Pupils receiving secondary instruction (high-school grade). <i>a</i>					Students receiving higher instruction.				
	Public.		Private (largely estimated).		Public. <i>b</i>	Private (in preparatory schools, academies, seminaries, etc.).		Public. <i>d</i>		Private. <i>f</i>		Public. <i>e</i>		Private. <i>g</i>	
	2	3	4	5		6	7	8	9	10	11	12	13	14

South Atlantic Division .....	2,115,448	88,947	27,404	24,004	3,762	10,200	13,962	831	6,017	6,848	3,794	1,581	5,375		
South Central Division .....	2,903,112	147,172	37,151	31,522	2,848	11,401	14,219	1,118	4,740	5,858	3,272	4,155	7,427		
North Central Division .....	5,446,865	423,170	212,655	49,803	14,180	21,093	35,273	5,556	17,572	23,138	16,325	14,826	31,151		
Western Division .....	726,580	31,543	27,727	9,614	4,105	3,049	7,154	774	1,330	2,104	3,763	775	4,478		

*a* Including pupils in preparatory or academic departments of higher institutions, public and private, and excluding elementary pupils, who are classed in columns 2 and 3. *A* classification of public and of private secondary students, according to the character of the institutions in which they are found, is given in Chap. XLI, vol. 2.

*b* This is made up from the returns of individual high schools to the Bureau, and is somewhat too small, as there are many secondary pupils outside the completely organized high schools whom there are no means of enumerating.

*c* Including colleges for women, agricultural and mechanical (land-grant) colleges, and scientific schools. Students in law, theological, and medical departments are excluded, being tabulated in columns 9-11. Students in academic and preparatory departments are also excluded, being tabulated in columns 4 and 5.

*d* Mainly State universities and agricultural and mechanical colleges.

*e* Including schools of dentistry, pharmacy, and veterinary medicine.

*f* Mainly in schools or departments of medicine and law attached to State universities.

*g* Nonprofessional pupils in normal schools are included in columns 4 and 5.

*h* There are, in addition to this number, 25,307 students taking normal courses in universities, colleges, and public and private high schools. (See Chap. XL, vol. 2.)

## AVERAGE AMOUNT OF SCHOOLING PER INHABITANT.

The following tables answer the question: How much schooling does the inhabitant of the United States receive on an average? The first table includes both public and private, the second only the "common schools."

TABLE III.—Average number of years of schooling (of 200 days each) that each individual of the population received at the different dates specified in the table, and taking into account all public and private schooling of whatever grade.

α Subject to correction.

*State school systems.*—Appended to this introduction, Mr. F. E. Upton, specialist in State school systems, has presented in a series of tables, numbered 1 to 19, the results of his compilation of the returns made from year to year by State superintendents of public instruction.

*Dental schools.*—I also print as an appendix a conspectus of the courses of study of dental schools in the United States, so far as these can be determined from published catalogues. Recently there has been an increased sale of bogus diplomas, certifying to the competency of their purchasers to practice dentistry. The sales have been made not only in this country, but in various countries of Europe. The courses of study will aid officers of the law, wherever this report comes to hand, to decide upon the merits of institutions in good standing, while the list of schools which are members of the National Association of Dental Faculties (prefixed to the conspectus of the courses of study) will furnish an additional test. The issue of bogus diplomas in medicine and dentistry calls for a concerted movement on the part of honest practitioners, as well as the faculties of institutions that offer a thorough course of instruction, to second proper legislation against the

fraudulent issue of diplomas. The numerous scandals connected with the two or three chartered schools which are engaged in this nefarious business go far to discredit abroad the standing of American physicians and dentists.

*Great Britain and Ireland.*—Chapter I gives a historical review of the movement of elementary education in England. It appears that the annual Government grant for elementary schools in England, which began in 1833 with \$100,000, had increased to \$22,405,930 in 1897, in which year the total cost of such schools was \$52,537,325, while in Scotland the current expenditure was \$7,403,068 and in Ireland \$5,822,999. In England the attendance was 81.5 per cent of the enrollment; in Scotland, 84.45 per cent; and in Ireland, 63.9 per cent.

After the Berlin conference of 1890 some concern was felt that England was not keeping pace with the leading nations in the matter of elementary education, and it was urged that this inertness might result in a diminution of commercial supremacy as compared with Germany. This apprehension, supported by other considerations, such as the relation between illiteracy and crime, exemption of working children, etc., led to much vigorous discussion of the condition and defects of elementary education by the school authorities and the press, and this agitation of so important a matter resulted finally in the recent legislation upon the subject, which, beginning with such matters as attendance and children's work in factories, culminated in the board of education bill in 1899, affecting secondary education. It will be observed that there was nothing theoretical or experimental in this step. The characteristic conservatism of the national character appeared in waiting until the proposed action was felt to be a commercial need before adopting it.

The science and art department, which has been a prime mover in the encouragement of the branches of education indicated by its title, had 197,796 students in science and 146,720 art students in 1897, a total of 344,516 in this class of secondary schools. It is significant that 142,293 of the art students were pursuing some branch of industrial art. The department has the disbursement of an annual grant which amounted to \$3,960,229 in 1897-98.

The interest in technical education which has been developed in England in the last twenty years has also been somewhat increased by the commercial competition of Germany and a consciousness of inferior technical training in certain branches. An idea of the esteem in which technical education is now held may be gathered from the fact that \$5,000,000 from all sources were expended for scientific and technical schools in 1897, while 32,899 students attended the different courses of instruction.

The board of education bill introduced by the Duke of Devonshire in 1898 became a law in 1899. It provides for the establishment of a

board connected with the superintendence of secondary education in England and Wales. This board will supplant the education department, including the science and art department, and will be the preliminary step, as Professor Jebb remarked in his speech in Parliament, toward organizing secondary education in England. It provides for inspection of secondary schools, if desired by them, and from its general character and functions will tend to promote the continuity and unity of the system. It is a significant feature of recent education in England that many pupils of the elementary schools take secondary studies.

The multiplication of local colleges in England and the increase of university affiliations and influence are noticeable features of the recent history of higher education. The modern spirit is shown by the disposition to make scientific pursuits prominent and give them official recognition at the universities. At Oxford this tendency was manifested some years since by the provision for special study and scientific research and the creation of degrees of bachelor of letters and bachelor of science. Cambridge also admits advanced students for the purpose of research. The determination to make not only science and technology university subjects, but even commerce and industry, is also shown by the papers quoted in the appendix to Chapter I upon the scope of the studies in the new universities of Birmingham and Wales.

*Australasia.*—Chapter II (pp. 67-87) presents the condition of education in Australasia, New Zealand, and Tasmania.

In Australia the educational standards established by law are only attainable in the larger towns or cities, and there is consequently a marked difference between the condition of schools in them and in the isolated communities and pioneer settlements. The law recognizes this difference and authorizes special adjustments making provision for teaching in places where the population is scanty by such means as alternate schools in adjoining districts or half-time schools; children are also carried to school at the public expense in sparsely populated districts. Each colony has hitherto had its own minister of public instruction, but the year 1898-99 marks the final adoption of articles of political federation of the colonies and the establishment of a common capital in New South Wales, which will doubtless tend to unify the educational system.

The average attendance of the elementary schools in 1897 was 399,128, the enrollment being 596,242, and the percentage of attendance ranging from 65.6 to 73 in the different colonies. The total expenditure for elementary (public day) schools was \$8,253,746 in 1897.

The development of elementary schools in Australia has followed the same course as in England, but has had less resistance to overcome. The schools are now mostly state and secular, and attendance is com-

pulsory by law. As is to be expected from the history and character of the population, technical and scientific education receives a large share of attention. In New South Wales, for example, technical training is begun in the public schools in the shape of drawing lessons, manual training, cookery, and needlework. There were 5,848 students attending the Sydney Technical College, the suburban and county classes, and special classes devoted to technical education in the public schools. Thirty-five students of the technical colleges were examined at the technological examinations of the "City and Guild of London Institute" held in April, 1898, of whom 28 passed. This tendency toward technical education is shown in the other colonies by the establishment of schools of agriculture, and by providing technical instruction in the higher classes of the elementary schools for pupils who intend to enter mining schools or agricultural colleges.

In New Zealand the public schools are free and secular and had on an average a daily attendance of 83.9 per cent of the enrollment in 1897. A striking feature of education in New Zealand is the provision made for teaching Maori children. There were 74 village schools for these natives in 1897 attended by 2,864 pupils with an average daily attendance of 77.5 per cent, and 4 boarding schools with 263 pupils, of whom 73 were maintained at the expense of the Government. This is exclusive of 2,260 Maori children in the ordinary schools.

New Zealand expended \$2,400,182 for public education in 1897, or \$3.36 per white inhabitant. The administration is centralized in one of the Crown ministers. Technical education in elementary schools is recognized by law and is continued in the secondary schools, of which there are 24, and at the university.

The University of New Zealand is an examining body empowered to confer degrees. Undergraduates pursue their studies at affiliated colleges. The university has conferred 627 degrees on examination; only 43 of these were B. Sc. and D. Sc. degrees. There were 730 candidates for admission in 1897 and 66 graduates, of whom 48 were B. A. and 4 B. Sc.

Eighty per cent of the population of New Zealand can read and write.

It is to be noted that the inspector of education in Tasmania appeals for secondary education on modern lines to supplement the elementary schools. The expenditure for education in 1897 was \$172,869.90 for an enrollment of 16,634 and an average attendance of 12,024, which makes the cost \$10.38 for each pupil enrolled.

*Belgium.*—Chapter III (pp. 89-123) gives a summary of the history of Belgian education from 1842 to the present time. The general form of the system has changed but little, and comprises primary, secondary, and superior departments, under the minister of public instruction and his directors. Institutions of all grades receive State

appropriations which are in larger and larger proportion the higher the grade, until they defray nearly the whole cost of the State universities. The total enrollment in primary schools, public and private, has increased from 426,385 in 1845 to 752,062 in 1896.

Until 1879, religious instruction was obligatory and in charge of the priest or of the minister of the commune. In 1879, when the Liberal party came into power, a new law inaugurated a total change in this respect and religious instruction was excluded from the school and left to the family and church. The law was in operation five years, during which period there was a falling off in the communal schools of 36 per cent of their pupils.

In 1884, when the Catholic party regained power, a new law restored religious instruction as an optional branch, while the law of 1894 made it obligatory, and the law of 1895 placed it in the charge of the clergy.

In Belgium the commune (or township) takes the initiative in providing elementary schools, every commune being required to have at least one. It contributes to the support of the school by special tax, the province and the State supplying the balance. In 1896 the expenditure for elementary instruction was \$6,663,705, equivalent to \$1.02 for each inhabitant, of which sum the communes contributed 46.2 per cent, the State 41.6, and the provinces 5 per cent, the rest being made up from fees, legacies, subscriptions, etc.

The secondary schools show the influence of the prevailing "modern" ideas by the modifications in their programmes, which show a notable decrease in the time given to Latin and Greek, more extended instruction in "modern humanities," the enlarging of the courses in mathematics and physics, and the introduction of commercial courses. These changes, however, have been rather favorable than otherwise to the Greek-Latin humanities in some respects.

In Belgium, which is noted for technological attainments, technical education is also divided into three grades. The primary degree contains the "écoles professionnelles," to the secondary belong the industrial schools, while the superior is represented by the engineering and architectural departments of the university. The use of the term "professional" as applied to primary technical schools is noteworthy. With us a professional school is a medical, law, or theological school, while in Belgium (and France) it means a school in which training for special occupations—tailoring, shoemaking, carpentering, etc.—is given, the French word "profession" meaning "business" or "calling," while the English word is restricted to the educated occupations. These schools are called trade schools in England. In Belgium they are equipped with workshops. The industrial schools are mostly evening schools, and are open on Sundays as well as week days. Their students are workmen or employees occupied in work-shops dur-

ing the day. The programmes of the schools vary, but all have drawing, mathematics, and physics. The initiative for professional schools is taken by the State in Belgium, while in Germany corporations generally take the initiative, as individuals do in England.

Superior technical instruction is given in schools of art, manufactures, mines, and engineering, attached to the universities, and a number of technical schools which have been grouped around the universities as adjuncts to the faculties of science. The university degrees to technical students are those of civil engineer of mines, of architecture, etc., and of mechanical or electrical engineering. Out of a total of 4,835 students at the four universities, 937 were science students and 1,010 technical students in 1896.

*Education in central Europe.*—In Chapter IV, entitled “Education in central Europe” (pp. 125–235), a comparative review of the educational statistics of the Kingdom of Prussia is first given, in which the results of the last three official quinquennial reports, those of 1886, 1891, and 1896, are subjected to a critical analysis. A number of facts, characteristic of Prussian conditions, come to light in this analysis, notably that the average number of pupils to a teacher in the elementary public schools is larger than it is in France and the United States, though it has decreased from 64 to a teacher in 1886 to 57 in 1896, while the total number of pupils enrolled has increased in ten years from five and a fourth millions to five and three-fifths millions. Compared with the school enrollment of the United States this seems small, but it does not represent the total number of children receiving elementary education. The secondary schools not only reach down to the tenth year of age, but have in most cases elementary classes for pupils from 6 to 10 years. While in this country all children from 6 to 18 attending school are counted, the Germans count only those who come under the law of compulsory attendance; that is, those 6 to 14 years of age.

Another very striking fact is, that in 1896 the number of children who spoke German only amounted to 86½ per cent, while that of the children who spoke Polish only was 10½ per cent. About 3 per cent spoke the two languages.

Especially large is the increase in the number of women teachers, from 6,848 in 1886 to 10,271 in 1896. This is attributable to the advantageous openings for young men in more lucrative pursuits during the recent phenomenal expansion of German industry and commerce. There is an urgent demand for teachers in Prussia, which is seen from the fact that there are only 86 regularly appointed teachers to every 100 classes or grades. The local authorities have resorted to the expedient often made use of in this country, namely, the establishment of half-day schools.

The salaries of teachers have been much improved in consequence of

the new laws passed by the Prussian Diet; the sum spent for salaries, which was \$19,500,000 in 1886, rose to nearly \$30,000,000 in 1896. The State's quota of the expenditures for elementary schools is now 16 per cent in cities and 39 per cent in rural districts. The per capita expense for elementary education, which was only 50 cents in 1861, 83 cents in 1871, 98 cents in 1886, has increased to \$1.53 in cities and \$1.29 in rural districts. This increase is very marked. If to this were added the per capita spent for maintaining evening and holiday schools and for elementary instruction connected with secondary schools, the per capita would be \$2 in cities, but would not be materially increased in rural districts.

While the number of classes far outnumbered the teachers appointed, it also outnumbered the class rooms available; hence the want of teachers combines with that of the want of room to make half-day schools necessary. This is plainly brought out by comparing the number of classes, 92,001, with the number of rooms, 78,431, and the number of teachers, 79,431. Such undesirable conditions are chiefly found in the eastern provinces.

A second article in this chapter deals with "School attendance and compulsory education in Europe." It is found that the earliest feeble endeavors to establish compulsory education date back to the sixteenth century. Slowly, but never retrograding, the movement spread among the German states, until finally, at the beginning of this century, laws making school attendance compulsory for children between 6 and 14 years were on the statute books of every German state. How strictly they were carried out may be seen from the fact that at the last conscription of army and navy recruits there was found only one one-hundredth of 1 per cent of illiteracy. The article contains quotations from the various laws in force in Germany and cites the provisions made for compulsory school attendance in other countries of Europe. It also shows how the laws are executed and with what results.

The third article deals with "Teachers' pensions and annuities." The present regulations in force in central Europe and other European countries are stated for elementary and secondary school teachers. The practice of paying pensions to teachers as civil officers of the State is quite old in Germany, but all other countries in Europe have followed the German example, except Switzerland, where teachers are elected by the communities for a period of six years. In most cases they are reelected, but the principle is maintained that in a democratic Republic the establishment of an official class is to be prevented by rotation in office. This also precludes legislation for pensioning teachers. In some cantons of Switzerland the teachers make the payment of a pension a condition in their contract with the communal authorities.

A symposium on manual training in Germany given in this chapter reveals the fact that the teachers and school authorities are not very enthusiastic in introducing shopwork in the elementary schools. They acknowledge the desirability of training youth to become practical and active men, with a view to saving them from falling into vicious and immoral habits, but they are emphatic in advocating this kind of training more especially for continuation schools; that is, schools for boys who have gone through the course of the elementary schools, but who are not old enough to enter upon the pursuit of a livelihood. It is claimed that the elementary school is primarily an institution for the intellectual development of children. There are, indeed, many advocates of manual training who would add the workshop to every school, but as yet they are in the minority.

The next section of this chapter states what is done in the various German States in maintaining supplementary or continuation schools. As far as possible, the expenditures are itemized. Corroborative evidence from consular reports and English visitors prove the wide and beneficial influence of these schools.

A table in which the professional preparation of the Prussian normal-school teachers is given shows that 16 per cent of them have studied theology, 21 per cent have graduated from the philosophical faculty of universities, 61 per cent are normal graduates, and 2 per cent have both normal and university training.

The educational institutions of the Kingdom of Saxony are sketched in detail, beginning with the University of Leipsic, and showing that this little Kingdom is admirably provided with institutions of learning for general as well as for special, chiefly industrial, education.

The Swiss Central Government, like our own Federal Government, has no jurisdiction over the local schools of the States or Cantons, and the constitution expressly forbids Federal interference in the management of schools. Nevertheless, efforts are being made to induce the Federal legislature to subsidize the schools, as it does other institutions. In this chapter a translation of a petition prepared by representatives of all the Cantons, in convention assembled, shows upon what grounds it is proposed to grant subsidies, and the mode of computing and distributing them. The document is especially interesting in view of the unsuccessful efforts in this country in behalf of Federal aid for common school education.

A brief history of Hungarian secondary schools, inserted in this chapter, will be welcome to those who are still discussing the question whether or not the state should go beyond providing for elementary education.

The chapter closes with a series of tables showing the attendance at German universities during a period of nearly seventy years. These tables, prepared by the eminent statistician, Prof. J. Conrad,

of Halle, demonstrate a steady growth of the faculties of law, medicine, and philosophy, but a very decided falling off in the number of students of theology, both Protestant and Catholic. The philosophical faculty, which really consists of two departments, (1) the philological, philosophical, and historical, and (2) the scientific and mathematical sections, has outstripped all the faculties in its phenomenal increase in the number of students in attendance. From 83 in every million of inhabitants in 1831 this faculty has increased to 213 in every million in 1899, despite the simultaneous development of the technological schools, which alone enroll thousands of students who in the other countries are obliged to attend universities in the absence of technological institutions.

*Education in Sweden.*—In Chapter V (pp. 237-257) is given an interesting statement of the educational conditions prevailing in Sweden, condensed from a pamphlet by Dr. C. G. Bergman, inspector of elementary schools in Stockholm.

The schools are of the same grades and general character as those of the United States, but in Sweden more stress is laid upon technical and industrial training and slöjd. For the younger children there are ambulatory (i. e., schools that move from house to house through the district) and stationary schools of elementary grade, the former being necessitated by the topography of the country. In the year 1882 there were about two-thirds of the pupils between 7 and 14 years of age in stationary schools, and one-third in ambulatory schools. In 1895 there were 22.6 per cent in ambulatory schools, and 77.4 per cent in stationary schools.

With a population of 5,062,918 in 1898 there were 733,836 pupils in elementary schools, 16,520 in secondary schools, 1,410 in people's high schools, and 1,221 students in normal schools. The amount spent on elementary education was \$4,180,568, one-fourth of which was furnished by the State. The ratio of elementary pupils to the total population was 14.49 per cent; the expenditure per capita of enrollment, \$5.69; per capita of population, 82 cents.

Among the recruits of 1896 only 0.13 per cent were unable to read, and only 0.63 unable to write.

There is a rigid school inspection throughout urban and rural districts, the number of the inspectors depending upon the needs of the schools, as determined by the school authorities.

A class of schools found in Scandinavia is that of the people's high schools, which "aim to inculcate knowledge of the history of the Fatherland, and to so train the children of the peasant class that they may feel especial interest in the problems of citizenship." These schools are a grade above the elementary; no entrance examination is required, but those desiring admission must have passed through the elementary schools and be 18 years of age in the case of boys, or 16

years in that of girls. Boys attend these schools from November to May; girls from May to August.

The secondary schools are classical and nonclassical in character, the former leading to the university, the latter training for practical life. Of the 705 graduates in 1896, 51 were women. In 1896 there were 3,977 students taking the classical course, and 4,246 the nonclassical.

Coeducational institutions are usually private, but several receive state aid. The Palmgrenska Samskolan, the oldest high-grade school of this class, receives \$2,144 from the state. The main effort of the coeducational schools is to have an eclectic course, to adopt the best methods of instruction in foreign languages and other studies, to train in slöjd, etc.

The pay of teachers varies in different schools, and for each class of schools the minimum amount is prescribed by law. These amounts will be found tabulated in detail. By law of Parliament in 1898 the salaries of teachers after ten years' service must not be less than \$214.40, with lodging, board, and fuel.

The pensioning of teachers in elementary and higher elementary schools is managed by a special board. Every school district pays from \$8 to \$13.40 annually toward this object, and the state gives a certain quota. The maximum pension is \$201, the minimum \$141, but an act of Parliament (in 1898) established a basis for a more substantial pension.

The universities in Sweden (Upsala, 1,426 students, and Lund, 582 students, in 1899) have the four faculties. To all except theology women are admitted. There is also a state faculty of medicine in Stockholm (296 students) and private philosophical faculties in Stockholm and Göteborg.

The Royal Central Gymnastic Institute trains both sexes in gymnastics. It was established in 1813 by Per Henrik Ling. In 1896 there were 59 men and 28 women receiving gymnastic training and 665 patients were being treated for various diseases. High-grade military and naval schools train for these two branches of the service, and there are lower-grade schools to train recruits.

The lower grade technical schools give industrial training. There are 32 of these, and they are generally evening and Sunday schools for the benefit of working people who have no other hours apart from their labor. Schools of agriculture and forestry give practical instruction along these lines.

Slöjd has been taught since the early seventies. In 1878 it was taught in 403 schools. In 1895 it was taught in 2,483 school divisions at a cost of \$49,643. While slöjd instruction is not a requirement of the State, there are subsidies for it, and there is the requisite State inspection.

Since 1896 regular arrangements for teaching cooking have been

established in some of the newest school buildings. Since 1890 bath houses, arranged for exercises in swimming, have been connected with many of the schools.

Special attention is paid to ventilation; in the Stockholm schools there is change of air in the rooms four times an hour.

*Education in Japan.*—Through the courtesy of the honorable Secretary of State I am enabled to give in Chapter VI (pp. 259-302) a statement of the development and present status of state education in Japan, prepared by Mr. Robert E. Lewis, of Shanghai. Mr. Lewis is well qualified to treat of this topic, through personal examination of Japanese educational institutions, interviews with prominent educators, and a study of the literature of the subject.

It is a source of satisfaction to note the formative influences that have been exercised by the United States in the upbuilding of the Japanese school system, whether through the medium of native Japanese educated in this country or that of Americans domiciled in Japan. In 1887 there were 699 Japanese students in America.

*Classification and promotion of pupils.*—In the grading of schools as ordinarily carried out, pupils of widely different capacities and rates of mental development will inevitably be found associated together in the same grade. To adapt the instruction and the rate of progress to the needs of each individual pupil in such a case is manifestly impossible. If the lesson is adjusted to the capacity of the average pupil, there are certain pupils for whom it will be found too short or easy, and certain others for whom it will be found too long or difficult. The bright pupils are held back and the dull ones dragged forward at too rapid a pace, so that the former are insufficiently occupied and waste a considerable portion of their time, while the latter are not able to keep up with the rest of the class and are not adequately prepared when the time comes for the annual examination and promotion. In order to avoid this peculiar evil that characterizes the system of grading and promotion with the one-year interval, it must be so modified as to permit each pupil to advance as fast or as slow as his abilities admit of, without reference to the rate of progress of any other pupil. A plan to effect this result was devised and put into operation in St. Louis and Chicago in the early seventies, a plan of which the distinguishing features were short class intervals and frequent promotions. This plan, or some modification of it retaining the essential features by which it is characterized, has since been adopted or rediscovered in a number of places, where it has stood with excellent results the test of trial continued through a series of years.

Chapter VII (pp. 303-356) contains a compendium of information upon the introduction of this plan in a number of places, beginning

with extracts from the St. Louis school reports from 1869 to 1875,<sup>1</sup> showing the difficulties encountered in the ordinary methods of grading and promotion, and giving an exposition of the short-interval system as introduced into the St. Louis schools. Then follow an account of the Elizabeth (New Jersey) plan of grading, by Supt. William J. Shearer; the Seattle plan of promotion and classification, by Supt. Frank J. Barnard; plan of the north-side schools of Denver, by Supt. J. H. Van Sickle; promotion in the grammar schools of Cambridge, Mass., by Supt. Francis Cogswell; and a report on the grading and promotion of pupils, by John T. Prince, agent of the Massachusetts State board of education.

*Common schools in the Western States.*—In Chapter VIII (pp. 357–450) Dr. A. D. Mayo has investigated the development of the common school in the Western States from 1830 to the close of the civil war. Circumstances of time of settlement, geographical location, and character of immigrant population have given rise to varied experiences in different States in the effort to found a system of free schools. The whole is instructive to pass in retrospect, and forms a valuable contribution to American educational history.

*The Royal Normal College for the Blind in London.*—It is coming to be generally recognized that the education of physically or mentally defective children should be made a charge upon the public no less than that of normally constituted children. Whatever currency this view has gained in Great Britain, in the case of blind children, is due in a great measure to the Normal College for the Blind in London, and to its founder and president, Dr. F. J. Campbell, a native of Tennessee, U. S. A. A sketch of this institution, with characteristic incidents in the life of its founder, has been prepared by Hon. John Eaton, formerly United States Commissioner of Education, and forms the subject of Chapter IX (pp. 451–470). Dr. Campbell has practically demonstrated that under proper training the blind can be made a capable and self-supporting class, who may cherish most of the aspirations common to seeing persons. His abilities, and the good results which have been obtained through his methods, have won for him the countenance and cooperation of influential leaders of public opinion in England, so that now the college is apparently established upon a sound basis.

*Mental abnormalities in children.*—Chapter X (pp. 471–478) is entitled “Minor mental abnormalities in children as occasioned by certain erroneous school methods.” The writer divides his paper into four parts, basing each part upon a distinct premise.

His first premise is that acquired characteristics are not transmitted

---

<sup>1</sup>Also reprinted in the Report of this Office for 1891–92, pp. 601–636. The renewed attention that has been given to this subject has rendered the reprinting of it again advisable.

from the parent to the child. The principal conclusion therefrom is that when a child enters school it should be taken for granted that he knows practically next to nothing of real educational value.

The second premise is that mental development occurs by stages. This leads him to the conclusion that the course of study must be in harmony with the processes of development; more depends on the order of studies than upon their contents; by merely changing the order of studies work that formerly required seven years has been done in three and one-half years.

The third premise is that mental disintegration attacks the higher faculties first, the simplest last. Fatigue is the most common cause of minor mental abnormalities and close watch should be kept for evidences of fatigue.

The fourth premise is the principle of localization of brain function. A brain cell grows only through exercise; without growth it is dead. Brain disorderliness is due more to one-sidedness of methods of education than any other cause. Nature study after the kind described in Whittier's Barefoot Boy is of more value as a corrective and educative force than books alone. Home study, especially for young children, is attended with dangers. Physical training is beneficial in cases of brain disorderliness.

*Miscellaneous educational topics.*—In Chapter XI (pp. 479-635) are collected a number of discussions of educational topics, essays, addresses, etc., among which are the following:

Military drill.—An inquiry (pp. 479-488) by Chancellor MacCracken, of New York University, into the physical and moral benefits of military drill. Dr. MacCracken questioned upon this subject a large number of principals of high schools, academies, and grammar schools, whose replies furnish a useful body of information and opinions.

Uniform school reports.—At its Chattanooga meeting in 1898, the department of superintendence of the National Educational Association appointed a committee to report upon a uniform style of financial school reports. The report made by this committee the ensuing year, containing among other things the form of financial report recommended by them, is given on pages 489-494.

Professional schools.—On pages 494-502 is reprinted from a pamphlet by Mr. Robert H. Thurston, director of Sibley College, Cornell University, a discussion on the proper organization and conduct of professional schools and on the entrance requirements which should be prescribed for them. The views of the writer tend in the direction of more completely differentiating technical and professional from academic instruction, beginning at an early point in the pupil's career, and of devising special adaptations of common-school instruction for children who must early be put to work.

Thaddeus Stevens's defense of public schools.—I reprint in this

Report (pp. 516-524) Thaddeus Stevens's speech in defense of the public school system of Pennsylvania, which forms one of the most noteworthy contributions to educational discussion. This speech has peculiar claims to preservation on account of its historical value as well as its sterling merits and the decisive influence it exerted, in that it saved the public schools of Pennsylvania from the overthrow which was on the point of being consummated.

Consolidation of schools.—The progress made in the centralization of rural schools and the conveyance of pupils at the public expense has been from time to time noted in the publications of this Office. On pages 526-529 is given a statement by Mr. Edward Erf of the plan of consolidation adopted in Kingsville, Ohio, under which the expenses of the schools are said to have been reduced nearly one-half, the attendance largely increased, and the quality of the work done greatly improved.

College admission requirements.—The new requirements for admission to the University of Illinois form the subject of a paper by Dr. S. A. Forbes, dean of the college of science of that institution (pp. 529-537). This university has made a new and noteworthy departure in introducing an elective system of entrance conditions carefully worked out in all its details. The institution has practically said: "Send us capable pupils, well trained, with minds well stored with something, and we will not inquire too closely what that something is."

State universities.—The position and functions of State universities in our educational system has been made by President James B. Angell, of the University of Michigan, the subject of an address which is reprinted on pages 647-655. The principal embarrassments which State universities have to encounter are considered in detail, as well as some of the advantages which have accrued to them and to the public from their peculiar organization, particularly in the greater variety of instruction they have been enabled to furnish as compared with most private colleges. These institutions have accomplished much, and hold out the promise of still larger usefulness in the future. Dr. Angell is of the opinion that the one great university in each of the Western States will be the State university.

Material progress in Mexico.—On pages 659 and 660 are given some extracts from a message of President Diaz, of the date of September 16, 1899, showing the progress made in Mexico in recent years in mining, agriculture, railroads, manufactures, the settlement of the public lands, etc. Especially noteworthy is the statement concerning the increased utilization of water powers for the development of electric energy, which is transmitted to convenient sites for use where power is required.

*The study of art and literature in schools.*—In Chapter XII I bring together some essays on the subject of literature and art and their func-

tion in the education of the race. Some suggestions are made as to their introduction into the curriculum of the school.

*The Western Literary Institute.*—Chapter XIII (pp. 707-745) traces the history of the Western Literary Institute from 1831, at which time it originated, with the title of College of Professional Teachers, under the auspices of the Academic Institute, which met for the first time that year at Cincinnati. The object of the discussions was to improve the quality of the teaching given in the public schools by introducing a higher standard and requiring a more complete preparation among the teachers. The meetings were useful in bringing the teachers together for discussion of methods and for mutual acquaintance.

Local societies, or teachers' institutes, were soon formed, which sent delegates to the college. The addresses on educational subjects at the meetings at Cincinnati were published, the college became an active factor in improving the schools of the Western States and the Mississippi Valley, and soon had branches or corresponding societies in neighboring States—Kentucky, Indiana, and Illinois.

The chapter gives extracts from some of the addresses and discussions, which show the state of education and pedagogy in the middle West nearly seventy years ago, and the steps of its progress. The college came to an end in 1845, after accomplishing an important work.

*The United States Naval Academy.*—The successful conduct of the naval operations during the late war with Spain furnished abundant evidence of the efficiency of the training given to naval officers at the United States Naval Academy. With a view to determine what that training is, and whether it affords any lessons that may be useful to common-school officials and teachers, Prof. Edward S. Holden made an examination of the organization, administration, and methods of instruction of the Naval Academy, the results of which are embodied in Chapter XIV (pp. 747-780).

*Text-books on arithmetic.*—The annotated chronological list of American text-books on arithmetic, by James M. Greenwood and Artemas Martin, which was begun in my Report for 1897-98, is brought to a conclusion in Chapter XV of the present Report (pp. 781-837). This bibliography is a unique one, tracing in its fashion the evolution of the arithmetic book from its crude beginnings, and contains many allusions of value to the future student of the history of education.

*Education in Italy.*—Chapter XVI (pp. 839-870) opens with a brief history of elementary education in Italy from the time of the political unification of the country in 1861 to the present. At that period the illiteracy was very high, over 60 per cent, reaching 93 per cent in some southern districts. Under Count Cavour's leadership the Italian Parliament made instruction compulsory. The law of 1877 enforced this compulsory instruction by requiring the appointment of teachers for a given number of persons in each commune. As a result of these

laws there were, in 1895-96, 2,589,423 pupils in primary schools, and, adding the pupils in kindergartens and in private and normal schools, the total was 3,089,380. The total expenditure of the communes for primary education was \$12,150,000, and the illiteracy had fallen to 55.24 per cent.

The report of Prof. F. Torraca, director of primary instruction, for 1896, shows the hygienic condition of the primary school buildings in many communes. The municipal authorities in some instances were opposed to making any improvements. The report criticises the furniture, apparatus, and material. On the other hand, the moral and intellectual education of the teachers was satisfactory, only 7,280 out of the 50,048 teachers having an education and training below the requirements.

It appears from the extracts taken from the report of Professor Costelli, of the Italian department of public instruction, for 1898, that the efforts of Minister Bacelli since 1881 toward reform in education have resulted in awakening emulation in all classes and have created a general change in public opinion.

This chapter mentions the establishment of agricultural and manual training schools, which shows that technical education is prospering in Italy. There are also engineering schools connected with the universities, the "schools" being faculties on a par with those of law and medicine. The secondary classical schools are, moreover, becoming "modernized" by changes in the programme.

The statistics show that in 1896 there were 77,267 students registered in the secondary classical schools and 47,504 in the technical schools and technical institutes, besides 44,778 pupils in the various industrial and commercial schools. These figures are significant.

The chapter closes with a discussion of the question, which is agitating the university world in Europe, of limiting classical education, from which discussion and the bill following it appears that in Italy the limitation will be attempted by checking admission to the universities while making the latter independent. The bill, which was very progressive and introduced many reforms in the direction of enlarged scientific study, freedom of teaching, and independence of the church, aroused great opposition and failed to pass in 1898.

*Training for railway service.*—Chapter XVII (pp. 871-955), prepared by Mr. J. Shirley Eaton, the statistician of the Lehigh Valley Railroad, contains a report on educational training for railroad service. The compiler, after stating the general relation of higher education to railroad operations, shows to what extent (1) higher mechanical instruction, (2) instruction in civil engineering, (3) higher commercial education, and (4) university and college education have been specialized for railroad service. He then advocates a more complete specialization through the establishment of schools of different grades whose

main object will be to provide railroads with men prepared for their service. He shows what the existing institutions of learning are doing for railroad men and for those who intend to become such. Minute information on this point is offered and numerous authoritative utterances are quoted. In discussing the different functions and qualifications of railroad employees, he arrives at the conclusion that "railroading" is a profession for which special preparation is necessary.

But while it would seem impossible for Government authority, be it Federal or State, to provide for the special education of railroad men, the writer thinks it most judicious and wise for railroads themselves to provide the means for such an education, as it is in their own interest, but might not be in the general interest of the Government. The answers by railroad officials to a series of inquiries are instructive, since they reflect the views of these men with reference to a specialized railroad education.

*University extension in Great Britain.*—In Chapter XVIII (pp. 957-1055) Prof. Herbert B. Adams, of Johns Hopkins University, contributes a review of the many efforts that have been made in England to bring higher education within reach of the masses. His compilation on "University extension in Great Britain" commends itself by its great number of instructive details. He calls attention to the fact that the educational facilities offered to the poor in England have been, as an inevitable law of affairs, taken possession of by the higher classes. Various waves of extension are passed in review. Then follows a statement of the defects of English universities, which are set forth in quotations from English scholars. The third section deals with academic pioneers in the form of brief but comprehensive biographies. This is followed by a description of some famous institutions, such as the Workingmen's College. Charles Kingsley and Christian socialism, the London colleges, and the liberal movement of 1848 are duly considered. Section 6 deals with university reforms since 1850, and properly emphasizes the efforts made in behalf of the poor. The university extension instituted by Cambridge University gives opportunities to show what the English have done in behalf of higher education for women. The London Society for the Extension of University Teaching, the Oxford efforts in the same direction, local college extension, and, finally, the work of extension emanating from the universities in Scotland are considered.

It is surprising, when looking over the sum total of this work of university extension, to see what energy and means are expended in raising the masses to a higher intellectual and moral level. Great Britain has set Europe an example which the Germans, first of all continental nations, imitated. Berlin, Leipsic, Munich, and Vienna, as well as a number of smaller universities, have begun the work of

extension, but as yet their efforts are feeble compared with the work in Great Britain and the United States.

*Bird's-eye view of the St. Louis school system.*—In Chapter XIX, I reprint from a report of the board of public schools in St. Louis a summary statement of the organization and management of the city school system (prepared by myself in 1876 and revised from year to year). It may be instructive to those who seek sources of information regarding city school systems.

*School gardens.*—Chapter XX contains an English translation of an article on school gardens by Mr. E. Gang, the director of a school garden in Triptis, Thuringia, Germany. After a brief historic review, of much interest and detailed information as to number and size of such gardens in different countries, the author discusses their arrangement; he specifies the sections that should be formed in every school garden, their management, and the work to be done in them; he suggests how the teacher may instruct in the gardens, what plants are to be cultivated, and how to best employ the children's desire for self-activity. The article closes with an argument concerning the educational and economic significance of school gardens. This chapter will be especially serviceable to those who are actually engaged in establishing school gardens, inasmuch as they will find in it not only the general principles involved, but also minute information as to how to lay out a school garden, what to plant in it, and how to utilize the garden for purposes of instruction.

*Education in France.*—Chapter XXI (pp. 1085–1138) gives a concise but clear summary of the French organization of education.

The term "university" is used in France in a peculiar way, and would be apt to create confusion in the mind of an American reader, who is accustomed to it only as applied to particular institutions, as is the case generally in the United States and Germany. The French speak of the whole State educational system as the University of France, which is subdivided into seventeen academies, each including what the Germans or English would call a "university," with associated lycées and colleges and the primary schools within its limits.

Formerly in each academy there were "faculties" of law, philosophy, etc., which were groups of university professors, and these "faculties" were transformed into organic universities by the law of 1896. These universities have a large measure of independence, manage their own affairs, and grant degrees independently of the state.

The tendency, which is now almost universal, toward technical and scientific studies is noticeable in the new universities. Large laboratories are being constructed, and some of the smaller universities may even become technical institutions of high grade.

There were 28,782 students at the French universities in 1897-98, and the expenditure on their account was \$2,772,001. The greater number of students were in the law faculties, viz, 9,371; in the "sciences" proper there were 3,544, the rest attending the faculties of letters (3,643), medicine (7,462), and pharmacy (3,326).

Provision has been made whereby foreign students can take degrees at the universities without passing certain lower grades required of French students.

The total expenditure for primary instruction at the date of the last statistics published (1895) was \$37,890,173, which was at the rate of 98 cents to each individual of the population. The total enrollment was 5,533,511.

An antialcoholic movement was inaugurated in the primary schools in 1897, of which the chapter gives a full account. Particularly noticeable is the temperance in statement enjoined upon the teachers. They are warned not to excite the imagination of the children by exaggerated pictures of the evils of intemperance.

The continuation of education after leaving school by means of schools for adults—lectures on art, history, and scientific subjects—has been taken up in France with characteristic taste, and a brief notice of the movement is given in this chapter.

The influence of the Republic in making primary public education compulsory and secular is shown in secondary education in the greater freedom and initiative allowed the professors. There has been a pronounced tendency toward "modernizing" instruction like that shown everywhere else in Europe. The discussion of this question and others connected with it was promoted by a series of questions put by the commission appointed for the purpose, which questions, with the depositions received by the commission, are given in the text. Depositions on the defects of the secondary system were made by some of the most distinguished French savants and writers, such as Messrs. Berthelot, Lavissee, and Bréal. That of Brother Justinus, secretary-general of the Christian Brothers, is in effect an account of the history and working of the schools of the order, which will be interesting in this country on account of the recent order forbidding these schools to teach Latin in the United States.

The total enrollment in the secondary schools (lycées and colleges) and church and private schools of the same grade was 182,221 in 1897.

This office is much indebted to Prof. E. Levasseur for his continued courtesy in sending valuable statistical information as to the school system of France. His own labors are among the most valuable in the world that go to elucidating educational problems by statistics.

"*Bibliography of Confederate text-books.*"—Dr. Stephen B. Weeks presents in his "Bibliography of Confederate text-books" (Chapter XXII) an interesting phase of the civil war. Prior to secession manu-

facturing received but little attention in the South. The making of books, particularly, was a thing almost unknown; the cultivated men of that section were for various reasons not much given to authorship, and when one of them did produce a work for publication it usually saw the light through the medium of a Northern publisher. But the closing of the Southern ports and the extension of the lines of the Union armies along the whole of the northern border of the Confederacy almost completely shut out the ordinary sources of supply of manufactured articles of all sorts. Even if there had been no prejudice in the minds of the Southern people against Northern books and wares, it was well-nigh impossible to get them into the country. Home industry had to supply the deficiencies. Richmond, Atlanta, Columbus, Montgomery, and other Southern cities speedily lost their characteristics as markets for agricultural products and became busy manufacturing centers instead. The writing and printing of books was stimulated along with other lines of industry, though naturally to a less extent than the rest. The result, so far as text-books were concerned, is shown in Dr. Weeks's bibliography. In view of the lack of experience and of facilities for such work, the demoralized condition of the country, and the necessary neglect of all things not directly pertaining to the prosecution of the war, the list is surprisingly long.

*Educational journals and educational directory.*—In Chapters XXIII and XXIV I have printed the educational directory containing the addresses of school officers together with the titles and addresses of the educational journals printed within the United States.

*Economic geography.*—Applied (or economic) geography forms the subject of Chapter XXV. It contains in addition to quotations which attempt to represent authoritative American opinion a reprint of an essay by Dr. A. J. Herbertson, lecturer in Edinburgh, Scotland, on industrial and commercial geography, in which the author points out the great importance of applied geography and gives a review of the status of this branch of study in the various countries of the Old and the New World.

*A review of Swedish gymnastics.*—The “warfare of the systems” which marked the discussions of physical training a few years ago appears to have practically died out. It is recognized that the essential aims of all the recognized systems are identical, and that the differences are in details, which are for the most part of little importance. Heated disputes by the partisans of this system and that have given place, therefore, to more profitable discussions on a higher plane.

“Physical training” has come to mean more than mere gymnastics; it now includes much that lies within the domain of the science of medicine. The size and fit of school desks, cleanliness of floors, the color of walls, and sanitation of buildings generally, as well as neat-

ness of person, defects in eyesight and hearing, contagious diseases, and bodily deformities have all received and continue to receive effective attention from officials whose titles imply the direction of bodily exercises alone. Much of this has been obviously due to the plain necessity and general demand for medical inspection of schools. In some instances it has, in fact, amounted to that. Gymnastics has not been neglected, however, in this expansion of ideas, and arguments in favor of the several systems have not ceased, for the time has not yet come for an obliteration of their peculiar characteristics. But these arguments are without acrimony, are constantly becoming more liberal in tone and broader in scope, and even now what is justly said for one system is in its essential particulars true of all. This is certainly the case with the paper of Mr. Theodore Hough on Swedish gymnastics (Chapter XXVI). Though not purporting to be such, it is an excellent exposition of the purpose of school gymnastics in general, and only when the writer touches upon characteristic features of the Swedish system are his statements of limited application. I copy it from the Yearbook of the Normal Training School for Teachers of Physical Training, established and endowed by the late Mrs. Mary Hemenway, whose life was devoted to unceasing efforts to elevate the tone of popular education and to ennoble it by patriotism, historic studies, wiser attention to health, and to an education in economic arts.

*Duty of the colored educated class.*—In Chapter XXVII is reprinted an address by Dr. A. D. Mayo on “The opportunity and obligation of the educated class of the colored race in the Southern States.”

*Education and crime.*—In Chapter XXVIII I have brought together a variety of treatises relating to education and its effects on crime, most of them noteworthy, either as attacks on or defenses of the schools as preventives of crime.

*Education in Canada.*—The noticeable historical and statistical features in the chapter on education in Canada (Chapter XXIX) are as follows: The right to legislate on education was granted to the separate governments of the Dominion by the British North American act of 1867. The mode of dealing with the question of religious instruction was thus left to each colony to decide for itself. The control of the schools is now divided between the central and the local authorities, but not equally, since in some provinces (in Ontario, for instance) the central predominates, while in others the local authority has independent action. The elementary schools are secular in all provinces except Ontario and Quebec. In Ontario there is provision for separate schools for Protestants and for Roman Catholics when desired, but little advantage has been taken of the provision, the vast majority, over 91 per cent, of the children attending nonsectarian public schools. In Quebec, on the other hand, the schools are sectarian, and provision is made for the separate control of the Roman

Catholic and Protestant schools, the Catholics in 1896-97 enrolling more than 86.6 per cent of all elementary school children. In the Northwest Territories, also, provision is made for separate schools. The division of the townships into school districts with school trustees elected by the proper taxpayers, and the requirement that the teachers should have government diplomas, facilitate the administration of the elementary schools.

The legislative grant for elementary schools in Ontario for 1897 was \$366,538, and the income from local sources \$4,621,617; in Quebec in 1898 the corresponding amounts were \$170,000 and \$1,425,986; in New Brunswick, \$163,022 and £320,807; Nova Scotia, \$182,500, besides a special fund of \$7,670 for poor schools. In the remaining provinces the schools are also supported by provincial grants and local taxes. The total expenditure for the Dominion was \$8,625,149. The expenditure per capita of the enrollment ranged from \$20.21 in Manitoba to \$7.46 in Prince Edward Island.

Higher education, which is represented by universities, colleges, and academies, is in a flourishing condition. Besides the old-established universities, dating from 1790, 1800, and 1821, which are famous for the scientific reputation of some of their teachers and the attainments and talents of their graduates, there are seven universities dating from the middle of this century.

There are, besides, 15 colleges, 16 so-called classical colleges in Quebec, which are a combination of school and college, 7 ladies' colleges, 1 academy, and 4 agricultural colleges. The foregoing are public institutions and are exclusive of 24 denominational private schools not empowered to grant degrees.

Education is receiving increased attention in the Dominion, as is shown by the discussions of such subjects as "Uniformity in teaching," "Extension of technical education," "Lack of male teachers," and others of a practical nature which are incorporated in the chapter. It concludes with a history of education in upper Canada.

*William Preston Johnston.*—The eminent services rendered by the late president, William Preston Johnston, of Tulane University, to Southern education make it peculiarly appropriate to place on record a general survey of his work and of the results he achieved, such as is given in Chapter XXX, from the pen of Dr. A. D. Mayo.

President Johnston's tact, sound judgment, and clear appreciation of the agencies to be made use of, emphasized by his commanding personality, enabled him to effect reforms, both in higher education and in the public-school system, which in the ordinary course of events would have been the result only of a slow process of development.

*Alaska report.*—In Chapters XXXI and XXXII Rev. Sheldon Jackson gives a history of the operations of this office in Alaska for the year and a detailed account of the experiment of introducing rein-

deer and teaching the natives the arts of herding and teaming. The recent gold discoveries in northwest Alaska have increased the need for teamsters and created a demand for food which a thousand herds could not more than supply.

*Consular reports.*—The chapter of Consular Reports (Chapter XXXIII) is more varied in contents, though the separate contributions are briefer than in former years.

*Foreign universities.*—In Chapter XXXIV the customary list of foreign universities and other institutions for higher education is inserted. It shows important accessions to the number of such institutions and a greatly increased attendance.

*City school systems.*—In regard to city school systems (Chapter XXXVI), the year just passed has been marked by a reaction against some of the tendencies and methods that have been conspicuous for several years past. What has been termed the "new education" has been subjected to more criticism and attacks than in any previous year. From the first the "new methods" have been consistently and earnestly opposed by a large proportion of the members of the teaching profession, but for the most part the public at large have remained in an attitude of indifference. During the last year, however, it is a noteworthy fact that the protests and the criticisms have come not from school men principally, but from the press and from the patrons of the schools.

There has been, too, a great deal of opposition—more marked this year than usual—to the further extension of a certain kind of supervision, namely, that of "special teachers." One city, Milwaukee, has entirely discontinued such supervision, others have materially reduced the number of specialists employed, and in still others recommendations of superintendents to the same effect will undoubtedly result in still further reduction in the near future. Questions of economy have naturally had their part in this movement, but such a consideration would scarcely have had much weight in this time of improved financial conditions and prospects were it not for the belief that, with the better preparation of teachers now demanded, special supervisors are of distinctly less value than formerly.

The lack of the usual yearly increase in school enrollment and attendance in cities is a noteworthy phenomenon developed by the statistics of 1898-99. Some of the cities show an actual decrease, and in nearly all the rest the increase is considerably below the usual rate. Private schools have grown at a relatively greater rate than public schools, but not enough to bring the total increase up to its accustomed proportions.

The reason for this relative falling off is not easily found. A few of the superintendents have suggested causes that seemed to them adequate in their respective cities, but none are sufficient to cover the whole ground. They refer generally to contagious diseases, vaccina-

tion, and the like—incidents of child life which may be considered as uniform in the country at large from year to year.

If only the total enrollment were considered, it would be reasonable to suppose that the return of prosperous times has increased the opportunities for employment and caused the withdrawal of many school children on that account. That was undoubtedly to be expected, and has probably happened in many cases. But if that were the cause of the general absence of the accustomed increase in school attendance, then the high schools would show the effect most, since the oldest children are the first to be withdrawn under such circumstances. But in nearly every case the high schools have grown at a greater ratio than the elementary schools. That fact would seem to set aside the explanation under consideration.

The only remaining supposition that would be justified by the evidence and broad enough to cover the case is that there has been a temporary check in the growth of the cities themselves. In view of the history of the movement of population for the last hundred years that would seem a violent presumption, but there is reason to believe that it is well founded. The school censuses available show but little increase as a rule, and in several cases the evidence of the city directories tends to the same conclusion.

*Higher education.*—The usual statistics concerning higher education are given in Chapter XXXVII. These show that 103,251 students were enrolled in the undergraduate and graduate departments of universities and colleges, an increase of 2,193 over the number of the preceding year. The degree of doctor of philosophy was conferred during the year on 336 persons, 11 of whom received it as an honorary degree. In view of the great interest now being manifested in graduate work, the requirements for the Ph. D. degree in 72 institutions have been compiled and given in this chapter.

The benefactions to institutions for higher education were unusually large—\$21,925,436. Of this amount \$11,000,000 were received by the Leland Stanford Junior University and \$1,544,330 by Harvard University.

The income for the year amounted to \$27,739,154, of which \$10,924,415 were derived from tuition and other fees from students, and the remainder from investments, State and municipal appropriations, and miscellaneous sources.

The University of Chicago has established a new degree, that of associate, to be granted to students who have completed the work of the junior colleges, embracing the work usually included in the freshman and sophomore years. The reasons for the establishment of the degree, as stated by President Harper, are given in full in this chapter.

In the last twenty-five years the number of inhabitants in the United States in each million who have taken up higher education has risen

from 590 to 1,215. The number of women has increased from 112 to 323 in a million in the past twelve years. In the same time the standard of higher education has been raised by the addition of nearly a year's work required for admission to the university. The American college or university course takes up about a year or a year and a quarter of the work that is required in the French college or lycée or the German gymnasium. In reducing the numbers registered in American colleges and universities to the European standard it is necessary to deduct about 30 per cent from the number reported as enrolled in higher education. It would seem, therefore, that after deducting the women students the increase of students is very large—over 50 per cent.

*Women college students to each 1,000,000 persons.*

1887-88 .....	112	1893-94 .....	256
1888-89 .....	129	1894-95 .....	263
1889-90 .....	163	1895-96 .....	295
1890-91 .....	185	1896-97 .....	291
1891-92 .....	202	1897-98 .....	308
1892-93 .....	223	1898-99 .....	323

*Professional education* (Chapter XXXVIII).—In the 163 schools of theology there are enrolled 8,261 students; in the 96 law schools, 11,874 students; in the 151 schools of medicine, 23,778 students. There are 50 schools of dentistry with 7,354 students, and 51 schools of pharmacy with 3,551 students.

In the ten years from 1889 to 1899 theological students increased only 18 per cent, while law students increased 204 per cent.

The pupils in nurse training now number 10,018 in 393 schools, nearly all of which have courses of two years.

*Land-grant colleges.*—In Chapter XXXIX are given the usual statistics furnished by the presidents of the several colleges, universities, and other institutions endowed by the acts of Congress of July 2, 1862, and August 30, 1890, accompanied by extracts from the presidents' reports showing any changes or improvements during the year. In view of the increased attention devoted to practical work in dairying, an outline of the course of study in that branch in a number of colleges, as well as a description of the equipment for such instruction, is given in this chapter.

*Normal schools.*—The number of persons in the United States engaged in teaching, from kindergarten to university, exceeds 485,000. Preparing to enter the ranks of this vast army there were in institutions of various grades 93,687 students pursuing training courses for teachers during the scholastic year ending June, 1899. Of this number, 44,808 were in the 166 public normal schools reporting to this Office, as shown in Chapter XL. The number of normal students in 165

private normal schools was 23,572. There were students in teachers' courses to the number of 9,491 in 235 colleges and universities. In 544 public high schools there were 8,930, and in 378 private high schools and academies 6,886 students pursuing such courses. Divided according to control, 56,279 normal students were in 739 public institutions and 37,408 in 749 private schools.

The number of students graduating from the teachers' training courses of the public and private normal schools in 1899 was 11,175. The normal graduates of other institutions were not reported to this Office, but it may be estimated that the number of students graduating from normal courses in all the institutions named, including the normal schools, was not less than 15,300. But this number does not represent the entire number required to fill the vacancies in the teaching force of the country each year. Thousands leave the normal schools after one year's study and begin the work of teaching, while thousands more join the ranks from other institutions.

The most significant fact pointed out in the chapter on the statistics of normal schools is the steady increase of State appropriations from year to year for the support of public normal schools. In 1889-90 these schools received for running expenses \$1,312,419; for 1894-95 the aggregate appropriation for the same purpose was \$1,917,375, and in 1898-99 the aggregate was \$2,510,934.

*Secondary schools.*—The secondary school, or high school, is understood to begin where the elementary school ends. Having successfully completed the course of study in the common branches prescribed for the eight years, or grades, of the elementary schools, the pupil is ready to begin the four years' course of secondary studies prescribed for the high school. Among the secondary studies may be mentioned algebra, geometry, trigonometry, physics, chemistry, general history, Latin, Greek, and modern languages. It is true that in some city elementary schools a beginning is made in the eighth grade in algebra and Latin, but these are typical high-school studies.

During the year ending June, 1899, there were enrolled in the various classes of institutions reporting to this Office 655,227 secondary students, a gain of 29,112 over the preceding year. As shown in Chapter XLI, these students were distributed as follows: 476,227 in public high schools, 103,838 in private high schools and academies, 54,405 in the preparatory departments of colleges and universities, 12,995 in secondary courses in public and private normal schools, and 7,762 in manual training schools. In localities in most of the States where high schools are not accessible there are many students pursuing secondary studies under the direction of teachers of the elementary schools. These students and others not reported may exceed in number 20,000, so that it is safe to estimate the number of secondary students in the United States at 675,000 for the year 1898-99.

For the year mentioned there were 5,495 public high schools and 1,957 private high schools and academies reporting to this Office. The statistics of these 7,452 secondary schools are given in detail in Chapter XLI and analyzed in the summaries of that chapter. There was an increase of 180 in the number of public high schools and an increase of 26,627 in the number of secondary students attending the public high schools, or nearly 6 per cent, over the preceding year. This rate of increase was less than the year before, when it was nearly 10 per cent. The number of private high schools and academies reporting was less by 33 than in 1897-98, and there was a falling off of 1,387 in the number of students.

The 7,452 public and private secondary schools had 28,128 teachers and 580,065 secondary students, 249,027 males and 331,038 females. This was an increase of 7,668, or about 3 per cent, in the number of males and of 17,572, or more than 5½ per cent, in the number of female students. The increase in the ratio of female students in the secondary schools has been continuous, with few exceptions, since 1889-90. That year the percentage of female students was 54.97. In 1894-95 it had reached 57, but the next year decreased to 56.60 and the next to 56.16. In 1897-98 the percentage of female students was 56.50, and in 1898-99 it was 57.07, the highest yet recorded by this Bureau.

The graduates of 1899 number 68,330, or nearly 12 per cent of the total number of secondary students enrolled in the public and private high schools. The percentage of graduates has increased from 10 per cent in 1890 to 11.78 in 1899.

One of the most significant facts disclosed by the percentages in the last ten years is the steady increase of the per cent of students in Latin. In 1889-90 the per cent in this study was given as 33.62, in 1894-95 it was 43.76, and in 1898-99 it had reached 50.29. There has been, also, a steady increase in the percentage of students in algebra. In 1889-90 it was 42.77 per cent, and in 1898-99 the per cent was 56.21. The per cent of students in geometry increased from 20.07 in 1889-90 to 27.36 in 1898-99.

*Portable schoolrooms.*—The provision of temporary schoolrooms has always been a troublesome question in city school administration. In spite of the most careful management and the most intelligent foresight it constantly happens that the number of children in a certain locality is too great for existing permanent accommodations. The completion of a new building is delayed, perhaps, or the circumstances do not yet justify the erection of one; there is a rapid shifting of population to an unexpected quarter, or a private school suddenly closes. Such things are common. They are to be taken as matters of course, for they occur in every city. How to meet the demands for school room thus presented is a source of difficulty nevertheless. It

has ordinarily been the custom under such circumstances to rent the best private quarters available—usually society halls, basements of churches, or even private dwellings. Such makeshifts are unsatisfactory to say the least. Defective heating and ventilation, poor light, absence of proper playgrounds and sanitary arrangements, and difficulties in janitor service make rented quarters a source of trouble and annoyance always. The problem of obviating such troubles seems to have been solved in Milwaukee and St. Louis. Portable schoolrooms, comfortable and well lighted, have been designed, which can be set up wherever needed, but preferably in the yards of larger buildings. The officials of those cities write in enthusiastic terms of the success of the idea, and in a chapter near the close of Volume II will be found a description of the St. Louis buildings, by Dr. F. Louis Soldan, the superintendent of instruction, and Mr. William B. Ittner, the commissioner of school buildings of that city.

*The Philippines.*—Under the disturbed conditions which have existed in the Philippine Islands for the last four years it is not to be expected that much information concerning such a peaceful occupation as education could be obtained. In Manila, however, the Americans reopened the schools soon after their occupation of the place. What educational advantages the Filipinos possessed before the American occupation are described in the following account by Señor Felipe Agoncillo, the representative of Aguinaldo in this country, in a letter to the New York Journal, February 3, 1899. The statement is especially interesting on account of its source. The author says:

The lowest grade of school in the Philippines is the primary. There are of schools of this description two to be found in every large town, one for boys and one for girls. If the population exceeds 5,000 in number, then the number of schools is correspondingly increased. These schools are in the scope of the studies taught much like similar American schools. Reading, writing, arithmetic, grammar, geography, and history, with special reference to Spain and the Philippines, occupy the attention of the teacher and student. Instruction is given in Spanish, although all the children also speak Tagal as their native tongue. The teachers are to a considerable extent priests, though many have graduated from the normal school, to be referred to, and all have received certificates of proficiency before being allowed to instruct, and all are native-born Filipinos. In fact all the work of government, except in the higher offices, was performed by Filipinos.

Next in grade are the academies to be found in all the capital cities of the provinces. These academies fit the scholars to be admitted to the University of St. Thomas.

In regular succession we next consider the University of St. Thomas. This was established in the year 1602, and has ever since been the center of learning in the Philippines. This university is under the control of the Dominican Fathers so far as the instruction is concerned, but, like the primary schools and the academies, is supported by the Government. Here the youth of my country receive instruction in higher branches of science and literature, the regular course of instruction leading to the degree of bachelor of arts. In connection with the university is the school of medicine, of which my associate in this country, Dr. Losada, is a professor of great

distinction. There is also a school of law, informing the youth attending it in all branches of the civil law, while theology receives also attention in all of its highest forms. It will be appreciated that this university exercises an important influence upon the life of the country when I say that it is attended by over 2,000 students, forming as it does the apex of a school system of more than 2,000 schools. All the instructors at this school at the present time are native-born Filipinos, although before the war some of them were Spaniards.

In addition to those named we must not lose sight of the fact that there are seminaries in Manila, Cebu, Jaro, and several other cities of importance, instructing the youth in the more important branches.

Manila possesses a nautical school for the education of naval officers and the officers of merchant vessels, while a military academy supplies special instruction for those designing to lead a military life. Capt. Marto Burgos, who is with me in this country, is a graduate of this school.

We must not lose sight of the very important normal school at Manila, with its course of seven years, and instruction and examination at which confers the right to be employed in the lesser schools. The instructors are native born.

Nor are the Philippine Islands at all behind in instruction in other respects, the importance of which is just beginning to be appreciated, as I understand, even in this country. The Manual Training School at Manila instructs in carpentering, cabinetmaking, lithographing, engraving, working in gold and silver, and other mechanical arts.

A school of painting, sculpture, and engraving served the purpose indicated by these words, and with such good effect that one of its students, Señor Luna, my associate, subsequently to his graduation from it, received prizes from the Salon in Paris.

Several schools organized for this particular purpose supply my countrymen with a business education, in bookkeeping, mercantile correspondence, French, and English.

We are also fortunate in having ten agricultural experimental schools, and through their work are improving the agricultural products of our islands. There are many private schools in the islands at the present time, their instructors being native-born Filipinos.

I have not now the opportunity to refer at length to the school for telegraphers, nor our botanical gardens or museums or libraries, each deserving more than mention. Nor may I speak at length concerning our many excellent and advanced schools for girls now educating our ladies in both polite and useful knowledge.

May we not be excused for refusing to regard ourselves as barbarians or beyond the necessity for consideration?

But for the pressure of time I should take pleasure in amplifying the foregoing and adding further proofs of the high civilization of my country.

The first American superintendent of schools was Father McKinnon, chaplain of the First California Volunteers, who proceeded to hunt up the former school children in Manila and induce them to attend school. He succeeded in restoring confidence, and by his energy many schools were opened. On his departure to another island to join his regiment, Mr. George P. Anderson was appointed in his place in June, 1899. Mr. Anderson was a graduate of Yale, and had had experience to fit him for his duties. A circular of the provost-marshal-general, dated June 28, 1899, providing for the reopening of the schools in Manila, made attendance compulsory, and called upon the police of the various districts to enforce the regula-

tion. One hour a day was to be given to the study of English, which study was made compulsory. In September, 1899, there were 35 public schools in Manila with an attendance of over 5,000 pupils. Several school buildings had been burned, but they were replaced by others furnished throughout for the reception of the pupils. The teachers were nearly all American men and women who had learned Spanish enough to make themselves understood. A report for October, 1899, showed an attendance of 5,706.

In connection with this reopening of Manila schools by the American authorities a paragraph appeared in the American newspapers which is characteristic and significant, and illustrates the views of a certain class of Americans. The correspondent was unpleasantly impressed with the manifestation of civility of the Tagal children in school, who all rose when the superintendent entered their room on making his visit. This act the correspondent appeared to regard as a relic of tyranny, and he looked forward to the speedy banishment of "urbanidad" (politeness) from the school under the Americans, who, he was proud to think, were too free and independent to show such manifestations of "servility."

From a manuscript report of Mr. George P. Anderson to the Acting Adjutant-General, dated March 15, 1900, it appears that there were then 41 public schools in 36 buildings (mostly small) in Manila, the attendance not being given. The nautical school was reopened with an American naval officer at its head in the latter part of 1899. The object of the school is to prepare young men to become mates and masters of vessels. By the new programme, English was to be taught half of each day's session by an American, Spanish being the language used at all other times.

Mr. F. W. Atkinson was appointed superintendent of schools in Manila in May, 1900, and will probably take charge by July. He was selected on account of his known qualifications and reputation, having been remarkably successful as principal of the Springfield, Mass., High School, where he had put in practice the ideas gained by the study of his profession both in this country and in Germany. He has the degree of doctor of philosophy from the University of Leipzig.

Professor Blumentritt, the German ethnologist, whose studies of the Filipinos have been known to students for some years, thus sums up their status as to education in a recent number (Heft 337-338) of Professor Virchow's collection of popular scientific lectures. "The Filipinos," he says, "have a greater proportion of educated people among them than the Kingdom of Servia and the principalities of Bulgaria and Montenegro. There are fewer illiterates among them than in the States of the Balkan peninsula, in Russia, in many provinces of Spain and Portugal, and in the Latin Republics of America. There are provinces where there are few people who can not at least read. The

Filipinos pay more attention to schools than Spain and the Balkan States.”

Some further items relating to education in the Philippines I have placed in the second appendix of this introduction.

*Cuba.*—Under the American régime in Cuba the military governor takes the place of the Spanish captain-general, who represented the King of Spain. Even the details of the system of education are directed by orders from the American military governor as they were formerly by royal decrees. Under American rule, however, changes have been made in the organization, much more attention being given to public schools than formerly, but the military governor, upon the recommendation of the secretary of public instruction, still arranges, by printed order, the courses of study in the university, the secondary schools (the institutes in the different provinces), and the special and art schools, and appoints the professors, leaving the elementary or public schools to the care of the superintendent of schools. An order, February 7, 1900, however, directed that assistant professors of the university and institutes should be appointed by the secretary of public instruction upon the recommendation of the faculties of the respective schools. Heads of laboratories and clinics are appointed in the same way. Assistants to professors in the medical school are now appointed by the faculty of the school upon recommendation of the professors.

The new programme of the school of commerce in the Institute of Havana shows that increased attention is being given to commercial studies, and a school of stenography and typewriting has also been established in that institute. The new programme of the faculty of pharmacy at the university also shows an increased tendency to practical studies. It includes a more extended course in physics and other experimental or laboratory studies.

On December 6, 1899, the military governor published an order reorganizing the elementary and secondary school system of the island. It provided that there should be a board of education in each municipality to take charge of the schools, with the mayor as president, who shall appoint the other members. It provided that there should be one public school for boys and one for girls in every town of 500 inhabitants and more as the population is larger. In smaller towns “incomplete” schools are provided. It made attendance compulsory under penalty of a fine of from \$5 to \$25, provided for the payment of the teachers, for superintendence and inspection of the schools, free text-books, and other details. The course of study is prescribed by the superintendent of schools.

The superintendent of schools in Cuba, Mr. Alexis E. Frye, has stated that there were not over 200 schools or more than 4,000 attendants in the island in 1899, while there were in February 1900, 2,058

schools (or schoolrooms), with an attendance of over 100,000. This statement was based upon returns from 97 municipalities, with 34 to hear from. He expected that there would be an attendance of 150,000 by June. By April 1 there were 3,079 schools in operation, with an attendance of 130,000 and 3,500 teachers. No later statistics are available. This enormous increase, Mr. Frye explained, was due to his impressing upon the mayors of the municipalities the necessity of elementary schools and assuring them that the United States Government would pay the salaries of the teachers.

On May 16, 1900, a circular was issued by the superintendent of schools notifying the teachers of the island of the invitation extended to them by Harvard University to attend the summer courses of the university free of expense and that the Government would provide free transportation. The circular gives the programmes of study and useful information for those teachers who might accept the invitation. It was expected that some 1,400 Cuban teachers would accept the invitation. This is an unique event in the history of education.

*Porto Rico.*—The report of Mr. Victor S. Clark, acting superintendent of education in Porto Rico, to General George W. Davis, military governor of the island, states that certain features of the Spanish system of primary education required a change when the Americans took possession. These were the absence of suitable schoolhouses and furniture, the practice of keeping school in the dwellings of the teachers, the divided attention of some of the latter who carried on other occupations besides teaching, and the want of adequate school material. To remedy these deficiencies and introduce changes in the programmes and method of teaching a school law (regulation, or order, would be a better term, since we limit the term "law" to the act of a legislative body), which was recommended by Gen. John Eaton, American director of public instruction of the island, was enacted by order of Gen. Guy V. Henry, the military governor, on May 1, 1899, which reorganized the system of education. An insular board of education consisting of five members was created July 8, 1899, which was to act in an advisory or superintending capacity. This board replaced the former bureau of education, and the president of the insular board is insular superintendent of education. The "law" divided the island into school districts something like those in the United States, provided English supervisorships, prescribed the manner of electing local school boards in the districts, and provided for district school taxes and the issuance of district bonds. The municipalities were required to provide buildings or quarters for the schools, the schools were graded, the courses of study and the qualifications of the teachers were prescribed and their salaries fixed, free text-books were provided for, and high schools, a normal school, and professional schools were organized. The "law," in short, and the orders promulgated under it, regulate nearly every

detail connected with primary education and are very much like the royal decrees under the Spanish rule.

From a table in Mr. Clark's report it appears that at the close of the school year, June, 1899, there were 212 town schools, 313 country districts with schools, and 426 without. In a population of 857,660, there were 152,951 boys and 144,851 girls of school age, of whom only 19,804 boys and 9,368 girls were enrolled in the schools, a total of 29,172, while the attendance was 21,873, leaving 268,630 children without school facilities. The municipal expenditure for primary schools in 1898-99 was \$203,372.99, and the total expenditure \$279,216. The appropriation for 1899-1900 was \$330,050. The institute of secondary instruction at San Juan, which gave the degree of bachelor of arts, was suspended, and secondary instruction is to be continued by a preparatory school designed to fit boys for colleges and universities in the United States, with a course of four or six years, and a model training school for teachers, with instruction given entirely in English, which is equipped with laboratories and apparatus. The board of education has also offered an annual appropriation of \$20,000 for any town in the island which would provide a like amount for site and buildings for an industrial and normal school. This offer was complied with by the town of Fajardo, and a secondary school, like the Atlanta University, the Hampton University, and the Carlisle Indian School, with a normal department and a department of scientific horticulture and agriculture, was therefore projected for that municipality. In 1899 over 80 per cent of the population could not read or write.

All of which is respectfully submitted.

W. T. HARRIS,  
*Commissioner of Education.*

## I.—CURRICULA OF DENTAL SCHOOLS.

The sixteenth annual session of the National Association of Dental Faculties was held at Niagara Falls, commencing Friday, July 28, 1899.

The following colleges were represented:

- Birmingham Dental College, Birmingham, Ala.
- University of California, Dental Department, San Francisco, Cal.
- Colorado College of Dental Surgery, Denver, Colo.
- University of Denver, Dental Department, Denver, Colo.
- Columbian University, Dental Department, Washington, D. C.
- Howard University, Dental Department, Washington, D. C.
- National University, Dental Department, Washington, D. C.
- Atlanta Dental College, Atlanta, Ga.
- Dental Department of Atlanta College of Physicians and Surgeons, Atlanta, Ga.
- Chicago College of Dental Surgery, Chicago, Ill.
- Northwestern University Dental School, Chicago, Ill.
- Indiana Dental College, Indianapolis, Ind.
- State University of Iowa, Dental Department, Iowa City, Iowa.
- Louisville College of Dentistry, Louisville, Ky.
- Baltimore College of Dental Surgery, Baltimore, Md.
- University of Maryland, Dental Department, Baltimore, Md.
- Tufts College Dental School, Boston, Mass.
- Harvard University, Dental Department, Boston, Mass.
- College of Dental Surgery of the University of Michigan, Ann Arbor, Mich.
- Detroit College of Medicine, Dental Department, Detroit, Mich.
- University of Minnesota, Dental Department, Minneapolis, Minn.
- Kansas City Dental College, Kansas City, Mo.
- Western Dental College, Kansas City, Mo.
- Marion-Sims College of Medicine, Dental Department, St. Louis, Mo.
- Missouri Dental College, St. Louis, Mo.
- University of Omaha, Dental Department, Omaha, Nebr.
- University of Buffalo, Dental Department, Buffalo, N. Y.
- New York College of Dentistry, New York, N. Y.
- New York Dental School, New York, N. Y.
- Cincinnati College of Dental Surgery, Cincinnati, Ohio.
- Ohio College of Dental Surgery, Cincinnati, Ohio.
- Western Reserve University, Dental Department, Cleveland, Ohio.
- Ohio Medical University, Dental Department, Columbus, Ohio.
- Pennsylvania College of Dental Surgery, Philadelphia, Pa.
- Philadelphia Dental College, Philadelphia, Pa.
- University of Pennsylvania, Dental Department, Philadelphia, Pa.
- Pittsburg Dental College, Pittsburg, Pa.
- School of Dentistry, Central Tennessee College, Nashville, Tenn.
- University of Tennessee, Dental Department, Nashville, Tenn.
- Vanderbilt University, Dental Department, Nashville, Tenn.
- North Pacific Dental College, Portland, Oreg.
- Milwaukee Medical College, Dental Department, Milwaukee, Wis.

Royal College of Dental Surgeons of Ontario, Toronto, Canada.

The applications for membership of the following schools, having been reported as regular by the executive committee, lie over for one year for final action:

Medico-Chirurgical College of Philadelphia, Dental Department, Philadelphia, Pa.

Central College of Dentistry, Indianapolis, Ind.

College of Dentistry, University of Southern California, Los Angeles, Cal.

Illinois School of Dentistry, Chicago, Ill.

Washington Dental College and Hospital of Oral Surgery, Washington, D. C.

Keokuk Medical College, Dental Department, Keokuk, Iowa.

At the Omaha meeting of the National Association of Dental Faculties in 1898 the following committee was appointed to report at the next meeting on a curriculum for dental schools: J. Taft, chairman, Cincinnati, Ohio; James Truman, Philadelphia, Pa.; A. H. Fuller, St. Louis, Mo.; Truman W. Brophy, Chicago, Ill.; C. L. Goddard, San Francisco, Cal.

The report of the committee was submitted at the meeting in 1899 at Niagara Falls and gave the following arrangement of studies for the different years and the number of hours per week in each study.<sup>1</sup>

*Schedule of studies.*

First year.	Hours per week.	Second year.	Hours per week.	Third year.	Hours per week.

RULES OF THE NATIONAL ASSOCIATION OF DENTAL FACULTIES, REGULATING THE ADMISSION OF STUDENTS TO DENTAL SCHOOLS.

PRELIMINARY EXAMINATION.

1. The following preliminary examination shall be required of students seeking admission to colleges of this association:

(a) The minimum preliminary educational requirement of colleges of this association, for the session of 1899-1900, shall be a certificate of entrance into the second year of a high school, or its equivalent, the preliminary examination to be placed in the hands of any State or county superintendent of public instruction.

(b) Nothing in this rule shall be construed to interfere with colleges of this association that are able to maintain a higher standard of preliminary education.

<sup>1</sup>See Dental Review, September, 1899.

## LIMITING THE TIME FOR THE RECEPTION OF STUDENTS.

2. No member of this association shall give credit for a full course to students admitted later than ten days after the opening day of the session, as published in the announcement.

3. In case one is prevented by sickness, properly certified to by a reputable practicing physician, from complying with the foregoing rule, the time of admission shall not be later than twenty days from the opening day.

4. In cases where a regularly matriculated student, on account of illness, financial conditions, or other sufficient cause, abandons his studies for a time, he may reenter his college at the same or a subsequent session, or where, under similar circumstances, he may desire to enter another college, then with the consent of both deans he may be transferred, but in neither case shall he receive credit for a full year, unless he has attended not less than 75 per cent of a six months' course of lectures.

## ADMISSION TO ADVANCED GRADES ON CERTIFICATES.

5. The colleges of this association may receive into the advanced grades of juniors and seniors only such students as hold certificates of having passed examinations in the studies of the freshman or junior grades, respectively. All students who have successfully passed their examinations for advanced standing shall have their certificates given or mailed to them within thirty days after such examinations shall have been completed. Such certificates to be pledged to any college of the association to whom the holders may apply, that the requisite number of terms have been spent in the institutions by which the certificates were issued.

6. This certificate shall, by correspondence, be verified by the dean of the college by which it was issued. Without such certificate no students shall be received by any college of this association for admission to the advanced grade except on such conditions as would have been imposed in the original school, and these to be ascertained by conference with the school whence he came.

## STANDING OF STUDENTS HOLDING CERTIFICATES FROM DENTAL COLLEGES IN FOREIGN COUNTRIES.

7. In cases of persons holding certificates from colleges of dentistry in foreign countries they shall be required to furnish properly attested evidence of study, attendance upon lectures, examinations passed satisfactorily, etc., the same as required of students coming from our own institutions.

## ADMISSION OF GRADUATES OF MEDICINE.

8. A diploma from a reputable medical college may entitle the holder to enter the second or junior grade in colleges of this association, and he may be excused from attendance upon the lectures and examinations upon general anatomy, chemistry, physiology, materia medica, and therapeutics.

## ADMISSION OF UNDERGRADUATES OF MEDICINE.

9. Undergraduates of reputable medical colleges who have regularly completed one full scholastic year, having attended at least 75 per cent of a five months' term, and passed a satisfactory examination in the studies of the freshman year, may be admitted to the junior grade in colleges of this association, subject to other rules governing admission to that grade.

## ADMISSION OF GRADUATES OF PHARMACY AND VETERINARY MEDICINE.

10. The colleges of this association may matriculate, as juniors, graduates of registered schools of pharmacy and veterinary medicine, subject to the examination requirements of each school of the association.

## ATTENDANCE, EXAMINATIONS.

11. Attendance upon three full courses of not less than seven months, or upon four terms of six months each, in separate academic years, shall be required before examination for graduation. The year shall be understood to commence August 1 and end the following July 31.

12. The examinations conducted by the colleges of this association shall be in the English language only.

13. A student who is suspended or expelled for cause from any college of this association shall not be received by any other college during that current session. In case the action of the first college is expulsion, the student shall not be given credit at any time for the course from which he was expelled. Any college suspending any student shall at once notify all other members of this association of its action.

## PUBLICATION OF CLASSIFICATION OF MATRICULATES.

14. Colleges of this association shall each year issue announcements containing lists of students classified in the three grades of seniors, juniors, and freshmen, designating absentees, and giving a list of graduates of the preceding session.

15. No college connected with this association shall confer any degree as honorary which is usually granted in due course of study and examination. All former rules on this subject are hereby repealed.

COURSES OF STUDY IN DENTAL SCHOOLS.  
[The figures after studies denote number of hours per week.]

Institution.	First year.	Second year.	Third year.
Birmingham Dental College, Birmingham, Ala., 1900-1901. (Subjects of examination for each year at this school are given.)	Anatomy, physiology, chemistry, materia medica, operative technic, operative dentistry, prosthetic technic, prosthetic dentistry, histology, bacteriology, dental hygiene, crown and bridge work, and anaesthesia.	Anatomy, physiology, chemistry, materia medica, therapeutics, operative dentistry, prosthetic dentistry, embryology, histology, pathology, bacteriology, orthodontia, metallurgy, dental surgery, dental hygiene, dental jurisprudence, crown and bridge work, and anaesthesia.	Dental anatomy, chemistry, metallurgy, therapeutics, operative dentistry, prosthetic dentistry, embryology, oral surgery, dental hygiene, dental jurisprudence, crown and bridge work, and anaesthesia.
College of Physicians and Surgeons of San Francisco, Cal., Dental Department, 1898-99.	Anatomy, physiology 2, chemistry, histology, operative and prosthetic technique.	Anatomy, physiology 2, chemistry, histology, operative dentistry, prosthetic dentistry, orthodontia, pathology and therapeutics, materia medica and anaesthetics, bacteriology, microscopy.	Operative dentistry, prosthetic dentistry, orthodontia, metallurgy, pathology, bacteriology and therapeutics, materia medica and anaesthetics, surgery and surgical clinics.
San Francisco College of Medicine and Surgery, Dental Department, San Francisco, Cal., 1899-1900.	Anatomy and surgery, physiology, materia medica, anaesthesia, chemistry, histology, bacteriology, and prosthetic dentistry.	Chemistry, operative and prosthetic dentistry, orthodontia, dental pathology, therapeutics, anatomy and surgery. Physiology, materia medica and anaesthesia, histology and bacteriology.	Metallurgy, operative and prosthetic dentistry, orthodontia, dental pathology, and therapeutics.
University of California, College of Dentistry, San Francisco, Cal., 1898-99.	Anatomy 2 with dissections, physiology and histology 2, chemistry 1 with laboratory work, mechanical dentistry 1, operative technic 2, mechanical technic, microscope technic 2.	Anatomy 2, with dissections, physiology 3 and histology, chemistry 3, mechanical dentistry, operative dentistry, pathology, therapeutics, materia medica, orthodontia 1 and orthodontia technic 1, bacteriology, clinics, and demonstrations.	Operative dentistry 2, mechanical dentistry 1, orthodontia 2 with practical cases, metallurgy 2, pathology, therapeutics, materia medica 1, surgery 2, clinics, and demonstrations.
Colorado College of Dental Surgery, Denver, Colo., 1900.	Anatomy, physiology, chemistry, histology, operative and prosthetic techniques, with practice in laboratory.	Dental chemistry, bacteriology, general pathology, dental histology, prosthetic dentistry, metallurgy, materia medica, operative dentistry, anatomy, physiology, and chemistry, practice in prosthetic laboratory, bridge work, etc.	Dental pathology, oral surgery, regional anatomy, special materia medica, therapeutics, orthodontia, crown and bridge work, including porcelain work, general anaesthesia, operative and prosthetic dentistry, general surgery, metallurgy and electricity, practice in prosthetic laboratory.
University of Denver, Dental Department, Denver, Colo., 1899-1900.	Anatomy, physiology, chemistry (lectures and laboratory), materia medica and therapeutics, histology, operative and prosthetic techniques.	Physiology, operative dentistry, materia medica and therapeutics, bacteriology, prosthetic dentistry and metallurgy, orthodontia, crowns and bridges, regional anatomy and histology, infirmary and laboratory work.	Operative dentistry, prosthetic dentistry and metallurgy, pathology and oral surgery, orthodontia, crowns and bridges, special lectures, clinics, specimen work, infirmary and laboratory work.
The Columbia University Dental School, Washington, D. C., 1900.	Anatomy, physiology, chemistry, materia medica, practical anatomy, operative and prosthetic techniques, and such infirmary work as is suitable for first-year students.	Subjects of first year continued, and to these are added operative dentistry, prosthetic dentistry, and histology, with more advanced infirmary work.	Operative and prosthetic dentistry, oral surgery, and bacteriology.

## COURSES OF STUDY IN DENTAL SCHOOLS—Continued.

Institution.	First year.	Second year.	Third year.
Washington Dental College, Washington, D. C., 1899-1900.	Anatomy 2, physiology 2, materia medica 2, chemistry 3, operative dentistry 2, prosthetic dentistry 2, histology 1, bacteriology 1. Laboratory work: Techniques of prosthetic and operative dentistry 4 daily, practical anatomy, chemistry 4, histology 1 for 3 months.	Anatomy 2, physiology 2, chemistry and metallurgy 3, materia medica and therapeutics 2, prosthetic dentistry 2, operative dentistry 2, oral surgery 1. Laboratory work: Practical anatomy, histology 1 for 3 months, dental pathology 1, bacteriology 1, crown and bridge work 1, infirmary practice 4 daily.	Metallurgy 2, operative dentistry 2, prosthetic dentistry 2, dental pathology 1, oral surgery 2. Laboratory work: Infirmary practice 4 daily, physiological chemistry 2 until Jan. 1, crown and bridge work 1, pathology 1.
Atlanta Dental College, Atlanta, Ga., 1898-99.	Elementary chemistry and physics, materia medica, elementary anatomy, osteology and general histology, general physiology except the nervous and muscular systems, dental histology, dental techniques.	Chemistry including laboratory, materia medica and therapeutics, oral surgery and dental hygiene, anatomy and general histology, physiology, operative dentistry, prosthetic dentistry, dental histology and pathology, metallurgy, general infirmary practice, dissecting.	Anatomy, physiology, chemistry, oral surgery, dental hygiene, prosthetic dentistry, operative dentistry, dental pathology, dental histology, orthodontia, metallurgy, dental medicine, bacteriology, general infirmary practice.
Chicago College of Dental Surgery, Dental Department of Lake Forest University, 1898-99.	Theoretical and practical chemistry, anatomy including dissection, physiology 3, materia medica 1, dental anatomy, histology, operative and prosthetic techniques, operative and prosthetic dentistry.	Anatomy, physiology, chemistry, histology, pathology, bacteriology, materia medica 2, comparative dental anatomy, crown and bridge work, regulating appliances, splints, plate work, infirmary work.	Oral surgery, therapeutics 2, operative dentistry, dental anatomy and pathology, orthodontia, bacteriology, clinics, practical prosthetic dentistry, construction and use of regulating appliances, infirmary.
Northwestern University Dental School, Chicago, Ill., 1898-99.	Anatomy and dissecting, physiology, histology and histological laboratory, prosthetic dentistry, chemistry and physics, metallurgy, operative techniques, prosthetic techniques.	Anatomy, physiology, dental development, dental pathology, chemistry, operative dentistry, prosthetic dentistry, clinical dentistry, crown work, materia medica, dissection, orthodontia technique, infirmary and laboratory practice, specimen work.	Special pathology and bacteriology, materia medica and therapeutics, oral surgery, orthodontia, dental jurisprudence and ethics, operative dentistry.
The Central College of Dentistry, Indianapolis, Ind., 1899-1900.	Anatomy, physiology, dental materia medica, histology, operative dentistry, operative technique, dental anatomy, chemistry, dissection, prosthetic technique, prosthetic dentistry, specimen work.	Anatomy 4, physiology 4, special pathology 2, therapeutics 2, operative dentistry 2, prosthetic dentistry 2, orthodontia 1, special lecture 1, prosthetic laboratory 6, orthodontia laboratory 3, inorganic materia medica 1. Spring programme, Chemistry 7, chemical laboratory 6, pathology 3, operative dentistry 2, oral surgery 1, orthodontia 1, histological laboratory 6, infirmary.	Operative dentistry, dental microscopy, orthodontia, special clinic, oral surgery, prosthetic dentistry, crown, bridge, and porcelain work; aurial, optic, and dental relations, nasopharyngeal and dental relations, general surgery, bacteriology, general pathology, metallurgy, dental jurisprudence and ethics, electricity, hygiene, infirmary and laboratory practice, specimen work.
State University of Iowa, Dental Department, Iowa City, Iowa, 1900.	Anatomy 4, physiology 3, histology 3, histological laboratory 2, dental anatomy 1, dental technic 2, operative technic 1, prosthetic technic 1, prosthetic laboratory 6, organic materia medica 1, recitation in materia medica 1. Spring programme: Chemistry 7, chemical laboratory 4, physiology 4, prosthesis 1, prosthetic laboratory 6.	Anatomy 4, physiology 4, special pathology 2, therapeutics 2, operative dentistry 2, prosthetic dentistry 2, orthodontia 1, special lecture 1, prosthetic laboratory 6, orthodontia laboratory 3, inorganic materia medica 1. Spring programme, Chemistry 7, chemical laboratory 6, pathology 3, operative dentistry 2, oral surgery 1, orthodontia 1, histological laboratory 6, infirmary.	Regional anatomy 1, pathology 1, special pathology 2, recitation pathology 1, special therapeutics 1, orthodontia 1, prosthetic dentistry 1, operative dentistry 2, special lecture 2, infirmary. Spring programme: Oral surgery 2, therapeutics 1, operative dentistry 2, prosthesis 2, special lecture 2, orthodontia 1, recitations 3, infirmary.

<p>Keokuk Medical College, Dental Department, Keokuk, Iowa, 1897-98.</p>	<p>Anatomy and dissecting, chemistry and chemical laboratory, physiology, histology and histological laboratory, dental anatomy, prosthetic techniques, operative technics.</p>	<p>Physiology, materia medica and therapeutics, prosthetic dentistry, operative dentistry, general pathology, chemistry, dental histology and pathology, dental anatomy, dental chemistry, metallurgy.</p>	<p>Operative dentistry, dental pathology, bacteriology, oral surgery, orthodontia, special materia medica, therapeutics and hygiene, anesthesia, dental chemistry, metallurgy and dental jurisprudence.</p>

## COURSES OF STUDY IN DENTAL SCHOOLS—Continued.

Institution.	First year.	Second year.	Third year.
Detroit College of Medicine, Department of Dental Surgery, Detroit, Mich., 1899-1900. (Whole number of hours is given.)	First semester: Osteology and descriptive anatomy 51, physiology 45, inorganic chemistry 45, prosthetic dentistry (lectures) 17, dental laboratory practice 300, general materia medica 34. Second semester: Descriptive anatomy 51, physiology 45, inorganic chemistry 45, histology 51, prosthetic dentistry (lectures) 17, dental laboratory practice 300, general materia medica 34, histological laboratory 80.	First semester: Regional anatomy 60, physiology 45, general materia medica 34, bacteriology 68, prosthetic dentistry (lectures) 17, organic chemistry 51, prosthetic clinic 125, dental anatomy 34, embryology 17. Second semester: Dental regional anatomy 17, physiology 45, qualitative chemistry 120, operative clinic 66, dental materia medica 17, operative technique 120, prosthetic dentistry (lectures) 17, anatomy dissection 120, prosthetic clinic 125, bacteriology (laboratory) 120.	First semester: Dental pathology and surgery 34, operative dentistry 17, clinical operative dentistry 250, materia medica and therapeutics 17, clinical oral surgery 34, prosthetic dentistry clinic, crown and bridge work 125, orthodontia and oral deformities 17. Second semester: Operative dentistry 17, clinical operative dentistry 250, oral pathology and surgery 34, dental materia medica 17, clinical oral surgery 34, prosthetic dentistry clinic, crown and bridge work 125, orthodontia and oral deformities 17. Pathology, bacteriology, oral surgery, physical diagnosis, anesthetics, orthodontia, operative dentistry, prosthetic dentistry, crown and bridge work, metallurgy, students' dental society. Clinical and oral surgery, dental pathology, operative dentistry, and prosthetic dentistry.
University of Minnesota College of Dentistry, Minneapolis, Minn., 1899.	Anatomy, physiology, histology and embryology, chemistry, dental anatomy, prosthetic technics.	Anatomy, pathology, materia medica, therapeutics, operative dentistry, prosthetic dentistry, orthodontia crown and bridge work.	First semester: Operative dentistry 17, clinical operative dentistry 250, oral pathology and surgery 34, dental materia medica 17, clinical oral surgery 34, prosthetic dentistry clinic, crown and bridge work 125, orthodontia and oral deformities 17. Second semester: Operative dentistry 17, clinical operative dentistry 250, oral pathology and surgery 34, dental materia medica 17, clinical oral surgery 34, prosthetic dentistry clinic, crown and bridge work 125, orthodontia and oral deformities 17. Pathology, bacteriology, oral surgery, physical diagnosis, anesthetics, orthodontia, operative dentistry, prosthetic dentistry, crown and bridge work, metallurgy, students' dental society. Clinical and oral surgery, dental pathology, operative dentistry, and prosthetic dentistry.
Kansas City Dental College, Kansas City, Mo., 1899-1900.	Anatomy, physiology and histology, chemistry, materia medica, dental anatomy, prosthetic dentistry, operative dentistry, prosthetic and operative technics and physics.	Freshman studies continued except technics and physics, clinical and oral surgery, and dental pathology.	Oral surgery, pathology (general and oral), materia medica and therapeutics, orthodontia, practical bacteriology, operative and mechanical dentistry, lectures and clinics.
The Marion Sims College of Medicine, Dental Department, St. Louis, Mo., 1898-99.	Histology, including laboratory work; dental anatomy, inorganic chemistry, osteology, operative technic, anatomy, physiology, operative dentistry, mechanical dentistry, metallurgy.	Anatomy, including dissection; physiology, organic chemistry, mechanical technics, metallurgy, surgery, pathology, materia medica and therapeutics, orthodontia, dental pathology, operative and mechanical dentistry.	Physiology, hygiene, surgery and clinical surgery, operative dentistry, institutes of dental science, mechanical dentistry, orthodontia.
Missouri Dental College, Dental Department, Washington University, St. Louis, Mo., 1899-1900.	Anatomy, materia medica, comparative anatomy with dissection, pharmacy, mechanical dentistry, dental technology and laboratory work, metallurgy.	Anatomy, therapeutics, chemistry, metallurgy, dental technics, physiology, operative dentistry, mechanical dentistry, orthodontia technics.	Oral hygiene 1, oral surgery 1, operative dentistry 2, orthodontia and fractured maxilla 1, dental materia medica and therapeutics 1, anesthetics 1, dental pathology 2, general surgery 1, dental jurisprudence, prescriptions and pharmacy 1, porcelain art 1, infirmary practice 30.
Lincoln Dental College, Department of Lincoln Medical College of Corner University, Lincoln, Nebr., 1900-1901.	Chemistry, including laboratory, 6, materia medica and therapeutics 3, histology, including laboratory, 2, osteology 1, dental anatomy 2, prosthetic technic 10. Subjects continued in junior year: General anatomy 3, operative technic 2, dissection, one part, physiology 2, bacteriology 2.	Subjects completed. General anatomy 3, dissection, physiology and dental chemistry 3, metallic 2, metallurgy and dental chemistry 3, special histology 2, special bacteriology 2, general pathology 1. Subjects continued in third year: Operative dentistry 2, prosthetic dentistry 2, orthodontia and fractured maxilla 1, infirmary 8, dental materia medica and therapeutics 1, dental pathology 2.	Oral surgery, pathology (general and oral), materia medica and therapeutics, orthodontia, practical bacteriology, operative and mechanical dentistry, lectures and clinics.
University of Omaha, Dental Department, Omaha, Nebr., 1899-1900. 1 Third and fourth years.

## II.—EDUCATION IN THE PHILIPPINES.

By F. F. HILDER.

Under Spanish rule education in the Philippine Islands was entirely under the control of the religious orders and centered in Manila, but instead of commencing with primary schools and elevating the masses of the people, they began by establishing colleges and schools for higher education. St. Joseph's College in Manila was founded by the Jesuits as long ago as 1595, and graduated its first class in 1601; the college of Santo Tomas was founded by the Dominicans in 1611, and the title of university was conferred on it by the Pope in 1645; and the college of San Juan Latran, also a Dominican institution, was established in 1630.

The Jesuits have made the most earnest and enlightened efforts in the cause of education, but when they were expelled from the islands in 1767 the Dominicans took possession of the institutions for higher education that they had founded and incorporated them with their own, and they have resisted all efforts to sever them from their authority and to place them under State supervision.

The result of this system of higher education has been to instruct and polish a few thousand of the wealthier natives and mestizos, who have demonstrated the intellectual capabilities of the race as statesmen, lawyers, artists, and writers, while the great mass of the people have been left in abject ignorance.

It is true that schools were established throughout the islands, but little progress was made in them, as the majority of the teachers did not understand Spanish, and what few rudiments of education the children acquired were forgotten when they left the schools.

Knowing no language but their own, in which little or no literature exists, a large proportion of the Filipinos are woefully uneducated. No Asiatic language serves any practical use outside of Asia, and the people of the Philippines must acquire a language that will open up to them a wider range of literature and place them in touch with current events and the world's store of knowledge before they can make substantial progress.

Side by side with the education of the children in English the work should go on of translating English literature into the native languages, so that those of the people who are past the school age and can not readily acquire a foreign tongue may not be without good reading and be kept in accord with the new ideas acquired by their children.

One of the first and best results of the substitution of American authority for Spanish rule is that everywhere throughout the archipelago the schoolhouse follows the flag. As the army advances and fresh territory becomes safe and peaceful, schools are at once established, regulated by the broad and liberal methods of American education.

Manila, being the metropolis and also the first territory to pass under the control of the United States, has been the first to demonstrate the beneficial effects of the enlightened policy of popular education.

At present the public-school system of Manila embraces 41 schools, which are maintained at a cost of nearly 10,000 Mexican dollars per month, equal to nearly \$5,000 in American currency, with a regular attendance of 5,000 pupils. They are in session every day in the week, except Thursdays and Sundays, from 7.30 to 10.30 a. m. and from 2.30 until 5 p. m.

Two of these schools, for boys, are conducted by 28 Jesuit fathers, and one, for

girls, by a Spanish sisterhood, of whom 12 act as teachers. These three schools embrace a high school with considerable academic work for boys, some high-school work for girls, a commercial school for boys, common-grade work for each sex separately, a normal school for males, and two primary schools for boys and one for girls, one of those for boys being a training school for teachers in connection with the normal school. In all these schools great interest is shown in the study of the English language, but beyond this the studies have been altogether in Spanish. This will be changed to some extent in the coming school year—June, 1900, to March, 1901—so as to embrace more work in English.

The remaining 38 schools are conducted under the auspices of the American authorities and the supervision of Mr. George P. Anderson, who was appointed as superintendent of public instruction by General Otis. They comprise 19 for each sex, scattered throughout the various districts and subdistricts of the city, the schools for boys and those for girls being located close to each other and sometimes in the same building.

The following is the official circular issued by the American governmental authorities for the school year commencing July 3, 1899, containing list of the public schools of Manila, their location, and the regulations, in three languages—English, Spanish, and Tagalog:

[Headquarters Provost-Marshal-General.]

CIRCULAR.

MANILA, PHILIPPINE ISLANDS, June 28, 1899.

The public schools of the city shall be reopened on Monday, July 3, for the school year of nine months' duration. Regular attendance, at some school, of all children between the ages of 6 to 12 years, inclusive, will be required. The police of each district will take note of this requirement to enforce this attendance and report delinquents when the facts are clearly established, seeing to the attendance at the proper public schools, according to residence, in each district or section of a district. One hour's instruction per day in all public schools shall be devoted to teaching the English language. The public schools shall be opened every day of the week, excepting Thursdays and Sundays, from 7.30 a. m. to 10.30 a. m., and from 2.30 p. m. till 5 p. m., provided that all public schools shall also be closed on legally constituted holidays, and teachers shall strictly enforce this requirement.

These holidays are:

- Circumcision.....Jan. 1.
- Three Kings' Day.....Jan. 6.
- Purification.....Jan. 6.
- Washington's birthday.....Feb. 22.
- Holy Week.....Feb. 22.
- Ascension Day.....May 1.
- Corpus Christi Day.....May 30.
- Independence Day.....June 1.
- Assumption Day.....July 4.
- Labor Day.....Aug. 15.
- All Saints.....Sept. 4.
- Thanksgiving Day.....Nov. 1.
- St. Andrew's Day.....Nov. 30.
- La Purísima Concepción.....Dec. 8.
- Christmas Day.....Dec. 25.

The following is the list of public schools, according to district and section of district:  
*Tondo*.—First section, boys, Plaza de Tondo; first section, girls, Plaza de Tondo; second section, boys, Calle Santa Elena, No. 3; second section, girls, Calle Sagunto, No. 16.

*Binondo*.—First section, boys, Camba, No. 49; first sec-

[Cuartel General, Oficina del Preboste-Mariscal.]

CIRCULAR.

MANILA, 23 de Junio de 1899.

Las escuelas de esta ciudad se abrirán de nuevo el lunes 3 de Julio, por el año de escuela (que dura nueve meses.

Se exigirá la asistencia regular en alguna escuela á todos los niños de 6 á 12 años de edad. La policía de cada distrito anotará las infracciones de este circular cuando el hecho fuere claramente establecido; se obligará á asistir á la dicha escuela pública, conforme á la residencia, en cada distrito ó sección de distrito.

Una hora de instrucción al día se dedicará al idioma inglés. Las escuelas públicas se abrirán cada día de la semana exceptuando los Jueves y Domingos, desde las siete y media de la mañana hasta las cinco de la tarde; prestando que las escuelas públicas quedarán cerradas en los días de fiesta legalmente constituidas y los maestros observarán rigorosamente este requisito.

Los días de fiesta son:

- Circumisión.....Enero 1.
- Los tres Reyes.....Enero 6.
- Purificación.....Enero 6.
- Nacimiento de Washington.....Febrero 22.
- Semana Santa.....Febrero y Viernes.
- Ascensión.....Mayo 1.
- Corpus Christi.....Mayo 30.
- Independencia.....Junio 1.
- Día de la labor.....Agosto 15.
- Todos los Santos.....Septiembre 4.
- Acción de Gracias.....Jueves último de noviembre.
- San Andrés.....Noviembre 30.
- La Purísima Concepción.....Diciembre 8.
- Paseo de Natividad.....Diciembre 25.

A continuación se expresan las escuelas públicas en sus correspondientes distritos y sección de distritos.  
*Tondo*.—Primera sección, niños, Plaza de Tondo; primera sección, niñas, Plaza de Tondo; segunda sección, niños, Calle Santa Elena Núm. 3; segunda sección niñas Sagunto, Núm. 16.  
*Binondo*.—Primera sección, niños, Camba, Núm. 49;

[Cuartel General, Oficina ng Preboste Mariscal.]

CIRCULAR.

MAYNILA, Ika 23 ng Junio ng 1899.

Ang mangga escuela nitong ciudad ay muling bibubuksan sa Lunes Ika 3 ng Julio at tatagal ng si am na buwan lamang sa loob ng isang buho.

Ang mangga bata magmula sa 6 na taon bangang sa 12 ng mangga bata magmula sa isang escuela ang lahat ng mangga bata magmula sa 6 na taon bangang sa 12. Ang polizia sa bawat distrito, tatanawan ang mangga di pag-alinsinod dito sa circular na ito. Kung ang di pag-alinsinod ay marangilala, tutusan na pumasok sa escuela na nararapat tungkol sa kani ang dinirahan.

Ang mangga maestro a siyang mamama ala ng katu-paran nitong titos.  
 Ang mangga arao ng fiesta a :

- Circumisión.....Enero 1.
- Los Tres Reyes.....Enero 6.
- Purificación.....Enero 6.
- Nacimiento de Washington.....Febrero 22.
- Semana Santa.....Jueves at Viernes Santo.
- Ascensión.....Mayo 1.
- Decoración.....Mayo 30.

Sa sumusunod dito nagsasabi ang lahat ng mangga escuela pública sa kaniang unang distritos.  
*Tondo*.—Unang sección, batang balake, Plaza de Tondo; unang sección, batang babayo, Plaza de Tondo;

iclanang sección, batang lalake, Calle Sta. Elena, n. 3; iclanang sección, batang babaye, Calle Siguanto, n. 16; *Bonardo*.—Unang sección, batang lalake, Camiba, n. 49; unang sección, batang babaye, Eleano, n. 33; iclanang sección, batang lalake, San José, n. 1; iclanang sección, batang babaye, San Jacinto, n. 55; iclanang sección, batang lalake, San José, n. 42; iclanang sección, batang babaye, San José, n. 21.

*Santa Cruz*.—Unang sección, batang lalake, Dulumbayan, n. 24; unang sección, batang babaye, Noria, n. 7; iclanang sección, batang lalake, Lacoste, n. 9; iclanang sección, batang babaye, Dulumbayan, n. 48.

*Quitapo*.—Batang lalake, San Pedro, n. 3; batang babaye, Villalobos, n. 12.

*San Sebastián*.—Batang lalake, San Sebastián, n. 32; batang babaye, San Sebastián.

*Sampaloc*.—Batang lalake, Gaztambide, n. 32; batang babaye, Alejandro VI, n. 8.

*San Miguel*.—Batang lalake, Novaliches, n. 10; batang babaye, Novaliches, n. 33.

*Concepción*.—Batang lalake, Marques ó Comillas, n. 87; batang babaye, Marques de Comillas, n. 85.

*Ermida*.—Batang lalake, Gallera Interior, n. 7; batang babaye, Real, n. 27.

*Normal Superior*.—Batang lalake, Calle de Observatorio, sa tumay na babay nang Observatorio.

*Malate*.—Batang lalake, Plaza de Malate; batang babaye, Nueva, n. 73.

*Singalon*.—Batang lalake, \_\_\_\_\_; batang babaye, \_\_\_\_\_.

*Paco*.—Batang lalake, Nozaleda, n. 92; batang babaye, Calle Real de Paco, n. 10.

*Pandacan*.—Batang lalake, Malapit sa Simbahan; batang babaye, Malapit sa Simbahan.

*Santa Ana*.—Batang lalake, Malapit sa Simbahan; batang babaye, Malapit sa Simbahan.

*Sa Loob Nang Maganda*.—Batang lalake, sa Ateneo, Arzobispo, n. 8; batang babaye, Escuela Municipal, Calles ng Victoria at Solana.

Por orden del Coronel Williston, Preboste Mariscal General.

By order of Colonel Williston, Provost-Marshal-General:

CHAS. T. MENOHER,

First Lieutenant, Sixth United States Artillery, A. A. G.

English is taught in all these schools, although there are at present only 23 teachers of that language, who are mostly Americans, and a majority of them ladies.

Fortunately, these teachers all possess superior qualification for their work, being principally discharged volunteer soldiers, formerly well-known teachers in the United States, and young ladies members of the families of military officers. All of them have acquired a sufficient knowledge of the Spanish language to enable them to teach English to Spanish-speaking children.

A difficulty encountered by some of the male teachers in the suburban districts was that many of their pupils had little or no knowledge of the Spanish language. They therefore resolutely set to work to acquire the Tagalog as a means of interpretation, so that at present four or five of them possess a very commendable degree of knowledge of that language, and will prove to be very valuable men for the work of education.

There are 86 Spanish-speaking teachers, composed of Tagalogs, mestizos, and a very few Spanish men and women; almost all of these are graduates from the normal schools of Manila conducted by the Jesuits.

The greater part of these 33 schools are in rented buildings, mostly unfit for the purpose and entirely inadequate to accommodate the number of pupils packed into them, a difficulty which is increased by the continuance in many of them of the objectionable Spanish plan of allowing the teachers and as many of their relatives and friends as they can smuggle in to live in the school buildings, thus further diminishing the space so urgently needed for the children.

From what I have heard from the superintendent, I believe this will soon be remedied; but there is urgent need for the construction of a number of large, well-ventilated, eight, ten, and twelve room two-story buildings, in which no one should be allowed to lodge, eat, or sleep. To all of these buildings playgrounds should be attached, and all should be supplied with modern furniture and conveniences. Binondo and Tondo, two of the most thickly populated districts of Manila, could furnish children enough to fill 5 twelve-room buildings.

Instead of schools crowded with 5,000 pupils, as at present, Manila should have accommodation, with healthful surroundings, for at least 30,000 or 40,000 children, the majority of whom have no occupation but roaming the streets and acquiring bad habits.

With the pacification of the country and the improved civil conditions which are rapidly superseding the old order of things, there is little doubt that these needs will be supplied as rapidly as possible, judging from the immense amount of work that has been done and the improvement that has been effected in such a short space of time.

During the school year which closed on March 29 of the present year (1900) considerable good work has been done and true progress made. The methods of the Spanish teachers have been investigated and higher ideals inculcated.

At the close of the school year a report is made by the principal of each school to the parents or guardians of the children on the following form:

[Escuela municipal de — del distrito de —, clase —, seccion —.]

MANILA, P. I., —, 1900.

Sr. D. —

Muy Sr. mio: Tengo el honor de poner en conocimiento de V. las notas que ha obtenido el alumno D. — en los exámenes — curso de 1899 á 1900.

—, *Principal de la Escuela.*

In spite of the scarcity of teachers, English has been taught in all the schools and a good foundation laid for elementary English instruction, provision having been made to afford each child one good lesson every day. In most of the schools this has been done in three grades, the first of which has finished the primary reader and is ready for the new books which have been provided for more advanced study.

In a letter addressed to the writer by the superintendent occurs the following:

The American spelling match has proven to be a great novelty and a source of deep interest to these native children. In the Tondo district I witnessed a contest between the boys' and the girls' schools in spelling words from the reader, so far as they had gone—namely, half through the book at that time—but the keen edge of the contest was dulled by the fact that at the close it was found that each school had five or six spellers who were able to spell every word that could be given; it was impossible and unfair to fall back on the dictionary, so the match was declared a draw, at least so far as regards finding one best speller; but many interesting contests were arranged on other lines. The children have been found to be keen, eager, and quite capable of speedy progress in acquiring language. In this regard the outlook is very hopeful.

In another communication Mr. Anderson says:

I have great faith in the Filipino children of Manila; they are bright, capable, polite, earnest, and persevering, at least those that have lived in Manila for a few years and are not "raw material." The Manila native is not a savage; he appreciates civilization and highly prizes good education; he wants his children to know English and to obtain a good common-school training. The native teachers are bright, faithful, and patient, and good, steady workers. All that these people need is to be led aright; they will follow. Give them schools and plenty of them. Wake them up to a higher sense of duty and proper living. They are good material. They have already acquired great confidence in the American as the representative of true liberty of conscience and the standard bearer of a better and nobler civilization.

Such testimony from a professional educator, whose daily contact with the children and their parents enables him to form a just estimate of the character and capabilities of those under his charge, renders the outlook for the future of these people very hopeful. Whatever difficulties may be encountered in molding all of the present generation of adults into good and useful citizens, our reliance must be on the men and women of the future, now to be trained in American schools. Under the new conditions in the islands we are responsible for the future welfare of these people, and

that can only be secured by placing a good primary education within the reach of the poorest peasant child.

The superintendent is fully alive to the necessity and importance of systematically increasing the study of English. In the letter before referred to he says:

For the next school year—June, 1900—March, 1901—more English studies should be taught and the proportion of teachers of English increased. This need is probably not overestimated in stating that next year should see one-half of the work and time devoted to English and the other half to Spanish branches, some especially equipped teachers possibly being brought over from the United States, in addition to the present force.

In general the teachers and the pupils are intensely interested in their work, the English studies being the center of the greatest enthusiasm.

During the vacation of the present summer new books from American publishing houses in both English and Spanish have been placed in the hands of all the teachers, and the superintendent states that it is a matter of great encouragement to him to find that many of the Spanish teachers have gathered together in little classes for the study of the English language in the Baldwin First Year Reader and other books. He also says they are begging him to provide them with copies of the Journal of Education, which they had seen in the hands of some of the English teachers, and adds:

But they will have during the coming year, if it is possible, in their meetings more elaborate and further-reaching instruction given them in these matters by means of good translators.

During my recent visit to Manila I was present at the exercises at several of the schools when they were closed for the summer vacation, and was surprised at the remarkable proficiency displayed by the pupils, particularly in the English language, considering the short time they had been under instruction. The buildings were crowded to their utmost capacity by the parents and relatives of the children, who evinced the most enthusiastic interest in the proceedings. The programmes included recitations and dialogues both in Spanish and English, and the proceedings were closed at each school by the singing of the patriotic song "America" by the pupils, in the English language, with a vim and enthusiasm that could not have been excelled in any school in America.

The following is a copy of the programme of the closing exercises at one of these schools for boys in the Binondo district of Manila:

*DISTRIBUCION DE PREMIOS PARA EL DIA 29 DE MARZO DE 1900.*

[A las 9 de su mañana.]

2<sup>a</sup>. ESCUELA MUNICIPAL DE NIÑOS DE BINONDO.

PROGRAMA.

- 1<sup>o</sup>. A. B. C. ingles, cantado por todos los alumnos de la escuela.
- 2<sup>o</sup>. Diálogo ingles declamado por V. y M.
- 3<sup>o</sup>. Declamacion en ingles por C. M.
- 4<sup>o</sup>. Distribucion de premios para estudios castellanos.
- 5<sup>o</sup>. Diálogo castellano declamado por D. y E.
- 6<sup>o</sup>. Diálogo ingles declamado por D. y E.
- 7<sup>o</sup>. Distribucion de premios para estudios de ingles.
- 8<sup>o</sup>. Diálogo ingles declamado por L. y V.
- 9<sup>o</sup>. Declamacion en castellano por D.
- 10<sup>o</sup>. Diálogo ingles declamado por F. y T.
- 11<sup>o</sup>. "My country" cantado por los alumnos.

In addition to the public schools a nautical school was opened in December last in the Tondo district of Manila, under the management of an American naval officer, for training graduates qualified as mariners to sooner or later become officers and captains of merchant vessels and to give them a thorough training in the English language. This promises to be a very useful institution.

In closing his letter to me Mr. Anderson says:

On June 1, 1899, when I was placed in charge of this work as the superintendent of public instruction in Manila, the insurrection was still uncrushed and but little attention could be given to the question of education for the rest of the islands; but as the army advanced and new territory became safe and peaceful, schools were started and advice and a source of supply sought in this office by the outside commanding officers, so that the work grew to be a great one, reaching from the north end of Luzon to the island of Mindanao. The schools have multiplied, but most of the work is in its merest infancy. Capt. Albert Todd has been placed in temporary charge as the superintendent of public instruction for the Philippine Islands, so that it now leaves me as superintendent for Manila only, which has been my technical position all the time. But I still have sufficient familiarity with the whole work to state that the people themselves are calling loudly for education and the best of it, with plenty of English, and that every effort is now being put forth to extend to all the towns and hamlets of the entire archipelago the same broad principles and measures of true American education that have already been in vogue in Manila for over a year. The last official letter I received from the outside districts told me that 180 schools would be in operation in the island of Mindanao alone. This is a fair sample of what is coming in the now well-nigh pacified Philippines.

Dr. Frederick W. Atkinson, formerly principal of the Springfield (Mass.) High School, has been appointed superintendent of public instruction in the Philippines, and is now on his way to his post of duty. Before embarking he said to a reporter:

In establishing a permanent educational system in the Philippines the industrial plan will probably be found the most effective at the beginning.

He will find on his arrival in Manila that an excellent foundation has been laid by the efforts of Father McKinnon, formerly chaplain of a California regiment, who took the first steps toward the establishment of a public school system, and by Mr. George P. Anderson, who succeeded him and has ably and successfully carried on the work.

It is to be hoped that a thorough pacification of the islands will soon enable Dr. Atkinson to extend an educational revivification to all the islands.

No nobler work could be allotted to any man than to spend his life in dispelling the clouds of ignorance and conferring on these long-neglected people the civilizing influences of a generous education.

## III.—STATISTICS OF STATE SCHOOL SYSTEMS.

TABLE 1.—The total population, the school population, and the adult male population.

a In 1896-97.

b Approximately.

c Includes pupils of legal school age only (8-17).

d In 1897-98.

*Method of ascertaining average attendance.*—The average daily attendance during a year (which is the average number of pupils actually present each day the schools were in session) may be computed as follows:

First, for a single school: Add together the number of pupils present each school day during the year, and divide the sum (which is the "aggregate attendance in days") by the number of such school days.

Second, for a group of schools having the same number of school days in the year (as the schools of most cities have): Divide the combined aggregate attendance in days of all the schools by the number of school days in the year.

Third, for a system of schools having different lengths of school year (as, for instance, those of a county): Add together the average attendance of the component schools and groups of the system, as ascertained by the foregoing rule. For larger systems, as those of a State or of the United States, the summing-up process is continued in the same way.

In a system of schools such as is specified under the heading "Third," the average number of days in the school year for the whole system is found by dividing the combined aggregate attendance in days of all the schools of the system by the average attendance as ascertained by the rule given. See observations on Table 8.

TABLE 8.—(1) Average length of school term at various periods; (2) aggregate number of days' schooling given to all pupils; (3) the same compared with the school population and the enrollment (columns 7 and 8).

State or Territory.	Average number of days the schools were kept during the year. <i>a</i>				Aggregate number of days' schooling given in 1898-99.	Average number of days' schooling given for every child 5 to 18 years of age in 1898-99.	Average number of days attended by each pupil enrolled in 1898-99.

*a* Certain States report their school term in months; these months have been reduced to days by multiplying by 20.

*b* In 1897-98.

*c* Approximately.

*d* In 1891-92.

*e* In 1896-97.

*f* Includes only pupils of legal school age (8-17 years).

*Observations on ascertaining the average school term.*—The “aggregate number of days’ schooling given” to all pupils (see column 6), which is the same thing as the aggregate number of days attended by all the pupils, has been computed for those States which do not make an explicit report of this item by multiplying the average daily attendance of pupils by the average length of school term in days.

Conversely, the average length of school term (column 5) for the United States as a whole and for each of its geographical divisions has been obtained by dividing the aggregate number of days attended by the average daily attendance.

By this method the school term of each State, in computing the average term for a number of States, is in fact given a weight proportioned to the school attendance of the State, as should be done under a correct interpretation of the expression “Average length of school term.” The result might more properly be called “Average length of attendance,” which is essentially what it is desired to know.

A method which has been in use in some States for finding the average school term, of a county, for instance, is to weight the different school terms of the towns or districts the county is composed of by the number of schools in each. In other words, the total number of days (or months) all the schools of a county were kept is divided by the total number of schools to get the average time each one was kept. So, in finding the average term for the State, the school is taken as the unit instead of the pupil. When the schools differ much in size (number of pupils), as they do in all mixed urban and rural systems, varying from some half a dozen to 500 or more pupils each, the average term obtained by this method varies considerably from that obtained by the Bureau’s method. The long terms of the large city schools not being given their proper weight, the resulting average is too small. The same objection applies still more forcibly to weighting the school terms of the different counties or towns by the number of school districts in each.

Another method is to divide the total number of months or days taught by the number of teachers. This is, better than the preceding method, as it takes some account of the size of the schools—that is, an eight-grade school with eight teachers has eight times the weight, in determining the average term, that a district school with one teacher has. This is manifestly as it should be. If every teacher taught the same number of pupils, the result would be the same as by the Bureau’s method. Care must be taken in working by this method to use the number of teachers’ places (or number of teachers necessary to supply the schools) for the divisor; for if a teacher teaches a school or grade part of the term, and is replaced by another for the rest of the term, the two should obviously count as one teacher for the combined period of service. The liability to overlook this distinction in practice, as well as the inequality in the number of pupils to a teacher, makes this method generally objectionable.

Still another and most faulty method is to add together the school terms of the different counties or towns and divide by the number of such counties or towns—i. e., the simple arithmetical mean is taken. An example of this occurs in a school report, where it is stated that 14,193 pupils in one district attended 185 days, and 856 pupils in another district attended 160 days, while the average time the whole 15,049 pupils attended is computed at  $172\frac{1}{2}$  days, although nearly all (16 out of every 17) attended 185 days. This method, if it can be so called, gives altogether too short an average term, and nothing can be said in defense of it. It is as if, wishing to get the population per square mile of Minnesota and Dakota combined, we said, Minnesota, 9.86; Dakota, 0.92; average number of persons per square mile in the combined territory  $(0.92 + 9.86) \div 2 = 5.39$ , instead of dividing the total population of the two States by the combined area in square miles.

The “aggregate number of days’ attendance” is a statistical item of the utmost simplicity and of great value, about the meaning of which there can be little or no

difference of opinion. Every teacher's register that records the number of pupils present each day in school, as they all presumably do, contains the data for ascertaining it for that school for the school year by the simple process of addition or summing up.

There are a few States that make no pretense of ascertaining how long their schools were taught, and others that use methods so faulty that they also are totally in the dark in the matter. Yet this is one of the most necessary and fundamental items of information in determining their educational status.

TABLE 9.—(1) Length of school term. (2) The aggregate number of days' schooling given compared with the school population.

Year.	Average length of school term, in days.						Average number of days' schooling given for every child 5 to 18 years of age.

d In 1894-95.  
e Number of schools.  
f In 1897-98.

g Buildings only.  
h Number of districts.

*Average salaries.*—In computing (for Table 12) the average monthly wages of all the male (or female) teachers in a group of States, the average wages of each of the States in question is multiplied by the corresponding number of teachers. The sum of the resulting products is then divided by the sum of the teachers, and the quotient is the average wages of all. Each rate of wages thus receives its due weight.

To illustrate the principle: If 48 teachers receive an average of \$72.20 per month, they all receive in a month \$3,466; if 473 other teachers receive an average of \$48.60 per month, these together receive in a month \$22,988; all the 521 teachers combined, therefore, receive per month \$26,454, or an average of \$50.77.

Attention is called to this matter for the reason that the practice of taking the arithmetical mean of a number of rates of wages (the mean is \$60.40 in the above case) in order to get the average of all is so common as to vitiate, to a considerable extent, the published statistics of average wages.

TABLE 13.—*Private schools (elementary and secondary).*

NOTE.—The reports of private schools are more or less incomplete, and the number of pupils as given below may be taken to represent the minimum number of private pupils in the States furnishing this item.

State or Territory.	Number of pupils enrolled in private schools.	Total public and private enrollment.	Per cent of pupils in private schools.

a Includes some receipts from other sources.

b Approximately.

c State appropriation for colored schools.

d Includes U. S. appropriation.

e Includes local systems only.

f In 1897-98.

g Not reported.

h Includes poll taxes.

i Includes surplus of specific taxes transferred.

j Includes proceeds of bond sales.

k Includes all receipts in cities.

l One-half the income of two years.

a Includes some local funds.

TABLE 15.—The school revenue analyzed.

State or Territory.	Average amount raised per taxpayer (i. e., per adult male).					Amount this will provide for each child 5 to 18 years of age.	Amount required from each adult male to provide \$1 for each child 5 to 18 years of age.	Per cent of the whole revenue derived from—			
	From permanent funds and rents.	From State taxes.	From local taxes.	From all other sources.	Total amount raised per taxpayer.			Permanent funds and rents.	State taxes.	Local taxes.	Other sources.

IV.—TABLES OF SCHOOL EXPENDITURE IN THE SOUTHERN STATES,  
CLASSIFIED BY RACE.

Table A gives the school expenditure, classified by race, in each Southern State that reports the expenditure so classified, as far back as the record goes in each. In Maryland the expenditure for negro schools for the first three or four years is mainly in the city of Baltimore. The totals, of course, include only the States tabulated.

Table B gives the white and colored school population (children 5 to 18 years of age) in each case where the school expenditure is given in Table A. The relative white and colored school expenditure, it is evident, possesses no significance unless considered in connection with the relative number of children of each race for whose benefit the expenditure was made.

Table C gives the expenditure for white schools per capita of white school population, and the same for the negro schools. The averages include only the States recorded each year.

In making an estimate of the white and colored school expenditure of the remaining Southern States the most obvious assumption to make in the absence of any positive information is to consider that their white and colored school per capita expenditures bear the same ratio to each other each year as the average per capita given in Table C. It is upon this basis that the classifications by race have been made that are given in Table D, except for the years 1870-71 and 1871-72, in which the ratio of white to colored per capita was taken at about 6.

*a* Excluding certain small sums not classified by race and a few counties not reported.  
*b* Does not include permanent improvements in Baltimore City.  
*c* Does not include permanent improvements outside of Baltimore.  
*d* Includes salaries of teachers and superintendents only (or cost of tuition).  
*e* Approximately.  
*f* Does not include permanent improvements.  
*g* For 3 months.  
*h* In 1886-97.

TABLE B.—Estimated number of children 5 to 13 years of age.

TOPICAL OUTLINE—Brief conspectuses of the systems of education in Great Britain and Ireland—Statistics, current and comparative—Current educational record of England—Evidences of progress in school administration and efficiency—Recent agitations due to conflicting interests of public and parochial schools—Signs of returning harmony—School attendance: Bill raising the age for exemption from 11 to 12 years; unsatisfactory conditions revealed by special inquiries—Measures affecting teachers: Terms of the superannuation law; unsuccessful effort to reduce proportion of pupil teachers—Schools for the blind and deaf—Report of the chairman of the London school board—Medical inspection for London schools—Public agencies for secondary education, viz, the science and

art department, the school boards, the county councils—Provision made by public agencies for science and technical instruction—Official report on secondary schools under private management—The board of education bill—The Welsh intermediate education law of 1889—The new scheme of classification for Scotland—University notes.

APPENDED PAPERS—(1) The proposed university for Birmingham—(2) The university of Wales, by C. C. Bremer—(3) Notes on the mediæval universities of Scotland, by D. J. Ritchie, professor in the University of St. Andrews.

#### BRIEF CONSPECTUS OF THE ENGLISH SYSTEM.

The education law of 1870 provided for a system of elementary education maintained by the combined action of State and local authorities.

The State assumed the responsibility of securing through local authorities—viz, elected school boards or private managers—adequate provision for the instruction of all children.

The annual grant for elementary schools, which had been allowed by the Government since 1833 for schools maintained by two great religious organizations, was henceforth to be applied only to schools fulfilling the conditions of "public elementary schools." These might be either board or private (voluntary) schools. Their work was systematized by Government regulations, which prescribed minimum conditions with respect to buildings, appointment of teachers, course of study, and length of sessions that should entitle a school to be classed as efficient. These regulations or codes are annually revised by the education department and submitted to the approval of Parliament.

The education department, which had been created in 1856 to administer the Government grant for elementary schools, became under the law of 1870 the central authority for the supervision of the public system. The annual grant distributed by the department, which began in 1833 with \$100,000, has rapidly increased, reaching the sum of \$22,405,930 in 1897. It was shared by 19,958 schools fulfilling the specified conditions.

For the inspection of the schools the department employs a force comprising at present 12 chief inspectors, 107 inspectors, 45 subinspectors, and 152 inspector's assistants.

There is also a special inspector of music, a directress of needlework, and an inspectress of cookery and laundry work. The experiment of appointing women to serve as subinspectors, first tried in 1896, has proved eminently successful. The reports of the inspectors determine the amount of the grant to which a school is entitled.

The school districts, or areas for which a school board should be formed under the law, are the metropolis, every municipal borough excepting Oxford, and every parish not included in the former. The number of school boards in 1897 was 2,502, representing 64 per cent of the population.

In districts having no school board, comprising at present about 36 per cent of the population, school attendance committees are appointed to enforce school attendance (law of 1876).

The schools that participate in the annual grant are characterized as board or voluntary, according to the management. Board schools, which enroll about 45 per cent of the elementary pupils, are maintained in part by local taxes, yielding \$11,300,963 in 1897. Voluntary schools have no claim upon the local taxes, but draw a portion of their support—25 per cent in 1897—from endowments, subscriptions, and fees.

A law of 1891 provided a special grant for all schools, whether board or voluntary, remitting fees. This grant amounted in 1897 to \$11,351,725. The number of schools

taking advantage of the fee grant in 1897 was 84 per cent of the total, and 86 per cent of the pupils were on a free basis. The voluntary schools, which are chiefly parochial, and which, as indicated above, still provide for more than half the elementary pupils (55 per cent on a total, in 1897, of 5,507,039), seek also to share in the rates or local taxes; but their effort is resisted, as they refuse to submit to the control of public local authorities. Their complaint of meager resources in comparison with those of board schools appears to be well founded and to constitute a serious evil in the system.

In 1897 a law was passed providing a special grant for the benefit of the "voluntary" schools, at the rate of 5 shillings per pupil. The measure was opposed as discriminating between public and private schools and as providing indirectly for sectarian endowment.

Up to 1880 the matter of making by-laws compelling school attendance was optional with district boards or attendance committees. A law passed that year empowered the education department to make compulsory by-laws for all school districts whose local authorities failed to take such action. Parents and employers violating the law are punished by fines and imprisonment. Attendance is therefore nominally enforced upon all children between the ages of 5 and 14, unless exempted under a by-law. The minimum age for exemption, which was fixed at 11 years (that is, 10 completed) by the law of 1893, was raised to 12 the present year; the by-laws also fix a grade not lower than the fourth which the child must have passed to secure an exemption certificate.

As the private schools recognized by the department are chiefly parochial, the question of religious instruction was one of serious consideration from the first. The law of 1870 provided that board schools should be strictly nonsectarian, and by a "conscience clause" prohibited private schools from forcing religious instruction upon children whose parents should object to the same. No public grants are allowed for religious instruction. The recent reopening of this question seriously threatens the prosperity of the system.

The scope of instruction in the elementary schools, which was originally very narrow, has been extended from time to time, particularly by the codes of 1875 and 1880. Up to 1882 the Government grant was apportioned at a certain rate per capita for those who passed individual examinations in the obligatory and in the optional branches. This system, popularly known as "payment upon results," was slightly modified by the code of 1882, which introduced a merit grant to be awarded at the rate of 1 to 3 shillings per capita on the basis of average attendance. By the code of 1895 for the system of annual formal examinations were substituted two annual visits by the inspector, to be made without notice, and average attendance became the basis for nearly the whole grant. Freedom of classification and improved methods of instruction have been thus promoted. The same liberal tendency is indicated also by a change in the character of evening schools. Since 1893 these have been regarded as evening continuation schools, and a wide choice of subjects has been permitted. The result has been an immense increase in their attendance, 121 per cent from 1893 to 1897, at which latter date the average attendance was 179,600.

The teaching force in the day schools comprises certificated teachers, 45 per cent of the total (130,773); assistant teachers, 25 per cent, and pupil teachers, 20 per cent. The last named are regarded as teachers in training, and an additional grant is made to the school on their account.

The average annual salary of certificated teachers is, for men, \$613 as against \$470 in 1870, and for women, \$407 as against \$287.

The cost of the maintenance of elementary schools in 1897 was \$52,537,325. Board schools, enrolling 45 per cent of the pupils, expended 52 per cent of this amount, and voluntary schools, enrolling 55 per cent of the pupils, expended 48 per cent.

The expenditure was met by the various contributing sources in the following ratios:

	From Government grants.				Local sources.	
	Annual grant.	Fee grant.	Grants through science and art department.	Total.	Taxes.	Subscriptions, fees, etc.
	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>
Board schools .....	36.0	18.0	2.0	56.0	41.9	2.1
Voluntary schools .....	47.2	24.8	1.8	73.8	.....	26.2

Teachers' training colleges established by private managers also receive appropriations from the State. In 1897 they numbered 44 residential colleges, with 3,492 students, and 14 day colleges, with 814 students, and received from the grant \$795,489.

Secondary education, or, as it is termed in England, middle-class education, is unorganized excepting in Wales, where adequate provision for secondary instruction under public auspices has been made under the Welsh intermediate education act of 1889. The Government has recently taken active measures to systematize and extend the provision for secondary education in England.

#### THE SYSTEM OF EDUCATION FOR SCOTLAND.

The Scotch system of education was organized by the law of 1872 on a basis similar to that of the English system. The general supervision was committed to the education department for Scotland under the same presidency as the English department, but with a separate vice-president and official corps. A grant for elementary schools was allowed as in England, the precise conditions for sharing in this to be annually determined by the "code" for Scotland.

The chief points of difference from the English system relate to—(1) Local control of schools: A school board is elected in every parish for the management of the parish schools, and in the towns for that of the burgh schools. (2) The scope of the system: The control of the board was extended from the first to higher grade schools, of which many were already existing as part of the public school provision of the country. Although not sharing in the treasury grant, these schools by subsequent laws have been allowed support from local taxes. (3) Compulsion: Whereas compulsion has been gradually introduced into the English system, the Scotch law made education compulsory for all children between the ages of 5 and 13 (raised to 14 in 1883), or until a certificate of exemption should be secured. The standard or grade for exemption was made the fifth (law of 1878); the age for exemption is 12 (law of July, 1899). (4) The matter of religious instruction: This was left to local authorities, with the simple restriction of a conscience clause making the attendance of children upon the religious exercises optional with the parents. A grant, in lieu of fees allowed by law of 1889 (England, 1890), has had the effect of making the schools free.

The elementary schools of Scotland, like those of England, are public (supported by the grant and local taxes), or voluntary (denominational), sharing in the grant, but not in the local taxes. The latter enroll only 22 per cent of the pupils, who numbered 716,893 in 1897. The school provision, which in 1872 was adequate for only 8.3 per cent of the population, is now sufficient for 20.22 per cent.

The current expenditure for the elementary day schools, amounting to \$7,403,068, was derived as follows: From local taxes, 25 per cent; from other local sources (fees, subscriptions, etc.), 5 per cent; from the Government annual grant and fee grant, 70 per cent.

The teaching body includes pupil teachers, who formed 25 per cent of the whole

number employed—16,252 in 1897. The eight training colleges are denominational schools, supported in part by Government grants. They had 934 students in 1897, and a force of 85 teachers, and received from Government \$179,445, which was 79 per cent of their whole income—viz, \$225,586.

In 1882 the educational endowments act was passed, under which the endowed schools, which are in the main secondary, have been gradually reorganized. In 1885 the education department arranged for the inspection of these and other secondary schools. The number of schools availing themselves of the inspection in 1897 was 82. In 1888 the department adopted the plan of a leaving certificate for students who, on the completion of a course of secondary study, should pass an examination for the certificate.

The number of students examined in 1897 was 16,378, representing 362 schools.

The portion of the surplus of the liquor duties which falls to Scotland is largely applied to secondary (including technical) education—\$160,000 in 1897 out of a total fund of \$280,000.

Through the application of grants from this fund and the service of inspection and examination the secondary schools of Scotland have been brought into close relation with the education department.

SYSTEM OF EDUCATION FOR IRELAND.

The system of national education in Ireland dates from 1831, when a board of commissioners for education was created by the Government. In 1845 the board was incorporated by royal charter, and in 1861 a supplemental charter was granted under which ten members must be Roman Catholic and ten Protestant. The board is composed always of representative men who adhere to the policy of strict impartiality in religious matters.

The schools under the supervision and fostering care of the board are supported by State and local funds. They may be denominational schools (*i. e.*, Roman Catholic or Protestant) or mixed, in respect to religion, but the rights of parents in the matter are strictly guarded by a conscience clause in the school regulations, which provides that no child be allowed to attend a religious exercise of a denomination other than his own, except upon the written request of his parent. Under this arrangement very little trouble has arisen on the religious question.

The classification of schools and pupils as regards religious denomination in 1897 was as follows:

	Number of schools.	Enrollment.	Proportion of pupils—	
			Per cent Protestant.	Per cent Roman Catholic.
Schools mixed as regards religion.....	3,292	298,219	73.2	26.8
Schools attended solely by one denomination:				
Protestant.....	1,404	112,249		
Roman Catholic.....	5,281	387,742		
Total enrollment.....		798,210	24.1	75.9

Grants in aid for the building of schoolhouses are allowed by the commissioners, but must be proportioned to the amount raised locally. The State pays also the larger proportion of the salaries for teachers, requiring a minimum annual augmentation from local funds of £12 (\$60). Altogether the State bears about 94 per cent of the annual expenditure for the schools, which amounted, in 1897, to \$5,822,999.

To avoid religious complications the State provides the text-books for secular branches, which are issued at a small cost to the pupils.

“For purposes of Government supervision the country is divided into 60 districts,

which are grouped in 6 divisions, each in charge of a head inspector. Under these are 29 district inspectors, 7 unassigned inspectors, and 10 inspectors' assistants. Inspectors and their assistants are appointed upon examination testing their scholastic and professional qualifications."

Local civil authorities have no control over the schools. The local managers of schools, who are generally clergymen, come into direct relations with the board of commissioners. They appoint and dismiss teachers and arrange the details of the school work. Of a total of 2,921 managers in 1897 four-fifths were clerical.

The commissioners have direct control of a special class of schools called "model schools," for which they provide the buildings.

"They are intended, as their name indicates, to afford models of the best methods of instruction and organization, and to serve as practice schools for students in training colleges or normal schools." These schools numbered 30 in 1897, with an enrollment of 10,335 pupils, included in the enrollment previously given.

A compulsory school law was passed in 1892, but it has been imperfectly enforced, and Ireland still stands below the other divisions of the United Kingdom in respect to school attendance, as is shown by the most recent statistics. These give the following rates of attendance to enrollment:

	Per cent.
England and Wales .....	81.5
Scotland.....	84.45
Ireland .....	63.9

Convent and monastery schools afford a large part of the provision for elementary education, and receive, under certain conditions, aid from the Government.

The number of such schools fulfilling the conditions for aid, according to the latest report, was 337, with an enrollment of 105,342 pupils.

For the training of teachers there are one national and three denominational normal schools, which receive grants in aid from the Government. There were 801 students in training in 1897. Provision for agricultural instruction is an important feature of the system. Instruction in the theory of agriculture is compulsory in all rural schools for boys in the fourth, fifth, and sixth classes, and optional for girls.

The commissioners maintain also two model agricultural schools, and in 1897 they reported 48 school farms in connection with elementary schools and 101 schools having school gardens attached.

An intermediate education board was established in 1878, which derives a yearly income from the Government, amounting to \$194,910 (in 1897), besides revenues from local taxation amounting in the aggregate to \$244,350. This gives for 1897 a total income from public sources of \$439,260.

The function of the board is the examination of intermediate or secondary pupils. In 1897 the number of pupils examined was 9,605 (7,182 boys and 2,423 girls), and on the results of these examinations payments were made to 367 schools, amounting in the aggregate to \$244,350.

The total amount expended on technical education in Ireland out of rates (local taxes) raised under the technical instruction acts and the public libraries acts by 11 local authorities during the year 1895-96 was \$21,379, and the estimated total expenditure during the year 1896-97 was \$22,637.

#### HIGHER EDUCATION—GREAT BRITAIN AND IRELAND.

Higher education is provided in Great Britain and Ireland by universities and detached colleges, and professional education by special schools of medicine attached to the principal hospitals and by schools of law and of theology. The multiplication of local colleges in England and the increase of university affiliations and influence are noticeable features of the recent history of higher education.

The chief statistics of education from the latest official reports are tabulated below.

## CURRENT EDUCATIONAL RECORD OF ENGLAND.

The foregoing statistics show the great development in the means of education in England since the passage of the school law of 1870. At that time there was provision in elementary schools for 8.75 per cent of the population; in 1897 the provision was adequate for 20.01 per cent. This gain, equal to 128 per cent, is the measure of the determined effort made to rid England of gross illiteracy. The deficiency of school places having been overcome, more and more attention is given to improving the quality of the schools. While results here are not so easily measured, detailed statistics show a steady advance in respect to school attendance and the duration of school life. These are clear indications of the increased hold of the schools upon parents and children. Even the recent disturbances in the system have not interrupted the progress of the schools in these respects, as is shown by the following particulars:

## ELEMENTARY DAY SCHOOLS (ENGLAND AND WALES).

Board schools.....	2 8 9 <sup>3</sup> / <sub>4</sub>	2 10 1 <sup>3</sup> / <sub>4</sub>	2 11 11 <sup>3</sup> / <sub>4</sub>	2 13 2 <sup>1</sup> / <sub>2</sub>
Voluntary schools.....	1 18 1 <sup>3</sup> / <sub>4</sub>	1 18 11 <sup>3</sup> / <sub>4</sub>	1 19 6 <sup>3</sup> / <sub>4</sub>	2 0 6

*Total current expenditure for public elementary education.*

1894.....	£9, 147, 825
1895.....	9, 670, 090
1896.....	10, 212, 688
1897.....	10, 507, 465

*Rate of increase in school accommodation and attendance as compared with increase of population.*

Year.	Population, increase per cent.	Accommodation, increase per cent.	Enrollment, increase per cent.	Average attendance, increase per cent.
1894-95.....	1.11	1.79	1.94	2.35
1895-96.....	1.33	2.27	2.33	2.26
1896-97.....	1.10	2.35	1.54	1.48

*Pupils examined in studies of secondary grade (algebra, geometry, Latin, French or German, physics, chemistry, etc.).*

Year.	Number examined.	Number passing.	Percentage of scholars presented to total number on register.
1894.....	142, 480	113, 384	2.1
1895.....	162, 103	128, 012	2.4
1896.....	175, 087	138, 814	2.5
1897.....	197, 812	156, 314	2.8

The most significant of the foregoing tables is that relating to pupils taking secondary studies. The tendency to prolong school life thereby indicated is shown also by the increasing proportion of children in the upper grades but not included among those who pursue secondary branches. Of this tendency the official report says:

In 1870 the average term of school life, as shown by the numbers on the registers of public elementary schools, was 3.76 years; but as the percentage of average attendance to the number on the registers was only 68.06, the actual average term of school attendance was only 2.55 years. The latter figure had in 1880 risen to 5.19 years. In 1890 it stood at 6.13 years. In 1897 it was 7.05 years. Thus since 1870 the period actually spent under school discipline by the average pupil attending a public elementary school in England and Wales has been nearly trebled.

CAUSES OF THE RECENT AGITATIONS.

The English system of elementary education illustrates in its origin and gradual development the persistence of two great interests, the

religious interest as embodied in the established church and that of local civil authorities. In a great measure the recent educational upheaval is due to the conflict of these interests. The religious authorities are alarmed for the welfare of their schools, whose resources and consequent efficiency are surpassed by the board schools, especially in the large boroughs. The boroughs, on the contrary, are jealous for their rights and intent upon preserving the impartial policy hitherto pursued by the Government. The situation has been aggravated by new educational demands growing out of new social and industrial conditions.

An endeavor was made by the education bill of 1896 to rid the system of the chief causes of disturbance by reorganizing the local control of schools, and at the same time, to meet the broader demands of the hour, by a better adjustment of the agencies for elementary education on the one side and those for the fostering of secondary education on the other. The defeat of the measure left the Government with an unfulfilled pledge of assistance to the voluntary schools, i. e., private schools chiefly parochial.

This pledge was met in part by the bill carried through Parliament in the session of 1897, providing a special grant for voluntary schools at the rate of 5 shillings per capita of their enrolled pupils.

The measure is criticised as inadequate in respect to the amount of help it affords, unfairly discriminating in its tendency, and further complicating the local control of schools. This it does by providing for the federation of schools entitled to the grant, which in practice tends to make the diocese the unit of control for the special grant. There are, however, signs that the crisis of unrest has passed, and that the troublesome questions arising from the dual control of elementary education will be adjusted on an equitable basis. This outcome may be reasonably inferred from the fate of a remarkable resolution introduced into the House of Commons the present session, March 7, which was as follows: "That, in the opinion of this House, the system of primary education in England and Wales inflicts upon a large portion of Her Majesty's subjects a serious grievance which demands the immediate attention of Parliament."

The resolution, as plainly shown by the speech of its author, was directed against "voluntary" schools; but it drew on an animated debate, during which the advantages and disadvantages of the dual system were discussed in a candid manner and in the spirit of compromise rather than of contention. The resolution itself was defeated by a majority of 123 votes in a total of 285.

Mere partisan contentions, it is evident, are giving way before the supreme question of how to secure adequate instruction and training for all the children of the realm.

## CURRENT MEASURES AND DISCUSSIONS.

We present here, from various sources of current information, a résumé of the questions that have been uppermost during the year:

*School attendance.*—A bill raising the age limit for exemption from school attendance from 11 to 12 years, introduced into the House of Commons March 1, 1899, by Mr. Robson, and which at this writing awaits only the royal signature to become law, brought to a crisis a long series of efforts respecting school attendance. The importance of the measure will appear from a review of the conditions leading up to it.

The education law of 1870 empowered school boards to make by-laws respecting school attendance; the law of 1876 gave like authority to school-attendance committees in districts having no school boards, and also prohibited the employment of children under 10 years of age. A law of 1880 prohibited exemption from school attendance for children under 10, and the law of 1893 raised the age to 11. It was further ordered by the law of 1876 that no child should be employed between the ages of 10 and 14 without a certificate from a government inspection, showing that he had passed the fourth standard (about the same as fourth grade in our city schools) in reading, writing, and elementary arithmetic, or that he had made a certain attendance (250 attendances for each of five years) at some elementary school recognized by the department as efficient.

Under these provisions a system of half-time attendance has developed, for which the annual code prescribes regulations. The latest issued are as follows:

The term "half-time scholar" means a scholar certified by the local authority to be employed in conformity with the by-laws, or, if not subject to the by-laws, in conformity with the elementary education act, 1876, or any other act regulating the education of children employed in labor, and in either case recognized by the department as a half-time scholar.

"An attendance" means attendance at secular instruction (*a*) during one hour and a half in the case of a scholar in a school or class for infants; (*b*) during two hours in the case of a scholar in a school or class for older children; and during one hour and twenty minutes in the case of a half-time scholar. The attendance of a half-time scholar for less than two consecutive hours is not recognized, but such two consecutive hours are reckoned as an attendance and a half.

At the Berlin Conference of 1890 England found herself in the category of countries that permit the employment of children at the lowest ages and show least solicitude for their education and welfare. The delegates pledged themselves to use every effort to remove the stigma, and in this they have been ably supported by the educational authorities and the Teachers' Association. The press has also given valuable assistance, especially during the past year. The Daily News even went so far as to employ a special commissioner to investigate the condition of half-timers in the factory centers of Lancashire and Yorkshire, from which came the chief opposition to an advance of the school

age. The Woman's Industrial Union has been unremitting in its endeavors to arouse public opinion on the subject.

As a result of these efforts the bill raising the age for exemption was carried through the second reading by a majority of 258 in a total of 517 votes.

It appeared from official statistics that the number of half-timers in 1897 was 119,747, of whom 54,491 were employed in factories. Of these 84 per cent were in the mills of Yorkshire and Lancashire. The term half-time, as applied to these children, is deceptive, as it means in nearly every case two hours or two hours and a half in school daily as against six hours in the mill. The rejection of the bill was urged by the member from Stockport, confessedly in the interests of Lancashire. This member declared that of 90,000 factory operatives belonging to the unions 74 per cent had been heard on the question, and of these 90 per cent were opposed to the measure. It was greatly feared that this ignorant but obstinate opposition would wreck the measure, but it finally yielded to the influence of a telling array of facts proving beyond question that juvenile labor brings down adult wages.

Mr. Robson, in moving the second reading of the bill, summed up the situation as follows:

Mr. Robson (South Shields) rose at ten minutes past 12 to move the second reading of his bill to raise the age for half-time labor from 11 to 12. The bill, he said, would come into operation on January 1, 1900; and it contained a proviso by way of a saving clause preventing it from having any operation with regard to those children who on January 1 next had already obtained total or partial exemption from attendance at school. The bill embodied a proposal to which the Government was bound by a definite international engagement which had been recognized by both parties in the State and which both parties had made attempts to carry into effect. At the Berlin conference in 1890 it was proposed that the minimum age for child labor should be raised to 12, and the right honorable gentleman (Sir J. Gorst) who represented this country obtained explicit authority from Lord Salisbury to assent to that proposition. An attempt was made to carry out that engagement in 1893 on the part of the then Liberal government, but it was not fully carried into effect, and the age was only raised from 10 to 11 as a provisional compromise between the Government and those who advocated that there should be no extension. It was urged, then, on behalf of Lancashire, that to raise the age two years would cause a great deal of derangement in the industry of that county, and that it would be better to proceed by two steps instead of one, and that was done. He found, however, that those who opposed the present bill said that the act of 1893 was not to be regarded as a compromise, but as a settlement of the question, which was an entirely erroneous view. It should be a cause of alarm to them that England should have become a laggard among European nations in regard to the education given to children. In France the conditions were much more stringent than in this country, and in Germany Sir P. Magnus reported that child labor had practically disappeared from the factories. In these countries not only did they keep a child at school longer, but they were incomparably more strict about regular attendance and more careful about qualifications of the teachers than we were. The argument that the effect of limiting child labor would be to expose us to foreign competition had disappeared, because everybody admitted that the foreigner was in this matter well ahead of us. He had deliberately left us without competition in this matter—and why? The

statesmen of Germany were intensely keen upon the development of the trade of their country, and a great rivalry prevailed between that country and England, but the fact was that in their opinion they were not missing but making a point, having regard to the physical and intellectual development of the powers of their people. Everybody recognized nowadays that the great secret of the success of Germany in nearly every sphere of human energy was due to the fact that she began this policy earlier and had pursued it more strenuously than any other country in the world. No doubt they would be told that the poverty of the working classes was a reason why this reform should not be made, but the working classes of this country were not poorer than those of Germany or France. Having explained the "half-time" system, the honorable gentleman complained that the standard for half-timers was fixed locally. He said the whole system was a careful endeavor to prevent any test being applied which showed whether the child understood its work or not. The vice-president of the council had himself pointed out that 20 per cent of the children who learned reading, writing, and arithmetic when they left school lost the faculty altogether. The prisons report for 1897 stated that 96.9 per cent of prisoners could neither read nor write, or could only do so imperfectly. This showed that an enormous number of children, especially those of the poorer classes, escaped our education system and, as recruits, joined the great army of those who were unfit to exercise the duties of free citizenship, which was one of the greatest dangers of the system of self-government in this country. That was the idea which prevailed in the United Kingdom, for Scotland and Wales were enthusiastic about education, and England was fairly well resigned about it, except in two or three districts where a particular trade was carried on, as in the case of Lancashire.

Even Lancashire did not now stand where she did before. Mr. Mawdsley, one of the chief leaders of the Lancashire textile industry, stated that he would not send his children to the mill at an early age, because early life in the factory affected the health, stunted the growth, and arrested the education of a child. So long as he had sufficient to keep them, he added, he would allow them to receive joys and advantages which belonged of right to child life. Although the Bolton cotton spinners had said that life in a factory was not unhealthy for a child, when they came to their own case they argued that it led to chest disease and rheumatism, and made an eight-hour day imperative. At the age of 12 the half timer showed a shortcoming in height, as compared with the average child, of 2.3 inches, and at 13 the difference was 3 inches, while there was a corresponding diminution in weight. The system of half timers disorganized the schools, and it had been shown that in 1,130 cases the earnings of the families from which these children came averaged £3 10s. per week, which demonstrated that the argument as to poverty was not well founded. It was said that for the sake of becoming technically educated in his trade it was necessary that a child should not have the half-time age raised. In Bolton there were between 3,000 and 4,000 half timers, but though there were 538 scholarships given in that town for technical and other education, only 1 had been obtained by a half timer. He heard from an honorable friend that that child was not a half timer when he obtained it. It was not easy for a nation to prosper by depressing the mental or physical development of the young. Even if the country did prosper by such means, he should say, "Beware of such prosperity!" Prosperity, unaccompanied by modern advancement, was a very dangerous thing either to the individual or to the state. Material prosperity, purchased at the cost of such advancement, was a forerunner of national danger.

Mr. Kenyon (Bury), in seconding the motion, said he did so because the whole standard of education throughout the world was being advanced every year, and other nations were making progress in this direction more rapidly than we were. In his own district the constant complaint of the technical-school committee was that the young girls and boys who attended the school were deficient in elementary

knowledge and could not grasp the education sought to be given to them. From an intimate knowledge of mill work and mill hands, he could say advisedly that a child could learn just as well at the age of 12 or 13 as at the age of 11. He was familiar with a case in which a boy of 17 went straight from one of the public schools to the loom, where in a fortnight he learned sufficient to entitle him to the average wage. The bill would certainly do good, because it would brighten the intelligence of the workers. The most difficult man to manage in any works was the man who could not read or write. There was not much to complain of in the sanitary condition of the factories nowadays, but what he did especially object to was the time children in factories had to get up at in the morning. No one could ever persuade him that it was a good thing for a child to be pulled out of bed at half past 5 in the morning. (Schoolmaster, March 4, 1899, p. 377.)

The case of half timers aside, it appears that the condition of school attendance is on the whole extremely unsatisfactory as regards the amount of schooling required by the law, the means of enforcing the compulsory law, and the regularity of attendance on the part of registered pupils. As these matters are wholly in the hands of local authorities the conditions differ widely in different districts. In London the evil of irregular attendance has become so great that several public conferences have been called for its consideration. Such a conference was held under the auspices of the National Teachers' Union in January of the present year, at which the president of the Union, Mr. Waddington, presented the following statement:<sup>1</sup>

Out of 754,000 scholars on the books of the metropolitan schools 145,000 are always away. In addition there are large numbers of children of school age in London who escape the schools entirely, and whose names do not appear on the roll of any school. Out of every 6 children of school age, and belonging to the class that use the elementary schools, 1 is not enrolled, and of the 5 enrolled 1 is always away—not always the same one, but nearly always the same one. Of the administrative counties 38 have a higher percentage of regularity of attendance than London, and, compared with the county boroughs of England, London stands thirty-ninth. Taking Glasgow as the Scottish town whose conditions are most closely analogous to those of London, the comparison stands: Glasgow, 89 per cent; London, 81 per cent.

The financial aspect of these figures deserves the attention of the London ratepayer. The three-quarters of a million scholars on the books of the schools of the London schools may be divided into three groups: Two-thirds of the scholars are regulars; one-sixth of the scholars are casual irregulars; one-sixth of the scholars are chronic irregulars. The machinery for enforcing compulsion exists almost wholly for the "chronic irregulars." The regulars would attend whether compulsion existed or not; their parents believe in education. The "casual irregulars," where possible, would disappear if the "chronic irregulars" were dealt with properly. This is a serious financial burden to the Londoner. Last year the London school board spent nearly £50,000 in endeavoring to secure the attendance of the "chronic sixth," and 145,000 scholars were absent each time the school was open. Supposing London had reached the standard attained by Glasgow the result would have been an increased grant from the education department of £80,000. The bill stands thus:

Cost of endeavoring to carry out the law.....	£50,000
Loss of grant compared with Glasgow.....	80,000
Total.....	130,000

<sup>1</sup> See Schoolmaster, January 28, 1899, p. 170.

Each "chronic irregular," therefore, costs something like £1 a year, and grows up a danger to the city and a future tax on the nation. Speaking of these education derelicts, Sir John Gorst said:

"Between the ages of 5 and 14 they were surely reclaimable, but if nothing was done they grew up to require an enormous expenditure in police and magistrates and prisons in order to prevent them from preying on society."

But this by no means represents the whole cost to the city. No small portion of the time of the teachers is spent in endeavoring to secure the regular attendance of the children. The irregular scholar retards the progress of the regular scholar. Much of the time of the teacher is taken up recovering the deficiencies arising from the neglect of the parent of the irregular. The parents of the regular scholars have a serious interest in the neglect of the parents of the irregulars. No impartial person will deny that the enforcement of the compulsory clause is a failure. Where lies the blame? Offenses against the education acts are not viewed in the same light as offenses against other penal laws. Sir John Gorst very truly pointed out that riding a bicycle on the footpath or the owning of an unmuzzled dog led to summary treatment by the magistracy, while offenses against the education acts could be perpetrated with impunity. The fact is, the public conscience revolts at the trial of offenses against the education acts being dealt with in the ordinary police court. The legislation of the last two decades has so multiplied the cases requiring the attention of the London magistracy as to overcrowd the daily work of the London police courts. There is not time to deal with the "chronic irregulars," and the number, therefore, grows apace. Magistrates lay down conditions which, although probably rendered necessary by the pressure of other business, make the enforcement of compulsory school attendance impossible. For instance, the number of summonses to be issued is limited. No matter how many offenses may be committed, only a certain number must be prosecuted.

The position last July was that after the most careful consideration the authorities decided that 1,142 persons had broken the law. The magistrates decided that only 108 could be called upon to appear before them until the offense was too old to be dealt with, and it must be borne in mind that the law has not only been broken, but flagrantly broken, before the case is ordered for prosecution. Carefully ascertained offenses against the education acts are ignored until enforcement becomes well-nigh impossible. Much of the "casual irregularity" would disappear if the "chronic irregulars" were dealt with summarily, and the offenders were visited while the offense is new. The failure to obtain effective treatment of the worst cases makes it impossible to deal effectively with irregularity in its milder stages. I am convinced that less tabulation and more visitation would be beneficial in removing some of the causes. The fine is altogether inadequate. It too often pays to break the law. Before me lies a list of 24 cases in the Marylebone division, where the average number of prosecutions reaches 13. Taking into consideration the procedure before prosecution, there can be no doubt that these children have been subject to prosecution almost from the day they entered the school. The maximum penalty ought to be increased to £1, and its infliction ought to be assured for cases of gross and continued neglect. A peripatetic stipendiary magistrate ought to be appointed to deal only with cases under the education acts. No doubt the majority of the metropolitan magistrates are anxious to administer the law, but the congestion of the courts makes effective administration impossible. Yet when account is taken of the attention given to the conscientious objector under the vaccination act, it would appear that more attention might have been given to the "conscientious evader" of the education acts. The last quarter of a century has taught us how expensive ignorance finally becomes. "Make your educational laws strict," writes Ruskin, "and your criminal ones may be gentle; but leave youth its liberty, and you will have to dig dungeons for age." Mr. Waddington concluded by moving—

"That this conference, while recognizing that the great bulk of the working-class parents send their children to school with commendable regularity, and often at

great personal self-sacrifice, desires to direct public attention to the serious obstacle to educational progress in London arising from the fact that a large number of children of school age are not found upon the registers of any school, and that of the 754,000 children who are upon the registers, no less than 145,000 are absent every time the schools are open; that of the many cases of irregular attendance, by far the larger number are absent without reasonable excuse, and that this irregularity of attendance is not only a source of serious injury to the children who do attend school, but renders a large part of the teachers' work unfruitful."

The second resolution, moved by Mr. Bowden of the London board, touched upon the relation between illiteracy and crime. It was as follows:

This conference desires to draw attention to the fact that out of the persons confined in prisons and convict establishments in England and Wales in the year ending March 31, 1898, no less than 20.9 per cent are recorded as absolutely illiterate and 62.6 per cent as only able to read and write imperfectly, while there exists indisputable evidence that street roughs, popularly known as "Hooligans," were the truants and other ill-governed children who were never brought under the disciplinary influences of a public school.

Mr. Bowden said the school is the place where character is formed, and it is because they believe that there they can prevent boys from becoming criminals that they wish to call the attention of the public to the absence of large numbers of children from school. Statistics since 1870 show very clearly that a diminution has taken place in the number of crimes, and that, too, among the very class that has come under the influence of the education provided by the act of 1870. Under these circumstances he considers they are justified in asking that steps shall be taken for compelling parents to send their children to school regularly. Mr. Bowden went on to show that in criminal statistics a man is entered as being well educated if he can pass Standard III, and yet even with this low standard a very small proportion of criminals can be described as being well educated. Recently the chairman of the Gloucester school board stated that out of 27 of their pupils who eventually found their way into prison, 25 were those who had been truants or who had attended school irregularly. Mr. Bowden added that there is an amount of irregularity that brings the law into contempt, and he further urged that the ratepayers should remember that the making of a criminal is a very expensive matter, and that a criminal costs the community £40 a year for the whole of his life. Thus, even upon the ground alone of expense, it is cheaper to compel the children to attend school.

Both resolutions were unanimously adopted.

Dr. Macnamara, of the London board, moved—

That, in the opinion of this conference, the existing machinery for securing regular attendance at school has to a great extent failed in its object. Cases of gross irregularity are not brought before the magistrates with sufficient rapidity, and the machinery of the police courts is neither satisfactory nor sufficient for dealing with those cases, while some of the magistrates themselves seem disinclined to administer the acts which require attendance at school.

He supported his position by detailed accounts of the police-court proceedings in cases brought before them.

The resolution was adopted, as were also the two following:

1. This conference is of opinion that special courts should be established for dealing with school-attendance cases, so that the parents and others who appear shall not be compelled to associate with the usual conditions of a criminal court.

2. This conference is of opinion that age and attendance should be the sole qualifications for exemption from attendance at school, and is of opinion that it is desirable that the maximum penalty allowed under the English act for the nonattendance of children at school should be raised from 5s. to £1, the maximum penalty under the Scotch act.

The press gave wide publicity to the proceedings of this conference, which has awakened intense interest on the subject.

According to estimates presented by Sir John Gorst, the vice-president of the education department, after making all allowance for cases of legal exemption, there are in the Kingdom 1,000,000 children between the ages of 5 and 14 who ought to be in the day schools, but of whom the authorities have no information. With respect to this million, the vice president said, in a speech before the Mechanics' Institute of Bradford, that—

The mere carrying out of the present law would never succeed in bringing up the attendance of the children to anything like the proper figure. He would like to call attention to the extreme importance of this derelict million of children from an economic point of view, in the welfare of the country. This was the class from which criminals and paupers were mainly recruited, and now, while they were of the tender age of from 5 to 14, they were reclaimable. If nothing was done a great proportion of them would grow up in such a way as to require an enormous expenditure in police, judges, prisons, and so forth, to prevent them preying upon society. If reformed they would grow up honest men and women, and instead of being a loss would enrich the country by their intelligence and their labor. [Applause.]

It is further estimated that of the number of children in attendance between the ages of 10 and 11—in round numbers 6,000,000—one-fifth leave school when the age of 12 is reached and one-sixth became half-timers.

In submitting the budget estimates the vice-president showed that the percentage of average attendance<sup>1</sup> for four successive years has been as follows:

Year.	Rate.	Year.	Rate.
1895.....	81.16	1897.....	81.50
1896.....	81.55	1898.....	81.66

In Wales the rate of average attendance was only 76.6 per cent; in Scotland it rose 84.3. The rate for England—81.6 per cent—is the highest attained since the passing of the education law of 1870. The vice-president expressed the opinion that the forthcoming report for 1899 would show that there had been great advance made, owing to the energy and attention of local authorities in securing better attendance.

The interest in the case of the half-timers led to the investigation of the employment of children who attend as full-time scholars, but many of whom are so overworked that they get little benefit from instruction.

<sup>1</sup>Average attendance for any period is found by dividing the total number of attendances made during that period by the number of times for which the school has met during such period.

The matter was brought to the attention of the education department by the Woman's Industrial Council, and as a result of their representations the department sent out a form of inquiry to all elementary schools designed to ascertain, as regards the children in full-time attendance, the number known to be working for wages or employed for profit, with their age, standards, occupations, hours of work, and rates of pay.

The results of this inquiry were summed up by Mr. Gorst in the House of Commons as follows:

A painful and disappointing return, which cast a very lurid light on the social condition of large classes of the population, and propounded a most difficult social problem for governments and parliaments to ponder over. When the return was made up it furnished the names of 144,000 children on the books as full-time scholars who were engaged as laborers for wages or profit—110,000 boys and 34,000 girls; and the few returns which came in since have added 1,000 more. But the returns reveal upon the face of them that this is only a part of the number of children so employed, and that there are multitudes of children working in this way whose names do not appear in the return. In the first place the names of children have only been returned who were in regular employment. No notice is taken of children in casual or seasonal employment. One correspondent says:

"Many children are kept from school for days, sometimes weeks, together, for such work as picking stones in the fields, weeding, sheep-shearing, harvest, and potato picking."

Another correspondent says:

"During the hat-sewing season, which usually lasts from about February to Whitsuntide, many girls of all ages are employed, both before and after school hours, in sewing hats for their mothers. Some have been known to work from 6 a. m. to the time for coming to school and again from school closing in the afternoon till bedtime."

The names of none of these children appear in the return.

The ages of the children dealt with in the return are as follows: Six years of age and under, 131; between 6 and 7, 1,120; between 7 and 8, 4,211; between 8 and 9, 11,027, and between 9 and 10, 22,131. As to the character of the work done by the children, Mr. Gorst said: I find a little boy of 6 is engaged peeling onions twenty hours a week for a weekly wage of 8d. Another delivers milk twenty-eight hours a week for the weekly wage of 2s. Another little boy of the same age is engaged in turning hose for twenty hours a week, and he is paid by 6d. being credited weekly to his savings-bank account. There is a little boy engaged in pea picking at 1s. 3d. a week, and the champion boy, who is under 6 years of age, works in a brick field at brick-making and earns a wage of 3s. 6d. a week. A little girl under 6 carries milk for thirty-five hours a week for her parents, and she receives no wages. Another little girl is engaged in seaming hose for fifteen hours at a weekly wage of 1d. Another is a nurse girl—a nurse girl under 6—who works twenty-nine hours a week for 2d. and her food, and another girl under 6 is an errand girl and runs about the streets fifteen hours a week for a wage of 6d. Of boys, there are selling newspapers 15,182; hawking other articles about the streets, 2,435; other occupations, such as knocking people up early in the morning and taking out dinners, 8,627; shop boys, 76,173; boys engaged in agriculture, 6,115, and odd jobs, 10,636. Then come the girls, minding babies, 11,585; housework and laundry work, 9,254; needlework and light work, such as making card boxes and things of that kind, 4,019. Now I come to the hours of employment. Under ten hours a week, 39,355; from ten to twenty hours, 60,268; from twenty-one to thirty hours, 27,008; from thirty-one to forty hours, 9,778; from forty-one to fifty hours, 2,390; over fifty hours a week, 793, of whom 75 are actually employed over seventy hours a week. Perhaps the committee is curious to know

what these boys and girls who are employed seventy hours a week work at and what wages they get. A boy of 10, in Standard IV, is returned as a farm laborer working seventy-two hours a week for a wage of 3s. A boy of 12, in Standard IV, is also returned as a farm laborer working eighty-seven hours a week for a wage of 2s. 6d. A newspaper boy of the age of 12, in the Sixth Standard, works one hundred hours a week—that is, including Sundays—and receives 3s. 6d. and his meals. A boy of 12, in Standard III, works in a marine-store dealer's shop, is employed seventy-four hours a week, and receives 1s. 6d. and his meals. A boy of 10, in Standard IV, is a donkey driver for eighty hours a week at a wage of 6s. In London there is a boy of 12, in the Fifth Standard, employed in a chemist's shop for seventy-eight hours a week at a wage of 5s., and there is an errand boy of 12 years engaged at a dairy. He is in Standard VII, and therefore, presumably, a very promising lad. He works seventy-two hours a week for a wage of 4s. I think it would be economical for the country to deliver that boy from those conditions, as it is evident something might be made of him. There is a girl of 13 years of age in a shop. She is in Standard V and works seventy-two hours a week for a wage of 2s. There are several girls of various ages and in various standards who carry bark for woodcutters. They work seventy and one-half hours a week for a wage of 6s. Now, of these overworked children there are several concrete instances given in the return, and I have picked out one or two as illustrations. Here is one: "This boy rises between 3 and 4 every morning, starts out at 4.30 a. m. to wake up 25 working men, each paying him 3d. per week; returns from his rounds about 5.30, but does not go to bed again, as at 6 o'clock he has to go a round as 'newspaper boy' till 9 o'clock, when he comes to school. He is a very regular boy, but is often half asleep, especially in the afternoons of hot days." Another boy "acts as latherer to a barber for thirty-two hours for a wage of 2s. He is at work on the whole of Saturday till 11 p. m., and for three hours on Sunday." Another boy is a "greengrocer's boy, aged 12, Standard II, starts for London at 2.30 a. m., returns about 9.30, and then attends school." Again, there are "two girls aged 12, in Standard IV, who are employed daily, one for 3d. per week in housework and errands from 7.45 to 10, 12.30 to 1.30, and 4.30 to 8, and the other at 9d. per week and her food in carrying out parcels for a milliner from 7.30 to 9.30, 12.30 to 2, and 4.30 to 8." Lastly, I have to call the attention of the committee to the wages which these children get. Receiving under 6d. a week there are 17,084; from 6d. to 1s. a week, 47,273; from 1s. to 2s. a week, 40,293; from 2s. to 3s. a week, 19,757, and above 3s. a week, 8,123.

The returns for the city of London were sifted and summarized by Dr. Macnamara, of the London board, whose efforts in behalf of the children of toil and sorrow are widely known. These particular returns deal with board school children only, and are limited to the cases of children who work more than nineteen hours a week. The replies from 112 schools show that—

One thousand one hundred and forty-three children work from nineteen to twenty-nine hours per week, 729 children work from thirty to thirty-nine hours per week, and 285 children work forty hours and above per week. Of these, 309 children are employed at housework and domestic work for eight thousand three hundred and nine hours per week, and receive a total sum of £21 9s. 3½d., which is an average of twenty-seven hours each child at ¾d. per hour; 719 children are employed at newspaper and milk delivery for twenty-one thousand six hundred and sixty-six hours per week, and receive a total sum of £94 1s. 10d., which is an average of thirty hours each child, at 1d. per hour; 1,056 children are employed at shop and factory work and errands for thirty-one thousand nine hundred and twenty-three hours per week, and receive a total sum of £121 4s. 11d., which is an average of thirty hours each child, at 1d. per hour, and 69 children are employed at various other employ-

ments for two thousand and one hours per week, and receive a total sum of £9 12s. 6d., which is an average of twenty-nine hours each child, at 1½d. per hour. (In some cases meals are allowed to the children in addition to the payment.)

It appears from the returns that poor boys in the metropolis are under worse pressure than the girls, and in respect to these Dr. Macnamara says:

From a study of these school returns it will be seen that the occupations which are most largely responsible for the out-of-school labor of the boys are the delivery of milk, the selling of newspapers, the running of errands for shopkeepers, and the performance of odd jobs in barber shops. Many of these occupations commit each boy to over forty hours' labor per week.

To take the return for the Yerbury-road School, Finsbury, only, we get the following: As newspaper seller, fifty and one-half hours per week; as errand boy, fifty-nine hours; as newspaper seller, sixty-three hours. As errand boy, fifty hours; as errand boy, sixty-eight and one-half hours. As milk boy, fifty-three hours. As milk boy, fifty-seven and one half hours.

The statement made by the headmaster of the Aldenham-street School, Marylebone, should be noted. It is to the effect that a boy who works for an undertaker twenty-three and one-half hours per week "helps in measuring corpses," and receives a shilling a week as the wage for his gruesome labors. \* \* \*

It will be observed that in many cases the occupation followed by these boys is thoroughly regularized, and will not fall into the category of occasional employment, such as occasional work for father or mother, running errands now and then for shopkeepers, minding neighbors' babies, doing occasional domestic work, and so on.

For the girls out-of-school employment does not appear to be so systematized. It mainly consists of minding babies, "errands," and "housework." Dr. Macnamara concludes his report as follows:

The first comment, of course, which everyone would make would be respecting the monstrous injustice which much of this out-of-school labor inflicts upon the children. Recreation and rest would seem to be almost unknown terms, to many of the boys especially; and it would be impossible to overstate the extreme unwisdom from the purely communal point of view of submitting the constitution and physique of the children to such terrible strain as is herein involved. Assuredly a great many of them must break down. Probably some die as a direct result of the severity of the toil inflicted upon them during their early years; and certainly many more of them must become a permanent and heavy charge upon the public purse, because of the physical incapacity resulting from the rigor of their early experiences. No doubt the extreme poverty of many of the parents makes the few pence that the child earns a very material consideration; but no doubt, again, the necessity to secure those few pence is the result in some cases of parental thriftlessness, drunkenness, and worthlessness.

Again, this employment of school children out of school hours is in many cases probably the result of the thoughtlessness that is consequent upon established custom. The publication of this statement may possibly cause numbers of working-class parents to think about a matter which previously received little or no consideration. Not only in London, but all over the country, and not only in this matter of the out-of-school employment of children, but also in respect of the drafting off of young children to the factories, the workshops, the mills, the pit banks, and even the coal pits themselves, the unthinking adherence to established rule is responsible at the present moment for much injury to the children. I decline to believe that any appreciable section of the people is wantonly unkind to its offspring.

On the other hand, I feel confident that the public ventilation of this grievous injustice will be enough to secure amelioration in many cases.

At the same time the most rapid and effective way to create a public conscience is to impose a public obligation. This has already been recognized in several of the great cities which have now at work by-laws regulating the employment of children of tender age. Among those cities may be mentioned Birmingham, Liverpool, Bradford, Hull, Manchester, and Sheffield.

Two courses seem to me to be open—the one drastic and far-reaching, the other more moderate and circumscribed in its scope. We might ask Parliament to pass an enactment absolutely prohibiting the employment, under any circumstances, for purposes of gain, of any child not legally exempt from the obligation to attend school; and I have no doubt that sooner or later such an enactment will be passed. Meanwhile the “poverty” cry would certainly be raised very effectually were such an endeavor attempted at the present juncture. I have therefore carefully considered the by-laws already in existence in the other great centers, and I recommend that the board seek the cooperation of the London county council in preparing for the adoption in London of a set of by-laws on the following lines:

“(I.) No child under the age of 14 years shall be employed in any casual employment within the metropolis before 8 o'clock in the morning or after 8 o'clock at night

“(II.) Casual employment shall mean any employment for purposes of gain in the streets or other public places, always excluding such employment as is already regulated by existing statutory enactment.

“(III.) Every person who employs a child in contravention of these by-laws shall be liable, on summary conviction, to a penalty not exceeding 40 shillings for each offense.

“(IV.) A parent or guardian of a child who employs such child in any labor exercised by way of trade, or for the purpose of gain, or who permits such child to be engaged in any such labor on its own behalf, shall be deemed, for purposes of these by-laws, to take such child into his or her employment.

“(V.) The proof that such child was over the age of 14 shall rest with the defendant.”

The recommendation of the school-attendance committee upon this report is as follows:

That the board make a representation to the London county council with a view of determining what should be the limitations of the out-of-school employment of school children; and whether the existing powers of the council will enable it to put such limitations into operation, or whether it will be necessary for the council to apply for further parliamentary powers. (Schoolmaster, February 18, 1899, p. 309.)

The matter now awaits some conclusive action. As has been repeatedly stated in public conferences and in parliamentary debates, the conditions revealed in these statements show most of all the need of a strong and intelligent public sentiment in favor of the education of the masses. This sentiment is particularly wanting in the rural districts and it is overborne by adverse influences in the cities. Industrial pressure, and especially the industrial competition of Germany, is, however, developing a strong sentiment in favor of education, compulsory and prolonged, as a condition of national prosperity, and statesmen and industrial leaders are joining with philanthropists to improve and increase the education of the masses. Meanwhile a new

argument is furnished by these conditions in favor of strengthening and extending the central control of education. The latest effort in this direction is the board of education bill hereafter considered.

#### MEASURES AFFECTING TEACHERS.

The superannuation bill for teachers, introduced in the House of Commons July 18, 1898, passed through both houses in August, and signed by the Queen August 12, brings to a close a remarkable series of efforts extending over a period of sixty years. As early as 1839, when the committee of council on education was created to distribute the parliamentary grants for elementary education, the agitation of the subject was begun. In 1840 a scheme of retiring allowances was adopted by the Government with a view to inducing competent persons to teach in elementary schools. The scheme remained in operation until 1862, when it was dropped, to the great injury of those who had been depending upon its benefits. It was partially revived in 1874, when the meager sum of \$32,500 was placed at the disposal of the education department to meet the claims of teachers employed while the former ruling was in force. The need of a general pension law becoming more and more evident, the House of Commons repeatedly appointed a select committee to inquire into the matter, and not less than four bills were introduced between 1870 and 1896, all of which failed of effect. The law passed last year provides a superannuation allowance, which is payable to a teacher on attaining the age of 65 years, at which age retirement is compulsory, save under exceptional circumstances.

The allowance is made up partly by an annuity purchased by small sums—£3 for a man and £2 for a woman—deducted annually from each teacher's salary, and partly by a state pension, calculated according to the years of actual service performed by the teacher.

A young man entering the service at 21 years of age would receive a pension of at least \$330 annually, and a woman teacher under the same circumstances would receive from \$225 to \$250. The law provides also for teachers who, from ill health, are compelled to relinquish their work at an earlier age than 65. This is called a "disablement allowance," and the amount is calculated on the number of years of completed service up to the date of the teacher's "break down." Thus, for a man who commenced teaching at the age of 21, and was compelled to retire from work at 55 years of age, the "disablement allowance" would be \$220, and for a woman \$155. The law is applicable to Scotland as well as to England and Wales.

#### PROPOSAL RESPECTING PUPIL TEACHERS.

The pupil-teacher system was the subject of an exhaustive investigation by a committee of the education department, the results of which were set forth in the Commissioner's previous Report.<sup>1</sup>

---

<sup>1</sup> Report for 1897-98, vol. 1, pp. 160-165.

An endeavor was made the present year to mitigate the worst evils of the system as developed in that investigation by reducing the proportionate number of pupil teachers in a school in accordance with the recommendations of the department committee. Under the present rulings the number of pupils must not exceed three for the principal teacher and one for each certificated assistant teacher. In place of this the code drawn up for 1899 provided that "after the 1st of January, 1900, no pupil teacher will be recognized in a school in which there are not at least two adult teachers employed, except with the special consent of the inspector.

"The number of pupil teachers recognized in a school may not exceed two (or in the case of pupil teachers already recognized, three) for the principal teacher."

This proposal would reduce the number of pupil teachers, and consequently the amount of grant which individual schools could obtain for their training.

When the code came up for discussion in the House of Commons unexpected opposition to the change was developed, and to the surprise and chagrin of all friends of progress the opposing motion prevailed. The opposition came chiefly from the rural schools, which are, as a rule, poorly staffed.

#### REPORT OF THE CHAIRMAN OF THE LONDON SCHOOL BOARD FOR 1897-98.

##### THE TEACHING STAFF.

The greatest care is taken in the selection of efficient teachers. The new conditions adopted by the board for the preparation of the small class of ex-pupil teachers for the certificate examination will secure for them systematic instruction by competent teachers, as adequate as the conditions of their employment will allow, and much better than that which they have hitherto been able to obtain. Senior pupil teachers will henceforth attend at the pupil teachers' schools half time, and candidates will be full time under instruction for the last nine months of their candidatureship. The money spent on the board's pupil teachers' schools is an investment which gives a high rate of interest. It secures greater power and intelligence in the assistants, and raises the general character of the education given in our schools. With regard to the preparation of lessons by the teachers, the board inspectors report that they are satisfied that any grounds which may exist for complaints will entirely disappear.

##### PREPARATION OF LESSONS BY THE CHILDREN.

With reference to the preparation of lessons by the children, much remains to be done. Among the causes the neglect of home work, the poverty of the homes, the ignorance and indifference of the parents, and the difficulty of examining the work of large classes were prominent. These unfavorable conditions are now being mitigated, and the tendency of education will be in the direction of making a child think for itself and learn for itself. The province of the teacher will be to supplement, illustrate, and explain, not to lecture. Primary education fails to produce all the results we have a right to demand, unless it stimulates in a child curiosity, the desire when it has left school to keep on learning.

## TEXT-BOOKS AND ORAL TEACHING—LITERATURE AND LENDING LIBRARIES.

The question of the supply of proper text-books has received additional importance since Mr. Sharpe, Her Majesty's senior chief inspector, in his last report, which deserves the most careful consideration, and to which I shall have occasion to refer frequently, has called attention to the evil of excessive oral teaching. The board has to hold the balance between the use of the oral method and the use of books which may tend to overload the memory rather than to quicken thought. Good books, with full information, have to be supplied and supplemented from time to time to the schools for the use of the teachers. Accurate text-books should be in the hands of the scholars for the purpose of summarizing the information orally given by the teachers. With a view to give a taste for reading, a varied supply of interesting and entertaining reading books is needed. The use of literature, not as an indirect means of giving a lesson in grammar, but as a means of exciting in the children's minds a desire for knowledge, is of great importance, where, in too many cases, the school is the chief, if not the only, source of awakening mental activity. Lending libraries are provided for every permanent school and for the evening continuation schools. Where the head mistresses express a wish for it, girls' departments are supplied with separate libraries.

## SIZE OF CLASSES.

The size of our classes is being gradually reduced, so that more individual attention may be given to the children, and the board have determined, in planning their new schools, to add to the number of class rooms, and thus make this reform more easy of accomplishment without wasting space.

## MANUAL TRAINING, DOMESTIC ECONOMY, ETC.

The results of manual training for boys and of the experimental scheme of domestic economy for girls, started in 1897, are very satisfactory. The syllabus of instruction in domestic economy adopted by the board at its last meeting will tend to further develop this branch of our work.

I trust that the education department will allow an inclusive grant of not less than 9s. per head for the combined subjects of cookery, housewifery, laundry work, and domestic economy, when taught in centers. It would be a step in the right direction of correlation of studies, and the combination is recommended by Mr. Sharpe. In order that the teachers may be thoroughly grounded in the scientific principles underlying these domestic economy subjects, the board are arranging for classes for mistresses in domestic science, and a large number of mistresses have applied to be admitted to these classes. The development and care bestowed by the board on manual training and practical domestic economy will, I trust, convince those who apprehend that the dignity of manual labor is not sufficiently inculcated in our schools that the London school board need not fear any criticism on that score. The number of county council scholarships obtained by our scholars is most satisfactory.

## TEACHING OF PHYSICS.

Training in physics is found to be preferable to chemistry, and the laboratories now in construction are, as a rule, so fitted as to be adapted to the teaching of physics rather than that of specialized instruction of chemistry.

## TEACHING OF ENGLISH.

Whatever may be the rival claims of literature and of science as instruments of awakening and means of training the mind, none can dispute that thorough instruction in the English language should be an essential part of our popular system of education. We have a right to demand, as an outcome of our school training, that

the scholars shall have acquired the power to express themselves clearly and correctly both in speech and in writing. I am afraid that in this respect we fall short of what is accomplished in many foreign schools. More attention should be given to the thorough teaching of our own language, and I heartily indorse Mr. Sharpe's second recommendation that "composition, writing, spelling, and the broad principles of grammar" should be united. In order to attain this object in every lesson, the language used by the teacher and by the scholar should be grammatical, clear, and precise. The habit of answering in complete sentences is a most valuable discipline, and should be acquired in our schools. Clearness of language will, if insisted upon, induce clearness of thought as its corollary. This carefulness and propriety of language in school will have its moral as well as its intellectual advantages. It will inevitably raise the tone of the scholars and encourage them to eschew that which is vulgar and low.

#### MODERN LANGUAGES.

Modern languages are not a prominent part of our teaching, but French is a popular subject, and is being taught more and more. French and shorthand have in some localities a realizable value.

#### GEOGRAPHY.

Geography in the past has been taught too mechanically. Map-drawing has been revived and greatly improved, but more attention should be given to physical geography, to the great phenomena of nature, to the laws influencing climate, productiveness of soil, etc. History should be connected with geography, and the lessons should be given in such a manner as to make history and geography illustrate each other. History also lends itself to give clearer ideas on the conduct of life.

#### GREATER LATITUDE IN SELECTION OF SUBJECTS OF INSTRUCTION.

In our schools there is the greatest latitude left to the heads of departments, and it would be very unsafe to draw deductions from a visit to a school in Islington which might be of a very different type from a school in Lambeth. The education department have, I think, wisely adopted a policy of decentralization, and the practical abolition of the standards has created a revolution which will have to be carefully watched. Everything now turns on method and life in teaching, but we must be on our guard not to lose sight of the importance of accurate thinking and thorough work. It is not only in politics that the evil effects may be felt of absence of continuity by the violent swinging of the pendulum.

#### HIGHER-GRADE SCHOOLS.

The advanced elementary education of this country has for some years occupied the attention and enlisted the support of the large urban school boards. London has hitherto done less in this direction than the large provincial towns. Nevertheless the board, from 1887 down to the present time, has passed resolutions and taken action for the purpose of developing upper-standard or higher-grade schools, and fifty-six schools have been selected for this purpose, with the approval of the education department. From March, 1890, to March, 1893, the ex-seventh scholars in fifty upper-standard schools existing at both dates have increased from 417 to 2,380. It was felt, however, that London still failed to furnish adequate opportunities in its board schools for those scholars whose parents wished them to make the best use of their school life, and this board has taken steps to secure further development for these and similar schools. The appointment of their staff has been intrusted to the school-management committee. It has been determined, in suitable districts, to provide schools for about 700 or 800 children each, admitting none below standard 5, and independent of junior departments; and in these districts all suitable scholars, on entering the work of standard 5, will be transferred to these schools from

neighboring schools. These buildings are to be planned with class rooms suitable in size for the smaller classes which are required in such schools. In some cases these schools will be organized as "schools of science;" in others the school course will have regard to commercial exigencies. Steps have been taken in many of the existing upper-standard schools to provide suitable rooms. The existing schools so improved, and the new ones now projected, with adequate accommodation and equipment, will do much to put the people of London in as good a position as the inhabitants of most of our great towns, where school boards have already taken action. These schools, available as a rule for the instruction of the junior scholars of the London county council, will furnish a two or three years' course of instruction for scholars who have passed through all the standards. The number of children in the upper standards is unsatisfactory. The board has raised the standard for total exemption of children between 11 and 13 from the sixth to the seventh, and for half timers from the fourth to the fifth standard, in order to secure a longer attendance at school.

#### IMPROVEMENT IN INFANTS' SCHOOLS.

In no department has a greater revolution been effected in recent years than in our infant schools by the development of the Froebel occupations and nature teaching. I can not go into details, but I think we may claim that some of our schools are very successful in the dovetailing of teaching through a judicious blending of play, occupation, and nature lesson. Remarkable skill and originality have been shown by the teachers in our infant schools, in interesting and educating the children in spite of the difficulties inherent in the large size of their classes.

#### KINDERGARTEN LECTURES.

In order to enable the teachers to obtain the special qualifications represented by the kindergarten certificate, special lectures were given on theory and practice, which commenced in October and ended in June or July. About 600 teachers attended. The decision of the board to bring, as far as possible, all our old schools up to date by the addition of halls will enable concerted games to be made a regular feature of every school curriculum, and with pianos musical drill will become general.

#### EXTENSION OF WORK IN EVENING-CONTINUATION SCHOOLS.

A most important department of the board's work is that of evening-continuation schools, and the rapid development of these schools is due in a large measure to the energetic initiative of the chairman of the committee, Mr. Stewart Headlam. Fees have been abolished, and I am pleased to find that the applications for entrance exceed by 100 per cent those of last year. The applications in the first week of this session were about 50,000, as compared with about 25,000 in September, 1897. The teaching of gymnastics has been very successful as an experiment at seven centers in the Hackney division, and has been extended to the whole of the metropolis in the present session. Swimming has been taught to over 3,000 pupils, and a large number of these were also instructed in life-saving. In the present session three schools have been set apart for instruction in commercial subjects and five for instruction in science and art subjects. The aim of these schools should be concentration of thought and of work on subjects made attractive, proper guidance in the art of acquiring knowledge by individual study. The danger, of course, is that the pupils in these schools should not be sufficiently in earnest, and look upon them more in the light of recreation than of stubborn effort.

#### DEFECTIVE CHILDREN.

Former boards, under the guidance of General Moberly, deserve the credit of being the pioneers in England of special and suitable instruction for defective children,

and we may be proud to claim that the recommendations of the departmental committee follow almost exactly on the lines which the London school board had laid down. We have in this board hastened to adopt and incorporate in our resolutions the recommendations of that committee. We have accepted as a rule accordingly what was already our practice, that a class of these children should not exceed 20. We have also adopted the rules of planning recommended for such schools, and ours are now planned with 20 feet of floor space per child and with ample half corridors. We also acquiesce in the calculation that about 1 per cent of the elementary schools' population are fit inmates for these schools. We have made a tentative scheme of school provision on this basis for London, and we are rapidly providing and extending this school provision. We endeavor, by a liberal scale of payments, to attract the best teachers to this difficult and responsible work, and we shall probably find it desirable still further to increase their efficiency by special instruction in psychology and in the observation of the physical concomitants of mental deficiency. The two medical officers appointed to assist our principal medical officer in this work will be of the greatest value. We look forward to securing for society as useful and self-reliant members many who might have otherwise been failures in life, and we are confident that, in doing this, we shall erect a lasting and worthy monument to the memory of our late respected colleague, General Moberly.

#### NUMBER OF CHILDREN OF SCHOOL AGE REDUCED.

For the first time in the history of the school board the number of children scheduled last Easter shows a reduction. This year it was 833,008 against 833,737 last year. I am not prepared to state the causes which have led to this reduction; but I may at once say that no argument can be derived from it to show that we have built schools in excess of our requirements. The decrease is in central London, but in the divisions of West Lambeth and Greenwich there are large areas at present undeveloped, where new centers of artisan population may have to be provided for. Besides, the education department is more exacting in its rules as regards overcrowding of class rooms, and the fact that the percentage of average attendance this year is the highest that has ever been attained in our board schools (81.4 per cent) makes it imperative that we should not be remiss in providing accommodation. The crown court school in Westminster was closed, which indicates that no unnecessary schools are maintained.

#### IRREGULAR ATTENDANCE AND COMPULSION.

I can not lay sufficient stress on the evil of irregular attendance. The legislature has wisely given compulsory powers and made free education possible. The London school board spends a large amount on the machinery necessary to enforce attendance. The parents, first of all, receive a gentle reminder, followed by a special notice to appear before a committee if the reminder fails, and the final notice in peremptory terms is only sent out after this double appeal fails. It is only after this careful procedure that summonses are issued to appear before a magistrate. It may be confidently asserted that no prosecution is instituted by the board except in those cases which fully warrant it. The next step should be a rapid and summary disposal of these cases. What happens, however, is exactly the reverse. First of all, in some districts, in consequence of pressure of other business before the courts, there is a restriction imposed on the number of summonses which can be issued. In one court during the past summer no summonses at all could be issued for four weeks; in others a second summons can not be obtained until the fine on the former one has been paid; and, as time is given to pay the fine, in many cases, owing to the disappearance of the defendant, it can not be collected. The fine is often a mere trifle as compared with the substantial wage earned by the child. The great majority of the children make a thoroughly good attendance—90 per cent and upward. In many cases the parents make great self-sacrifices. It is a small but appreciable proportion which make a thoroughly bad attendance of from 10 to 25 per cent.

## EFFECT OF NON-ENFORCEMENT OF THE LAW.

This serious hindrance of the work of the by-laws department of the board, on which for the year ended Lady Day, 1898, £48,404 was spent, encourages this small proportion of parents to defy the law, to neglect their children, and is the direct cause of increase of pauperism and crime. For these children the ratepayers have to provide the same educational machinery as for those who attend regularly, and it is obvious that for these children the school discipline is the only discipline which will restrain them from entering upon evil courses. I need not point out that the irregularity of these children seriously hinders the work of the teacher and places difficulties in the way of proper and continuous education of the children who do attend regularly. Unless regular attendance is enforced, the ratepayers do not receive full value for their outlay. To remove this very great scandal, which is felt equally by board and voluntary schools, it is a pressing need that these parents should be dealt with firmly. After a few months of resolute treatment, of strict enforcement of the by-laws, of immediate collection of fines, the ranks of these law-breaking parents would soon be broken and the children rescued. The board has laid this very serious state of things before the home secretary, and I have not the slightest doubt that means will be found to vindicate the law.

## EMPLOYMENT OF CHILDREN OUT OF SCHOOL HOURS.

The education department has instituted an inquiry into the extent to which children are employed out of school hours. I find from a return, which is not yet complete, that 829 children work from nineteen to twenty-nine hours per week; 548 from thirty to thirty-nine hours, and 221 forty hours and above. Of these, 207 children are employed at housework and domestic work for 5,473 hours per week, and receive a total sum of £14 19s. 3½d., which is an average of twenty-six hours for each child, at ¾d. per hour; 520 children are employed at newspaper and milk delivery for 15,882 hours per week, and receive £65 10s. 7d., which is an average of thirty-one hours for each child, at 1d. per hour; 808 children are employed at shop and factory work and errands for 24,442 hours per week, and receive £91 4s. 7d., which is an average of thirty hours for each child at 1d. per hour; 63 children are employed at various other employments for 1,799 hours per week and receive a total sum of £86s. 11d., which is an average of twenty-nine hours for each child, at ¾d. per hour. In some cases meals are allowed in addition to the payment. It is quite evident that steps will have to be taken to put a stop to this flagrant abuse.

## RELIGIOUS INSTRUCTION.

Concerned as we are with educational problems, we do not lose sight of the more important problem of the formation of character. The hostility or indifference which undoubtedly exists in some quarters toward education is due, I believe, to a latent suspicion that character is of greater importance than knowledge. Neither can it be denied that very striking instances might be given of great intellectual capacity with a marked infirmity of purpose. In the struggle for life we are aware that strength of character will count for more than mere culture. If our educational system were open to the criticism that it did not turn out boys and girls able to hold their own when they are cast on their own resources, we should have labored in vain. Education would then have a deteriorating effect. A skeptical, if not cynical, generation would arise, and we should have lost a characteristic which is the first cause of our greatness as a nation. The main point is that the children should be under a religious influence. Religious influence can be exercised in many ways. The selection of means must be left to the individual teacher, and I am confident that a thoroughly religious teacher will know how to impress the children. There is nothing in the education act, nothing in the school board system to handicap a teacher,

and the best evidence of this is to be found in the fact that a great number of our teachers have been trained in denominational colleges. It is inconceivable that the religious training they have received should not influence their teaching. I am perfectly satisfied that a Christian teacher in a board school need not have any conscientious scruples that in his daily work he will not be able to impart to the children what is most needful. I am not reopening a controversy, but I am vindicating the position in our board schools of teachers, who are a powerful influence for good. The religious character of a school does not depend upon the code regulations; it depends upon the religious influence exercised by the teachers as a living force.

#### UNIFORMITY OF SUCH INSTRUCTION IMPOSSIBLE.

Religious instruction, perhaps in a higher degree than any other instruction, depends on the individual teacher, and we are entitled to suppose that teachers, trained as ours have been, will reflect in their own teaching what they themselves have been taught. The religious teaching will not be uniform, but here I would ask: Is it uniform in voluntary schools of the same denomination? Does it not vary even within the fold of the same church? I do not regret it. I believe uniformity to be undesirable even if it were attainable, and in our country it is unattainable, and the country would not be more but less religious if there were a dead level of uniformity. The efficiency of the various churches is increased by the absence of a monopoly. In countries where there is practical uniformity, you will find much less religious vitality than that which happily makes itself felt in various directions among us. As far as I am aware, there are no complaints made by the parents with regard to the religious instruction given in our schools. Neither are there any from our inspectors, and as regards the syllabus of Bible instruction, it has created no division among the members of the board. It is my personal conviction that the religious education given in the day schools fully carries out what was intended by the Education Act, and what the parents desire for their children. And in their industrial schools the board has given every guaranty that the strictest attention should be paid to the children receiving such religious education as is in accordance with the tenets of the denomination to which they belong. We have gone out of our way to give more guaranties than the Industrial Schools' Act requires. I think the majority of this board may fairly claim to have shown a spirit of absolute and scrupulous respect for the religious opinions of the minority.

#### CLERICAL REPRESENTATION ON THE BOARD.

The constitution of this board is certainly not deficient in clerical representatives. I can not turn my eyes to the right, to the left, or to the center without meeting the glance of a divine. But I can not help feeling that the ratepayers have been very wise in sending these representatives of various churches. In the first place, because it gives a guaranty to the parents that Christianity will be taught in the schools, and that it will be taught in such a way that no offense is given to any denominational opinion. In the next place, because in the diversity of opinions held, conscientiously and sincerely, an amount of toleration and of charity has been shown, which I attribute to the consciousness of the clerical members of the board that it is their duty to cooperate in the endeavor to make the children in the board schools familiar with the fundamental truths of Christianity. This most satisfactory result has been attained by showing a scrupulous regard for the opinions of others, and I trust I may also attribute it to the fact that what unites us is of far greater importance than what divides us. There is a further advantage in the presence of clerical members on the board, that they have a more intimate knowledge of the homes from which the children are taken. But knowing what the cares and harassing labor of the London clergy are, I wish to state frankly how much I have been impressed by the manner in which they have discharged their duties on this board.

## ADMINISTRATIVE WORK OF THE BOARD.

I may, perhaps, allude to the administrative work of the board. In all administration you want a sense of responsibility and of continuity, and you have to avoid inaccessibility to new ideas. I confess that to those who, like Sir C. Elliott and myself, have been associated with Indian administration, the thought must occur occasionally whether a representative body exposed to recurrent triennial elections is exactly the proper authority for the exercise of such administrative power as the London school board wields. I admit that on a closer acquaintance with the nature and the magnitude of the work my doubts increased. But a year's experience has satisfied me that there is no ground for this apprehension. And it may be as well that the reasons should be given, because the nature of our organization is, I find, not generally known, and is even obscured by the publicity given to our weekly proceedings. These form only a very slight part of our labors.

## COMMITTEE WORK.

It is in the committees that the real work is done, and it is on the chairmen of these committees that the greater part of the burden falls. On the knowledge, on the energy, on the tact of these chairmen the success of our operations mainly depends. But the duties of the board could not be adequately discharged unless every member of the board made himself acquainted with the details of the work in his division, and were assisted by managers, whose cooperation is most valuable. And I must be permitted to state that the way in which individual members discharge these arduous duties is beyond all praise. I do not think that in any other country you will be able to find persons sufficiently public-spirited to undergo this severe ordeal of constant work which is imposed on members of the London school board. And this applies to the ladies in a marked degree. I think we are all agreed that there are aspects of our work which are dealt with, and can only be dealt with, by them. I believe I am right in saying that it is not unusual for them to devote more than eight hours a day to the work in which they put their heart and soul. And unless the work was done unobtrusively, and with a minimum of talk, it could not be cleared off. The test of the efficiency of a board is in the absence of controversial discussions at our weekly meetings, because the work having been threshed out in the committees, revision of that work ought, as a rule, to be superfluous. And, as far as this board is concerned, I only wish that in parliamentary assemblies the speeches were compressed within the limits which are accepted here. We are an administrative body, we have to carry out duties prescribed by act of Parliament, and there are only rare occasions which justify acute controversy, because administrative and executive functions are essentially different from those with which a legislative body deals. And it is quite clear that our efficiency as administrators must be impaired by infusing into our discussions party spirit, for which I have very seldom found any excuse. I am not sure that it might not be wise to grant a gold medal annually to the member who had made the shortest and most business-like speeches. Probably the board would have voted it unanimately to Miss Morten, whose incisive rhetoric would almost preclude all possibility of calling her to order before she resumed her seat. The triennial elections prevent the board from running into a groove, secure the infusion of new blood, compel us to give an account of our proceedings, and keep up the interest of the public in educational affairs.

## VOLUNTARY SCHOOLS.

I do not see why the London school board should entertain the slightest hostility to voluntary schools. Anyone knowing the constant expansion of the work of the board can not but welcome every effort to give us auxiliary aid. Such a school as

the Jews' Free School,<sup>1</sup> for instance, doing such excellent work, securing such a high percentage of attendance, is an institution of which the success can only inspire a grateful feeling of admiration. I am convinced that this board has not the slightest desire to interfere with the supply of schools for which there is a bona fide demand. If voluntary schools are what their name represents them to be, really voluntary and educationally efficient, they may be very beneficial in answering special needs of certain sections of the London population. In London there is plenty of scope for the work of various educational agencies.

*Medical inspection.*—The London school board has agreed upon the appointment for one year of two medical practitioners (one a man and one a woman) to take charge of the work in connection with the examination of defective children and children alleged to be defective, each to give an equivalent of at least half time, at a salary in each case not exceeding \$250 per annum, and that the woman practitioner shall also, as part of her duties, examine and report to the board as to female applicants who may desire to be examined by her, and that the "general purposes committee" be authorized to nominate two persons for appointment by the board accordingly.

*The London School Nurses' Society.*—The London School Nurses' Society has been formed with the object of supplying visiting nurses to elementary schools in poor districts. Already these nurses visit some of the poorest schools and attend to the small ills of the scholars, such as sore heels and inflamed eyes. Excellent results follow their ministrations. Each is able to visit five schools in a day and see about 100 children, who are sent to her one by one by the teachers.

*Schools for the blind and deaf.*—The official report with regard to the schools for the blind and deaf, under the "Elementary education (blind and deaf children) act, 1893," for the year ending August 31, 1897, states that the number of schools recognized by the department increased during the year from 91 to 95, and the accommodation provided in these schools increased from 1,476 to 1,616 for blind children, and from 3,004 to 3,123 for deaf children. The number of scholars on the books of these schools increased in the case of blind scholars from 1,226 to 1,280 and in the case of deaf scholars from 2,459 to 2,566. The number of blind or deaf scholars boarded out under the superintendence of boarding-out committees increased from 16 to 25. The total grants paid for the year under the minute of April 2, 1894, increased from £15,629 to £16,727 7s. 6d. A satisfactory advance was made during the period in question, both in the work of supplying places in certified schools (that is, schools accredited by the depart-

<sup>1</sup> This school, situated in the midst of the district where the poorer Jewish immigrants congregate, has accommodation for 2,250 boys and 1,250 girls. It is one of the most efficient schools in London, as shown by the large annual grant which it secures upon the results of the Government examination. Besides tuition, breakfasts are provided every morning, and each child is given a suit of clothes and two pairs of shoes yearly. A savings bank is connected with the school, which pays the pupils 10 per cent on small deposits.

ment) for these classes of children, and also in the efficiency of the instruction and training given in the schools. The second Queen's scholarship examination for blind students proposing to enter the Norwood (Smith) Training College was held July, 1897, when four candidates passed out of five presented. The first certificate examination for blind candidates was held at the same time, when ten candidates passed their first year's examination, of whom eight were students and two acting teachers.

#### SECONDARY EDUCATION.

Secondary education has become a topic of absorbing interest in England, and the need of Government action in this matter is urged with scarcely less earnestness than was shown three decades ago in respect to elementary education.

The royal commission of 1896 advised immediate legislation, with a view to systematizing the work in this department, economizing the public money available for secondary schools, and equalizing their advantage throughout the country.

Up to a recent date secondary education in England was left entirely to private and endowed schools, which are independent of public control, excepting so far as regards the administration of endowments. This interest was committed by the "endowed schools act of 1874" to the charity commission.

Other public agencies, which under recent laws have come into relation with secondary education, are (1) the science and art department; (2) the school boards; (3) the county councils (including county boroughs), which are empowered to appropriate the funds from the surplus liquor duties (customs and excise act of 1890) to technical schools and classes.

*The department of science and art.*—The science and art department was established to foster the knowledge of the arts and the principles of design among the people, especially the manufacturing population. At the time of the formal organization of the department, which took place in 1853, or 18 years after the Government began to move in the matter, the original scope was extended to include science, especially in its practical application.

The department has had the disbursement of an annual grant, which amounted to \$3,960,229 in 1897-98. It has exercised a powerful influence, not only through the direct application of the money, but in shaping educational ideals through the standards for examination which it has maintained and the equipments which it has required in schools receiving the grant.

For the year under review the department distributed to science schools \$838,325 in the form of grants for pupils passing its examination and grants for attendance, and to schools of art on the same basis \$387,419.

The number of students under instruction in science<sup>1</sup> was 197,796 and in art 146,720. Of the latter, 142,293 were pursuing some branch of industrial art.

This gives a total of 344,516 students in secondary schools fostered by this department. The amount distributed to them, \$1,225,744, is 31 per cent of the whole amount expended by the department. The remaining two-thirds was appropriated to pupils in elementary schools on account of drawing and manual instruction; to the teachers' training colleges for free-hand and model drawing; to the Royal College of Arts and Science, and to the geological surveys, which are supported by the department.

*The school boards.*—As regards the work of secondary education under the school boards no complete view can be given, as in the reports this division is not distinguished from the elementary grade. The reports, however, make it clear that about 200,000 pupils are in secondary courses of study, and many of these in schools admirably equipped for instruction in science and the modern languages.

*County councils.*—The action of the local authorities with respect to the disposition of the surplus from the liquor duties placed at their disposal is set forth in a return prepared in accordance with an order of the House of Commons and covering the two years ending March 31, 1897. The summarized report is as follows:

In England, excepting the county of Monmouth, the councils of 37 counties out of 49 are applying the whole of the residue and 12 a part of it to technical education. The councils of 54 county boroughs out of 61 are applying the whole of the residue and 7 a part to the same purpose, while 15 are also making grants out of the rates (local taxes) under the technical instruction acts. The councils of 71 boroughs and 126 urban districts are making grants out of the rates under the technical instruction acts. In several cases local authorities are also devoting funds to technical education out of the rates under the public libraries acts.

In Wales and Monmouth the councils of the 13 counties and 3 county boroughs are devoting the whole of the residue to intermediate and technical education, chiefly under the Welsh intermediate education act, 1889; and the councils of 10 counties and county boroughs and 11 boroughs and urban districts are making grants out of

<sup>1</sup>The development of the science division of the work is shown by the following decennial table:

Year.	Science.		Students under instruction in schools eligible for grants.
	Schools.	Classes.	
1888 .....	1,952	6,759	112,808

the rates under the technical instruction acts, while one local authority is devoting a part of the public libraries' rate (that is, local tax for public libraries) to technical education.

In England and Wales the total amount expended on technical education during the year 1895-96 was \$3,629,426, and the estimated total expenditure during the year 1896-97 was \$3,931,265. In addition, the amount raised by loan on the security of the local rate under the technical instruction act, 1889, mainly for the erection of technical and science and art schools, was in 1895-96 \$872,377 and in 1896-97 \$637,447.

In Wales and Monmouth the estimated total amount devoted annually to intermediate and technical education, under the "Welsh intermediate education act," 1889, is \$208,304.

Since the passage of the technical instruction act, 1889, empowering local authorities to levy a rate not exceeding a penny in the pound in aid of technical instruction, 239 municipal schools<sup>1</sup> have been established.

It appears then that public funds, including Government grants, the surplus liquor duties, and local taxes, are supplying nearly \$5,000,000 annually for scientific and technical training in secondary schools, not including higher grade board schools.

It is interesting to note in this connection that the land-grant colleges of the United States have an annual income but little below this sum (\$4,293,199 in 1897) from State and Federal sources.

The city and guilds of London, although a private corporation, is national as regards the extent and importance of its educational work.

The report for 1897-98 shows a very satisfactory progress in technical instruction, as provided by the institute and attested by its examinations. The number of distinct subjects in which classes have been at work is no less than 67, the number of classes being 1,569. As many as 32,899 students have attended the different courses of instruction, 13,062 presented themselves for examination, and 7,553 have obtained certificates. Of these successes, 1,673 are accounted for by the London classes, 625 by Manchester, 240 by Bolton, 200 by Leeds, 164 by Birmingham.

The efforts of the public agencies, whose work has been reviewed, have been exerted to increase the provision for secondary education available for the artisan and laboring classes and to equalize the provision in different parts of the country. Their influence has combined with the increasing industrial pressure to confound technical with secondary education, a relation which was favored by the report of the royal commission of 1894. In fact, since this report was issued, secondary and technical education have been united in current discussion and in legislative measures. It is therefore not surprising that the sudden purpose to distinguish between the two, as indicated in the bill for creating a new central authority for the general charge of public education (board of education bill) now pending, should have caused much excitement and criticism. This change of purpose is due to the

---

<sup>1</sup>These schools are distributed as follows: (a) In 47 boroughs, 71 schools; (b) in 130 noncounty boroughs and urban districts, 132 schools; (c) in 30 counties, 36 schools. The capital expenditure upon technical schools since 1889 has been in round numbers \$11,700,000.

efforts of the advocates of traditional secondary schools, who fear that secondary education in the time-honored sense of an education based upon the humanities will be starved out in many places because of grants for technical subjects or for education supposed to be based on handicraft skill.

The bill, which is the second measure submitted to Parliament as a solution of the conflicting interests in education, is appended.

Before passing to this, it will be interesting to consider the private agencies by which secondary education in England is chiefly maintained. A special inquiry has recently been instituted by the Government with reference to these. The returns thus secured, which were officially published, though incomplete, furnish the only recent information respecting the great body of secondary schools in England. The following particulars are cited from this report. Monmouthshire, which has the benefits of the Welsh intermediate education law, was omitted in the inquiry.

#### REPORT ON SECONDARY SCHOOLS.

The schools comprised in the inquiry are classed under three heads—"public" (excluding public elementary schools), endowed, and proprietary or private.

No pupils were counted for whom grants were claimed from the education department, and it was decided to exclude from the return any pupils who might only be receiving instruction in occasional classes or in evening schools. Students at universities, university colleges, and technical institutes (except so far as regarded secondary day schools conducted in the buildings otherwise devoted to technical instruction) were also excluded from the return.

It was clear, says the report, that the large and important class of schools which prepare boys for the great public schools, and form, in effect, an integral part of that grade of school supply, fell strictly within the range of secondary education. Though the ages of the pupils range from 9 or thereabouts to 14 or thereabouts, these schools are in reality the preparatory section of one department of secondary education. Some of the great secondary schools possess a preparatory division of their own, and if this be included (as must necessarily be the case) the corresponding preparatory schools under independent management must obviously not be omitted. At the same time it should be pointed out that a mere return of the age of the pupils does not enable us to distinguish (so far as those statistics go) between these truly secondary schools and other schools having much the same age limits which are little less than alternatives to the public elementary schools, and at which the pupils complete the education they receive without proceeding afterwards to a higher school.

Owing to differences in curriculum and other causes, the education of boys and girls who are destined by their parents to proceed to secondary schools is often distinct from a very early age from that received by boys and girls in the public elementary schools. The latter are not, under present conditions in England, the common basis of secondary education; nor, though an increasing number of pupils proceed from them to secondary schools, are the public elementary schools the sole or, indeed, the chief channel through which pupils proceed in this country to day or boarding schools of the second grade.

The ages of pupils in the public elementary schools are recorded in the statistics of the education department. They vary from 2 and under 3 years to 14 and under 15 years. (Report of Education Department, 1896-97, p. 23.) But parallel with these there are large numbers of other schools, distinctly of a secondary character, which

also possess kindergarten and preparatory departments. Strictly speaking, from the point of view of educational organization, the younger scholars in the latter ought to be enumerated among those receiving primary education. But the annual official statistics of elementary education refer only to schools inspected under the elementary education acts, and therefore do not include the pupils receiving instruction in the kindergarten and preparatory departments of secondary schools. Thus it is impossible to take age as a criterion between elementary and secondary education.

A converse difficulty arises in respect of the older children in public elementary schools. Large numbers of them are of the same age as some of those in secondary schools. Some are receiving instruction in many or all of the same subjects as are taught to pupils of the same age in some of the schools included in this inquiry. But, as the former are already included in the annual official statistics for public elementary education, they are omitted from this return in order that the same pupil may not be counted twice over.

A further difficulty arises in the case of those higher grade elementary schools to which is attached, as part of the school, an organized science school (or, as it is now called, a school of science) in connection with the science and art department. This organized science school portion is, in fact, not a separate school (except for administrative reasons in the eyes of the departments concerned), but the top of a school. Just as the upper division of a secondary school is recruited by boys prepared in lower forms under the same roof, and by means of a curriculum specifically directed to secure their appropriate preparation, so is the "organized science" portion of most higher grade elementary schools recruited mainly by boys who have been prepared under the same roof in the "standards" of the elementary day school code. Educationally speaking, therefore, this "organized science school," at the top of the school, and the lower classes or "standards" in which pupils are so taught as to be fitly prepared for the organized science portion form one unit. In such a case both portions of the school are housed in the same building. But from the point of view of Government supervision, the two portions of the school are wholly separate, and, as the pupils in the "standards" in the school have already been reckoned in the annual official statistics for public elementary education, this return only takes account of the pupils in the organized science school portion. This line of division, however, is dictated in the present case by reasons of statistical accuracy, and does not correspond to any strictly educational demarcation between different parts of the same school.

Evening continuation schools and classes (though many of them impart instruction which is secondary rather than elementary in character) are excluded from this return because the statistics concerning them are actually given in the reports of the education department.

Technical schools and classes do not fall within the scope of this return, but day secondary schools with a complete curriculum (i. e., not merely isolated day classes), conducted in the buildings of technical institutes, are included.

Special schools (e. g., those for the blind and deaf), occasional classes (e. g., university extension classes), have not been included in this return. The preparatory classes of university colleges have also been excluded, though some part of the work done in them would appear to be less advanced than that done in some higher secondary schools.

A good deal of private tuition is on the border line between secondary and university instruction. In some cases private tuition is organized in well-known institutions, but in the majority of cases it is given under more domestic conditions. As the aim of this return is to give, as far as possible, a statistical summary of that part of secondary education which is given in schools, private tuition in its various forms has been excluded from the tables. But no clear line can be drawn

between the case of a gentleman who takes a number of private pupils into his house and that of one who teaches a similar number of pupils, but calls his establishment a school. Secondary schools fall, so far as the sex of the pupils is concerned, into three main categories, according as they are for boys, for girls, or for pupils of both sexes. But even this classification has to be qualified in some cases. A large number of secondary schools for girls admit little boys into their kindergarten department; but it would be misleading to reckon these schools as if they were "mixed schools for boys and girls" from top to bottom. Throughout their principal part they are exclusively for girls. The classification, for example, of the girls' high schools, in which the lowest classes often contain little boys, among the mixed schools for boys and girls would convey a false impression as to the extent, in this country, of coinstruction of boys and girls other than those of tender age. A different case arises when one or two girls (probably the master's daughters) are taught in the classes of a school otherwise exclusively for boys. But here also it would be misleading to classify such a school among the mixed schools, strictly so called. Those tables, therefore, which refer to "mixed schools" include those only which appeared from the returns to be open under all circumstances to boys and girls alike. Every now and again this has involved a somewhat arbitrary distinction, but it is believed that the classification as given in the tables will not convey a false impression of the facts.

Boarding schools form a very important and characteristic element in English secondary education, but a very large proportion of these schools admit a comparatively small contingent of day pupils. The number of schools which have none but boarders is relatively small. It is, however, the "boarding" element which chiefly determines the character of the education given in many of the schools where a few day boys (often the sons of masters) are admitted as well.

With these preliminary explanations the following details will be intelligible:

1. The statistics in this return are based on information received from 6,209 schools; of these, 1,958 are entered in the return as boys' schools, 3,173 as girls' schools, and 1,078 as mixed schools.

NOTE.—(a) A school has been entered in the return as a mixed school when the boys and the girls in it are practically within the same upper and lower age limits.

(b) A school having both sexes, but in which practically all the boys leave at a much younger age than is the average age of the girls in the school, is entered as a girls' school.

(c) Among the 1,958 schools entered as boys' schools there are 16 in which there are a few girls; but the number of girls in each is so small that it would have been misleading to enter them as mixed schools.

(d) Schools entered as mixed schools are very often not places of coeducation. The boys in very many of them are taught quite separately from the girls; but as the details were not furnished for each portion of the school separately, it has been impossible to enter them otherwise than in the list of mixed schools.

2. (1) In the schools comprised in the return there were 291,544 pupils on June 1, 1897. Of these, 158,502 were boys and 133,042 were girls, distributed thus: 122,313 boys in boys' schools, 21,252 boys in mixed schools; there were also 14,937 boys in 2,116 schools entered as girls' schools as explained in (b) above, making a total of 158,502 boys; 114,239 girls in girls' schools, 18,740 girls in mixed schools, and 63 girls in 16 schools entered as boys' schools as explained in (c) above, making a total of 133,042 girls.

(2) It may be noted that, taking the population of England (excluding Monmouthshire) at 29,140,945, as estimated to the middle of 1897 in the register-general's quarterly returns, the total number of boys in the schools entered in this return amount to 5.4 per thousand of the whole population of the country and the girls to 4.5 per thousand.

3. The following table shows the classification of the pupils by age periods :

Ages.	Boys.	Girls.	Percentage of total.	
			Boys.	Girls.
Under 12.....	64, 339	60, 866	40.6	45.7
Between 12 and 16.....	79, 359	57, 040	50	42.9
Over 16.....	14, 804	15, 136	9.3	11.3
Total.....	158, 502	133, 042	.....	.....

4. For the purposes of this return the head masters and head mistresses of schools were asked to enter their schools under one of the following categories, according to the constitution of the authority which controls them :

A. Controlled by a private individual or by partners in private enterprise.

B. Controlled by a committee representing a body of subscribers, but not registered under the companies' acts.

C. Controlled by a company formed under articles of association with limited liability, the dividend being limited by (1) the constitution of the company, or (2) resolution of the shareholders.

D. Regulated by (1) royal charter; (2) act of Parliament; (3) scheme of the court of chancery; (4) scheme under the endowed schools acts; (5) scheme under the charitable trusts acts; (6) scheme under section 75 of the elementary education act of 1870; (7) some other legal instrument.

E. Controlled by a local public authority.

5. (1) For the purpose of arranging and tabulating the final statistics these various subdivisions have been grouped, except in section 12, simply under five categories, viz, private enterprise, subscribers', companies', endowed, under local authority, as the tables would have been too cumbersome if presented under each of the thirteen heads separately.

(2) It may be noted that schools supported by religious communities have been included under subscribers' schools, as also those supported by city companies which are not for profit and also have no fixed endowment for maintenance.

(3) The difference between schools of the first category and subscribers' and companies' schools may be said to be that in the private schools the administration, the direction, and generally a part of the teaching is in the hands of the owner or owners. In subscribers' and companies' schools this is not so.

(4) The following table shows the total number of schools in the return, and of the pupils in them, as distributed among these five categories of control :

Form of control.	Schools for boys.		Schools for girls.		Mixed schools.	
	Number of schools.	Boys in them.	Number of schools.	Girls in them.	Number of schools.	Pupils in them.
Private enterprise.....	1, 311	46, 617	2, 886	80, 256	970	26, 027
Subscribers.....	70	8, 719	99	6, 321	28	3, 626
Companies.....	48	5, 183	99	13, 238	3	398
Endowed, etc.....	502	59, 517	86	14, 119	31	3, 035
Local authority.....	27	2, 272	3	275	46	6, 996

(5) The above table may also be given in percentages.

	Percentage of total.		Percentage of total.		Percentage of total.	
	Number of schools.	Number of boys.	Number of schools.	Number of girls.	Number of schools.	Number of pupils.
Private enterprise.....	66.9	38.1	91	70.3	90.1	65.3
Subscribers.....	3.6	7.1	3.1	5.5	2.6	9
Companies.....	2.5	4.2	3.1	11.6	.3	.7
Endowed, etc.....	25.6	48.6	2.7	12.3	2.7	7.5
Local authority.....	1.4	1.8	.1	.2	4.1	17.4

The general leaving age of the individual schools may be shown thus

	Number of schools—							Total.	Percentage of schools—						
	Having no pupils over the age of—						Some pupils over 18.		Having no pupils over the age of—						Some pupils over 18.
	10.	12.	14.	16.	17.	18.			10.	12.	14.	16.	17.	18.	
Boys' schools.....	32	65	224	553	391	256	437	1,958	1.6	3.3	11.4	28.2	19.9	13	22.2
Girls' schools.....	26	75	394	898	483	540	757	3,173	.8	2.3	12.4	28.3	15.2	17	23.8
Mixed schools.....	109	204	303	266	107	50	48	1,078	9.2	18.9	28.2	24.8	10	4.6	4.4
Total.....	158	344	921	1,717	981	846	1,242	6,209	2.5	5.5	14.8	27.6	15.8	13.5	20

The left-hand column in this table clearly shows that this return can not be taken to represent exclusively secondary schools. Many of these 158 schools are really private elementary schools, not essentially different in character from the public elementary schools, but as, in the absence of inspection, they can not be identified in character in the list of private schools in any given place, they could not be excluded from this return; moreover, their statistics are not included as are those of the public elementary schools in the annual report of the education department, which deals with elementary school provision.

The size of the individual schools on the return may thus be shown :

	Number of schools having—						Total number of schools.	Percentage of schools having—					
	Under 31 pupils.	Between 31 and 50.	Between 51 and 100.	Between 101 and 200.	Between 201 and 500.	Over 500 pupils.		Under 31 pupils.	Between 31 and 50.	Between 51 and 100.	Between 101 and 200.	Between 201 and 500.	Over 500 pupils.
Boys' school.....	846	430	396	184	84	18	1,958	43.2	21.9	20.2	9.3	4.2	.9
Girls' schools.....	1,628	894	469	131	48	3	3,173	51.3	28.1	14.8	4	1.5	.1
Mixed schools.....	702	201	110	45	19	1	1,078	65	18.6	10.3	4	1.7	.1
Total.....	3,176	1,525	975	360	151	22	6,200	51.1	24.5	15.7	5.7	2.4	.3

The following table gives the number and proportion of boarders and day pupils in the schools on the return :

	Boarders.	Day pupils.	Total.	Boarders are per cent of whole number.
Boys' schools.....	43,692	78,621	122,313	35.7
Girls' schools.....	20,670	93,569	114,239	18
Mixed schools:				
Boys.....	2,771	18,481	21,252	13
Girls.....	1,652	17,038	18,740	9

Out of the total number of 6,209 schools in the return, 343 have no day pupils, viz, 224 boys' schools containing 13,268 pupils, all of whom are boarders; 101 girls' schools containing 3,864 pupils, all of whom are boarders; 18 mixed schools containing 2,147 pupils, all of whom are boarders.

The following table shows the numbers and the proportions of graduates and of

nongraduates on the staffs of the various schools, inclusive of the head master or head mistress:

	Men teachers.						Women teachers.					
	Exclusively attached.			Visiting staff.			Exclusively attached.			Visiting staff.		
	Graduates.	Nongraduates.	Graduates are per cent of whole.	Graduates.	Nongraduates.	Graduates are per cent of whole.	Graduates.	Nongraduates.	Graduates are per cent of whole.	Graduates.	Nongraduates.	Graduates are per cent of whole.
Boys' schools.....	4,165	3,285	55.9	545	2,410	18.5	117	925	11.3	107	471	18.5
Girls' schools.....	53	85	29.2	829	2,590	24.2	1,534	10,472	12.7	491	3,885	19.3
Mixed schools.....	265	587	25.8	42	358	10.5	150	1,782	7.8	14	326	4.1

Taking the seven subdivisions of category D, on page 40 above, i. e., endowed schools, etc., we find that the 619 schools coming under this head in the return group themselves thus:

	Boys' schools, No. of—		Girls' schools, No. of—		Mixed schools, No. of—		Total No. of—	
	Schools.	Pupils.	Schools.	Pupils.	Schools.	Pupils.	Schools.	Pupils.
I. Royal charter.....	33	6,152	6	752	4	375	43	7,279
II. Act of Parliament....	22	5,205	2	294	.....	.....	24	5,589
III. Scheme of the court of chancery.....	22	2,968	1	33	2	114	25	3,115

#### THE BOARD OF EDUCATION BILL.

The board of education bill was submitted to the House of Lords by the Duke of Devonshire in August, 1898, just at the close of the session, merely, as was announced by the author, to secure public discussion of its provisions. It was reintroduced with modifications on the 14th of March, and was explained at that time in full by its author, the president of the education department. Although the measure is pending only,<sup>1</sup> the text of the same and the speech of the Duke of Devonshire on its second presentation are given here for the light they throw upon the administrative problem. After rehearsing the points in the speech he made the last session, the Duke proceeded as follows:

That speech had invited discussion and criticism upon the bill of August 1 last, and he was glad to say that both the board of education bill and the teachers' registration bill had received public attention. He went on to insist that the organiza-

<sup>1</sup> The bill has just passed (August 9) with slight modification, as this matter goes to press.

tion of the central authority must precede the constitution of the local authority, toward which he thought he now saw some progress toward agreement in the localities themselves. The question had been pretty fully discussed between the associations of county councils, county boroughs, and borough councils, and we do not see that any insuperable difficulty prevents agreement between these bodies. He still had to make some reservation as to school boards. From causes for which they were not responsible school boards had been constrained to enter to so considerable an extent upon the field of secondary education that many of them were most naturally unwilling to surrender the position they now occupy. Though he conceived that very few of them would contend that the school board as now constituted would be the proper secondary education authority for the future, yet he apprehended that many of them would be disposed to claim a larger share of representation on, and influence over, these local bodies which will be set up in future than it might be possible for the Government to concede. But, under any circumstances, if the differences as to the constitution of the local authorities disappeared, he still thought it would be a mistake to create those local authorities and call upon them to undertake the important duties it was proposed to assign to them in the absence of any central organization which would be in a position to give them all the information, advice, and assistance they had a right to expect.

The dual administration under the education department and the science and art department had never been in all respects satisfactory. It was the intention of the Government to reorganize these departments, and when the secretaryship of the science and art department became vacant it would, of course, not be at present filled up. There must ensue a period of transition in which the defects of this dual administration would necessarily for a time be accentuated. The Duke went on to describe in what respects the bill now introduced differed from that of last August. He said:

“The constitution of the board of education provided in that bill has been criticised, I think not without some justice, as being somewhat awkward and clumsy. It provided in certain cases for the retention as a member of the board of the vice-president of the council. In other contingencies there would have been no vice-president. We propose in the present bill to constitute a board of the same character as the board of trade or board of agriculture. Like the board of trade, but unlike the board of agriculture, it will have a parliamentary secretary as well as a president, and the office of vice-president will cease to exist. We have, however, followed the precedent of the board of trade act, 1867, introduced a temporary provision that during the tenure of office of the vice-president he will continue to be a member of the board. In justice to the present vice-president, I ought to state that this provision has not been introduced in any way on his initiative, and that he himself entertains doubts as to its expediency. We have, however, considered that the experience and knowledge of the subject possessed by the vice-president will be of great value, not only in the conduct of the bill through the other house of Parliament, but in organizing the department. Therefore we have thought it desirable to follow the precedent of the course taken under the board of trade act of 1867. The present bill will give more elastic powers of transfer of the educational functions of the charity commissioners to the new department. It will give power to the Queen in council to order the transfer to the education board of such powers as may appear to relate to education. The question of whether a trust is of an educational or other character, and the apportioning of endowments for educational or other purposes will, however, as in the bill of last year, be reserved to the charity commissioners. Our intention is that this transfer shall only come gradually into operation, and the only power which at present will be transferred from the charity commissioners to the board of education will be that of the inspection of schools which are under schemes framed by the endowed schools commissioners.

“The question of inspection and examination of schools by the new board is one of such importance that it will be dealt with in the present bill in a separate clause instead of in a subsection of a clause, as in the former bill. That subsection conferred considerably larger powers of inspection than were intended by us, and I am advised that under the bill introduced last year all public schools would have been liable to inspection, except Eton and Winchester. I have endeavored to ascertain from the governing bodies and head masters of public schools how far they are of opinion that it is desirable that the inspection of public schools by an educational board should be general, and how far they would themselves be willing to come under it. The result of these inquiries had been to me somewhat unexpected, and I think in a sense eminently satisfactory. Most of them, the largest and most important public schools included, have, through their head masters, expressed the opinion that they are so impressed with the public advantage of a general inspection of secondary schools by some competent authority that they would be willing, on certain conditions, although they might have little or nothing to gain by it themselves, to come under such a system of inspection. But some of the conditions which they very properly lay down are conditions which, at present, it is very difficult to satisfy. The head masters indicate a great dread of any attempt to impose upon them uniformity of instruction or curriculum. They therefore attach great importance to the permanent existence of a consultative committee in which they see a guaranty against any attempt on the part of a Government department. They also require that university inspection should be recognized as alternative to State inspection. These are conditions which may be satisfied without great difficulty, but there are others which will be less easily met. They attach the greatest importance to the selection of inspectors, whose competence for such responsible and difficult duties would be generally recognized. I need not say that such men do not exist in very great numbers, that such men can not easily be found, and that, if they can be found, their services will have to be very highly remunerated. And they, further, generally express the opinion that, if inspection by the State were to be made compulsory, it ought also to be gratuitous. It would be impossible to draw an exact line of demarcation between those schools in which it would be desirable that inspection should be compulsory and those in which it should be optional; and, therefore, we propose that inspection in all cases should be optional, except in the case of those schools which are being conducted under schemes of the endowed school commissioners, in whose case the new department will inherit the powers of inspection which are already possessed by the charity commissioners. We recognize that the conditions which will be required for the higher and more important schools ought, in their due degree, to be applied to the case of the smaller local public schools, and that, in the first place, no attempt should be made to impose upon them anything like uniformity in their course of instruction; that the inspection should be conducted on the advice of, and in consultation with, the consultative committee formed under the bill; that due care should be taken in the selection of the inspectors; that university or other competent organizations shall be admitted as equivalent to give inspection; and, though we are unable to ask Parliament to devote funds to provide for the inspection of schools which are mainly for the benefit of the upper or middle classes, we recognize that in the case of the poorer schools the cost of inspection may properly form a charge upon funds placed at the disposal of the counties for educational purposes.

“The registration of teachers was provided for last year in a separate measure. We now consider that this is unnecessary. We consider that the register of both elementary and secondary teachers may be most properly kept by the department itself, and we provide that the regulations under which these registers are formed shall be framed in consultations with and on the advice of the consultative committee. The composition of that committee will not be stereotyped by the terms of the bill further than it will be provided that it shall be as two-thirds representative

of the universities or other teaching bodies, and endowed, as it will be, with the permanent functions to which I have referred. I hope that any doubt which has been felt as to the intention of the Government to make the consultative committee a permanent institution under the board will be removed.

"I stated," continued the Duke, "last year that certain changes might be necessary in the educational departments.

"The science and art department has grown up, as I pointed out last year, almost imperceptibly from very small beginnings, so that it is probable that in its case a very searching and complete examination will be necessary. That department has a character distinct and differing from anything in the State, and, I think, differing from anything which exists in any other country. Through its colleges of science and schools of art it is itself a teaching institution. It distributes a large sum in aid of instruction in certain subjects, and, therefore, it exercises a considerable control over the course of study throughout the country. It is also an examining body whose certificates possess a value of the same character as that of a university degree. It also directs great museums at South Kensington, Bethnal-green, Edinburgh, and Dublin. Its internal arrangements are also of a peculiar character, having, as it has, directors of science and art who possess no executive authority, and whose functions and responsibilities I have always found it rather difficult to understand. The intention expressed in the bill of making this department a branch of a larger education department, and also the pending vacancy in the secretaryship of the science and art department will obviously make a thorough revision of this department necessary. That revision will be undertaken by a departmental committee, and as soon as the principle of amalgamation of the two departments has been approved by Parliament, that committee will be appointed and the revision commenced. It will extend to both the science and art sides of the department, and also to the administration of the museums. It is an inquiry which will necessarily occupy a certain amount of time and entail a great deal of labor, and we therefore propose that the bill shall not come into force until the 1st of April of next year, which will certainly not allow more than the necessary time for conducting this very difficult inquiry." (Schoolmaster, March 18, 1899.)

#### TEXT OF THE BOARD OF EDUCATION BILL.

The following is the text of the board of education bill reintroduced into the House of Lords March 14, 1899:

Be it enacted by the Queen's most Excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal, and Commons, in this present Parliament assembled, and by the authority of the same, as follows:

1. (1) There shall be established a board of education charged with the superintendence of matters relating to education in England and Wales.

(2) The board shall consist of a president, and of the lord president of the council (unless he is appointed president of the board), Her Majesty's principal secretaries of state, the first commissioner of Her Majesty's treasury, and the chancellor of Her Majesty's exchequer.

(3) The existing vice-president of the committee of the privy council on education shall also be a member of the board, but on the next vacancy in his office the office shall be abolished, and the education department act, 1856, shall be repealed.

(4) The president of the board shall be appointed by Her Majesty, and shall hold office during Her Majesty's pleasure.

(5) The board shall be deemed to be established on the appointment of the president thereof.

2. (1) The board of education shall take the place of the education department (including the department of science and art), and all enactments and documents shall be construed accordingly.

(2) It shall be lawful for Her Majesty in council, from time to time, by order, to transfer to, or make exercisable by, the board of education any of the powers of the charity commissioners in matters appearing to Her Majesty to relate to education, and the order may make such provision as appears necessary for applying to the exercise of those powers by the board of education the enactments relating to the charity commissioners: *Provided*, That any question as to whether an endowment or

any part of an endowment is held for or ought to be applied to educational purposes shall be determined by the charity commissioners.

3. (1) The board of education may, by their officers or by any university or other organization approved in that behalf by the board, after taking the advice of the consultative committee hereinafter mentioned, inspect any school supplying secondary education and desiring to be so inspected, for the purpose of ascertaining the character of the teaching in the school and the nature of the provisions made for the teaching and health of the scholars, and may so inspect the school on such terms as may be fixed by the board of education with the consent of the treasury.

(2) The council of any county or county borough may, out of any money applicable for the purposes of technical education, pay or contribute to the expenses of inspecting, under this section, any school within their county or borough.

4. It shall be lawful for Her Majesty in council, by order, to establish a consultative committee consisting, as to not less than two-thirds, of persons representing universities and bodies interested in education, for the purpose of—

(a) Framing, with the approval of the board of education, regulations for the formation of a register of teachers; and

(b) Advising the board of education on any matter referred to the committee by the board.

5. The draft of any order proposed to be made under this act shall be laid before each House of Parliament for not less than four weeks during which that House is sitting, before it is submitted to Her Majesty in council.

6. (1) The board of education may appoint such secretaries, officers, and servants as the board may, with the sanction of the treasury, determine.

(2) There shall be paid, out of moneys provided by Parliament, to the president of the board, unless he holds another salaried office, such annual salary not exceeding £2,000, and to the secretaries, officers, and servants of the board such salaries or remuneration as the treasury may determine.

7. (1) The board of education may sue and be sued, and may for all purposes be described by that name.

(2) The board shall have an official seal, which shall be officially and judicially noticed, and that seal shall be authenticated by the signature of the president or some member of the board, or of a secretary, or of some person authorized by the president or some member of the board to act on behalf of a secretary.

(3) Every document purporting to be an instrument issued by the board of education, and to be sealed with the seal of the board, authenticated in manner provided by this act, or to be signed by a secretary or any person authorized by the president or some member of the board to act on behalf of a secretary, shall be received in evidence, and be deemed to be such an instrument without further proof, unless the contrary is shown.

(4) A certificate signed by the president or any member of the board of education that any instrument purporting to be made or issued by the president or some member of the board is so made or issued shall be conclusive evidence of the fact.

8. (1) The office of president of the board of education shall not render the person holding it incapable of being elected to, or of voting in, the Commons House of Parliament, and shall be deemed to be an office included in Schedule H of the representation of the people act, 1867; in Schedule H of the representation of the people (Scotland) act, 1868; in Schedule E of the representation of the people (Ireland) act, 1868; and in Part I of the schedule of the promissory oaths act, 1868.

(2) After the abolition of the office of the vice-president of the committee of the privy council on education, one of the secretaries of the board of education shall not, by reason of his office, be incapable of being elected to or of voting in the Commons House of Parliament; but the president of the board and a secretary of the board shall not at the same time be members of that House.

9. (1) This act shall not extend to Scotland or Ireland.

(2) This act shall come into operation on the first day of April, one thousand nine hundred.

(3) This act may be cited as the board of education act, 1899.

At the annual conference of the National Union of Elementary Teachers Professor Zebb, member of Parliament, made an address heartily commending the bill, especially as tending to unify the educational work of the country. He said:

The board of education bill, which will certainly pass, has some features which claim a brief notice in connection with our subject. It is a bill which forms the first step, and a most important step, toward the organizing of secondary education. But it possesses also a significance of a still wider kind, inasmuch as some of its

provisions or its consequences will tend to the proper correlation of primary with secondary teaching, and to a clearer recognition of the manner in which their interests are connected. As we have been told by the lord president, it is contemplated that in the new education office there shall be three departments—one for primary, one for secondary, and one for technical education. The separateness of these departments is of less moment than the fact that all three will be brought under the cognizance of a single board. Such an arrangement can not fail to facilitate the provisions of the requisite links between the different grades and kinds of schools. Continuity and unity of system will be more easily secured, while at the same time due regard will be had to those circumstances in which primary and secondary schools require different modes of treatment. Then the bill provides for a consultative committee, which is to advise upon such matters as are referred to it by the board of education. This committee will consist, as regards two-thirds of its members, of persons nominated by the universities and by "other bodies interested in education." The expression "other bodies interested in education" is a comprehensive one, which leaves no room for doubt that the interests of primary education will be duly represented on the consultative committee. This committee will also, with the approval of the board of education, frame regulations for the registration of teachers. It has thus become unnecessary to reintroduce the teachers' registration bill of last year. Under the provisions of that bill the register was to contain primary and secondary teachers in one common list, while, in addition to this list, it might give also separate catalogues of the two classes. A similar plan, it may be expected, will be adopted under the new bill, and the unity of the teaching profession will thus receive an express recognition. It might be premature to discuss the probable constitution of the local authorities which are to be established at no distant date, and it would plainly be inappropriate on the present occasion to enter on the discussion of details connected with that subject. It may, however, be regarded as certain that primary education will find adequate representation on those bodies. Altogether, then, it appears reasonable to hope that the coming legislation, of which we are to have an important installment this year, will lead to beneficial results for our whole system of education, primary and secondary alike. It will be not the least of those benefits if the actual and visible unity of the new education board should serve to impress upon teachers of every kind the unity of the cause in which they are engaged, the demand which that cause makes upon them for unity of endeavor, even at some sacrifice of personal predilection or convenience, and the greatness of the reward which will be theirs who, in a country which is still too little alive to the supreme importance of education, shall yet succeed, by unity of effort and by unity of spirit, in securing for the kingdom and for the empire an indispensable safeguard—one not less needful, in the long run, than ships or swords—the safeguard of intellectual and moral competence to hold our own in every field with the most progressive nations of the civilized world.

#### THE WELSH LAW OF 1889.

The Welsh intermediate education law, passed in 1889, is of great importance, not only because of its immediate effects in Wales, but because of the suggestions it offers to guide similar efforts in England. Briefly outlined, it may be said that the law constitutes every county of Wales a district for educational administration under a local authority called the joint education committee of the county council, and consisting of five persons, three of whom are to be nominated by the county (a county borough) council and two by the lord president of Her Majesty's privy council. Nominees of the county council are not

required to be members of that body. Nominees of the lord president are required to be "persons well acquainted with the conditions of Wales and the wants of the people," preference being given to residents within the county for which the committee is appointed. The joint education committee has the duty of reporting to the county council, but its acts and proceedings are not required to be submitted to that body for approval.

The county organizations are unified through a central board (central Welsh board of intermediate education) created in 1896, whose most important functions are the examination and inspection of schools. The law is administered under the general oversight of the charity commission, which has the relation of a Government authority.

Under the operations of this law, adequate provision for secondary education has been made throughout the province. The public funds available for the work are, besides existing endowments, local taxes, supplemented by a grant from the treasury equal in each district to the income from the tax.

The proceeds of the liquor duties have also been almost entirely applied to immediate education in Wales. In 1897-98 88 county schools were reported as in operation, and provision had been made for 8 other public secondary schools.

The schools had a force of 410 permanent teachers, mostly university graduates, and 130 visiting teachers. Their pupils numbered 7,000, equal to 35 for every thousand inhabitants.

The annual income of the schools from the public sources above specified was about \$420,000. Tuition fees are charged in these schools, ranging from £2 to £12 (\$10 to \$60) per annum. About 10 per cent of the pupils hold free scholarships, and another 10 per cent half scholarships.

The average annual expenditure per capita is about \$70 a year.

#### NEW SCHEME OF CLASSIFICATION FOR SCHOOLS OF SCOTLAND.

In Scotland the general conception of education approaches much more nearly that maintained in the United States than the English idea.

In the northern division of the Kingdom there is little trace of those educational distinctions based upon social caste, which color all the discussions of the subject in the southern division.

The latest regulations for day schools issued by the Scotch department have swept away at one stroke all cast-iron limits and provided for flexible classification, national tests of attainment, and regular progression from the elementary schools to the secondary. These regulations, which embody the most advanced idea of popular education which has thus far been officially promulgated in Great Britain, are here briefly epitomized.

They provide that—

After April 1, 1900, the six standards, with their distinctive limits, shall disappear. Along with them goes the formal yearly inspection, as well as the many and varied grants fixed for optional subjects. In future, elementary public schools will have three divisions: (a) infants, (b) junior, (c) senior, and the arrangement of work in each division is to be such as shall secure the attainment of the education department's merit certificate by the completion of the elementary course of instruction. The classification of work is to be such as to afford every opportunity for progress. Promotion in one subject is not to be hampered by lack of proficiency in another. The scheme of education must provide principally for the instruction of the pupils in reading, writing, and arithmetic, amplified by the teaching of English, geography, history, and nature knowledge, together with adequate physical exercise, singing, and, for girls, needlework.

In each class a record of work in every subject is to be kept by the teacher with sufficient detail to show the previous course of instruction at any time throughout the year, and any examination of a class which the inspector shall make at any time of his visits, in order to satisfy himself as to the efficiency of the teaching, is to be based on this record. The grants to be earned will be determined by the scheme of work approved by the department and the general efficiency and thoroughness of the instruction given. Subject to conditions securing satisfactory staffing, there is to be paid on the average number of children in attendance throughout the year, (a) under 7 years of age a normal grant of 18s., (b) from 7 to 10 years of age a normal grant of 20s., and (c) over 10 years of age, who have not obtained the merit certificate, a normal grant of 22s. These grants may be increased, on the recommendation of the inspector, by 6d. a head for meritorious work, or diminished by the same sum for defects in instruction, and by 1s. for any omission of essential requirements.

Where efficient instruction in drawing is given for at least 1½ hours per week, an addition of 1s. 6d. in the junior division and 1s. 9d. in the senior division will be paid, with 3d. more if exercises in simple forms of manual occupation are given.

Scholars who have obtained the merit certificate pass into the advanced department of the school or enter a higher grade school. The so-called secondary departments of elementary schools have hitherto been encouraged or in great measure provided for out of a grant paid to committees in counties, and the larger burghs in Scotland for the purposes of secondary education. They will now have their definite name and place given to them. In the advanced departments managers must arrange for the continuance of adequate instruction in English, geography, history, arithmetic, and drawing; also for instruction in such subjects as the department, having regard to the circumstances of the school, shall determine—viz, languages, mathematics, science, practical instruction in experimental science. Laundry work and dressmaking are to be encouraged by special grants.

A distinct class of schools, to be called higher grade (science) schools, finds its place in the code. To it has been added also a higher-grade commercial course, in which modern languages are given an important place, along with bookkeeping, shorthand, and knowledge of commercial products. The first year of these science and commercial courses may be made identical, provided that it includes instruction both in experimental science and a modern language. In the second year of the commercial course at least eight hours, and in the third year ten hours, a week must, as a rule, be devoted to the study of modern languages. These courses are designed for pupils leaving school to begin the work of life at thirteen or fourteen years of age, and their chief value lies in their constituting, if effectively carried out, a sound general education of a distinctly modern type, and preparatory to the commercial, scientific, or technical training to be obtained in the evening classes of a technical institute or college.

## UNIVERSITY NOTES.

*Special study and research at Oxford.*—In 1891 the University of Oxford instituted the degrees of bachelor of letters and bachelor of science, which are intended to promote and recognize the value of study and research.

A candidate for either degree must be of the age of 21 years, and (1) must either be a bachelor of arts in the University of Oxford or give evidence of a good general education; (2) must give evidence (to the board of faculty or studies to which the course of study or research on which he proposes to enter belongs) of his fitness to enter on it, as well as that it is such as may profitably be pursued within the university.

If his application is approved, his name will be registered and he will pay a fee of \$15.

If he is not already a member of the university, he must be admitted to some college or hall, or as a noncollegiate student and be matriculated. He will be held to be admitted as a candidate for the degree at the time when his notice was first received if he was then a matriculated member of the university, or, if not, at the time of his matriculation.

No one is allowed to take the degree until he has kept at least eight terms of residence, but the terms will be reckoned from matriculation, so that anyone who has kept two years as an undergraduate will be qualified by residence. Leave may be obtained to substitute in any one year forty-two (not necessarily consecutive) days in vacation for a term's residence.

Every candidate's work is under the direction and supervision of the board of the faculty to which his subject belongs or of a committee appointed by that board. When a candidate has completed his course and applies for leave to proceed to the degree, the board of the faculty must satisfy itself of his merit and proficiency, either by examination simply or by requiring a dissertation or report of work done and also by examination. The boards are directed to give certificates only to those candidates who have attained a high standard of merit, and the grounds on which the certificates are granted must be stated in the University Gazette. The certificates are to be signed by two professors or readers, or by a professor or reader and two persons appointed by the board. They are registered by the secretary of the board of faculties.

Unlike degrees in arts, degrees in letters or in science do not carry with them any share in the government of the university, nor is a bachelor of letters or of science allowed to proceed to the degree of M. A. unless he has at some time qualified himself for and taken the degree of bachelor of arts.

The statute establishing the examination in English language and literature, first held in 1896, directs that as far as possible equal weight is to be assigned to language and literature, provided that candidates who offer special subjects shall be at liberty to choose subjects connected either with language or with literature or with both.

The subjects of examinations are:

1. Portions of English authors to be studied with reference to the forms of the language, as examples of literature, and in their relation to the history and thought of the period to which they belong.
2. History of the English language.
3. History of English literature, including the history of criticism and of style in prose and verse.
4. Special subjects (one must be taken by candidates who aim at a place in the first or second class). Among those are old English, middle English, old French philology,

Scandinavian philology, French literature to 1400 A. D., Italian literature to the death of Milton, German literature from 1500 A. D. to the death of Goethe, these last three in their bearing on English literature.—[Student's Handbook to the University and Colleges of Oxford. 1895. pp. 183, 218.]

*Advanced students at Cambridge.*—The University of Cambridge admits persons as advanced students under the following conditions:

Each applicant must submit (1) a diploma or other certificate of graduation; (2) a statement as to the course or courses of (a) advanced study or (b) research which he desires to pursue, with such evidence of qualification, attainments, and previous study as he may be able to submit; (3) a certificate or declaration that he has attained the age of 21 years.

In exceptional cases persons who do not present a diploma or certificate of graduation may be admitted as advanced students, provided they give such evidence of special qualification as may be approved by the degree committee of the special board of studies with which the proposed course of advanced study or research is most nearly connected.

When the application has been approved by the special board connected with the applicant's studies, he must be admitted a member of a college or a noncollegiate student. An advanced student who has kept by residence at least six terms and has obeyed the regulations as to examinations, etc., may proceed to the degree of B. A., as also may an advanced student who has obtained a certificate of research. [Ordinances of the University of Cambridge, 1896.]

*Chair of political economy at Owens College.*—The city of Manchester, which has given its name to a special school of economists, is found wanting in adequate provision for the teaching of political economy.

A few students of economics may be found at the evening classes of the Owens College, but until recently there has been no chair of political economy. By the generosity of a member of the city council, Mr. W. F. Rothwell, this defect is now to be remedied. He has presented to the college a permanent endowment of \$1,000 per annum, which will enable the authorities to raise the lectureship of political economy at Owens to the rank of a full professorship.—Educational Times, August 1, 1898, p. 307.

*Laboratories of physiology and pathology.*—The new laboratories of physiology and pathology at the University College, Liverpool, were formally opened on October 8. The laboratories have been erected and equipped in the most adequate way for study and research by the Rev. Thompson Yates, at a cost of £25,000.

*Owens College* has received benefactions from the Whitworth estate and otherwise, amounting to over £65,000 (\$325,000).

*Women students at Owens College.*—The following retrospect of the education of women at Owens during the past fourteen years is from the Manchester Guardian:

In 1883 only two women, the first to take up work for a Victoria degree, attended classes in college, but gradually one class after another has been opened and now almost all the work, except some elementary classes, is done as it should be, in the college itself. The gradual manner in which the change was carried out has enabled the experiment to justify itself at every step. For some time there was a difficulty about instruction in science, laboratories as well as class rooms being necessary, but that has now been overcome, and the women students have full access to the excellent chemical, physical, and biological laboratories. The evening classes, too,

are open to women. Further, almost all prizes, scholarships, and fellowships connected with the college have been generously offered for the competition of the women students. Women graduates take their place among the associates of the college, thus sharing indirectly in the government of the college. In lighter matters, too, they take part in the corporate life of the institution, for though the women have their own debating and other societies, apart from the men's, joint meetings are not infrequently held by invitation, of one side or the other, and the subject of the moment is debated by the united societies. The change in academic arrangements has been accompanied by a change in the character of the students. Though there were always a few who gave their whole time to study, the majority attended one or perhaps two classes only. Now, out of 102 students last session, 67 were studying for the degrees of the Victoria University, and a few for London degrees. Thus the majority are now serious students. (Ed. Times, November 1, 1897, p. 446.)

*University examinations for women.*—In an address at the opening of the session at Bedford College, Mrs. Fawcett said, in regard to the refusal of Cambridge to remove the disabilities of women at Cambridge:

Notwithstanding this defeat, she was certain that the general drift of opinion was in favor of the removal of the educational disabilities of women. As to the proposal for a separate university for women, she regarded it not only as useless, but distinctly mischievous. Separate colleges, however, they must have. It was represented at Cambridge that they desired young men and women to live together in the same colleges. They desired nothing of the kind, but that was no reason for the creation of separate machinery for testing the knowledge which a university afforded. A separate university would involve waste of time, money, and energy. In the whole of the United Kingdom there were nine universities which opened their degrees entirely to women—in England, London, Victoria, and Durham; in Scotland, the four ancient Scottish universities; in Wales, the Welsh University; and in Ireland, the Royal Irish University. Did those who advocated a separate university want different subjects taught, or the same subjects taught differently? She remembered that one professor, on being asked if he would admit ladies to his classes, replied, "Yes, they may come, but I can't make my subjects amusing for ladies." They did not want that kind of thing. They wanted to be taught seriously and in the best manner. Teaching might be adapted for varying needs, but the cleavage line was not sex, but individuality. (Ed. Times, November 1, 1897, p. 447.)

*London School of Medicine for Women.*—The trustees of the Reid trust for the education of women have decided to offer a scholarship at the London School of Medicine for Women in memory of their cotrustee, the late Miss Bostock, of Penmaen, Glamorganshire. The value of the scholarship will be £60 a year, tenable for two or four years, and awarded on the result of the preliminary scientific examination of the University of London. The Bostock scholar must read for the London medical degree. (Nature, February 23, 1899, p. 404.)

*The Library Association,* through its education committee, has just completed a provisional scheme for classes in library economy, which it is hoped may eventually provide a thorough course of technical training. For the last five or six years a summer school has been held in London and has proved a great success, the present classes being the outcome of a demand for additional means of professional education. The first session is inaugurated this week at the Museum of Practical Geology, Jermyn street, W. (Public circular, February 26, 1898, p. 233.)

*University of London.*—The bill for the reconstruction of the University of London which was passed in August, 1898, just at the close of the session of Parliament, brings to a close efforts and agitations

extending over twenty years. The bill provided for the creation of a statutory commission whose advice will determine the ultimate character of the new university, which it is settled shall be a teaching university. The commission has already entered upon its duties, and the reports of its investigations promise a very complete view of the agencies for higher education that exist in London. Many of these will eventually be included in the new university.

It appears certain that higher commercial instruction will find place in the university curriculum. Even a faculty of commerce is proposed, and there is already talk of a preparatory course in commerce in some secondary school, as the City of London College, which shall lead to the university course. It is also probable that the London School of Economics and Political Science, recently established, will be added to the list of institutions to be recognized as schools of the university.

*New university for Ireland.*—The question of a Catholic university for Ireland has been prominently before Parliament during the present session, but no satisfactory measure has been yet submitted.

---

#### APPENDIX I.

##### THE PROPOSED UNIVERSITY FOR BIRMINGHAM.<sup>1</sup>

The movement started in Birmingham fifteen years ago for the establishment of a university in the Midlands has been growing so steadily in energy and in volume that the promoters feel justified in taking definite steps for the accomplishment of their object. The first stage of operations was reached last year, when the college founded by Sir Josiah Mason in 1880 was incorporated by act of Parliament under a new constitution and received the new name of "Mason University College." An important step forward was taken last week, July 4, 1898, when the first public meeting in favor of the proposal to create a university was held in the Council House under the chairmanship of the lord mayor of Birmingham and was attended by Mr. Joseph Chamberlain, M. P., and an influential gathering. The proceedings must have been in the highest degree satisfactory to the promoters, for not only were some interesting speeches delivered and much enthusiasm displayed but a very substantial proof of the earnestness with which the scheme is being taken up by the inhabitants was afforded by the announcement of promised donations to the requisite funds of about £96,000 (\$480,000). The next step will be the issue of a public appeal for further donations, and it is confidently expected that the sum of £250,000 (\$1,250,000), which it is estimated is necessary to complete the equipment of the college, to found new chairs, to supply additional buildings, and to provide for the administrative machinery of the university, will before long be subscribed.

The proceedings at the recent meeting included the resolution: "That in the opinion of this meeting it is essential that in the interest of the city and the Midland district generally a university shall be forthwith established in Birmingham." Mr. G. H. Kenrick, who moved this resolution, is a manufacturer at West Bromwich employing a large number of men, and is himself a donor of £10,000 to the fund. He has for many years taken a prominent and honorable part in promoting elementary and technical education in the city, and his opinion on such a question,

---

<sup>1</sup> From *Nature*, July 7, 1898, p. 227.

whether as a man of business or as a school manager, is entitled to respectful attention from his fellow-citizens. After referring to the influence which the existence of the university would have upon the training and education of teachers, Mr. Kirkpatrick went on to give his view as to the intimate relation which must be established between the university and the industries of the district, and it is hoped that both parties, the professors on the one hand and manufacturers on the other, will be careful to note the very sensible observations of the speaker upon this topic.

No man can now stand up and say that industry can get on very well without science. That idea has been almost given up, but a more dangerous one has arisen in its place. Some manufacturers know quite well that their industries are dependent upon scientific knowledge but they have got into the way of saying that they do not want people around them knowing too much, and that when they want a scientific man they can send for him. But a man of science called in on such occasions is not always able to prescribe the exact remedy for the particular disease concerning which he is consulted. This is not to be wondered at, considering that industry has done her best so long to keep science at a distance that science has pursued her own path independently, with small direct reference to the needs of industry.

Professor Tilden seconded the resolution, and took the opportunity of pointing out that, though in the past there had been much prejudice in the minds of British manufacturers against a university training, because they had been disposed to regard it as all very well for clergymen and schoolmasters, but useless in practical affairs, nevertheless a university rightly organized and rightly conducted might be made a most practical kind of thing.

He urged upon the meeting the importance of noting what is being done in other countries, especially the United States of America and Germany, and pointed to the fact that in these countries not only are universities numerous, but are influential and richly endowed, while the directors, managers, and even foremen in manufacturing concerns are almost entirely men who have received a complete scientific education and have taken a degree in one of the universities, or if not in the university in one of the polytechnics or technical schools. The polytechnics of London and the municipal technical schools in this country are institutions which have done and are doing good service; but there are indications that the public do not realize how different they are from their prototypes on the Continent, partly in consequence of the inferior quality of the teaching staff, and partly by reason of the fact that the instruction given in such institutions in this country is only partial, and does not demand the devotion of the whole time and energy of the student. As to the influence of the universities in England, it was obvious that the ancient universities, though perhaps partly alive to the question, are incapable of providing what is wanted by industry. A great opportunity is now at hand for creating a university of a new type, in which all that is best of the old and the new can be associated together; not merely a large public school, but a place for men and women, a place for study, and also eminently a place for research, and a place where that predominance of examinations which unfortunately prevails so generally in most British universities would be got rid of. In constituting her university Birmingham would do well to emphasize the claims of science in its application to industry by establishing a faculty of "technics," in which "applied science" should be put on an equality, so far as honors and rewards are concerned, with the faculties of arts and of pure science.

Mr. Chamberlain supported the motion in a speech which passed in review the course of events that had led up to the movement then inaugurated. He made a strong and effective appeal to local patriotism, which had done so much in the past, which had made Birmingham what it was, and which he believed would now set the crown upon their educational work.

The bishop of Hereford, in moving for the formation of a general committee, made

an interesting speech, which was listened to with all the more attention that the bishop of the diocese had endeavored to throw cold water on the scheme by pointing to the spiritual destitution of the district, and indicating his opinion that this ought to be remedied before other schemes were brought forward. The bishop of Hereford, however, pointed out that not only was it impossible to put a stop to a great tidal movement, which arose out of civic patriotism, but that the work in which they were engaged was actually more likely than any other to keep the growth of that spirit in every denomination in the city which would never rest till the spiritual needs of the community were adequately supplied. The bishop in concluding referred to Bristol and its University College, of which he is president.

At one time it seemed probable that the Birmingham project would take the shape of a federation of colleges, among which Bristol would be included. That idea seems now to be abandoned. But the success of movements of this kind seems to be dependent chiefly upon financial support, and if Birmingham brings her scheme to completion it may be hoped that this will serve as a stimulus to other cities to follow her example, so that at some future, not far distant, time not only will London have a university worthy of her great position, but every large center of population will be occupied by a seat of learning at once the guide and helper of local industry and a focus of the light and culture of the world.

---

## APPENDIX II.

### THE UNIVERSITY OF WALES.<sup>1</sup>

For the present, and until such time as Birmingham shall achieve a university, "Wales" stands in the position of Britain's youngest university. The three constituent colleges had been at work some years before the university was constituted, in 1893. Of these colleges, the University College of Wales, at Aberystwyth, was opened in 1872; the University College of South Wales and Monmouthshire, at Cardiff, in 1883, and the University College of North Wales, at Bangor, in 1884. Aberystwyth is the pioneer and premier college. It has the handsomest buildings, the longest stretch of history behind it, the largest number of university students, although in this last respect Cardiff runs very close. When Aberystwyth college had been ten or twelve years in existence, a commission was appointed to inquire into the question of university colleges for Wales. The commission recommended that there should be two colleges, for North and South Wales, respectively; that the college then at Aberystwyth be removed to Bangor; that a new one be founded at Cardiff, and that £4,000 per annum of the public money be allotted to each institution. But Aberystwyth clung to its college. It preferred to support the institution rather than dispense with it. As a result of many and strenuous efforts, an additional grant of £4,000 was allotted to Aberystwyth, and in this way Wales has one college more than some might think strictly necessary, especially when one considers her population. Each of the three colleges has a training department for men and women, thus bringing the elementary school teachers into close touch with the university. Cardiff has schools for mining and civil engineering; Bangor and Aberystwyth have departments of agriculture and rural economy. In all, in this small country of one and a half million inhabitants, there are now more than a thousand students at work. They are, however, by no means all Welsh; a very large majority of the men are Welsh; among the women there is a considerable number of students who belong to the "adjacent peninsula."

If primogeniture counts for anything, Aberystwyth has a natural right to take precedence, and a brief description of the college may not be out of place. It is

---

<sup>1</sup>By C. C. Bremer. Reprinted from the Educational Times, May 1, 1899.

built on the south side of the town, with a great number of class rooms and lecture halls overlooking the sea. The north or main building, with two towers, which somewhat recall the tower of Pisa to those who know Italy, is now the oldest part; the science wing on the south side, is decorated with mosaics more curious than admirable. This wing and the main building were long connected by an ancient and inconvenient block, which was pulled down a short time ago and replaced by the new central block, formally opened in the autumn of 1898. The block cost £15,000, exclusive of furniture and equipment. It is not as handsome and distinctive in its architecture as the buildings it connects, but is doubtless light, convenient, and, above all, necessary for the expansion of the work. The main building contains what the students call "The Quad," but what is really a handsome covered hall, affording a meeting ground for professors and students. A few photos, three small Turners and other pictures, some by Lord Leighton, Dante Rossetti, Sir E. Burne-Jones, adorn the walls, and some cases of pottery and so forth run down the center of the hall. It is surrounded by an inner balcony, on which a large number of professors' class rooms open. Other notable features are the library, with a fine sea view and beautiful fixtures, presented to the college by American Welshmen and Welshwomen; and the examination hall, with a small stage, which suggests that the drama is not unknown at Aberystwyth. The college is built on a very small space, close to the pier and sea front; indeed, it intercepts the right of way along the sea front. At the back it leaves a pavement of shabby width and a narrow roadway. After the fire of 1884 the question was discussed whether it might not be advisable to remove the college farther from the town and obtain a larger space; but proximity has also its advantages, and these were considered to outweigh the disadvantages.

The town numbers 8,000 inhabitants. It is a fashionable watering place during the summer and early autumn months. The method of disposing of the students is convenient for lodging-house keepers, a class with which Aberystwyth abounds. All the women—to wit, 177—are gathered into a hall of residence, Alexandra Hall, at the extreme north of Marine Terrace; men students, on the other hand, live in lodgings. Five shillings a week is not an uncommon figure for lodging, and two men together pay 4s. each. A professor assured me that the weekly bill of one of his students came to 11s. 6d., and on this sum he was in the habit of entertaining friends. Fifteen shillings or 18s. a week is quite a common sum for board and lodging, and, as the tuition fee for the college is £10 per annum, it is evident that at least there is a chance at Aberystwyth of reaching a different class from the general run of undergraduates at Cambridge or Oxford. Where a man enters for a scientific course requiring a great deal of chemical paraphernalia, a laboratory fee might make his expenses mount to £15, inclusive, but it never exceeds this sum unless special coaching be necessary. The number of students at the beginning of the 1898-99 session was 407, and of these 190 were women.

It is interesting, at a time when such fierce attacks are being made on the classics as a branch of study, to note how many students devote their time to them. The figures are as follows: Greek, 154; Latin, 287; English, 245; history, 187; Welsh, 48; French, 138; German, 13; Hebrew, 16; elementary logic, 129; philosophy, 29; mathematics, 231; chemistry, 95; physics, 63; general biology, 24; botany, 35; zoology, 6; geology, 13; agriculture, 8; agricultural chemistry, 8; political economy, 2; education, 5; veterinary science, 8; together with some other subjects with smaller figures attached. It is thus evident that even in a college of yesterday the classics do more than hold their own.

Wales is the most democratic university that the mind of any man, except, perhaps, an American, has yet conceived. It is more democratic than the Scottish universities.

Each university college has a court of governors. Out of these is selected a council. Moreover, each college has a senate, mainly composed of the teaching staff.

The senate has charge of all academic matters, such as the framing of schemes, discipline, and so forth; the court must sanction everything; the council is greatly concerned with finance.

The university also possesses a university court, including 12 representatives from each college; a university senate, composed of the heads of the departments of the three colleges, and the guild of graduates, composed of all the graduates and the three staffs. Members of the guild become so two years after graduation.

After matriculation the student must take up a minimum of 10 subjects, including elementary logic. Of these five may be carried to the intermediate stage, and in one a student must specialize. If a student passes in honors, this is allowed to count as two. The degree course is different from London, in that a student of the latter may take the course in two years, whereas Wales, approving slow assimilation, demands three years.

The university is too young to have specialized; its aim so far is general culture. But, though it offers no speciality, the circumstances already referred to have developed two departments which are of first-class importance—the training department and agriculture.

The former is mainly for elementary teachers, although a few secondary students are pursuing their studies at Aberystwyth, practising in the elementary schools just as the elementary students do. The Government course in a training college is for two years, but the education department now looks with a more favorable eye on general culture for teachers, and grants encouragement and money aid to all who will work for a third year. This fits in admirably with the degree course, so that a vast majority of the students are working for the degree whether or not they complete their third year. The great difficulty in this department is that a number of students have matriculated before coming to the university, and others are only ready to matriculate after a year's work. University colleges, from financial and other considerations, can not always pursue the wisest policy, which in this case would be to accept no student below the matriculation standard. The training department numbers 110 students, of whom 50 are women. Of the first year only 2 out of 20 men students had not matriculated; out of 28 women 12 had not matriculated. The reason why the women fall below the standard is that the Queen's scholarship does not require mathematics, and women devote much time to domestic economy and sewing. Two years ago it would have been impossible to find so many as 12 matriculated women, so that the standard is rising.

As regards the degree, for which many students are working, men incline to classics, mathematics, natural science; women to English, French, German, history. The love of science receives a fillip from the grants which teachers earn from South Kensington. A degree in English history and literature is an admirable foundation for the elementary school teacher to erect his structure upon; and, perhaps, to Wales, as much as to any other university, is due the idea that the degree is not only for the secondary teacher. Moreover, it is highly useful for elementary teachers to rub shoulders with a world outside the narrow one of the training college, one of the worst features of which is the development of a self-satisfaction that can not be shaken, and a poor, mean ideal too soon reached and rarely disturbed by comparison with greater attainment. The Queen's scholars often enter college after four years of pupil teaching, dull, dazed, mechanical, overworked. Happily the recuperative power of the mind is great, and, at the end of the course, many students have been mentally remade, their horizon widened, their ideal altered. Most of the men are Welsh, and some have a pretty strong accent, since they come from rural districts. The women, on the other hand, are urban, and, generally speaking, come from a higher social class than the men.

The agricultural section is of more recent date than the training department, and can not boast such large figures, but it is a solid and practical development which has proceeded from the people's necessities. It is associated with six county coun-

cils, which subscribe £1,200 per annum toward its maintenance. In a recent report Principal Roberts claimed for it that it is effecting a silent revolution in Welsh agriculture. The board of agriculture has also come to its aid, granting at first a subsidy of £250, now increased to £800 per annum. Landowners and farmers are cooperating, and, at great expense, test practically the methods expounded in class rooms. Theorists, that is, unpractical theorists, would need to tread warily when tests are applied in this way. Farmers can now get access to scientific information and guidance in a way undreamed of before. The department works in four ways, determined to cast the seed into all sorts of soil. It would be many years before anything could be achieved if Wales waited until farmers could go through the agricultural-degree course. There are, therefore, four courses of instruction provided: (1) An elementary seven weeks' course is provided for farmers during the winter months. (2) An advanced course lasting sixteen weeks, and mainly for those who have profited by the first course, begins in October. Both these short courses deal with the essentials of agriculture, and are intended for those who have already practical knowledge of the subject. In both courses students take agricultural chemistry, since it is the basal science of modern agriculture. (3) The diploma course lasts for two full sessions, and is chiefly for boys who have left school and who have had a good preliminary education. Such subjects are studied as botany, physics, mathematics, zoology, in the first year; agricultural engineering, surveying, geology, entomology, veterinary science, in the second. The diploma a student earns is "associate in agriculture." (4) The fourth is the degree of B.Sc. in the University of Wales, lasting three sessions, with specialization in agricultural science during the last two sessions, as well as in two or three branches of pure science. Thus agriculture is as well provided for in Wales as anywhere in the kingdom. This is the Aberystwyth College programme in agriculture. Come there, and you will be served with a course. Numbers of people, however, will not do this, and Aberystwyth sends out an extension lecturer and dairy instructors to catch the farmers in highways and hedges and compel them to learn. Seven hundred lectures have been given in this way between 1891 and 1897 to audiences of 50,000 persons. The traveling dairy schools have had 1,900 pupils. During the summer months 150 women have come to Aberystwyth to get instruction in butter and cheese making, and though practically Welsh visitors only get bad and very salt butter, there is always the hope that the leaven will yet leaven the lump. During the 1897-98 session 51 men were agricultural students; 44 took short courses and 7 the full course. Young Welshmen are likely to benefit by the agricultural department. They are enterprising and go-ahead, like the Scotch, not so much rooted and grounded in their ancestors' methods as the average English farmer. It is significant that a chair of agriculture was founded at Edinburgh University in 1790; in Wales, 1890-91.

Space fails to tell of the pleasant social life of the college, shared by both sexes, and including debates, lectures, concerts, dramatics, and other social entertainments. The staff may be said to be mixed, since one lady has a post in the training department and another teaches needlework. The sexes are almost on an equality, and attend the same classes without distinction or difference. Saving a few students who reside with parents or relatives in the town, the women are all resident in Alexandra Hall, under the care of Miss E. A. Carpenter, of whom it is only fair to say that the great expansion of the college on the women's side is due to her. When she assumed the post of superintendent in 1887 there were 11 women students. House was added to house under her able management until, in 1896, Alexandra Hall, a handsome structure facing the sea at the north end of the parade, was opened, accommodating 150 students. Even this has not proved sufficient, and in 1898 a new wing was added, so that the entire building can now hold 207. At present the number is 177.

General studies, used by those who have cubicles, face the "melancholy ocean," as do a large number of study-bedrooms, the dining room, and library. Students

obtain board and lodging for a sum varying from 30 guineas per annum for a cubicle to 40 guineas for a study-bedroom. The completeness of the service arrangements, the excellence of the food, the large amount of liberty accorded, would require an article to themselves. Most people know the unbending rigidity of life in an institution, yet the tired student (not a sick person) at Alexandra Hall may have any meal except dinner in her own room, if a student will carry the meal upstairs. If the reader add 30 guineas and the college tuition fee of £10, it becomes evident that a young woman can obtain an excellent education for a little less than £42 per annum. This explains why so many Englishwomen flock to the Welsh colleges. It only remains to be said that Aberystwyth air is as fine as the scenery, so that even a pretty severe course of study does not injure, but rather improves, the health of the students.

---

### APPENDIX III.

#### SOME NOTES ON THE MEDIEVAL UNIVERSITIES OF SCOTLAND IN RELATION TO THEIR CONTINENTAL MODELS.<sup>1</sup>

[By D. G. RITCHIE, Professor in the University of St. Andrews.]

The origins of those universities and colleges to which we are proud to belong should be of some interest to all of us, and especially to a society such as this, which seeks to restore the ancient links that bound the students of one country to those of another. I must begin by apologizing for trespass on the province of the historian, and I should state that my materials are mostly collected at second-hand from such sources as Mr. Rashdall's recent work on the mediæval universities.<sup>2</sup> Only in a few small points am I able to supplement Mr. Rashdall's scholarly researches; yet possibly these points may interest you.

Three of our Scottish universities were founded in the fifteenth century—St. Andrews in 1413, Glasgow in 1450, and Aberdeen in 1494.<sup>3</sup> (Edinburgh was founded nearly a century later, in 1582, after the Protestant Reformation.) In earlier days Scottish students had resorted to Oxford in considerable numbers; but the frequent wars with England, and the fact that in papal schisms Scotland and England generally adhered to different popes, made Scottish students find Oxford a somewhat uncomfortable place of residence. The feeling of Oxford toward Scottish students is curiously illustrated by the fact that the principal of an Oxford hall insisted on being allowed to take a solemn oath that he was not a Scotsman!<sup>4</sup>

Numbers of Scotsmen resorted to Paris (where the Scots College had been founded in 1326), and was specially encouraged by the Bruces as a rival to Balliol College, Oxford), and they formed one of the "tribes" of the German nation there. They constituted one of the student nations at Orleans and also at Padua, and the wandering Scot was to be found at most of the universities of continental Europe. But in the beginning of the fifteenth century Scotland came to desire a university of its own. The dangers of travel by sea and land, the risk from wars and brigandage, the impediments put in the way of Scotch students by "schismatics their enemies," are recited in the papal bull of August 28, 1413, as reasons for founding a university in Scotland; and the inconveniences suffered by Scotch students had then probably reached their maximum, for the pope, Benedict XIII (Peter de Luna), who issued this

<sup>2</sup> "The Universities of Europe in the Middle Ages," by Hastings Rashdall, M. A., 2 vols., Oxford, 1895.

<sup>3</sup> The dates here given are those of the papal bulls.

<sup>4</sup> Rashdall, II, p. 417.

bull, was a pope acknowledged by Spain and by Scotland alone. The first Scottish university was thus founded by a pope whom only two countries acknowledged, and with no royal charter, for the king of Scots, the poet-king, James I, was then a prisoner in England. We can assign a definite date to the foundation of St. Andrews, as of all the later universities of Europe; but even before the papal bull was issued or asked for by the bishop, the seeds of the university had been planted. In the summer of 1410 (as Mr. Maitland Anderson tells us<sup>1</sup>) a number of enlightened Scotch ecclesiastics formed a society for the instruction of all who chose to attend their lectures. The abbot of Scone, Lawrence of Lindores, expounded the great philosophical text-book of the Middle Ages, the "Sentences" of Petrus Lombardus; others gave lectures on theology, on logic, on canon and civil law; and this society of lecturers and students assumed the title of a "university" (in its mediæval sense), even before the bishop's charter (of 1411) was granted conferring on this society of masters and scholars the customary privileges and immunities. If we go further back, to the rise of the oldest universities, we can point to no definite date for the foundation of Bologna or Paris, of Oxford or Cambridge. They were not made, but grew; and Oxford never even obtained a papal bull at all to define or secure its privileges, but maintained them simply in virtue of unquestioned custom. That the University of Bologna was founded by the Emperor Theodosius II, that the University of Oxford was founded by Alfred the Great, and the University of Paris by Charlemagne, are myths of the same kind and of comparatively late origin.

Universities are a distinctively mediæval product. Writers on Greek and Roman history sometimes, in an endeavor to vivify the past, speak of the "University of Athens," or the "University of Rhodes" or "of Alexandria;" and it is true that the young Roman of Cicero's time, for instance, resorted to Athens to carry on his education in the same spirit as that in which students flocked from all parts of Europe to Bologna, or to Paris, or to Oxford in the twelfth and thirteenth centuries. But to speak of the "University of Athens" or "of Alexandria" is strictly an historical anachronism. The teachers of philosophy and of rhetoric in the ancient world taught quite independently of one another. They came so far to perform the function of a university, but they did not constitute a university. If I may borrow a distinction from zoology, the schools of Athens and our universities are "analogous," but not "homologous" structures. "Universitas," in its original sense, means a "society," a "guild," a "corporation." And the mediæval universities are the product of the same spirit of voluntary association which produced the trade guilds. This mediæval habit of voluntary association was rendered necessary by the weakness of the State for the maintenance of law and order. The "university" of Bologna originally meant nothing more than the society formed by the foreigners who had come to Bologna to study civil and canon law, and who bound themselves together for mutual help and protection against the citizens. The notion is still current in some quarters that a "university" means an institution where all subjects are studied. Historically, this is a complete delusion. Some of the greatest mediæval universities never had all the faculties. Thus at Paris there was no faculty of civil law,<sup>2</sup> at Bologna there was no proper faculty of theology. A mediæval "university," if we look for the truest parallel in the modern world, was a trade union of scholars, or of teachers, or of both; and the method by which these associations sought to enforce their demands was, as with modern trade unions, the method of a "strike"—a "suspension of lectures" on the part of a university of masters, the threat to migrate and leave the town on the part of a university of scholars.

In modern times universities, at least in Europe, have come in varying degrees to be more directly under the governments of the countries in which they are situated—

<sup>1</sup> "The University of St. Andrews: an Historical Sketch" (Cupar, 1873), p. 2; a sketch which, it is to be hoped, may some day be worked up into a complete picture.

<sup>2</sup> See Rashdall, I, page 323, note 4.

more so in France and Germany than in Scotland, more so in Scotland than in England. We may, perhaps, find the first germs of this later stage of academical evolution in the constitution which Bishop Elphinston framed for the University of Aberdeen; the power of making statutes was intrusted to the chancellor, rector, resident doctors, etc., but along with them were put at least two privy councillors of Scotland.<sup>1</sup> We can thus distinguish three distinct stages in the evolution of the higher education of Europe—first, the isolated “sophist,” “philosopher,” or “rhetorician,” who might become the founder of a school or sect, which in course of time might be endowed by private or public munificence, but who was quite independent of the other and generally rival teachers of the same place; secondly, the association or guild of teachers or scholars, or of both, which constitutes the mediæval university, and out of which has been developed the third stage, our modern systematically organized universities, more or less directly under state control.

In the papal bull for the foundation of St. Andrew’s a term is used as convertible with *universitas studii*, which originally had a distinct meaning—*studium generale*. (The bull of Alexander VI, for the formation of Aberdeen, speaks of *universitas studii generalis*.) This term contains more of the meaning we usually connect with a university, but it is likewise often misunderstood. It does not mean an institution for the study of all sorts of subjects, but an institution for students from all quarters of the world, as distinct from a merely local school. It was this cosmopolitan character of the mediæval universities which brought the pope into special connection with them. It came to be recognized that only the pope, or the holy Roman emperor (in those countries which acknowledged his authority) could confer the necessary privileges; and thus even *studia*, which had arisen and acquired a more than local reputation independently of papal and imperial authority, came to apply for papal bulls and imperial charters. It is this, also, which explains the way in which the universities of one country came to influence the type of those in another, irrespective of neighborhood or of political ties—how, e. g., the universities of Scotland bear more resemblance to those of Italy and of Germany and of the Low Countries than to those of England, or even of Scotland’s ancient political ally, France. The bull of foundation of Glasgow (Nicholas V, 1450), conferred on it the privileges of Bologna, and the statutes of its arts faculty make frequent reference to the customs of the University of Cologne. Bishop Elphinston, however, in his statutes for Aberdeen, enjoins the regents in arts to lecture after the manner of those of Paris; the professor of canon law was to take Paris, and the professor of civil law was to take Orleans, as his model.

There are some respects in which the Scottish universities retain more distinct survivals from (or revivals of) mediæval institutions than any other universities.<sup>2</sup> One of these is the election of the rector by the students, including those who have not yet taken any degree and who may never take any. Some of the students, if asked, might perhaps say that they have this right because of the eternal fitness of things, students being always wise and professors foolish. A lawyer, if consulted, might be content to say that they have this right because it has been conferred on them by the act of Parliament of 1858. A historian requires some further explanation of a practice so unlike what exists elsewhere; and for a historical explanation we must go back to the Italian law school of Bologna in the twelfth century. When the study of Roman law, which had never died out in Italy, revived in Bologna, the fame of some of the teachers of that city attracted students from all parts of Christendom. The foreign students found it necessary to form themselves into a society, a guild, a “students’ union.” That, as already explained, is the original meaning of “*universitas scholarium*.” The teachers or students, who were citizens of Bologna,

<sup>1</sup> Rashdall, II, page 310.

<sup>2</sup> This was clearly pointed out by Prof. S. S. Laurie, in his “Lectures on the Rise and Early Constitution of Universities” (1886), p. 193.

had the protection of their own municipality and did not feel the need of special organization; the "universitas," or students' union, was an attempt on the part of the foreigners "to create for themselves an artificial citizenship."<sup>1</sup> This guild, or union, elected its own president, who was called by a title which had come to be used as the Latin equivalent of the Italian podestà (the elected chief magistrate of a Lombard town), and that title was "rector." (In Oxford and Cambridge we find the words rector and procurator or "proctor" used as convertible terms.) These law students of Bologna were, as a rule, much older than the arts students of mediæval Paris or Oxford, or than the arts students of the Scottish universities either in mediæval or modern times. Many of them were beneficed clergy, who had obtained leave of absence in order to study canon or civil law. At Bologna the rector had to be a secular clerk (i. e., of the clerical order, but not under monastic vows), at least twenty-four years of age. The real modern analogue of the original mediæval rector would be the president of the students' representative council.

There can be no doubt that it was from the Italian student universities that the election of the rector by the students was transferred to the Scottish universities when they were founded. In Paris, where the rector of the arts students became the chief authority in the university, he was elected by the masters of arts, and not by undergraduates. (Similarly, in Oxford, the two proctors were elected by the masters of the northern and southern "nations," respectively.)

The position of the rector in the Italian universities became somewhat burdensome, except to very wealthy men. Thus, at the inauguration of the rector of Padua, a tournament was held, at which he had to provide 200 spears and 200 pairs of gloves for the combatants. In the sixteenth century, at Bologna, it was the established custom for the students to set upon the newly elected rector, tear his clothes off his back, and then require him to buy back the fragments at high prices. The statute of 1552 was passed in order to restrain "the too horrid and petulant mirth" of the occasion; but it only prohibits the demand for money, and expressly says: "We do not forbid the pulling off and tearing in pieces of the raiment, provided that those who have torn the clothes may not exact any payment therefor."<sup>2</sup> Such was the moderation of university reform in those days. Quite lately, at St. Andrews, the rector, instead of giving the customary address, provided at considerable expense a dinner and a dance. I do not know how far this is to be interpreted as a reversion to mediæval practices.

The Scottish universities are peculiar in having at their head, alongside of a rector elected for short periods, a chancellor holding office for life. (Elsewhere one or other of those offices has disappeared, or, as with the proctors at Oxford and Cambridge, its functions have become practically different.) It is the chancellor, or in his absence the vice-chancellor, who alone confers degrees. For an explanation of the office of chancellor we must turn, not to Bologna, but to Paris and Oxford. The chancellor in Paris was not an officer of the university at all, but the chancellor of the cathedral church of Paris. Before the rise of the universities the cathedral schools had been the most important educational institutions in northern Europe—far more important than the monasteries, which did not care to train those who were not going to become monks. The custom had grown up that anyone wishing to exercise the profession of teacher must obtain the license of the chancellor; and a university degree in its original meaning is simply a teacher's certificate. The University of Oxford, whether or not it came into existence (as Mr. Rashdall argues<sup>3</sup>) through Henry II's recall of English students from Paris in 1167, certainly grew up on the model of that great theological and philosophical school. But Oxford was not in mediæval times a cathedral city. It was in the diocese of Lincoln. The bishop was far away. So that the chancellor was from the first an officer of the

<sup>3</sup> II, p. 329.

university, and came to combine the functions of a continental chancellor with those of a continental rector. When the Scottish universities were founded we find, alongside of the temporary rector, on the model of Bologna, the permanent chancellor to a large extent on the model of Oxford. In each of the three mediæval Scottish universities (all of them being in cathedral towns) the bishop was himself the chancellor. And this practice was followed in St. Andrews, Glasgow, and Aberdeen during the periods of restored episcopacy in the seventeenth century.

The academic degree is, as I have already said, a license to teach. Our degree of *artium magister* is identical in its meaning with the *doctor philosophiæ* which survives in Germany and which has been borrowed from Germany by many of the American universities. German diplomas, it may be mentioned, often confer the degree in the style *doctor philosophiæ et magister artium*. In their original mediæval use the names *magister*, *doctor*, *professor*, were all convertible. We have a survival of this last identification in the English use of S. T. P. (*sacræ theologiæ professor*) as the equivalent of D. D. Originally every master (or doctor) might be compelled to teach at his university for a short period after receiving his degree. There is a formal survival of this in Oxford; for two years after taking the M. A. degree a graduate is a *magister necessariorum regens*, and may be compelled to attend the "Ancient house of congregation," which exists for the purpose of conferring degrees. The B. A. was only a preliminary stage. The word *baccalarius* simply means an apprentice. The bachelor is the "pupil teacher," who has to do some teaching while continuing his studies. The old Oxford form of admission to the B. A. degree ran: "Domine A. B., ego admitto te ad lectionem [i. e., dictating and expounding] *cujuslibet libri Logices Aristotelis et insuper earum artium quas et quatenus per statuta audivisse teneris.*" The "ethics" and the "metaphysics" could only be taught by masters, the logic was intrusted to the apprentices.

Only gradually did a definite class of university teachers come to be differentiated from the other graduates. The process in Scotland was rendered much more rapid by the formation of colleges, which are now distinguishable from the university in St. Andrews alone. The Scottish colleges were not, like those of Paris and Oxford, primarily houses of residence for students, but were mainly endowments for teachers, with provision for only a small number of resident scholars, as in Germany and the low countries. The professors of the Scottish universities are the lineal successors of those *magistri regentes* for whom a salaried post as a teacher was provided by the foundation of a college. For a long time the practice of "regenting" survived in Scotland—i. e., the masters or regents (as they are called) were not teachers of one particular subject, but of all in turn, like the tutors of an Oxford college until quite lately. Only by gradual steps the specialized professor was developed, and first of all in subjects like "the humanities" (Latin and Greek), which did not enter into the mediæval curriculum, or like mathematics, which made such great advances in the seventeenth century. The specialized professorships were not completely realized till the early part of last century; not till the middle of it in Aberdeen.

What has just been said will serve to explain some of the ancient forms which survive in our ceremonies of conferring degrees. The Scottish ceremony of capping (*birettatio*) is a survival of the original ceremony of "inception"—i. e., the admission of a new member to the guild of teachers. The ceremony still used at Oxford may seem to the eye of the onlooker somewhat more elaborate, but is in reality not the ceremony of inception, which has died out, but only the giving of a license to incept. Scotland has retained the actual "capping." The academic cap was in old days only worn by duly licensed teachers, and they used to keep it on their heads while lecturing, as some Oxford and Cambridge professors do still, and precisely as a Roman priest wears his biretta in the pulpit. The ceremony by which professors are still inducted at St. Andrews seems to me the most complete survival of the old form of inception. It includes the handing over to the person admitted of a book as a symbol of office, and in his "incepting"—i. e., beginning the exercise of his

functions by having to give a lecture. When degrees in grammar were conferred, as, e. g., at Cambridge in the Middle Ages (i. e., a license to teach Latin to boys, for Latin was not taught at the university, but a knowledge of it was presupposed), the ceremony consisted in the person incepting having a birch rod handed to him as a symbol of his office, and straightway proceeding to flog a "shrewd [i. e., naughty] boy." The boy was purveyed by the bedel, and received a groat "for his labor."<sup>1</sup>

Universities differ greatly in the ceremonies by which they confer degrees. They differ in the kinds of examinations which are a preliminary to these ceremonies. They all agree in one thing—they require (except in the case of purely honorary degrees) the payment of fees. Very good reasons of finance can be given why fees should be paid. But what is the origin of the practice? It is simply the newcomer paying his footing. Originally a master incepting had to "stand a drink" to the others of his nation. After a time the money, or some of it, came to be set aside *pro bono communi*, and thus a regular system of fees grew up. The earliest custom was no doubt to send presents of robes to the doctors, bedels, and other officials; but these came to be commuted into money payments, though there were still also certain customary presents—e. g., at Bologna, a cap, gloves, and a present of sweetmeats to each of the doctors and to the archdeacon. At Bologna, also, the new doctor had to give a banquet to his colleagues and university friends. Even tilts and tournaments were sometimes provided by the wealthier students, though this was forbidden. In Spanish universities a bull fight was given at the expense of the inceptor. As late as 1626 banquets on such occasions were suppressed in King's College, Aberdeen; but it was permitted "to bestow upoune the maisteris and examinaturis ane drinke upoune fute for recreation allanerlie without anie forder addition."<sup>2</sup> Among the students at St. Andrews there still lingers on a custom, though it is not, I believe, so rigidly observed as of old, which seems to me undoubtedly a survival of those usages in which graduation or matriculation fees originated. The day of a certain fair in November is known as "Raisinday," and on that day any fourth-year man may exact from any freshman one pound of raisins, giving in exchange a certificate, which till lately was always in Latin. This certificate was the bearer's proof that he was now a duly admitted member of the society of students. I have seen one of these certificates, but it was unmistakably modern English turned into dog Latin. I have been told of an older formula, which ran somewhat as follows: "Ego A. B. Magistrandus accipio a te C. D. Bejauno [i. e. bejaune, "freshman"] unum pondus racemorum."

Three of the Scottish universities are mediæval in origin. They are the three in which an academic dress is still worn by the students, at least by the arts-students, or some of them—red gowns, such as were worn by the German nation at Bologna, of which the Scotch students there would form a part. The fourth, the University of Edinburgh, is the offspring of the Reformation and the Renaissance. It was founded in the name of the king, with no sanction given or asked of the pope. It is not officially described as "universitas" or "studium generale;" it is the *Academia Jacobi VI.* Academies had begun with the Italian Renaissance, with the Academy of Florence, which renewed the name of Plato's school. In accordance with the Renaissance character of Edinburgh University is its dedication, still to be read on an old stone built into the present building, "Christo et Musis"—a mode of expressing "true religion and sound learning," which one is tempted to think may have been suggested by George Buchanan, who wrote classical dramas on Jephthah and John the Baptist, and turned the Psalms into the meters of Horace. But there is no evidence to connect Buchanan with Edinburgh University, which claims, indeed, to possess his skull, but may only be indirectly indebted to his brains.

From the first, Edinburgh University, unlike the other Scottish universities, had

<sup>1</sup> Mullinger, *History of University of Cambridge*, I., p. 345; Laurie, *Universities*, p. 71.

<sup>2</sup> R. S. Rait, *The Universities of Aberdeen* (1895), p. 133.

a close connection with the city. It was "the town's college," and the town council of Edinburgh were its patrons and rulers, sometimes enlightened and sometimes not. The model for Edinburgh was not Paris nor Bologna, not Orleans nor Cologne, but Geneva. Geneva, however, was a sovereign republic, and the relations of the government of this city republic to its academy were transferred to the case of Edinburgh.<sup>1</sup> It was historically fitting that when the constitution of Edinburgh University was reorganized by government in 1858 the town council should be represented in its ruling body (the court); but there were no reasons of historical fitness why the provosts of the other university towns should have been accorded a similar position in connection with the three older universities, which were never in any sense municipal institutions.<sup>2</sup>

These are only a few miscellaneous notes. But it is perhaps worth while to try to see some present usages in the light of their far-back origins. Of course, to know what universities originally were does not of itself settle the question of what they ought to be now. Different times have different needs. But it is always worth knowing the past life of the institutions under which we live. There is great gain in the continuity of sentiment that links distant generations together. It is a pity to drop old traditions when they are harmless; it is worth reviving some things that are not merely venerable, but useful.

The immediate effect of the ecclesiastical revolutions of the sixteenth century was to destroy, to a great extent, the international character of universities and to make them merely national institutions. Scotland was, indeed, in some respects less cut off from the Continent than England. Scottish students, after the Reformation, resorted to Leyden and Utrecht, as in older days they went to Paris or Bologna. In this century we are recovering a little of the international academic sentiment between students of different countries; and it is a most valuable sentiment, which may make more for peace and civilization than much of the work of statesmen and ambassadors.

## CHAPTER II.

### EDUCATION IN AUSTRALASIA.

[For previous articles in the Reports of the Commissioner of Education see: Secondary Education in New Zealand, by Sir Robert Stout, K. C. M. G., Report for 1890-91, Vol. 1, pp. 45-94.—Education in New Zealand, Report for 1892-93, Vol. 1, pp. 258-261.—Systems of Public Education in Australia, New Zealand, and Tasmania, Report for 1897-98, Vol. 1, pp. 189-214.]

#### TOPICAL OUTLINE.

*Australia:* Population and leading industries of the five divisions.—Proposed federation.—Educational statistics, current and comparative.—The systems of education: Control; sources of support; completeness of school provision; compulsion; secular character of the schools.—Historic survey.—Particulars from current reports: New South Wales; Queensland; South Australia; Victoria; West Australia.

*New Zealand:* Provisions of the school law and statistical summaries: Education, free, secular, and compulsory; local control; sources of school fund; course of study and classification of pupils; qualifications and salaries of teachers.—Provision for special classes: Schools for the deaf-mute; for the blind; for the natives; for vicious and unruly children.—Manual training and technical instruction.—Secondary schools.—Superior schools.—Libraries and learned societies.—Statistics of illiteracy.

*Tasmania:* Summary of latest official report.

#### AUSTRALIA.

*Area and population.*—The five colonies of Australia comprise a total area of 2,946,691 square miles and a population of 3,476,439, as estimated June, 1897. The importance of these particulars in a survey of the educational systems of the colonies will be better understood by the separate statement for each colony, as shown below:

	Area, square miles.	Population, June 30, 1897.	Popula- tion per square mile.
1. New South Wales .....	310, 709	1, 311, 400	4. 22
2. Queensland.....	668, 497	422, 941	. 70
3. South Australia .....	903, 690	356, 835	. 39
4. Victoria .....	87, 844	1, 177, 444	13. 4
5. West Australia.....	975, 920	157, 819	. 16

The leading industries of the colonies—agriculture, grazing, and mining—imply for a large proportion of the population all the conditions that pertain to rural life. The increase of the urban population is, however, noticeable. In New South Wales more than one-third the people (37 per cent) are in towns of above 9,000 inhabitants; Sydney,

the capital, has 410,000. Of the population of Victoria 47 per cent are in towns having each more than 20,000 inhabitants; the capital, Melbourne, has 451,110.

The ratio of the population of the capital to the total population of each colony is as follows:

Capital.	Population, 1897.	Ratio to total pop- ulation.
		<i>Per cent.</i>
Melbourne (Victoria) .....	451,110	38.3
Sydney (New South Wales) .....	410,000	31.2
Adelaide (South Australia) .....	144,350	40.4
Brisbane (Queensland) .....	100,913	21.1
Perth (West Australia) .....	25,000	15.8

Under the conditions of population here indicated the difference between urban and rural schools is very marked. The standards expressed in the law are only attainable in the large centers, and this is so clearly recognized that special adjustments are authorized by law for isolated communities and pioneer settlements. The present year promises to be made memorable in the history of these colonies by the final adoption of articles of federation and the establishment of a common capital in New South Wales. The federation, if accomplished, will naturally have a tendency to unify still further the educational systems of the separate colonies, which are already alike in many essentials.

The principal facts in the current record of the public school systems, and also a comparative view for the period 1890 to 1897, are here presented. To complete the summary the statistics of private schools and universities are also given.

*Statistics of public day schools, 1897.*

	Year.	Total enrollment.	Average attendance.		Teachers.			Expenditure.		
			Number.	Per cent of enrollment.	Men.	Women.	Total.	Total.	Per capita of enrollment.	Per capita of population.

a Also three theological colleges and one college for women.

b Also 608 students attending lectures. Three colleges or schools are affiliated.

THE SYSTEMS OF PUBLIC EDUCATION.

*Control of the systems.*—The control of education in each of the colonies is vested in a minister appointed for this particular interest or combining it with some closely allied interest; thus in New South Wales the minister of education has charge also of industry; in South Australia education and agriculture are combined. To the chief officer is consigned not only the general administration of the system but also its local direction. He decides as to the establishment of school districts and schools and controls the school funds and properties. In Victoria and New South Wales appointments of teachers and inspectors emanate from a civil service board; in the other colonies they are made by the minister.

Local boards of advice are constituted by election (in Queensland appointed by the Governor), and their representatives carry great weight in respect to the school affairs of their several districts, but the authority remains in every case with the minister.

*Sources of support.*—In all the colonies the schools are supported by appropriations from the public treasury; instruction is gratuitous excepting in New South Wales, where a weekly fee is required of 3d. per child, but not to exceed 1s. in all for the children of one family. Power is given, however, to the minister or the local board to remit the fees in cases where the parents are unable to bear the charge.

*Completeness of school provision.*—The classes of schools recognized in the several laws give evidence of the widely different conditions

under which the schools of different districts are maintained and also the efforts to adjust the school provision to these varying conditions.

The typical school is called simply the public or State school. It must maintain a certain average enrollment and must be kept in session the full time. There are also provisional schools, that is, schools which may be kept open for the full time annually, but whose average enrollment is below the standard, and half-time schools in districts where the number of children is too small to justify the expense of a full-time school. In such cases a teacher is appointed for two or more districts, and holds the school in each on alternate days or for a half session each day, according to the distance to be traveled. House-to-house schools have also been recognized as a temporary expedient. The plan of conveying children at public expense from isolated districts to a central school has been recently adopted and is gradually superseding that of special and half-time schools. In Victoria this plan is extensively employed and has virtually eliminated the half-time schools. Night schools, and in some of the colonies infant schools, complete the public provision for popular education.

*Compulsory attendance.*—Attendance upon school is compulsory for all children of legal school age (this varies in the several colonies, as shown in the detailed statements) unless they are educated privately or exempt by law.

*Secular character of the schools.*—In Victoria and Queensland the public schools are strictly secular; in South Australia unsectarian religious instruction is allowed; in New South Wales and West Australia provision is made for religious instruction in the schools at an hour when children may be withdrawn if their parents object to their presence.

*Historic stages.*—In their development up to the present state the systems of education in these colonies have passed through the same phases as that of England, but they have more easily thrown off the restraints of the earlier stage. The first attempts to establish schools were made by religious denominations and the first public effort in this direction was in the form of appropriations to the managers of such schools. New South Wales, whose history as a colony begins with a penal settlement in 1788, had increased its white population to 6,000 by 1800. For fifty years the Government did nothing in respect to popular education. In 1834, the year after the English Parliament made its first appropriation for elementary schools, the government of New South Wales allowed a grant for the same purpose. The money was to be distributed to the heads of the religious bodies in the proportion of the amounts they were expending for education. In 1839 a grant was made to provide undenominational schools for those who preferred them. The first school law, passed in 1848, made equal provision for State and denominational schools and constituted separate boards of control for each. The school law of 1866 abolished the dual control, placing all the schools under a single board called the council of education.

It was not until 1880 that State aid to denominational schools was discontinued. The education law of that year constituted the system as it is now operating, created a minister of education, and gave him full authority in respect to the schools. In the colonies that have been formed from the original area of New South Wales, Victoria (1851), Queensland (1854), there has been a similar transition from denominational to State schools.

In Victoria a State system was established as early as 1873. The present law, which created a ministry of education, was passed in 1890. In Queensland the dual system of national and denominational schools continued until 1875, when the present law was passed. This law created a department of public instruction, to be controlled by one of the Crown ministers, and provided that State aid to denominational schools should not continue after December 31, 1880. Since that date parochial schools, excepting those belonging to the Roman Catholic Church, have ceased to exist.

South Australia was declared a colony in 1836, and in 1847 the first school law was passed. It was followed by the law of 1851, which laid the foundation of a State system by grants-in-aid for the erection of school buildings and for the salaries of teachers. The law of 1875 organized a secular compulsory school system to be controlled by a responsible minister of education. The amending act of 1878 extended the authority of the minister, and that of 1891 abolished fees in all State schools.

The settlement of West Australia began in 1829, but its growth was very slow until 1850, at which date the colony numbered about 6,000 inhabitants. The census of 1859 showed great increase, the population having risen to 14,837. The earliest schools, as in the other colonies, were established by the churches, and the school law passed in 1871 provided that both government and denominational schools should receive public grants upon specified conditions. The amending law of 1893 vested the control of the system in a minister; that of 1894 made school attendance compulsory upon all children, unless they receive efficient instruction at home or live more than 3 miles distant from a school; the amending law of 1895 provided for the discontinuance of grants to denominational schools after the 1st day of January, 1896.

#### PARTICULARS FROM CURRENT REPORTS.

Considering each colony separately, the following details from the latest official reports, covering the year 1897, are of interest.

## NEW SOUTH WALES.

*School attendance.*—In addition to the enrollment in public elementary schools (226,157), there were 1,558 pupils in attendance at other state schools, classified as follows:

The Sydney Grammar School.....	532
The industrial schools .....	737
The school for the deaf and dumb and the blind .....	118
The reformatory schools .....	171
Total.....	1,558

From the returns of private schools it is estimated that they enrolled 55,000 pupils. Thus of 347,044 children in the colony between the ages of 4 and 15 years 227,713 attended State schools and 55,000 attended private schools, while the remainder, 64,331, received instruction at home, had completed their education, or were untaught.

It appears further that 61,727 children between the ages of 6 and 14 years failed to complete the minimum attendance of seventy days required by law during the first half of the year, but in 738 cases only was the law set in motion. The parents of 3,554 were cautioned, while in the remaining cases satisfactory explanations were furnished or the circumstances were not such as to render any action necessary. In a large number of instances pupils had obtained certificates by examination, and were thus legally exempt.

For the second half year the number between the compulsory ages who did not attend seventy days was 45,560. In 856 cases legal action was taken and cautions were sent to parents in 2,543 cases.

The enrollment in public schools includes 577 pupils in the five public high schools, whose course is preparatory to the university. The expenditure for these schools was \$31,091, of which the state provided \$21,090, the balance being met by fees. The state provides a certain number of scholarship funds to be competed for by students who have completed the course of the high schools. These are available in secondary schools of higher grade or in the university.

The progress in technical education in the colony is summarized as follows:

*Technical education in public schools—drawing.*—One hundred and fifty-two thousand four hundred and eighty pupils were examined in this subject, of whom 124,208, or 81 per cent, satisfied the standard. In 203 departments in the metropolitan and submetropolitan districts visited by the superintendent of drawing 45,746 pupils were present at examination; 80.4 per cent of these were found to reach the standard.

*Manual training.*—Eight workshops were in existence in 1897, which afforded instruction to the pupils of 24 schools. The total enrollment of these classes, including students in training for teachers' places, was 634. Of these 415 presented themselves for examination and 375 passed.

*Cookery.*—The number of schools in operation in 1897 was 12, with an enrollment of 880 pupils. Of this number 773 presented themselves for examination, of whom 748, or 97 per cent, were successful.

*Needlework.*—Fifty-five thousand eight hundred and ninety-one girls were examined in needlework, of whom 49,926, or 89 per cent, passed the standard. In the Metropolitan district 99 schools, representing 14,539 children, were examined by the directress, who reported satisfactory progress.

*Scientific and technical education.*—A comparative statement of the total enrollment of students of the colleges and branch schools for the years 1896 and 1897 is given below:

	1896.	1897.
Sydney Technical College .....	3,302	3,678
Suburban classes .....	578	726
County classes .....	2,285	2,342
Classes connected with public schools .....	954	912
Total .....	7,119	7,658

Deducting from this enrollment all cases where students were members of more than one class, the number of individuals attending the classes was 5,848, as against 5,396 for last year. The average weekly attendance was 3,983, giving an increase over 1896 of 265.

The students examined at the end of the year numbered 2,702, of whom 1,923, or 71.1 per cent, were successful; in 1896 there were 2,576 examined, 1,822 of whom, or 70.7 per cent, passed. At the technological examinations of "The City and Guild of London Institute," held in April last, 35 students of the technical colleges were examined, of whom 28 passed. Two candidates in plumbing and one in telegraphy obtained first-class honors, whilst two in plumbing, one in telegraphy, and one in electric lighting obtained second-class honors. Seven of the candidates also passed the practical examination in plumbers' work.

The teaching staff comprises 85 persons, viz, 13 lecturers in charge of departments, 5 resident masters in charge of branch schools, 36 teachers, 12 assistant teachers, and 19 teachers in charge of classes remunerated by pupils' fees only. As in former years, lectures upon technical subjects have been delivered by the officers of the department in the various centers of population.

The new buildings at Bathurst are rapidly approaching completion, and it is expected that the college will be ready for the reception of students very shortly.

The superintendent states that much original and important economic work was done during the year in connection with the technological museum, which, it is anticipated, will lead to the opening up of new commercial avenues by the utilization of indigenous vegetable products.

Great interest continues to be taken in the country museums, as is shown by the large number of specimens received locally. In May last a new museum at Albury was formally opened.

The Technological Museum was visited by 224,984 persons. The total expenditure on technical education during 1897 amounted to \$19,435.

#### QUEENSLAND.

*School attendance.*—With respect to the enforcement of the compulsory attendance law, the report states that 1,637 children between the ages of 6 and 15 and living within reach of a school are not educated up to the standard required by the law and are not attending any school. This is 66 less than the number reported in 1896.

The number of children reported as not attending school the minimum number of days required by the education act—that is to say, 60 in the half year—was 9,422 in the half year ending June, and 7,968 in the half year ending December—a decrease of 388 defaulters in the first half year and of 652 in the second half year. Besides the enrollment in public schools (85,229) there were 1,616 children supported by the State in orphanages. The State makes some provision by scholarship funds for the continued education in secondary schools of pupils from the public schools. The number holding such scholarships in 1897 was 257.

#### SOUTH AUSTRALIA.

*School attendance.*—Effects of compulsion. From the official report it appears that of the children subject to the compulsory law (ages between 7 and 13), 86.5 per cent attended in 1897 the thirty-five days required by law, 11.62 per cent were excused for satisfactory reasons, and 1.88 per cent were cases of neglect.

*State scholarships.*—The Government makes a limited provision for the continued education of elementary pupils in secondary schools and the university by means of scholarship funds open to competition. For the years reviewed there were 19 holders of State scholarships in the advanced school for girls and 9 pursuing university courses.

*Schools of agriculture and of domestic industry.*—The establishment of a secondary school of agriculture is an interesting fact in the year's record.

Arrangements are being made for other schools of this class, and in course of time a complete system of practical secondary education for boys will be formed on these lines throughout the colony. A house-keeping school for girls of secondary school age has also been organized in connection with one of the city schools, which will serve as a model for other similar institutions.

General advance is noted in drawing, manual training, and agricultural teaching.

*Woman inspector.*—The experiment was made during the year of appointing a woman on the staff of inspectors.

## VICTORIA.

*School attendance.*—In addition to the attendance upon public day schools, as shown in the tables, the returns of private schools give an enrollment of 47,651 pupils. There were also 293 children in the reformatories and schools for neglected children.

It appears that of the total number of children of the compulsory age (6-13), 60.4 per cent fulfilled the requirements by attendance upon public or private schools, and 9.7 per cent were exempt. Of the remainder, one-fourth were dealt with according to the law, and as to the balance, no specific information was obtained.

*Provision for conveying children to central schools.*—With respect to the plan of conveying children from remote districts to central schools, the report says:

Under the system of conveyance 253 schools have been closed up to the 30th of June last. There are besides several instances where, instead of establishing new schools, the educational requirements have been met by conveyance.

In the case of closed schools the saving, after allowing for those schools which would of necessity have been closed in consequence of paucity of attendance, after deducting the cost of conveyance, amounts to about \$74,000.

The attendance of the children whom this system provides for continues to be characterized by remarkable regularity, and the system has become so popular that applications are constantly being received to be brought under its provisions.

The payments for conveyance are restricted as hitherto to (a) cases where schools are closed through low average attendance and (b) applications where the number of children would warrant the department in establishing a school. Under the plan of combining schools, no fewer than 81 schools have been made adjuncts of more central and more important schools in the neighborhood.

The actual saving realized in connection with the schools that have thus been dealt with amounted for the year to \$185,000.

*Industrial and technical education.*—Movements are in progress for the introduction of cookery into the schools for girls and for courses of instruction in the higher classes of the elementary schools for pupils who propose to enter mining schools or agricultural colleges. Grants in aid were continued during the past year to the 18 schools of mines and technical schools. The total expenditure for these schools amounted to \$60,000.

## WESTERN AUSTRALIA.

*Efforts to improve school attendance—the compulsory law.*—The official report of Western Australia says with respect to compulsion that an attempt has been made during the year to enforce the law more fairly and uniformly throughout the settled parts of the colony, and in the

latter the staff has been strengthened, and consequently more inspection work has been carried out. In a young country there must be many small schools in distant and expensive places, and the fact that these are necessarily very costly must always be remembered. The most expensive of all the schools are the half-time schools, where the cost per head of average attendance is \$30. The next are the little provisional schools, where the cost is \$26.50; and then come the gold-fields and other special schools, where the cost is \$20.36. In the ordinary State schools the average cost is only \$16.08. As a set-off against the increased cost of these smaller schools, it is satisfactory to note that the attendance in the half-time and provisional schools is better than in the State schools and special schools, being 89 per cent in the half-time schools and 82 per cent in the provisional schools, compared with 74 per cent in the State schools and 68 per cent in the special schools. The low attendance in special schools—which are, as shown above, costly to the department—would seem to point to the necessity of compulsory officers on the gold fields so that the department may, by a little further expenditure, get more value for its money.

*Defects in the law.*—The Inspector-General points out the following defects in the compulsory law: (a) There is no provision for scheduling or taking a census frequently of children of school age, so that with a very fluctuating population many children do not come under the compulsory officer's notice at all. (b) There is no right of entry into private schools to see if children are attending and no return of attendance furnished by them. This enables parents to withdraw their children from Government schools and nominally enroll them in private schools with the intention of breaking the law. Returns of attendance ought to be furnished, and the Government should also have the right of inspecting all private schools to see that they are efficient and sanitary. (c) There are no provisions for preventing juvenile labor. Factories are springing up and there should at once be legislation preventing the employment of children under 14. (d) Prosecutions are beset with difficulties: (1) Some magistrates insist on the teacher being present to prove attendances—a most unnecessary requirement. (2) The officers have to wait for the quarterly returns before prosecuting, though they may know the parent is defying the law. With some parents the only course is to prosecute repeatedly until the child is regularly sent. (3) No doctor's certificate or even parent's written statement of illness to the teacher is required. A parent may, therefore, send word that the child is ill and plead this message as a reason for absence to the magistrate when there has been no foundation in fact for the excuse. A bill embodying his suggestions has been presented to Parliament.

*The teaching force.*—With respect to the teaching service, the report says further: Larger attendances in the schools, bringing with them larger classes under individual teachers, should eventually effect a considerable economy; but with this enlargement of classes arises the

necessity to insist on higher qualifications for the teaching staff. It is needful, therefore, to offer more adequate salaries. In the present regulations the salaries range for head teachers from \$450 to \$1,400 male and from \$300 to \$1,120 female (though in the central boys' and girls' schools in Perth this amount is exceeded, as the circumstances are exceptional). In provisional schools lower salaries may be paid. The salaries of assistants range from \$450 to \$875 male and \$300 to \$700 female. There are many more in the lower grades than in the higher, and the average salary of adult teachers is \$575. It will be seen that in a country where the cost of living is so high the salary is, in many cases, too small. The difficulty that this department has in preparing its estimates for the coming year is evidenced by this item alone; for, supposing, as last year, the children increased by 3,000, allowing 50 children to a teacher (which is the outside number that can be given to an individual), at the average salary named, an increase of \$35,000 will be required upon the estimates for salaries alone. It is, however, necessary, if a sound education is to be given that the best men and women that can be found should be chosen. As has been said, good education is a wise national investment. The State must therefore be prepared to see that the quality of the education given is as high as possible. It has become essential that there should be greater facilities given to the teachers for self-improvement, and the training college, so long promised, should be established as soon as possible. Only in this way will it be possible for the young western Australians who are growing up, to qualify themselves for taking part in school teaching, while those who have been in the service for a long time need further opportunities for learning the latest methods.

*Teachers' association.*—The teachers' association, formed early in the year, is welcomed by the Department as a very valuable auxiliary, and that body should help, by the practical experience of its members, to greatly improve the general efficiency of the teaching staff. In this work the inspectors must also take a large part; and to insure a greater continuity in their work, by enabling a better comparison of one year's results with another, the colony has now been divided into four districts, for which the four inspectors will be responsible.

#### EDUCATION IN NEW ZEALAND.

Population (census 1896) 754,016, or, excluding 23,854 natives, 714,162.

*Public schools and school attendance.*—Under the school law, or, as the title reads, "Education act" of 1877, the public schools of New Zealand are free and secular. The compulsory clauses of this law were repealed by the school attendance law of 1894, which made the requirements as to school attendance more stringent, extended them to the children of the aboriginal Maoris, and empowered the education boards to appoint truant officers for the more complete enforcement of the law.

The law also authorizes the issuing of good attendance certificates.

These certificates are of two classes—the highest is issued to all pupils of the public schools who for a period of twelve months are present at every session of the school in their respective districts; the lower class certificate is issued to all pupils who for a like period are not absent more than five times.

The official report for 1898 shows that for the year ending December 31, 1897, there were in operation 1,585 public schools, an increase of 53 over the preceding year. It appears that the increase in the number of schools is more rapid than in the number of pupils.

The average number of pupils to a school was less than 70, and the number of schools with less than 25 pupils was increased during the year by 55, or more than the total increase in the number of schools.

The enrollment in these schools for the year was 132,197, an increase of 1,160 over 1896, and comprising 18.5 per cent of the white population. The average attendance was for boys, 57,504; for girls, 53,019; total, 110,993, an increase of 2,017 over the preceding year. This average was 83.9 per cent of the enrollment. These numbers indicate a high degree of success in enforcing school attendance. The teaching staff numbered 3,628, of whom 1,456 were men and 2,172 women. There were also 183 sewing mistresses employed.

The enrollment above given includes 2,260 Maori children in attendance upon the ordinary schools. In addition there were 74 village schools for natives, attended by 2,864 pupils and maintaining an average attendance of 77½ per cent, and in the four boarding schools for Maoris 263 pupils, of whom 73 were Government pupils maintained at public expense.

The expenditure for public education amounted to \$2,400,182.

*Administration of the system.*—The control of the system of education is centralized in one of the Crown ministers who is designated by the governor of the colony to the special duties of the education department. The governor also appoints a secretary for the department and school inspectors.

The colony is divided into thirteen educational districts, in each of which an education board of nine members is constituted.

These boards have the power to form school districts in their respective divisions, to establish and maintain schools, appoint and remove teachers and school officers, and to receive and disburse the school income of their respective areas.

In each local school district there is a school committee of five to nine persons elected by the householders. These local committees elect the members of the district boards.

Thus while the unit of local control is the area included under a district board, the local school committees have great power, as they virtually determine the composition of the boards. The number of school districts is increased as conditions require. In 1893 they numbered 1,075 and the local committees included 7,525 members; thus of the male

population above 25 years of age one in every twenty was a member of a school committee. Objection is made to this system because a committee representing a very small or sparsely settled school district has just the same voice in the election as a committee representing a larger district. The following criticism of the system by the president of the Otago Educational Institute makes this weakness very clear. He says:

To elect the 117 members of our 13 education boards is, perhaps, the most important duty these local bodies have to discharge. Each committee, representing generally one school, has the right to give one vote to each or any of three candidates for the positions vacated by three members of the boards retiring annually. At once this places an enormous power in the hands of school committees. When it is remembered that of 1,302 schools in New Zealand no fewer than 840 have an average attendance of under 50 pupils, it will readily be understood that the choice of men to serve as members of our education boards may really be in the hands of a very small section of the community. To illustrate my meaning, I may state that of 202 schools in Otago 122 have an average attendance of under 50 pupils, 57 under 25, 39 under 20, and 21 under 15. Taking the 21 smallest schools, I find that they average 11.6 pupils each. Now, any four such schools with a total average attendance of 46 pupils possess the same voting power in electing members to our education boards as, say, George street, Albany street, Kaikorai, and High street schools with a total average attendance of 2,696, or nearly 60 times as many children. This is manifestly unfair, and has led to such abuses, especially in the smaller education districts, as establishing schools where there is no absolute necessity for them, pulling down old schools to be replaced by new ones, when the old ones might last for years, making unnecessary additions to schools and residences, and other extravagances. As three members of each board retire annually, and they are at the mercy of the committees, they dare not, if they wish to be reelected, move in the direction of any reform, if such reform be not agreeable to the committees of these very small schools. This is not a desirable state of things, and any plan to remedy this defect in our act should be welcomed.

The local committees have the management of educational matters within the school district, subject to the general supervision and control of the board and to inspection by a Government inspector. The law provides that—

Every committee may, with the sanction of the board of the district within which the school district is, previously obtained, provide, by building or otherwise, schoolhouses, and may improve, enlarge, and fit up any such schoolhouses, and supply apparatus and everything necessary for the efficiency of the schools provided by them, and such proportion of the cost of providing, fitting up, improving, and keeping in repair such schoolhouses as may be prescribed by such board shall be defrayed by the committee out of the school fund, and the remainder (if any) of such cost shall be defrayed by the board of the district within which the school is situated, by and out of any moneys at their disposal.

The committee may from time to time, with the approval of the board, appoint teachers of sewing for any school under its control.

On the application of the committee, the board of the district may select, purchase, lease, or acquire a suitable site or sites for a schoolhouse, and the board, if it shall so think fit, shall require that the whole or any portion of the cost of such purchase shall be defrayed by the school committee out of the school fund.

The committee, with the approval of the board, may establish savings banks for the use of children attending the school.

*Public school funds.*—The funds available for the public schools consist of the board fund and the school fund. The former comprises (1) grants from the consolidated fund, (2) rents and profits derived from property or endowments vested in the board, (3) special endowments or grants for particular purposes, (4) special fees for higher education, (5) any other moneys which the board may receive from donations, subscriptions, or otherwise.

The school fund, which is at the disposal of the school committees, consists of:

(1) Moneys granted out of the board fund.

(2) Donations, subscriptions, and all other moneys which may be granted to the committee for the purposes of this act.

The two funds are paid into such bank as the district board appoints to an account called "The education board account," and no moneys are drawn out of the bank except by authority of the board. The moneys are paid out by check, signed by the treasurer and by such other members of the board as that body may authorize.

The accounts of the boards therefore comprise the whole expenditure for the schools.

The expenditure for 1897 will be found tabulated below.

*Studies and classification of pupils.*—The subjects of instruction in the public schools, as required by the law, are:

Reading, writing, arithmetic, English grammar and composition, geography, history, elementary science and drawing, object lessons, vocal music, and (in the case of girls) sewing and needlework and the principles of domestic economy. Provision must also be made for the instruction in military drill of all boys in the schools.

The course is arranged for six grades (standards); the number of pupils in each grade in 1897 was as follows:

Standards.	Classification of pupils by grades.		
	Boys.	Girls.	Total.
Preparatory class.....	17,361	15,124	32,485
Class for standard—			
I.....	8,437	7,818	16,255
II.....	8,786	8,196	16,982
III.....	9,793	9,108	18,904
IV.....	9,514	9,124	18,638
V.....	7,185	7,224	14,409
VI.....	4,934	4,667	9,601
Passed standard VI.....	2,446	2,467	4,913
Total.....	68,459	63,738	132,197

By comparison with the corresponding statistics for the past four years it appears that in all grades above the third the proportional number of pupils is constantly increasing; that in the classes preparing for grades III and IV the change in this respect is intermittent, and in all the lower classes the proportional number of pupils is diminishing. This is regarded as quite satisfactory, assuming, as may be fairly assumed, that the standard of examination is maintained if not advanced.

*Teachers' qualifications and salaries.*—The law requires that all teachers, saving pupil teachers (numbering 1,076, or 29½ per cent of the entire force in 1897), shall be certificated. At the same time recognizing the peculiar difficulty of enforcing this requirement in the more sparsely settled districts, it allows some latitude to the education boards in this matter. The number of teachers holding rank in 1897 which properly requires a certificate was 2,549, and of these 2,244, or 88 per cent, actually held certificates; of the remainder 2 had passed the required examinations, but had not served the full probationary period.

The average salary, including in the estimate all classes of teachers, was £94 6s. 8d. (\$459).

The following table shows the attendance on the public schools at the beginning and close of the decades 1877–1887, 1887–1897:

Year.	Number of pupils.	Average attendance.		Ratio of average attendance to enrollment.
		Fourth quarter.	Whole year.	
1877.....	55,688			
1887.....	110,919	87,386	85,637	77.0
1897.....	132,197	110,523	110,993	82.9

The expenditure for 1897 was as follows:

For management by boards .....	\$60,928
For inspection and examination.....	61,308
For maintenance of schools .....	1,981,844
For school buildings .....	239,961
Interest.....	997
Refunds and advances .....	1,141
Total.....	<u>2,346,179</u>

#### PROVISION FOR SPECIAL CLASSES.

An interesting feature of the public school provision in New Zealand is its extension to the defective classes and to the native Maoris. The following citations from the report show the status of these divisions of the work during the year 1897:

*School for deaf-mutes.*—The well-known school at Sumner, where even congenital deaf-mutes are taught actually to speak and to understand the vocal speech of others, continues its beneficent operations with little variation and with few incidents fitted to give rise to any comment. Three boys and 5 girls left at the end of 1896, and 4 boys and 3 girls were admitted in 1897. The attendance at the end of the year was 27 boys and 20 girls. The director in his work of instruction has the assistance of 5 teachers. The household arrangements are supervised by a steward and matron. The expenditure for the year was \$15,928.

The amount contributed by parents is \$755.

*Institute for the blind.*—The Jubilee Institute for the Blind at Auckland receives some pupils for whose tuition the education department is responsible. The number of such pupils declined in the year 1897 from 19 to 14. The payments made by the department on their behalf to the institute amounted to \$2,242, toward which a sum of \$196 was contributed by parents.

*Native schools.*—The number of native village schools was the same (74) at the end of the year as at the beginning. The number of children on the roll at the end of 1897 was 2,864, greater by only 2 than the corresponding number for the previous year. The mean of the weekly returns of pupils on the roll was 2,955, greater by 81 than at the end of the preceding year, and the strict average attendance was 2,291, showing an increase of 71 in the year. The average daily attendance for the year was equal to 77½ per cent of the roll number for the time being. Four schools were finally closed in 1897, and one was transferred to the care of an education board; four new schools were opened, and one school has reopened after having been closed for some years.

The closing of the schools is due either to the apathy of the natives or to the decline of native population; in one case, to both causes. One native school, recently transferred to the local education board, "had for years contained a preponderating number of European pupils, and the Maori people had long lived in European fashion."

The four boarding schools for Maoris had at the end of the year 236 pupils, of whom 73 were Government scholars. There were 10 boys holding industrial scholarships, apprenticed as follows: Three to farmers, 3 to saddlers, 2 to carpenters, 1 to a blacksmith, and 1 to a printer. Scholarships for \$200 a year each were enjoyed by two young men studying, one at University College, Auckland, and the other at Canterbury College, Christ Church.

The following table summarises the statistics of native schools for a period of years:

*Provision for the education of natives.*

Year.	Village schools.						Boarding schools.				
	Population.	Total number of schools.	Number of new schools opened during the year.	Number of schools discontinued during the year.	Enrollment.	Average attendance.	Teachers.				
							Men.	Women.	Total.	Number of schools.	Enrollment.
1888 .....		67	.....	2	a 2,512	2,070	65	b 75	140		
1891 .....	41,993	72	.....	c 4	2,259	1,877	59	d 76	135	4	e 180
1893 .....		62	5	4	2,220	1,585	51	f 55	166	4	197
1896 .....	39,805	74	.....	.....	2,862	2,220	62	g 90	152	4	214
1897 .....		74	5	5	2,955	2,291	60	88	148	4	236

a 1,412 boys, 1,100 girls.

c Two for boys two for girls.

e 111 boys, 86 girls.

g Includes 14 sewing mistresses.

b Includes 41 sewing mistresses.

d Includes 11 sewing mistresses.

f Includes 16 sewing mistresses.

*Industrial school.*—Public provision for the training of vicious, unruly and neglected children is made in both State and private industrial schools.

Great care is taken to avoid an undue commingling of different classes of children in the Government schools, so that, although there are 1,099 nominal inmates of these schools, the number actually resident is only 199—only 18 per cent. The rest are accounted for as follows: Three hundred and eighty-five are boarded out, 85 are living with their friends, 371 are in service, 41 in institutions better suited to their condition, and 18 absent without leave.

The policy of boarding out the children who are for the time wards of the State is extensively employed, and with excellent results. Careful watch is kept over the children thus provided for by trusted agents of the Government. The following table summarizes the principal statistics relative to this class of schools for the years 1896 and 1897:

	Boarded out.				In residence.				At service, etc.				Total.			
	December, 1896.	Increase.	Decrease.	December, 1897.	December, 1896.	Increase.	Decrease.	December, 1897.	1896.	Increase.	Decrease.	1897.	1896.	Increase.	Decrease.	1897.

MANUAL TRAINING AND TECHNICAL INSTRUCTION.

With regard to recent measures for fostering manual training in the public schools of New Zealand, the minister states in his report for 1897 that the local education boards have not manifested great activity in the development of that kind of elementary manual training which, under the operation of the act of 1895, is now recognized as being part of the proper educative work of the primary schools and which, while including kindergarten occupations and sloyd, is capable of wide development in cardboard work and in the construction of models in wood and metal as illustrations of many subjects of scientific instruction. He adds further:

With respect to another form of manual instruction, a form in which it constitutes, through the handling of tools and materials, a more direct preparation for manual trades, the act of 1895 contemplates a measure of cooperation between the department and the boards, since any serious treatment of the subject from this point of view seems to require a workshop and some expenditure on tools, and to have its proper place outside of the time properly devoted to such mental development and equipment as is generally comprehended under the word "schooling." It has been deemed a great gain to have secured in our time this "schooling" for the children of all classes, and it ought not to be proposed now to encroach upon its hours in the interests of that kind of serious preparation for a trade or a business which naturally begins when school days are over. For manual instruction out of school hours the boards receive subsidies at the same rate as for any classes they may institute outside of the schools for technical training.

The total payments to education boards in respect of manual training and technical classes conducted outside of the regular school hours were \$5,999.

#### SECONDARY SCHOOLS.

The New Zealand school law makes provision for continuing the education of youth beyond the elementary branches, by means of public scholarships to be competed for by the pupils attending any public school, and also of scholarships open to all children of school age under special conditions to be determined from time to time. It is also provided that any board on receiving an application in writing from the committee may, with the express sanction of the minister previously obtained, convert any public school in the district into and establish the same as a district high school.

All the branches of a liberal education, comprising Latin and Greek classics, French and other modern languages, mathematics, and such other branches of science as the advancement of the colony and the increase of the population may from time to time require, may be taught in such school. For such higher education fees shall be paid by the pupils at such rates as shall be fixed by regulations.

The number of such public high schools is not specified. The amount expended from public funds for scholarships was \$39,415.

The summarized statistics of 24 secondary schools that receive state aid show an attendance of 2,709 pupils, of whom 166, or 6 per cent, were under 12 years of age. The current income of these schools for 1897 from school fees, exclusive of fees for boarders, was \$118,850; from rents and interest, \$122,310; from endowments under public administration, \$11,515; total, \$252,875. The amount paid out for salaries, estimated at the rates prevailing at the end of the year, was \$157,145.

#### SUPERIOR SCHOOLS.

The oversight of the minister of instruction extends also to the University of New Zealand, which is an examining body empowered to confer degrees. Undergraduates pursue their studies generally at one or the other of the following affiliated institutions: The Auckland University College, the Canterbury College, and the University of Otago, each of which has a staff of professors and lecturers.

The chancellor of the university reports for 1897 that the number of graduates admitted on examination now amounts to 603. The number of degrees conferred have been as follows: Number who have received the degree of M. A., 162; B. A., 343; B. Sc., 40; LL. B., 47; M. B., 23; D. Sc., 3; LL. D., 5; M. D., 4.

The number of degrees conferred after the examination of 1897 was 66; B. A., 48; B. Sc., 4; LL. B., 4; M. B., 5; M. A., 5. The number of candidates at the entrance examination for 1897 was 730. Three hundred and sixteen sat at examinations for degrees, and 152 for professional qualifications not academical, making a total of 1,198.

The income accrued under the "University endowment act, 1868," and applicable to purposes of higher education yet to be determined by Parliament, amounted, at the end of 1897, to \$19,290.

Superior scientific and technical instruction is fostered in the university colleges and in the higher secondary schools by examinations held in the colony by committees of the English science and art department and the city and guilds of London Institute, the expenses of these institutions being met by the colonial government. Mining schools are conducted under the auspices of the department of mines, and the department of agriculture fosters technical instruction in connection with public agricultural experiment stations, fruit farms, and dairy schools.

#### AUXILIARY AGENCIES.

The public school system is supplemented by private and denominational schools, of which there were 283 in 1896, attended by 13,947 pupils. The Sunday schools of the colony were attended the same year by 116,045 pupils.

The following statistics show the number of public libraries and other literary and scientific institutions in the colony:

#### PUBLIC LIBRARIES AND OTHER LITERARY AND SCIENTIFIC INSTITUTIONS.

Although the number of these institutions only increased from 298 to 304 between the years 1891 and 1896, according to the census returns, it is found that the membership increased from 14,489 to 17,638, or at the rate of 21.73 per cent. There was also a large increase of books (23.83 per cent), which numbered 330,770 in 1891 and 409,604 in 1896. In considering these facts it must be borne in mind that the population increased 12.24 per cent in the quinquennium.

#### STATISTICS OF ILLITERACY.

As to the outcome of these various educational agencies, we may consider the statistics of illiteracy as presented in the census of 1896. The following tabulation shows the conditions at each census period, expressed in percentages:

Year.	Read and write, per cent.			Read only, per cent.			Can not read, per cent.		
	Male.	Female.	Total.	Male.	Female.	Total.	Male.	Female.	Total.
1878.....	72.11	66.33	69.52	5.91	7.80	6.76	21.98	25.87	23.72
1881.....	73.31	68.94	71.32	5.01	6.39	5.63	21.68	24.67	23.05
1886.....	75.40	72.41	74.01	4.36	5.31	4.80	20.24	22.28	21.19
1891.....	77.97	76.48	77.27	3.74	4.24	3.97	18.29	19.28	18.76
1896.....	81.06	80.09	80.60	2.71	3.08	2.89	16.23	16.83	16.51

The statistician, commenting on this showing, says:

Besides the improvement in the degree of education as here indicated, and which is observed in respect of both men and women, it is further noticeable that, whereas the difference in the percentage able to read and write is very considerably in favor of the male sex for the year 1878, the proportions approximate more closely at each successive census year, until in 1896 there are found to have been 80.09 per cent of the female sex who could read and write, against 81.06 of males. \* \* \*

In considering the proportions of the population at different age periods the improvement in education is even more clearly proved. It is found that in 1896, of persons at the age period 10-15 years, 98.73 per cent were able to read and write, while 0.65 per cent could merely read and 0.62 per cent were unable to read. The proportion who could not read increased slowly with each succeeding quinquennial period of age until at 50-55 years it stood at 4.04 per cent. At 75-80 years the proportion was 7.05 and at 80 and upward it advanced to 8.07. Similarly the proportion of persons who could read only increased from 0.65 at 10-15 years to 3.66 at the period 50-55 years and again to 9.74 at 80 and upward. The better education of the people at the earlier ages is thus exhibited.

Further evidences of improved education will be found in the portion of this work relating to marriages, where it is shown that the proportion of persons in every 1,000 married who signed by mark has fallen very greatly since 1881. The figures for the sexes in the year 1881 were 32.04 males and 57.94 females, as against 6.19 males and 7.02 females in 1896.

#### TASMANIA.

The number of public schools in Tasmania in 1897 was 282, an increase of 12 over the previous year and of 62 in the decade 1887-1897. These were attended by 21,763 pupils, an increase of 937, or 4.3 per cent, in the decade. The increase in average daily attendance has more than kept pace with that of enrollment, being 4.4 per cent from 1896 to 1897, and 37.7 per cent in the decade. These figures show the excellent results of the measures for promoting school attendance. Two inspectors are appointed for the examination of the schools and two truant officers to keep watch over the children of school age who are absent from school. There are also special visitors who visit the schools in a semi-official manner, but whose influence is beneficial in maintaining general interest in the schools. The directors of education, whose duties are chiefly administrative, also from time to time visit individual schools.

The teaching force includes head and assistant teachers. In 1897 the former numbered 244. Of these 170 were men, with average salaries ranging from £55 17s. 3d. (\$271.82) to £412 18s. 4d. (\$2,006.77), and 74 were women, with average salaries ranging from £36 19s. 10d. (\$179.77) to £106 16s. 11d. (\$519.26).

The expenditure by the Government in 1897 was £35,569 18s. 10d., equivalent to \$10.30 per capita of average enrollment. Fees to the amount of £9,934 2s. 11d. (\$48,279.94) were collected in the schools and turned over to the public treasury.

The director of education reports returns from 187 private schools, having a gross enrollment of 8,691 pupils. The need of public provision for secondary education is urged in the report. On this point one of the inspectors says:

What is wanted to secure the full fruition of our elementary school work is some State provision in the way of secondary education, not on mediæval, but on modern lines. There are numbers of parents able to support their children for two or three years after the completion of their State-school course who would rejoice to secure for them at a small fee the opportunity of obtaining advanced instruction. Nor would I disregard the case of those boys and girls who are under the necessity of

"going out to work" at an early age. For such as these similar teaching might be provided in night classes. The oracular dictum one sometimes hears that "the State has fulfilled its duty when it has provided efficient primary schools" can not be regarded as a tenable objection to the plea for higher education. State intervention at all in the matter of education rests simply upon a strong ground of expediency, and this being so, expediency alone can determine how far State education should extend; at all events it is quite arbitrary to draw a line at the elementary school system and say, "Thus far and no farther." But in fact the justification for the State provision of higher education is already conceded virtually by the public endowment of a university, only we are at present in the position of an eccentric person who should spend much money in making a ladder, but who refused to have any middle rungs put into it. Our educational ladder is similarly defective; it has lower rungs, and everyone may mount them; and it has its upper rungs, but they are only of use to those who have their own means and appliances for reaching them. I share the hope expressed by the director of education in his report for 1896, that when funds are available a comprehensive scheme of secondary education of the character he has indicated will be adopted.

The following table summarizes the statistics for 1888 and 1897:

Year.	Number of schools.	Scholars.				Expenditure.		Income from fees.
		Enrollment.	Average monthly enrollment.	Average number in daily attendance.	Percentage of average daily attendance on average enrollment.	Total.	Per capita of average attendance.	
1888.....	220	17,125	12,002	8,730	72.74	\$158,671.03	\$13.21	\$49,644.50
1897.....	282	21,763	16,634	12,024	72.28	172,869.90	10.38	48,279.92

## CHAPTER III.

### EDUCATION IN BELGIUM.

[For previous articles see System of Public Education in Belgium, Report for 1892-93, vol. 1, pp. 157-201. Public Education in Belgium, Report for 1894-95, vol. 1, pp. 313-319.]

*Belgium*: Constitutional monarchy.—Area, 11,373 square miles; population (census of 1890), 6,069,321.—The executive and legislative powers vested in hereditary King, Senate, and Chamber of Representatives. Senators of two classes: First class, in number equal to half the number of representatives, elected directly by the voters; second class, elected by provincial councils, their number being proportioned to the population of the respective provinces. Representatives elected directly by the voters, number proportioned to the population, but may not exceed 1 for every 40,000 inhabitants.

The divisions of the Kingdom for local government are provinces (9) and communes (2,596, census of 1890), both of which enjoy a large measure of autonomy. The affairs of the former are administered by a governor appointed by the King, a provincial council (elected), and a permanent deputa-tion, consisting of the governor and six members of the council chosen by that body.

Three distinct authorities participate also in the administration of the commune: an elected council, a burgomaster appointed by the King from the members of the council, and a body of aldermen (collège échevinal), consisting of the burgomaster and from two to five members of the council chosen by that body. The council, which represents the people directly, is the principal source of authority in communal affairs (law regulating provincial and communal organization, March 30, 1836, and modifying laws, 1838, 1842, 1843, 1860, 1865; also Les ministres dans les principaux pays d'Europe et d'Amérique, par L. Dupriez, tome 1, pp. 262-266).

The provinces are also divided into arrondissements and these again into cantons. These divisions are intended to facilitate the control of the central authority, and are not strictly speaking divisions for local government.

In three provinces lying along the border of France—i. e., Hainault, Luxembourg, and Namur, and also in Liège, a central province—French or Walloon is the prevailing language. In Antwerp, Brabant, East and West Flanders, and Limbourg, the Flemish or Dutch.

The population of Belgium, as shown by the census of 1890, was 6,069,321, comprised in an area of 11,373 square miles. Further analysis gives 2,894,694 as the population of communes of 5,000 inhabitants or more and 3,174,627 for communes of less than 5,000 inhabitants.

The census, by sex, gives men, 3,026,954; women, 3,042,367. It appears, moreover, that about 36 per cent of the males (1,079,035) and 40 cent of the females (1,204,647), or 38 per cent of the entire population, are unable to read and write. In 1866 illiterates formed 53 per cent and in 1880 42 per cent of the entire population.

Belgium is preeminently a Catholic country. Protestants number only about 10,000 and Jews 4,000. The census of 1890 gives 30,098—men 4,775, women 25,323—members of religious orders in the Kingdom, of whom 24,585 are native Belgians.

The executive affairs of the Government are administered through seven departments. The educational interests are intrusted to the minister of the interior and of public instruction.<sup>1</sup>

**TOPICAL OUTLINE.**—Brief conspectus of the system of public education—Summarized statistics—Comparative view of school population and school attendance 1846-1890—Effects of successive school laws—Expenditure on primary schools—City of Brussels: Inquiry into the living conditions of children attending the public schools. Secondary schools: Recent changes in curriculum—Technical and industrial schools of Belgium—The Antwerp Congress on commercial education.

#### BRIEF CONSPECTUS OF THE EDUCATIONAL SYSTEM.

The system of public education in Belgium has changed but little in general form since its organization under the law of 1842.

It comprises three departments, primary, secondary, and superior, under the direction of the minister of the interior, who is also minister of public instruction.

<sup>1</sup> The present incumbent is M. Schollaert.

The principal officers of education below the minister are two general directors, one in charge of the primary department the other of the secondary and superior departments.

Institutions of all grades receive State appropriations, which cover about 38 per cent of the cost of primary schools, about 65 per cent of that of secondary schools, and nearly the entire cost of the State universities. The balance of expenditure is borne by the provinces and communes or by private managers (usually clerical), private schools being also subsidized by the State.

All schools maintained or aided by the State are subject to State inspection. For this service there are three inspectors appointed for secondary instruction (*enseignement moyen*), namely, one general inspector and two ordinary inspectors, one for the humanities the other for mathematics and the sciences; for primary instruction there are principal inspectors, one or more in each of the nine provinces and subordinate cantonal inspectors.

The minister exercises his authority in advice with the deliberative councils (*conseils de perfectionnement*). These are three in number, corresponding to the three scholastic departments. They are formed by appointment from the teaching bodies and the officers of education, and deliberate upon the questions submitted by the minister.

The principal secondary schools, Royal *Athénées*, for boys only, are controlled directly by the minister. He appoints their professors and, in advice with the council, determines their curriculum. Their enrollment, 5,852 students in 1895, is about 20 per cent of the enrollment in all the public secondary schools. In the inferior secondary schools, managed and supported by the communes with some aid from the State, there were enrolled the same year 24,007 pupils, of whom 6,937 were in schools for girls.

The minister also appoints the professors in the State universities and regulates the university programmes. The students in the two State universities, Ghent and Liège, numbered 1,918 in 1895. The attendance in the two private universities, Brussels and Louvain, raised the total number of university students to 5,004.

The control of elementary schools rests largely with the communes. In every commune there must be at least one elementary school. Under the existing law, passed in 1895, this school may be a communal school, supported entirely by public funds, an adopted school, a subsidized private school, or a private school fulfilling the conditions of adoption. The communal council appoints the teacher and arranges the school programme, subject only to the requirement of the school law as to the obligatory branches. The enrollment in all classes of State-aided primary schools in 1895 was 720,191. There was also 142,384 children in infant schools (*écoles gardiennes*) under public inspection. The detailed statistics of these several classes of schools at the beginning and close of the half decade 1890-1895 were as follows:

Classes of institutions.	Pupils or students.				Teachers or professors.				Current expenditure.			
	1890.		1893.		1890.		1893.		1890.	1893.

a No census.

#### CHANGES EFFECTED BY SUCCESSIVE LAWS.

The statistics of enrollment in the several classes of primary schools, as shown above, indicate the general progress in school attendance for a period of fifty years, and also in a measure the peculiar disturbances caused by successive laws which, emanating from parties bitterly opposed to each other, have been framed from a political rather than from an educational point of view.

The changes effected by these laws have turned ostensibly upon the question of religious instruction, although their deeper purpose has been that of enlarging or restraining clerical influence in the management of the schools. The latest law, that of 1895, is more extreme in respect to religious instruction than any previous law. Its bearings will be best understood by a brief rehearsal of the main provisions of the successive laws.

The first general law respecting popular education was passed in 1842, twelve years after the separation of Belgium from the Netherlands. The law followed in many essentials Guizot's law of 1833, which forms the basis of the elementary school system of France. It provided that in each commune one primary school at least should be established in an accessible place. The commune was not, however, obliged to establish a public school if its educational needs were fully met by private schools. A commune might also adopt one or more private schools if the provincial authorities so approved. For all indigent children instruction was to be gratuitous.

The commune appointed the teacher and had control of the communal schools, excepting in the matter of religious and moral instruction; this was reserved to the clergy. It was required that a teacher should be paid an annual salary of not less than 200 francs (\$40); increased afterwards to 850 francs (\$170). The teacher was also to be provided with a house or money equivalent for the same.

State appropriations for the schools were available only when the commune had raised a certain sum and the province had duplicated the amount. A double system of inspection was established—lay and ecclesiastical. The former was exercised by cantonal and provincial inspectors appointed by the Government; the latter was confided to the bishops. Two State normal schools (increased in time to six) were established for the training of primary teachers, and church normal schools were also recognized. The law made religious instruction obligatory, and placed it under the direction of the minister of the denomination to which the majority of the pupils in the school should belong. The children, whose parents so desired, were to be excused from the religious exercise. In like manner religious instruction in each normal school was confided to a clergyman attached to the staff and supervised by church authorities. This law remained in force thirty-seven years.

In 1879, the Liberal party having come into power, a new law, almost revolutionary in its requirements, was passed.

The particulars in which it departed radically from the previous law were as follows: Every commune was obliged to maintain at least one public school, the actual number to be determined in each case by the Government. (As under the previous law, however, two or more communes might be authorized to unite together for the maintenance of a single school.) Moreover, the State could oblige the commune to establish also an infant school and a school for adults (evening school).

For cantonal inspectors appointed by the Government, under advice of the provincial authorities and serving without salary, the law of 1879 substituted two classes of inspectors—provincial inspectors, appointed by the King, and subordinate inspectors, appointed by the central authority. All salaried officials were made responsible directly to the minister or to his representative. Although the right of the communes to control their own schools was respected by the new law, it determined the manner in which this control should be exercised. Moreover, it created a special agency, school committees (*comités scolaires*), to keep watch over the schools. The members of these bodies were to be appointed by the communal council, excepting where several communes had united to maintain a school, when the appointment went to the minister of public instruction. The minimum salary of teachers was raised to 1,000 francs (\$200). The number of State normal schools was raised from 6 to 12.

The law required that teachers should be native Belgians and furnished either with the diploma of a teacher or of a professor in the lower order of secondary schools. It forbade the employment of members of a religious order as teachers, and abolished the ecclesiastical inspection of schools.

The programme of obligatory subjects was greatly extended, and religious instruction was excluded. This was to be left to the care of

the family and the churches, excepting that ministers might be allowed the use of a room in the school building, before or after the school session, to give religious instruction to the children of their respective communions attending the school.

It was also provided that if no clergyman came to give instruction in the school the teacher should be entitled to hear the "repetitions" which were "necessary to engrave on the memory of the child the form of religious instruction prescribed by the communion to which the child belonged." All books used in the schools were to be approved by the Government. The law also withdrew State recognition from private normal schools and the clergyman from the staff of the State normal schools, "assuring to each student complete liberty to perform the religious duties prescribed by the faith to which he belonged."

The law of 1879 was bitterly opposed by the Catholic party, and within eighteen months of its passage the church had opened primary schools in 1,936 communes, which, on December 15, 1880, contained about 450,000 pupils. These efforts continued during the five years of the law's operation, in which period the number of pupils in the communal schools fell from 510,588 to 324,656, a loss of 36 per cent.

In 1884 the Catholic party, having gained a majority in the legislature, a new school law was passed. This provided for the adoption of private schools, restored religious instruction to the programmes as an optional branch, opened the teaching service to naturalized foreigners, and in general gave a large measure of independence to the communes with respect to the conduct of the schools.

The articles respecting these fundamental conditions were as follows:

Every commune must have at least one communal school situated in an accessible place.

The commune may adopt one or more private schools. In this case the King, upon the advice of the "permanent committee," may exempt the commune from the obligation to maintain a communal school. This dispensation can not be accorded if twenty heads of families having children of school age demand the creation or the maintenance of a school for the instruction of their children and the "permanent committee" concurs in this demand.

In case of necessity two or more communes, upon authority from the King, may unite to found and maintain a school. (Art. 1.)

Communal primary schools shall be directed by the communes.

The number of the schools and of the teachers shall be determined by the communal council according to the needs of the locality. The council also controls everything relating to the establishment and organization of infant schools (*écoles gardiennes*) and of schools for adults. (Art. 2.)

The children of poor parents shall receive gratuitous instruction. The communes must see that all those who do not attend uninspected private schools are provided with instruction either in a communal or adopted school. (Art. 3.)

Primary instruction comprises as obligatory branches reading, writing, elements of arithmetic, the legal system of weights and measures, the elements of the French language, of the Flemish, or the German, according to local requirements, geography, history of Belgium, elements of drawing, singing, and gymnastics. Moreover, it comprises needlework for girls, and for boys in the rural districts notions of agriculture.

Communes have the right to extend the programme as may be possible or desirable. The communes may inscribe religious and moral instruction at the head of the curriculum of all or some of their elementary schools. This instruction must be given at the commencement or at the end of the school hours. Children whose parents so request shall be excused from attending such instruction.

(a) In the case of a commune in which twenty heads of families having children of school age ask that their children shall be exempted from assisting at religious instruction, the King can, at the request of the parents, oblige such commune to organize for the use of these children one or more special classes.

(b) If, in spite of the request of twenty heads of families having children of school age, the commune refuse to inscribe the teaching of their religion in the school curriculum, or hinder such instruction being given by the ministers of their religion, or by persons approved of by these latter, the Government can, at the request of the parents, adopt one or more private schools, as may be requisite, provided they meet the conditions prescribed for adoption by the commune. (Art. 4.)

\* \* \* \* \*

The communes bear the expenses of primary instruction in the communal schools; the provinces also contribute not less than the product of 2 centimes on the amount of the direct tax.

A commune can not obtain subsidies from the State or province for primary instruction unless it contributes at least 4 centimes additional to the direct tax and carries out the present law in all points. (Art. 6.)

Certain provisions of the law with respect to teachers favored church at the expense of secular teachers, or at least they gave authority in respect to the suspension of teachers, which was eventually used to replace the latter class by the former.

Article 7, regulating the appointment, tenure, and salary of teachers, is as follows:

The communal council has the right of appointing, of suspending, of placing *en disponibilité* (out of active service but drawing pay), and of revoking the appointments of teachers. At the same time the teacher's appointment can not be canceled without the approval of the permanent deputation.

The council and the teacher may appeal to the King. The same rules apply to all suspension for more than a month and to all suspension with stoppage of pay or upon reduced pay. Suspension once decreed by the communal council can not be renewed by it on the same facts, nor shall it exceed six months' duration. The King, in accord with the advice of the permanent deputation, both the teacher and the communal council being heard, may suspend or revoke a teacher's appointment. Subject to the same advice, he may place a teacher *en disponibilité*.

The salary of an unattached teacher is paid by the commune if the order depriving him of service is issued by the communal council; by the State, if the order is issued by the King. No place may remain more than a month without a teacher.

The Collège Échevinal (board of aldermen) designates the substitute. The council fixes the minimum of teachers' salaries. The salary can not be less than 1,000 francs (\$200) for assistant teachers, and 1,200 francs (\$240) for principal teachers. The teacher has besides this the right to be lodged or to receive an allowance for house rent.

The communal council can place a teacher on the unattached list, and so keep him from active employment, in which case he will receive waiting pay, under conditions which will be determined by royal decree. The amount can not be less than half his salary nor less than 750 francs. This pay will be furnished by the State, the province, and the commune in the proportions fixed by law.

Article 8, opening the service to foreigners, was as follows:

The communal schoolmasters are chosen from among those Belgians, either by birth or naturalization, who have gained the diploma of an elementary teacher after

being trained in a public normal school, or who have passed an examination after having attended lectures during at least two years, or who have gained a diploma for secondary teaching (*enseignement moyen*) of the second degree. They can also be selected from among those persons who have successfully passed the teachers' examination before a jury appointed by the Government.

With respect to adopted private schools, it was further provided that—

- (1) The school must be established in a suitable building.
- (2) At least half the number of teachers must have received a diploma or have passed the examination for the male or female teachers; but the minister is at liberty to dispense with this condition during the two years following the promulgation of this law. Those who have had charge of communal schools prior to the present law are exempt from examination.
- (3) Should religious instruction form a part of the curriculum, such instruction shall be given at the beginning or at the end of the school hours. Children, on the application of their parents, shall be exempted from attending religious instruction.
- (4) The curriculum shall comprise the subjects mentioned in section 1 of article 4 of the law.
- (5) The adopted school must accept State inspection.
- (6) It must admit poor children without requiring other payment than that prescribed in article 3 of the law.
- (7) The number of hours of school attendance shall not be less than twenty per week, without including the time devoted to teaching of religion and morals; after deducting the time employed on needlework, this number shall not be less than sixteen. (Art. 9.)

Communal and adopted private schools were subject to State inspection, but this was not to be extended to religious and moral instruction.

Private normal schools were recognized under the law, and might receive State aid if they submitted to State inspection. It was further provided that persons who obtained the diploma of primary teacher from a private normal school between the adoption and the repeal of the law of July 1, 1879, might receive the appointment of communal teacher on condition of obtaining a confirmation of such diploma from a board organized in accordance with the law.

Within three years from the passage of the law 802 communal schools and 492 teachers' places were suppressed and many teachers were placed "*en disponibilité*." The law proved unsatisfactory, however, to extremists of both parties, and was bitterly opposed by the State teachers. The Catholic party, which was strengthened by the violent demands of the Socialists, complained that the law did not put religious teaching into the right hands. "Practically," they said, "there can be no religious instruction in schools without the help of the clergy." They urged, further, "that in many important towns religious teaching had been added to the curriculum, not from a disinterested desire to provide it, but in order to prevent the Government from stepping in to adopt private schools, and that in such cases the character of the religious instruction left much to be desired; that those who in their anxiety to secure religious instruction between 1879-1884 had founded

private schools which were still continued, but were not as yet subsidized by the State, were paying for education twice, viz, in the schools of their choice and in the communal schools, to which they contributed through central and local taxation."

To meet some of the complaints of those who subscribed to private elementary schools, the Belgian Government provided in 1894 a sum of 3,000,000 francs to be spent in aid of private schools. This encouraged proposals for further expenditure in the same direction, which were eagerly demanded by one party and violently opposed by the other. The whole country became excited over the subject, and finally, in the summer of 1895, the Belgian ministry introduced a new law, which was designed to satisfy the dominant party and to improve the condition of teachers. It provided that religious instruction should be made obligatory and confided to the clergy; that subsidies to private elementary schools should be increased, and it regulated both the salary and tenure of teachers. The general provisions as to the establishment or adoption of schools, free tuition for poor children, and the persons eligible for appointment as teachers, remained as under the law of 1884.

The principal change effected by the law relates to religious instruction. This is made a compulsory subject, to be placed at the head of all primary school programmes. Instruction in the same is confided to the clergy, who must have free access to the schools, either to give or to supervise the religious lessons, as they may decide. The requirement extends to normal schools also.

The articles referring to religious instruction are as follows:

Primary instruction comprises, as obligatory branches, instruction in religion and morals, reading, writing, elements of arithmetic, the legal system of weights and measures, the elements of the French language, of the Flemish or the German, according to local requirements, geography, history of Belgium, elements of drawing, singing, and gymnastics. Moreover, it comprises needlework for girls, and for boys in the rural districts notions of agriculture.

Communes have the right to extend the programme as may be possible or desirable. In the primary schools to which the law is applicable, the ministers of the several denominations shall be asked to give the instruction in religion and morals, or to cause it to be given under their supervision, either by the teacher, if he consents to do so, or by a person approved by the communal council.

The first hour or the last half hour of the morning or of the afternoon session shall be given each day to this instruction. Children whose parents make the request in the following form may be exempt from the religious instruction: The undersigned, in pursuance of the right conferred upon him by article 4 of the law relating to primary instruction, requests that his child be exempt from attending the instruction in religion and morals. (Art. 4.)

The inspection of the instruction in religion and morals shall be exercised by persons delegated by the "chiefs of the confessions." The delegates discharge their duties according to conditions specified in a royal *arrêté*.

The chiefs of the several confessions notify the minister of the interior and of public instruction of the appointment of their delegates, who, after sanctioning the same, transmits the necessary instructions to the provincial and communal officials, as well as to the inspectors of primary instruction.

Every year, in the month of October, each of the "chiefs of religion" addresses to the minister of the interior and of public instruction a detailed report upon the manner in which the instruction in religion and morals is given in the schools controlled by the law. (Art. 5.)

Teachers must show an equal solicitude for the education and instruction of the children under their charge. They are to neglect no opportunity to inspire in their pupils the sentiments of duty, love of country, respect for national institutions, and attachment to constitutional liberty. They must abstain from any attack upon the religious beliefs of the families whose children are intrusted to them. (Art. 6.)

With regard to the support of elementary schools, the law of 1895 provides, as heretofore, that this shall be at the charge of communes, the provinces, and the State. The commune must take the initiative in establishing the school, whether communal or adopted, providing the building and equipments, and, in order to share in either the State or the provincial appropriation,

Must contribute a sum equal to the product of 4 centimes additional to the direct tax, and must execute the law respecting primary instruction in all particulars.

The province must contribute for school purposes an amount not less than the product of 12 centimes additional to the direct tax. The funds at the disposal of the commune for primary instruction can not be used for another purpose. (Art. 7.)

Article 8 provides for an annual grant from the legislature for elementary education, to be divided among communal schools, adopted schools, and private schools. The conditions for apportionment are the same for all classes of schools. They must submit to inspection and conform to the general regulations as to curriculum, staff, and position, but private schools will not be under the management of any local authority. It is explained in an official circular addressed to the governors of provinces that it is not necessary for a private school to include religious instruction in its programme in order to receive Government aid.

The advocates of the law defend the appropriation for private schools on the ground that if the State and communes had been required to establish and maintain all the elementary schools, public and private, which are now in existence in Belgium, the annual cost would have been 6,500,000 francs (\$1,300,000) greater than the present outlay from central, provincial, and communal funds.

As under the previous law, the right of appointing and suspending teachers and of revoking their appointments rests with the communal council, appeal to the "permanent deputation" (provincial committee), and finally to the King, being possible in each case. There is also the same provision for dispensing with the services of public teachers as under the law of 1834.

The new law further provides that no teacher's salary shall be reduced during his tenure of office in any one commune. The position with respect to salaries is slightly improved. As against a minimum annual salary of \$200 for assistant teachers and \$240 for princi-

pals under the previous law, the present law fixes the following classes and rates:

	Principals.		Assistants.	
	Men.	Women.	Men.	Women.
Fifth class, communes of 1,500 inhabitants or less.....	\$240	\$240	\$200	\$200
Fourth class, communes of 1,501 to 10,000 inhabitants.....	280	260	220	220
Third class, communes of 10,001 to 40,000 inhabitants.....	320	280	240	220
Second class, communes of 40,001 to 100,000 inhabitants.....	360	320	260	240
First class, communes of more than 100,000 inhabitants.....	480	440	280	240

The teacher must also be provided with a residence or indemnity for the same ranging from \$40 to \$160. (Art. 13.)

An increment of \$20 is allowed for every four years of good service until the total increment amounts to \$120. (Art. 15.)

It was earnestly contended by the advocates of the bill that the spread of socialistic doctrines was due to the purely secular character of the teaching in the public schools, and that in order to insure sound public opinion religious instruction must be made compulsory. The socialists urged on the other hand that the law violates the principles of the constitution by requiring parents to make a declaration of their religious faith and by recognizing an official religion. They also maintained that it interfered with communal rights and gave teachers no real security in their positions.

M. Beernaert, the former minister of the interior, expressed the views of the moderate opponents of the law—among whom were many Catholics—in a speech delivered while the bill was pending.

He held that the proposed measure gave too much power to the State in respect to determining the character of religious instruction, and that if it became law it might easily be used by a reactionary party for the destruction of all religious teaching in the schools. He foresaw, as a result, constant change in the educational policy of the country, which would entail great discomfort upon the teachers and greatly weaken the influence of the schools. He desired some more stable settlement of the problem.

The moderate party in the legislature, under the lead of M. Beernaert, urged a measure less stringent than the law of 1879 and giving greater independence to the communes than the proposed law.

They submitted proposals as follows: (1) That the State should, where necessary, subsidize denominational schools not under private management, and that each commune should be free to give religious instruction or not in its own or in adopted schools as it might prefer. (2) That the communes should not be compelled to make religion an obligatory subject in the programme of the communal schools, and to submit to ecclesiastical authority in all matters pertaining to religious instruction. The efforts of the moderates were so far successful that it was proposed in the lower chamber to divide the Government bill into two parts,

treating separately the clauses touching the salaries and position of teachers, upon which all parties seemed agreed. The proposal was, however, lost by a vote of 73 to 61.

#### EXPENDITURE ON PRIMARY SCHOOLS.

The expenditure for primary instruction in Belgium reached the sum of \$6,663,705 (33,318,527 francs) in 1896, equivalent to \$1.02 per capita of population and to \$8.85 per capita of enrollment. Of the entire sum the State provided 41.6 per cent; the communes, 46.2 per cent; the provinces, 5 per cent; school fees, 4 per cent, and subscriptions, legacies, etc., 3.2 per cent.

The direct maintenance of the infant schools (*écoles gardiennes*), 1,769 in number, and the primary schools, either public or subsidized, numbering in all 6,546, absorbed 74 per cent of the entire expenditure.

As compared with 1894 this expenditure showed an increase of \$620,408, of which the State contributed \$225,083. This has gone really to the support of subsidized, private, or, in other words, parochial schools.

#### CITY OF BRUSSELS—INQUIRY INTO THE CHARACTER OF THE CLOTHING, NOURISHMENT, AND LODGING ACCOMMODATIONS OF THE PUPILS OF THE COMMUNAL SCHOOLS—REPORT OF THE COMMITTEE TO THE CHIEF MAGISTRATE, ALDERMEN, AND COMMON COUNCIL OF BRUSSELS.

The schools of Brussels, which attained a very high degree of efficiency during the supremacy of the Liberal party, have suffered less than those of other communes from the political vicissitudes. The city has long been noted also for efforts in behalf of destitute and neglected children. An investigation was recently made under the order of the municipal council into the living conditions of the children attending public schools. The report of this investigation, which is valuable both as a model and for its valuable results, is here summarized:

In 1888 the Progress Club was authorized by the *collège échevinal* to provide soup for the needy children of the primary schools on their leaving school at noon. The distribution of soup was at first made in the rooms of the cooperative society called "*Les Ateliers Réunis*," but after a while, in order to avoid the crowding of the rooms of the society, the distribution took place in the schools themselves, the society continuing in charge of the preparation of the soup, the city furnishing the tables, the Progress Club providing the dishes, while the school servants washed the dishes and cleaned up the rooms. This arrangement was extended to the kindergartens, and the city having placed certain drays at the disposal of the Progress, together with the necessary men, the soup could be carried rapidly and with the necessary regularity, while the considerable expense of transportation was saved the club by this means.

It was upon this rock of the expense of transportation to the different schools that the attempt of 1880 was wrecked. At that time a society for feeding the poor children in the communal schools was founded, under the presidency of M. Buis, alderman in charge of public instruction, by the financial assistance of the late M. Bischoffsheim, whose generosity was never appealed to in vain. It was compelled

to abandon its distribution of food because the expense of transportation absorbed the greater part of its resources.

However, that difficulty being overcome, the "Progress Club" was able to continue its distribution, its work became popular, and sufficient resources from collections, entertainments, and subscriptions even permitted the club to extend its operation.

But other objects soon solicited the generosity of the public, the receipts of the club began to diminish, while new extensions were demanded, and then it was decided to ask for pecuniary assistance from the city.

At the session of the communal council of the 24th of December, 1891, M. Lemonnier proposed to grant a subsidy of 5,000 francs to the "Progress" Club.

The "College échevinal," acting in accord with the section of public instruction, which had deliberated upon this subject in the session of the 9th of December, had come to a conclusion unfavorable to the grant. While acknowledging the philanthropic sentiment which dictated the request and the zeal of the promoters of the work, the college saw in the grant the beginning of a constantly increasing expenditure which would, before long, result in an enormous charge for the city.

Moreover, notwithstanding the explanations and circumspection with which the vote for the subsidy was surrounded, it was a question of principle whether the feeding of poor children was really an obligation incumbent upon the commune, and whether it was a duty of the city to maintain or develop works of private philanthropy.

Nevertheless the council voted a subsidy of 5,000 francs, specifying that this subsidy was only granted for one year, but the apprehension expressed in the meeting of December 24, 1891, was speedily realized. The official intervention of the city gradually led to the withdrawal of private assistance. The proceeds of collections, gifts, etc., continued to diminish, and public feeling, attracted by other nonsubsidized benevolent undertakings, was diverted from that which official support seemed to guarantee against any unfortunate eventuality.

In the session of December 18, 1893, Councilman Richald proposed to raise the subsidy for the "Progress" Club from 5,000 francs to 10,000 francs for the school soup, and to allot a supplementary subsidy of 5,000 francs for clothing.

The college restricted its action to repeating the arguments of 1891, and, after discussion, the communal council adopted unanimously the following motion, that a commission be appointed to consist of members of the council and to be elected by it, to examine into the condition of the children who attend communal schools, in regard to their food, lodging, and clothing. Its duty also was to examine into the financial outlay for furnishing soup and clothing for the school children. This proposition having been submitted to the section of public charities, education, and finances, this section, on January 15, 1894, decided that the following method should be followed in carrying out the investigation proposed by the council:

(a) A schedule should be forwarded to the principals of the schools, who, with the assistance of the teachers, should make returns upon the character of the clothing, usual quality of food, cleanliness, and attendance of the scholars.

(b) The city physicians should be required to report upon the health and the sufficiency or insufficiency of the usual food.

(c) The police should report upon the character of the lodgings.

Under (b) the physicians were required to classify their answers: 1, as to health, under the heads "good," "medium," "bad"; and, 2, as to nourishment, under the heads "sufficient," "insufficient." As to lodgings, the following schedule was adopted:

What is the number of children sleeping in one bed; having no bed; sleeping in the same room with their parents; sleeping in the same bed with their parents; sleeping with brothers or sisters; brothers sleeping with sisters; sisters sleeping with brothers; sleeping in the kitchen; sleeping in the cellar or basement.

The inquiry extended to 11,904 pupils of the primary schools, and 2,543 pupils of the kindergarten, 14,447 in all. It was found that 2,442 children, or 16.89 per cent, had

insufficient foot wear; 3,620, or 25.04 per cent, were ill-clothed, and 3,663, or 25.35 per cent, were insufficiently fed. The expense necessary to provide for the wants indicated was estimated at 389,000 francs (\$77,800) a year.

On November 24, 1894, the results of this inquiry were submitted to the sections, and Alderman André showed not only the magnitude of the obligation which would be imposed upon the city—an obligation out of all proportion to its resources—but also the insufficiency of its resources. Experience shows, unfortunately, that any charitable distribution immediately gives rise to crowds of petitioners whose demands it is impossible to avoid and whose ingenious combinations it is equally impossible to baffle. He also objected to the transformation and extension of the school soup supply, the fear that parents would become by its means indifferent to their children, and that it would conduce to destroying the family sentiments. The real subject for discussion, according to him, was whether the commune ought to be a substitute for parents in clothing and feeding their children. Another member, M. Furnemont, after expressing his opinion that the figures of the report should be verified, requested that an inquiry should be made into similar organizations in Belgium and abroad. After much discussion the question was adjourned until further study of the matter, especially abroad, could be made.

(The schedule of questions sent to foreign countries is given later on in the report.)

We have coordinated the returns, although the differences between the political or charitable organizations of different countries do not allow an absolutely exact comparison. Some general principles, however, are deduced from the inquiry. These are: First. That nowhere is the right to assistance in food and clothing recognized for all pupils. Second. That except in France the organization of assistance for poor pupils is everywhere left to private initiative. At Ghent and Liège the communal distributions are confined to kindergartens. It is difficult to draw any conclusions as far as Brussels is concerned, as may be seen by consulting the column where the expense for each city in proportion to the population is shown. But this is explained by the circumstance that there is no resemblance in the organizations of different cities, each having its own. The inquiry, nevertheless, contains some very interesting information. It shows particularly what private initiative can do when the efforts are concentrated, when the attention and the sympathy of the public are kept constantly awakened, and its generosity is exercised in favor of well organized works whose benefits are tangible, evident, and publicly known, and directed to those natural objects of charitable sympathy—children. While in other countries philanthropic associations follow one aim and adhere to it, endeavoring to establish a settled system of charitable work and gather for it and about it the needed resources in order to secure its continued existence and prosperity; our own people dissipate their activity and revenues upon a multiplicity of charities which are not related to one another and are successively taken up and abandoned. We exhaust our resources in building up hastily devised organizations which are ill-sustained, and when the critical moment comes, when the obligations exceed the receipts, and the public, assailed and solicited on all sides, turns away and forgets us, then we endeavor to make the public authorities undertake the burden which we had rashly assumed. Perhaps we might derive a useful lesson from the practice of other countries in this matter.

The examination of the situation, which the inquiry has revealed, has not altered the opinion of the collège as to the principle involved of the commune assuming the obligation of supplying food and clothing to the children attending the public schools.

We wish to express our appreciation of the generous ideas which have prompted the charity of school soup and clothing, nor shall we make difficulties in giving them our individual support and, within certain limits, the aid of the city, but there is a great step from this to transforming what is the part of private initiative into a public service of general obligation.

The reason is simple. Where a private individual finds a person who has met with

misfortune, he helps him to the extent of his power without stopping to inquire whether his intervention may not have moral consequences which will be unfortunate for the assisted one. He follows the impulse of his heart and is otherwise free from responsibility. His charity may be well or ill directed, but he is master of his property and may do what he likes with it. But the mission of public authority is different, and when it is proposed to create through it, in perpetuity, a vast organization of charities, it is its duty to inquire whether the remedy is not worse than the disease, whether the moral consequences of the project, which are inevitable, will not be disastrous, and, in short, whether the result will not be diametrically opposite to what the advocates of the new ideas expected.

We no longer believe in the simple formulas which the French revolution applied as a remedy to social miseries. A long and sad experience has taught us that the evangelical command, "Feed those who are hungry and clothe those who are naked," is not a solution. When we come to discuss the evil effects of official benevolence, which is inspired by the simple principle we have pointed out, we come to the unanimous conclusion that, aside from cases of accidental distress, gratuitous assistance always ends in the moral deterioration of the assisted. It is the extension and revival, under a modern form, of the distribution of food which the religious orders used to make every day in former times, and which resulted in the maintenance of whole communities in poverty and idleness.

In regard to the children whose condition was found to be precarious, the question was whether their parents were to blame for their poverty or not. It was found that most of the children were the victims of the idleness, debauchery, and improvidence of their parents, or sometimes of the ignorance of housewifery on the part of the mothers.

As far as unmerited poverty is concerned, in the case of the children of widows or of persons temporarily in distress in consequence of stoppage of work or of sickness, it is not only the children who need assistance from the public, but the entire family, which must be aided either by providing work for the father or in supplying the urgent needs of the family during the critical period. The child can receive food and clothing at school, as a case of urgency, but aside from such cases, school aid will find sufficient resources in private initiative and the charities it has ingeniously created and maintained.

But there is a further consideration. It is expected that all the children who shall need or seem to need assistance will be permanent beneficiaries. Is it not obvious that this is the surest way to increase largely the number of these children who are practically orphans, although they have parents? So that with a charitable object in view, and acting from sentiment rather than reason, people would sever the last tie that unites parents to their children, that makes them sensible of the obligations they have undertaken, and that removes the last consideration which prevents them from yielding irrevocably to that base and egotistic conception of life which leads to idleness or drunkenness. This condition has been described by a French economist as one in which the poor are put at their ease in their poverty instead of being urged to free themselves from it, and it would be accentuated by the method above recommended. Whence comes the obligation upon the public to take the place of parents and replace with the public funds those which have been perverted to debauchery or idleness? It is useless to urge that this obligation is the same as that of public instruction. Instruction is a great social interest and something which every citizen can not provide for his children, and therefore it is the duty of the public to organize schools and facilitate access to them. But to provide food and clothing is not a part of the public service, and it can not be seen that there is any obligation to provide for evident but purely personal needs unless it can be shown that parents are absolutely unable to give their children the necessaries of life. On the contrary, we should strive to awaken the sense of dignity in the man afflicted by poverty, urge him to earn the assistance which is given him, rouse him from the demoralizing acquiescence in the continuance of this assistance, and make him

feel the spur of necessity. Efforts should be directed to avoiding the contingencies of unmerited poverty by developing the spirit of providence, order, and economy, and facilitating the practice of these virtues.

As to those who remain refractory to all efforts to rouse them and remain dead to all moralizing influences, what is gained by aiding them? The money that would be thus retained from the maintenance of their children would be paid out for drink, and thus the evils which charity, whether public or private, engenders about us, in spite of all precautions, would be extended.

It should not be concluded from the foregoing that nothing should be or has been done, for this would be to forget the outburst of philanthropy which provides warm clothing for poor school children every winter. The ladies of the school associations, benevolent societies, and the young ladies of our paying schools also make contributions. In the primary schools the clothing charities make frequent and abundant distributions of clothing, and the members of the teaching force in certain schools have devoted the profits of certain emoluments to the use of the poor children. The administration of charities has helped us greatly by providing clothing for 1,435 children since the 1st of January. Finally the communal council allotted 10,440 francs for the purchase of supplies for the course of manual training in girls' schools, and the clothing thus made is distributed to the other needy school children. Nor should we leave out of account the sanitary inspection of the communal schools which has been initiated by a number of cities both in Belgium and abroad. Sixteen physicians have charge of the schools, each of whom has to visit a certain number of them at least once in ten days. The health office has a check upon these visits through the thermometric bulletins which the physicians are obliged to sign at each visit. Children in poor health take every day a dose of cod-liver oil or of zootrophic powder, which is supplied by the public charities. These medicines are administered by the teachers. Each child has a glass, which is washed every day. Once a month the school physician witnesses the distribution.

A dentist visits the schools every week and attends to the teeth of the children.

In 1894-95, 3,676 children were subjected to preventive treatment and at the end of the year a considerable improvement was observed in 3,409 cases, or 92.7 per cent, and 1,292 were treated by the dentist. This shows services of inestimable value for the people, which could not, however, take the form of charity, and notwithstanding the expense, which may be put at 10,000 or 11,000 francs a year, the city did not hesitate to organize and extend them. As to food, the "Progress" Club organized, with the help of the city, a service for supplying a plate of hot soup, with bread, to the children designated by the teachers. This organization, wherein private initiative plays the leading part, has the great advantage, resulting from the very limitation of its resources, that its extension beyond what is strictly useful is forbidden, whereby abuses are prevented. We believe that this organization will continue, aided by the city, to exercise its charitable functions, possibly with some improvements in the details of its management.

The annual expense of distributing clothing and food to all the school children who need them would amount to about 389,000 francs (\$77,800), without including certain expenses of administration, superintendence, and installation. In the session of November 26, 1894, Councilor Richald, on the strength of figures supplied by the president of the "Progress" Club, estimated that 51,000 francs (\$10,200) would be sufficient for all needs. There is evidently here some misunderstanding. There is no doubt that if it is only a question of prolonging the service, as at present organized, throughout the year, 51,000 francs would be sufficient. But the members of the council who are in favor of the organization of school canteens and wardrobes wish to go much further and, from their point of view, they are doubtless right. The allotment of 51,000 francs on the advice of the "Progress" Club is, perhaps, a concession to public sensibility, but it is only a partial solution. In fact, while the soup does the poor children good by warming their stomachs, it can hardly be called food. The stew which is given them from time to time is more substantial, but even

that does not realize the full idea of nourishment, and no physician would say that it does. On the other hand, there are parents who use these distributions as a pretext for not giving their children anything to eat at noon. Physicians declare that every child who does not eat meat or eggs four times a week is insufficiently nourished.

The discussion as to school nourishment has been carried to high ground, so as to cover the future of the nation and the conservation of the species. Now if we start upon this ground, it is no longer soup alone which must be furnished, but a nourishment sufficient to make up for the insufficiency of the family food, in which case 389,000 francs would doubtless be needed to defray all expenses on that score.

This expenditure does not include bedding, which is a more difficult question. Poor people crowd together, and the want of bedding is very often not due to their poverty so much as the want of space. It would be useless to give them beds and mattresses since they would have no place to put them. No estimate can be made upon this point.

Questions of the kind before us should be examined dispassionately, avoiding as much as possible all appeal to the sensibilities. The inquiry requested by the council has been carried out as loyally and completely as possible, and it has now been informed upon the different points raised in the interrogatory which was sent out. It knows the needs and the cost. It should not be forgotten that the inquiry was limited to children attending the communal schools, and that the reasons for providing school canteens and wardrobes for these children apply as well to those who attend other schools and those who do not go to school at all. The number of children of school age is about 27,000, or nearly double the number of those attending the communal schools. Taking the same proportion, we should have an expenditure of nearly 800,000 francs (\$160,000) if the remaining children were to receive the benefit of the food and clothing distribution. We have already answered the question whether the city ought to bear this expense, and an examination of the budget will show that it can not bear it. It is, of course, desirable to relieve or suppress the miseries of poor children, but where could the city get the funds for such an object? There are many good purposes for which money is wanting, and there are no means of getting it. The financial conditions of the administration of large cities is becoming more and more complex and difficult, while the demands upon the duties of the commune are augmenting every day.

But the public energetically resists every contribution which is asked from it in exchange for the service it receives, and the communal resources are based, in fact, upon special services which are essentially uncertain in their nature. It therefore seems preferable to continue to provide for the most pressing needs with the assistance of public charity and that of benevolent individuals. To propose to create vast services of charity and not be able to carry them out for want of funds is to arouse hopes which can not be realized and make the poor feel still more keenly the extent of their poverty. Besides, we repeat, this course favors improvidence, vice, and idleness, and encourages the unworthy to anass themselves around those who are temporarily and unmeritedly in want.

As a general rule no gifts should be gratuitous, but all assistance should be paid for by work when the man is well. Every other form of charity degrades a man and perpetuates his poverty and that of his children. The necessity of working for their children is with many the last guaranty of the preservation of personal dignity and the highest prompting of conscience toward work and sobriety. It does not do to cheapen this condition of mind, and on this point we can repeat the words of M. Paulian in his work on poverty, "A benefit wrongly bestowed is a wrong."

The summary of the results of the investigation for communal schools is as follows:

Total number of pupils attending the primary schools .....	11,904
Number wearing wooden shoes .....	2,347
Number wearing leather shoes .....	8,536
Number wearing slippers .....	187
Number wearing other footwear .....	834
With insufficient footwear .....	1,910
Number whose shoes are satisfactory .....	9,994
Number who are habitually neatly and cleanly clothed .....	10,498
Number of those whose clothing is habitually dirty and untidy .....	1,406
Number of those who receive clothing from charitable sources .....	2,187
Number who should receive such on account of their habitual condition .....	2,733
Children who habitually come to school dirty (face, hair, hands, neck) .....	876
Number who are bathed all over at least ten times a year .....	5,577
Number who take foot baths at least once a week .....	9,036
Number who wash the entire body once a week .....	8,234
Number who have no pocket handkerchief .....	1,924
Number who take the noon soup provided for the school .....	3,109
Number who appear to be insufficiently fed .....	2,120

KINDERGARTENS.

Total number of pupils .....	2,543
Number with wooden shoes .....	392
Number with leather shoes .....	1,925
Number with slippers .....	51
Number who have other kinds of shoes .....	175
Number who are ill furnished .....	532
Number who are sufficiently furnished .....	2,011
Number whose clothing is habitually clean and neat .....	2,090
Number whose clothing is dirty and slovenly .....	453
Number who receive clothing from a charity .....	1,215
Number who ought to receive it from charity .....	837
Number who come to school habitually dirty (face, hair, hands, neck) .....	212
Number who take baths at least ten times a year .....	1,264
Number who take foot baths at least once a week .....	1,898
Number who take baths every week .....	2,009
Number who have no pocket handkerchief .....	492
Number who take the noon soup provided for the schools .....	800
Number who appear to be insufficiently fed .....	354

LODGING, PRIMARY SCHOOLS.

Children sleeping alone .....	10,543
Having no bed .....	538
Sleeping in the same room with their parents .....	5,635
Sleeping in the same bed with their parents .....	590
Brothers sleeping with sisters .....	578
Sleeping in the kitchen .....	2,608
Sleeping in a cellar or basement .....	99

KINDERGAERTENS.

Sleeping alone .....	2,031
Without bed .....	146
Sleeping in the same room with parents .....	1,526
Sleeping in the same bed with parents .....	165
Sleeping with brothers .....	638
Sleeping with sisters .....	649
Sleeping in the kitchen .....	636
Sleeping in the basement or cellar .....	11

## NOURISHMENT, MEDICAL INQUIRY.

	Primary schools.	Kinder-gartens.
Number of pupils whose health is habitually—		
Good.....	8,410	1,801
Medium.....	2,231	522
Bad.....	963	292
Total.....	11,604	2,525
With sufficient nourishment.....	9,042	1,832
With insufficient nourishment.....	2,513	693
Total.....	11,555	2,525

The physicians state that these statistics are not of the highest value in the case of the kindergartens, on account of the difficulty in obtaining reliable information as to the nourishment either from the children themselves or the teachers. As to health, they depended on absences for sickness, the nature of the maladies, and the constitutional condition of the children. As to nourishment, they deemed a child insufficiently fed who did not have meat or eggs at least four times a week.

*Distribution of school soup in Brussels.*

Period of distribution, (Nov. to Mar. 1.)	Number of distributions.	Total expense.	Remarks.
1888-89.....	110,661	\$311.83	Ordinary soup of the cooperative society.
1889-90.....	185,640	2,188.86	Special soup prepared for the children. Stew twice a week.
1890-91.....	299,359	3,220.05	
1891-92.....	274,328	2,898.28	
1892-93.....	289,365	3,963.54	From 1892 each child receives one ration of bread.
1893-94.....	248,666	2,711.56	
1894-95.....	253,090	2,618.79	

In 1890-91 the soup was distributed during seventeen weeks at an average cost of \$189.40 per week. In 1891-92, seventeen weeks, average \$190.40 per week. In 1892-93, fifteen weeks, at \$264.20 per week. In 1893-94, thirteen weeks, at \$295 per week. The bread rations amounted to 4,725 pounds in all. In 1894-95, sixteen weeks, averaging \$165.60 per week; bread 4,902 pounds.

The Progress Club receives annually—

First. From the city .....	\$1,000
Second. From the committee on markets .....	600
The balance of the cost is paid by members of the club.	

*Wants for which provision should be made.*

1,910 } 2,442 children with bad shoes who ought to have one pair of galoches each in winter,	
532 } at 40 cents .....	\$976.80
2,783 } 3,920 children poorly clothed, each of whom should have one suit a year, at \$2.....	7,240.00
837 } .....	
2,513 } 3,176 children insufficiently fed <sup>1</sup> .....	69,554.40
663 } .....	
	77,771.20

The report continues with tables showing the number of distributions of food and clothing to pupils of the primary schools and kindergartens in various other cities in Belgium, France, Holland, Germany, Austria, and Switzerland, giving the source of the assistance, whether public or private, and the cost.

<sup>1</sup> If only one meal is given at noon, the expense would be one-half this sum, or \$34,777.20.

Table of sums distributed for food and clothing of poor children in the primary schools and kindergartens in different cities.

Cities.	Population.	School population.	Number of pupils aided.	Total amount expended.	Mean per inhabitant.	Mean per pupil.
<i>Cities where aid is given to needy pupils without their request.</i>

a Primary schools only.

The report gives the following information concerning the organizations of the charities for poor school children of the official schools in the various cities mentioned:

1. *Cities where assistance is given to needy children only, without their request.*

BELGIUM.

*Ghent.*—Children attending the écoles gardiennes, whose parents request it, may stay at the school all day and receive one ration of soup at noon. The number of such children diminishes in proportion as the schools multiply and are nearer the homes of the children.

FRANCE.

*Bordeaux.*—Food and clothing are supplied by sociétés de patronage. Some schools only receive food. For the écoles maternelles there are ladies' committees, who make the clothing.

HOLLAND.

*Rotterdam.*—Food was first supplied to school children in 1885 by a private individual, M. Koene, who bore all the expenses of this charity until 1891. The number of children increasing from year to year and M. Koene no longer being able to supply all the wants, two friends of his joined him in the work, the value of which is now recognized, and it receives donations from all sides. The city provides the rooms. M. Koene and his friends also distributed clothing to needy children; but a society having been formed in 1893 for the distribution of clothing, the first company only attends to the food.

GERMANY.

*Berlin.*—The Verein für Kindervolksküchen, which is not subsidized by the city, furnished 500,000 complete meals in 1894, the first year of its existence. If we suppose that the distribution only took place in the winter months, or for 125 days, and that the cost per meal was 5 cents, this society must have fed 4,000 children and paid out

\$25,000. The money for this purpose is derived from interest of endowments administered by the city, subscriptions from charitable clubs, and appropriations made by the city.

## AUSTRIA.

*Vienna.*—The distribution of food is carried out by a society which has its office at the Hôtel de Ville, and is administered by a commission of 30 members, 8 of whom are delegates from the communal council. Its bank deposit is supplied by an annual subsidy of \$10,000 from the city, by legacies, gifts, and assessments upon its members. The receipts from these last three sources amounted to \$6,906 in 1893-94, of which \$2,681 was added to the reserve fund, which amounts to \$54,875, producing an annual revenue of \$2,655. The expense of the distribution for 1893-94 was \$14,623.50. The society appoints a local committee in each quarter, whose duty is to make inquiries and superintend the distributions.

In Vienna there are crèches, écoles gardiennes, and kindergartens. The first two are attended only by children of the working classes, while the kindergartens have pupils from the well to do. In the crèches and in certain écoles gardiennes all the pupils are fed free of expense. In the other écoles gardiennes food is only supplied gratis to those pupils who do not go home at noon. The same is true in certain official kindergartens. The city grants an appropriation for these schools.

All indigent children can participate in the gratuitous distribution of clothing without the necessity of going to school for that purpose.

Orphans or abandoned children committed by the city to foster fathers get their clothing from them. If they can not furnish it, they can obtain it from the committee on charities, on proper representation, the funds coming from legacies, orphans' banks, subscriptions, etc. Funds for supplying clothing in winter through local committees come from similar sources and from appropriations to each committee by the communal administration. This appropriation amounts to \$8,000.

2. *Cities where indigent children receive aid at the request of their parents.*

## BELGIUM.

*Antwerp.*—All children in the kindergartens participate in the distribution of soup, and pay at the rate of 1 cent per plate when the cost is 1½ cents. In 1893 the total expense for kindergartens was \$8,400, while the children paid \$7,000. The expense is borne by the bureau of charities. Clothing is supplied by private societies.

## FRANCE.

*Paris.*—The law of 1882 affecting public instruction made it obligatory upon the communes to establish one or more school banks, whose funds are supplied by the city, the department, and the State, together with private gifts. Their object is to furnish assistance of all kinds to indigent children—clothing, shoes, food, school books, financial aid, school colonies. The school banks of Paris possess a large reserve fund. In 1892 their receipts proper amounted to \$232,553, besides grants from the conseil général, the municipality, and the Government. Their expenses during the same period were \$379,216, only a very small portion of which was devoted to food. In 1893 the contribution of the school banks to the school canteens amounted to only \$1,500.

The food is distributed by the school canteens, and is free for poor children. Children who are able to pay can get a complete meal for 2 or 3 cents, the net cost being 5 or 6 cents. The school canteens are administered by the commission of school banks.

*Lyons.*—Food is furnished by the school canteens, which are under the direction of the municipal authorities. These canteens furnish meals for tickets, which are supplied gratis to needy children and sold at 3 cents each to those who can afford to pay for them.

*Lille*.—The city only subsidizes the school bank. Some societies have organized canteens for primary schools.

*Roubair*.—The distribution of food and clothing is made by the school bank. The pupils of the primary schools receive no food yet, but will soon participate in the distribution.

*Marseilles*.—The food is distributed in the school canteens, which also sell it at a low price to nonindigent children. Clothing is distributed by the school bank.

## GERMANY.

*Barmen*.—Most of the money for food and clothing for poor children comes from private sources.

## SWITZERLAND.

*Geneva*.—There is no central committee. The first kitchens were established in 1887 by a private society, which superintended the distribution. Owing to the inconvenience of attending to this work—which often required going some distance—and the increase in the work itself, it was finally turned over to independent local committees.

3. *Cities where aid is given in part to all the pupils, the indigent alone receiving the other part.*

## BELGIUM.

*Liège*.—Gratuitous distribution of food to the children of kindergartens has been going on for more than forty years. All children of these schools can participate in it. Clothing is only given to the needy children who are designated by the head teachers. The city lends the poor children cloaks for the winter, which must be returned at the close of the season. There is besides a distribution of clothing by a society, "*Le vestiaire libéral*," which distributed 3,558 articles (shoes, trousers, shirts, etc.) in 1893-94 at a cost of \$1,900.

In all the preceding cases the distribution requires some formality, such as request, authorization by the committees, etc.

## SECONDARY SCHOOLS—RECENT CHANGES IN THE CURRICULUM.

In his report for the triennial period 1891-1893 the minister of public instruction considers the effect of the changes introduced into the public secondary schools of Belgium by a decree of 1888. The matter is an interesting contribution to the general discussions of secondary education now going on in all the leading countries of Europe. This portion of the minister's report is here cited:

## ROYAL ATHÉNÉES (SECONDARY SCHOOLS).

During the triennial period 1891-1893 the organization, established by royal decree of the 30th of August, 1888, taking the place of that of the 30th of June, 1881, was applied successively to the fourth, third, and second classes, so that at the end of that period only pupils in ancient and modern humanities of the class of rhetoric were still under the régime of the decree of 1881.<sup>1</sup>

<sup>1</sup> By this order the athénées are now organized in three sections: Section of ancient humanities, including both Greek and Latin; section including Latin only; and the section of modern humanities, having neither Latin nor Greek. There are seven classes in each section, the seventh or lowest being in a sense preparatory; the highest class is the first or rhetoric. The section of modern humanities divides after the fourth class, and has two divisions in each of the following classes—the scientific and the commercial.

The vote on the law of superior instruction, and the decree issued in conformity with the advice of the "Council for the improvement of superior instruction," making Greek compulsory upon students who are destined for medicine, prohibits the division of the Latin section into a scientific section, and a section of natural sciences in any class above the third.

The Latin section includes only students pursuing the mathematical studies necessary for entering special schools. It has not been possible to allow students preparing for medicine to pursue the course of chemistry, which would, however, much facilitate their studies for candidacy in natural sciences.

*Condition of studies.*—In a general report to the Government the supervisor of intermediate instruction describes the situation as to the progress of studies as follows:

"Although it will not be possible before the close of the school year 1893-94 to estimate the results obtained in the class of rhetoric under the new programme, and to decide if it was well to substitute it for that of 1881, yet it may be said that experience during the last six years justifies favorable expectations.

"If the programme of 1888 does not realize perfection (and what part of the programme of studies may not be criticised with more or less reason?), it has made improvements in several respects, namely: Diminution of the number of obligatory modern languages; change in the number of hours assigned to different studies; branches distributed through a greater number of years; the humanities better divided; Flemish made as important as French; the study of Greek made more serious and connected with only one division of humanities; separation reestablished and made more radical between secondary instruction of the higher degree and that of the lower degree (*enseignement moyen de degré supérieur et l'enseignement moyen de degré inférieur*)."

Improvement resulting from these different changes is now quite manifest.

*Latin.*—Although Latin is taught at present for seven years, when it might be learned in five years under the régime of the law of 1881, it is given fewer hours than before—fifty-three instead of fifty-six. The highest maximum for Latin is eight hours a week; in the sixth class it has seven hours, and in the seventh class six hours.

It was found that the twelve hours for Latin which might be assigned to poetry and rhetoric were too many; that it was very difficult for professors to vary exercises sufficiently to hold the students' attention so long. The time and the programme as now existing are more favorable to the study of Latin; however, the results of the "concours" (competitive examination) do not yet allow us to say how great a change has been produced. Yet there is no need of haste in judging the new programme, whose working has been attended by certain difficulties; in effect, without sensibly increasing the personnel, it has been necessary to create two new classes—the seventh and sixth of the ancient humanities.

In the *athénées* where the seventh and sixth classes were doubled one of the sections has become the section of Latin and the other that of modern humanities. In the other *athénées* one of the two professors of the seventh and the sixth has been assigned for the instruction in Latin in both classes, the other to French. This arrangement presents the inconvenience of joining, for instruction in French, two classes of different preparation, for whom the course in French should be differently taught. The change in the duties of professors has also proved unfortunate; a professor assigned to a new course necessarily needs time to ascertain how to make his instruction profitable. Furthermore, from the fact that students of the class of rhetoric do not appear to have a more thorough acquaintance with Latin than their schoolmates of the lower classes, it would be rash to conclude that the new programme does not contribute to increase the force of studies.

The last "concours" (competitive examination) showed sensible progress in

translating, yet there is much to gain; the Latin theme (translation into Latin) in the superior class of the athénée is still defective. \* \* \*

*Greek.*—Before 1888 Greek was taught four years, and its study began in the fourth Latin. Six hours a week were given to Latin and Greek humanities; in Latin humanities, for students who aspired to special schools and a doctorate in physical and mathematical sciences, the study of Greek was obligatory in the fourth and optional in the three higher classes.

In Latin humanities, for students destined for natural sciences and medicine, Greek was obligatory in the fourth and fifth classes and optional in the two higher.

Under the programme of 1888 Greek is taught only in Greek-Latin humanities. The study commences in the fifth class and continues five years at the rate of five hours a week, thus making twenty-five hours instead of twenty-four.

The new programme is more favorable to Greek than the old, because the subject is distributed over five years instead of four, and begins two years after Latin.

In the study of Greek and Latin there has been a question of making trial of the inductive method; but before coming to a decision the Government ordered an examination of the inductive method of Halle in the monthly conferences of the athénées. Opinions were divided, but the unfavorable were the most numerous. Nevertheless, a professor of the athénée has been charged to make trial of that method for two years, with Greek in the fifth and fourth classes.

Results in Greek vary much with different professors. In the athénées, where professors of rhetoric seek to enable students to translate at sight certain authors more or less easy, the result is far from being uniform, and it is to be remarked that if under the old system good professors receiving in the class of rhetoric scholars already well prepared, did not expound to them a complete oration of Demosthenes, nor the Crito of Plato, nor an entire tragedy of Euripides, nevertheless, by numerous extracts, by happy choice of dictated passages for translation, they succeeded in imparting to young men incipient acquaintance with the principal examples of Greek literature.

*French.*—The programme of 1881 assigned to French twenty-six hours; that of 1888, twenty-eight, distributed as follows: Seven hours in the seventh class, six hours in the sixth, and three in each of the five higher classes, which before that had only two hours a week; this was too little. The authors of the programme supposed that exercise in translation would contribute to the study of French, but that exercise, though done with greatest care, could not do so, nor even serve to impart acquaintance with the principles of literature, and time was lacking for reading and commenting upon authors.

The study of French, therefore, has been reenforced in raising from two to three the hours per week assigned to it in the higher classes.

Before 1888 literary branches were rather neglected, and the useful were in too much favor. There was a sort of apathy in the matter of literature. It was easy to recommend reading at home, but few pupils had the time for that.

To-day the programme is less crowded and literary taste is perceptibly rising. However, it is well to avoid going to an extreme by confining the lower classes exclusively to the literary analysis of French authors.

The study of grammar in these classes is of highest importance, but it is a mistake to make the exercise of reading simply the occasion for grammatical theories. Only the explanations are desirable which serve to elucidate the text. \* \* \*

*History and geography.*—Under this head the report says that the former programme, being found fully satisfactory, has been continued.

The following brief paragraphs are interesting:

A sensible difference has been shown between results in the two rhetorics. Pupils in that of modern humanities are quite superior to their fellows in ancient. This can be attributed to nothing else than the importance attached to history and geography in examinations for the military schools.

The jury charged with the correction of examinations in history have found that answers made in Flemish were much more correct than those made in French. In many of the latter the precise word is often wanting. That difference arises from the fact that a goodly number of Flemish pupils render their answers in French, when the course has been given in Flemish. \* \* \*

*Germanic language.*—The programme of 1881 imposed too many languages. Pupils in the fifth class had five, those in the fourth, six. It was too much to exact of children of thirteen and fourteen years, who, with very rare exceptions, can derive but little benefit from such superabundance of school work.

All these languages continue to figure in the programme of 1888, but they have ceased to be compulsory. It might be supposed that the majority of pupils would content themselves with studying obligatory languages, leaving the best endowed to follow optional courses; there has been nothing of this, and the majority would prefer to continue the study of all languages, notwithstanding the futility of their efforts.

In order to prevent mediocre students from wasting their time in such work it has been decided that only those who have obtained 0.6 of the total points allowed for compulsory languages should be permitted to study the optional languages.

In the scientific section the courses of modern languages have an importance which is quite different from that accorded to them in examinations for admission into special schools. The student who presents French needs to have studied but one more language—Flemish, German, English, or Latin; while in the scientific section of the athénées, to be in regular standing, he must have studied two of these languages, and the passage from one class to another is not allowed unless progress in the two other languages besides French is satisfactory.

*German.*—The general “conours” (examination) justifies the statement that in the athénées instruction in modern language is very thorough. The results have been satisfactory in the two rhetorics, and especially so in the classes under the programme of 1888. These results will be further emphasized hereafter if greater importance is attached to grammar.

At the request of the athénée d’Arlon there has been organized a special “conours” for German. Work presented by contestants has been weak, below that of the ordinary “conours” in that language. The distinctions were nearly all won by German students not belonging to the German region of the country.

*English.*—Results in the English language have been inferior to those in German.

*Mathematics.*—In the preceding report the Government put forth some rather important changes in the programme of mathematics, so as to render the study more simple and attractive, especially for students in Greek-Latin humanities, and diminished the number, entirely too large, of those who finish their studies without knowing, so to speak, anything about mathematics, or having only too incomplete acquaintance to derive any benefit from it hereafter.

Important progress has been made in the study of algebra. Instead of devoting numerous lessons to algebraic operations which discourage pupils by their difficulties, professors require students to solve and discuss problems, an exercise particularly well adapted to awaken the intelligence of pupils and stimulate their endeavors.

The change of method met with some opposition, but results obtained by those who unhesitatingly adopted the new methods have led others to leave off old errors and recognize that, for students in the Greco-Latin sections, the study of mathematics is only a means of developing their understanding and has not the purpose of imparting determinate knowledge.

Pupils on leaving the first scientific class continue to succeed in examinations for admission into special schools; the success obtained by them subsequently proves the advantage of an education complete, and of studies reasonably conducted without being limited to matters required for the entrance examination.

*Physics and chemistry.*—A change has been wrought in the programme of physics with intent to lessen its tension in the third class of modern humanities and in the

second of ancient humanities. That part of light relative to refraction has been carried back to the programme of the second class in the section of modern humanities and to the class of rhetoric in that of ancient humanities.

The requirement for future doctors of medicine, that they should present certificates of studies showing that they have pursued the course in Greek, has obliged these students to stop the study of chemistry, despite the important advantages offered by it for their university studies.

The course of chemistry, not being pursued except by students, always few, of the second and first commercial classes, lost much of its importance at the very time when laboratories were thoroughly organized in the majority of the secondary schools.

*Commercial sciences.*—The programme of bookkeeping in the fourth class has been divided. One part is now given in the fifth class, occupying one hour a week, the rest in the fourth, with two hours a week. The time devoted to that study remains the same. The division was made in the hope that pupils destined for scientific studies would continue in the fourth class the study of accounts begun in the fifth, so that thus the professor of commerce might not see his course neglected by students.

That hope does not seem to have been realized. In the fifth class all the students follow regularly the course in commerce, which is important for their passage into the fourth; it is not the same in the fourth. Those who are to go into the scientific section know that results obtained in commerce have no influence upon their passage into the third class, where they are to pursue it no further.

It would be of importance, however, to future engineers and directors of workshops to have thorough knowledge of accounting. This would enable them to verify their own books and render them more exact in the management of their business.

*Drawing.*—Results in the course in drawing vary considerably in different athénées. They depend less on the artistic accomplishment of the professor than upon his pedagogical aptitude and especially the order and discipline which he maintains.

In fine, to obtain regular and continued work on the part of students prizes are bestowed upon the basis of all the marks obtained during the year. At the end of each trimester the professor sends to the prefect the work of the students with his marks.

For students in the scientific section it has been recommended to attach much importance to linear drawing. Examinations in descriptive geography, held during the lessons in drawing, are much more careful than formerly. The correctors of the general examination notice that improvement.

*Gymnastics.*—Instruction in gymnastics during the triennial period, 1891-1895, remained as it was in the preceding period. Courses are organized in all the establishments of intermediate instruction, and in the majority of them half-hour lessons are given conformably to ministerial instructions. Nevertheless in several athénées and in a certain number of intermediate schools each lesson lasts a full hour. However, the number of institutions wherein this obtains diminishes from year to year.

The lessons, more often than otherwise, are given after class hours; that is to say, at 11 or half past 11, sometimes at noon, or at 4 o'clock. The consequence is that students who reside at considerable distances from school generally leave without participating in the exercises.

The material required for this exercise, good, or reasonably so, in some establishments, is quite inferior in others. In some of the schools there is no equipment for this work, communal authorities almost always refusing to make expenditures, without which the course can not be given to any advantage. Such conditions discourage both professors and students, and are the cause of much weakness and irregularity.

## TECHNICAL AND INDUSTRIAL SCHOOLS OF BELGIUM.

The system of technical and industrial training for which Belgium is somewhat noted is not as a whole under the charge of the minister of public instruction. Three grades or degrees of this instruction are recognized: To the elementary degree pertain the "écoles professionnelles;" to the intermediate grade, the industrial schools; both of these classes are under the minister of industry and labor. The superior degree of technical instruction is comprised in the engineering departments of the universities, which are under the charge of the minister of education. It is not always possible to distinguish between the first two classes of schools, i. e., the "écoles professionnelles" and the industrial schools; indeed, a few schools have both characters. In a report presented before the International Congress on Technical Education (London, 1897), M. Edouard Séve describes these schools as follows:

In general, it may be said that the industrial schools are in session in the evening and on Sunday, and the students are workmen or employees occupied in workshops during the day. The "professional" schools are open every week day and have their own shops, where the pupils are trained in manual work.

As regards their direction and support, the schools of either of the two classes may be public (communal) schools or private (*libre*). The former are administered by a commission in which communal delegates must form a majority, the latter—that is, the private schools—are administered by representatives of industries affected, or by syndicates formed by the workmen. The expenses of the schools, both the "professional" and the industrial, are borne by the State, the province, the commune, and by private persons. Generally the State bears one-third of the expense (exclusive of rents and the receipts from day pupils) for the industrial schools and two-thirds for the "professional," whose expenses are the heavier.

The programmes of the schools vary according to the locality, but they all have a common base, which comprises drawing, mathematics, geometry, elements of physics and of mechanics, hygiene, and industrial economics. Each school has its special practical course appropriate to the industry of the locality. In this course drawing plays an important part, developing according to the demands of the technical arts. Further particulars respecting the professional schools (*écoles professionnelles*) are comprised in a paper on technical instruction and private initiative in Belgium, presented before the same congress by Oscar Pyfferoen, doctor of laws and doctor of political and administrative science and professor at the University of Ghent.

*Écoles professionnelles.*—The expression professional applied to schools which give instruction in special manual arts is misleading in its English form, because the term has so long been applied to schools of a very different character. Its meaning as applied to technical schools

in Belgium and also in France is made clear by Professor Pyfferoen by the enumeration of the special trades for which their training prepares. These are tailoring, shoemaking, painting, carpentering, upholstering, etc. In England such schools are classed indiscriminately as technical and as trade schools. Professor Pyfferoen notes at the outset that in Belgium the State took the initiative in the establishment of these schools, and he contrasts this with the course pursued in England and in Germany.

In Germany corporations generally take the initiative in this work. After the value and utility of the schools are assured, the State may come to their aid with small subsidies. In England the polytechnics and higher technical schools have been established almost entirely through the efforts of private individuals and with the aid of funds subscribed by public-spirited citizens. In Belgium the tendency has been to depend upon the State for provision of this kind. As a consequence the number of schools has not multiplied heretofore in proportion to the local requirements, the difficulties in this respect being greater than are experienced in countries where local effort is the main dependence. Thus for a long time Belgium had only one or two technical (professional) schools for workers in wood and in iron, notably those at Ghent and at Tournay, a few technical courses in industrial schools, a few workshops in the country for workers in textiles, and in Hainaut workshops for apprentices in stonecutting.

The reluctance of artisans and manufacturers to establish schools pertaining to their respective industries is explained by their failing to comprehend the value of the training and their unwillingness to bear the initial expense, which is considerable. Those who best understand the importance of the training are themselves too old to profit by it and show little disposition to make provision for others.

*Development of private initiative.*—Within a few years the tendency in this respect has changed somewhat. The Government itself, and especially M. Nyssens, the minister of industry and labor, encourages private initiative and strives to excite it by holding out the hope of State aid. As a consequence of these efforts technical schools have multiplied within a few years, and the State subsidies for these have been increased, reaching in 1898 the sum of \$170,000, most of which was applied to schools started by private effort.

Private initiative is exercised in three or four forms:

(1) In many districts groups of artisans or workmen form syndicates or associations for the purpose of establishing trade schools (*écoles de métiers*) and solicit subsidies from the State, the communes, or the provinces. They themselves bear a very small part of the financial charge. Such was the origin of the schools for tailors at Brussels and Liège, schools for tapestry workers, clockmakers, jewelers, and hair dressers at Brussels; of armorers at Liège, and the schools for brewers at Ghent.

By the manner of their origin these various schools are entirely separate from each other. Nowhere in Belgium are found polytechnics like those of England, where all this instruction is concentrated under one direction. As a rule these technical or trade schools of Belgium are day schools equipped with workshops, and have a systematized course extending over two or three years. They are intended to take the actual place of apprenticeship and to turn out complete workmen. From these conditions also it becomes necessary to pay the pupils for coming to the schools, otherwise the parents refuse to send their sons for training, preferring to put them at once into the shop of an employer. Even with the plan of paying pupils for attending, the remuneration is so small that many parents will not sacrifice the chance of higher wages and allow their sons to take the time for training.

The men also who make their living by working at the small trades oppose the day trade schools, which being free from commercial competition can sell their products at such prices as they may command. Professor Pyfferoen suggests as a remedy for these apparent evils that the sessions of the schools should be held in the evening, which would enable those who are working to have the benefit of the training while they are earning wages, and also that the workshops of the schools should be used simply to supplement the theoretic teaching and not to make goods for the market. The advantages of this plan are seen from the school for printers at Brussels, which is an evening school open only to those who are already working at the trade. On the other hand, a serious crisis was provoked by the opening of a day school of metal-lurgy. The young apprentices from this school, passing forth into the workshops, crowded out experienced workmen and excited the jealousy of their fellow laborers. The consequence was a strike, which had a disastrous effect on the industry.

(2) Another type of technical schools due to private initiative, and one for which Belgium is specially noted, is found in schools established by the religious orders. The most important schools of this class are the academies of drawing and the St. Luke Technical Schools (*écoles professionnelles St. Luc*), directed by the Christian Brothers. The majority of the St. Luke schools confine themselves to the trades, for which a knowledge of drawing is the chief requisite; some of them, however, go farther and include workshop practice. Until recently these schools have had no aid from the State.

The schools of St. Luke are for day pupils exclusively. But there are numerous orphanages and boarding schools maintained by other religious orders in which technical training finds a place. Such are the schools of the Salesian priests at Liège and of the Brothers of Our Lady of Lourdes at Oostacker and Maltebrugge, which have technical departments, to which day scholars as well as boarders are admitted. The Brothers in charge of the schools take orders for work, but the pupils receive no money for their work. They are, however, lodged, fed, and

clothed at the expense of the establishment. The period of apprenticeship is from five to six years.

According to Professor Pyfferoen the principal objections to the system of these schools is the length of the period of training under conditions unlike those actually affecting the trades for which the pupils are preparing and the absence of effective stimulus in their daily routine. Complaint is also made that these establishments compete unfairly with private industries. This is not a legitimate objection to the training itself, but simply to the work as managed by the religious orders. Corresponding to the schools for boys maintained by the Brothers are the "ouvroirs" for young girls. These are schools maintained generally by religious sisterhoods, but in some cases by private individuals, where young women are trained for the manual arts which are open to them, such as the cutting and making of garments, plain sewing, and embroidery. In the same category as regards their purpose are the schools of domestic art and economy, which exist in all the cities and many of the rural communes of Belgium. They are attached generally to the elementary school, whether public or private, and are often under the patronage of women of noble rank, and in some cases even of members of the Royal family.

(3) The demand for commercial education has given rise to a third form of private initiative in the establishment of technical schools. The Commercial School of Antwerp (Institut Supérieur de Commerce d'Anvers), which has existed for a long time, is a State school. Recently several similar schools have been founded by private effort. These have been established either by church authorities or private associations. An example of the former is found at Louvière. Here a church college has annexed a section of commercial studies which bids fair to surpass even the school at Antwerp. The work of associations is illustrated by the Cercle Polyglotte of Liège. It comprises 500 members, who pay each a small annual fee. The fund thus secured enables the society to maintain evening schools, where, for a small tuition fee, young men may fit themselves for commercial business. It seldom happens in Belgium that the great manufacturers show the disposition to promote technical training by such princely gifts as are freely subscribed by English manufacturers for the foundation of technical schools.

In this respect, France also greatly surpasses Belgium. At Roubaix and at Tourcoing notable schools of spinning, weaving, and dyeing are maintained without public subventions from any source. The only example of this sort in Belgium is that of Verviers, where subscriptions running up into the hundred thousand francs have been secured for technical schools.

In concluding his survey, Professor Pyfferoen says:

If in Belgium private initiative has varied developments, it is because of the liberal character of our institutions and the assistance afforded by the public authorities.

As yet, there is no settled legislation respecting technical instruction in its three

degrees. So far the experiments have been empirical in their character. It seems that it would be desirable to apply to this department the principles adopted for primary instruction, namely, public subsidies for private schools and at the same time the maintenance of public schools at the cost of the State, the provinces, and the communes, which should serve as models to the private establishments or fill the gaps left by private efforts.

The hope is also expressed by the author that the policy of giving civil personality to private technical schools may soon be adopted, so that the schools may have the right to receive, to part with, and to manage their own property. Until they have such legal recognition, their existence and future are insecure. The example of England is quoted where the administration of such schools by trust committees has proved eminently successful.

*Superior technical school.*—What has been called the superior or higher degree of technical instruction in Belgium is comprised in schools annexed to the universities, namely, schools of art and manufactures, mining schools, and schools of civil engineering. Two of the four universities—the University of Liège and the University of Ghent—are State universities; the other two—Brussels and Louvain—are private foundations. Each of these universities comprises the four faculties of philosophy and letters, law, science, and medicine. The University of Louvain possesses also a faculty of theology under the surveillance of the Catholic Episcopate of Belgium.

A number of technical schools have been grouped around the universities as adjuncts of the faculties of science.

All the universities possess schools of engineering and of architecture, but only those belonging to the two State universities have the privilege of preparing engineers for the service of the State. The engineering school of Liège recruits the mining service, and that of Ghent prepares engineers for the construction of public roads and bridges.

The technical school of the University of Liège, founded in 1825, comprises four sections—the school of mines, the school of arts and manufactures, the section of mechanics, and the section of electricity. These four sections lead respectively to the diploma of honorary engineer or of civil engineer of mines; of civil engineer of arts and manufactures; of mechanical engineer (*d'ingénieur civil mécanicien*); of electrical engineer. The institution is admirably equipped with apparatus, laboratories, etc.; it has an ample teaching force, and the instruction is supplemented by expeditions to the mines and the manufactures in which the province of Liège abounds.

The special school of civil engineering attached to the University of Ghent comprises an inferior section for the training of assistant engineers and a superior division for the training of engineers. This university possesses also a school of arts and manufactures for young men who seek the diploma of industrial engineer. The school comprises in its programme the branches necessary for the application of the sciences to the general processes of industry and to particular manufactures. It

consists of a preparatory division having a two years' course, and a division for practical work called the special school of arts and manufactures, in which the course is also two years. This division is open to students from all countries.

The Polytechnic School of the University of Brussels, founded in 1873, is intended to teach the application of the sciences to the arts and to industry. It comprises the following sections: Mining, civil, and mechanical engineering, metallurgy, industrial chemistry, and architecture. The University of Louvain has also annexed to it a special school of arts and manufactures, of civil and mining engineering, and a superior school of agriculture.

The importance of this provision for higher technical training is indicated by the large proportion of students availing themselves of the same. The official statistics for 1895 show the following distribution of university students for that year:

University.	Total number of students.	Number in the special schools.	
		Engineering.	Arts and manufactures.
Ghent.....	640	145	71
Liège.....	1,248	a 222	
Louvain.....	1,636	433	
Brussels.....	1,311	139	

<sup>a</sup> By the law of June 30, 1893, the technical schools of Liège are grouped together under the title of technical faculty.

The total number of students in the four universities was 4,835. Of these 937 were enrolled in the faculties of science and 1,010 were in the technical faculty of Liège and the special schools of the remaining universities.

*Auxiliary institutions.*—The development of this special training in the industrial arts is promoted also by the Royal Academy of Science, of Letters, and of Fine Arts, which has its seat at Brussels, and is under the immediate patronage of the King.

The discussion of questions bearing upon technical instruction is encouraged by prizes from the funds of this academy.

Besides the universities with their special schools, there are several other establishments in Belgium which are included among those of higher grade and which give combined theoretic and practical training. Among these are included the Schools of Art and Music. The principal institution of the former class is the Royal Academy of Fine Arts founded at Antwerp in 1663. It is administered by the Government and the city council and consists of two divisions, the Superior Institute and the Academy proper; the former is designed to give complete training in the graphic and plastic arts. The courses of the latter include elementary training in drawing and its applications, and the preparatory stages of the graphic and plastic arts. The Royal Academy of Fine

Arts and School of Decorative Arts of Brussels is similar in scope to the Antwerp school. In the same category are included the conservatories of music for which Belgium is noted.

The enrollment in the royal conservatories was as follows at the date of the latest report:

Conservatory.	Number of students, 1895.	
	Men.	Women.
Brussels.....	426	329
Liège.....	498	255
Ghent.....	278	280

There are also about 225 schools of music, of which 50 are communal establishments receiving subsidies from the State. These had at the date of the last report 11,567 pupils, of whom 6,642 were men and 4,925 women.

The Government and local authorities stimulate the culture of national taste and artistic skill by grants in aid of the schools and the organization of musical festivals and expositions of fine arts, for which liberal appropriations are made.

The State gives also great encouragement to instruction in agriculture and commerce.

The State Agricultural Institute at Gembloux, in the province of Namur, was founded by the Government in 1865. It includes an experimental station and a finely equipped laboratory. The diploma of agricultural engineer is bestowed upon the students who successfully pass examination before a State board. Those who pass with special distinction receive subsidies to enable them to continue their studies and researches in foreign countries.

The Superior Institute of Commerce at Antwerp completes the list of special schools endowed by the State. By a law of 1883 the diploma of this institute is placed on an equality with the university diplomas.

The following tables summarize the principal statistics of the several classes of special schools here considered:

SPECIAL SCHOOLS.

## I. PROGRESS OF THE ELEMENTARY SCHOOLS OF PRUSSIA IN TEN YEARS—1886-1896.

TOPICAL OUTLINE.—General remarks.—Schools of German-speaking countries.—Number of schools, pupils, and teachers.—Pay of teachers.—Expenditures for elementary schools.—Overcrowded schoolrooms.—Summary of statistics.

### GENERAL REMARKS.

The German Empire, of which the Kingdom of Prussia forms a large part (having about three-fifths of the population), has of late years made such astonishingly rapid strides toward industrial and commercial supremacy in Europe that thinking people of other nations have begun to inquire into the causes of this success. Various reasons are stated, to wit: The unification of Germany and the revival of national feeling, aided by centralized legislative and executive efforts in behalf of industry and inland commerce; tireless exertion of the Imperial Government and shipping corporations in Hamburg and Bremen for the purpose of extending German commerce abroad; the vivifying influence of scientific work performed by the old universities and secondary schools, many of which are centuries old; the establish-

ment and generous maintenance of a great variety of special schools—art, polytechnic, industrial, and trade schools—which prepare men and women for intelligent labor; the aid given to labor from the State in the form of pensions and accident insurance, which secures increased income and better care for skilled labor. All these and several other reasons have combined to give an impetus to efforts in every domain of human exertion such as inevitably result in increased wealth, comfort, and national strength.

But it seems that the secret lies deeper. Governmental efforts, however vigorous and well directed, and private enterprise, however farsighted and prudently managed, can not change the entire aspect of a nation in so short a period, as we find it changed in Germany within the last twenty years. The nation must have gone through a long preparation for such a change, and this is indeed true in the case of Germany. English and American students of public affairs confirm it. The English consul, Mr. Powell, recently forwarded to the foreign office in London an exceedingly interesting report on commercial education in Germany, in which he makes it quite apparent—how widely and energetically the German nation is aroused to the necessity of commercial education as an important factor in their newly developed competition with other trading nations, and especially is it noteworthy to remark how the study of modern languages is being encouraged and fostered by the nation at large.

But he admits that the success of these special schools would not be possible if there were not a broad and secure foundation laid for them in general education and culture. He says:

The great success which has attended German trade since 1873, but more especially during the last ten years, has been frequently attributed in Great Britain to the superiority of commercial and technical education in Germany. This is not the view taken by those best able to judge of the facts by close acquaintance with them in Germany. They are rather of the opinion that this success is due less to superior commercial education than to the high state of general education that Germany has enjoyed for many years, and which was formerly lacking, and is even now lacking in several essential points, in Great Britain.

The London Schoolmaster, commenting upon the report, adds to the emphasis of the foregoing quotation by saying:

Now what does this really mean? Does it not mean that, given a thoroughly well-grounded and efficient system of primary education, you can with rapidity and effectiveness develop from it technical, commercial, or any other branches of specialized higher education? So far so good. The result is exactly what might have been expected. But suppose your foundation of elementary education is not thorough. Suppose the children leave the primary school too early to have permanently impressed upon them the fundamentals of a general education. Suppose money is lacking and teaching power inefficient and insufficient in the primary school. What then? Will not much of our expenditures upon commercial and technical education of necessity be wasted? To us this has for a long time past been a matter of firm conviction; and we are glad to have Consul Powell's support for our own and Sir John Gorst's emphatic opinion, as stated to the commercial

education conference at the London Guildhall on July 8 last, that "we can not have high commercial education unless we have a solid basis of elementary education upon which to build."

Waking up in a characteristic panic, we are now lavishing money right and left on technical and commercial education. This is, of course, zeal of the most praiseworthy character. For, as Sir John Gorst told the people of Langton a year ago, "There is no doubt that unless we intend the English people to become the hewers of wood and the drawers of water for the world, we must make them as well prepared for the work they have to do as are foreign workmen." But it can not be too often or too emphatically insisted, that much of the newly awakened enthusiasm on behalf of technical and commercial education must necessarily be followed by barren and disappointing results, unless we go to work promptly and thoroughly to put the foundations of the whole fabric of national education upon a solid and effective basis.

The fact, then, that in Germany elementary education has been general, compulsory, and, to a large extent also, gratuitous for more than one hundred and fifty years, is recognized to be an essential factor in the recent political, industrial, and commercial successes of the nation. But it is also clearly seen that any system of special schools, secondary and higher, must rely upon a thorough elementary education. It is not enough to have a few thousand highly gifted and trained men to plan industrial and commercial campaigns; there must be hundreds of thousands of intelligent persons who can comprehend and execute these plans and act as intelligent interpreters and skilled laborers. They can be the product of thorough elementary schools only. Nothing short of a general uplifting of the mass of people will raise a nation to a higher level of existence and importance.

This point has been discussed before (see Report of the Com'r of Ed. for 1888-89, p. xxvii):

#### THE SCHOOLS OF GERMAN-SPEAKING COUNTRIES.

Although all the nations of Europe are largely of Teutonic stock, yet there have developed wide departures from the parent stock which has remained at home in Germany. In a certain sense Germany furnishes a deep contrast to England in its mental characteristics. The modern German, like the ancient Greek, has theoretic tendencies and art tendencies, while the Englishman, like the Roman, has tendencies to will power and practical experiment. While it would never do to say that the Germans lack will or that the English lack intellect, yet to understand their difference in character it is necessary to say that there is a very different emphasis placed on the two sides of mental power by the two races. The tendency of the German is to think before he acts, while the tendency of the Anglo-Saxon is to act before he thinks. The English way is to learn through doing, and to use its will rather than its intellect in the attainment of knowledge. It takes pride in making an inventory of the facts as it finds them where they actually exist—it prizes real experience and original observation, and makes small account of reflections and reasonings and a priori truths. Its national form of mental activity is empiricism. It knows the world as it is and not as it ought to be or might be. But the German, on the other hand, makes up his mind first and acts afterwards. This, at least, is his tendency. His mental habit is to seek out

all that is known on a given question and review it carefully; then he proceeds to verify this by comparing it with an actual inventory made by himself. He settles the object to be attained and the proper means to be used, and then at last acts with great effect in accordance with his deliberately formed plans.

Of course there are exceptions. This is not a fixed and absolute difference between the two national characters. But it is the distinction that we must make and keep in view if we would understand the two trends and explain the methods followed and the results obtained by the two peoples. The German loves system quite as much as the Frenchman, only the latter looks more to the realization of his central unity into the art forms of regularity and symmetry, while the former looks more to dynamic features and wishes to make sure the connections between the highest and lowest links of power and authority. While the English people lay great stress on immemorial usages and privileges that have grown up by compromises in the past, the German wishes above all to have a consistent and reasonable system. It is more important to him that the government shall be reasonable than that there shall be individual freedom to act out one's desires and caprices.

From the German idiosyncrasy it is evident why they have invented gun-powder and the art of printing rather than the steam engine and the telegraph; why they have labored most efficiently in the lines of comparative science rather than in the inventory of isolated data. They wish to see each branch of knowledge in the light of all others. They have created comparative philology, that reveals to us the profoundest traits of mind as exhibited in the structure of language. They have created the science of comparative history, giving us an insight into the sum total of the striving of each nation that has flourished on the earth. They have reenforced comparative history by comparative studies in religion, art, jurisprudence, and psychology. Each new comparative study gives a new critical point of view from which to confirm or reject what has before been held. In this way the German scientific industry tends to reach a stable result in the science of nature and also especially in the science of man.

But this discovery of the trends of nature and human history brings the intellect into a condition where it decides upon the practical questions of the day and leads to action. Having summed up the case in view of all the provinces in any way related to it, the will may now act with the most intense conviction. The present generation has seen a new kind of national power rise into the world history out of Germany. Goethe said in 1792, after the battle of Valmy, where he saw a French army representing the people and officered by the people defeat the army representing the nobility and officered by them: "From this place, and from this day forth, commences a new era in the world's history." Democracy would from that time be a power to be reckoned with. The new German Empire is founded on science and means many things of the utmost importance to future civilization. Comparative science brings together all the kindred provinces and discovers the net result. It attacks problems of the utmost complexity, none more so than that of war with surrounding nations. It delivers its decisions to the executive power of the nation and preparations are made in view of all the contingencies. An absolutely accurate survey of all strategic points, giving with precision every stone fence and every bridge and ford, the whole nation trained to military service, the means of transportation prepared so that the whole power of the nation may be concentrated without fail in the least possible time on any point of the frontier—these things belong to science. The intellect converts itself into will power by settling in advance all problems that may arise, so that in the field nothing can occur that will surprise the commander. At every point he will be stronger than his enemy.

The practical outcome of the rise of Germany to a new world power is the

necessity of the universal education of the people. Germany, with its principle of the supremacy of conscious intelligence and the reenforcement of the will power by comparative science, had all along consistently moved toward an efficient system of education. The powers of the individual may be indefinitely increased by education. An educated nation is far more powerful than an uneducated nation of equal population and wealth. Education of all the people in schools renders possible great strategic combinations in war, commerce, and industry.

It is this principle which distinguishes the modern German people. The Greeks were great in plastic art and literature and philosophy. The German is equally great in music and philosophy. His philosophy is based on psychology where the Greek philosophy took the form of ontology. The German turns science into philosophy by making it comparative, and thus completing a total survey of an entire province.

Feeling this national principle at work in his soul, he finds popular education the most natural of all human interests to him. Studying the comparative aspects of science, he becomes observant of methods. He neglects this fact and that fact to look at the process by which they arrived. Nowhere else is there so much exercise for this quality of observation which sees method as in pedagogy. Upon the study of method depends the arrangement of the course of study and the development from one grade of school work into the next. Upon the study of method depends the art of teaching and the discipline and management of the school. \* \* \*

While it is demonstrated, thus, that a general elementary education of the people is the primary cause of Germany's present success as a producing and trading nation, as well as of its former success as a scientific nation, it is of interest to see whether its system of elementary education is making the same progress which other departments of exertion make. This might be done by comparing its school system as it is now with that of ten years ago. For the Empire, such a comparison is impossible, since each State in Germany manages its own educational affairs; hence, no perfect uniformity is aimed at, neither in purpose nor in nomenclature, but by taking the statistics of the leading State, Prussia (31,855,123 inhabitants in 1895), we may present a comparison which in its results will not be far from representing the conditions of the whole empire, the 26 States being somewhat homogeneous in their management of elementary schools. A recent governmental publication gives the desired data. It is entitled "Das gesammte niedere Schulwesen im preussischen Staate im Jahre 1896," being volume 151 of "Preussische Statistik."

#### I.—SCHOOLS, PUPILS, AND TEACHERS.

It has been the custom in Prussia to take a statistical inventory of the public elementary schools every five years. Previous to the World's Fair in Chicago extensive statistics were published by the royal school authorities, based on the school census of 1891. Recently a new publication has been issued, based on a thorough investigation in 1896. This offers an opportunity to compare the numbers of the

last three statistical statements—1886, 1891, and 1896—covering a period of ten years.

The results of the school census of 1896, recently published, give an extensive and very interesting picture of the entire system of lower schools, including the public and private elementary and the girls' intermediate and advanced schools, as well as the schools for defective classes—blind, deaf and dumb, epileptic, morally unsound, and orphaned children. For the purpose of comparison with other countries, it is particularly the public elementary or common school which will be described here. Unessential details will be omitted, and the statistics of other than public schools will be brought into the focus of observation when occasion offers.

The private elementary schools of Prussia play a very subordinate part in the system. There were in 1886, 248; in 1891, 495, and in 1896 only 404 private elementary schools. Compared with the number of public schools, 34,016, 34,742, and 36,138 for the respective years, they are a vanishing quantity. This holds good also with the number of pupils in private schools, which, as a rule, is much smaller than in an average public school.

The increase in the number of public elementary schools is very noticeable:

Year.	Number of schools in cities.	Number of schools in the country.	Total number.
1886.....	3,718	30,298	34,016
1891.....	3,871	30,871	34,742
1896.....	4,242	31,896	36,138

The comparatively small increase during the first half of the decade (1886-1891) is explained by the corresponding small increase in the school population during these years, which will be discussed later.

The increase in the number of schools has not been quite equal in the separate denominations. The increase in the number of Catholic schools is greater than that of Protestant schools; the number of Jewish schools has decreased, and the increase of undenominational schools is relatively largest. Here are the absolute numbers:

Year.	Protes- tant.	Catholic.	Jewish.	Undenom- inational.
1886.....	23,122	10,061	318	515
1891.....	23,749	10,154	244	595
1896.....	24,487	10,725	246	680

Hence, in 1896 of every 100 elementary schools 67.76 were Protes- tant, 29.68 were Catholic, 0.68 were Jewish, and 1.88 were undenom- inational schools.

But while this shows an increase in the number of schools, the increase would seem inadequate, at any rate disproportionate to the enormous increase of the population, which was 28,318,470 in 1885; 29,957,367 in 1890, and 31,849,795 in 1895. This apparent discrepancy is lucidly explained by the authorities, as follows: The local school authorities, in cities especially, have generally followed the policy of enlarging the school buildings and placing more classes under one principal than formerly. While on an average the city schools had each 6.28 classes in 1886, they showed an average of 7.11 classes in 1896. This same policy, which was evidently dictated by economical considerations, is noticeable to a certain degree in the village and rural schools. This is seen from the fact that the average number of class rooms in rural schools in 1886 was 1.71, and in 1896, 1.94. But since this expansion was undertaken partly to relieve overcrowded classes, the number of pupils does not show the ratio of increase which is shown in the number of class rooms to each school. On an average a public elementary school in Prussia had 142 children in 1886, and 145 in 1896. In cities the averages were 404 in 1886 and 418 in 1896, while in rural districts the averages were 110 in 1886 and 109 in 1896. The last-mentioned number is conclusive evidence that the overcrowded condition of class rooms has begun to be relieved. The following table makes this plainer. The average number of school children per class room was, in—

Year.	Cities.	Country.	Total.
1886.....	64	64	64
1891.....	61	59	59.5
1895.....	59	56	57

The improvement in this particular feature was greater during the first five years than during the later five years, which would seem to indicate an unequal provision on the part of the authorities in building schoolhouses. But that would be judging erroneously, for the true reason is the disproportionate increase in the school population during the second half of the decade under discussion. The census counted—

Year.	Children between 6-14.	Population.	Ratio.
1886.....	5,225,891	28,318,470	<i>Per cent.</i> 18.4
1891.....	5,299,210	29,957,367	17.7
1896.....	5,602,093	31,849,795	18

The increase from 1885 to 1890 was 73,419, or 1.40 per cent, while from 1890 to 1895 it was 302,783, or 5.71 per cent. An explanation of

this inequality is very difficult, especially since the rate per cent of increase in the population is different, to wit: 5.78 per cent during 1885-1890, and 6.34 per cent during 1890-1895. The chief cause may be found in the relatively unfavorable industrial and agricultural conditions during the period preceding the lustrum of 1885-1890, which resulted in a large emigration. The official reports do not enter into a discussion of this question.

Aside from these particulars of the census, there is one fact which is very satisfactory to friends of popular education; it is that the percentage of children of school age attending the public school is steadily increasing. While in 1886 as many as 93.44 per cent attended these schools, the percentage rose to 93.90 in 1891, and to 94.51 in 1896. If the number of children are deducted who in 1896 were still in elementary schools, though having passed their fourteenth year of age, we find that 227,253, or 4.06 per cent, were attending secondary schools, which begin as a rule with the ninth or tenth year of life.

Particularly interesting to us in the United States is the chapter dealing with the mother tongue of the children of school age in Prussia. We confine ourselves to the public elementary schools in this summary, and merely state that the percentage of non-German-speaking children in schools beyond the elementary course is very much smaller.

Language spoken.	1886.		1891.		1896.	
	Number.	Per cent.	Number.	Per cent.	Number.	Per cent.
German only.....	4,188,857	86.58	4,263,909	88.63	4,518,645	86.29
Polish only.....	500,315	10.35	491,142	9.99	553,232	10.56
Polish and German.....	70,868	1.46	76,298	1.55	87,239	1.67
Lithuanian only.....	12,752	.26	12,625	.26	11,534	.22
Lithuanian and German.....	8,372	.17	6,863	.14	8,570	.16
Wendish.....	9,961	.21	10,488	.21	9,722	.19
Wendish and German.....	4,419	.09	3,060	.06	2,929	.06
Other Slavic.....	8,760	.18	11,042	.23	12,599	.24
Danish.....	24,088	.50	22,735	.46	21,971	.42

Other non-German elements mentioned in the official report may be here omitted. The Polish population is chiefly found in the eastern provinces, Posen and East and West Prussia. In Westphalia a large mining colony is found to consist of Polish inhabitants, 4,490 children in school speaking both Polish and German. The number of children speaking only Polish has slightly increased within ten years, but the report points to the fact that this increase is almost exclusively found in agricultural districts, not in cities. The percentage of children in Alsace-Lorraine speaking exclusively French or French and German is not stated here because, though these provinces form an imperial crownland and are under the imperial government, they do not form part of the Kingdom of Prussia.

The number of teachers has very materially increased during the

ten years referred to. Especially large is the increase of the number of women teachers. The following table makes this clear:

Year.	Men.		Women.	
	Number.	Per cent.	Number.	Per cent.
1886 .....	57,902	89.42	6,848	10.58
1891 .....	62,272	88.67	8,439	11.93
1896 .....	68,688	86.99	10,271	13.41

In cities the per cent of men decreased from 81.73 to 77.87, in the country from 93.50 to 92.50, while the per cent of women employed in cities rose from 18.27 to 22.13 and in the country from 6.50 to 7.50. In the aggregate the number of women increased 50 per cent during the decade 1886-1896—that is, in the cities 60.5 per cent and in the country 34.3 per cent, while the whole number of male teachers increased only 18.6 per cent—that is, 26.2 per cent in the cities and 15.1 per cent in the country.

Of all the male teachers in the public elementary schools in the year 1886 there were 70.64 per cent Protestants, 28.58 per cent Catholics, 0.04 per cent other Christians, and 0.74 per cent Hebrews. In 1896 the proportion of Protestant teachers had slightly decreased, to wit, to 70.40 per cent; that of Catholics increased to 29.9 per cent, while the proportion of other Christian teachers decreased to 0.01 per cent and that of Hebrew teachers to 0.50 per cent. The proportion of female teachers of the Protestant faith was 37.25 per cent in 1886; Catholic, 61.81 per cent; other Christian, 0.16 per cent, and Hebrew, 0.78 per cent. These proportions changed materially in ten years: Protestant, 44.41 per cent; Catholic, 54.98 per cent; other Christian, 0.01 per cent, and Hebrew, 0.60 per cent. These figures plainly indicate that the number of female teachers in Protestant schools is increasing. For the purpose of making these facts more distinct, they may be tabulated as follows:

*Teachers in Prussian elementary schools.*

MALE.

Year.	Protes- tant.	Catholic.	Other Christian.	Hebrew.
	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>
1886 .....	70.64	28.58	0.04	0.74
1896 .....	70.40	29.09	.01	.50

FEMALE.

1886 .....	37.25	61.81	0.16	0.78
1896 .....	44.41	54.98	.01	.60

The question whether a sufficient number of teachers is provided for these schools may be treated from different points of view. One may take the average number of children to each teacher or the number of teachers compared with the number of class rooms or

grades. If the latter be taken as a standard a very unsatisfactory result is obtained.

*Number of teachers to every 100 school classes or grades.*

Year.	Cities.	Country.	Total.
1886 .....	96	82	86
1891 .....	99	81	87
1896 .....	99	80	89

These figures prove that there is a great number of schools in which half-day classes are taught for want of teachers. This expedient is frequently resorted to in rural districts. If teachers were provided for all the grades the entire body of elementary teachers in Prussia would need to be increased one-sixth of its present number, or about 17 per cent. But if all the overcrowded classes were reduced to normal number, by increasing the number of classes, there would be required still 7,000 more teachers. The total body of teachers would have to be augmented by 20,000, for in 1896 there were still 17,165 overcrowded classes containing 1,390,525 children. If Professor Rehmke's demand be complied with—namely, to reduce the number of pupils per teacher to 30—the present staff would need an increase of 100,000 teachers. This seems Utopian in Prussia, but if the conditions of fifty years ago are considered, when almost uniformly 150 pupils were taught by one teacher, the case does not look hopeless.

II.—TEACHERS' SALARIES.

The official report states the sums paid for salaries of public elementary teachers in the three years referred to, but it fails to state what amounts have been paid for special teachers, such as instructors of handiwork, and for assistants not employed for a specific purpose. It merely quotes the sums paid to permanently engaged teachers; that is, regular, not special, teachers, to wit:

Year.	Men.	Women.	Total.
1886 .....	\$17,799,599	\$1,805,183	\$19,604,782
1891 .....	21,767,900	2,586,460	24,354,360
1896 .....	26,059,523	3,135,888	29,195,416

The average income of the teachers, which includes either free dwelling and fuel or an equivalent in money, has increased considerably, which is seen from the following summaries—(A) for men, (B) for women:

A.

Year.	In cities.	In the country.	Average in State.
1886 .....	\$389.13	\$270.13	\$307.50
1891 .....	431.26	360.84	344.15
1896 .....	482.90	322.77	386.75

## B.

Year.	In cities.	In the country.	Average in State.
1886.....	\$286.98	\$225.15	\$263.70
1891.....	300.60	242.76	278.70
1896.....	331.30	269.41	304.16

To judge these numbers correctly it is to be considered that equivalents for rent and fuel are calculated at higher rates in 1896 than in 1886 and that the average age of the teachers is found to be higher also; hence that the apparent increase is not in every case an actual one. Furthermore, the population's wealth has risen during the same period. Thus, for instance, the average income in the Kingdom of Saxony rose between 1886 and 1896 from a per capita of \$78.54 to \$111.86, and in Prussia it rose from \$83.30 in 1893 to \$92.82 in 1897. Whether the salaries of teachers have increased in the same ratio is questionable.

The value of rent and fuel per annum, either paid in kind or equivalent, has been calculated at—

Year.	In cities.	In the country.	Average in State.
1886.....	\$66.64	\$40.22	\$49.50
1891.....	81.16	45.00	58.31
1896.....	82.59	48.31	61.17

It is plain that the increase in the latter has not been proportional to that of the former five years. The report reveals the fact that the number of teachers provided with official dwelling, either in the school-house or in the vicinity, has decreased. While in 1886 there were still 68.36 per cent of the teachers thus provided (to wit, 20.78 per cent in cities and 90.38 per cent in the country), the proportion has decreased to 63.71 per cent in 1896 (to wit, 15.74 per cent in cities and 88.10 per cent in the country).

Another wholesome change is plainly demonstrated by the figures of the report. It is the decrease in the number of teachers who are still obliged to perform service for the church (as church wardens, organists, beadles, sextons, etc.). Their number has decreased during the five years from 1891 to 1896 from 24.40 to 21.50 per cent. In the cities these positions decreased from 9.26 to 7.80 per cent and in the country from 31.93 to 28.46 per cent. The absolute numbers were 15,430 in 1891 and 14,860 in 1896.

There have been vital changes in the salaries paid to elementary teachers, caused by the recent law which regulated salaries upon the principle that a certain fixed salary should be paid by the community and that the State should pay annual increases until a certain maximum be reached. This has resulted in the following average salaries

paid in the following-named fourteen provinces of the Kingdom of Prussia:

Province.	Salaries paid to— <i>a</i>					
	Male teachers.			Female teachers.		
	1886.	1891.	1896.	1886.	1891.	1896.
East Prussia .....	\$250.85	\$250.60	\$290.36	\$210.15	\$222.77	\$235.86
West Prussia.....	250.85	250.85	298.69	221.15	240.58	261.80
Berlin .....	565.25	618.09	716.38	346.77	366.04	387.22
Brandenburg.....	297.74	332.72	363.33	243.95	259.18	282.75

Average.....	307.60	343.18	376.75	263.70	278.70	304.31

*a* The fractions of dollars are occasioned by changing the German marks into American money. A mark is quoted at 23.8 cents.

The foregoing amounts represent the cash salaries of class teachers, not of principals of schools.

They are, however, lower than the salaries paid in this country or in France and England, but the greater purchasing power of money in Germany is to be considered in making comparisons.

III.—EXPENSES FOR PUBLIC ELEMENTARY SCHOOLS.

The total expenditures for public elementary schools (so-called Volksschulen) have increased at a greater ratio than the salaries of teachers, owing to the necessity of building and equipping new schools. The following tables plainly show this—(A) contains the total expenditures, (B) the salaries:

A.

Year.	In cities.	In the country.	Total.
1886.....	\$11,947,642	\$15,587,066	\$27,534,708
1891.....	14,373,450	19,428,175	33,801,625
1896.....	19,794,829	24,463,520	44,258,349

B.

1886.....	\$9,316,839	\$11,287,943	\$20,604,782
1891.....	10,658,506	13,480,793	24,139,299
1896.....	12,391,578	15,794,683	28,186,261

To these latter sums, representing the salaries paid, should be added the pay of special teachers, which is not stated in the report, and the pensions paid by the State. The amounts paid in pensions were \$742,708 in 1886, and \$2,104,695 in 1896.

The incidental expenses increased greatly, as is seen from the following numbers for 1886 and 1896: In cities these expenditures rose from \$3,087,548 to \$5,474,987, while in the country the increase is still greater, to wit, in 1886 the incidental expenses (chiefly for erection of buildings) were \$3,557,511, in 1896 they were \$7,002,054. These few numbers show that, while the expenditures for salaries have increased in ten years not quite 50 per cent, the other expenditures have increased nearly 100 per cent.

The foregoing statements are all clear and distinct, but less clearness is found when the report refers to the sources of the income, and this is owing to the involved condition of vested funds, taxes, and other sources of income. There are three distinct factors contributing to the income—(a) the State, (b) the communities, and (c) irreducible funds. The report does not always keep them asunder, hence it is necessary to resort to the expedient of quoting sums to which two of these factors contribute. The following table will speak for itself:

*Sources of income.*

Received from—	In cities.		In the country.	
	Amount.	Per cent.	Amount.	Per cent.
State's contribution .....	\$3,174,583	16.05	\$9,539,360	38.99
Local taxation .....	13,709,796	69.25	10,481,379	42.85
Irreducible funds.....	186,770	.94	1,643,770	6.72
State and communities combined .....	252,285	1.27	409,480	1.67
State, communities, and invested funds combined.....	2,470,421	12.49	2,389,543	9.77
Total .....	19,784,835	100	24,463,537	100

These numbers show that the State does not participate in bearing the burdens of maintaining the schools of the cities as liberally as it does in the country. This difference has been considerably increased through the passage of the law regulating the teachers' salaries (March 3, 1897). There are also great inequalities in the State's and the local provision for primary schools in the various parts of the Kingdom. In the eastern provinces the State pays a great deal more for rural schools than for city schools, while in the western provinces the State's quota for rural schools is insignificant.

The burden of school taxation is best stated by giving the per capita of the population. On an average the expenditure for elementary schools is shown in the subjoined statement.

*Expenditures per capita of the population.*

Year.	In cities.	In the country.	Total.
1886.....	\$1.14	\$0.89	\$0.98
1891.....	1.29	1.07	1.16
1896.....	1.53	1.29	1.39

These figures, though small if measured by our American standard, demonstrate great improvement if compared with the per capita paid in former decades, as the following items will show:

Year.	In cities.	In the country.
1861.....	\$0.50	\$0.34
1866.....	.53	.35
1871.....	.83	.46

The per capita expenditure during the year 1896 (the year in which the statistics were gathered) in the various provinces of the Kingdom is not uniform, as the following table shows:

Province.	In cities.	In the country.	Total.
East Prussia.....	\$0.99	\$1.12	\$1.09
West Prussia.....	1.16	1.23	1.21
Berlin.....	1.79	.....	1.79
Brandenburg.....	1.25	1.39	1.28
Pomerania.....	1.45	1.23	1.61
Posen.....	1.29	1.21	1.22
Silesia.....	1.38	.99	1.12
Saxony.....	1.45	1.31	1.57
Sleswic-Holstein.....	1.57	2.00	1.78
Hanover.....	1.67	1.37	1.47
Westphalia.....	1.74	1.51	1.64
Hesse-Nassau.....	1.71	1.88	1.45
Rhenish Prussia.....	1.64	1.38	1.52
Hohenzollern.....	1.16	1.50	1.40
Total.....	1.53	1.29	1.39

An essential factor in determining the amount paid for public education is the percentage of children of school age in the community, hence the foregoing figures alone can not serve as a standard measure of comparison. For instance, a number of districts in the provinces of West Prussia and Posen have from 191 to 213 children of school age (6 to 14) in every 1,000 inhabitants, while in the provinces of West Prussia and Brandenburg the percentage ranges from 168 to 183 and 150 to 179. In some northwestern districts the percentage is not higher than 150 in 1,000. Owing to this inequality the per capita of the population may seem high while the cost per capita of the enrollment is low.

Generally, however, the per capita of enrollment is taken as a standard, since it indicates the economic conditions of the district, and the care and consideration education finds among the people. The fol-

lowing table is therefore inserted to enable the reader to compare the conditions mentioned:

*Expenditure per pupil.*

Province.	In cities.	In the country.	Total.
East Prussia.....	\$9.03	\$3.07	\$3.59
West Prussia.....	8.83	6.33	6.88
Berlin.....	16.00	.....	16.00
Brandenburg.....	10.59	8.00	8.55
Pomerania.....	11.21	6.71	8.01
Posen.....	8.44	6.45	6.95
Silesia.....	9.86	5.44	6.59
Saxony.....	9.93	7.02	8.19
Sleswic-Holstein.....	11.88	10.92	11.17
Hanover.....	12.61	7.60	9.03
Westphalia.....	10.23	7.88	8.63
Hesse-Nassau.....	15.59	7.49	9.86
Rhenish Prussia.....	10.69	7.53	8.88
Hohenzollern.....	9.43	8.96	9.00
Total.....	11.16	7.05	8.40

IV. OVERCROWDED CLASS ROOMS.

The official statistical statement does not suffer from want of candor, for it frankly reveals the fact that in 1896 there were 92,001 full-sized elementary classes, but only 78,431 class rooms for them. The remaining 13,570 classes were obliged to share class rooms with others either all day or their time was reduced to half-day sessions. The increase in the number of school rooms during the decade under discussion has not kept pace with the increase in the number of classes, for while the number of classes has increased by about 17,000 since 1886, the number of rooms suitable for school purposes has increased by not quite 14,000 during the same period. The following table gives the exact figures :

Year.	Number of class rooms.	Number of classes.
1886.....	64,688	75,097
1891.....	70,950	82,746
1896.....	78,431	92,001

The discrepancy between the number of classes and class rooms varies in the different provinces of the kingdom, as is seen from the following table:

Province.	Class rooms.	Classes.	Number of rooms needed.
East Prussia.....	5,035	5,428	333
West Prussia.....	3,708	4,362	654
Berlin.....	3,543	3,583	40
Brandenburg.....	6,659	8,108	1,449
Pomerania.....	4,265	5,011	646
Posen.....	4,149	5,786	1,637
Silesia.....	9,954	13,548	3,594
Saxony.....	6,758	7,869	1,111
Sleswic-Holstein.....	3,886	3,945	59
Hanover.....	6,334	7,379	1,044
Westphalia.....	6,560	7,710	1,150
Hesse-Nassau.....	4,368	5,285	917
Rhenish Prussia.....	12,914	13,788	874
Hohenzollern.....	193	199	6
Total.....	78,431	92,001	13,469

This discrepancy does not seem to be very great in the cities, for 30,153 classes were provided with 29,190 class rooms. But in rural districts the disproportion is very great. For about every 150 classes only 100 class rooms are provided. The report frankly states the names of the governmental districts in which this disproportion is exceptionally great. Dr. Bosse, the minister of education, in commenting on these facts in the Prussian Diet, said: "Life and health of both teacher and pupils is endangered by such a condition." He urged an appropriation of several millions of marks for the erection of new school-houses in overcrowded districts, but the Diet refused the request.

A like disproportion is noticed in the official report between the number of classes and that of teachers, for the number of teachers is little greater than the number of school rooms, the discrepancy between the number of teachers and that of the classes being 12,570. This plainly indicates that rural teachers, particularly, are obliged to teach half-day schools, that is, teach one section of their school in the morning, the other in the afternoon, or allow them both to occupy rooms that are barely large enough for one of them. The following table gives the exact figures for 1896:

Province.	Number of teachers.	Number of classes.	Classes without teachers of their own.
East Prussia.....	5,063	5,428	— 332
West Prussia.....	3,729	4,362	— 633
Berlin.....	3,587	3,583	+ 4
Brandenburg.....	6,686	8,108	—1,422
Pomerania.....	4,389	5,011	— 622
Posen.....	4,196	5,786	—1,590
Silesia.....	10,105	13,548	—3,443
Saxony.....	6,832	7,839	—1,037
Sleswic-Holstein.....	3,923	3,945	— 19
Hanover.....	6,424	7,379	— 955
Westphalia.....	6,724	7,710	— 986
Hesse-Nassau.....	4,411	5,285	— 874
Rhenish Prussia.....	13,158	13,783	— 630
Hohenzollern.....	198	199	— 1
Total.....	a 79,431	92,001	12,578

a This number does not agree with the total number given on page 134, because it includes 472 teachers only provisionally employed.

These conditions do not show an improvement over those in 1886, for in that year there were 64,750 teachers for 75,097 classes, or a discrepancy of 10,347 teachers. Only in the cities the disproportion between teachers and classes has decreased, but in the country schools it has increased. This is explained by the relatively greater wealth of the centers of industry and commerce, and by the well-known retrogression in wealth in agricultural districts of Germany.

The official report states the number of overcrowded classes, and also shows how many pupils they contain.

Year.	Classes.	Pupils.
1886.....	25,535	2,333,373
1891.....	19,819	1,661,182
1896.....	17,165	1,800,525

The improvement was greater during the first than in the second five years. The cause of this is the very rapid growth of the population during the second period. In late years prosperity in Germany has tended to promote the increase in the population. But the migratory movement of the rural population toward the cities, so noticeable in this country also, makes it almost impossible to provide the school population with the necessary buildings; hence we see that in 1896 there were 5,569 overcrowded classes, with 432,603 pupils. The following table gives the details for the 14 provinces for cities and the country in separate columns:

Province.	In cities.		In the country.	
	Classes.	Pupils.	Classes.	Pupils.
East Prussia .....	160	12,358	926	78,074
West Prussia .....	226	18,145	695	69,423
Berlin .....	3	217	-----	-----
Brandenburg .....	223	17,471	504	41,815
Pomerania .....	105	8,953	419	36,980
Posen .....	252	20,000	715	61,275
Silesia .....	628	49,004	2,029	164,605
Saxony .....	465	36,783	1,038	86,680
Sleswic-Holstein .....	155	11,664	177	14,183
Hanover .....	288	21,556	706	59,240
Westphalia .....	1,128	87,861	1,607	131,650
Hesse-Nassau .....	129	10,252	439	35,656
Rhenish Prussia .....	1,802	129,341	2,323	185,963
Hohenzollern .....	-----	-----	18	1,438
Total .....	5,569	432,703	11,596	957,922

The report mentions some of the schools and localities in which overcrowding is excessive. A glance at this list reveals the fact that they are chiefly found in the eastern districts of the Kingdom. They are as follows:

Governmental districts or counties.	Localities.	Classes.	Pupils.
Königsberg .....	Palmnicken .....	2	293
Do .....	Astrawischken .....	1	171
Gumbinnen .....	Kleschkaw .....	1	161
Do .....	Saspe .....	2	299
Marienwerder .....	Battlewo .....	1	155
Do .....	Lüben .....	1	159
Posen .....	Mechnin .....	1	173
Do .....	Nitsche .....	1	152
Do .....	Neustadt .....	1	144
Do .....	Punitz .....	1	175
Do .....	Liedmitogowo .....	1	152
Breslau .....	Hongrowitz .....	1	133
Do .....	Strelno .....	1	154
Oppeln .....	Sakran Turawa .....	1	171
Do .....	Petersdorf .....	4	805
Do .....	Langenau .....	1	143
Merseburg .....	Hofen .....	1	166

Münster .....	Sassenburg .....	1	152
Düsseldorf .....	Alstaden .....	1	172
Do .....	Odenkirchen .....	1	141

V.—INCREASE IN THE NUMBER OF WOMEN TEACHERS.

The number of women teachers in the Kingdom of Prussia has greatly increased, as stated before. The following table gives the details of the movement for ten years.

Province.	Women teachers in—	
	1886.	1896.
East Prussia.....	164	248
West Prussia.....	156	209
Berlin.....	850	1,199
Brandenburg.....	193	471
Pomerania.....	119	254
Posen.....	86	132
Silesia.....	446	628
Saxony.....	1,220	834
Sleswic-Holstein.....	195	451
Hanover.....	173	302
Westphalia.....	206	1,820
Hesse-Nassau.....	231	346
Rhenish-Prussia.....	2,855	3,732
Hohenzollern.....	4	5
Total.....	6,848	10,271

The official report gives the figures as far back as 1822, and the percentages of women teachers in Prussia, according to these figures, were, in 1822, 2.21 per cent; in 1834, 2.98 per cent; in 1846, 7.16 per cent; in 1855, 8.03 per cent; in 1864, 9.14 per cent; in 1887, 8.10 per cent; in 1886, 11.83 per cent; in 1896, 14.90 per cent of the number of men. The percentage of women of the total number of teachers was 12.84 in 1896. This shows how gradual but uninterrupted the increase of women as teachers has been in Prussia since 1822.

Two-thirds of all women teachers in Prussia are found in the three provinces of Berlin, Westphalia, and Rhenish Prussia. In rural schools only 3,703 women teachers are employed, or about one-third of the total number, while of all the men employed two-thirds are found in rural and only one-third in urban districts. Women teachers in rural districts are mostly Catholics—2,926; only 777 are Protestants. The large cities are, as a rule, more favorably inclined toward the employment of women teachers. Only four large cities are exceptions—Duisburg, Crefeld, Elberfeld, and Barmen, all in Rhenish Prussia. The proportion of women among Catholic teachers is greater than the proportion of women among Protestant teachers. For instance, in Westphalian cities the 219 Protestant women teachers are offset by 1,013 Protestant men teachers, while the Catholic women teachers, 552 in number, are offset by only 572 Catholic men. In one governmental district in Münster the number of women is larger than that of the men teachers.

The following table contains a few items of interest:

Governmental districts.	Protestant teachers.		Catholic teachers.	
	Men.	Women.	Men.	Women.
Münster, Westphalia.....	58	17	157	170
Menden, Westphalia.....	264	31	72	64
Arnsberg, Westphalia.....	661	171	343	318
Coblenz, Rhenish Prussia.....	109	2	143	95
Düsseldorf, Rhenish Prussia.....	1,459	270	1,108	668
Cologne, Rhenish Prussia.....	122	39	458	445
Trèves, Rhenish Prussia.....	54	29	111	94
Aix-la-Chapelle, Rhenish Prussia.....	24	9	256	237

Recently the normal schools of Prussia have by legislation acquired the privilege of admitting their students to a State examination, the passage of which entitles them to the one year's service in the army (instead of three years). This privilege opens other occupations to them, and this will result in a lack of men teachers, whose places will doubtless be filled by women. Hence a further and rapid increase in the number of women in the schools is confidently expected.

#### SUMMARY.

The last three school censuses of Prussia, of 1886, 1891, and 1896, brought out the following facts:

	1886.	1891.	1896.
Number of schoolhouses.....	34,016	34,742	36,138
Number of class rooms.....	66,540	72,921	80,311
Number of school children.....	4,838,247	4,916,476	5,236,823

Of these schools there were—

	1886.	1891.	1896.
IN CITIES.			
Number of schoolhouses.....	3,718	3,871	4,242
Number of class rooms.....	23,078	23,616	30,080
Number of school children.....	1,509,906	1,615,455	1,773,370
IN RURAL DISTRICTS.			
Number of schoolhouses.....	30,298	30,871	31,896
Number of class rooms.....	43,462	49,305	50,231
Number of school children.....	3,334,341	3,301,021	3,463,453

As has been stated before, the number of class rooms does not express the number of classes taught. The following numbers show this more in detail:

	1886.	1891.	1896.
Total number of classes.....	75,097	82,746	92,001
Separate classes of boys.....	19,066	12,168	14,422
Separate classes of girls.....	10,297	12,281	14,532
Classes of both sexes.....	54,704	58,297	63,027

The grading of schools has not progressed in Prussian schools as in American city schools, as is seen from the subjoined figures. There were—

	1886.	1891.	1896.
Ungraded schools .....	17,744	16,600	15,892
With school children .....	1,146,701	969,598	886,864
Schools of two grades .....	8,845	9,474	10,181
With school children .....	1,078,459	1,047,507	1,061,716
Of these were half-day schools .....	5,400	5,878	6,817
With school children .....	571,474	568,235	621,820
Schools of three grades .....	3,949	4,447	4,930
With school children .....	883,013	850,383	889,703
Schools of four grades .....	1,352	1,553	1,709
With school children .....	449,744	476,403	489,900
Schools of five grades .....	649	692	863
With school children .....	285,282	274,412	320,166
Schools of six grades .....	1,187	1,551	1,830
With school children .....	829,823	994,952	1,102,642
Schools of seven or more grades .....	209	425	733
With school children .....	215,225	303,221	485,535

In schools with one teacher there were instructed in either whole or half-day sessions:

1886 .....	1,718,076
1891 .....	1,530,314
1896 .....	1,477,558

With regard to sex, there were:

	1886.	1891.	1896.
IN URBAN SCHOOLS.			
Boys .....	745,187	805,182	881,794
Girls .....	758,719	810,273	891,666
IN RURAL SCHOOLS.			
Boys .....	1,676,857	1,662,376	1,743,012
Girls .....	1,657,484	1,630,645	1,720,444

Of these were taught in mixed classes—

	1886.	1891.	1896.
Boys .....	1,766,807	1,718,269	1,764,393
Girls .....	1,745,343	1,691,812	1,739,963

With regard to religious denomination, there were—

	1886.	1891.	1896.
Protestant children .....	3,062,856	3,107,701	3,296,481
Catholic children .....	1,730,402	1,766,835	1,901,013
Other Christian children .....	9,569	11,554	12,317
Jewish children .....	35,420	30,386	27,015

The school children in some districts have far to go to reach school. In order to ascertain where new schools were needed, the Government made inquiry concerning the distance children had to walk, and the

following is the result. More than  $2\frac{1}{2}$  kilometers (or about  $1\frac{1}{2}$  miles) was walked by—

	1891.	1896.
Children .....	217,389	292,320
In cities .....	20,244	19,713
In the country.....	197,145	182,607

The number of regular teachers in the public elementary schools was—

	1886.	1891.	1896.
Total appointed.....	64,750	71,731	79,491
Permanently .....	(?)	79,711	78,895
Temporarily .....	(?)	1,020	596

To these should be added assistants and special teachers who are not appointed as class teachers:

	1886.	1891.	1896.
Total appointed.....	35,655	41,354	39,944
Special teachers.....	34,270	36,871	37,193
Teachers of religion.....	(?)	2,407	2,252
Total number of teachers, regular and special.....	100,405	113,085	119,875

According to their religious denominations the regular teachers are classified as follows:

Denomination.	1886.	1891.	1896.
Protestant:			
Men .....	40,900	44,937	48,670
Women .....	2,551	3,545	4,574
Catholic:			
Men .....	16,549	17,959	20,112
Women .....	4,233	4,890	5,662
Other Christian:			
Men .....	21	5	3
Women .....	11	1	1
Jewish:			
Men .....	432	326	347
Women .....	53	58	62

The schools are classified according to religious denomination as follows:

	1886.	1891.	1896.
Protestant schools .....	23,122	23,749	24,437
With regular teachers .....	41,539	46,382	50,715
With pupils .....	2,593,852	3,050,864	3,238,590
Catholic schools .....	10,661	10,154	10,725
With regular teachers.....	19,632	21,547	24,264
With pupils .....	1,613,497	1,655,779	1,749,731
Jewish schools .....	313	244	243
With regular teachers.....	407	365	398
With pupils .....	13,270	9,519	8,123
Mixed schools .....	515	595	630
With regular teachers.....	3,172	3,597	4,144
With pupils .....	217,628	220,314	250,412

The expenditures for public elementary schools are summarized as follows:

	1886.	1891.	1896.
Personal (salaries, etc.).....	\$20,888,027	\$26,241,972	\$31,871,323
Incidental.....	6,645,081	8,559,652	12,377,041
Total.....	27,533,108	34,801,624	44,248,364

Of these sums the following amounts were paid for the purposes mentioned:

	1886.	1891.	1896.
Salaries for regular teachers, excluding all special teachers..	\$19,604,782	\$24,134,359	\$29,186,261
Pensions.....	682,659	1,420,666	2,023,317
New buildings.....	4,483,228	5,190,849	7,760,797

The last-named sums have been expended for the purposes mentioned below:

	1886.	1891.	1896.
New schoolhouses.....			3,266
Containing class rooms.....	5,948	7,968	6,435
Containing teachers' dwellings.....	2,833	3,786	3,086

## II. SCHOOL ATTENDANCE AND COMPULSORY EDUCATION IN CENTRAL EUROPE.

[After a statement in Rein's Encyclopedia of Education.]

TOPICAL OUTLINE.—1. Historical remarks.—2. Present regulations as to school age and duty of attendance: (a) In Prussia; (b) in other German states; (c) in other foreign countries.—3. Actual attendance in public elementary schools.—4. Control of attendance.—5. Punishment for absence from school.—6. Dispensation from attendance.—7. Propositions for changes.

### 1. HISTORICAL REMARKS.

Regular school attendance is necessary for successful instruction. It is brought about by various means in different strata of society and the different grades of the schools. Whereas educated and well-to-do parents, as a rule, strive to give their children thorough schooling under all circumstances, and even at great expense, the less educated and poorer classes seldom, if ever, recognize the necessity of regular and progressive instruction. Even when the value of greater knowledge is appreciated, parents attend more to what concerns their immediate wants and a livelihood, thinking that absence from school may be easily repaired. Physical wants are felt. Intellectual wants are not. Thus it comes that even enlightened, conscientious parents in moderate circumstances do not send their children to school regularly unless compelled by law. It has therefore been considered the duty of the State in German-speaking countries to enforce school attendance. Even though educated and well-to-do communities may

have established a thorough school system (which was the case for centuries in Germany before the State took hold of education) without any intervention whatever from the State, it is understood by German administrative law that regular and general public instruction begins only with the adoption of the law of compulsory school attendance. Hence it is stated that the German school system, meaning the State system, dates back only to the first compulsory school laws of Prussia (about the middle of the seventeenth century). Feeble as they may have been, they established the principle of the State's authority.

It is true that compulsory school attendance may be justly considered an infringement on civil liberty, and especially a limitation of parental authority, and in England and the United States that view held sway and, until the middle of this century, prevented the passage and successful execution of compulsory school laws. But their necessity and judiciousness had been recognized early in Germany. Since Luther (1483-1546) the fact has been frequently dwelt upon that parents are not always the most pious, conscientious, and farsighted educators. Moreover, the law of school attendance, as it exists, does not much affect parents who are enlightened and mindful of their children's welfare. As a rule, it is felt by those only who misjudge the real good of their children or make it secondary to their worldly interests. That compulsory education forces many parents to make great personal sacrifices can not be denied, as the actual premises are not in every case met when the law is enforced. The earlier school laws and regulations in central Europe are principally characterized by being purely police measures and limited to admonition and stimulation. Their requirements were seldom mitigated by positive measures, such as providing for school facilities. In the beginning compulsory education is everywhere and always felt to be severe and meets with energetic contradiction and opposition. Those who favor keeping the masses in ignorance encourage opposition, either openly or secretly. In the course of time, however, the masses become reconciled, and the law enforcing regular school attendance is recognized as a protection; yet its suspension would be followed by a noticeable falling off of attendance, even in the most advanced States.

By compulsory school attendance the Germans do not mean the obligation of sending children to any one particular school, but only the legal requirement of giving them regular, sufficient, and continuous instruction conferring adequate proficiency. The so-called forced school attendance is, in reality, nothing more than compulsory education. Most of the school laws that have been in effect up to the present do not go beyond this. Consequently all private educational enterprises, including private instruction by tutor at home, are allowed the same liberty in their development as public schools. In single instances, as in Bavaria, efforts have been made through the royal

authorities to interpret the law of compulsory education as compelling attendance at one particular class of schools, i. e., the public schools. The political measure of "obligatory attendance at public schools," i. e., the duty of sending a child to a public school for a specified number of years, or until graduation, has gained many warm advocates in southern Germany, and was mentioned in the platform of one German political party, the Social-Democracy, in the year 1891.

When we speak of compulsory education in central Europe (Germany, Austria, and Switzerland), the term generally applies, as a matter of course, to the education acquired in public elementary schools. No one is obliged to attend secondary schools, where irregularity of attendance is a violation of private rule, to be punished by the school authorities, but not by police or higher officers of the law. The earliest school ordinances (*Schul-Ordnungen*), those of the sixteenth century, make no mention of school attendance, the regularity of which was attempted by other means. The ordinance of Count (Landgraf) Philip the Generous, of Hessa, for instance, closes with these words:

In all places where schools exist the clergymen shall urge and earnestly exhort parents to send their children to school, so that they may learn.

The ordinance of 1559 in Würtemberg required only attendance at catechism class on Sunday. The "general regulation" of the elector of Saxony, Augustus I (1580), required the regular attendance of boys only. This prescription is undoubtedly one of the first legal measures relating to the subject under discussion.

A general attendance of both boys and girls has been required in the most advanced German States since the very beginning of legislation on this subject, but with greater rigor since the middle of the seventeenth century. Pre-eminence, not in point of time, but as respects energy and success, is due to the Duchy of Gotha, the regent of which, Ernest the Pious, a friend and promoter of learning, published his well-known "*Schul-Methodus*" in 1642. One passage of this famous document reads:

All children, boys and girls, in cities as well as in villages, should, when 5 years old, without further delay, after the announcement is made from the pulpit, be sent to school. They should remain so long without interruption during the winter and summer, until they have learned all the necessary rudiments and can recite what has been taught them. They should not leave of their own choice, still less should they be withdrawn, until upon examination by their superior they are found worthy of discharge and are dismissed in a proper manner.

The law of the largest German State, Prussia, to-day, does not go beyond these requirements but covers exactly the same ground. Most of the German States followed the example of Ernest the Pious, only after several decades. According to the "general ordinance" of the Duchy of Brunswick, 1647—

All parents shall be compelled to send their children to school, either to the schoolmaster or the sexton of their respective villages, until the children can

understand the catechism and read print. In case of neglect, parents shall be punished by officers and judges of the law.

Attendance, however, was exacted only in winter. During the summer instruction was confined to reviews on Sunday. Still earlier, in 1619, Count (Landgraf) Ludwig, of Hesse-Darmstadt, ordered that all children in the country should likewise be sent to school. Besides being obliged to pay the tuition fee, negligent parents were punished with fines. According to the regulation of Count Ludwig VI (1670), all children above 5 and under 12 years of age were obliged to attend the elementary school five hours daily in winter and three hours daily in summer.

The "school ordinance" of Hesse-Darmstadt for 1733 required children to attend school from their seventh to their fourteenth year of age—seven years under any circumstances. In winter as in summer, classes were to be held six hours a day, four days in the week, and three hours on Wednesday and Saturday. A fine of 1 kreutzer<sup>1</sup> was imposed for every failure of attendance. The consistorial ordinance of the electorate of Hesse (Hesse-Cassel) for 1726 reads: "All parents are required to send their children to school from their eighth to their fifteenth year of age at least two or three times a week, winter and summer." In Würtemberg regular school attendance was prescribed by ordinance in 1649; the law of compulsory attendance has been in force since 1729. Throughout the electorate of Saxony the regulation for school attendance was issued in 1713; since 1724 all children have been required to attend school from their fifth to their fourteenth year of age; negligent parents are punished by law. In Bavaria the beginning of compulsory education may be traced to before the Thirty Years' War (1618-1648); no general application of the provisions made, however, was to be thought of under the lamentable conditions that prevailed in this State during the first half of the seventeenth century. In Baden ordinances date from the middle of the eighteenth century, providing for compulsory education in accordance with modern principles, and introducing secular Sunday schools for boys and young men of 14 to 20 years of age, and for girls and young women of 14 to 18 years of age.

In Prussia no earnest effort was made toward compulsory education before the year 1717. There existed, however, no lack of good counsel and admonitions. The school ordinances of the Elector John George (1573) required that—

In villages every Sunday afternoon or on one week day the sacristan shall, with the pastor's advice, read the small catechism of Luther aloud to the people and especially to children and servants, and teach them to pray, questioning them on what they have learned. Pastors shall publicly announce and exhort that all of their children when arrived at the proper age be sent to school and be brought up in good discipline and the fear of God.

---

<sup>1</sup> It is impossible to state the present value of that small coin, it having been long out of use. It was worth approximately 2 cents, but its purchasing power was much greater.

The great elector, Frederick William, commanded in 1662—

That churches and communities exert themselves diligently to establish well-appointed schools in villages, towns, and cities.

His successor, King Frederick I, 1698, expressed the wish that—

children in the country attend school at least two hours every morning, during harvest time, too, and be kept at school regularly.

Education became truly compulsory in the Kingdom of Prussia first under Frederick William I through his decree of September 28, 1717, a date which has been mentioned before. This memorable decree required that—

in the future, wherever schools exist, all parents shall, under penalty of the law,<sup>1</sup> be obliged to send their children to school, paying a tuition fee of sixpence<sup>2</sup> a week for each child. Children must attend every day in winter, and in case their parents need them at home, at least once or twice a week in summer, so that they may not altogether forget what they learned during the winter. Should parents not have the means, the said tuition fee of sixpence shall be paid out of the public local poor fund.

Frederick the Great defined these provisions with greater exactness in his general school regulation (1763), section 1 of which reads:

Primarily, we demand that all our subjects upon whom the education of youth devolves, be they parents, guardians, or masters, send their own children, as well as those intrusted to their care, boys or girls, to school at 5 years of age, if not before, and allow them to attend till their thirteenth or fourteenth year. They shall be kept at school not only until they understand what is of importance for them to know about Christianity and can read and write, but until they can give intelligent advice and answers upon what they have learned from the readers ordered and approved by our consistories.

These prescriptions were given still greater definiteness in the general civil code (*Landrecht*) (1794), which states in paragraph 43 and paragraph 46, article 12, Part II:

SEC. 43. Every inhabitant who can not, or will not, provide private instruction for his children is obliged to send them to school when they are 5 years old.

SEC. 46. Instruction must be continued until the child has acquired, according to the statement of his pastor, the knowledge necessary to him in his station of life.

By a cabinet order of King Frederick William III, dated May 4, 1825, these provisions went into effect also in those parts of the Kingdom which did not then come under the general civil code, and they define the present state of the law in Prussia. In practice, the letter of the law respecting children 5 years old was not observed, owing to pedagogical considerations, and gradually the custom grew up of extending the time set for compulsory attendance, so that it ended with the completed fourteenth year of age. Subsequent cabinet orders confirmed this by giving it the force of law.

The charter (or constitution) wrested from the King, Frederick

<sup>1</sup>At that time a royal decree or order was synonymous with law.

<sup>2</sup>Actually "zwei Dreier."

William IV, during the revolution of 1848 and 1849, and signed by him January 31, 1850, defines no more than this:

Parents and their representatives must not deprive their children, or their wards, of the instruction prescribed for public schools.

The observance of the regulations quoted has not, of course, been at all times equally strict. Often a highly developed municipal or provincial school system sank to a lower plane through lack of attention. A few figures will serve to illustrate. In the year 1824 the district of Aachen (Aix-la-Chapelle) numbered 66,611 children between 5 and 14 years of age; only about half of whom, 34,140, attended school, namely, 1,600 of the 1,852 Protestant children, 32,403 of the 64,401 Catholic, and 137 of the 378 Jewish children, attended primary, secondary, and higher schools. The conditions were, in all probability, about the same in other parts of Prussia. In the city of Berlin, 1,818 out of 6,000 children, according to Beckedorff's year book, were deprived of schooling. According to the census of that decade (164,000 inhabitants) the total number of school children amounted to 27,000. The official statistics of the Prussian State authorities of education show a gradual improvement to some extent. The following table gives the number of children attending public elementary schools, together with the number of inhabitants.

NOTE.—The table does not include the pupils of private schools, nor of elementary classes of secondary schools, nor pupils taught at home by governesses and tutors, nor the children of defective senses and other abnormals who are kept in asylums, nor yet the morally unsound who have been placed in reform schools. If all these were included, the ratio would be about 2 per cent higher—i. e., not less than 18.72 per cent of the population. If the pupils of supplementary schools and the students of secondary schools, general and special, were added, the ratio would be no less than 20 per cent of the population.

*School children (age 6 to 14) in public elementary schools in Prussia.*

Year.	Boys.	Girls.	Total.	Population.	Per cent of population.
1822	743,207	683,838	1,427,045	11,664,133	12.2

a Includes only the old provinces without Hanover, Sleswic-Holstein, Nassau, and Hesse-Cassel.  
b Includes the newly acquired territory.

Besides the increased rate per cent of school children in relation to the population, the fact that the number of boys and girls is nearer to being equal than formerly may be considered a proof of better school attendance. In the German States the education of girls in public schools has long been below that of boys. Even to-day there is no equality. Independent of compulsory attendance in continuation or supplementary schools, which is in force generally for boys (only a few smaller States extend the benefits of this law to girls), several States provide for an earlier dismissal of girls from the elementary schools, i. e., Alsace-Lorraine, Schwarzburg-Rudolstadt, several parts of Oldenburg, and Sleswic-Holstein. As a rule, the number of boys in attendance at public elementary schools is greater, even in cases where the education of boys and girls is equal in point of time, owing to the larger percentage of male children.<sup>1</sup> Where this is not the case, as in Bavaria, much more ample provision is made for boys in the establishment and maintenance of intermediate and secondary schools than for girls.

## 2. PRESENT REGULATIONS REGARDING SCHOOL AGE AND DUTY OF ATTENDANCE.

(a) *Prussia*.—The provisions of the general civil law quoted in the foregoing section are in force throughout the greater part of Prussia, but are not observed strictly to the letter. Articles 31 and 65 of the school order for Sleswic-Holstein (dated August 24, 1814) declare that children shall attend school from the beginning of their sixth, or, at the latest, their seventh year, until their confirmation in church, which takes place for boys at the age of 16 and for girls at the age of 15. According to section 1 of the school ordinance for the province of East and West Prussia, December 11, 1845, any child 5 years old may be sent to school; but at 6 years of age attendance becomes compulsory. In practice the sixth year is generally accepted as the limit of age for first attendance; in no instance is compulsory attendance recognized before that age. Because of personal and local causes, as physical weakness and difficulty of access to school, the commencement of schooling is not infrequently deferred with the cognizance of teachers and authorities, until the eighth year; whereas on the other hand, especially in cities, in cases where the children are later on expected to enter secondary schools many parents desire, and as a rule succeed in gaining earlier admission for them.

The close of the school age is determined by the general civil law, which is identical with the cabinet order of May 14, 1825, both of which provide that—

A child must attend school until it has acquired the education necessary to any person of average intelligence for his station of life.

This degree of education is determined by the parish pastor, who,

---

<sup>1</sup> Yet the census of 1895 showed that the female population of the Empire exceeded that of the male by nearly 1,000,000 (957,401).

however, by the law of school inspection, March 11, 1872, is displaced by the secular inspector of schools. The boards of education, in unison with the highest courts of justice, so interpret the law that compulsory attendance is in force until the beginning of the fifteenth or the completed fourteenth year of age, as that length of time is ordinarily required to attain the degree of development contemplated by the law. A longer term of schooling is obligatory in cases of deficiency at the age above mentioned. Although fully agreed in their understanding of principles, school boards and courts of justice have come to very different decisions in individual cases, so that the error of basing conclusions altogether upon a child's age is quite manifest. Therefore, in the school bills submitted to Parliament in 1890 and 1891, decisions based upon the old civil law were set aside, and the following conclusion accepted:

The term of school attendance ends with the completion of that school semester during which a child attains its fourteenth year of age.

For reasons not germane to the matter in hand the bills were not passed by Parliament, and the old provisions are still in force. In practice the rule is so applied that a child is discharged from attending school at the close of a semester, the date of which approaches nearest to that of its birthday, consequently when  $13\frac{3}{4}$ , 14, or  $14\frac{1}{4}$  years of age. According to the regulations in force from 1817 to December 11, 1845, in the Duchy of Nassau and in the provinces of East and West Prussia, the term of school attendance ends with the completion of the fourteenth year of age. This provision is in so far impracticable as, in accordance with the decision of the supreme court of Prussia, rendered March 23, 1885, the time of discharge can not be made to coincide with the close of the semester immediately following upon the fourteenth birthday. The authorities at Dantzic, for instance, have decreed that all children who have passed their fourteenth birthday by March 31 shall be discharged in the spring, and those fourteen years old by September 30, in the fall. In pursuance of the decision of the supreme court, the following order was issued June 24, 1898:

(1) The local school supervisors or inspectors shall decide<sup>1</sup> whether children whose fourteenth birthday will fall in the following half-yearly term are sufficiently advanced to be relieved from compulsory attendance at the close of the semiannual examination. (2) If so, the inspector (superintendent) shall give permission to them to leave school at the close of the semiannual term, during which they have been examined. (3) If examination proves that a child has not attained the required progress, the school inspector shall defer the discharge from compulsory attendance according to section 32 of the regulations of December 11, 1845.

The Hanoverian school law of May 26, 1845, in section 5 refers to

---

<sup>1</sup>As a matter of fact, few such cases are submitted to him for personal examination. The superintendent ordinarily decides upon recommendation of the local teacher or principal. Only in cases where parents appeal from the decision of the teacher does the superintendent conduct an examination in person.

territorial school regulations which fix the limit at 14 years of age. In Sleswic-Holstein the school age of boys closes with the completed sixteenth, that of girls with the completed fifteenth year of age.

The Prussian Government has entered into an agreement with the Governments of all the German States excepting Bavaria and Brunswick, which submitted reasons for withholding from such an agreement, to the effect—

That all Prussian children resident in another State of the union, and all children belonging to any one of these States but resident in Prussia, shall attend school in obedience to regulations existing where they may be resident, the same as native children.

That this compulsory attendance shall extend not only to elementary schools (6 to 14), but also to so-called secular Sunday or continuation schools to which the obligation of regular attendance attaches.

That, however, children who have received a certificate from the school authorities of their native place, showing that they have complied with the law of their homes to its full extent, shall be exempt from further attendance, even though the law in force at their new place of residence may require a longer term of school age.

Agreements of this kind, which also exist between the other German States to some extent, take the place of any expressly formulated legal provisions for imperial uniformity regarding the school system.

(b) *The other German States.*—In Bavaria the law of December 23, 1802, requires every child to attend week-day school from its sixth to its twelfth year of age, and since 1856 to its thirteenth year. From then until the sixteenth year of age attendance at holiday schools is compulsory. In Württemberg (order of November 6, 1858, article 1) school age continues from the beginning of the seventh to the close of the fourteenth year of age. Release before the fourteenth year of age is allowed in cases where sufficient progress has been made and home circumstances seem to demand or justify it. Compulsory attendance at continuation<sup>1</sup> and holiday schools is coupled with that of elementary schools. In Saxony (school law of April 26, 1873, article 4) the school age extends from the beginning of the seventh to the beginning of the fifteenth year of age, and in case of deficiency till the close of the fifteenth year. Boys are required to attend continuation schools three years, provided no other arrangements are made for their further instruction, such as attendance at a secondary, industrial trade, or art school. In Baden (law of May 13, 1892) school age begins with the close of the sixth and ends with the close of the fourteenth year of age. Provision is made for exceptions. The law of February 18, 1874, requires boys to attend continuation schools two years and girls one year. In Hessa (law of June 16, 1874, article 9) the school age likewise covers the same eight years. In cases of inefficiency in the chief studies, religion, language, arithmetic, and writing, the term may be extended one year. Boys are required to attend continuation school

---

<sup>1</sup> Continuation schools are evening and secular Sunday schools. In some cases they are day schools for the trade apprentices.

three years. In Oldenburg (laws of April 3, 1855, and February 26, 1870) the school age extends from the beginning of the seventh to the beginning of the fifteenth year, and in the smaller principalities till the close of the fifteenth year. In Mecklenburg-Schwerin the school age begins with the seventh and ends with the thirteenth year, in most cases with the date of church confirmation. In Mecklenburg-Strelitz the school age begins with the completed sixth year and continues till confirmation. In the remaining German States departures from the rule of admission at 6 years (completed) and release at 14 years (completed) are unimportant. Besides, in the States already mentioned, attendance at continuation schools is compulsory, for boys two years in Saxe-Coburg-Gotha; for girls and boys two years in Saxe-Meiningen; for boys two years in Saxe-Weimar, and for boys until their sixteenth year of age in Schwarzburg-Sondershausen.

(c) *Other European countries.*—The following table shows how much the school age varies throughout Switzerland.

NOTE.—The cantons of Switzerland manage their school systems independently of one another, just like the States of the United States. Hence the diversity.

*Term of school attendance in Switzerland.*

Canton.	Age of admission (years).	Day schools—Number of years of compulsory attendance.	Continuation schools—Number of years of compulsory attendance.

*a* Girls are required to attend industrial and domestic science school one year.

*b* Only for boys.

*c* Only eight years for girls.

*d* Only seven years for girls and one year industrial school.

*e* For girls, eight years day school and two years singing and industrial school.

In the Austrian crown lands<sup>1</sup> the period during which school attendance is compulsory extends in some cases over six years, as in Dalmatia,

<sup>1</sup> While the divisions of Germany are called States, of Switzerland cantons, in Austria they are called crown lands.

Istria, Galicia, Bukowina, and the rural schools of Carniola, in others over eight years. Where attendance is required eight years, the superintendent may shorten the term in the two highest grades; for instance, by lessening the number of hours per week, or by exempting needy pupils from instruction during the summer.

In Hungary all children who do not receive sufficient private instruction, which is tested by participating at examinations in public educational institutions, must attend day school from their sixth to their twelfth, and continuation or review schools till their fifteenth, year of age.

The Swedish school law of December 10, 1897 (section 35, articles 1 and 3), reads:

The length of time during which a child is required to attend school is reckoned from the calendar year in which it attains its ninth year to that in which its fourteenth year of age closes. A pupil who, at the end of that term, has not acquired the prescribed knowledge is still subject to compulsory attendance, whereas pupils who complete the course of study in less time may be released before their fourteenth year of age.

Section 38 of the same law says:

Children of school age instructed at home shall be exempted from school attendance, provided that their parents or guardians are competent to watch over their education. Children thus taught are bound to take a set examination upon summons of the school inspector of the district. In cases of deficient instruction they shall be required to attend school.

In Norway (school law of May 16, 1860) all children are required to attend school from the beginning of their tenth year until confirmation in church, which takes place at 13 or 14 years of age. Children sufficiently developed physically and far enough advanced in their studies may be dismissed when 13. The law of 1889 requires city children to attend school from 6½ to 15 years of age; children in rural districts from 6 to 14.

The Danish law of May 2, 1855 (amended September 30, 1864), says:

School attendance is required at the beginning of the seventh year of age. When a child has completed its thirteenth year and gives satisfaction in studies it may, upon the desire of parents or their representatives, be released from school. This release must follow upon parents' request when the child is 15 years old. Children under private instruction must take the semiannual examinations in the public schools. Should they fail or not attend, they are at once required by the authorities to receive public instruction.

In England the State assumed special responsibility with respect to elementary schools by the law of August 9, 1870. Compulsory education, however, was not introduced with this law. Local school boards were left to pass special ordinances approved by the Government introducing compulsory attendance in their districts, with the right to fine delinquent parents 5 shillings. Where there are no school boards, the law of August 15, 1876, requires that school-attendance committees be formed, with the same power to enforce regular attendance. These regulations, together with the factory law of 1878, which

requires all children working in factories to attend school at least five times a week until their thirteenth year, have made instruction virtually general and compulsory.

The Netherlands have no compulsory education law. Boards of teachers and college directors are supposed to establish a regular attendance of children from 6 to 12 years of age by means of exhortations, circulation of roll calls, and indirect compulsory measures, such as withdrawal of public support, etc.

In Belgium no compulsory education exists. Children attend school from the seventh to the fourteenth year.

In France the law of March 28, 1882, reads:

All children are required to attend instruction from their sixth to their thirteenth year. Release at the age of 11 is allowed upon the passing of an examination.

In Italy the school age covers four years. The law of July 15, 1877, requires children to attend the lower elementary school from their sixth to their completed ninth year, and night schools one year longer where such schools exist.

Russia has no compulsory education law.

### 3. ACTUAL ATTENDANCE OR ENROLLMENT IN PUBLIC ELEMENTARY SCHOOLS.

It is difficult to find a definite measure with which to gauge how far the foregoing provisions and regulations are executed and obeyed. Statistics at hand are affected by different circumstances—duration of school age, relative number of children in the population, the extent to which secondary education reaches down into the primary, expansion of secondary and special school systems, popularity of private and parochial schools—all these and other questions disturb the uniformity so essential for comparative statistics. - We should arrive at altogether false deductions if we based our conclusions entirely upon the percentage of school children in the total population, i. e., apply the "educational denominator," as European statisticians say. For in that case Finland, for instance, would be far ahead of Germany; yet other indications prove that Germany is ahead of Finland in results of compulsory education; the rates of illiteracy in the two countries plainly show this; better even than that does the limited and inadequate number of schools in Finland show it, where the inadequacy is remedied by means of ambulatory schools. Nevertheless the rate per cent of school children to the population gives us a useful measure of the excellence of public instruction. The presumption is that a country with a large percentage of school children possesses an extensive and well-equipped system of schools with a well-matured course of study. And even if statistics refer to public schools only, it may be taken for granted that their plan throughout is good, otherwise a system of private schools would spring up in

competition with it. The following figures give the statistics for the German States:

*Ratio of elementary pupils to the population in the German States.<sup>1</sup>*

States.	Population (census of 1890).	School children (in 1890-91).	Ratio to popu- lation.
Prussia .....	29,957,367	4,916,476	16.41
Bavaria .....	5,594,982	823,279	14.79
Saxony .....	3,502,684	576,641	16.46
Württemberg .....	2,036,522	314,690	15.45
Baden .....	1,657,867	272,604	16.44
Hessia .....	992,883	163,036	16.42
Mecklenburg-Schwerin .....	578,342	84,894	14.67
Saxe-Weimar .....	326,001	53,540	16.42
Mecklenburg-Strelitz .....	97,978	15,309	15.62
Oldenburg .....	354,968	60,407	17.02
Brunswick .....	403,773	68,999	17.09
Saxe-Meiningen .....	223,832	39,592	17.69
Saxe-Altenburg .....	170,864	29,625	17.34
Saxe-Coburg-Gotha .....	209,513	33,503	16.22
Anhalt .....	271,963	45,222	16.63
Schwarzburg-Sondershausen .....	75,510	12,963	17.17
Schwarzburg-Rudolstadt .....	85,863	14,567	16.96
Waldeck .....	57,281	10,440	18.23
Reuss, senior line .....	62,754	10,988	17.51
Reuss, junior line .....	119,811	19,593	16.23
Schaumburg-Lippe .....	39,163	6,738	17.26
Lippe .....	128,495	23,595	18.32
Lübeck .....	79,485	8,956	11.71
Bremen .....	180,443	25,718	14.25
Hamburg .....	662,540	66,658	11.49
Alsace-Lorraine .....	1,603,566	223,845	13.96
Total .....	49,428,470	7,925,688	16.03

The figures show the effect of the different regulations and laws on school attendance. The low ratio for Bavaria and Mecklenburg, as well as Alsace-Lorraine, is due to the shortness of the school age, see p. 155; that of the Hanseatic cities (Lübeck, Bremen, and Hamburg) to the small percentage of children, and the great number of secondary, special, and private schools. Other large cities have low percentages also; for instance, for the decade 1881-1891 Berlin had 10.8 per cent, Breslau 11.3, Leipsic 8.9, Dresden 10.8, Vienna 8.1, Budapest 7.2 per cent of the population.

A few special features for Prussia and Bavaria are subjoined.

On December 1, 1890, Prussia numbered 5,299,310 children of school age, i. e., between 6 and 14, and 722,883 children at the age of 5 to 6 years, of whom a few attended school (see p. 153). About as many as attended school before being 6 years old, were over 14 years and still in school owing to inefficiency. On May 25, 1891, there were counted on the rolls and belonging to school—

In public elementary schools.....	4,916,476
In private schools, or taught at home.....	280,389
Not admitted owing to overcrowded schools.....	3,239
Not sent to school yet for hygienic reasons, though 6 years old.....	17,527

<sup>1</sup>This table does not include the pupils of private schools, nor of elementary classes of secondary schools, nor pupils taught at home, nor defective children in asylums, nor morally unsound children kept in reform schools; only the pupils of public elementary schools (Volksschulen). The census of 1895 could not be used, since the school statistics date from 1890-91.

Released from school before the completion of the fourteenth year, having completed the course.....	62, 838
Excused from attendance owing to physical or mental defects, or placed in asylums .....	10, 041
Truants, or withheld from attendance .....	945
Total.....	5, 291, 455

If we rely upon the census, we find that nearly 8,000 children are not accounted for on the school rolls in Prussia.

In Bavaria the number of children at public elementary schools has decreased in late years despite notable improvement in the system of education, to wit, from 859,116 in 1886-87 to 817,589 in 1892-93, but then the attendance at holiday schools and continuation (day and evening) schools has considerably increased, to wit, the former 263,103 in 1884-85 and 304,227 in 1892-93; the latter 24,031 in 1884-85 and 31,121 in 1892-93.

The actual school enrollment in the schools of other countries is characterized by the following ratios to the population:

*Ratio of elementary pupils to the population.*<sup>1</sup>

	Per cent.		Per cent.
Belgium .....	11. 10	Portugal .....	4. 66
Denmark .....	12. 87	Roumania .....	4. 41
France .....	14. 47	Russia (Europe) .....	<sup>3</sup> 1. 03
Greece.....	6. 19	Finland.....	<sup>4</sup> 18. 29
Great Britain and Ireland.....	15. 45	Sweden .....	16. 37
Italy.....	<sup>2</sup> 8. 14	Norway .....	<sup>5</sup> 17. 02
Netherlands .....	14. 25	Switzerland.....	15. 73
Austria .....	13. 40	Servia .....	3. 38
Hungary.....	12. 59	Spain .....	10. 95
Bosnia .....	2. 70		

A few items concerning the various crown lands of Austria may be added. In 1889-90, the number of physically and mentally normal children who were withheld from attending school was very large, despite the compulsory attendance law in force, to wit, 436,731. This shows that the execution of the law, being in the hands of local authorities, varies considerably. It is noticeable that in crown lands settled chiefly by Germans the percentage is small, while in those chiefly Slavie it is large.

<sup>1</sup> Other sources give the following ratios: Denmark, 10.61 per cent; Greece, 4.02 per cent; Sweden, 14.72 per cent; Norway, 15.65 per cent; Spain, 7.68 per cent.

<sup>2</sup> Enrolled 8.14 per cent, but actually present only 5.91 per cent.

<sup>3</sup> European Russia without Poland.

<sup>4</sup> Includes all children receiving instruction in day schools and ambulatory schools.

<sup>5</sup> This ratio includes all children of school age, which is presumably identical with the number enrolled in school.

*Percentage of children withheld from school in Austrian crown lands in 1889-90.*

	Number.	Per cent.		Number.	Per cent.
Nether Austria.....	171	.05	Carinthia.....	1,495	2.78
Upper Austria.....	.....	.....	Carniola.....	6,633	8.39
Salzburg.....	23	.00	Dalmatia.....	4,029	15.63
Bohemia.....	1,749	.18	Trieste and Istria.....	21,288	27.05
Moravia.....	926	.23	Galicia.....	359,596	38.04
Silesia.....	773	.85	Bukowina.....	33,658	42.82
Tyrol and Vorarlberg.....	2,065	1.41			
Styria.....	4,385	2.42	Total.....	436,731	12.23

The previous table, which credits Austria with 13.4 per cent of children in school, proves that the conditions there have greatly changed in recent years, chiefly owing to the imperial school law of 1869, amended in 1888.

4. CONTROL OF ATTENDANCE.

For the control of school attendance, individual school boards in some countries, in others the governmental school authorities, have issued orders in pursuance of which they exercise control in conjunction with the police authorities. The great variety of relations existing does not allow entering upon details respecting this control. The Prussian provincial governments have issued orders which prescribe the keeping of enrollment and absence lists of pupils (see order of the authorities at Bromberg, December 1, 1870); also orders which require control of attendance at religious lessons in nondenominational schools (see order of the authorities at Dantzic, March 31, 1872); also orders which require that the "floating school population," children living on canal and fishing boats, be accommodated in any school convenient to them for the time during which they leave their boats, usually not less than a week; likewise orders which provide for juvenile shepherds, whose attendance at school causes trouble in the eastern provinces, chiefly devoted to agriculture and cattle raising. In regard to the last-named category of children, the earlier and stricter laws have been amended on account of the opposition raised by agriculturists. These amendments have made the control much less strict, and they may be said to stand in contradiction to the strict prohibition of child labor expressed by the imperial factory law.

5.—PUNISHMENT FOR ABSENCE FROM SCHOOL.

In Prussia the penalties attached to absence from school are accounted as penalties for the transgressions of parents, and are treated as such. Accordingly, an appeal to law is possible; the motion for punishment must be made by the school inspector (superintendent). Without such a motion, the police authorities that decide upon the punishment are not justified in interfering. The police judge has the right, however, to set aside any motion which seems to him without cause. (Ministerial act of July 17, 1873.) School inspectors may demand an

account of the judgment rendered; in case of a setting aside or modification of their motion, they have the right of appeal to a higher court. The limit of punishment is fixed partly by laws, partly by regulations. Wherever the general civil code rules, and according to the act of May 6, 1886, for East and West Prussia (two provinces which formerly did not belong to the German Federation), as also for Silesia, school attendance is controlled by the school and police authorities. Section 48, article 12, part 2, of that code reads:

School inspectors, with the aid of magistrates [which means police authorities], are required to see to it that all able-bodied and mentally competent children, in obedience to the foregoing provision (section 43), regularly attend instruction, by force, if necessary; and that delinquent parents be punished.

The police are authorized, on their part, to institute regulations, and to impose fines "in accordance with the prevailing local circumstances." This is important, as the earlier regulations provided for such low fines that parents did not feel their payment as a burden. Fines are paid into the school treasury. Besides punishing parents with fines, and in default of them with confinement for a number of days, the children may be forced to attend school by police or truant officers.

#### 6.—DISPENSATION FROM ATTENDANCE.

Religious instruction occasions much irregularity in attendance, particularly if children are required to go any distance for that purpose, as is often the case in rural districts. School authorities are battling against such irregularity in vain. In Catholic countries, part of one day in the week, generally Thursday, is set aside for religious instruction.

Absence from secular instruction on Saturday, or else exemption from written work during school hours, is often required by and also granted to Jewish children. Other dispensations, for instance, for purposes of employment, aiding parents in gaining a livelihood, have, in the course of time, become very rare in Germany. The increase of national prosperity, which has been quite phenomenal during the last twenty years, and the consequent increase of parental supervision, have given children more chances to attend school. The prohibition by imperial law of child labor in factories (June 1, 1891) has done more even than the increased prosperity. Still, too much of children's time out of school is often taken up by home industries, which materially depreciates the advantages of exact regular attendance. In the country, particularly in the eastern provinces, agricultural labor, such as tending flocks, is still performed by children. The time of instruction for some children, and for nearly all during the summer, is so much shortened that good progress in school can not be expected. This is the case especially in Mecklenburg, where the "Dienstschule" (service school) is still a poor substitute for a modern public elementary school. Some vacations, for instance, the one during beet-raising

time, are also among the deplorable causes of irregularity in attendance; these vacations afford the opportunity of drawing children into industrial labor in a way that undermines their health and morals.

#### 7. PROPOSITIONS FOR CHANGES.

Propositions for changes come from two antagonistic parties—the one opposed to progressive national education and the elevation of the masses; the other, in favor of advancement of popular education as the guaranty of increased national prosperity in all directions. While the former is laboring not only to prevent every expansion and safeguarding of school attendance, but to bring about restrictions and contractions, the latter party, to which, of course, all educators belong, is aiming at extending compulsory education, and, first of all, at removing all hindrances to a complete utilization of school time for purely educational purposes. German teachers consider eight years' school attendance sufficient in general, presupposing that elementary instruction is continued and supplemented by an appropriate three or four years' course at well-organized continuation schools, be they agricultural, commercial, or industrial. The demand, coming especially from physicians, but sometimes also from educators, and not infrequently from politicians, to defer the commencement of school attendance one year until the beginning of the seventh year, could be justified if arrangements were made to prevent the neglect of uncared-for indigent children, and kindergartens or institutions of like kind were established in which young children would be properly occupied whose parents either can not, or will not, see to it that they have sufficient mental exercise.

If study were omitted during the first year of school, and play and lively physical and mental occupation were introduced to a greater extent, the essential import of the demand for shortening the course of compulsory attendance at school would be complied with and the disadvantages of later entrance obviated. This demand, when it comes from politicians, naturally conceals another purpose, that of reducing the cost of schooling fully one-eighth.

The public elementary school of the future will, beyond doubt, attach greater importance to the attendance of advanced children than those of an earlier period of age. During hard, poverty-stricken times, when public elementary schools were first established in Germany, a child was hurried from the cradle to the school desk in order to give it an education. The child formed a part of the assets of the family business. It had to do its share of bread-winning. At present a much greater number of children are allowed a longer time for development free from the yoke of labor, and schools have the right to claim them at a later age. How far this period may be extended is an open question in Germany. As the interim between school and military service has already been very much curtailed by extending

compulsory attendance to supplementary evening and holiday schools, it may be taken for granted that the interruption will, at some time in the future, be entirely bridged over. The entire educational history of Germany seems to indicate this.

Whether compulsion is beneficial in all respects is doubtful. But it is an "ultima ratio" against brute force and evil influences in life, and it is indispensable to successful work of teachers. Penalties attached to absence from school are unavoidable, even in highly civilized states. Like all penal laws, they form a wall of protection against the forces of evil. As for the rest, schools must endeavor to effect regular attendance by their internal organization, kind management, and wholesome influence upon the adults at home, also by their plan of study and ready cooperation in the amelioration of social conditions. Judges, it is true, can compel a few delinquents not to prevent their children from receiving the benefit of education, but Nemesis does not establish social progress; positive aid is necessary, therefore, and from that alone can it be expected that in the future no child shall suffer in its development because of ignorance and crudity or want and misery.

---

### III. TEACHERS' PENSIONS AND ANNUITIES IN CENTRAL EUROPE.

[After an article by J. Tews, of Berlin, in Rein's Encyclopedia of Education.]

TOPICAL OUTLINE.—Introduction.—1. General remarks.—2. Conditions governing pensions for teachers of elementary schools in Prussia.—3. Pensions for teachers of elementary schools in other German States.—4. Pensions for teachers of elementary schools in other European countries.—5. Pensions for teachers of secondary schools in Germany.—6. Pensions for teachers in secondary schools of other countries.

#### INTRODUCTION.

The statement that teachers in Germany, Austria, and Switzerland have long been entitled to a pension after a certain number of years of service, specified by law, is both correct and incorrect. It is true that after a certain term of faithful service they could resign and continue to draw a fraction of their salary—i. e., live on a pension. But this so-called pension was, to a large extent, money which the teachers had paid into the pension funds during their term of service. This was the rule until recently, but now State and communal governments have come forward to increase these funds by annual appropriations. This appreciation of the teachers' past services has during the last twenty years increased to such an extent in several States of central Europe that contributions to the pension funds on the part of the teachers have ceased, and the State and the communities now bear the entire burden. This is quite in harmony with other measures of social legislation inaugurated by Prince Bismarck, such as compulsory accident and invalid insurance for laborers, old-age pensions for

workingmen, and others. But that the State and communities pay the teachers' pensions exclusively is by no means the general rule, though the trend may be that way in all continental European States. A statement concerning the laws and practices governing the payment of pensions to teachers in central Europe, based upon a compilation by Prof. J. Tews, of Berlin, may be welcome, since the question of pensioning teachers is of importance in this country, as is seen from various legislative enactments of recent years. (See Report of 1894-95, pp. 1079 to 1113, and of 1895-96, pp. 1343-1350.) With few exceptions (such as Württemberg) the provisions concerning pensions are the same for male and female teachers; hence for the sake of brevity the pensioning of "teachers" is referred to in tables.

#### GENERAL REMARKS.

The pensions at present paid in most countries advanced in education are not salaries for past services in the strict sense of the word; but the required amount accrues, wholly or partially, from contributions of those benefited. Pension funds in that case are really only life-annuity funds under the control of the State or community. Even in States where this subject has made the greatest progress, in Prussia among others, the payment of pensions was not at first included in the question of school appropriations. It is only during the last few decades that teachers and officers themselves no longer contribute to this fund. In some countries (England and a few of the Swiss cantons) pensions were unknown until very recently. Teachers and school officers themselves provided for their old age by saving or taking advantage of benefit societies, annuity and life-insurance companies.

The great differences which appear in the following statements are explained not only by the various degrees of difference in providing for educational necessities, but also in the difference of social views maintained by separate nations and the consequent conditions of industry and living. In England everything is referred to personal responsibility, consequently pensions were things unknown until recently. In Switzerland a similar condition is brought about by the autonomic government of the people, often rather economical on such questions as pensions for civil officers. In the Romanic countries citizens engaged in industrial pursuits retire earlier than in Germanic countries; the laws, therefore, provide for a shorter time of service for teachers.

Theoretically considered, free pensions—i. e., salaries for past, not current, services—are open to objections. They complicate the question of salary considerably, in so far as an officer entitled to a pension and to a claim of provision for his family in case of his death can hardly compare his resources with those of other salaried persons. Neither can such contrasts be easily brought to bear justly on claims for higher salaries. Practically considered the usual result is plain, that in regulations respecting salaries the benefits of pension claims are estimated entirely too high; 6 to 7 per cent of the salaries of teachers of elementary schools in Prussia would cover the amount paid out to present pensioners. Because of this sum the salaries must be rated higher in order to compare them with incomes not subject to pension claims. Where provision for widows is also a matter of public expense, a corresponding numerical relation must likewise be established for it. In Prussia this amounts to about  $3\frac{1}{2}$  per cent of the salary for teachers of elementary schools. From this it is plain that in comparing the salary of a Prussian teacher with that of an American teacher, for instance, about 10 per cent should be added to the former.

## 2. CONDITIONS GOVERNING PENSIONS FOR TEACHERS OF ELEMENTARY SCHOOLS IN PRUSSIA.

(a) *Provision for retired teachers until the year 1885.*—During the first half of the past century no state had made provision for teachers in their old age. They either worked until their death, or, when too old and decrepit, were cared for by their successors, a considerable portion of whose small income and restricted quarters were perforce given over to their predecessors. In the second half of the century conditions were only little better; they had not improved any in Prussia. For instance, when in 1773 many incompetent teachers within the province of Brandenburg lost their positions, Minister von Zedlitz proposed to the King that their fixed salaries should be paid until the time of their death. The great King Frederick II, however, could not decide upon such a resolution, and directed them instead to continue their trades in the small cities. (Teachers of elementary, especially rural, schools at that time being tailors, carpenters, blacksmiths, etc.) The Prussian Government did not establish stable regulations until much later. A ministerial decree of August 9, 1819, says that the regulations of the general statute, part 2, chapter 11, paragraph 522, which among other things order the pensioning of the clergy, “should also be applied to teachers.” In pursuance of paragraph 529, pensions must be taken out of the revenues of the office in such a way that the retired teacher receives one-third and his successor two-thirds of these revenues. This principle was maintained in the pensioning of teachers for a long time. Nevertheless, views on this subject seem to have been very uncertain. According to a ministerial enactment of August 17, 1827, there is no question of doubt but that every teacher of an elementary school whom age or sickness has rendered incapacitated and in need must be supported by the community. His successor can not be obliged to deliver any of the revenue of the position over to him, for the regulations that enforce this in cases of ecclesiastical positions are nowhere extended to apply to teachers’ positions. In this enactment the right of the Government to demand the payment of a pension to teachers from the community is founded on the “right of the Government to define the limit of support for the poor of any one locality according to circumstances,” \* \* \* “without taking into consideration the usual fund appropriated annually for the support of the poor.” The pensioning of teachers consequently was considered under the head of care for the poor. In 1835 (decree of August 17) the Government returned to the one-third of the salary attached to the position and abided by that regulation. (See also decree of April 10, 1840.) In the last two decrees the cooperation of the community is required only in cases where the salary of a position does not admit of a reduction by one-third. The provision for retired teachers remained on this basis in Prussia up to 1885, while in Württemberg, for example, as early as 1840, the pension, after a term of service of ten years, was fixed upon 50 per cent of a salary of 250 florins (or about \$120), and 20 per cent of all amounts over and above that sum.

(b) *The regulation of teachers’ pensions in Prussian school bills (proposed legislation).*—In the school bills prepared by the Prussian ministers of education, various ways of adjusting the question of pensions have been pointed out. The bill of 1819 defined, among other things, that “the support of retired teachers should be derived from the means that maintain the school at which they were stationed.” Where the community is too poor the State should assist with extraordinary benefices. For the rest, the prospective law concerning the pensions of civil State officers is referred to. According to the school regulation for the province of Prussia (December 11, 1845), decreed by Minister von Eichhorn, “a teacher rendered incompetent, by no fault of his own, shall receive one-third of his salary as a pension, which may be paid in part in commodities (vegetables, fuel, etc.).

The sum shall not be less than \$37.50 a year, after a term of service of twenty years. The pension shall be derived from the revenues of the position as far as is possible without decreasing the lowest fixed salary of the new teacher. All deficiency must be made up by the means available for maintaining the school." The department of education, presided over by Minister von Eichhorn, endeavored to make this regulation apply to the whole country, as similar provisions in the bill for a school order for Brandenburg prove. How little this corresponded to the wishes of teachers we see from the resolutions passed by district and provincial teachers' meetings in 1848. They demand, among other things, that as regards pensions teachers should be on an equal footing with other officers of the State (meetings held in Brandenburg, Pomerania, Silesia, Saxony, Westphalia, and Rhenish Prussia); the amounts of pensions should increase only at longer intervals (meeting held in the province of Prussia); the State should guarantee every teacher a pension of at least \$75 (meetings held in Pomerania and Rhenish Prussia); the smallest pension should be \$187.75 (meeting in Saxony); after twenty years every teacher should receive one-fourth, after twenty to thirty years one-half, after thirty to forty years three-fourths, and after forty years the whole of his salary as a pension (meeting in Posen); no teacher should suffer any loss of salary to pension his predecessor (meeting in Westphalia).

The proposed school law of Minister Ladenberg (1850) did not respond to these resolutions. It passed over pensions in silence; this is the more significant, since on the 28th of May, 1846, the Government had regulated by law the pensions for State officers according to salary and time of service. On the other hand, the bill of Minister von Bethmann-Hollweg provided for teachers a pension increasing with length of service (one-third after twenty years, one-half until the thirtieth year, and two-thirds after thirty years of service). The costs were to be defrayed by the community and the teachers (the latter with contributions amounting to 1 per cent of their salary). A pension fund was to be established in every county (Regierungs-Bezirk). Under the ministry of Von Mühler, the Prussian house of deputies resolved on March 24, 1863, "That the same principles shall apply to pensions for teachers of elementary schools as apply to those of other officers of the State. The pension of a teacher shall not be deducted from the salary of his successor; it shall rather be derived from contributions of teachers and appropriations made regularly by the State and the communities." In December, 1867, Minister von Mühler himself presented before the Diet "A bill relating to the pensioning of teachers of public elementary schools, and defining pension claims," in pursuance of which teachers were to receive a pension of no less than 50 thalers (\$37.50) after fifteen years, 100 thalers (\$75) after thirty years, and 120 thalers (\$90) after forty years of service. With a salary of more than 200 thalers (\$150) the retired teacher was to receive one-third of the excess in addition as a pension. These provisions were also contained in Von Mühler's bill of 1863, only that the pension for the time from the sixteenth to the thirtieth year of service was raised from 50 to 60 thalers (\$37.50 to \$45). That this bill shared the fate of all its predecessors, that is, failed to be passed, is a matter of history. (Prussia has not, to this day, a general school law. The ministry, or department of education and worship, governs the school by decrees and regulations.) Until the enactment of the law of July 6, 1885, which regulates salaries and pensions only, teachers in the greater part of Prussia were obliged to rest content with the old custom of curtailing the salary of the successor by one-third. It was only when the pension law of 1885 went into effect, that other rules and principles, in part rather favorable, began to govern conditions in Silesia and the new Prussian provinces (Hanover, Nassau, Sleswic-Holstein, etc.).

A basis for comparison of the actual condition of retired teachers is furnished by the following figures taken from the printed records of the Prussian house of deputies. In the spring of 1881 there were 3,575 retired teachers who collectively

drew \$430,709 in pensions and \$121,200 from State funds. The pensions averaged \$155. Of all the pensioned teachers 8.23 per cent received \$75, 50.88 per cent from \$75 to \$150, 37.42 per cent from \$150 to \$225, and the remainder over \$225. The progress attained in consequence of the pension law of 1885 is shown in the following statement: In the year 1891, pensioned male teachers numbered 5,691; females teachers 400. At the same time, the pensions amounted to \$1,492,296, of which the State paid \$978,115, an average of \$245. Besides, the State pays out \$202,000 as a relief fund to those teachers who were pensioned before April 1, 1886. In 1867 all that the State paid for this purpose, including subsidiary relief, amounted to no more than \$6,000; in 1877 this had increased to \$75,000; in 1887 to \$787,500, and according to the statement for 1897-98 the State's contribution had reached the sum of \$1,389,500.

(c) *The pension law affecting male and female teachers of public elementary schools in Prussia.*—The most important provisions of the law of July 6, 1885 (the last law signed by Emperor Frederick, the passage of which he was impatiently awaiting while on his deathbed), are as follows: A service of ten years entitles to a pension. Should the inability of teacher be the result of sickness, wounds, or other physical harm, either suffered in the practice of his profession or occasioned by it, without fault of his own, he is entitled to a pension within a shorter term of service than ten years. In that case the pension amounts to fifteen-sixtieths of the salary. At the age of 65, teachers may retire, even if still able to serve. Should they retire at the end of the tenth year of service, but before the eleventh, the pension amounts to fifteen-sixtieths of the salary, and increases by one-sixtieth of the same for every successive year of service. There is no increase beyond forty-five sixtieths of the salary. Teachers who become disabled before the close of the tenth year of service, even if their disability be not traceable to the practice of their profession, may, in case of necessity, receive a pension for a stated time, or for life, amounting to not more than fifteen-sixtieths of the salary. Pensions up to \$150 are paid out of the State treasury; those over and above that amount are to be defrayed by the authorities upon whom the obligation of pensioning teachers has hitherto rested; and if that be impossible, by those who maintained the teacher in service. The income of a teacher's position may be drawn upon for pensioning his predecessor only in so far as has been valid heretofore (this has never been the case in Nassau and Sleswic-Holstein), and never to such an amount that it should fall below three-fourths of its stated amount per annum, nor below the rate of the smallest fixed salary. The law therefore sets aside the use of revenues of positions to cover the pensions attached to it. After the law went into effect these sums increased considerably; from \$37,316 in the year 1855 to \$77,607 in 1891.

(d) *The law of July 23, 1893, which created special pension funds.*—By this recent law Prussia created an individual organization, the so-called pension fund, for the payment of pensions not covered by the State's contribution (\$150 for every pensioner being the limit of the State's subsidy). Such funds are established in every county (Regierungs-Bezirk). All who are taxed for school support pay for every position an equal percentage of the salaries, minus \$200, which percentage is calculated according to the requirements of the community for all positions within its jurisdiction. For instance: If the prescribed assessments amount to 6 per cent for the year in question, the county's contribution for a position commanding \$750 is found to be \$33 over and above the fixed State pension of \$150. (Mode of calculation: \$750 minus \$200 equals \$550, at 6 per cent equals \$33.) These special pension funds are like our customary sinking funds, for which a tax is levied according to the requirements of the year. By doing away with all contributions from the teachers, except so far as they are taxed like other citizens, the law places them on an equal footing with other State officers and with teachers of secondary schools.

(e) *The pension law of June 11, 1894, for teachers of intermediate or advanced elementary schools.*—The law of June 11, 1894, provides the same pensions to which State officers are entitled, for all male and female teachers of public intermediate schools of Prussia. To this category of schools belong girls' high schools, advanced elementary schools, burgher schools, etc. Only two of these classes are State schools; all the remainder are private or communal schools.

### 3. PENSIONS FOR TEACHERS OF ELEMENTARY SCHOOLS IN OTHER GERMAN STATES.

*Bavaria* has no law providing for uniform pensions. A pension association, legally supported by subventions from governmental districts and the State, is established by law in every district. Male and female teachers pay an initiation and a yearly subscription fee. In Upper Bavaria the initiation fee is 18 marks (\$4.50); in Lower Bavaria, 24 marks (\$6); in the lower Palatinate, 100 marks (\$25); in the upper Palatinate only 10 marks (\$2.50); in upper Franconia, 6 marks (\$1.50); in central Franconia, 5 marks (\$1.25); in lower Franconia, 7 marks (\$1.75); in Swabia, 20 marks (\$5). The annual subscription fee is for the same provinces as follows: 15, 24, 10, 14, and 9 marks, 1 per cent of the pension, and 12 marks, or in dollars: \$3.75, \$6, \$2.50, \$3.25, and \$1.75, and 1 per cent of pension, and \$3.

The pensions amount to—

The pensions of female teachers are quoted from the official statement of 1893. Since then some advances have been made. Thus, for instance, in Upper Bavaria the pensions for female teachers at present (1898) amount to \$210 for the first to the tenth, \$232 for the tenth to the fifteenth, \$234 for the fifteenth to the twentieth, \$246 for the twentieth to the twenty-fifth, \$258 for the twenty-fifth to the thirtieth, \$276 for the thirtieth to the thirty-fifth, \$295 for the thirty-fifth to the fortieth, and \$322 after the fortieth year of service.

*Württemberg.*—In this kingdom teachers of elementary, or so-called people's, schools are entitled to a pension when they are permanently employed, or from the beginning of their twenty-fifth year of age, should their appointment be deferred. (Previous to their definite assignment to a position they are employed as

assistants.) At the commencement of the tenth year of service the pension amounts to 40 per cent of the salary and increases with every successive year of service by  $1\frac{1}{4}$  per cent of salaries up to \$600, until the highest rate of  $92\frac{1}{2}$  per cent, and by  $1\frac{1}{2}$  per cent of salaries above \$600, until the highest rate of 85 per cent is attained. Free residence and compensation for rent are excluded in computing the pension—that is to say, the cash received in the form of salary alone forms the basis of computation. Women teachers are not pensioned, but receive a gratuity of 40 to 50 per cent of their salary (without residence). A change in this provision is under consideration. Pensions to teachers are paid by the state and do not increase after the fortieth year of service (sixty-fifth year of life).

*Saxony.*—In the Kingdom of Saxony the same regulations for pensions apply to the teachers of elementary schools as to those of secondary schools. Teachers are entitled to a pension after the completion of their tenth year of service. At the close of the sixty-fifth year of age, or after forty years of service, any teacher is allowed to retire, or he may be retired by the royal authorities with a pension. If within the first ten years of service a teacher is rendered unable to continue in service by sickness contracted through no fault of his own, and outside the practice of his profession, he is entitled, in case of need, to receive a gratuity not exceeding the lowest pension. If within the first ten years of service a teacher becomes incapacitated through an unavoidable accident suffered in the practice of his profession, he receives the lowest pension without consideration of his being in needy circumstances. The pension amounts to thirty one-hundredths from the eleventh to the fifteenth year of service, and increases by one one-hundredth each year from the fifteenth to the seventeenth, amounting therefore to thirty-two one-hundredths; each year from the eighteenth to the twenty-fifth, inclusive, it increases by two one-hundredths; hence the pension amounts to forty-eight one-hundredths at the close of the twenty-fifth year. From the twenty-sixth to the thirty-second year, inclusive, the pension increased three one-hundredths each year, which makes it sixty-nine one-hundredths; again it increases two one-hundredths each year from the thirty-third to the thirty-fifth year, inclusive, which raises it to seventy-five one-hundredths, and finally the increase is one one-hundredth each year from the thirty-sixth to the fortieth year, inclusive, so that at the close of the fortieth year the pension amounts to 80 per cent of the salary. There is no further increase.

*Baden.*—Paragraph 35 of the statute relating to civil service in this State contains the provision that "in cases of retirement after the tenth year of service but before the completion of the eleventh, the pension shall amount to 30 per cent of the sum representing the officer's income before retirement, and increase by  $1\frac{1}{4}$  per cent of this sum with every completed year of service. The estimated income consists of (1) the regular cash salary, (2) the estimated amount of rent, (3) the regulated estimate of fluctuating tuition fees, and (4) the estimate of collaterals, such as free dwelling, fuel, etc. A pension may be claimed within a shorter term of service than ten years in cases where sickness, wounds, or other personal harm can be proven to have been suffered either in consequence or in the discharge of professional duties. A pension shall never exceed 75 per cent of the estimated income. In the consideration of a pension the full time of service is taken into question. Only completed years of service are considered. The time given to State service before completion of the applicant's twentieth year of age, or a leave of absence for at least one entire year, is not included in the term of service. Time in active service in other countries or States than Baden is counted in." These regulations refer to regular female teachers, to teachers of handiwork and domestic schools, etc., also.

*Hessia.*—In this State permanently employed teachers whose disability results from no fault of their own draw a pension within the first ten years of service amounting to 40 per cent of their income, and increasing by  $1\frac{1}{2}$  per cent with

every successive year until it amounts to their salary in full. Inadequate amounts are proportionally increased to prevent the pensioner from falling into want.

*Mecklenburg-Schwerin*.—In this State a pension law exists for teachers in schools for the aristocracy only. After twenty years' service these receive a pension amounting to 20 per cent of the lowest salary, \$225. After forty years of service the pension increases to 75 per cent; after fifty years, to 90 per cent of that amount; hence, not as in other States, to a certain percentage of the salary last received. According to a standard set by the Government the same percentages prevail in the schools maintained by the people, but on the bases of the actual cash salaries of \$150, \$175, and \$200 to \$325. A pension bill for cities has been lately rejected by the State legislature. The larger cities establish fixed standards through local authorities; in Schwerin, for instance, they are similar to those in the rural districts; in Parchim the rules for the State officers' pensions apply. Smaller cities with definite standards are isolated cases, and they often oppose all payment of pensions to teachers. A bill for pensioning female teachers is before the legislature.

*Mecklenburg-Strelitz*.—The conditions governing pensions for teachers in this State are not regulated by law or regulations. Each case of retirement is treated individually.

*Odenburg*.—Within the first ten years of service pensions amount to 40 per cent of the salaries last received, and increase  $1\frac{1}{2}$  per cent each successive year up to 80 per cent. Teachers contribute 2 per cent of their salary toward the pension fund.

*Saxe-Weimar*.—The pensioning of teachers of elementary schools comes under the State service law, in pursuance of which the maximum pension of 80 per cent of the income is received after thirty-seven years of service.

*Brunswick*.—After five years of service a pension amounts to  $33\frac{1}{2}$  per cent of the salary last received, and increases by  $1\frac{1}{2}$  per cent with every successive year until the salary in full is paid as a pension after fifty years of service.

*Anhalt*.—The permanent appointment of a teacher entitles him to a pension. At the end of the fifth year of service a pension amounts to one-third of the income, and increases by  $1\frac{1}{2}$  per cent every successive year. A pension never exceeds the amount of cash income. With fifty years of service it reaches its maximum, the salary in full.

*Saxe-Altenburg*.—Until the end of the eleventh year of service a pension amounts to 34 per cent of the salary, after which it increases by  $1\frac{1}{2}$  per cent every successive year, consequently up to 76 per cent at the end of the thirty-eighth year, subsequently by 2 per cent up to the maximum of 88 per cent, which is received at the close of the forty-fifth year of service. The term of service is reckoned from the twenty-fifth year of age. Permanently appointed teachers are entitled to a pension of \$75 if disabled before they reach the twenty-fifth year of age. Teachers who have completed their forty-fifth year of service, or their seventieth year of age, are entitled to retire without special proof of inability, or may receive honorable discharge without application. The same pension law (that of December 22, 1875) applies to female teachers.

*Coburg*.—The honorable discharge of a teacher of elementary schools follows upon application if he has completed his fortieth year of service and sixty-fifth year of age, or takes effect without application on his part if he can prove that he has been incapacitated for professional duties because of incurable mental or physical weakness contracted through no fault of his own. A retired teacher draws a pension based upon his term of service and the estimated remuneration, including free residence, attached to the position which he last held. At the end of ten or fewer years of service the pension amounts to 40 per cent of the estimated pay. For every successive year or fraction thereof it increases by  $1\frac{1}{2}$  per cent. A pension never exceeds the salary in full. In case a teacher honorably discharged becomes again able to resume his professional duties before the close of his fortieth

year of service and sixty-fifth year of age, he can be again appointed. As a matter of course, his appointment means but a partial continuance of office, in connection with which his pension is taken into consideration.

*Gotha*.—The pension law, in all essential points, is similar to that of Coburg.

*Meiningen*.—Within the first ten years of service a pension amounts to 60 per cent of the salary, and increases by  $1\frac{1}{2}$  per cent with every successive year until the full amount of the salary last commanded is received. At the end of his fiftieth year of service a teacher is entitled to a pension of a salary in full without proving inability.

*Reuss, senior line*.—Within the first ten years of service a pension amounts to 40 per cent of the income, and increases by  $1\frac{1}{2}$  per cent with every successive year until it amounts to 80 per cent of the salary last received. Teachers pay an annual subscription of 2 per cent of their salary toward maintaining the pension fund.

*Reuss, junior line*.—The pensioning of male and female teachers is regulated by the law of October 9, 1891. The pension percentages are the same as in the other state of Reuss. In determining the age at which pension may be received all facts relative to the first appointment are taken into consideration. No one can receive a pension before he is twenty-one years old.

*Schwarzburg-Sondershausen*.—Pensions are prescribed by the civil-service law of 1850. Within ten or fewer years of service the pension amounts to 40 per cent of the salary; for every successive year or fraction thereof a pension increases by  $1\frac{1}{2}$  per cent until the maximum of 80 per cent is attained. A teacher who has completed his fortieth year of service or seventieth year of age may retire and claim his legal pension. The term of service is reckoned from the beginning of the twenty-second year of age. The conditions that govern the pensions for female teachers are regulated by the law of July 17, 1897, according to which those who have completed their thirty-fifth year of service or sixty-fifth year of age may retire and claim the legal pension. This is determined on the same basis as that of male teachers. The term of service is reckoned from the time of permanent appointment.

*Schwarzburg-Rudolstadt*.—Here pensions increase from 40 per cent of the salary after ten years of service to the amount of the salary in full after fifty years of service.

*Lippe*.—Teachers' pensions are defined by the general pension law for civil service. After ten years of service the pension amounts to 40 per cent and increases by  $1\frac{1}{2}$  per cent with every successive year up to 80 per cent of the salary.

*Schaumburg-Lippe*.—After ten years of service teachers receive a pension of 30 per cent of their income. From the tenth to the thirtieth year the pension increases annually by 1 per cent as high as 50 per cent. From the thirtieth to the forty-fifth year it increases annually by 2 per cent up to the maximum of 80 per cent. The same regulations apply to female teachers with permanent appointment.

*Waldeck*.—After a service of ten years a pension amounts to one-third, from the eleventh to the twenty-fifth year to one-half, and subsequently to two-thirds of the regular income. The equivalent for residence and fuel is included.

*Bremen*.—Pensions for male and female teachers amount to 40 per cent of the salary after ten years' service, and increase annually by 2 per cent, as high as 80 per cent.

*Lubeck*.—A pension can be claimed after ten years of service, when it amounts to one-third of the salary, increasing by one-sixtieth until the maximum of forty-five-sixtieths, is attained, after a term of thirty-five years of service. The same regulations apply to permanently-appointed female teachers.

*Hamburg*.—Teachers who have completed their thirty-fifth year of age may claim a pension after at least ten years' service. If disability is occasioned by sickness or physical harm suffered in consequence and in the discharge of professional duty,

and without grievous fault of his own, a teacher may retire before the completion of his tenth year of service, or thirty-fifth year of age, and claim a pension amounting to 40 per cent of the salary. In other cases, where an officer becomes disabled before his tenth year of service, or thirty-fifth year of age, and is in need, he may claim either a single relief payment or payments of that kind for an indefinite time, even for life; these, however, can not exceed 40 per cent of the salary. If honorable discharge is granted at the close of the tenth year of service, the pension amounts to 40 per cent of the salary, and subsequently increases for every successive year of service, with salaries of \$500 and over \$500, respectively, 2 per cent and 1½ per cent of those salaries which were received at the time of pensioning, until the full amount is realized. When, in cases of a salary above \$500, the pension thus calculated is less than the sum which the applicant would have received with a salary of only \$500, the pension is computed on the latter sum as a basis. The income on which the pension is calculated includes, besides the regular salary and age gratuities, certain legally-granted personal addenda, as residence, or the equivalent thereof, and the value of partial or entire board allowed for the position, garden land, lawful fees and "tantièmes," exclusive of gratifications, office expenses, traveling expenses, horse hire, and other incidentals. When its equivalent is not otherwise legally defined, office room is calculated at 20 per cent of the regular salary, exclusive of age gratuities. In calculating the amount of pension, the term of service which entitles to a pension begins with the first year, provided the teacher be 25 years old when permanently appointed. In other cases at the close of the twenty-fifth year of age.

*Alsace-Lorraine.*—Permanently appointed male and female teachers receive a life pension, if after a term of service of at least ten years they are disabled for their position because of physical infirmity or mental debility. If disability is the result of a disease, a wound, or other physical harm unavoidably suffered in consequence, or in the discharge of professional duties, a teacher is entitled to a pension within a shorter time than ten years. After the sixty-fifth year of age a pension may be claimed or allowed without consideration of disability. If honorable discharge is given after ten years of service, but before the end of the eleventh year, the pension amounts to fifteen-sixtieths of the salary, increasing by one-sixtieth up to forty-five-sixtieths—the maximum. The time of service before the twenty-second year of age is not taken into consideration. According to the law of March 29, 1889, the pension is calculated on the salary last received. If, on account of special grants, calculations are based upon a salary exceeding that stipulated, the legal salary appertaining to the one in question is reckoned upon unconditionally; the consideration of the sum in excess, however, is governed by its average during the last six calendar years preceding the one in which the teacher receives his honorable discharge. Additional receipts, *i. e.*, residence and pay for ecclesiastical services, do not affect pensions. (Law of December 22, 1873.)

#### 4. PENSIONS FOR TEACHERS OF ELEMENTARY SCHOOLS IN OTHER EUROPEAN COUNTRIES.

(a) *Austria.*—Teachers who are disabled within ten years of service receive one relief payment of 150 per cent of their annual income. The payment of pensions begins with the eleventh year of service. Pensions begin with a third of the salary and increase up to the full amount, which is realized at the end of a term of service of forty years.

(b) *Hungary.*—The full claim to a pension is established at the close of the sixty-fifth year of age and the fortieth year of service. Teachers of elementary schools receive \$150; those of advanced and burgher schools \$200.

(c) *Switzerland.*—See notice under pensions for teachers of secondary schools.

(d) *Denmark.*—Permanently appointed male and female teachers are entitled

to a pension after they have served ten years and are thirty years old. The pension increases until as high as two-thirds of the average salary received during the last five years of service.

(e) *Norway*.—Pensions for teachers and other civil officers are under the control of the Storting (Parliament) and subject to individual decision.

(f) *Sweden*.—The payment of pensions begins after ten years of service. The highest pension, which amounts to 75 per cent of the income, but may not exceed \$250, is received in the fifty-fifth year of age, and after thirty years of service. Pensions paid before this time decrease by 1 per cent for every year less than 30.

(g) *The Netherlands*.—A teacher is entitled to honorable discharge at the age of 65, and after forty years' service. The highest pension amounts to two-thirds of the salary; the rate of increase is one sixtieth per annum. Pensions are paid by the State.

(h) *Belgium*.—All teachers who have attained the age of 60, and have served thirty years, as well as those who, through no fault of their own, have become disabled after 12 years of service, have the right to be pensioned. Teachers who accordingly can not claim pensions receive relief payments from the pension funds. For city teachers there is a central fund; for teachers in the country special funds have been established in the principal cities, out of which pensions for widows and orphans are paid. For the benefit of these funds 3 per cent of the teacher's income, and also from one-twelfth to one-fourth of special grants are annually deducted. These funds receive, besides provincial contributions, State appropriations and special grants.

(i) *France*.—According to the law of August 17, 1876, teachers are entitled to a pension after they are 55 years old, and have served twenty-five years, unless infirmity has disabled them before that time. From the twentieth year of age on, the years spent at the normal school, after receipt of the teacher's diploma, are included within the term of service. On the other hand, time spent in private instruction is never taken into consideration. After twenty-five years of service the pension amounts to one-half of the average salary (*i. e.*, the average of salaries received during the six years preceding his discharge); increases by one-fiftieth of the salary for every successive year, but never exceeds three-fourths of the average salary. On the other hand, a pension is never less than \$120 for male and \$100 for female teachers. This minimum does not apply to cases of disability because of infirmity of any kind.

(k) *Italy*.—In consequence of the law of 1878 a pension fund has been established for teachers of public elementary schools, which benefits those teachers who have attained the age of 55. Others depend upon mutual assistance, for which purpose private associations have been formed.

(l) *Great Britain and Ireland*.—Teachers of elementary schools, as well as those of secondary schools, receive no legal pension. But pensions and annuities are paid by beneficial societies and insurance companies. These societies have become very strong of late.<sup>1</sup>

---

<sup>1</sup>Since the publication of the foregoing statement in Rein's Encyclopedia, the teachers in England have succeeded in securing by legislative enactment a pension law called the "Superannuation act."

"It provides mainly that teachers shall make premium payments into a fund of £3 (\$15) a year in the case of men and £2 (\$10) a year in the case of the women. The teachers' contributions are increasable, as time goes on, by an amount not exceeding 5s. (\$1.25) a year for each full 10 per cent increase in the average salaries beyond the average for the year 1892. These premium payments will be received and invested by the national debt commissioners. Actuarial inquiry is provided for every seven years. To the annuities brought by the teachers' premium payments the State will add a sum equal to 10s. (\$2.50) per year for every

## 5. PENSIONS FOR TEACHERS OF SECONDARY SCHOOLS IN GERMANY.

(a) *Prussia*.—A general regulation governing conditions of pensions for teachers of secondary educational institutions was issued in the year 1846. The pension fund was partly raised by contributions from those benefited. Teachers paid their first month's salary after permanent appointment, and in case of promotion one-twelfth of their annual increase, consequently a month's salary, together with the subsequent annual assessment of 1 per cent to  $1\frac{1}{2}$  per cent of their salary. These conditions were set aside by the pension law of March 27, 1872, now in force and modified by the amendments of March 31, 1882, and April 30, 1884. The present regulation is, in all essential points, the same as for teachers of elementary schools, according to the laws of July 6, 1885, and July 23, 1893. Compare previous paragraphs. The last-named law includes all teachers and officers of gymnasia (classical high schools), Realschulen (modern high schools), normal schools, institutions for deaf-mutes and the blind, as well as technical and industrial and preparatory schools. Universities and other higher seats of learning are excluded. It is worthy of note that teachers of secondary schools maintained by the community and not under State control receive the full benefit of the law.

(b) *Bavaria*.—After a three years' provisional employment, pensions during the first ten years of service amount to seven-tenths, during the second to eight-tenths, and during the third to nine-tenths of the fixed salary. At the end of the seventieth year of age, which equally with the fortieth year of service justifies

year of 'recorded service.' In the case of existing teachers, the State subsidy to the annuity will be augmented 'in the case of a man by threepence and in the case of a woman by twopence, for each complete year of recorded service served before the commencement of this act.'

"A vitally important feature of the scheme is that which provides for the granting of 'breakdown allowances.' Where a teacher satisfies the treasury that he has served not less than ten years, and not less than half the years which have elapsed since he became certificated, and becomes permanently incapable owing to infirmity of mind or body, the treasury may grant an allowance not exceeding—

"(a) If the teacher is a man, twenty pounds for ten complete years of recorded service, with the addition of one pound for each complete additional year of recorded service.

"(b) If the teacher is a woman, fifteen pounds for ten complete years of recorded service, with the addition of thirteen shillings and four pence for each complete additional year of recorded service; and

"(c) In any case, the total annual sum which the teacher might obtain from an annuity or superannuation allowance under this act, by continuing to serve until the age of 65 years.

"The value of the act will largely depend upon the manner in which this 'breakdown' scheme is administered.

"Service under the act is obligatory upon future teachers. Existing teachers are to have the option of a year from the commencement of the act to say whether they will or will not join the fund. Retirement, unless an extension of service be especially granted by the educational department, will take place at the age of 65 for both men and women. The act comes into operation on 1st April next, and applies to Scotland. If a Scotch teacher joins the fund, then his school board may not grant him a pension allowance as under section 61 of the Scotch act of 1872. Pensions and allowances will be paid quarterly. No grant of any allowance will be made to any teacher who at the commencement of this act is in receipt of a pension out of moneys provided by Parliament for the service of education." (Extract from the "Schoolmaster," London.)

the highest pension claim, the full salary is received. Since the year 1894 assistants come under the pension regulations for nonactive officers, such as supervisors, clerks, etc.

(c) *Württemberg*.—At the beginning of the tenth year of service a pension amounts to 40 per cent of the salary, inclusive of age gratuities, but exclusive of allowances for residence. Until the fortieth year of service a pension increases annually by  $1\frac{1}{2}$  per cent as high as  $92\frac{1}{2}$  per cent in cases where the salary is not higher than \$600. The rate of increase is  $1\frac{1}{2}$  per cent as high as 85 per cent with salaries over \$600. No pension can exceed \$1,500. A teacher who becomes incapacitated at the end of his ninth year of service may claim a life pension from the State treasury. If disabled before that time he is entitled to a relief allowance, which is paid only once. The State can order the pensioning of a teacher without his application or consent, if he has attained his sixty-fifth year of age and is hindered by age in the exercise of his duties, or has become disabled through physical infirmity or mental debility, or when sickness incapacitates him for longer than a year. On the other hand, no teacher can claim honorable discharge for life. The pension and widow fund claims 25 per cent of the first year's salary and 2 per cent initiation fee at the first permanent appointment, and 25 per cent of the allowance, whenever a salary is increased, together with 2 per cent of the salary received, as regular contribution.

(d) *Saxony*.—In consequence of the law of May 26, 1868, a general pension fund, to which teachers and the State contribute, has been established. The law of April 9, 1872, provides for pensions at the close of the tenth year of service. After forty-five years of service the highest pension of 80 per cent of the salary last received is realized. The law of March 25, 1892, somewhat improved conditions. The first pension, it is true, was, in consequence, reduced from 83 to 80 per cent, but the highest pension (80 per cent) is now received after forty years of service. The term of service is reckoned from the close of the twenty-fifth year of age, without regard to the fact whether the position held at that time of life was a permanent one or only that of a substitute. After forty years of service, or when 65 years old, a teacher may apply for honorable discharge, which he may also receive without his application or consent. Teachers' contributions toward pension funds were discontinued in 1899.

(e) *Baden*.—At the close of ten years of service a pension amounts to 30 per cent of the income, and increases each year by  $1\frac{1}{2}$  per cent until the maximum of 75 per cent is realized at the end of forty years of service. As is the case with all other officers, honorable discharge may be given at the close of the sixty-fifth year of age, or sooner in case of disability. A teacher can not claim a pension before he has completed his tenth year of service.

(f) *Hessia*.—Pensions may be received at the close of the fifth year of service; they then amount to 40 per cent of the salary. From the sixth to the tenth year they increase annually by 2 per cent; from the eleventh to the thirtieth year by  $1\frac{1}{2}$  per cent, and from the thirty-first to the fortieth year by 1 per cent.

(g) *Mecklenburg*.—There is no definite pension law in either Mecklenburg. In Schwerin, however, in accordance with fixed principles of administration, teachers of public schools, like all officers of the State, may claim a pension after twenty years of service, when it amounts to 50 per cent of the salary, increasing by 1 to  $1\frac{1}{2}$  per cent, until with the fiftieth year of service 90 per cent of the salary is received.

(h) *The smaller States of Germany*.—We can not give the details respecting the smaller States. The following table (p. 177) taken, from the statistical yearbook of secondary schools in Germany for 1897-98 (Leipzig, B. Teubner), states clearly the conditions of pensions for teachers in secondary schools throughout Germany.

*Pensions paid teachers in secondary schools.*

States.	Minimum.		Amount of pension in per cent of the salary after—			Maximum.		Annual dues.
	Begins after years.	Per cent of salary.	Ten years.	Twenty-five years.	Forty years.	Reached after years.	Per cent of salary.	
Prussia and Alsace-Lorraine	10	25	25	50	75	40	75	None.

## 6. PENSIONS FOR TEACHERS IN SECONDARY SCHOOLS OF OTHER COUNTRIES.

(*a*) *Austria*.—A pension may be claimed after eight years of service. With teachers three years are reckoned as four; consequently they receive the full salary as a pension after thirty years of service instead of forty, as is the case with other State officers. At the age of 65 teachers of secondary schools may retire on a pension amounting to the salary last received and additional personal allowances; after the seventieth year of age their honorable discharge is compulsory by law.

(*b*) *Hungary*.—Teachers of secondary educational State institutions may claim a pension of 40 per cent of their salary after ten years of service. From that time on the pension increases by 3 per cent annually, so that after thirty years of service the full salary is received, but without residence indemnification. Every teacher, however, is obliged to make one payment of a third of the excess of his salary over \$120, as well as one-third of the amount of increase for every advance in salary. Since 1894 teachers of institutions not under State control are entitled to the same pensions.

(*c*) *Switzerland*.—The conditions governing pensions in the different cantons are so manifold that it is impossible to state them briefly. It may be well to mention, though, that in some cantons—Lucerne, for instance—pensions are not paid to teachers at all. Even in the advanced cantons the conditions are not favorable, and the people of the Swiss Republic are generally slow in acknowledging pension claims on the part of civil officers.

(*d*) *Denmark*.—Here each teacher's pension claim is decided by the minister of education, in accordance with the general pension law for officers. One-tenth of the salary may be received as a pension after two years of service. The maximum of two-thirds is obtained at the seventieth year of age.

(*e*) *Norway*.—Pensions for teachers are not regulated by law, but are specially granted in each case by the Storting or Parliament.

(*f*) *Sweden*.—A teacher receives a pension after he is 70 years of age and has

served thirty years, or when he is 65 years old and has served forty years and a physician confirms the necessity of his being pensioned on account of ill health. For teachers of upper grades the pension amounts to \$900; for assistants and teachers of lower grades, as well as preparatory grades, \$800. If a regular teacher becomes disabled before his sixty-fifth year of age, he is required to pay for a substitute out of the salary, which he continues to draw, until he is old enough to receive his pension.

(g) *The Netherlands*.—Teachers of advanced burgher schools are entitled to a pension after ten years of service. The amount drawn increases annually by one-fortieth of the regular salary, until the highest amount of two-thirds is received. Teachers of secondary state schools must, within five years of their appointment, pay a full year's salary into the pension treasury. Teachers of communal schools, though receiving the same amount of pension, are exempted from this obligation. The pension law that applies to civil officers applies also to teachers of gymnasia, which, in the Netherlands, are communal institutions. For every year of service a pension amounts to one-sixtieth of the average income of the last sixty months of service.

(h) *Belgium*.—A pension for teachers of secondary schools is reckoned from the average income of the last five years of service; for every year additional one fifty-fifth of this amount is received. A pension never amounts to more than two-thirds of the income, or more than \$1,000. Upon application, at the age of 55, and after thirty years of service, a teacher may retire and a pension is granted him. Teachers who become disabled before completing their tenth year of service are provided for as in Prussia.

(i) *France*.—Teachers of lycées are entitled to honorable discharge at the close of thirty years of service, but only after they have reached 60 years of age. The pension amounts to two-thirds of the average salary during the last five years of their service. With the first payment of salary, and with every increase, one-twelfth is deducted for the benefit of the pension fund. Besides 10 per cent of the salary is retained and turned into this fund during the whole time of service.

(j) *Spain*.—Regular teachers of secondary schools receive two-fifths of their highest salary for two years after twenty, three-fifths after twenty-five, and four-fifths after thirty-five years of service.

(k) *Portugal*.—Disability after ten years entitles a teacher to a pension of one-third, after twenty years to one of two-thirds of the salary last received. After twenty-five years of service honorable discharge with full salary can be claimed. When a teacher stays in office beyond twenty-five years his salary is increased by one-third; after a further term of service of ten years his pension amounts to the increased salary.

(l) *Italy*.—Teachers of secondary schools may retire from service for a period of months or years on account of ill health and still draw from one-half to three-fourths of their salary, according to the number of years they have been in service.

(m) *Greece*.—Teachers are entitled to two-fifths of their salaries after nineteen years and seven months of service. The pension increases annually by one-fiftieth. Seven and one-half per cent of the monthly salary of teachers is deducted for pensions.

(n) *Russia*.—The pensions for teachers of secondary schools are not uniform. In most parts of the Empire a principal draws \$400, an inspector \$350, teachers \$300, and special teachers of German and French \$275 pension after twenty-five years of service. In St. Petersburg, Moscow, Riga, Reval, Warsaw, Kiev, Kharkov, and in Caucasus pensions are higher. In the first four cities a principal draws \$600, an inspector \$450, and a teacher \$375. Whoever is retained in service after twenty-five years draws a pension and a salary. The pension increases with every five years by one-fifth.

(o) *England.*—Pensions for teachers of secondary schools are almost unknown as far as the authorities are concerned, owing to the fact that nearly all secondary schools are private. Every teacher provides for himself through beneficial societies and life insurance companies. At a few distinguished public schools, Eton, for instance, pensions are paid.

---

#### IV. MANUAL TRAINING IN GERMANY.

It is interesting to note that the Germans are not as enthusiastically in favor of introducing manual training into the elementary schools as is commonly believed in this country, and that the extent to which it is practiced in the United States is much greater than in Germany. The attitude of the German teachers to the general introduction of this branch of education has been unfavorable. The same may be said with reference to the kindergarten, child study, and the study of domestic science for girls. But while manual training has little hope to become an integral part of public-school education for children of school age (6-14), it, as well as industrial and trade education, is taken up as a legitimate branch after school age—that is to say, the so-called continuation or supplementary schools take up manual training. The executive officers of the German National Teachers' Union have submitted the question for discussion in the various provincial teachers' meetings. The question is formulated as follows:

What position shall we take with reference to the introduction of manual training for boys and domestic economy for girls into the course of study of the public elementary school?

In order to provide the members with suitable material, the executive officers have published a symposium of resolutions passed by various bodies of teachers during recent years, and accompanied this symposium by a bibliography of the German literature on the subject. The publication is here reproduced in English:

##### I. CONCERNING THE POSITION, ACTIVITY, AND RESOLUTIONS OF THE GERMAN SOCIETY FOR THE ADVANCEMENT OF MANUAL TRAINING.

The proceedings of the congresses held under the auspices of this society are published annually by Dr. Götze, in Leipsic. The first congress was held in Munich, in 1888. The subjects discussed were: Courses of study and methods of manual training (F. Groppler). The movement in favor of manual training in foreign countries (v. Schenckendorff). Manual training in the service of general education (Dr. Götze). Manual training as a preparation for industrial education and industrial art (Dr. Grunow). Manual training viewed from the standpoint of political economy (v. Schenckendorff).

The second congress was held in Hamburg, in 1889. The following questions enlisted the attention of the members: What interest have the German teachers in promoting manual training? (R. Rissmann.)

What interest have wageworkers in promoting manual training among the young? (Dr. Brinkmann.)

The third congress, held in Strasburg, in 1890, discussed the following points: Essence and aim of manual training for boys (Dr. Götze). Is manual training to be made a separate branch of study in schools? (Fr. Groppler.)

The fourth meeting, held in Eisenach, in 1891, occupied itself with a statement of how manual training should be arranged for boys of 7 to 10 years (Hertel and Kalb).

The fifth congress was held in Frankfort on the Main, in 1892. The subjects discussed were: Shall manual training serve general education or special school instruction? (Dr. Götze.) Who shall conduct manual training? (Dr. Rohmeder.) The difference between the methods of manual training in Germany and France (P. Neumann). Amos Comenius and his relation to manual training (Fr. Groppler).

The sixth congress was held in Dantsic, in 1894. Subjects: Should manual training be introduced into the normal schools, and what are the experiences made in this respect in foreign countries? (Dr. Götze.) German manual training and its importance for popular education (Gothein and Schmedding). Manual training for boys adapted to rural conditions (G. Kalb).

The next and last congress was held in Kiel, in 1896. The subjects discussed were: The methods of manual training adopted by the Society for Manual Training (Dr. Götze). The revival of home industry in Sleswic-Holstein by means of manual training in school (Dr. Matthäi). The introduction of manual training into normal and elementary schools (Rümelin and Polack).

Since 1888, the German Society for Manual Training has published a monthly "Blätter für Knabenhandarbeit," in which the various theories and methods of manual training are discussed. This periodical is published in Leipsic.

## II. RESOLUTIONS OF TEACHERS' ASSOCIATIONS CONCERNING MANUAL TRAINING.

(a) The National German Teachers' Union in its meeting at Cassel, in 1882, passed the following resolutions after a thorough discussion of the question by Mr. Töppler, of Breslau:

(1) The meeting acknowledges the good and benevolent intentions which aim at the establishment of working schools for the purpose of training youth to become practical and active men, and thus to save them from falling into vicious, immoral habits.

(2) However, though recognizing the good intentions of these steps, we must emphasize (a) that the introduction of the workshop into our schools has not the same importance which it has in northern countries (Denmark, Sweden, and Finland) because the social and industrial conditions of our country are different. (b) A normal course of six weeks in manual training for teachers, or even a longer

term, will be entirely inadequate, and to employ artisans for this special branch is inadvisable for pedagogical reasons. (c) Our schools are institutions for the intellectual development of children (Lernschulen), workshops for intellectual work, and can not be changed if they are to come up to the demands of the time. They can not spare the time for new branches that will radically change the aspect of our schools. Moreover, the principle of harmonious education is fully taken care of in the course of study as it stands, since the training of the hand is attended to in various ways. (d) To burden the school with a greater number of hours of tuition per week, and to keep the children longer from home than at present, are matters for serious consideration.

(3) For these reasons a combination of workshop and school can not be recommended.

(4) For the promotion of German industry and skill in trades it is advisable to increase the existing technical, industrial, and trade schools and other professional institutions.

(5) To introduce the workshop into the public school would necessitate very considerable outlay, but it seems more advisable to provide the school with larger appropriations before the establishment of workshops is considered.

(b) The twenty-eighth meeting of the General German Teachers' Association, which was held at Augsburg in 1888, listened to two papers on the subject of manual training, which were exhaustively discussed. The following resolution was then passed:

"The meeting recognizes the educational importance of manual training, but does not consider the subject sufficiently matured to decide in favor of its introduction into the elementary and normal schools, and therefore postpones the decision to a subsequent annual meeting."

(c) The eighth meeting of the National German Teachers' Union, held in Berlin, was notable for its departmental meeting devoted to the question of manual training. Mr. Groppler read a paper which discussed the following theses: (1) Among the duties modern education has to perform, the development of a creative and formative activity by means of methodical training of hand and eye and the awakening of practical talents in the child are among the most prominent and imperative. (2) This meeting looks upon manual training which follows educational principles as a suitable means to reach the purpose set forth under (1). It thinks that manual training is a necessary addition to the customary educational methods. Hence, all steps taken to promote the spread of manual training among the young deserve the friendly and active cooperation of teachers. (3) The way which the German Society for Manual Training has adopted to promote manual training—i. e., to develop this branch by means of private, communal, and society support—is considered the best, partly because

it is in accord with the spirit of the time, and partly because it offers opportunity to settle the question whether a general introduction of manual training is wanted.

(*d*) The thirtieth annual meeting of the General German Teachers' Association, held in Leipsic in 1893, adopted the following theses: (1) Manual training promotes school education by training the pupil in diligence, economy, cleanliness, and order. (2) It deepens the influence of the school, because it trains in the same manner, though in a different way, in which writing and drawing train hand and eye, or in which nature-study trains the sense of observation, or arithmetic and geometry awaken concepts of number and space, or gymnastics develop bodily dexterity and force of will. (3) Manual training supplements school instruction, because it places empirical experience side by side with theoretical knowledge, and hence it materially aids the growth of practical intelligence. (4) It is able to serve school instruction directly, because it appeals to sense perception and represents empirically the ideas gained in study; but chiefly because it enables the pupil to make the means of exemplification and desirable simple apparatus with his own hands.

(*e*) The Rhenish Provincial Teachers' Union adopted the following resolution in 1889: "We have with much interest taken cognizance of the movement in favor of manual training, and declare our willingness to aid the inner pedagogical development of this new branch of education, and to bring to clearer comprehension the principles underlying it."

(*f*) The Pomeranian Teachers' Association accepted the following theses in 1888: (1) The movement in favor of manual training for boys is based on sound educational principles; hence its introduction into educational institutions, such as reform schools and separate work schools, deserves commendation and support. (2) Its introduction into the public elementary schools, however, is to be rejected for practical as well as general educational reasons.

(*g*) The Fourteenth Annual Westphalian Teachers' Meeting in 1890 decided: That manual training exercises a beneficial influence upon the education of boys, by aiding their physical development, quickening their intellectual life through minute observation and opportunities for practical experiences, by strengthening their will power, promoting creative activity, and forming the sense of order and beauty.

(*h*) The teachers of Sleswie-Holstein in their annual meeting of 1889 resolved: "We recognize the aim of the elementary school to be, to educate the young to be useful citizens of the State, but think it best to leave the question of introducing manual training to each individual teacher, who may decide it according to local circumstances."

(*i*) A normal school conference at Delitzsch, in 1888, adopted the

following declaration of principles: "The conference acknowledges that manual training, conducted according to educational maxims, seems well adapted to serve important educational and social purposes. The profession of teachers should therefore take occasion to aid its development in system and method. It is recommended to make a practical trial with its introduction in as many cities and villages as is possible without curtailing the intellectual work of the school."

(j) The teachers in Gumbinnen and other school districts of eastern Prussia discussed the subject, and concluded that manual training for boys had not as yet been sufficiently developed to be made an integral part of the course of the public elementary school. That province is almost entirely devoted to agriculture.

(k) The Teachers' Association of Berlin adopted the following resolution in 1886: "This association has taken cognizance of the aspirations of the Society for Promotion of Manual Training in Berlin. It recommends its members to aid the purposes of the society, so that, through active participation of practical teachers, the principles of manual training become better understood and acknowledged in practice."

(l) The Section for Manual Training of the Berlin Teachers' Association repeatedly called attention to the subject of manual training, and resolved, as late as November, 1897, as follows: "(1) Although we consider well-meant criticism of the arguments in favor of manual training justified at all times and, indeed, desirable in its own interest, yet we greatly regret that recent publications on the subject, especially in the Frankfort Schulzeitung, lack thorough comprehension of the arguments advanced in favor of manual training, and betray want of knowledge of subject and method as well as practical experience. (2) We denounce any disparagement of the advocates of manual training, and repel the attacks made upon honest friends of this branch of study when they are stigmatized as advocating a 'sport' or 'swindle.' We particularly object to the imputation that participation on the part of the teacher in manual training is a danger to the profession and a lowering of his social standing. (3) This section will continue to test the literature and methods of manual training and adheres to its conviction that this branch of study contains elements of culture which no other branch has; that it trains hand and eye, develops the sense for forms of beauty, influences the growth of will power, and aids in the acquisition of new ideas by means of intuition. (4) This section has not declared itself in favor of a general introduction of shopwork into the elementary school, because the latter has still other more pressing needs which claim all the available means for school purposes in state and communities, before manual training can be made an integral part of the course of study."

(m) The Teachers' Association of Memelgau occupied several meet-

ings recently with a discussion of the question and came to the following result: (1) It can not be denied that the movement in favor of manual training for boys and domestic work for girls is justified, first, because the training in hand labor is part and parcel of a harmonious development of the human being; second, because it is well adapted to develop the self-activity inborn in man; third, because it is an admirable means of education of the intellect; fourth, because it aids boys in preparing for future occupations in trade and industry and the girls in domestic work. (2) Physical occupation of the children and proper training for it is a matter that concerns the parents—first, because no child can remain unoccupied at home; second, because opportunities for occupation at home are more numerous than in the best course of school instruction; third, because the useful work at home will create greater interest in the child than the apparently useless work in school; fourth, because manual work at home gives the child a variety of valuable experiences. If the home can not undertake the task of training in manual occupations, special manual-training schools, not connected with the regular schools, may be of assistance. For educational boarding institutions which undertake the entire education of the pupils, obligatory training in manual work seems highly commendable. (3) To insert training in manual work and domestic duties into the curriculum of the common school is unnecessary, because that school is amply provided with educational methods and means. (4) It would seem questionable to introduce the new branches, first, because the common school is to be used uniformly by all the people, and would assume the character of a professional school if it undertook to give manual and domestic training; second, because hygienic considerations advise against it; third, because the common school is already overburdened with a large number of subjects, and each increase to that number would lead to broadening and flattening instead of deepening the education the school can give; fourth, since the school can not spare any of the time allotted to the legitimate branches, the introduction of manual training for boys and domestic science for girls would necessitate an increase in the number of hours per day now devoted to school work; fifth, because the said introduction would require a similar introduction in the normal schools—this would lead to a perversion of their object; sixth, because the new branches would require a large increase in the annual expenditures that would be out of proportion to the gain derived from these branches; seventh, the methods of instruction in the new branches are not yet definitely formed, and the common school should not be made a testing station for experiments. (5) The school will ever be ready to absorb matters pertaining to the new branches so far as they fit into the work it is performing. (6) The teachers of the common school are ready to assist in the development of the said branches outside of the pale of school.

## III. LEGISLATIVE EXPRESSIONS.

The only German State in which there is a provision for manual training in the school law (1892) is the Duchy of Baden. Article 3 of this law says, in an enumeration of the branches of study:

Boys may receive manual training, girls instruction in domestic science, provided their parents or guardians signify in writing that they be so instructed.

The ducal government had offered the following argument in the legislature in support of the passage just quoted:

Manual training for boys does not have the aim to prepare them for occupations immediately applicable in practical life, as instruction in domestic work for girls has, for manual training is not intended to give the boys opportunity for entering into competition with industrial labor. Manual training, such as is here provided for, is intended to meet a demand which has been raised from a pedagogical standpoint only, namely, that the boys should receive, aside from mental training and abstract, intellectual activity, a training of the senses, of the power of observation and representation, which is so often neglected. Also for the reason that the boy's physical strength be exercised, and that creative activity be awakened, which in its turn awakens practical intellect and love for labor, which are eminently essential in nearly all occupations and professions in life.

The legislative authority in Prussia which deals with questions of school management, the lower house of the Diet, adopted, March 30, 1893, a resolution which read as follows:

In consideration of the fact that the movement in favor of manual training in the schools has in late years spread over all civilized countries, and in consideration of the further fact that the general introduction of this branch has economic as well as educational importance, the Royal Government is requested to bestow more attention upon, and aid financially in a more extensive manner than hitherto, any local attempt at introducing manual training, and to induce the normal schools to adopt it as an optional branch into their course.

In 1895 the same body resolved:

The house of deputies acknowledges the care hitherto bestowed by the educational authorities upon physical education and manual training of the young, and expresses the expectation, (1) that they will continue to work in promoting gymnastics and juvenile open air games; (2) that manual training for boys and domestic science for girls in places where local needs have led to the introduction of these branches, may be aided liberally from the State appropriation for schools, and especially in cases where the communities find the maintenance of the said branches too burdensome.

## IV. BIBLIOGRAPHY OF GERMAN BOOKS ON MANUAL TRAINING FOR BOYS.

## A. Books and other publications in Germany which contain general discussions of the object of manual training.

## V. CONTINUATION (OR SUPPLEMENTARY) AND TRADE SCHOOLS IN GERMANY.

Continuation schools (Fortbildungsschulen) in Germany are mostly day schools; some are evening, some secular Sunday schools. Their object is to supplement the elementary education acquired in the common schools, and to bridge over the time from the fourteenth to the seventeenth year of age of boys who do not attend a high school or a secondary industrial school, the law prohibiting factory or shop labor of children under 17 years. These continuation, or, as they are sometimes termed in English, supplementary schools, are essentially elementary schools, for as a rule they teach no languages, except the mother tongue, and no higher mathematics, hence can not be classed among secondary institutions, as that term is understood in this country.

There is very little if any uniformity in the courses of study of these schools. They adapt themselves readily to local needs, some being designed to serve the needs of agricultural, others of industrial popu-

lations. Nor are the educational authorities anxious to subject these schools to a uniformity such as seems necessary for common schools, because if anywhere it is in these supplementary agencies of the people's education that the individuality of the pupils should be fostered and attempts be made to meet local needs.

Oskar Pasche's *Handbuch des deutschen Fortbildungsschulwesens* (three parts, Wittenberg) offers, for the first time, comprehensive statistics of these schools, from which the following tables are gleaned. The following list shows the number of pupils in continuation schools to every 1,000 inhabitants in German States. The only two States from which no statistics are available are Bavaria and Alsace-Lorraine.

TABLE 1.—*Number of pupils in continuation schools to every 1,000 inhabitants.*

Württemberg.....	50	City of Bremen.....	10 $\frac{2}{3}$
Baden.....	35 $\frac{1}{2}$	Schwarzburg-Rudolstadt.....	8 $\frac{1}{3}$
Hesse-Darmstadt.....	34 $\frac{1}{3}$	City of Hamburg.....	7 $\frac{1}{3}$
Saxony.....	28 $\frac{1}{3}$	Brunswick.....	7
Waldeck.....	22 $\frac{1}{2}$	Mecklenburg-Schwerin.....	7
Coburg-Gotha.....	22 $\frac{1}{3}$	Prussia.....	6 $\frac{2}{3}$
Saxe-Weimar.....	22	Reuss (senior line).....	6 $\frac{1}{3}$
Saxe-Meiningen.....	21	Saxe-Altenburg.....	6
Schwarzburg-Sondershausen.....	20	Lippe.....	5 $\frac{1}{3}$
City of Lubeck.....	18	Anhalt.....	5 $\frac{1}{4}$
Mecklenburg-Strelitz.....	14 $\frac{1}{3}$	Oldenburg.....	3 $\frac{1}{4}$
Reuss (junior line).....	12 $\frac{1}{2}$	Schaumburg-Lippe.....	2 $\frac{1}{4}$

The Bavarian official returns state that in 1892-93 the Kingdom had 304,227 "holiday"—that is, supplementary—school pupils. Besides, there were 232 industrial schools with 1,048 courses and 31,321 pupils, and 477 agricultural schools with 516 courses and 9,022 pupils. This would give Bavaria the first rank in the foregoing list, with 57 pupils in supplementary schools to every 1,000 inhabitants. But this is misleading, since the Bavarian elementary course of study reaches only to the thirteenth year of age, hence the many evening and "holiday" schools, which are virtually common schools. The city of Berlin, if placed in the foregoing list, would occupy a high rank, having 24 $\frac{1}{2}$  pupils to every 1,000 inhabitants in such schools.

Several communities in German minor States have decreed compulsory attendance for pupils of continuation schools, which is, however, enforced only where children are employed in factory and shop labor.

In Saxony the school system has been greatly benefited by the establishment of a large number of trade schools and schools for foremen (*Werkmeisterschulen*). The city of Chemnitz, in its technical institutions for foremen, has given the example for other cities. Chemnitz has a dyers', a cotton-printers', a bleachers', and a soap-boilers' school, and other technical schools. The Kingdom of Saxony had in 1894, aside from the technical schools in Chemnitz, 64 trade schools, of which 30 were found in the large cities. The number of these schools is steadily increasing. Previous to 1874 there were 7; in 1884 there were 21; in 1894 there were 64. These trade schools

had 227 teachers, who taught 63 trades to 4,040 pupils, 3,383 of whom were natives of Saxony, 489 natives of other German States, 104 came from Austria, and 64 from other foreign countries. Of the 1,766 hours of instruction in 1894 there were devoted to practical exercises 720, and 565 to drawing and designing. The annual expenditure of 55 of these schools (the others not reporting) was about \$60,000. This sum was secured by (a) tuition fees, \$27,000; (b) state subsidies, \$13,000; (c) contributions from associations, corporations, and trade-unions, \$6,000; (d) communal appropriations about \$5,000, and the remainder was secured through the sale of the products of the pupils' labor.

The school law of the Grand Duchy of Hessa of 1874 contains the following provisions: "Every community is obliged to establish at least one continuation school. All continuation schools shall be common schools in the sense that they are free from tuition fees and open to all without regard to the occupation or previous preparation of the pupil. Several small communities may combine to maintain such a school in common, if centrally located, to facilitate the better grading of the pupils." All Hessian continuation schools are subject to the supervision of the State authorities. Their plan of organization and management must be submitted to the State school inspector of the district. According to legislative enactment the State supports these schools. In 1894 they cost the State \$42,150. In 1895-96 the State had 900 of such schools, with 24,623 pupils. The per capita was insignificant, to wit, \$1.71. Hessa had also 10 agricultural schools, 4 schools of pomology, a large number of Sunday drawing schools, industrial and advanced trade schools, all of which cost in 1894 the sum of \$87,485, which sum was defrayed by the State, private corporations, and communal governments.

The State authorities of the Kingdom of Prussia do not seem to bestow so much attention upon continuation schools as those of the minor German States. But the city government of Berlin exercises a great deal of parental care over the boys. The number of pupils in continuation schools in Berlin has increased from 9,837 in 1887 to 40,969 in 1896 (32,489 of whom are boys). But since there are about 50,000 boys of the age between 14 and 18 in the city not attending secondary schools, it would seem that nearly 18,000 do not attend continuation schools. Efforts are made to induce the city council to decree compulsory attendance, but thus far the authorities have not yielded to the pressure brought upon them, probably owing to the steady increase in the attendance upon such schools.

TABLE 3.—Statistics of continuation schools in Germany: B. The minor States of the Empire.

a The number of these schools is contained in the number of schools for boys.

There are no means of determining the actual cost of maintaining industrial and trade schools in the whole Empire, partly because the sources of their income are so numerous—State, provincial, and communal governments, associations, trade-unions, and private benevolence all contributing to their support; partly because the trade schools are not under uniform supervision. Some are under the jurisdiction of the department of education, others under that of the department of public works; again, others are purely communal, and still others are private institutions. Only so far as the State appropriations are concerned can a definite statement as to expenditures be made. Professor Lüders in his memorial on the subject of industrial education in Prussia (1898) offers a few interesting items of information, which are here inserted.

While in 1892 the State as such paid for industrial and trade schools (exclusive of polytechnical and art schools) \$452,940, in 1897 the sum thus expended was \$586,166. In 1892 the communal governments paid for the same purpose \$116,126; in 1897 the sum thus expended had increased to \$177,262.

The following table shows the State's participation in the support of industrial and trade schools for six years:

TABLE 4.—*Prussian State appropriations for industrial education.*

Kinds of schools.	1891-92.	1892-93.	1893-94.	1894-95.	1895-96.	1896-97.
1. Trade schools (building trades, weavers', metal workers', designers' schools).....	\$213,484	\$232,164	\$241,766	\$278,807	\$300,431	\$340,050
2. Lower continuation schools.....	104,720	104,720	104,720	104,720	130,900	130,900
3. Same kind of schools in the provinces of West and East Prussia.....	93,300	93,300	93,300	93,300	71,400	71,400
4. Industrial art schools.....	8,830	8,330	8,330	8,330	8,330	10,710
5. Industrial education offered in connection with other institutions.....	33,106	33,106	33,106	33,106	33,106	33,106
Total.....	452,940	471,610	481,222	518,363	544,167	586,166

The same writer also gives a table which shows the attendance in Prussian schools for the builders' trades. These schools are very popular, and many students are denied admittance every year.

The following table mentions the cities and provinces, and states not only the actual number of students, but also the number of applicants who could not be accommodated for want of room.

TABLE 5.—Number of students in Prussian schools for the building trades.

Cities and provinces.	Students in attendance.					Students denied admission for want of room.

The foregoing table shows that there is need for more schools of this kind. But a more pressing need is found in the lack of properly trained teachers, since merely skilled artisans will not do. The author of the aforementioned memorial recommends increasing the salaries and admitting the teachers to the privilege of the pension law, as well as making these trade schools purely State schools, so as to remove them from the influence of communal politics.

In Dortmund, province of Westphalia, the city authorities established in 1892-93 a secondary technical school in connection with the existing trade school for foremen. The plan for this school was furnished by the Association of German Engineers. This school was opened with 40 students, and has prospered so well that the city authorities have concluded to build a schoolhouse with twelve classrooms and many shops and laboratories, the cost of which will be \$142,500.

In Gleiwitz, province of Silesia, a secondary engineering school was opened in 1896-97, while in Hagen, Westphalia, a regular secondary school has been changed to a school for mechanical engineers. Prussia now has six such schools, all of which are intended for foremen, to wit, Dortmund, Duisburg, Gleiwitz, Magdeburg, Cologne, and Hanover. However, their courses of study and plans of organization are not uniform. Weaving schools are found in Berlin, Crefeld, Sorau, Kottbus, and Mühlhausen (in Thuringia).

Since 1892 the State has employed a number of itinerant teachers in Silesia. These teachers travel from village to village and teach the weavers in their own shops at home. They examine their looms, suggest improvements, and act as agents for the purchase of new and better looms or parts of looms. It was found that since these teachers began their work the weekly earnings of the weavers in Silesia has increased from 10 to 50 per cent. The King of Prussia has given a large sum of money for the purchase of new looms, regulators, and other tools. Great tact would seem an indispensable quality of such

a teacher, and their popularity is probably owing to their prudent selection.

Six weaving schools—that is, those in Aix-la-Chapelle, Berlin, Kottbus, Crefeld, Mülheim, and Sorau—serve to prepare factory owners and superintendents, and hence are called higher weaving schools. According to the courses of study now in force, the weaving schools of Berlin, Crefeld, Einbeck, and Mülheim treat all branches of the weaving trade, while those of Aix-la-Chapelle, Kottbus, Falkenburg, Forst, Nowawes, Rummelsburg, Sommerfeld, and Spreenberg pay special attention to wool weaving, that of Sorau to linen and cotton weaving. The author of the memorial claims that each school should direct its attention chiefly to that branch which is represented in factories of the locality in which the school is situated. He recommends the granting of diplomas of graduation and thorough inspection by experts.

In 1891 it was urged that in every city of the Kingdom having 33,000 and more inhabitants, an industrial drawing school be established (a school of design, as we term it). The government granted the required appropriation for three cities besides those which had such schools already: Elberfeld, Barmen, and Charlottenburg (Berlin), but since that time other cities have reached and passed that number of inhabitants, so that in 1897 the number of cities of the kingdom entitled to the same appropriation was 37.

The number of industrial continuation schools has increased from 722 in 1891 to 761 in 1895, and the schools in which attendance is compulsory from 413 to 472, while those in which attendance is optional has decreased from 309 to 289. The commercial schools have increased from 100 in 1891 to 138 in 1895. The schools maintained by guilds (labor unions) have decreased in number, to wit, from 123 to 104.

The continuation schools of West Prussia and Posen occupy an exceptional position, inasmuch as the State government in these two provinces is required to bear the entire burden of the maintenance of such schools. The State government increased the appropriation from \$50,000 in 1886 to \$93,000 in later years. As early as 1886 the two provinces had 157 continuation schools, but since the supreme court of Prussia declared illegal the act of obligatory attendance for such schools, the employers of boys (the shopmasters) kept their apprentices from attending these schools, and in consequence 34 schools were closed in 1891. It was of little avail that in 1891 (June 1) a paragraph was inserted into the new law concerning labor, which contained the prerogative, granted to local governments of communities, of decreeing compulsory attendance. The local authorities failed to execute this right since the law expressly termed it a right, but not a duty. And hence, since 1891, again 43 schools have had to be closed.

In connection with the foregoing it may be of interest to quote United States Consul W. K. Anderson at Hanover, Germany, who

writes to the State Department, under date of December 9, 1898, as follows:

German tradesmen and manufacturers are alive to the importance of increasing the efficiency of their mechanics and artisans and improving the quality of their goods. They are resolved that "made in Germany" shall no longer pass as a term of opprobrium, but be a synonym of excellent materials and good workmanship.

On December 8, 1898, there took place in this city a meeting likely to exercise a very important influence in this direction. It was in the nature of a conference, under governmental sanction and direction, to discuss German trade and manufacturing interests and to devise plans for their extension and improvement. It was held at the instance of the Prussian minister of trade and commerce, and was presided over by the president of the province of Hanover, Count von Stollberg. Representatives of the Government from Berlin, the highest officials of the Hanoverian provincial and municipal administrations, leading manufacturers and business men, delegates from the chamber of commerce, the manual training and industrial or trade schools, and from the workingmen's trades unions, attended and took part in the deliberations.

As a result of the conference it was unanimously resolved—

(1) To establish at once in the city of Hanover advanced lecture courses, in which artisans and apprentices in all trades shall have an opportunity to complete their mechanical education and be instructed by experts how to install and manage a model workshop and work and use machines and tools to the greatest advantage. Instruction will also be given in bookkeeping, the making and rendering of accounts, the making of estimates of the cost of work and materials, how to conduct business correspondence, drawing, and other practical branches.

(2) The oversight and control of the said lecture courses shall be under the direction of a commission composed of representatives from the imperial, provincial, and municipal administrations, the chamber of commerce, the manual and art schools, and from the trades unions.

(3) The first course of lectures will be to cabinetmakers, locksmiths, shoemakers, and tailors. Those to other trades will follow.

(4) A fee for tuition will be exacted from mechanics able to pay, but those unable to pay will be instructed free. Funds for the payment of the tuition of the poor will be provided by the Hanover provincial and municipal governments.

(5) Only mechanics and apprentices will be admitted to the classes whose theoretical and practical knowledge is such as to give promise of success as students. The commission has power in all cases to decide as to qualification of applicants for admission.

(6) Teachers are to be selected by the commission and confirmed by the minister of trade and commerce.

(7) The cost of the establishment and maintenance of the lectures is to be supplied by the general government and that of the province and city of Hanover, together with the trades unions, the chamber of commerce, and others interested therein.

(8) It is further intended that great care shall be used in teaching apprentices how to obtain the most practical advantages from the knowledge acquired by them in the classes. To this end, the creation of workingmen's cooperative societies is to be urged.

(9) A permanent exposition of all power machines and tools used in the small trades is to be established in the Gewerbe-Halle (Industrial Hall) at Hanover. The machines exhibited there are to be worked by competent mechanics, who, on request, will exhibit their uses and management to all inquirers.

In connection with the machine exhibition there will also be established an exposition of sample products, in process of manufacture as well as finished.

(10) In order to enable small manufacturers and tradesmen to purchase their raw materials at wholesale prices and to facilitate the sale of their products, the formation of cooperative stores at designated places is to be encouraged.

I am informed that the establishment of these courses of lectures to mechanics is the initial move in a general plan to be inaugurated in all the main labor centers of Germany, dependent upon the success of this experiment.

The expositions of tools and machinery proposed to be established in connection with the lecture courses, in my opinion, offer an excellent opportunity to American manufacturers to make exhibits.

In the boot and shoe trade, from the making of the lasts to the finished product, American machines are the favorites. Perhaps the same result might be reached with the other small trades, if masters and workmen in Germany had an ocular demonstration of the superiority of our tools and machines over those they have been using.

In the summer of 1897 a committee appointed by the city council of Manchester, England, visited many monoteknical and polytechnical schools in Germany and reported upon what they had observed. This special report contains, among other highly important features of the German school system, some remarks about trade schools which may be quoted in this connection:

At Crefeld, in Rhenish Prussia, the textile school enjoys a world-wide repute for the splendor of its equipment and the effectiveness of its influence in promoting the special industry for which Crefeld is famous. The Prussian Government has built and equipped a large three-story building in the neighborhood of the present textile school and museum, to be used as a dyeing and finishing school. It is, indeed, very clearly understood and accepted that the designing, coloring, and finishing of the goods are factors of supreme importance if they are to command the market. Hence the efforts made to give the best artistic and technical training to the students who will be the manufacturers of the future.

This school contains extensive chemical laboratories for instruction in qualitative and quantitative analysis, physical laboratories, rooms for designing, lecture and testing rooms, chemical museum, reading room, and library. In the library are found technical books of all nations bearing upon textiles, all of which are introductory to the special work of the school, namely, the dyeing and finishing of textile goods, particularly those of importance to the special industries of Crefeld and the district.

The equipment is on a most liberal scale, and includes, among other appliances, machinery for dyeing yarn and piece goods in bulk, bleaching vats and kiers, washing machines for piece goods, hydroextractors, yarn washers, milling machines, hydraulic presses, steam drying chambers and machines, jiggers, stretching machines, raising machines, silk and velvet finishing and velvet cutting machinery, and printing machinery. These machines and appliances are in constant use, and under skilled guidance the students carry out the work, which is on a commercial scale.

Much attention is given to the examination of coloring matters and to mordanting on all kinds of fibers and cloth; and constant experimenting with a view to new materials and processes is a special feature of the instruction. As an example of the esteem in which the dyeing school is held as an institution competent to undertake highly responsible work and important researches, the visiting committee was informed that the school is intrusted by the Royal Gobelines Factory, in Berlin, with the dyeing of the yarns used in its special productions, which offer many serious difficulties in producing the delicate shades required. Experiments

are undertaken in testing the colors employed, and in dyeing the yarns for exposure to light, adverse atmospheric influences, resistance to acids, alkalies, and soaps; and investigations are made with a view to the production of coloring matters formerly employed in the dyeing of ancient tapestries.

Every effort is made to assist the manufacturers and merchants; and on their behalf the school will undertake investigations as to the dyeing and finishing of materials submitted, which, when completed, are reported to the manufacturer, with information as to the methods used and the chemicals employed on the fabric, together with the cost of production. These investigations are carried on by the students under the direction of the teachers, and are of inestimable value to them as a training in solving real industrial problems. The importance of this help to the merchant is considerable. He often gets patterns from abroad of goods dyed to a particular shade, which, if he can get produced, probably involve considerable business. These patterns are sent to the school for examination and report. On the occasion of the visit of the committee the students of the school were all, for the time being, engaged in dyeing for a manufacturer 100 kilos of yarn to a particular color which the dyer himself could not produce.

It was a matter of very great interest to the committee to see the highly satisfactory way in which all the appliances and the material in course of working throughout the weaving and dyeing school were kept. Especially is this the case in the weaving school, where there is a great variety of weaving machinery of every class and make, continental and foreign, wide and narrow hand and power looms, driven by belt, rope, and by electric motors. Whenever a new loom comes upon the market it is immediately bought and placed in this school, provision being made for the easy replacement of one loom by another. There are looms for all classes of goods, whether weaving simple patterns in all kinds of yarn, or looms weaving elaborate designs in costly materials for damasks, quilts, tapestries, broché velvets, ribbons, cut and embossed velvets, towels, plushes, pearl gauze, silk and half silk goods of every kind, and worsted and woolen goods. The number of looms in the school, each engaged on separate and specific work, exceeds 180, of which two-thirds are power looms.

It is, indeed, the express object of the school to give variety of experience, and everything is directed to make the teaching vital and inspiring to the students. The beneficial results of this, and of the practical character of the studies is seen in the fact that when the silk trade was depressed, owing to a change in fashion, manufacturers were enabled to start new branches of the textile industry, and so have helped Crefeld to maintain its position as an important textile-producing center.

In the weaving school there are 108 regular day students, most of them sons of manufacturers, chiefly native, but with some foreigners. On Sunday the school is attended (for drawing and lectures only) by about 250 weavers and others employed in the mills. The tuition fees for day students, natives of Prussia, are \$30 and \$45 per session; for other Germans, \$45 and \$72.50 per session; for foreigners, \$120 and \$180 per session. The dyeing school has 45 day students.

The museum, which is open free to the public, is of especial interest and value. It contains not only an admirable collection of ancient and mediæval stuffs, but no opportunity is lost of obtaining samples of the best modern productions, and it is visited by many thousands of designers in the course of a year—a striking evidence of the value of an intelligently conceived and well-organized museum under competent direction. Exhibitions of textile fabrics are occasionally held. The last resulted in the establishment of a new industry in the town for making Smyrna rugs.

It is interesting to note with what discrimination and judgment the educational authorities of Prussia pursue their objects. The authorities at Crefeld were

anxious to see the establishment, as a development of their school, of a department for cotton spinning, but the royal authority declined to give effect to the representations made, and expressed their determination to build and equip such a school in the center of the cotton industry at Gladbach (also in Rhenish Prussia).

There are no less than 13 schools in Prussia devoted to textile training, each with its own peculiar conditions. This enables a certain elasticity and variety of method to be established and tried, and the evils of undue educational competition and rivalry, which are found in England, and which go so far to prevent the establishment of really efficient institutions attended by competent students, are obviated. An instance of this differentiation is seen at Aix la Chapelle (also in Rhenish Prussia), whose textile school was also visited by the committee. This school is devoted to the worsted and woolen industries of the district, and is a good instance of what is called a "Fachschule," or special professional school. The feature which specially characterizes and differentiates it from Crefeld and other like schools is that the spinning and weaving school is conducted upon the principles and, with obvious limitations, on a similar scale to that of a woolen factory. A considerable number of regular workmen are employed in the spinning, weaving, and finishing of woolen cloth, and these men instruct and are assisted by the 60 students in attendance upon the studies of the school.

At Crefeld, on the other hand, the students do the work entirely themselves under the direction of two weaving or two dyeing masters, and the committee venture the opinion that the methods pursued at Crefeld are better calculated to promote sound technical training in the industry and the greater efficiency of the student. At Aix la Chapelle yarn is supplied to the school by the manufacturers, who pay the actual cost, the school being responsible for its quality and workmanship. About 60 pieces of cloth, finished for manufacturers, are turned out each week. As many different kinds of machines as possible are used—for instance, there are three different kinds of doubling. The school possesses a very fine museum, of which the distinctive feature is a collection of patterns of all the goods manufactured in Aix la Chapelle since 1801. Its collection of models is also very extensive, and the students have access to all the textile journals of Germany and other countries.

The committee also visited the municipal weaving school of Berlin, which is devoted mainly to the manufacture of materials for which Berlin enjoys a special repute, namely, buttons, gimp, braids, gold and silver threads, lace and plush goods, and machine embroidery, many of which goods were formerly manufactured to a considerable extent in Manchester, England, and the manufacture of which might be again revived. Dyeing also forms part of the school course. The mantle and ladies' clothing trade of Berlin, in which these small wares are largely used, is exceedingly important: of mantles alone it is said that upwards of \$5,000,000 worth are annually exported to England. This school, like others visited by the committee, was exceedingly well equipped, and the goods in course of manufacture in the looms were characterized by great variety of materials and make, and were being most carefully executed.

As showing the thoroughness and the zeal with which the Government supplies the means of technical training in the various industries of the country, it was stated that if any paper—dealing, for example, with some department or detail of the textile industry—is read before any foreign society, and is published or appears in any journal, the communication is immediately translated and circulated throughout the textile schools of Prussia, with directions to have it dealt with as a lecture to the students, and if models, illustrations, or lantern slides are required by way of illustration, they are prepared and sent with the paper. Moreover, in Berlin there exists a department in the bureau of education, not accessible to visitors or inquirers, where models, diagrams, or other means of illustration are prepared

and circulated to the technical schools of the country. The director of the Berlin school superintends the other textile schools of Prussia, and spends three months of each year in visiting them, reporting upon their condition and progress, observing their work, giving information relating to the best points of each, and generally keeping them well abreast of textile improvements and developments. In addition to this, and to insure the advantages to be derived from mutual discussion and serviceable comparison on all points of difficulty and practice, periodical meetings are held of representatives from the textile schools.

The municipal textile school of Berlin is attended by 50 regular day students and 300 evening students, 100 of whom attend on Sundays and in the evenings, and 200 on Sundays only. The evening students include shop assistants and workmen (weavers and dyers). The complete course of study in weaving and dyeing extends over three years, and the weekly hours of study and exercise are 44. Certificates of competence are granted to day students. From the figures given it will be observed that these splendidly equipped schools are intended to accommodate only a small number of day students. These, however, are the men who for the most part will be the "brains" of the industries into which they will shortly enter as foremen, managers, or employers.

Evidence was forthcoming of the value of these schools to the industries concerned, and of the interest taken in them by merchants and manufacturers alike. There is no disposition to question their value, though it is recognized that the cost of their equipment and maintenance, which is mainly provided by the State for the benefit of particular industries or localities, is very great. Not less surprising was it to find the quality of the general education possessed by the students attending these special schools was exceptionally high. Of those in attendance at the Berlin municipal weaving school, 95 per cent possessed the leaving certificate of the highest grade of the "Realschule," which ranks with the best class of our secondary schools, and gives the holder the privilege of only one year's military service, reducing it to one-third. There is no entrance examination for evening students, but the excellent system of instruction in the public schools, continued until 14 years of age, insures educational attainment equal to the standard required before entering upon courses of scientific and technical instruction. Poor students can attend without charge upon application being made. Here, as elsewhere, the manufacturers receive from the school every assistance in problems affecting their industry.

The committee are convinced that the textile schools of Germany, so far as they have observed them, are of singular value in training up a supply of exceedingly well-instructed men, capable, by reason of the methods employed, the examples studied, the variety of the appliances used, and the investigations and experiments made, to take the lead as foremen, managers, and manufacturers in the industries concerned.

---

## VI. THE PREPARATION OF NORMAL SCHOOL TEACHERS IN PRUSSIA.

During recent years the preparation, professional and general, of normal school teachers in Germany has been under discussion. Frequently the complaint is raised, in Prussia particularly, that too many theologians are appointed to the principalship of such schools; and with equal emphasis it is said that not enough university men—that is, graduates of the philosophical faculty—are appointed. Many writers urge that appointing only, or chiefly, normal school gradu-

ates as teachers and principals would have a tendency to lower the standard of these schools. They would rise in usefulness and influence with the appointment of teachers who have acquired a higher education than normal schools can and do give.

The following tabular statement, which is taken from the Pädagogische Blätter (No. 1, 1899), Gotha, is the result of an inquiry instituted by the editor of that journal, and states the facts as they existed on May 1, 1898. The table includes also the royal school inspectors (superintendents). Their professional training has also been under discussion in the press and the House of Deputies (lower house of Parliament).

The sum total of 1,191 (including the 277 school inspectors) does not tally with the statistics published by the State authorities in 1896; for at that time the number of teachers in normal schools for men was 832 and that of teachers in schools for women 97. Together with the number of inspectors (277) the total is 1,206. It is evident that some schools failed to report, but the report shows a large enough number to safely judge from it.

Comparisons are to be made with caution; unless the conditions are the same a comparison with normal schools in this country can not be instituted, the course of study of Prussian normal schools being one of four years, and the legal age for admission of students being 18.

Table showing the professional preparation of normal school teachers in Prussia.

Province.	Rank or position of teacher.	Total number.	Studied theology in university.	Studied philology in university.	Studied science and mathematics.	Normal school graduates.	Normal school and university graduates.

VII. EDUCATION IN THE KINGDOM OF SAXONY.

CONTENTS.—Introduction.—I. Higher education.—II. Military schools.—III. Institutions devoted to secondary education.—IV. Normal schools.—V. Institutions devoted to industrial education: (a) Polyindustrial schools; (b) Monoindustrial or trade schools.—VI. Secondary mining schools.—VII. Elementary industrial schools: (a) Supplementary schools; (b) Drawing schools; (c) Industrial schools for girls.—VIII. Agricultural, horticultural, and dairy schools.—IX. Commercial schools.—X. Elementary or common schools.—XI. Kindergartens.—XII. Other institutions.

INTRODUCTION.

Saxony, one of the 26 States that constitute the German Empire, has a population of 3,783,014 (census of 1895) and an area of 5,787 square miles, or 654 persons to the square mile. Next to Belgium it is the most densely populated country in Europe. This density facilitates the educational efforts of the authorities. Where the population is clustered together in centers, such as cities, towns, and villages, it is easy to provide for schools. But Saxony is chiefly an industrial State,

and hence we find in that State a bewildering number of industrial schools of every kind and description, lower, middle, and higher.

It is interesting to know what agencies combined to make Saxony a perfect beehive of industry. Before and at the time of Martin Luther (1483-1546) the ore mountains (Erz-Gebirge), a long range of mountains separating Saxony from Bohemia, were the seat of an active mining industry; silver, iron, copper, and other ores, as well as coal, were found there. From all parts of the Empire people flocked toward the rich treasures of these mountains.<sup>1</sup> The country's topography is simple: Saxony shelves down toward the north from its southern border, the ore mountains; and the rivers all have a northern direction. Trade and commerce naturally took a northern course.

The silver and other mines in the course of time attracted from all parts of Germany not only a large mining population, but commercial and tradespeople flocked to Saxony also. The population increased enormously. The mines in course of time became exhausted, and a large portion of the population was obliged to resort to other pursuits, it not being so fluctuating as now. Agriculture was out of the question for the majority, hence industrial pursuits, as the other alternative, were resorted to. The rushing mountain streams gave water power for factories, in which household goods and wooden toys were made. The slopes of the mountains, being well provided with various kinds of wood, offered material for a variety of woodworking industries. The woods soon disappeared on the ore mountains, and the people had to resort to other pursuits. Human ingenuity was taxed to find occupation for a large population. The Saxony of to-day has the most varied assortment of industries, textile and otherwise.

The density of population explains in a great measure why the school facilities are so ample. They in turn have led to an ever-increasing differentiation, and improvement in the methods of teaching has gone hand in hand with increasing specialization. At present it may be stated that nowhere else is there such a variety of schools as in Saxony.

The latest governmental report of that State on the educational system, comprising the statistics of 1894 (published in 1897), begins with higher education. Saxony has one university, at Leipsic; one polytechnic institute, at Dresden; one veterinary school, in Dresden; one mining academy, in Freiberg; one forestry academy, in Tharandt;

---

<sup>1</sup> Luther's father was a miner, and in his time the coins struck from the silver found in the mines of the Joachim's Valley (Joachim's Thal) were called Joachims-thaler. For brevity's sake the adjective Joachim was dropped, and the coins were called "thaler." This word was used universally in Germany, and also in Holland, where it was changed into "daler." This term was carried into England, where it soon changed its spelling and became "dollar." Subsequently it was adopted as the name of the standard monetary measure in the United States. Thus we see that the common everyday word dollar has its origin in Saxony.

one academy of fine arts, in Dresden; one conservatory of music, in Leipsic, and other institutions that may be classed among the higher seats of learning.

### I. HIGHER EDUCATION.

*The University of Leipsic.*—The university was founded in 1409. In 1896 it had 196 professors, who gave, during the scholastic year of 1895-96, 859 series of lectures, consisting of from two to five lectures each. The number of students was 3,112, ranging in age between 20 and 26. Among the total number of students there were 127 not matriculated. These are called "hearers," and are not included in the detailed statistics. Seventy students were Americans. The university has a great number of adjuncts, such as libraries, museums, and seminaries, clinical, surgical, and pathological institutes, an observatory, physical and chemical laboratories, linguistic and philosophical, economic, agricultural, and veterinary seminaries, trial or experimental stations, and is one of the most interesting centers of intellectual life in Germany. While in 1889 the value of the buildings belonging to the university amounted to about \$600,000, it was \$1,209,000 in 1894, an increase of more than 100 per cent. The current expenditures rose from \$342,802 in 1889 to \$422,181 in 1894.

*The Polytechnic Institute at Dresden.*—This institution was founded in 1828, and is now one of the largest of its kind in Germany. In 1894 it had 47 professors, who gave, during the scholastic year of 1893-94, 140 series of lectures, ranging between five and eight lectures each. The number of students was 645, of whom 380 were not matriculated; 9 students were Americans. Like the university, the polytechnic has many institutes, laboratories, and experimental stations. The current expenditures rose from \$71,594 in 1889 to \$91,863 in 1894.

*The Veterinary School at Dresden* was established in 1780. In 1894 it had 12 professors and 125 students. The expenditures rose from \$15,855 in 1888 to \$19,138 in 1894.

*The Mining Academy at Freiberg* was founded in 1766. In 1894 it had 12 professors and 161 students, 20 of whom were Americans. The expenditures decreased from \$27,419 in 1888 to \$25,588 in 1893.

*The Forestry Academy at Tharandt* was founded in 1811. In 1894 it had 13 professors and assistants and 65 students, among whom were 27 foreigners. The report fails to state the number of American students attending. The expenditures increased from \$16,098 in 1888 to 19,823 in 1893.

*The Royal Academy of Fine Arts at Dresden* was founded as an academy of painting in 1705, but in 1764 it was changed to its present form. It gives instruction in drawing, painting, sculpture, engraving, wood carving, and architecture. The academy has 18 professors and 114 students. The current expenditures in 1884 amounted to \$21,000; in 1895, to \$32,000.

*The Royal Academy of Fine Arts and Industrial Arts at Leipsic* was founded in 1764. In 1871 this institution was directed by the government to devote its chief energy to industrial art; since that time it has increased in attendance considerably. While in 1871, when it was still an academy of fine arts, it had 42 students, in 1894 the number of students had increased to 306. The number of professors is 23. The expenditures during the year 1894 amounted to \$23,000.

*The Royal School of Industrial Arts and Industrial Art Museum at Dresden* was founded in 1875 as a separate school. Previous to that date it had been connected with the Polytechnic Institute. It has 20 professors and 317 students, among whom are 21 foreigners. The entire expenditures during the year 1894 amounted to nearly \$40,000.

*A Preparatory Department* of the School of Industrial Arts at Dresden and the *Royal Industrial School* at Plauen may both be considered preparatory schools for industrial art schools in Saxony.

*The Royal Conservatory of Music at Leipsic* was established in 1843 and has now 35 professors and 617 students, 239 of whom are foreigners.

*The Royal Conservatory of Music and Theater School at Dresden* was founded in 1850. This institution has elementary, secondary, and higher classes, but it is difficult to state details.

*Sixteen private music schools in Chemnitz, Colditz, Dresden, Jöhstadt, and Leipsic.* These schools have together 295 professors and 2,575 students.

*The Theater School at Leipsic* was founded in 1875. It promotes the dramatic arts.

Other institutions, such as the *Royal Stenographic Institute* at Dresden and the *Royal Woman's Clinic* at Dresden, are also classed among the higher institutions of learning.

## II. MILITARY SCHOOLS.

These schools should properly be classed among secondary schools, but their singularly exclusive character and special purpose demands a separate classification.

*The Cadet-Corps at Dresden*, a school for army officers, is an institution similar to that at West Point, N. Y. It had in 1894 a total of 200 students.

*The Military School for Non-commissioned Officers at Marienberg* had 249 students in 1894.

*Soldier-boys' schools at Kleintruppen and the Fortress Königstein* have 98 students.

A system of examinations has been arranged for the privilege of serving only one year in the army instead of three years. Every

student of a secondary school may pass that examination after having attended a secondary school for six years. (All secondary instruction in Germany begins with the 11th year of age of the students.) These examinations show a marked increase in the number of successful candidates.

### III. INSTITUTIONS DEVOTED TO SECONDARY EDUCATION.

To this group of institutions belong all schools the scope of which ranges between elementary schools and higher seats of learning. They may be devoted to general culture and prepare for higher education, notably for the university and polytechnica, or for more practical pursuits. The former are divided into gymnasia (or classical high schools), Realgymnasia (schools with Latin, but without Greek), and Realschulen (schools in which modern languages take the place of Latin and Greek). Saxony has 17 gymnasia, 10 Realgymnasia, and 23 Realschulen.

The following table gives the statistics in detail, but to understand the figures correctly it must be stated that this group of schools admits only boys:

Preparatory schools for boys.	Number of teachers.	Number of students.	Total expenditures.	Amount paid by State.	Amount of tuition fees.
Gymnasia (17) .....	432	5,451	\$537,748	\$214,245	\$153,986
Realgymnasia (10) .....	243	3,317	223,038	54,978	74,494
Realschulen (23) .....	330	5,516	291,977	48,552	56,406
Total (50) .....	1,005	14,284	1,052,763	317,775	284,886

Of secondary schools for girls Saxony has two which rank with the preparatory schools for boys. These two schools have 40 teachers and 741 students. The total expenditures amounted to \$39,728, of which the State contributed nothing. The chief supporters of these schools are the city governments of Leipsic and Dresden. About \$23,800 tuition fees were paid by the students.

Aside from the public secondary schools a number of small private schools for boys exist in Saxony. Their students numbered 1,343, and their course of study commonly corresponds to that of Realschulen.

### IV. NORMAL SCHOOLS.

The Kingdom of Saxony had, in 1894, 19 normal schools, 15 of which are for men, 2 for women, 2 are mixed. Together they had 302 teachers or professors and 2,931 students. The practice schools connected with these normal schools were attended by 2,040 children. The expenditure for the maintenance of normal schools is entirely borne by the State. It amounted to \$421,929 in 1894. Aside from these normal schools, which prepare teachers for elementary schools, there

exists in Dresden a normal school for gymnastic teachers. It is open, also, to the students of the Dresden polytechnicum, and was attended by 1,439 students in 1894. The State supports this school almost exclusively. The expenditures amounted to \$3,089 in the same year.

#### V. INSTITUTIONS DEVOTED TO INDUSTRIAL EDUCATION.

##### (a) FOR GENERAL INDUSTRIAL EDUCATION.

The schools grouped here under (a) are secondary in character and results, but do not prepare for admission to higher seats of learning.

General industrial schools.	Number of teachers.	Number of students.	Number of foreigners.	Total expenditures.	Tuition fees.
In Chemnitz:					
Technical school .....	49	297	13	\$70,000.	\$13,691
School for builders .....		141	1		
School for foremen .....		241	10		
Industrial design .....		155	8		
In Leipzig:					
City industrial school .....	38	730	3	21,000	4,500
In Mitweida:					
Technical school .....	30	1,236	333	(a)	(a)
Total .....	117	2,790	368	.....	.....

a Private support and tuition fee.

##### (b) FOR SPECIAL INDUSTRIAL EDUCATION.

The following-named schools are trade schools—i. e., not poly-industrial, but mono-industrial:

Special industrial schools.	Number of teachers.	Number of students.	Total expenditures.	Amount of State's contribution.	Tuition fees.
5 schools for the building trades .....	41	769	\$26,582	\$22,432	\$4,150
27 weaving and passementerie schools .....	167	2,430	30,978	22,825	8,153
64 schools for other trades .....	267	4,032	56,477	31,106	25,371
Total .....	475	7,231	114,037	76,363	37,674

To the foregoing schools, which represent 47 different trades, should be added 6 navigation schools, which were attended by 118 pupils. The State supports these schools and pays a per capita of about \$3.50.

There should also be added 13 courses arranged for machinists and stokers, which were held in the year mentioned in 27 different cities and attended by 4,312 students.

#### VI. SECONDARY MINING SCHOOLS.

There are three of these, at Freiberg, Zwickau, and Zittau. The one first mentioned is not to be confounded with the mining academy at Freiberg, which is a higher institution.

Secondary mining schools.	Number of teachers.	Number of students.	Total expended.	Amount of State's contribution.	Tuition fees.
Freiberg.....	5	62	\$2,829	\$1,629	\$200
Zwickau.....	5	78	4,232	1,249	.....
Zittau.....	2	8	300	125	.....
Total.....	12	148	7,361	3,003	.....

## VII. ELEMENTARY INDUSTRIAL SCHOOLS.

## (a) INDUSTRIAL SUPPLEMENTARY SCHOOLS.

Saxony has 30 such schools, in 8 of which attendance is compulsory for boys between 14 and 17. Thirty per cent of the whole time given to this kind of instruction is taken in secular Sunday schools, 41 per cent in evening schools, and 29 per cent in full-day schools. The number of teachers in 1894 was 364, and that of pupils 8,053. These schools are not free, but liberally supported by the communities, the tuition fees amounting to 64 per cent of the total income, which was nearly \$40,000 in 1894.

## (b) INDUSTRIAL DRAWING SCHOOLS.

Industrial drawing is one of the branches of the elementary schools, but not satisfied with that, the State, large cities, and private corporations combined to establish 9 special drawing schools to aid industry in a very essential way. Many of the students of such drawing schools afterwards enter upon some trade and some even secondary industrial schools. These 9 drawing schools had 28 teachers and 554 pupils and cost about \$3,000, of which sum about \$800 was defrayed, by tuition fees.

## (c) INDUSTRIAL SCHOOLS FOR GIRLS AND WOMEN.

There are 18 of these in Saxony, chiefly devoted to pursuits especially adapted to women; among them are sewing, embroidery, domestic economy, designing, etc. They had in 1894 121 teachers, 1,562 pupils, and cost the corporations and communities about \$27,000, but of this sum about \$16,000 were defrayed by tuition fees.

## VIII. AGRICULTURAL, HORTICULTURAL, AND DAIRY SCHOOLS.

There are 10 such schools in Saxony, mostly supported by agricultural societies, having 105 teachers and 628 students. Cost of maintenance about \$33,000, of which sum \$8,000 were defrayed by tuition fees. None of these schools can be classed among the secondary schools.

## IX. COMMERCIAL SCHOOLS.

Of these, Saxony, though a minor State, has 41, 4 of which are of so high an order that they are classed among the secondary institutions. Taking them all together, they had, in 1894, 254 teachers and 4,819 students. The amount necessary to maintain them was \$121,000, of which sum \$105,000 were defrayed by tuition fees.

## X. ELEMENTARY OR COMMON SCHOOLS.

These schools are the pride of the people. The Kingdom had 2,254 schoolhouses, with 11,278 teachers, 9,041 of whom were class teachers, and 617,848 pupils. To this number should be added 79,289 pupils who attend continuation or supplementary schools (evening or secular Sunday school). This system of schools costs \$5,846,786 to maintain, 61 per cent of which is defrayed by communal or local taxation, 17 per cent by the State, and the remainder by tuition fees paid chiefly by city children.

Among the agencies for elementary education may be mentioned the schools for defective children, deaf mutes, blind, idiotic, and depraved children, detailed statistics of which are not available. Their pupils are not included in the foregoing total of elementary school pupils. All these institutions for defective children together have 1,313 pupils, while 5,076 defective children are provided with instruction by competent teachers at home.

Twenty-seven lace-making schools for little children are found in the mountainous districts of Saxony. They have 1,295 pupils. Also three braiding schools are maintained with 251 pupils. These manual training or handiwork schools are of course supplementary to the elementary schools, and are maintained chiefly to stimulate the local industries, a policy which is found often under paternal governments such as that of Saxony.

## XI. KINDERGARTENS.

In 142 localities of the Kingdom 234 institutions for the training or safe keeping of children of pre-scholastic age are kept; but only 95 of these 234 institutions are real kindergartens. It is difficult to draw a line between kindergartens and "crèches," that is, places to which laboring people bring their very young children to be kept during the day, for all of them attempt kindergarten occupations and plays without laying claims to being kindergartens. All these institutions had in 1894 13,747 children who were cared for by 346 nurses and kindergartners.

## XII. OTHER INSTITUTIONS.

In large cities, such as Dresden, Leipsic, Chemnitz, and Zwickau, institutions are maintained in which boys are kept after school hours to keep them from evil associations. In these places well-trained and

enthusiastic teachers keep the boys employed (and in some cases the girls) with manual work and plays until the hour arrives when fathers and mothers come home from the factories. All these and many (at least 50) other manual-training schools for boys and girls are private institutions and do not receive subsidies from State or city authorities. They are doing very excellent work training the children in order, diligence, cleanliness, and general moral conduct, children who would be lost in the slums for want of proper direction and guidance.

From this array of educational institutions it is obvious that few, if any, States in the world can claim to have set afoot so many moral and educational agencies as the small State of Saxony in Germany.

---

#### VIII. FEDERAL AID FOR ELEMENTARY SCHOOLS IN SWITZERLAND.

TOPICAL OUTLINE—Introduction of the Translator—Original Resolution in Parliament—Arguments in Favor—Basis of Distribution—Estimate of Expenditures—Resubmission of the Project.

The following important document will be more readily understood if it be stated that in Switzerland, as in the United States, education—elementary, secondary, and higher—is a matter that concerns each individual State (canton). The Federal Government maintains only a polytechnic institute (at Zurich) and spends a limited sum (annually appropriated by Parliament) for physical and industrial education, because these are affairs of the general State, or union, and affect the army or common defense. Now, elementary education in the different cantons varies greatly in organization, management, and results. The schools maintained in cantons such as Basel, Berne, Geneva, Zurich, and others, are excellent, and the communities and cantonal governments spend large sums of money in maintaining them in a high state of efficiency; while in poorer cantons, especially in mountainous and other rural sections, the schools are rather backward.

This state of affairs it is the object of the following report to improve through Federal aid. The report was occasioned by a resolution in the National Council (upper house of Parliament), which was referred to the Federal Council (lower house), where it was pigeonholed. The question was taken up by various cantonal governments, and the combined replies of these authorities, under the lead of those of Zurich, were reported back to the Federal Executive and Parliament.

The movement has its origin in the desire of a certain influential part of the communities to procure a Federal subsidy for primary education, the granting of which the Federal constitution expressly forbids, but which it is hoped can be obtained on the same grounds on which Federal subsidies for manual and industrial training, phys-

ical education, and the training of apprentices were obtained, namely, on the plea of the general welfare of the Federation.

It is doubtful whether the Federal Council (lower house of Parliament) and the Executive will concede the point, but the document is very well adapted to serve as an object lesson in Swiss government.

REPORT OF THE CANTONAL GOVERNMENTS TO THE SWISS CENTRAL EXECUTIVE AND PARLIAMENT (FEDERAL COUNCIL) CONCERNING A LAW FOR SUBSIDIZING PUBLIC PRIMARY SCHOOLS THROUGH THE FEDERAL GOVERNMENT, APRIL 15, 1898.

To his Excellency, the President, for his own notice and that of the members of Parliament.

Mr. PRESIDENT: Gentlemen of the Federal Council:

I.

On the 7th of June, 1893, the National Council<sup>1</sup> declared the following resolution of Messrs. Curti and confrères in order, and it was subsequently passed:

"The Federal Council is requested to investigate whether the provisions of article 27 of the Federal Constitution, which requires sufficient elementary instruction for every Swiss child, are everywhere within the limits of the union complied with, and whether the several cantons may not be subsidized by the union, in the measure that its means permit, for the purpose of securing sufficient primary education."

The Federal Council accepted this commission, and in the year 1895, on the basis of a report by one of its members, Dr. C. Schenk (since deceased), defined the principles upon which a federal subvention to the primary school systems of Switzerland might be granted.

Since then the question has not been agitated. The plan of 1895 received no further recognition from Parliament, but was laid aside, probably on account of the great unsettled questions of insurance for accident or sickness and federal control of the railroads.

The fact that the school question did not receive the consideration from the members of the Federal Council which was popularly desired caused a state of excitement among the teachers in all parts of the country. This excitement found expression in an initiative measure proposed by the teachers' union of Switzerland, relating to federal aid to public schools. According to this an amendment to the federal constitution is contemplated as the foundation for subsidizing primary schools.

Particularly because of the pressure brought to bear by the teachers of different cantons, this measure of initiative<sup>2</sup> was to be among the first in order at the beginning of the year 1897. At this juncture the educational authorities of several cantons took the matter under advisement, and upon invitation of the board of education of Zurich, the director of which took the chair, the various boards met four times to discuss the question.

Various reasons explain the interference of cantonal boards of education in the question of subsidizing public primary schools through the Federal Government:

(1) The desire to have the Federation administer the affairs of public education

<sup>1</sup> Upper house of Parliament, consisting of deputies chosen by the cantonal legislatures; the Federal Council is the lower house, members of which are elected by popular ballot.

<sup>2</sup> A law may be proposed by the people, who are said in such case to take the "initiative"; if it has 40,000 subscribers it is to be taken up by Parliament, which, in case the bill is passed, submits it to the "referendum", or popular vote.

is based upon the inadequacy of means at the disposal of cantons for the extension of school organization. The invitation addressed to the various cantonal school authorities to come together for consultation (January 20, 1897) emphasizes this in the following terms:

“A glance at the efforts made in behalf of public schools shows that all the cantons, without exception, are striving to advance as far as they are able their school systems. Imbued with the spirit of emulation, they are making every endeavor to give them that form required by the modern development of the condition of life. Despite the best of intentions, the cantons are often unable to proceed as far as they might wish; for, at the present time, ever-increasing demands in every direction are made upon them. The necessary consideration of these claims, especially those of an economic nature, which the cantonal governments must meet, makes it impossible for them to allow ample means for the extension of school organization, and particularly that of the elementary schools. Experience teaches that any development of the school means a greater outlay, for which a number of cantons find it difficult to provide. This is especially the case where taxation has reached almost the limit as regards the individual or where the revision of revenue laws does not keep pace with the increase of expenditures.

“We have intimated that a deep-felt desire prevails in all the cantons to extend their school systems. A few of them have already bills to be submitted to their legislatures; but the fate of nearly all these measures is uncertain, as they involve important financial consequences. A cursory review of the Swiss cantons will shed a clearer light on this subject:

“In the Canton of Zurich, where a new school law is to be submitted to the authorities and the people, it is more than probable that the project, which calls for an increased expenditure of a quarter of a million of francs, will come to naught on account of the consequent increased taxation.

“The Canton of Berne in 1894 added a number of progressive amendments to its primary school law to be successively carried into effect. The law as amended came into full force in 1897; and in consequence of its faithful execution the finances of the cantonal government for the year 1897 showed a rather depressing deficit. The increase in the expenditures for primary schools amounts to over three-fourths of a million of francs.

“The authorities of the Canton of Lucerne are engaged in discussing a bill relative to a change of the law of September 26, 1879, in which bill are incorporated a number of material improvements in popular education.

“The Canton of Uri is about to make considerable progress in education by the introduction of compulsory attendance at continuation schools and the extension of time of attendance in primary schools. Such an advancement will hardly be brought about without a noticeable increase of expenditures.

“In the Canton of Zug an excellent bill for the reorganization of the school system has been under consideration for years; its financial consequences alone prevent its adoption for trial.

“The Canton of Soleure has for years been engaged in reorganizing its school system. A preliminary fruit of this work, the law passed by the legislature changing the regulations of compulsory attendance, was annulled by popular vote on February 28, 1897.

“St. Galle has considerably increased the teachers' salaries by voting in favor of periodical increments (*Alterszulagen*), and at the same time greatly enlarged the State's contributions toward the school fund and deficits of elementary and secondary schools, as well as continuation schools. It has built many school-houses and increased the teachers' pension fund.

“Thurgau is preparing a new school law. A similar attempt in Grisons failed of popular approval. St. Galle is carrying out the measure of free text-books for

children with indomitable energy, despite financial difficulty at the beginning. During the summer of 1893, in Thurgau, an attempt in this direction was defeated by popular vote, influenced, no doubt, by the consideration of expense. Since then no further effort in that direction has been made, although the measure is regarded with favor.

"In Appenzell Inner Rhodes the progressive school regulation of October 29, 1896, demonstrates the settled purpose of that State to perfect its school system. Appenzell Outer Rhodes is waiting for a favorable opportunity to present a new school bill.

"The Canton of Aargau likewise has an excellent draft of a school law in readiness, which will entail an increase of expenditure amounting to hundreds of thousands.

"The Cantons of Ticino and Valais, during the past year, revised their laws regulating the salaries of elementary school teachers. These were considerably increased, and the discussions which took place gave ample evidence that only insufficient means prevented further increases.

"In the Canton of Vaud the question of teachers' pensions was solved, February, 1897, by a liberal interpretation of the excellent laws for primary schools (1889) and for secondary schools (1892).

"Thus throughout Switzerland a number of bills are awaiting official consideration and the confirmation of the State. They all represent decided progress in educational affairs, and it would be regretted if their latent force should not be utilized. All the cantons desire their bills to become law. Such action, however, will, in many cases, be possible only when the question of attendant increased expenditures shall have been satisfactorily solved."

Since the publication of this circular the facts mentioned in the foregoing paragraphs have been somewhat changed. A bill for the extension of the course of study at the normal school at St. Gallé to four years met with negative popular vote during the year 1897, partly because of the increase of expenditure which it would have entailed. In the Canton of Thurgau a new law respecting teachers' salaries received the sanction of the State by only a small majority of votes.

As regards the cantons not mentioned in the circular quoted, Glarus, among others, has made efforts at different times within the last ten years to model its otherwise well-organized school system so as to meet the increased demands of modern society. We need only call to mind the projected reforms of secondary schools. The prime cause that prevented the adoption of these reforms was the very considerable increase of expenditure involved.

That no important changes in the school laws have been considered in the cantons of Schwyz, Obwalden, Nidwalden, Baselland, and Schaffhausen is likewise due to insufficiency of means. All these cantons have been obliged to develop their school system as far as possible within the limits set by existing laws and school regulations.

Freiburg has revised its law concerning the age allowances of teachers. In respect to the remaining cantons, Basel City, Vaud, Neuchâtel, and Geneva, it may be said that they have taken the lead in Switzerland during the past five or ten years, as far as progressive legislation affecting education is concerned.

(2) An active interest on the part of the teachers in the school initiative would hardly have met with successful issue, considering the great questions just then pending, namely, the law of compulsory insurance for accident and sickness, and even in the most favorable case would have deferred the final solution of the question of Federal subsidy for many years.

The aforementioned conferences of school authorities were well attended by representatives from all the cantons, excepting Vaud and Geneva, delegates of which were present at the first sitting only.

## II.

A proposition prepared by a select committee, consisting of the representatives from the cantons Zurich, Berne, Lucerne, St. Gall, and Neuchâtel during the first conference, defined the principles which in the opinion of the leaders of education should be accepted in framing a Federal law relative to subsidizing State primary schools by the Federal Government. The result of the discussions was the draft of a proposed Federal law, as given below. This bill is based on the one adopted by the Federal Council, July 5, 1895, following the report of Dr. Schenk, but in essential points proposes far-reaching changes. It may be advisable to make brief mention of the separate points in the bill which was the outcome of the discussions at the directors' conferences and to quote the Federal bill only when necessary for comparison:

ART. I. The bill treats of compulsory and State primary education, and therefore the wording of its title and of article 1 corresponds with the demands of article 27 of the Federal constitution. It must not be forgotten at the same time that the conception of primary instruction varies in the cantonal school laws in significance and extent. The conference of cantonal school directors is of opinion that the interpretation of the idea as to what constitutes primary education should be as comprehensive as possible.

The varied interpretation of the idea of primary education which characterizes cantonal legislation is promoted by considerations of a purely practical nature. Many cantons are no longer able to institute improvements for the primary school in its narrower sense (week-day and supplementary schools), as they are restricted by the industrial relations of the people, considerations of a geographical nature, etc. On the other hand, the higher grades of primary instruction (so-called continuation schools and preparatory courses for army recruits, either compulsory or optional), which the school laws of some cantons expressly declare to be a part of primary instruction, open a broad field to State activity.

Since thus the conception of primary education is specified in the new Article I, the same rule (or measure) will be fairly and justly applied to the school systems of all the cantons; hence there can be no dickerings with individual cantons for consideration of grades of schools instituted specially by them to meet local demands.

ART. II. The purposes for which the Federal subsidy may be lawfully expended, according to the judgment of the canton, are also described in this circumscribed sense of primary education. Too wide an interpretation, of course, would result in a complete loss of the subsidy. On this account a proportionately small number of purposes was mentioned in Article II; still it gives room enough for the consideration of the manifold cantonal school arrangements, and too great a variety of needs would create too many hindrances. By means of the Federal subsidy, soup may be distributed to hungry school children in one canton; in another, old, deserving, disabled teachers may be pensioned, and the vexed question of pensions settled by a fair and humane measure. In a third canton female handiwork may be generally introduced, or the law of compulsory attendance at continuation or supplementary schools may be enforced. In some cantons the purposes mentioned may all be considered in order, according to existing conditions.

ART. III. Instead of the text of the Federal proposition, which was intended simply to apply the regulations for subsidizing industrial and technical schools to elementary schools, a form was selected which does not imply an immediate greater burden for cantons and communities, or, in other words, does not require a continuation of their present heavy taxation for school purposes; but in presenting something like financial equalization in detail Article III makes a fair allowance for the fact that in many cantons and communities the citizens have arrived at the limit of economic capacity as regards primary schools. The facts of what has

been accomplished until now were clearly defined, and the average of the accomplishments of cantons and communities within the last ten years was accepted as a standard. By this consideration of a longer period of time allowances are made for the cantons of western Switzerland, which during the last ten or fifteen years have made decided sacrifices in behalf of the improvement of their schools, as well as for those (Bern, for instance) whose appropriations for primary schools have in the last two years largely increased in consequence of the new primary school laws.

ART. IV. This article contains the most important measure of the bill. It mentions the limit of Federal subsidies and the methods of their calculation. As Article IV, which takes the place of Articles IV and V of the Federal proposition, is altogether different from the latter, a closer examination of it is deemed advisable. According to it the basis of calculation is the number of appointments of teachers; whereas the Federal proposition divides the cantons into different classes, with varying quotas of 30, 40, and 50 cents per capita of the population. The following details are worthy of notice:

#### A. THE BASIS OF CALCULATION.

In determining the annual payments to the cantons, the Federal Council had in its plan taken population and economic capacity for a basis of calculation. As seriously as these two factors should be considered theoretically, it can not be denied that especially in reference to economic capacity the classification of cantons would be determined more by sentiment than by calculations and considerations based on economics and tax rolls, because of the lack of reliable data. Every classification based on economic capacity of the cantons is necessarily liable to arbitrariness, and in consequence the most just efforts to secure the correct medium would provoke criticism. The division of the cantons into categories by the Federal Council is by no means free from objection.

The basis of calculation, especially in Switzerland with its 25 cantonal governments, must be, as far as possible, reliable and unchangeable. The necessary "standard measure" has therefore been sought. The different bases, as schools, class rooms, percentage of attendance, and force of teachers in the different cantons, could all be and were considered in that connection.

A more minute study of the conditions of the primary schools<sup>1</sup> in Switzerland discloses the fact that the meaning of the terms school and class or grade changes from canton to canton; attendance could with even less surety be taken as a basis, since it is difficult to quote the exact number of pupils in the different cantons. It would not be practical to take the attendance at week day and supplementary schools, review classes, drill classes, continuation schools, female work schools, and singing schools as the sum total upon which to determine the amount of subsidy. In the categories of pupils mentioned the number of hours a week per annum varies between one-half hour and thirty-three hours, according to the limit or organization of compulsory education as determined by the cantonal school laws. In all good faith, different opinions might be formed as to the understanding of the term pupil, by which the amount of Federal subsidy should be decided.

Hence the number of teachers or appointments was finally accepted as a standard measure. This basis best expresses, absolutely and relatively, the burden which the several cantons have undertaken to carry, for from three-fourths, to four-fifths of the total expenditures for public schools in Switzerland is paid to teachers. Cantons with a smaller force of teachers receive a smaller quota corresponding to their activity in the field of education; others with a stronger force

<sup>1</sup>In Switzerland the primary school is usually an elementary school of six years; sometimes one of four years.

of teachers a proportionately larger sum. Taken absolutely the average per teacher is the same for all. Relatively, it is true, the poorer cantons paying only modest salaries would, of course, receive a proportionately larger amount than the richer cantons. This fact only contributes to the elevation of schools principally where it is most necessary and without hurting other justifiable claims. The accepted basis of calculation exercises an immediate and directly favorable influence on schools, even under the most varied territorial conditions. Important rational improvements in school systems pay at once.

If the number of appointed teachers determines the amount of subsidy, the relief of overcrowded classes and the erection of new schools become easier.

Therefore the number of primary school-teachers definitely appointed is taken as the basis of calculation. It has also the advantage of being easily and accurately determined. Appointments in cantons where for geographical reasons half-year schools predominate (Grisons, Ticino, Valais, and part of Uri) could be reckoned with those of full term.

By reckoning on the number of primary school appointments the factor of population is, up to a certain point, likewise considered, though it must be conceded that this is done in an indirect and inconspicuous manner.

Since the factor of population influences the amount of subsidies only in a secondary or indirect way, and depends upon the annually changing number of appointments, so that it can keep pace with the development of school conditions, any unfairness is avoided which would necessarily result from basing the calculation on the latest Federal census. The basis adopted originates in the fact that the annual increase of population, particularly in industrial cantons, and other fluctuations in cantons situated near the boundaries, could not receive consideration in the calculation of subsidies during the interim between census reports.

B. THE QUOTAS OF THE DIFFERENT CANTONS COMPARED WITH THOSE OF THE PROPOSITION OF THE FEDERAL COUNCIL.

Article IV of bill newly submitted (see supplement) prescribes 200 francs (about \$40) per primary school appointment, which makes the total Federal subsidy for the 10,000 appointments in Switzerland amount to 2,000,000 francs (about \$400,000) in round numbers.

To form a correct idea of the comparative significance of the Federal subsidy, one must necessarily take into account the total expenditures of cantons and communities for primary schools.

The following tabulated review presents the subject clearly and needs no further comment:

No.	Cantons.	Number of primary school-teachers, 1896-97.	Total expenditures for primary schools in 1896.		Federal subsidy.		Per cent of present expenditures.
			Cantonal.	Local.	Calculated by the Council, July, 1895.	Calculated by the conference, July, 1897.	
1	Zurich .....	837	\$346,442	\$780,000	\$22,231	\$35,480	10
2	Bern .....	2,106	265,915	500,000	42,936	84,200	32

	Total, Switzerland .....	10,274	1,692,820	3,235,834	222,428	416,920	24

NOTE.—Slight deviations from the data of columns 2, 3, and 4 have been disregarded by the translator. In computing the value of the sums stated in the report in American money, 5 francs have been taken to be equal to \$1.

According to the foregoing scheme the Federal budget would in future suffer an increase of expenditure of over 2,000,000 francs, or about \$400,000. This sum is the minimum of what the future reserve fund for public schools must be. The ever-increasing receipts make this a possibility, although we are confronted by the further fact that the Federal insurance in cases of accident or sickness will consume a great portion of tax and custom receipts, and hence much of the available income intended for administrative purposes. We, too, honestly desire that that new and eminently important measure be favorably decided. All other demands on the Federal treasury must take that measure into consideration. Too far-reaching claims must be modified in the interest of social progress, which will follow upon the realization of these insurance schemes. The school-subsidy proposition must therefore be content with modest Federal assistance, and this consideration has led us to set the federal subsidy for primary schools at as low a figure as possible. If any noteworthy progress in public education is to be made by means of Federal subsidy, the amount can not be less than 2,000,000 francs.

In contradistinction to the federal proposition, which allows a subsidy to definite classes of cantons for five years unchanged, our plan offers a greater adaptability to conditions.

\* Articles V, VII, and VIII require no further explanation, since they contain the application of the principles laid down in Articles I to IV. As regards Article VI, it upholds the principle that the sovereignty of the cantons in school affairs must not be encroached upon. The cantons reserve the full right of distributing and accounting.

### III.

The foregoing propositions are the result of mature deliberations of the representatives of the cantonal departments of education. In this form they may be accepted as the view of the majority and are the product of loyal reciprocation. In the last conference, therefore, the report of the chairman met with no opposition. It moved that the bill for subsidizing public primary schools through the Federal Government be recommended to the legislatures of the several cantons for approval. The report adopted reads that the result of the deliberations contains that which is useful and necessary for the Federal law to include, and it expresses the sense of competent representatives of public education. Consequently the proposed bill presents a concurrence of opinion on the part of the cantonal departments of education as a whole, but several representatives expressly declared dur-

ing the conference that the question of Federal subsidy in behalf of primary schools could be made possible only by a previous revision of article 27 of the Federal constitution and by a law based on such an amendment, and not by a law alone.

Still, the majority of the members of the conference were of opinion that the Federal authorities should decide the constitutionality of the question and that the material side alone deserved their consideration.

Through the influence of the members of the Federal Council from the Canton of Zurich, the bill proposed, together with foregoing report and argument, was laid before all the cantonal governments with the request to express either their agreement or disagreement to its terms.

By the middle of April, 1898, the following cantons reported in its favor: Zurich, Bern, Lucerne, Glarus, Zug, Soleure, Baselstadt, Basel Land, Schaffhausen, Appenzell I and II, St. Gall, Grisons, Aargau, Thurgau, Ticino, Valais, Neuchâtel, Geneva (together 19 cantons). Uri, Schwytz, Obwalden, Nidwalden, Freiburg, and Vaud (6 cantons) declared against it.

In presenting this report now we make the request that if at all possible it be discussed during the next session of the Federal Council.

For the government of the Canton of Zurich:

J. E. GROB,  
*President.*  
STÜSSI,  
*State Secretary.*

ZURICH, April 15, 1898.

SUPPLEMENT.—DRAFT OF A LAW FOR SUBSIDIZING PUBLIC PRIMARY SCHOOLS THROUGH THE SWISS FEDERAL GOVERNMENT.

[Proposed by the cantonal educational authorities.]

ARTICLE I. The Federal Government is hereby allowed to subsidize the cantons for the purpose of properly supporting their public primary schools.

ART. II. The Federal subsidy shall be expended only for public primary schools, and for the following-named purposes, as the cantons may see fit: (1) equipment of gymnastic halls; (2) new school buildings and remodeling old ones; (3) increase of teaching force and new appointments; (4) appliances for instruction and object-lesson material; (5) free text-books and stationery for pupils; (6) clothing and food for pupils during school hours; (7) higher professional preparation of teachers; (8) increase of salaries and pensions of teachers; (9) establishment of special classes for weak-minded pupils; (10) improvement of continuation schools supplementing primary education.

ART. III. The amounts of subsidy shall not lessen any canton's expenditures for primary schools, estimated by what it spent during the last ten years (cantonal and local expenditures together).

ART. IV. For the said purpose an annual sum, allowing at least 200 francs (\$40) for every primary teacher appointed, shall be provided by the Federal Government.

ART. V. Every canton shall be at liberty to accept or refuse the amount of subsidy.

ART. VI. The organization and supervision of schools shall remain a matter for cantonal legislation and administration. The cantons, however, shall be required to hand in a yearly report to the Federal Government showing how the amounts received have been expended.

ART. VII. The subsidy shall be paid in the year following that in which the canton presents its financial statement and after the examination of the latter by the Federal Government.

ART. VIII. The Federal Executive shall decide upon any necessary regulations for the execution of this law.

## IX. HISTORY OF SECONDARY SCHOOLS IN HUNGARY.

CONTENTS.—Introduction—Historical review, laws, courses of study and medium of instruction, biographical sketches of Hungarian ministers of education.

The millennial celebration of the foundation of Hungary, coupled with an international exposition in Budapest, gave rise to a great number of retrospective reviews of public life. In every domain of public activity an inventory seems to have been taken in Hungary in 1896. Especially interesting to teachers has proven a monograph on secondary schools in Hungary prepared by Prof. Franz Kemény. His work has been authorized by the minister of education and published in several languages, but not in English. The following chapter, translated from the German, is intended to give the essential points of Kemény's work. It seems prudent, though, to express the technical terms of school organization in American equivalents, so as to present the facts to the American reader in a convenient form for comparison with those of our own schools.

## 1. HISTORICAL REVIEW.

An exhaustive and authoritative history of the Hungarian secondary school system has not yet been written. Valuable contributions to such a work are not lacking, especially since the minister of public instruction has ordered a separate history to be written of every secondary institution of the Kingdom. This material, chiefly consisting of interesting chronicles, needs to be summarized. The scientific utilization of these monographs and of numerous existing archives will, in time to come, furnish a history both authoritative and exhaustive. At present a sketch of the past in brief outlines may suffice.

The historical development of the Hungarian secondary schools may be divided into four epochs: (1) The time in which the church founded and maintained secondary schools. This exclusive action of the church reached to the middle of the eighteenth century. (2) The beginning of an organization of such schools on the part of the State, during the reign of Maria Theresa. (3) The awakening of a national consciousness and the desire to prove it by organizing the entire educational system under State control. (4) In the last period, the present, the principle of the supremacy of the State is further strengthened, and the eminent importance of secondary education for the entire national intelligence is recognized.

During the earliest of these four epochs the church ruled supreme in educational matters in Hungary as well as in other countries. Wherever the church stepped upon the scene the clergy, with the well-understood purpose of strengthening its own position, established schools as an irresistible means for the assertion of its power. The Latin language and ecclesiastical teachers predominated, and the object of the schools consisted exclusively in preparing clergymen and believers.

This tendency received a new impetus through the Reformation. The competition arising between the different denominations called into existence a new school at every step, which school was to act as a fortress of the faith. The unequal territorial distribution of secondary schools in Hungary to-day is partly the result of this competition. Another peculiar feature of this period was the predominance of foreign models. Scholars, who had returned from the West, brought with them an eagerness to reform and remodel, much to the disadvantage of home traditions. Thus the national individuality suffered. Moreover, the country suf-

ferred during several centuries almost constantly from the ravages of war. In considering this, the energy which the people displayed in self-preservation, though it followed foreign models, deserves to be highly appreciated. The national characteristics suffered injuries thereby, but the bloody centuries that rolled over Hungary must be borne in mind when the civilization of the Kingdom is measured. During the ecclesiastical period no distinction was made between secondary and higher education. The institutions (gymnasia) of that time had the exclusive object of promoting the humanistic studies; classical education and general education meant the same thing. The schools of the Protestants and those of the Catholics (Jesuits) spurred one another to increased efforts, and generally exercised a wholesome influence upon each other.

The second epoch, the one which worthily and significantly is named after that illustrious Queen Maria Theresa, appears highly important in consequence of two abiding monuments: (1) the "ratio educationis" of 1777, a study order, and (2) the establishment of a school fund. Beside these the founding of a great number of educational institutions is worthy of mention. There were founded law academies, mining schools, military academies, post-graduate schools, boarding and select schools for the nobility. During this period several important administrative reforms were inaugurated. Unfortunately, under Joseph II a reaction took place which was not advantageous to the schools. This energetic ruler attempted too many reforms. After his brief reign, and after the impetus which national agitation received during the decade beginning with 1790, which culminated in the fostering of the Hungarian language as the national tongue, there followed a time of peace, a standstill as it were (1790-1848). In 1806 the second "ratio educationis" was issued, and remained in force for over forty-two years.

The Protestants replaced Latin by the mother tongue as a medium of instruction in gymnasia or classical schools much earlier than the Catholics. Finally the Government, after a prolonged discussion in Parliament during 1843 and 1844, followed the example of the Protestant Church, and decreed that instruction should be given in the Hungarian language, while Latin was to be treated as a foreign language—i. e., as a branch of study. This met a long-felt desire of the best educated stratum of society, and did much toward consolidating the heterogeneous population. This decree, by means of which the high schools became an important factor of national life, opened the third epoch of development. While formerly the graduates could exhibit only knowledge of Latin as the fruit of eight years' study, now the mother tongue became the medium for the acquisition of a general education and real practical and scientific knowledge. Higher education in consequence was also modernized.

In 1848 the minister of education, Baron Joseph Eötvös, began to reform the entire system of education in Hungary, especially the secondary schools, by introducing so-called departmental teaching; that is to say, appointing the teachers with special regard to the branches they could teach best, and giving into the hand of each one or several kindred branches, thus abandoning the former class-teacher system. But the political revolution of that year interrupted his work. After the country was pacified the then absolute imperial government imposed foreign models upon the high schools, by decreeing for Hungary the same order of organization as was in vogue in Austria proper and in Germany. This order remained in force till 1860. Though the local school authorities tried to materially modify the order to meet local conditions, nothing new was formulated or established. The denominational high schools continued to follow their privileges of autonomy and deviated considerably from the course pursued in state schools.

The "year of adjustment," 1867, was the year in which the Empire of Austria, after the disastrous war with Prussia, was divided into two separate autonomous States, Austria (Cisleithania) and Hungary (Transleithania), each of which is

now sovereign in all matters pertaining to internal affairs, hence also in school affairs. In this year it was that a new life began for Hungarian secondary education. Methods of teaching, organization, and management that dated back several centuries were thoroughly improved; the natural and exact sciences found ample representation in the faculties and the course of study; the system of departmental teaching was adopted; elements that had no legitimate place in secondary schools, as elementary, higher, and professional branches, were lopped off or transferred to other special institutions; and now the classical schools (*gymnasia*) and the modern high schools (*Realschulen*) could devote themselves entirely to the purpose of continuing and perfecting a general education and prepare the students for universities and professional schools. The secondary schools of Hungary became the centers of national culture.

Simultaneous with the efforts in reorganizing the whole school system was the attempt to change the various branches—elementary, secondary, and higher—according to the modern demands of pedagogy. After Minister Eötvös had succeeded, in 1868, in submitting a general elementary school law which was passed by Parliament, he began a general secondary school law, but his untimely death put an end to his memorable labors. His bill, though it did not pass as he had prepared it, is noteworthy in one respect—it provided for uniformity in the lower grades, and for a trifurcation of the course in the upper grades, which gave the students an opportunity to choose a profession much later than was possible in former years. This bill was followed by no less than five others, submitted to Parliament by succeeding ministers of education, all of which failed to pass, until at last the bill prepared by Minister August Trefort, in 1883, became a law.

## 2. LAWS AND COURSES OF STUDY.

(1) *Laws*.—The earlier centuries, owing to constant warfare and denominational quarrels, were not favorable to progressive legislation in behalf of schools. However, there are a few legal regulations dating from the middle of the sixteenth century, which in a general way refer to the establishment and maintenance of schools, but particularly to the protection granted to them. The laws of 1715 and 1723 define the royal supervision of the schools, and that of 1773 refers to the education of the sons of noblemen.

The first noteworthy royal decree referring to schools is the “*ratio educationis*,” the first edition of which appeared under the title “*Ratio Educationis Totiusque Rei Literariæ per Regnum Hungariæ et Provincias eidem adnexas. Tomus I. Vindebonæ MDCCLXXVII* (pp. 496, 8<sup>o</sup>). The second complete edition of the “*ratio*” (two volumes) was issued in 1806, and embraced all the branches of the public educational system. It remained in force till 1848, but was not recognized as authoritative by the Protestants, who had, by a law of 1790-91, secured autonomy in religious and educational affairs. The adherents of the Greek Catholic faith acquired this privilege by law in 1868.

The laws of 1791 and 1792 have reference to instruction in the mother tongue; that of 1844 made the Hungarian language the medium of instruction. This law, however, failed to be generally obeyed, owing to political disturbances that began soon after its passage. During the period from 1849 to 1860 provisional ministerial regulations were followed, until at last, in 1883, a fundamental law for secondary schools was adopted which, with slight modifications, has been in force till today.

(2) *Courses of study*.—The courses of study of secondary schools may generally be considered standards of measurement for the culture development of any age or country, and they offer instructive information if chronologically compared. In Hungarian courses of study individual features began to appear during the reign of Maria Theresa.

The first officially prescribed course, the "ratio educationis," in force from 1777 to 1806, met with many obstacles, which had to be removed before its requirements could be generally followed. The organization it provided for was one of three steps: The lower embraced three years of elementary Latin; the middle, two years of "gymnasial studies," and the upper, two years of philosophical studies. Latin grammar and literature claimed the lion's share of time, to wit, 10 hours a week during the first three years, 6 hours during the fourth and fifth years. The other studies, mathematics, history, etc., were reasonably well provided for; but the mother tongue of the students had only 2 hours a week in the two lowest grades, and none above those grades.

The second "ratio educationis," in force from 1806 to 1848, was in truth merely a second, though somewhat modified, edition of the first. It provided for a course of eight years, a grammar department of four years, which was called "the little gymnasium," a humanistic department of two years, and a philosophical course of two years. The course of study provided for the languages, Latin, Hungarian, and German, the latter as an optional study.

From 1849 to the passage of the law that is now in force the secondary schools were governed by ministerial regulations, binding on all kinds of public secondary schools. The chief features in the first administrative order, called the "Entwurf," were departmental teaching and increased attention to instruction in literature and modern studies. In place of the three departments, lower, middle, and higher courses, two courses were arranged, in both of which the classical languages remained the center. Greek was changed from an optional to a regular study. The mother tongues were amply provided for—that is, German was made the medium of instruction in schools of predominating German communities, Hungarian in others. But in schools where the Hungarian language was treated as the mother tongue German was taught also as a foreign tongue. These regulations provided for graduation examinations and also for professional examinations for teachers.

A noteworthy reform measure was the establishment of modern high schools (Realschulen), called modern in contradistinction to classical schools. These new schools had a course of only six years and were intended to serve as preparatory schools for polytechnical and other professional schools.

These "modern" high schools aimed to impart a general education without the aid of the classical languages and to offer a suitable preparation for agricultural, industrial, and commercial pursuits, as well as to prepare their students for technological universities. To meet the requirements of various pursuits the ministerial regulations provided courses for six, four, three, and even two years. In small towns a three-year "Realschule" was allowed to complete its course by relying upon one year's attendance upon a higher burgher school. "Realschulen" of only two years were connected with elementary schools and served tradesmen and skilled laborers. There was one more kind of school which deserves mention; it was a mixed school, the course of which was framed like that of "Realschulen," but in the upper grades the so-called technical branches, drawing, etc., were replaced by Latin and Greek. The "Realschulen" or modern high schools devoted twenty-seven hours per week (in all the grades) to the mother tongue, twenty-five hours per week to a second modern tongue. The third class studied technology and acquired a limited knowledge of merchandise.

When Hungary was granted the institution of a royal Hungarian council of education an attempt was made in 1861 to reform the secondary-school system, but, no definite school law existing, the Emperor of Austria, in his capacity as King of Hungary, decreed that no changes be made except such as were demanded by modern conditions. Within these restrictions the following alterations were then made: The departmental system was curtailed and the class-teacher system

employed in the first two years. In the classical course of study Latin was given forty-five hours a week (total in all the grades); Greek, eight hours (beginning with the fifth to the eighth grade); Hungarian and literature, thirty-three hours, but only twenty-seven in schools with a purely Hungarian constituency. The course in modern high schools remained as before.

After the readoption of the constitution and the appointment of responsible ministers Baron Joseph Eötvös began a great reform, the principal features of which may be shown in brief outlines, proving that the much-discussed plan of uniformity in secondary education (*Einhauptschule* in Germany) came very near being realized in Hungary. The proposed secondary school was to have a course of nine years, with three divisions—the lower and the upper gymnasium and the lyceum. As has been said before, the noble statesman did not live to see his plan realized, for he died before he had completed his work in detail and before Parliament could pass upon the measure. Neither the spirit of the time nor the educational men were in sympathy with the plan, and the autonomous ecclesiastical schools shunned the costs which the ministers' plan necessitated. The following time-table will explain the plan:

*Time-table of Eötvös's uniform secondary school.*

[The figures indicate the number of hours per week.]

*a* I to III, geometrical; IV, freehand drawing.

The minister of education who succeeded Baron Eötvös, Theodor Pauler, returned to the former policy, modified the "Entwurf" (provisional law or regulations), and decreed a new course of study, according to which the classical high school was divided into a lower and an upper gymnasium, each with a four years' course. This decree came into force in 1871. It is worth mentioning that the German language, which had been an optional study in most of these schools, was now made a regular study, to which two hours a week was devoted.

But this ministerial decree did not meet with much approval. The division into lower and upper gymnasium and the want of a gradual development of intellectual culture by means of the mother tongue, and the impossibility of harmonious growth, led to a desire to introduce a better course of study and a more suitable method of instruction based upon psychological foundations. Thus originated the new course of 1879, which was amended by the law of 1883. In this course the Hungarian language, as the mother tongue, for the first time in the

history of secondary schools of the country, became the center of the course and the medium of the entire instruction. The provisions of this law will be found further on.

The "Realschulen" (modern high schools) of Eötvös's Entwurf remained unchanged till 1875, when a new course was prescribed for them. At about this time the professors of the polytechnicum in Budapest began to oppose these modern schools, though specifically intended as preparatory schools for polytechnical studies. They claimed that the graduates of the classical schools were better prepared than the graduates of modern schools, and attributed this fact to the study of classical languages, while the true cause was evidently the fact that the modern secondary school had a course of only six, while the classical had one of eight and nine years. Moreover, another fact was not considered, that the students of these modern schools were not as well prepared when they began their secondary studies, the requirements for admission being low, while those for classical schools were high and very rigidly enforced. Still, the effect of the professors' statement was that the "Realschulen" themselves raised their course from six to eight years, and succeeded in having this course legally established. Hence the plan of former years of establishing a uniform lower secondary course, which might end in a bi- or trifurcation, thus meeting all the various requirements of preparation for university, polytechnicum, and other higher seats of learning, was abandoned, and the dual school, the "gymnasium" or classical, and the "Realschule" or modern school, has been perpetuated.

*Time table of the completed "Realschule."*

*a* History: Grades I to III, native history; IV to VI, universal history; VII, history of modern times; VIII, philosophy of history.

*b* Two hours devoted to philosophy, elements of psychology, and logic.

The secondary schools, up to 1883, maintained by the churches and enjoying independence from State control, had a great number of study plans, almost as many as there were schools, and they changed quite frequently. Previous to 1883 two conflicting interests, that of the State and that of the autonomous church, which maintained private schools, clashed. The State was an opponent of weak private schools; the autonomous church, however, saw in them a means of existence. Thus it may be seen that the courses of study of church schools had no influence upon those of public schools, but the latter essentially influenced those of the private schools. To enter into this more minutely would be unprofitable, inasmuch as by the uniform law of 1883 the causes of antagonism were removed.

(3) *Language of instruction.*—Originally the language in which knowledge was

imparted was the Latin, in which also the text-books were printed. Even in the lowest grades of secondary schools (representing the age of 10 or 11 years) the mother tongue was used only to make brief explanations until the knowledge of Latin had progressed far enough for conversation between teacher and pupils. During the reign of Joseph II, German was, by decree, made the medium of instruction, which decree, however, was carried out only in regions where German was the mother tongue of the community; at other places and sections of the Kingdom the professors disobeyed the order, simply because neither teachers nor pupils understood the language; hence Latin was again made the "official" medium of instruction after the death of Joseph II.

But we find that the denominations, as well as the community, and in many cases the likes and dislikes of the professors, decided the language to be used in teaching. The use of the Hungarian language was first practiced by the Protestants toward the end of the eighteenth century. There were Protestant secondary schools with Latin, Hungarian, and German speaking teachers in endless variety in Hungary, while in Siebenbürgen German text-books were in use as early as 1678. Those who tenaciously held on to Latin were the Catholics, until the law of 1844 put an end to Latin as a medium of instruction. During the fifties the imperial government of Austria made new attempts at Germanizing the schools, and permitted other mother tongues as media of instruction, as Bohemian in the upper regions, Servian in Neusatz, Roumanian in Siebenbürgen.

This chaos of languages was at last definitely ended by the law of 1868. The law of 1883 also contains precise statements concerning the school language in secondary schools, which has been mentioned as "The Law of 1883."

#### BIOGRAPHICAL SKETCHES OF HUNGARIAN MINISTERS OF EDUCATION.

A sketch of the life of each of the ministers of education may close this brief glance into the past. Hungary has had six such ministers since the year 1848, which was the beginning of constitutional government.

(1) *Baron Joseph Eötvös* (1813-1871), after completing his school studies, entered government service first as simple clerk in the office of the Hungarian court, acted for some years as district assessor, traveled much through foreign European countries, then devoted himself to literature, and later on to politics. When the revolution in March, 1848, had led his party to victory, and the first responsible cabinet of ministers was formed, he was called to enter the cabinet as minister of public worship and education. But his work of reform was greatly hampered by conservative influences, and when the revolution in September broke out he resigned. For several years he lived outside of Hungary, and employed his time in literary pursuits, until after the "adjustment" between Austria proper and Hungary in February, 1867, when he was called upon by Count Andrassy to enter his cabinet. He took the same portfolio he had once held and kept it till his death, in 1871. His most noteworthy achievements in office are the drafting of a school law for elementary education, which was passed by Parliament in 1868, and the institution of school inspection, by which the control of the education on the part of the State was secured. With regard to secondary and higher education also, Eötvös effected reforms by establishing a normal school for teachers in high schools and by inviting noted men of science to occupy chairs in Hungarian universities.

(2) *Theodor Pauler* (1816-1886) was professor in the law academy at Agram in 1838, at Raab in 1847 and professor of natural and criminal law at the university at Budapest in 1848-1869. After that he was appointed to the bench (Curial-Richter). From February, 1871, till September, 1872, he was minister of public worship and education, from 1872 to 1875 minister of justice. In 1875 he resumed his work in the university; but in 1878 he was again appointed minister of jus-

tice, which he retained till his death. Pauler is the author of several works on the science of law, history, and philosophy. With his name is coupled the course of study for secondary schools of 1871.

(3) *August Trefort* (1817-1888) studied law and traveled much throughout Europe; was clerk in the Hungarian court office, representative in Parliament, academician, and in 1848 became chief secretary in the department of commerce. From September 4, 1872, until he died, in 1888, he was minister of public worship and education. In 1885 he was made president of the Hungarian Academy of Sciences. Bishop K. Szász says of him: "The characteristic feature of his work as a minister is the universality with which he promoted every branch of his large office. With equal affection he cared for all kinds of educational institutions and promoted their interests." Of greatest importance is the creation of a law for secondary schools, passed in 1883, which will forever be coupled with his name. He published in German "Speeches and Studies" (Leipzig, 1883), and "Essays and Memorial Orations" (Leipzig, 1887).

(4) *Count Albin Csáky* (born in 1841) attended a classical secondary school in Lőcse, studied law in Kaschau and Budapest, and acquired the diploma for practicing law in 1863. In 1865 he was elected representative in Parliament, in 1867 governor of the Zipser Comitate. During this period he wrote extensively about questions of administration. At the beginning of 1888 he was made vice-president of the upper house of Parliament, and in September of the same year was appointed minister of public worship and education. Aside from his important work in settling vexing denominational questions, it may be stated that he has been one of the staunchest advocates of modern education. The following measures are his work: He introduced gymnastics into the schools, reduced Greek to the position of an optional study, reorganized the state board of education, revised the teachers' pension law, and prepared a new law for the introduction of the kindergarten. In regard to making the secondary institution uniform throughout the kingdom, well-meant efforts were made by him. His term of office lasted till 1894.

(5) *Baron Roland Eötvös*, son of Baron Joseph Eötvös, born in 1848, studied law and administrative science for two years, then followed his inclination and turned to the study of natural science in Königsberg and Heidelberg (Germany). In 1871 he occupied a chair as professor of science in Budapest. In 1883 he became a member and in 1889 the president of the Hungarian Academy of Sciences. In 1894 he was called to the ministry of education, but after little more than a half year he resigned to take up his work in the university. His chief aim, while minister of education, was directed at raising the standard of university professors.

(6) *Julius Wlassics*, born in 1852, is a doctor of laws and a practicing lawyer. In 1875 he entered the service of the State, became in 1882 state prosecutor, and in 1890 professor of law in the university of Budapest. He wrote several works on jurisprudence, which were also translated and published in other countries, and prepared bills which were submitted in Parliament. Since 1892 he has been member of the Hungarian Academy of Sciences and representative in Parliament. His acceptance of the ministry of education dates from January, 1895. He is eagerly laboring in behalf of secondary school reform by assisting the State board in examining the text-books, by instituting examinations, and improving the secondary and higher education of woman.

## X.—SEVENTY YEARS' ATTENDANCE IN GERMAN UNIVERSITIES.

Prof. J. Conrad, of the University of Halle, Germany, published in his "Jahrbücher der National-Oekonomie und Statistik" a review of the attendance at German universities, which is very complete and interesting, owing to the fact that it goes back to the year 1831, and shows in ratios to 1,000,000 of the inhabitants how the number of students in the highest seats of learning in Germany has at times fluctuated, yet since the year above mentioned has risen from 395 to 599 in every 1,000,000 of inhabitants. Only matriculated students are counted—no "hearers"—hence few foreigners are among the numbers given, since they only in rare cases matriculate, partly because they have not gone through the regulation routine of the preparatory schools, and partly because they do not aspire to academic degrees or state positions.

From the year 1831-32 to 1896 the numbers in the following tables are given in averages for periods of five years each, while the attendance during the five semesters since 1896 is given in detail. See Tables I, II, III, IV, V, VI, following. Blanks in these tables indicate that the universities have not that particular faculty mentioned in the heading; thus, for instance, in Table II, Münster, Braunsberg, Munich, Würzburg, and Freiburg have no Protestant theological faculty, while in Table III, Berlin, Halle, Greifswald, Königsberg, Göttingen, Marburg, Kiel, Erlangen, Heidelberg, Leipzig, Jena, Rostock, and Strasburg have no Catholic theological faculty. In Giessen the Catholic theological faculty was abandoned in 1850.

The old German University of Strasburg, which had been discontinued during the possession of Alsace by the French, was reestablished in 1871, after the conquest of Alsace and Lorraine; hence the figures given date from that year.

Fluctuations in the attendance are particularly noticeable in Tables II and III, showing that the study of theology is subject to the prevailing political complexion and the economic conditions of the nation. It is certainly significant that 69 years ago 137 Protestant and 100 Catholic students were enrolled as theological students for every 1,000,000 Protestants and Catholics respectively, while in 1899 only 75 Protestants and 77 Catholic students were so enrolled.

On the other hand, we see the number of students of law first decrease from 110 in 1831 to 74 in 1886, and then gradually increase, till it reaches in 1899 a ratio of 165 to every 1,000,000 inhabitants.

The students in medicine numbered only 78 in every million in 1831, decreased to 35 in 1850, rose to 182 in 1890, and since then has decreased to 145 in 1899.

The least fluctuation is noticeable in the attendance of the faculty of philosophy, which prepares teachers for secondary schools, as well as

technologists, mathematicians, political economists, and pharmacists. It began with an attendance of 83 to every 1,000,000 inhabitants in 1831, and rose to 213 to every 1,000,000 in 1899. This great increase gives expression to the fact that this faculty attracts the students of natural sciences, political economy, and financial and administrative sciences, the State administration in Germany requiring many more officers versed in these sciences than formerly. The phenomenal expansion of German industry and commerce also has its influence upon the attendance of this faculty, and induces an ever-increasing number of students of empirical sciences to enroll in the universities, though the number of students of mental philosophy and philology is not decreasing, owing to the great demand for teachers of secondary schools in Germany.

Münster and Braunsberg are incomplete universities, having neither a law nor a medical faculty.

A very interesting feature of the attendance at German universities is seen in the fluctuations of summer and winter semesters. In the winter of 1896-97 Berlin had 1,816 law students; in summer of 1897, only 1,297. Again, in the winter of 1897-98 there were 1,921 law students, and in the following summer only 1,407; the number rose again in the winter following to 2,107. These fluctuations are partly explained by Prof. J. Conrad, who says: "Only a small number of students complete their studies in one university. A large number change universities several times; many attend two or three different universities in order then to return to the first." During the year 1891-92 a comparison resulted in the fact that the average length of attendance was 3.12 semesters, or 1.56 years. These numbers may not express the truth accurately, since foreigners are included in the comparison. The longest time was found to be spent by students in Königsberg, namely, 4.5 semesters; in Breslau and Tübingen, 4; while Heidelberg and Bonn, to which the students flock in summer, owing to the beautiful surroundings of the cities, show only 2 semesters. Naturally the facility with which students change their universities has constantly increased during the last five decades; for during the thirties the average time spent by students in universities was more than four semesters. The strongest migratory tendency is displayed by the law students, who, during recent years, spent on an average 2.58 semesters in one university; the Protestant theologians, 3.15; the Catholic theologians, 4.62; the medical students, despite their very extensive course, 3.72; the students of the philosophic faculty, 3.55 semesters.

TABLE I.—Number of students in German universities, 1831-1899.

[Number of matriculated students; averages for several years, or semesters, respectively.]

Brief statement of the schools of Sweden, with statistics .....	1878	clxxi- clxxii
Another brief statement .....	1884-85	cxcviii- cxcv
The school system of Sweden .....	1888-89	193-221
Education in Sweden .....	1895-96	966-994

[The following survey of education in Sweden is condensed from a pamphlet of 147 pages, by Dr. C. G. Bergman, inspector of elementary schools of Stockholm, which was prepared for the Art and Industries Exhibition held in Stockholm in 1897.

Dr. Bergman's arrangement is retained, the schools for the defective classes preceding the normal and secondary schools, the universities preceding the technical and manual training schools.]

#### ELEMENTARY EDUCATION (FOLKUNDERVISNINGEN).

[Infant schools (Småskolor); higher elementary schools (Folkhögskolor); elementary schools (Folkskolor); schools for defective classes (Abnormskolor); normal schools for elementary grades (Folkskoleseminarier).]

The education of the common people is now carried on in accordance with a royal decree of January 20, 1882. Preparatory to the elementary grades are schools for little children, who obtain therein the first elements of knowledge. Lower grade elementary schools are found in outlying sections of the country where the topography does not permit attendance at the elementary schools proper. Higher people's schools are also found in rural districts which may be too remote from the centralized graded schools. According to the reports of inspectors there are 13 of these higher schools in the 2,385 school districts of Sweden. One-fourth as many ambulatory as stationary schools are reported, namely, 8,296 stationary, 2,861 ambulatory, or a total of 11,157 schools (including the higher people's schools, 11,170). If the parents or guardians are too poor to fully equip their children for attendance in school, then the district provides the needed garments or text-books. The schools are under regular inspection, about 20 inspectors having been appointed in 1861; for the years 1893-1898 there were 50, to which may be added others in large cities, their numbers depending upon the needs of the schools as recognized by the city authorities. In 1895 there were 806,981 children of school age in Sweden; of these 409,977 were boys and 397,004 girls.

Children between 7 and 14 years of age classified, with the per cent in each class.

In order to become a teacher of the elementary schools it is necessary to hold a certificate of capacity from a State normal school, to be of good moral character, and to have passed the twenty-first year of age. For the lower grade elementary and infant schools similar prerequisites are expected, also special aptitude as teacher; a diploma of a seminary in the vicinity and proof of teaching capacity from the school committee may take the place of a State normal certificate. For the position of teacher of a high-grade public school a university diploma is to be held by the candidate, who must also have had experience as teacher in the practice department of a normal school.

a In 1868 the teachers were classified under infant and elementary school-teachers.

As the number of pupils for the year 1895 in the public schools was 724,253, so it happens that, there being in all 13,962 teachers, an average of 52 pupils to a teacher is found. The pay of teachers varies in the different schools, and for each class of school only the minimum amount is regulated by law. For a regular teacher, the length of school term being eight months, 600 crowns (\$161) is the salary, 700 crowns (\$188) after five years' service. Additional are a suitable lodging, firewood, summer and winter feed for a cow (or the same amount for other purpose), a piece of land on which potatoes and vegetables for one's own use may be planted.<sup>1</sup> In some cities the pay is sufficient to cover these necessities. For teachers of the above class of schools (i. e., elementary), in cities of over 15,000 inhabitants, the following table gives more specific details:

Cities.	Salaries (in crowns) of men teachers in elementary schools.				Salaries (in crowns) of women teachers in elementary schools.				Salaries (in crowns) of women teachers in infant schools.			
	For the first 5 years.	After 5 years' approved service.	After 10 years' approved service.	After 15 years' approved service.	For the first 5 years.	After 5 years' approved service. [The crown is valued at 25.8 cents, and hence the amounts can be reckoned at a little over one-fourth in dollars.]

<sup>1</sup> By decision of Parliament in 1898 the salaries of teachers after ten years' service must not be less than 800 crowns (\$214.00), with lodging, board, and fuel. The same decree establishes a basis for more substantial pension. (Allgemeine Deutsche Lehrerzeitung, den 7ten August, 1898.)

The pension of ordinary teachers in the elementary and higher elementary schools is managed by the "Folkskolärarnes pensionsinrättning." Every school district pays toward this institution from 30 to 50 crowns (\$8 to \$13.40) annually. The State also gives a certain subsidy, which amounted to \$95,762 in the last few years. The maximum pension is 750 crowns (\$201); the minimum, 525 crowns (\$141). Every teacher who has been in the service thirty years and is 55 years of age is entitled to a pension. Widows and orphans of teachers also receive a pension, which varies from 140 (\$38) to 200 crowns (\$54) for widows alone, and from 210 (\$56) to 300 crowns (\$80) where there are children. Marriage leads to loss of pension. Instruction is free in the elementary grades, the district and State authorities, as heretofore remarked, having arranged that matter satisfactorily, so that subsidies, State or local, support the schools. The expenditures for the elementary schools in 1895 were as follows:

For teachers' salaries:	Crowns.
In money, 9,102,072 crowns . . . . .	} ----- 10, 205, 714
Lodging, etc., 1,103,642 crowns )	
For school buildings and fixtures -----	2, 655, 734
For educational appliances -----	296, 544
Incidentals -----	2, 441, 144
Total -----	15, 599, 136
United States equivalent -----	\$4, 170, 570

From the State, for the salaries of teachers in elementary and infant schools, subsidies of 4,253,731 crowns (\$1,140,099) were expended; for teachers of continuation schools, 61,050 crowns (\$16,371). In the same year (1895) 2,483 schools received 185,236 crowns (\$49,643) for slöjd instruction, and 13 people's high schools received 15,600 crowns (\$4,280). Substitutes for 242 teachers received 42,245 crowns (\$11,321) from the State. The number of students being 724,253, the average cost for each pupil was 21 crowns 54 öre, about (\$5.50). Reckoned per inhabitant, the expenditure becomes 3 crowns 17 öre (or about 72 cents).

The teaching force receives its preparatory training, if men, in some one of the seven normal schools at Upsala, Linköping, Växjö, Lund, Göteborg, Karlstad, and Hermösand; or if women, at one of the five normal schools in Stockholm, Skara, Kalmar, Falun, and Umeå, all of which are State institutions. Four classes of a year each, covering thirty-six weeks of instruction—autumn and spring terms—are found in each of these schools. Three years of theoretical and one of practical instruction is the rule, the latter in the subjoined practice school. The studies are grouped as follows:

Branches of study.	Hours per week.			
	First class.	Second class.	Third class.	Fourth class.
Religion -----	6	5	5	4
Swedish language -----	6	5	5	5
Arithmetic and geometry -----	4	4	4	2

Slöjd -----	4	3 (4)	3 (4)	-----
Practical school exercises -----	-----	2	2	6

Admission to these schools is accorded if proper certification from the elementary grades is presented, and if the ages range between 16 and 26 years.

Examinations for promotion to a higher class occur at close of each year until the fourth year is reached. The diploma accorded at close of that year entitles to a position as teacher in elementary grades. At the close of 1896 there were 697 students in the 7 normal schools for men and 502 in the 5 normal schools for women, and there were 265 graduates (146 men and 119 women). The students of the first and of the second class of the normal schools can, by passing a certain examination, obtain positions as teachers of infant schools. In 1896 there were 2 men and 82 women students who passed this examination for teachers in infant schools. There are also private and provincially supported normal schools which prepare teachers for infant schools. The former graduated 231 teachers for infant schools, the latter 436, during the year. For teachers of the infant schools in Lapland there is a normal school, with a two-years course, at Mattisudden, in Jockmock district, from which 6 men and 30 women graduated in 1896. For teachers of the Finnish infant schools (*småskolor*) there is a school, with a three-years course, at Haparanda, which school graduated 5 men and 22 women teachers in 1896. The State gave 75,000 crowns (\$20,020) in stipends to students of the normal schools, plus 16,765 crowns (\$4,493) to those of the Lapland and Finnish normal schools, in 1896. For 1896 (stipends not included) a total of 353,325 crowns (\$94,691) was appropriated to prepare teachers for the elementary grades.

The people's high schools (*Folkshögskolor*) are an outgrowth of district regulations of 1862 and a parliamentary decree of 1866, which aimed to inculcate knowledge of the history of the fatherland and to so train the children of the peasant class that they would feel special interest in the problems of citizenship. In 1868 the first of these schools was opened; now there are 27 of these—11 for boys and 16 for girls. The term of study is from beginning of November to May for boys and from May to August for girls. No entrance examination is required, but the candidate must have passed through the elementary grades and be 18 years of age (boys) or 16 years of age (girls). There were 1,211 students in 1896; of these 760 were boys and 451 girls. The majority of these schools are established by private corporations or the provincial or district authorities aid in carrying them on. State subsidies are also given at stated periods. In 1896 the State subsidy was 65,550 crowns (\$17,647); for indigent students 15,000 crowns (\$4,020) were appropriated by Parliament.

The studies arranged for the boys are: General and Swedish history, geography, political economy, physics, chemistry, geology, hygiene and sanitation, Swedish language, arithmetic and geography, agricultural and commercial bookkeeping, linear drawing, surveying, penmanship, singing, and gymnastics. There is a more limited course for girls, viz: History and geography, hygiene and sanitation, domestic economy, Swedish language, arithmetic and bookkeeping, penmanship, singing and drawing, sewing, weaving, etc.

Schools for the defective classes include those for the deaf and dumb, in which instruction is given by three methods—articulation, writing, and drawing. The plan of study is that of elementary schools, and covers eight years. Expenses are defrayed by the districts. There are also private schools for this class of pupils. For deaf and dumb persons who are between 12 and 30 years of age there are three institutions, at Vadstena, Skara, and Bollnäs, but as the teaching of this class of unfortunates has been made obligatory, the schools for adults will eventually be closed.

The blind are taught at Tomtebodå, near Stockholm, in a preparatory school and also in a regular institution at Växjö. Special aptitude for skilled handiwork is developed. At Kristinehamn there is a manual training school for persons who have become blind late in life. The cost is paid in part by State subsidies. The course of study varies from four to six years in the different schools.

The twenty schools for idiots endeavor to develop whatever may be lacking in

the children. Supported by provincial governments, associations, and private individuals, these schools give physical training, moral and religious instruction, and when possible they give an elementary education. Children incapable of development are placed in asylums. Teachers for these defectives are especially trained for such purpose either in normal schools or other similar institutions.

#### SECONDARY EDUCATION (DEN HÖGRE UNDERVISNINGEN).

[General educational institutions of secondary grade (Allmänna läroverk); private educational institutions for boys (enskilda läroverk för gossar); coeducational schools (samskolor); royal higher normal schools for women teachers in Stockholm (kungl. högre lärarinneseminarium i Stockholm); private higher schools for girls (enskilda högre skolor för kvinnlig ungdom); boarding establishments for teachers (pensionsrättningar för lärarinnor).]

Secondary schools are those which aim to train the youth to become good citizens, by continuing the education commenced in the elementary grades or by preparing them for universities or special schools. These general high schools are divided into higher (7-class divisions or grades) and lower (5 or 3 classes or grades). The 5 lower grades are one-year classes; the 2 higher grades (sixth and seventh) occupy two years each; the school course, therefore, is of nine years. From the fourth grade the students follow either the classical or Real course. The first has Latin; the latter does not include that language. From the sixth grade there is another bifurcation for those who study Greek, or do not study it. These secondary schools are not all arranged on a similar plan, however, as some few of them are (1) complete classical schools, (2) others are complete Real schools, and (3) others have similar courses in all classes, from the fourth down. There are also pedagogier, or 2-class schools, with a course of study similar to that of the lower classes of the "Reallinien and Latinlinien." The number of secondary schools is 75. Of these 22 have 5 classes, 17 have 3 classes; in 20 there are complete courses for both divisions—Latin or Real. Twelve are complete for the Latin course and 4 for the Real course. One school is purely classical in its course of study; that is, the studies of the practical course (Reallinie) are not found therein. Two schools are purely Reallinien, the classical studies not being found throughout. Two 5-class schools are pure Real schools; the remainder have both classical and Real courses (Real och Latin linien). There are 4 "pedagogier." Three of these have 2 classes and 1 has 1 class. In Stockholm there are 4 higher grade schools, and 3 with only 5 classes; in Göteborg there are 2 higher grade schools and 1 of 5 classes. The other cities have only 1 high-grade school. Generally speaking, these higher schools are found in the chief towns of districts or in the larger cities; the 5-class schools in other important places; the 3-class schools and the pedagogier in the small cities.

The length of term is thirty-six weeks, divided into two semestri, autumn and spring. The former commences at close of August and ends in the middle of December; that is, sixteen weeks. The spring term is twenty weeks—from the middle of January to the beginning of June—when vacations commence and the school year is ended. During the thirty-six weeks there is a week's vacation at Eastertide and four days at Michaelmas. The number of hours of study per week varies in the different classes between twenty-seven and thirty-two, wherein are included instruction in singing and gymnastics. English is optional in the seventh class. Drawing and instrumental music are optional in all classes. Obligatory instruction in singing is given for two hours each week in each class, obligatory gymnastics for three hours. The daily hours of instruction—four to six hours—vary in different places. In the most of the schools it is from 7 to 9 o'clock and from 11 to 2 o'clock, and on afternoons from 4 to 5 o'clock. The hours for gymnastics, music, and drawing are still otherwise arranged, generally in the afternoon. Before the morning study hours the pupils have prayers, singing of psalms, and Bible reading. This is not reckoned in their study hours.

The hours of instruction are thus arranged:

Studies.	Common to both divisions.					Latinlinie.								Reallinie.					
	Class I.	Class II.	Class III.	Class IV.	Class V.	Class VI A.		Class VII A.		Class VI B.		Class VII B.		Class IV.	Class V.	Class VI.		Class VII.

Work is given out for the vacation period in languages, arithmetic, reading, and penmanship, and an examination at beginning of the term indicates the advancement made by the students. Admission is usually at commencement of the fall term. The pupils must be 9 years of age and give proof of ability to read fluently in Swedish, to write that language correctly, to have knowledge of Biblical history, of arithmetic, of the animals of the kingdom, geography of Scandinavia, with some information regarding the geography of the world. These requirements have been arranged lately so as to aid the student in his desire to enter the secondary grades. Examinations are also held from class to class, and if a pupil is forced to remain over two years in one class he is dismissed as unprepared or incapable of going on.

The examination at close of the school course, both oral and written, is attended by prominent officials. The written exercises for the classical A division consist of: Composition in Swedish, translation from Latin into Swedish, translations into German and French. For classical schools, B division, the written examinations include Swedish composition, translations from Latin into Swedish, translations into French or German, mathematics, four exercises in plane geometry and analytical geometry, exercises in mechanics and physics. Those who in the teacher's opinion have indicated sufficient knowledge in the written examination (the above exercises being sent to the minister of ecclesiastical affairs and public instruction) are given opportunity to pass the oral examination. This includes the studies in the highest grade, except the Swedish language, although a censor may absolve the students from examination in one or more of the branches pursued. If these examinations are passed, the student obtains a diploma which indicates fitness for entrance to the university. Of the 705 certificated students in 1896 there were 51 women. Of the students, 503 were from the public secondary schools, 75 from private schools, and 68 who had home instruction. As has been stated, the minimum age of admission to the secondary grades is 9 years. The course being of nine years, the age of graduation would be about 18 years. But in 1894 the average age in classes was 1.40 years above the normal; in 1895 the graduation examination showed that the pupils averaged 19.21 years of age.

The number of teachers and directors of these schools was in 1896 as follows:

Teaching force.	Second-ary schools.	Five class schools.	Three-class schools.	Total.
Directors (rektoren).....	36	22	17	75
Lecturers (lektoren).....	207	.....	.....	207
Assistant teachers.....	377	115	54	526
Teachers of music.....	36	22	17	75
Teachers of drawing.....	36	22	17	75
Teachers of gymnastics.....	35	21	17	73
Total.....	727	202	102	1,031

The pay of a teacher depends upon the number of years of service; an increase of pay comes with the number of years, providing that competency to fill the position has been shown. The salary of an extraordinary (extra ordinarie lektor) is 3,000 crowns (\$536); for teachers recognized as competent to fill regular positions in this grade of school, 1,800 crowns (\$482); other teachers, 1,500 crowns (\$402). The director receives also free lodging or money to pay rent from the city authorities, and sometimes other teachers receive similar extra compensation. All approved teachers of Stockholm and Göteborg have free lodging, and extraordinary teachers of these cities receive money for rental. Pensions are given to superannuated teachers, and teachers pay so much annually toward a fund for their widows and orphans.

The salaries of different grades of teachers is tabulated as follows:

Teaching force.	Grade of salaries.				
	First.	Second.	Third.	Fourth.	Fifth.

Upon entrance into an institution it is necessary to pay an admission fee of 10 crowns, which is divided as follows: To light and wood fund, 4.50 crowns; to library and apparatus, 3 crowns; to prize and poor fund, 2.50 crowns. For each semester each pupil is required to pay 4.50 crowns toward the library and apparatus fund, 5.3 crowns to the building fund, and 3 crowns to the light and wood fund, which amounts vary somewhat, but come to about 5 or 6 crowns. There are always students who can not pay these different fees, so that for those who are able it amounts to about 30 crowns (\$9.04). At every high-grade and every 5-class school, also at every 3-class school when means permit, a physician is stationed, who aids the rector in watching over the hygienic conditions of the school. All the higher schools have a library, many of them in the diocesan centers are of great value. The chapter and school library at Linköping has 80,000 volumes, 1,600 manuscripts, 1,000 parchment letters, 1,000 foreign and 12,000 Swedish academy dissertations. There are also collections of natural history, zoological collections, instruments and apparatus for instruction in physics. Each school building must be so constructed that all rooms shall be of sufficient capacity for seating purposes and recitation, also well lighted and heated, so that the health and comfort of the pupils may be taken into consideration. Each city must give sufficient space for the school buildings, grounds, gymnastic halls, and playgrounds. In some cases the city authorities have to erect and keep up the schoolhouses, in other cases the diocesan authorities have the expenditures under their control; again State subsidies are applied for. The cost of some late school buildings, with their furnishings, was as follows.

City.	Cost of buildings. <i>a</i>	Year.	Amount.
Stockholm.....	(The Higher Classical Institute at Normalm.....	1880	\$225,656
	(The Higher Institute at Södermalm.....	1891	242,888
	(The Higher Real School.....	1890	209,844
Göteborg.....	The Higher Real School.....	1885	157,256
Sundsvall.....	.....	1886	83,884
Vaxjö.....	.....	1889	84,956
Lund.....	.....	1896	53,600

*a* Cost of grounds, 300,000 crowns (\$80,400).

Each diocese has for the benefit of the schools a building fund, a prize and a poor fund, which funds are subdivided among these institutions in proportion to the number of pupils.

The State expenditures for the institutions of a secondary grade were 3,483,574 crowns (\$933,594) for 1895. The average of pupils for the two semesters of 1895 was 14,971. When this amount is divided it gives State aid to each pupil of 229 crowns (\$71).

The private institutions for boys have the same right to give maturity certi-

cates as the public schools. These are the Beskowska School, in Stockholm, the Fellstedtska School, in Upsala, and the Lund Private Elementary School.<sup>1</sup> The Fellstedtska School trains students to become preachers in the State church; the Beskowska School takes both boys and girls in its lower division, but in the gymnasial division, the four higher classes, there are only boys.

The "Samskolor," namely, schools where boys and girls work together in all classes, are of a private character; the "Palmgrenska Samskolan," in Stockholm, is the oldest; it has the same high grade of maturity examination as in the public schools of this grade. The main effort in these coeducational schools is to have an eclectic course, to employ the best methods of instruction in foreign tongues and other studies; to train in slöjd, etc.

There are two coeducational institutes in Stockholm in addition to the Palmgren School, one in Upsala, and others in Falkenberg, Hedemoda, Lindesberg, Motala, Ronneby, Sollefteå, and at Djursholm. Generally speaking, the coeducational school is the only school of the town where a higher grade of instruction than that of the elementary school can be obtained. Several of these schools receive State aid, the largest amount, 8,000 crowns (\$2,144), goes to the Palmgren School.

The Royal Higher Normal School in Stockholm and the lower normal school connected with it, serves to train women for the teaching profession, and to give them opportunities for practice. Free instruction is given to students generally; the State subsidy is about 49,500 crowns (\$13,266). The length of term is thirty-four weeks, from September to June, with vacation periods at Christmas, Easter, and in summer. Examinations are held at close of the school year in the seminary, and at the close of the three years' course—a fourth year is optional—a graduation examination leads to the requisite diploma for admission to the teaching force. The course of study for the seminary includes religion, Swedish, French, German, and English languages, geography, history, mathematics, natural sciences and natural history, pedagogics and methods, physiology, and the laws of health, singing, drawing, and gymnastics. In the normal school the course is as follows:

	Preparatory school grades.			Normal school grades.								
	1.	2.	3.	1.	2.	3.	4.	5.	6.	7.	8.	
Religion .....		3	3	2	2	2	2	2	2	2	2	2

a Optional.

b Optional in seventh and eighth classes.

c Optional in fourth, fifth, and sixth classes.

<sup>1</sup> The "Elementar skola" really classes with secondary schools; hence the term elementary seems almost a misnomer.—[E.D.]

Pupils of 5 to 6 years of age enter the preparatory class; at the age of 17 or 18 years they are ready for graduation. The expenditures per pupil range as follows:

*Annual expenditures per grade.*

	Fall term.	Spring term.	For the year.
	<i>Crowns.</i>	<i>Crowns.</i>	<i>Crowns.</i>
Grades 1 and 2 of preparatory school.....	55	40	75
Grade 3 of preparatory school.....	45	55	100
Grade 1 of the school proper.....	50	60	110
Grades 2 and 3 of the school proper.....	60	75	135
Grades 4, 5, and 6 of the school proper.....	70	90	160
Grades 7 and 8.....	80	105	185

Instruction is given in domestic economy in these schools since 1893. The State gives 5,000 crowns, a private individual 1,500 crowns, for that purpose. Both theoretical and practical courses are given. Private schools for girls numbered 120 in 1897; of these, 91 received State subsidies under certain conditions. According to the regulations they are expected to submit to inspection similar to that of State schools, to furnish an annual report, to have at least 30 pupils in the last three years of a five-year course, to receive gifts and donations from district or private parties in amount equal to the State gifts, to have medical inspection, and to show that all hygienic rules have been adhered to.

The general rule for these schools is a five-year course, but there are those which have eight years. The course of study is similar to that of the State normal school for girls (mentioned above); but hand work includes slöjd-training sometimes, also the history of art and literature in the highest classes. There are continuation classes to train pupils for entrance into the normal school, or even to become teachers of language or some other branch. Male teachers instruct for only a few hours. The women teachers are regularly employed, at salaries varying from 800 to 1,400 crowns (\$314 to \$375). The directress receives at the largest schools \$536.

The Swedish Association for the Pensioning of Women Teachers accords life pensions to teachers after their fifty-fourth year. Each recipient is obliged to exhibit a certificate of graduation from a normal school or indicate that she has had two years' experience as teacher. Each teacher pays for a twenty-five-year period, or to the fifty-fourth year of age, at least 15 crowns (\$4) annually toward the fund. This is in accordance with a royal statute of May 29, 1885.

There is also a "pension" or boarding institution for women teachers of the high-grade schools who have reached their fifty-fifth year, or, if unmarried and over 25 years of age, they may desire to live in a teachers' home and specified payments are made toward that end.

UNIVERSITIES AND HIGH SCHOOLS (UNIVERSITET OCH HÖGSKOLOR).

Royal University at Upsala and Lund (Kungl. universiteten i Uppsala och Lund); Royal Caroline Medico-Surgical Institute in Stockholm (Karolinska mediko-kirurgiska institutet i Stockholm); The high schools (universities) at Stockholm and Gothenburg (Stockholms och Göteborgshögskolor); Royal Central Gymnastic Institute (Kungl. Gymnastiska Central institutet.)

The University in Upsala was opened in 1477, the University of Lund in 1668, and the Caroline Medico-Surgical Institute in 1815. The chancellor, appointed by the King, holds the highest office in connection with these universities; the archbishop (Upsala) or bishop (Lund) is the pro-chancellor. The rector, academic consistory, and board of finance are under supervision of the pro-chancellor. The medical institute is under the general supervision of the rector and a body of professors. Each university has its four faculties, theological, legal, medical, and

philosophical, the last being divided into the philologic, the mathematical, and natural science divisions. The students are divided into corps in accordance with the provinces from which they come. There are 13 of these corps<sup>1</sup> at Upsala and 12 at Lund University, which have certain members of the professors or student force in charge.

The university library at Upsala has 280,000 volumes and 12,000 manuscripts; at Lund University there are 150,000 volumes and 1,500 manuscripts; the Caroline Medico-Surgical Institute has 30,000 volumes. All have scientific collections.

	Stu- dents.	Profes- sors.	Expenditures.	
			Crowns.	United States equivalent.
Upsala University .....	1,460	131	842,752	\$225,855
Lund University .....	570	94	533,372	143,476
Caroline Medical Surgical Institute .....	305	41	195,058	54,275

At Upsala there were 25 women students (philosophical faculty, 23; medical and legal, 1 each); in Lund, 10 (medical faculty, 4; philosophical faculty, 6); at the Caroline Institute, 14. They are not permitted to study in the theological faculty. In the summer of 1893 vacation courses were held at Upsala, and 329 persons, mostly teachers, attended. Similar courses were introduced in Lund in 1894. The high school, or university, at Stockholm commenced under the auspices of an association having as its object the development of science and of scientific instruction. There are four faculties—historico-philosophical, philological, mathematical, and natural scientific—and the law faculty. The board of directors consists of 7 members—1 from the Swedish Academy, 2 from the Royal Scientific Academy, and 2 from the municipal authorities; the sixth is the rector; the seventh is chosen by the other members of the board. The appointment of professors is made by the board. Each student pays 25 crowns (\$6.70) at the beginning of each semester and 25 more at graduation, unless it may be proven that the financial condition does not permit of such expenditure. Hearers pay 10 crowns (\$2.60) for each course taken. There are no examinations at Stockholm University. The students numbered 40 in 1897; hearers, 123. The funds of the university at close of 1896 were 3,890,248 crowns (\$1,042,586). Of this amount, 3,747,576 crowns (\$1,004,350) was under control of the directive board of the university and the remainder under the board of finance of Stockholm. In 1894 it was decided to establish a division for the science of law and state administration, but this has not been accomplished.

The University at Göteborg was founded through private donations, but in 1889 its statutes were ratified by King Oscar, and in 1893 it was given the right to hold public examinations. In 1897 there were 7 professors at Göteborg University, 6 docents, and 2 "extraordinary" teachers for languages. Students in 1896 numbered 52 (2 women); hearers, 36. At the public lectures there averaged 250 to 300 hearers. Since the first examination, in 1894, 8 students have passed the examination prescribed for candidates in philosophy (filosofie-kandidat examen), and 2 for that of licentiate in philosophy (filosofie-licentiat examen). The funds<sup>2</sup> of the university amounted to 2,035,000 crowns (\$545,380) in 1897.

The Royal Central Gymnastic Institute in Stockholm trains young men and women to become gymnastic teachers or to act as masseurs. Among the students

<sup>1</sup> Called Studentenkåren. These indicate, as in Finland, the "nation" or section of the country from which the students come.

<sup>2</sup> Through donations, etc., the funds (fonder) of the university amount to the above; those form the capital for purposes indicated by the university authority.

are young officers who require gymnastic exercises. The board of directors consists of a chairman, a military man, a teacher, and a physician, which board has supervision of gymnastic instruction in all institutions. The number of students in 1896 was 87 (59 boys and 28 girls), and 665 patients (579 women) were treated for various diseases. The annual expenditure was 46,000 crowns (\$12,308). This institution was founded by Per Henrik Ling in 1813 and carried on by him until 1839. The followers of Ling have since carried out his views regarding the training of the human organism, so that the youth of the land bids fair to have a good bodily (as well as mental) education.

#### MILITARY SCHOOLS (MILITÄRLÄROVERK).

[Educational institutions for the army (Armeens undervisningsantalter); educational institutions for the navy (Flottans undervisningsanstalter).]

The lowest grade of schools are to train recruits (rekrytskolor) for a soldier's career, for corporals and subofficers. Volunteer schools at Karlsborg, Norrköping, Hernösand, Ronneby, and Notviken are for persons who hold the diploma of a secondary school and have had a previous four months' training as recruits. A cavalry school in Stockholm trains for that branch of the service. Instruction in hospital work, in manufacture of gunshot, and horseshoeing is also given. For officers and aspirants for that position there is a military school at Karlberg, with a seventeen months' course. A high-grade artillery and engineer school is at Stockholm for those desiring to enter that branch of the service. The course includes military science, mathematics, mechanics, physics, chemistry, descriptive geometry, geodesy, and architecture. A high-grade military school at Stockholm has a two years' course which covers, among the different subjects, history of wars, the art of war, service on the general's staff, military administration, tactics, the art of making fortifications, military geography, geodesy, foreign languages, etc. Additional schools for this branch of military affairs are that for instruction in shooting at Rosersberg, for officers of infantry and cavalry; the artillery school at Marma, for field practice, and at Vaxholm, for fortification shooting; the riding school at Stockholm, where the officers of the cavalry must take a course in order to obtain a position as officer of the second degree.

For the navy there is the Royal Naval School, which gives the theoretical and practical instruction needed for a position as officer in the royal navy. Schooling is given both on sea and land, the teaching force consisting of officers in the military service and civilians for other branches of the service. The course is one of six years. There is an apprentice school at Karlskrona, and navigation schools at Stockholm, Göteborg, Malmö, Gäfle, Kalmar, Karlshamn (complete), Hernösand, Visby, Västervik, and Strömstad. The navigation school per se instructs the sailor in the requirements of his profession. A complete navigation school has two divisions—that for ship's captain, helmsman, and a division for machinists, mechanics, etc. The courses are held during the months of September-October and April-May.

#### TECHNICAL INSTRUCTION (DEN TEKNISKA UNDERVISNINGEN).

[Lower technical industrial schools (De lägre tekniska yrkesskolorna); technical school at Eskilstuna (Tekniska skolan i Eskilstuna); school of Slöjd Association in Göteborg (Slöjdföreningens i Göteborg skola); technical elementary schools (De tekniska elementar skolorna); Chalmers technical school in Göteborg (Chalmers tekniska läroanstalt i Göteborg); technical school in Stockholm (Tekniska skolan i Stockholm); technical high schools (Tekniska högskolan).]

Quite a number of technical schools of higher and lower grades are found in different parts of Sweden. The technical high schools train young men who purpose entering the technical industrial field. The one in Stockholm has five divisions, the highest being an industrial art school, with a seminary for training teachers

in drawing, fine penmanship, and modeling. The Chalmers Technical School, in Göteborg, and the four technical institutions in Malmö, Norrköping, Örebro, and Borås are especially adapted to the instruction of students who devote themselves to some phase of engineering. Representative of the industrial phase of education (metal work, blacksmithing, etc.) are the schools at Eskilstuna, and the 32 technical handwork and industrial schools. These receive State subsidies and are under State inspection. Schools of a private nature, including the Slöjd Association in Göteborg, train in similar industries to the above. All the technical schools have developed during the last ten years, the number of students having nearly doubled. Expenditures were consequently greater during that period.

Instruction has become more rational, and important branches have been added to the course in the higher-grade schools, while in the lower grades there is greater tendency toward industrial training rather than toward a continuance of elementary branches.

The 32 lower technical industrial schools are evening and Sunday schools for the benefit of workmen who have no other hours apart from their labor. They receive 45,000 crowns (\$10,060) annually from the State, provided a similar amount is furnished by the municipality where situated, and State inspection is allowed. Men and women receive instruction in the elementary branches in free-hand and linear drawing, geometrical combinations, Swedish language, fine penmanship, etc. Modeling, wood carving, plastic art, bookkeeping, fine sewing, and decorative art come into the woman's course; painting, mechanics, the use of machinery, and construction of buildings are branches in the course for men. If there are technical elementary schools in the same town, then those and the evening and Sunday schools complement each other.

To become a student in these schools the twelfth or possibly fourteenth year of age must have been passed and the student must have been taught the minimum course in the elementary schools. In the 32 schools in 1895-96 there were 5,392 pupils—i. e., 4,180 males and 1,212 women.

The largest of these schools is at Malmö, where 23 persons taught 900 students in 1896-97 in geometrical free-hand, perspective, and figure drawing, in algebra, geometry, mechanics, Swedish, fine writing, and bookkeeping. Entrance fees were 2 crowns (53 cents) in the autumn term and 2.50 crowns (67 cents) for the spring course. The school year commences on September 1 and ends on May 15, with seventeen days' vacation at Christmas.

The technical school at Eskilstuna has a special division for iron and metal industry, in addition to the Sunday and evening schools, which were established in 1858. Instruction is given in a regular course similar to the above course by lecture, practical application, and exhibits of the raw stuff and the manufactured article. The fourteenth year must be passed before one can enter this school. In 1895-96 there were 150 students and in the special school 33 pupils.

The school of the Slöjd Association in Göteborg is private in character. Its fees vary from 1.50 crowns (40 cents) to 2.50 (67 cents). Instruction is given from 7 to 9 and 8.30 to 10.30 a. m. and from 1 to 3 p. m. The number of pupils in 1896-97 was 941 (of whom 341 were women). This school is not inspected by the State, nor does it receive subsidies therefrom.

Between the technical industrial schools and the higher institutions there stand four technical schools—at Malmö, Norrköping, Örebro, and Borås; the first established in the year 1852, the others in the following year. The studies are arithmetic, planimetry, stereometry, logarithms, trigonometry, elements of analytical geometry, linear drawing, practical geometry, field surveying, mechanics, science of machinery, mechanical and chemical technology, experimental physics, chemistry and laboratory work, mineralogy and geognosy, the Swedish tongue (and either German, French, or English), bookkeeping, commercial correspondence, exchange, the first elements of architecture, sketching (krokiriting), free-hand

drawing, modeling, gymnastics, and practice in the use of weapons (vapenföring). A three-years course is required, of thirty-six weeks each. For one and one-half years the course is common to all; then comes a division, and the studies lead to the special technical or industrial trade or profession which the student intends to follow as a career.

To enter these schools the fourteenth year must have been passed, and an entrance examination is required. The pupil pays 10 crowns (\$2.68) entrance fee and 20 crowns annually; or sometimes a sum specified by the board of directors. If there is poverty, these fees may be dispensed with. Each of these institutions receive State subsidies of 22,600 crowns (\$6,056). In 1896-97 the Malmö technical had 85 pupils; Norrköping, 71; Borås, 68; at Örebro, 85.

The Chalmers Technical Institute, at Göteborg, which is a grade between the technical elementary and the technical high school, dates from 1811. Various changes in the government of the school have taken place, until the present statutes of 1877 were sanctioned by the King. Its present name, Chalmers tekniska läroanstalt i Göteborg, dates from 1883. The school has higher scientific-technical and lower-practical divisions; knowledge of, and examination in, certain branches are required for entrance into these divisions. In the higher division there is examination in mathematical branches, in history and geography, in Swedish grammar, and translations from German or English. For ship construction knowledge of English is required.

*Number of students.*

Years.	Students.	Years.	Students.
1829-30 .....	29	1869-70 .....	123
1839-40 .....	62	1879-80 .....	144
1849-50 .....	68	1889-90 .....	168
1859-60 .....	107	1896-97 .....	245

The income for 1896 was reckoned as follows:

	Crowns.	Dollars.
State subsidies .....	57,232	15,338
School fees .....	4,896	1,312
Revenues from donation funds .....	3,404	912
Gifts and from rents .....	1,148	307
<b>Total .....</b>	<b>65,682</b>	<b>17,869</b>

The technical school in Stockholm has the following subdivisions: (a) The technical evening and Sunday school; (b) the technical school for female pupils; (c) the higher industrial art school, with a division for instruction of drawing and writing teachers; (d) the school of architecture; (e) the school for machinery. Each subdivision has its special hours and course of study and its directive board, although there is a general governing board for the whole school.

In the (a) division the youth who are engaged in some industry are taught branches which will be helpful to them in their work, such as all kinds of drawing, ornamental work, mathematics, mechanics and mechanical drawing, technology, drawing, construction of buildings, etc. The men have opportunities, under certain conditions, to attend the courses in wood carving, metal work, and engraving in the higher art industrial school.

The school year (October 1 to April 30) is divided into school days from 8.30 to 10.30 a. m., 5 to 7 and 7 to 9 p. m. Entrance requirements are that the student be 14 years of age, have good habits, and a certificate indicating knowledge of arithmetic, composition, good penmanship, etc. If there is no certificate, an examina-

tion is required. The school fees for students who are already in the trade are 4 crowns (\$1.07); for other students, 50 crowns (\$13.40). The (*b*) division furnishes technical instruction to women who are already engaged in industrial work. The school year is from October 1 to April 30; the entrance requirements and fees are similar to those of division (*a*); the hours are from 9 to 11 a. m., 12 to 3, and 5 to 7 p. m. The course includes geometrical and linear drawing, the elements of geometrical drawings, perspective free-hand, figure, and landscape drawing, and special instruction in drawing for industrial art work, painting, modeling of ornaments and figures, arithmetic, geometry, natural sciences, knowledge of wares, composition, bookkeeping, and fine penmanship. Under certain conditions the pupils may attend the course of instruction in wood carving, cutting in metal, and the art of engraving in the higher school for art industry. The (*c*) division—Högge Konst industriella Skolan—instructs both men and women in a knowledge of the higher types of industrial art. The instruction aims first to train in designing, decorative art, modeling, metal work, and engraving, so that skill in such form of work will be developed. Another division of the school trains individuals to be teachers of drawing, modeling, fine penmanship, etc. The school year is from September 1 to May 31; school hours from 8.30 to 11 a. m., 12 to 3, and 5 to 7 p. m. To enter the first section of this school a certificate of good conduct and of having passed the sixteenth year is required; also some exhibit of free-hand and linear drawing, painting, and modeling. To enter the second section there are similar requirements, except that the eighteenth year must have been passed, and the certificate of having passed through the fifth class of the higher school is required; also knowledge of perspective and shading. The subjects of instruction are industrial art drawing, composition and combinations of color and fabrics, modeling, sculpture for industrial art, and practice in making of plaster casts, painting and decoration, wood carving, metal work and engraving, style in art and the elements of art history, drawing for use in painting on porcelain and glass, leather work, etc. Free-hand drawing, perspective, and instruction in methods and practice occupy the student's attention a part of the time. With care and industry the course may be completed in three years, although it is optional with the student to attend for a more or less extended period.

The annual school fees were, for students from technical industrial trades, 20 crowns (\$5.36); for candidates for teachers of drawing and penmanship, 20 crowns (\$5.36); other students, 60 crowns (\$16.08); students taking optional branches, 15 crowns (\$4.02) for each branch.

The (*d*) division is that for builders, who can pass the winter months (November 1–April 30) obtaining more skill and training in their special trade. Admission requirements cover the sixteenth year, good conduct, knowledge of arithmetic, algebra, linear and free-hand drawing, and a half year's practice in construction. The course of study includes construction according to a geometrical basis, linear drawing, composition of simple ornaments, arithmetic, algebra, planimetry and stereometry, land surveying, mechanics, natural science, architecture and practice in drawing of planes, description of processes of building, bookkeeping, and composition. Three years complete the course, and pupils may enter at commencement of any year. Hours of study, 8.30 to 10.30 a. m., 11 to 2 and 5 to 7 p. m. School fees, 10 crowns (\$2.68).

The (*e*) division consists of the machine school (maskinyrkesskolan), in which from November 1 to April 30 instruction is given in similar studies, except that the tendency is toward the use of machines, mechanical drawing, mechanical technology, etc., rather than toward architectural training. A two or three years' course is given, in accordance with the needs of the pupils. Special teachers and courses are given in this Stockholm technical school in still life (stillära), ornament composition, fine needlework, painting, photography, drawing from the

form and anatomical study, gymnastics, electro-technical course in mounting (montörkurs), etc.

An annual fee for attendance at any one of these courses is 2 crowns for those in the trade and 5 crowns for others. The library of the school has 10,000 volumes, mostly of a technical character. The museum contains several thousand models. The school has its own building, paid for by the State and city. The annual income is 123,000 crowns (\$32,964). Pupils in 1896-97 numbered 1,794.

The technical high school in Stockholm, the highest institution of the kind in Sweden, dates from 1798, and has undergone many transformations since that period. The statutes of 1877 are the basis of the present school work. The object is to instruct pupils who desire to follow a technical industrial career by giving scientific instruction leading to such an end.

Years.	Candidates.			Pupils admitted.			Total number of pupils.			Examined.

1858-1869 .....	66	27	44	50	23	32	137	93	115	36	13	24
1869-1878 .....	156	33	95	104	27	63	232	113	193	66	20	39
1878-1896 .....	133	50	102	103	41	80	336	153	240	107	98	51

The course of study includes pure mathematics, geodesy and topography, geometry, elementary mechanics, higher theoretical mechanics, description of science of machinery, construction of simple machines, theoretical teaching about machinery and machine construction; the chemistry, mechanics, and science of mining; ship construction; mechanical technology, physics, theoretical and practical electrotechnic, general and analytical chemistry, metallurgy and metallurgical investigations, mineralogy and geology, architecture and statics of building, house construction, history of architecture, waterworks construction, road building, linear and free-hand drawing, ornamental work, modeling, work in the shop with practical exercises; as optional branches national economy, technics of hygiene, and electrolytical chemistry. There are special subdivisions of this school—one for the science of machinery and mechanical technology, with a three or four years' course; one for chemical technology, with three-years' course; one for the science of mining, with three subsections—one for the mechanical science of mining, with four-years' course; for metallurgy, quarrying, and mining-furnace work, with three or four years' course; one for architecture, with four-years' course, so arranged that the student can at close of the third year attend the Academy of Liberal Arts, and one for public works (water and roads), with four-years' course. There are two semesters, from September 10 to December 23 and from January 7 to June 10. In some of the schools there were practical exercises carried on to a later date. The teaching force consists of full-fledged professors with thorough scientific attainments, also teachers and assistants who aid in the instruction. The students numbered 319 in 1896, divided into ordinary, extraordinary, and special students. Each ordinary student pays from 20 crowns (\$5.76) to 10 crowns (\$2.68). For the special and the extraordinary students the fees vary in accordance with the class and number of studies pursued. The annual State subsidy for this school amounts to 146,700 crowns (\$39,315). For 1897 an extra amount of 5,574, for strengthening the instruction, was given by the State. The State subsidy to indigent students amounted to \$804 for the year 1896. There are also ten scholarship funds, which amounted in 1896 to \$37,610. The library possessed 23,600 volumes at close of the year 1896. The technical high-school building dates from 1860-1863, but new buildings for certain purposes are in process of erection.

## SPECIAL SCHOOLS (ANDRA TILLÄMPNINGSSKOLOR).

[Royal Academy of Fine Arts (Kungl. Akademien för de fria konsterna); Royal Conservatory of Music (Kungl. Musikaliska akademien och Musikkonservatorium); agricultural schools (landtbrukets undervisningsanstalter); forestry schools (skogsläroverken).]

The Academy was founded in the year 1735, and at that date was called the Academy for Painting and Sculpture. United with it is a higher institution for painting and sculpture for both sexes and a school of architecture for men. The Academy has a director and seven professors—three in drawing of figures and painting, one in figure drawing and modeling, one in landscape drawing and painting, one in architecture, and one in plastic anatomy, and three in drawing from the antique, in perspective and shading, and in art history.

The Royal Conservatory, united with the music academy, established in 1771, is an institution which trains organists, choir singers, teachers of music for schools or directors of music in the military corps. Instruction is also given in such branches as would naturally be found in an institution for the scientific study of music and dramatic presentation. There are seven branches of study: Organ, singing, wind and string instruments, harp, piano, and composition.

The agricultural high schools at Ultuna and Alnarp teach the higher theoretical and practical knowledge required for a rational development from the agricultural side. There is also study in phases of agriculture in other lands, with its possible application in Sweden. Two courses of two years each, a higher and a lower, are required for such purpose. The 23 agricultural schools aim to give skill to students in agricultural pursuits and to give thorough practical training for such avocation. In order to give practical application of the branches studied, it is required of the students that they work in the fields, etc. A two-years' course of study includes instruction in the mother tongue, fine writing, arithmetic, linear drawing, rural engineering, forestry, etc. (liniers och ytors samt solida figurers beräkning, uppmätning, afvägning och kartläggning af ägofigurer).

Schools for farmers (landtmannaskolor) are more especially for the theoretical training of would-be farmers.

The higher agricultural schools are maintained by the State. The agricultural schools only receive certain subsidies. Dairying is an accompaniment to instruction in agriculture. Still there are regular dairy schools maintained by the State, namely, an institute at Alnarp, two dairy schools and sixteen dairy stations. The State has also a certain number of instructors and teachers in cattle raising, dairying, woolgrowing, and sheep raising.

*Forestry schools.*—The Academy of Forestry in Stockholm and the eight forestry schools give instruction tending toward the position of foresters and their aids.

The course leads to a knowledge of management of forests, forestry cultivation and classification, field and wood measurements, instruction concerning the earth and climate, and science of planting.

The course in the forestry schools is of one year, in the institute two years, and students are permitted in the institute only after passing through the forestry school of Omberg.

Other schools coming under the head of special schools are the pharmaceutical institute (to train persons desiring to be pharmacists), the veterinary school, schools to train gardeners, expert fishermen, commercial schools, and those for domestic economy.

## SLÖJD INSTRUCTION (SLÖJD UNDERVISNINGEN).

[Slöjd for Boys (Mänlig Slöjd): wood, paper, and metal work (Träslöjd, Papp och metallslöjd); Slöjd for Girls (Kvinnlig Slöjd); Normal School for Teachers of Slöjd at Nääs (Nääs Slöjd lärare Seminarium).]

In the early seventies the first movement in regard to the introduction of slöjd for boys took place first by private initiative; then communal and provincial authorities and agricultural societies carried on the matter. The State only aided in the general maintenance at first. The Royal Agricultural Academy, having charge over slöjd, obtained aid from the agricultural societies.

In 1877, when nearly 80 schools had instruction in slöjd, the Diet gave a subsidy to needy students in each school district, at the rate of 75 crowns (\$20) annually, when four hours' or more slöjd instruction was given in the schools. In 1894 changes were made, so that if there were at least 10 students in each school receiving such instruction, with no neglect of other branches, 75 crowns (\$20) a year for each school was given by the State, if four hours a week were devoted to this branch during the school year. If there are divisions for slöjd instruction with at least 15 pupils, then the \$20 subsidy is given to each division. The schools receiving State aid for slöjd, mostly elementary schools, were as follows:

Year.	Schools.	Year.	Schools.	Year.	Schools.
1878.....	103	1884.....	584	1890.....	1,392
1879.....	163	1885.....	727	1891.....	1,492
1880.....	234	1886.....	872	1892.....	1,624
1881.....	300	1887.....	901	1893.....	1,787
1882.....	377	1888.....	1,167	1894.....	1,887
1883.....	463	1889.....	1,278		

The new subsidies went into effect in 1895, and the 2,483 divisions (afdelningar) received 185,236 crowns (\$49,643), some portion of which came from provincial and communal authorities and agricultural societies, corporations, etc. The increase of those under slöjd instruction is so great that, as the State subsidy goes to the school district for distribution, it follows that higher grade schools, private schools, etc., do not receive any part of it.

Slöjd instruction is given in the 7 teachers' seminaries, since 1876 in Karlstad, since 1888 in Lund and Hernösand, since 1892 in Linköping, and since 1893 in Upsala, Göteborg, and Växjö. Courses in slöjd have been carried on in several provinces under the supervision of recognized teachers (State appointees) of the Royal Academy of Agriculture. Other persons are employed for the instruction proper, the majority of whom have followed courses in the Slöjd Seminary at Nääs. Slöjd instruction is not a requirement of the State, but there are subsidies for it, and there is the requisite State inspection. In Stockholm there are special slöjd-school inspectors. The best methods to be employed for the development of slöjd instruction were discussed in 1895 at the meeting of the Northern Teachers' Association in Stockholm. These include a graduated series from easy to more difficult exercises, the cultivation of individuality in the work, the harmonious development of body and mind leading toward work, order, exactitude, and skill, the courses to be given by teachers who have both theoretical knowledge of slöjd and pedagogical training.

In addition to the teaching of slöjd in wood, there is in the Stockholm schools work in pasteboard and metal slöjd. The training in the different kinds of pasteboard work is especially for children of both sexes in the lower classes, wood slöjd not being undertaken until the eleventh or twelfth year of age. Training in metal work, with a well-arranged series for this kind of instruction, greatly interests those who take part in it.

Slöjd instruction for girls is not obligatory in Sweden, although it is stated to be so in most European countries, but within the last twenty years slöjd for girls has been introduced into many schools. This is the outcome of the development in skilled handiwork, such a system being known in Germany as the Schallensfeld method, from Rosalie Schallensfeld, who introduced and developed it. The Swedish plan is known as "the Stockholm method," which has gradually been introduced from the elementary school into schools of higher grade and into seminaries. The special effort is to train hand and eye, to develop individuality, skill, and system, and to so train the young girls that they will be thoroughly in sympathy with duties in the household. Progressive methods are used. The course includes knitting, darning, sewing, drawing, designing, cutting and planning of garments, and skilled handiwork generally. During the years 1885 to 1897 fully 573 slöjd teachers have been trained to carry on the above phase of slöjd training.

The Slöjd Teachers' Seminary at Nääs was established twenty-five years ago as a slöjd school for boys, which afterwards developed into the well-known seminary where teachers of slöjd in the elementary schools were trained. The courses aim to give thorough training in pedagogical slöjd. The instruction, which is gratuitous, covers slöjd pedagogy, history of pedagogy, psychology, drawing, wood slöjd, and gymnastics. All the material used is free, also lodging (if desired), but meals cost from 45 to 47 crowns (\$12.06 to \$12.59) a course. The finished work is given to the pupils so that it may be used in the courses over which they may have charge.

The number of persons in attendance at the four courses per year was from 270 to 290, the majority of them teachers. Since the foundation 1,904 men and 723 women have taken part in some one or more of the courses to date of 1896, but if one counts each course taken by a person the number is 3,441. Some 670 teachers from other countries have followed the courses. Since 1895 there has been a course to train teachers having charge of plays and games for children. This course in the theory and practice of educational games seems an especially popular one. The term "Nääs-system" is given to pedagogical slöjd as taught at this school, its aim being to so thoroughly train the individual under instruction that he develops skill, character, readiness of thought, love of work, exactitude, neatness, dispatch, practice in teaching, thoroughness in production. He is taught how to hold his body, to develop the muscles, to understand physiological ideas, to develop the will, and broaden his ideas. In the main work of slöjd instruction in wood he is taught to carry out his own individuality to a certain extent. The special tool used in slöjd, as taught at this school, is the knife. The pupil must have attained the tenth to twelfth year. The workshop for the workmen and the training school for the teacher are the two main elements in the Nääs system. Experience has taught that this is the best method for an all-round development.

## EXPENDITURES.

The expenditures for the year 1895 were subdivided as follows:

Expenditures.	Crowns.	Dollars.
The common schools .....	16,074,934	4,307,948
The higher schools .....	5,161,500	1,383,282
The universities .....	1,492,283	399,931
Technical instruction .....	921,283	246,933
Total .....	23,650,120	6,338,064

Divide this amount according to the total of inhabitants, 4,886,922, and we have per capita 4 crowns 84 öre. Then there must be added thereto the expenditure

for military, agricultural, forestry, and veterinary schools. The cost for private schools is not reckoned except when they receive subsidies from State, provinces, or communes.

## MISCELLANEOUS.

[Cooking schools (skolköken); school baths (skolbaden); ventilation (luft växlingen i våra skolsalar).]

About ten years ago efforts were made in the elementary schools to give poor children a midday meal, the food being brought in from outside. It was soon considered advisable, however, to have the food prepared in the school itself, so that school kitchens were established, and the oldest girls took part in the preparation of foods. An outgrowth of this idea has been the teaching of cooking as a part of the course. In 1893 the first elements of domestic economy—as this was called—were established. In 1896 regular cooking arrangements were established in some of the newest school buildings, and in every case the very best methods of ventilation have been adopted, so that there is no danger of drafts upon the person engaged about the cooking stove. About 18 girls, of from 12 years on, can be instructed at the same time in any one of these rooms, so that during the term some 103 girls have opportunity to become experts in making the fire, preparing the special food desired for the day, cleansing the kitchen utensils, serving the food, and cleaning up afterwards preparatory to the next day's instruction. After the cooking lessons (from 10 to 2 or 3 o'clock) are over the girls are ready to go home. The interest in this phase of domestic economy is such that in one school a gift of 75,000 crowns (\$20,100) to further the work was made, the revenue therefrom being turned into the pension fund. In another district 100,000 crowns (\$26,800) was given to erect a building for a cooking school, which is to be equipped with six ovens. This plan for cooking schools was begun in Stockholm, but has now been extended to Malmö, Landskrona, Göteborg, Örebro, Gäfle, Hudiksvall, Norrköping, and other towns.

*School baths.*—During a period of several years there have been baths and exercises in swimming arranged for pupils during the summer in Stockholm, but during the winter months economic reasons prevented such bathing exercises. Since 1890 bath houses have been erected in connection with the schools, and the children in turn are given baths every three weeks at a very small price. Care is taken of the children, and an hour's rest after the bath is required of each child.

Ventilation is recognized as an absolute necessity in schoolrooms if the school work is to be of an excellent character. The result of investigations in this matter is that furnace heat with ventilating shafts is now used in the largest and most modern school buildings of Sweden. Steam and hot-water heating are used in different localities. In parts of the country where such methods of heating and ventilation can not be employed ventilating shafts are introduced, which in the Stockholm schools change the air of the rooms four times an hour, so that the children have the best sanitary conditions around them in the schools wherever such methods have been introduced.

---

The writer has been privileged to make a study in Japan of Japanese education. The chief sources of information have been: (1) Personal examination of educational institutions, (2) interviews with prominent educators, (3) the Government publications on education, (4) publications of various colleges, and (5) interviews with students in many Government and Christian colleges. The writer has been able to buttress his statements, as well as settle his convictions, by reference to general works on Japan and to current literatu

## SECTION I.—STATUS OF EDUCATION BEFORE THE MEIJI ERA.

A comprehensive survey of modern education in Japan can scarcely be made without first sketching the status of education prior to the present Meiji Era. The educational system of Japan was adopted from the West, but he who fails to take into account the educational status of the Japanese previous to the Renaissance will not form an adequate judgment of present forces.

The Meiji Era is the official designation of the reign of the present Emperor of Japan, who was restored to supreme power by the revolution of 1868; and it has marked the seclusion of the Shogun, the great expansion of commerce, the inauguration of constitutional government, and the establishment of a national system of education.

Previous to the Meiji Era Japan was in a state of organized feudalism. From the beginning of learning in Japan to the present century there is no evidence that the State as such provided education for its people.<sup>1</sup> Education was left to private or local enterprise.

---

<sup>1</sup> Japanese Education (Government of Japan), pp. 11-12; Religions of Japan, Griffis, p. 313.

## 1. THE INFLUENCE OF BUDDHISM.

The story of learning in the Middle Ages in Europe was repeated in medieval Japan.<sup>1</sup> The Buddhist temples became the seat of a rude learning. While the national rulers despised or forgot the education of the people, the Buddhist priests were the schoolmasters of the nation. They deserve no little credit for seizing this opportunity, for though the instruction was based on the Buddhist sutras, yet it served for many years to keep the flame of knowledge from being extinguished.<sup>2</sup> In the temples, up and down the country, primary schools were conducted for plebeian or patrician. In the midst of fierce internecine struggles these men quietly plied their craft, and such instruction as Japan had they gave.

Nor were they content to teach simply. The priests were the creators of a literature which may be variously regarded in this century, but which in the sixteenth was the best that Japan had. The temples became the repositories of this literature and the monks its guardians.<sup>3</sup>

Before the sixteenth century was ended Buddhism had indelibly stamped itself upon the spoken language as well as upon the literature of Japan. These early priest-teachers influenced the phraseology of the people somewhat as the Christian Scriptures have permeated the language of the Western nations.<sup>4</sup>

## 2. INFLUENCE OF CONFUCIANISM.

The influence of Buddhism began to wane with the advent of the Tokugawa Shogunate. In 1603 Confucianism took up its silent march through the Japanese mind. It took possession as it proceeded and held its own until the Shoguns were driven from power in 1868. For three and a half centuries Confucius was the head master of Japan, with the Buddhist priests as his understudies. With that adaptability which Buddhism has shown in other parts of Asia, it shaped itself in Japan to Confucian ideas and became the propagator rather than the opponent of Chinese learning.<sup>5</sup> From the printing of the Chinese classics in Japan by the order of Ieyasu to the coming of Western ideas Confucian philosophy is the one force to be reckoned with in the educational life of the Japanese nation.<sup>6</sup>

To understand where Western learning found Japan, and what its task was in Japan, we must allude to the dominant features of Confucianism. Confucius, the Aristotle of Asia, produced what may be

<sup>6</sup> Mikado's Empire, p. 297.

considered either as a "system of ethics or of anthropology."<sup>1</sup> He claims to have been, in his own words, "a transmitter and not a maker."<sup>2</sup> Man; his relationships to the family, to society, to the state, to heaven; these are the subjects on which he collates his material. With marvelous detail he elaborates his "Superior Man." In the "Great Learning" the relationships and prerogatives of the Superior Man are marked out: (1) The study of things, (2) the completion of knowledge, (3) the veracity of intention, (4) the rectification of the heart, (5) the cultivation of the whole person, (6) the management of the family, (7) the government of the state, and (8) the peace of the whole empire. In this iron mold for centuries the men of Japan, China, and Korea had been cast. Confucius had spoken, and, ipse dixit, there was nothing to be added or deducted. The mind of the far East for centuries has had no other nourishment than the words of this one man. In literature—prose or verse—in philosophy, in patriotism, in sociology, there was but one standard. Originality was a species of disloyalty. The Chinese language was infused into Japan, "mispronounced, and in sound bearing as much resemblance to Pekingese speech as 'Pennsylvania Dutch' to the language of Berlin."<sup>3</sup> In seeking to estimate Confucian education we may ask, first, What was its attitude toward the education of woman? Professor Legge, of Oxford, the foremost Confucian scholar, quoted Confucius as follows: "It is no undesirable thing for a wife to be stupid, whereas a wise woman is more likely to be a curse in a family than a blessing."<sup>4</sup>

The text-book of morals was Confucian. Polygamy was an integral factor in the system. Contempt is thrown upon "common men who are bound to one wife."<sup>5</sup> The ideal woman is she who is not jealous of the concubines in her husband's family.<sup>6</sup>

The text-book of politics was Confucian. It places the emperor above all earthly power. He is the "Son of Heaven." In him centers and from him radiates all power. He therefore can not recognize the sovereigns of other empires as his equals. This Confucian doctrine in China and Japan is the basis of the violent contempt for foreign nations which only gave way when it could no longer resist.

The text-book of history was Confucian. Professor Legge is authority in regard to the historical qualifications of the sage:

First, he had no reverence for truth in history; I may say, without any modification, no reverence for truth. He understood well enough that it was the description of events and actions according as they had taken place; but he himself constantly transgressed it in all the ways which I have indicated. Second, he shrank from

<sup>6</sup> Prolegomena to the She-King, p. 140.

looking truth fairly in the face. It was through this attribute of weakness that he so frequently endeavored to hide the truth from himself and others by ignoring it altogether or by giving an imperfect and misleading account of it. Whenever his prejudices were concerned he was liable to do this. Third, he had more sympathy with power than with weakness, and would overlook wickedness and oppression in authority rather than resentment and revenge in men who were suffering from them. He could conceive of nothing so worthy of condemnation as insubordination. Hence he was so frequently partial in his judgments on what happened to rulers and unjust in his estimate of the conduct of their subjects.<sup>1</sup>

In the later development of the feudal system in Japan the seats of the great lords, or Daimios, became the centers of Confucian learning. There were two classes of schools for the education of the military class, the Kanga-ku and the Hyoga-ku.<sup>2</sup> The length of the course of study covered six or seven years. The result of the combination of Confucian learning and Daimio patronage was the samurai, or soldier-scholar, class. The samurai gradually supplanted the Buddhist priests as the real leaders of the people.<sup>3</sup> The samurai became the most influential class in Japanese society, and "now constitute over one-twentieth of the populace." From the soldier-scholar class have come "nearly all the great warriors, statesmen, scholars, reformers, Christians, thinkers, and philanthropists of modern times."<sup>4</sup> The samurai to-day make up, with few exceptions, the governing class of Japan.<sup>5</sup> The transformation of this most important element among the people of Japan from a double-sworded, high handed, clannish patriot into the scholar, the legislator, and the merchant of the Meiji era is one of the fascinating studies of modern Japan.

### 3. THE YOGAKU, OR NEW LEARNING.

The mind of Japan was restive in its Confucian fetters. There were attempts to select the best in the Chinese philosophy and unite with it the better parts of Shinto and Buddhism.<sup>6</sup> The most successful of these movements was the Yogaku. It collapsed in the internal struggle which racked Japan at the time of its opening to foreign nations. It serves, however, to show the temper of the people toward the old system, and explains the readiness with which the new system was later on adopted. The Yogaku movement, together with other forces, was the means of opening the eyes of the people to the unwarranted seclusion of the Mikado and the unnatural assumption of the Shogun. The Yogaku illustrates the general tendency which finally led up to the battle of Fushimi in January, 1868, which marks the beginning of the modern era in Japanese history.<sup>7</sup>

## SECTION II.—GENERAL SURVEY OF THE NEW EDUCATION.

## 1. FIRST ATTEMPTS.

To the Hollanders undoubtedly belongs the credit of creating a thirst in Japan for Western education. From 1630 the Dutch had been allowed to hold a trading post in Nagasaki Bay. Here, despised by the Japanese Government and treated as an inferior people, they plodded on. Their rights curtailed, their island spied upon, themselves the center of suspicion, they were resorted to in secret by Japanese who were willing to risk life in the pursuit of knowledge.<sup>1</sup> This surreptitious teaching took such a hold that "Rangaku" (Dutch learning) became the common designation of the new ideas.

It was something to acquire a smattering of engineering, mining, pharmacy, and astronomy. But the Dutch teachers went further in medicine, and "Rangaku" became largely a synonym for Dutch medicine. So strong was the influence of these Nagasaki merchant-teachers, and so open did the avowal of the new ideas become, that schools were started by Japanese in Tokyo to pass on what they had learned from the foreigners.<sup>2</sup> The ardor of those who would escape from the bondage of Confucianism is illustrated by Shozan Sakuma. He sent up a radical petition to his feudal lord, the sixth article of which proposed "to establish schools even in the smallest villages to instruct the people in the principles of morals." He was assassinated in 1864 for his temerity.<sup>3</sup> It was in the midst of such a groping after light that America appeared and opened the doors of Japan.

## 2. AMERICAN DIPLOMACY.

There had been repeated attempts by England, France, Russia, and America to open negotiations with Japan, but with no success.<sup>4</sup>

Had they been willing to assume the Hollanders' position of vassalage they would have got no farther than the Hollanders.

Commodore M. G. Perry with his American fleet anchored in Yeddo Bay in 1853. Three incidents of his stay indicate the results of his mission. (1) On July 10, in Yeddo Bay, Perry and his men joined in the hymn—

"Before Jehovah's awful throne  
Ye nations bow with sacred joy," &c.

(2) He insisted on an interview with the Shogun, a then presumptuous demand, and (3) he brought as one of his gifts a Webster's Dictionary. He accomplished his end, and his treaty paved the way

in Japan for Western commerce, education, and Christianity.<sup>1</sup> He was followed by the Hon. Townsend Harris, the first envoy resident in Japan. Mr. Harris, unaided by ship or gun, forced his way into Tokyo (Yeddo), had an audience with the Shogun, and after a weary siege carried through a permanent treaty which was for years the basis of all diplomatic relations on the part of Europe, as well as America, with Japan.<sup>2</sup>

Lord Elgin, the British diplomat, arrived in Japan five years after Perry made his historic visit, and called on Mr. Harris in Shimoda, only to learn that the latter had already consummated his commercial treaty. Mr. Harris showed his good will by loaning his confidential secretary and interpreter to Lord Elgin, who then proceeded to Tokyo.

On August 28, 1858,<sup>3</sup> the British-Japanese treaty was signed, thirty days after Harris's American-Japanese treaty.<sup>4</sup>

The results to education of this (American) diplomacy in Japan were immediately felt. Schools were opened for the study of foreign languages, and institutions and independent academies grew up like mushrooms.<sup>5</sup> When the stern task of solving revolutionary problems was once finished, education began to take organized form. In 1868, at the opening of the Meiji era, a provisional board of education was established in Kioto.<sup>6</sup> The court nobles, feudal lords, and public officials were commanded to attend the new schools opened in Tokyo. In 1871, the Mombu-sho, or department of education, was established, and the minister of state for education began the quiet revolutionary work upon which the future of Japan so largely depends.

American influence did not cease with the decisive diplomatic success of Perry and Harris. Without the thought of territorial acquisition the United States impressed one of its greatest institutions upon the Japanese Empire. In 1860, through the influence of Envoy Harris, the first Japanese foreign commissioners visited America, taking passage in the United States warship *Powhatan*. Mr. Shimmi was the head of this mission.<sup>7</sup> The world's embassy followed in 1872, and numbered among its 49 members Prince Iwakura and Count, now Marquis, Ito. It called as its secretary J. H. Neesima, who was studying in America. One of the most important parts of the report of this embassy related to its observations on education.<sup>8</sup>

<sup>1</sup> Treaty signed Friday, March 31, 1854. The United States-Japan Expedition, published in 1853 by the Government of the United States, and edited by F. L. Hawkes, LL. D., contains a complete record of the whole expedition. For text of treaty, see pp. 377-379.

<sup>8</sup> Japanese in America, Lanman, pp. 7-9.

As early as 1866 the first group of students went to America, and during the next ten years about 500 Japanese students sought training in the Dutch Reform Colleges alone in America. Over 300 Japanese young men have studied at Rutgers College. In 1887 there were 686 male and 13 female Japanese students in America.<sup>1</sup>

The Government sent many men at its own expense to study in foreign lands. At first these were largely sent to America, but later to Germany and other European countries. In 1873 there were 250 students studying at Government expense in foreign lands. They were all recalled in 1874, and from 1875 to 1890 only about 90 Government students were sent abroad.<sup>2</sup> In the year 1895 11 students were officially sent to various countries to pursue studies, as follows:<sup>3</sup>

Number of students.	Country.	Subjects to be studied.
8	Germany .....	Street mapping, seismology, chemistry, medicine, and embryology.
1	Austria .....	Skin diseases, syphilis.
1	England .....	Mechanical engineering.
1	Holland .....	Zoology.

### 3. BREADTH OF THE NEW PLAN.

In 1872 the Government of Japan considered itself ready to launch the new scheme. In promulgating the educational code the Emperor said:

All knowledge, from that necessary for daily life to that higher knowledge necessary to prepare officers, farmers, mechanics, artisans, physicians, etc., for their respective vocations, is acquired by learning. It is intended that henceforth education shall be so diffused that there may not be a village with an ignorant family or a family with an ignorant member. Persons who have hitherto applied themselves to study have almost always looked to the Government for their expenses. This is an erroneous notion proceeding from long abuse, and every person should henceforth endeavor to acquire knowledge by his own exertions.

That was no small undertaking which soberly started out to educate an oriental nation on western lines until there should "not be a village with an ignorant family or a family with an ignorant member." But the magnitude of the task is overbalanced by the magnificent resolution displayed in carrying the plan to a culmination.

### 4. SOURCES OF THE NEW LEARNING.

The relationships of the United States and Japan are clearly seen in educational matters. Hon. William H. Seward expressed his early conviction as follows:

If the tutorship of the United States in Japan is to be successful, it must be based on deeper and broader principles of philanthropy than have hitherto been

<sup>1</sup> Intercourse of the United States and Japan, pp. 165-166. Yankees of the East, vol. 2, pp. 398-399.

<sup>2</sup> Outlines of Modern Education in Japan, pp. 202-204.

<sup>3</sup> Japanese Government Report, 1895, p. 14.

practiced in the intercourse of nations; \* \* \* a philanthropy which shall not be content with sending armies and navies to compel, but which shall send teachers to instruct and establish schools on the American system, where philosophy and morals, as well as religious faith, are taught with just regard to their influences in their social and domestic life.<sup>1</sup>

This advice of the great statesman has actually been the American policy. This largely accounts for the fact that in the formative days American influence was predominant.<sup>2</sup> It can not be said to be so at present, as will appear.

President K. Ibuka, of Tokyo, said in an address in America that when Japan reached out after western ideas she copied her navy from Great Britain, her army from France, her medical science from Germany, and her educational system from America.

To be exact, we will refer to some Americans who, among others, laid the educational foundation in Japan. Dr. J. C. Hepburn was the lexicographer who made possible to Japanese and to English the mutual study of their respective languages, and whose work alone stands protected by imperial edict. Prof. R. Pumpelly surveyed mining lands and first introduced powder and blasting in mining. Prof. Edwin S. Morse founded the Archæological Museum of the Imperial University and taught zoology. Prof. J. C. Mendenhall, as professor of experimental physics, made a scientific study of the force of gravity, wave length, etc., in Japan. Mr. B. S. Lyman surveyed oil lands and made official charts for the Government. Gen. Horace Capron introduced American agriculture and prepared the way for William S. Clark, LL. D., to develop the first fully organized agricultural college in Japan. Musical education was introduced by Luther W. Mason, of Boston. Dr. Leland founded the system of school gymnastics. Miss Linda R. Richards, some time superintendent of the Boston city hospital, inaugurated scientific training of nurses. Mr. M. M. Scott was the founder of the normal school system in Japan. Dr. David Murray, secretary of the board of regents of New York, was the official adviser of the Japanese department of education, and founded the Educational Museum.<sup>3</sup> The formative influence of America is also seen in the Japanese who were trained for educational leadership in American universities. Among such men we find a president of the Tokyo University, a vice-president of the university, a dean of the literature faculty, a professor of English and Latin, a professor of jurisprudence, a professor of physics, and a professor of botany; also the founder of the Doshisha University, and many others.<sup>3</sup>

But two men, one an American missionary and the other a Japanese educated in America, who in the early stages did most for education in Japan, have not yet been mentioned. Dr. Guido F. Verbeek, a

<sup>2</sup> Things Japanese, p. 124. Intercourse of the United States and Japan, p. 117.

<sup>3</sup> Intercourse of the United States and Japan, pp. 121-123.

Hollander by birth and early training, finished his education in America and entered Japan in 1859, nine years before the Restoration. He settled in Nagasaki and began to teach. The first Japanese youths to be sent to America went in 1866 through his cooperation. It was he who proposed the Japanese world's commission of 1872, and when its personnel was announced he found that over one-half had been his students.<sup>1</sup> In 1869 he came to Tokyo at the call of the Government, and began his work as founder of the national educational system and first president of the Imperial University, then of course in embryo.<sup>2</sup> Of foreigners the most accomplished Japanese linguist, he became the confidential adviser of new Japan. He translated into Japanese the Code Napoléon, Bluntschli's "Staatsrecht," "Two Thousand Legal Maxims," the constitutions of various nations, and many other invaluable documents to guide the nation.<sup>1</sup> He trained the foremost men of state, and to him, together with Drs. Brown and Hepburn, more than to any others new Japan owes a debt of perpetual gratitude.<sup>3</sup>

It was Dr. Verbeck's cosmopolitan training that led him to advise the Government to adopt the German method of medical instruction, which placed the medical colleges of Japan under German leadership.<sup>4</sup> It was through his counsel and cooperation that the French legal code and legal study were partially adopted in Japan.

At the time Dr. Verbeck was unfolding his educational plans in Tokyo, J. D. Neesima, LL. D., was founding the Doshisha at Kioto, the first Christian college in the Empire. We can scarcely understand the influences that shaped Japanese education if we pass by Mr. Neesima. This scholarly Samurai graduated at Phillips (Andover) Academy, Amherst College, and Andover Seminary. In 1871-1873 he served the world's embassy as interpreter on the one condition that he should be permitted to teach English and Christianity on his return to Japan. His career may possibly be thus summarized: He was brought up a Shintoist, became an atheist, was converted to Christianity, was graduated with honors, became a clergyman, and, returning to Japan, figured as one of the greatest educators and reformers his country has produced.<sup>5</sup>

His work in Japan was pressed into the years from 1874 to 1890. His influence was felt throughout the nation, but his special work was the creation of the Doshisha. At his death the institution had 570 students, with 20 buildings. There were 13 dormitories, a chapel, library, science hall, and gymnasium. The Japanese have not been

slow to recognize his strength of character.<sup>1</sup> Dr. Verbeck and Dr. Neesima were both men of retiring character, but both had the faculty of bringing things to pass. Both were sinologues, yet neither were simple scholastics.

Among the men who have laid the foundation of western education in Japan, Mr. Fukuzawa can scarcely rank second to any. His personal influence has been longer applied than that of Mr. Neesima, and since the latter's death Mr. Fukuzawa has been the greatest Japanese educator-reformer. Europe seems to have most strongly influenced him. Declining all official preferment, he has held to his one aim, and Japan has felt the power of his independent mind. He has built up an independent college in Tokyo, the attendance at which has been over 1,000. As a writer, his books have had an enormous circulation. His "Promotion of Learning" consisted of seventeen volumes, and 200,000 sets of the complete work were sold. His book on his observations in Europe reached a sale of 250,000 copies. He has not been afraid to assault those customs of his land which he has considered unworthy, and his work is not yet finished.<sup>2</sup>

We pass from the sources of the general educational renaissance to note the sources of one or two phases of education in Japan. The university system was first on an American plan, but was radically changed by German influences. The present organization of the Imperial universities finds no complete counterpart in America.<sup>3</sup>

In medical education the German system has altogether prevailed.<sup>4</sup> In 1870 the Government was memorialized that foreign physicians and surgeons, and specifically Germans, be invited to teach medicine in Japanese medical colleges. The petition was favorably considered, and that same year 12 Japanese medical students were sent to Germany. During 1871-1873 the following foreigners were prominent in the medical department of the university; Dr. Müller, a Prussian chief staff surgeon; Dr. Hoffman, a Prussian fleet surgeon; Drs. Wagner, Simmons, Cochins, Helgendorf, Funk, and Professor Niewerth; in 1873 Dr. Doenitz joined the others. In 1880 the first degrees of doctor of medicine were conferred on 18 students who finished the German course of study. There had been added the following pro-

<sup>1</sup> Mr. Fukuzawa, a noted educator, writing in the *Contemporary Review*, of Japan, about Dr. Neesima, said: "Independent men make an independent society. Mr. Neesima, living in a corrupt age, was not corrupted by it. Working earnestly in the cause of education and religion, his purpose was ever single. His body perished, but his name is beyond the reach of oblivion." President Kato, of the Tokyo University, spoke as follows of Mr. Neesima: "I am not a believer in Jesus. \* \* \* Neither am I a Buddhist. I am a man of no religion. \* \* \* I praise him for that steadfast spirit, so essential in every sphere—of religion, politics, or trade. I believe this spirit is the greatest necessity of this country." Mr. Takagoshi wrote in a prominent journal: "His fame is the common glory of the nation." Mr. Tokutomi said in the *Kokumin-no-Tomo*: "As a society we have lost the leader of the cause of moral reformation in Japan." Quoted in Hardy's *Life of Neesima*.

fessors to the medical department of the university: Drs. Wernich, Gierke, Schultze, Langgaard, Martin, Tiegel, Baelz, Diesse, Scriba, Van der Heyden, and others.<sup>1</sup>

Outside the Imperial University there were men eminent as teachers of medicine. Dr. Faulds, a Scottish missionary, founded Tsukiji Hospital and introduced Lister's system of antiseptic treatment. Dr. J. C. Hepburn, of the Presbyterian board, began medical work at Yokohama (Kanagawa) in October, 1859, and through his clinical instruction trained many Japanese who rose to prominence in medicine. The Japanese state hospital was for years in charge of Dr. Simmons as surgeon in chief. Drs. Wheeler and Anderson from 1874 to 1879 laid the foundations of the naval hospital, and Dr. Benkema those of the military hospital.

At Hakodate two Russian surgeons gathered medical classes in 1858 and 1859. They were Surgeons Albrecht and Zalisky, of the imperial royal navy. When Dr. Stewart Eldridge took up their work in 1872, permanent hospitals were established in the northern island of Yezo, of which Hakodate is the chief port. In Osaka, about 1868, a second military medical college was established and put in charge of Dr. Bowdin, who was succeeded in 1871 by Dr. Emerens. In 1873, the St. Barnabas Hospital, as it is now known, was opened in Osaka by Dr. Lanning of the Presbyterian board. Dr. Vedder, surgeon in the United States Navy, opened the first hospital in Kobe. Here Dr. J. C. Berry, of the American board, became director of the new government hospital, and in 1873 gained the first permission to dissect human bodies. Dr. Thornicraft was associated with him in his important work.<sup>2</sup> We refer in particular to those in charge of hospitals as well as medical colleges, because the hospital is an essential in medical education. And furthermore, much instruction was given to medical students in hospitals before the system of colleges was perfected.

German influence is again seen in the pharmacopœia compiled by the central sanitary bureau, which largely follows the German classification, and came out first in the German language. The foreign medical literature relating to Japan finds most eminent exponents.<sup>3</sup> There has arisen a school of eminent Japanese whose skill in general practice or in specialization is a satisfactory indication of the future place of western medicine in Japan.<sup>4</sup>

This section, on the sources of the new education in Japan, would

not be complete without taking into account the number of foreign professors employed. In 1895 the system had reached the stage where it was anxious to "walk alone." The foreigners in the department of education and in the colleges under its immediate control, as distinguished from the institutions controlled by the Fu, Ken, or Gun, were as follows:

*Foreigners in the institutions of the department of education.*

Nationality.	1895. a	1896. b
Great Britain .....	9	10
Germany .....	8	11
United States .....	6	2
France .....	3	3

a Japanese Government Report, 1895, p. 93.

Of the total of 268 foreign instructors in all classes of Japanese institutions, it is to be remarked that 202 were engaged in what are termed miscellaneous schools—i. e., schools which may make a specialty of English, literature, law, etc., but which on other subjects may have a deficient curriculum. Here are also grouped mission schools.

##### 5. SUCCESS OF THE GENERAL SCHEME.

The strength or weakness of education in Japan will appear later under the third main section, where the common schools, middle schools, higher institutions, and universities are discussed separately. We are treating the system as a whole at present.

The first educational code was promulgated in 1872, and in 1891, though twenty years had not passed, the Government was teaching 3,630,000 pupils.<sup>1</sup> Although Dr. Rein, of Germany, has written the most complete work on Japan, yet he makes meager reference to education. However, this important observation is made:

Accordingly, of all the innovations made during the Meiji period, those are justly regarded as most important which emanated from the department of education, and had in view a better and more liberal training of the Japanese youth.<sup>2</sup>

In 1880, that remarkable traveler, Miss E. L. Bird, wrote in her *Unbeaten Tracks in Japan*: "Nothing is more surprising than the efforts which the Government is making to educate the people." Western learning is in universal demand.<sup>3</sup>

The national educational plan has six distinct classes of institutions. As the nomenclature is not familiar to an American, an explanation is necessary.

*Comparative names of institutions.*

Japan.	United States.
Lower elementary .....	Primary.
Higher elementary .....	Grammar.
Ordinary middle .....	{ Grammar.
	{ High school, first and second year.
Higher .....	{ High school, third and fourth year.
	{ College, first and second year.
Colleges of the university .....	{ College, third and fourth year.
	{ Professional schools.
University hall .....	{ Post-graduate courses in arts or professions for advanced degrees.

This comparison is little more than suggestive. It shows (1) that the system is more closely graded in the higher courses than ours; (2) that it presupposes graduate work at least in the colleges of the university, as no A. B. degree is conferred until students have finished, not the "higher" institutions, but the colleges of the university; and no doctor's degrees are conferred until the course in the university hall is completed.<sup>4</sup>

<sup>1</sup> The educational department estimates the total number of pupils in 1873 at 400,000. *Japan Mail*, January 23, 1874. *Outlines of modern education in Japan*, p. 7.

Special .....	47	44	592	653	8,717	8,741
Miscellaneous .....	1,261	1,149	3,250	3,228	64,948	68,395
Elementary .....	26,631	26,835	73,182	76,693	3,670,345	3,877,981

Special schools are designed as institutions in which special instruction is given in such subjects of study as medicine, pharmacy, law, political economy, literature, and science.

Thus, by taking the last Government report, issued in September, 1898, for the year 1896, we find the educational status of all grades to be as follows:

Total number of institutions 28,404, of which 1,762 are private; total number of professors and teachers 84,014, of whom 5,509 are in private institutions; total number of students or pupils 4,030,973, of whom 148,858 are in private institutions.

### SECTION III.—ANALYSIS OF THE NEW EDUCATION.

In treating of education in Japan, as in any western country, a beginning may be made with the common schools.

#### 1. ELEMENTARY SCHOOLS.

The elementary schools are of two grades, ordinary and higher. They are "designed to give children the rudiments of moral education and of education especially adapted to make of them good members of the community, together with such general knowledge and skill as are necessary for practical life, due attention being paid to their physical development."<sup>2</sup> The course of study in the lowest grade must cover three years, and may cover four. In the higher department of the common schools the course of study varies from two to four years in length. The schools are supported by the cities, towns, or villages, or by several villages in conjunction. Private individuals are welcome to establish elementary schools from their own means. In 1896 there were 539 such schools, as against 26,294 supported by the public. It is an interesting fact that elementary

<sup>1</sup> Japanese Government Reports, 1895 and 1896, pp. 22 and 27, respectively.

<sup>2</sup> Japanese Government Report, 1896, p. 28.

agriculture is being introduced as a study, and that sewing and needle work are taught the girls in over 4,000 elementary schools.

The school age is a period of eight years, from the sixth to the fourteenth year of the child's life. Each city, town, or village appoints school directors and inspectors. The system of elementary schools was first upon the American plan, but at present is more largely German. The first remodeling took place in 1886 and was extended in 1890.<sup>1</sup>

## SCHOOL ATTENDANCE.

One of the first tests to put to a national common school system is its relation to the school population. The Government reports give the following:

Year.	Population.	School population. <sup>a</sup>	School attendance.
1885.....	38,458,000	6,413,684	3,182,232
1890.....	41,322,005	7,195,412	3,520,718
1895.....	43,045,906	7,683,143	4,333,069
1896.....	43,499,833	7,187,059	4,615,842

<sup>a</sup> Excluding those excused from attendance by the Government.

This table records the fact that, in 1885, of the school population 49.62 per cent were under instruction; in 1895, 61.24 per cent; and 1896, 64.32 per cent. From 1885 to 1897 the effectiveness of the school system is seen in that it raised the per cent under instruction from 49.62 to 64.22. The present status compares favorably with that in the United States, where, in 1897, there was 69.50 per cent of school population under instruction.<sup>2</sup>

There is a compulsory educational law in Japan, and school committees are expected to enforce attendance except in certain cases of sickness and poverty. Parents or guardians are also enjoined to compel the attendance of children.<sup>3</sup> Of those who did not attend the prescribed course in 1896 the following statement can be made:

*School children not attending school.*<sup>4</sup>

Not obliged to attend.....	578,546
Kept away by poverty.....	1,484,694
Kept away by sickness.....	226,758
Kept away by other causes.....	859,765

3,149,763

<sup>1</sup> Outlines of Modern Education in Japan, pp. 20-22. Intercourse of the United States and Japan, p. 120.

<sup>2</sup> That is, 69.50 per cent of the children from 5 to 18 years of age. In the United States probably more than 90 per cent of the children from 6 to 14 years of age attend school.—ED.

<sup>3</sup> Specimen Regulations for Compulsory Attendance. Outlines of Modern Education in Japan, p. 23.

<sup>4</sup> Japanese Government Report, 1896, p. 43.

DIAGRAM NO. 1.—*Total number of children not in school and reasons therefor.*  
(1896.)

It will be seen that nearly half of those who are out of school, though of school age, are deterred by poverty. But continuing the investigation, we may note whether the parents are more likely to keep the boys or the girls from school privileges.

*Number of boys and girls of school age in school.*<sup>1</sup>

Year.	Boys.	Girls.
1890 .....	<i>Per cent.</i> 65.14	<i>Per cent.</i> 31.13
1895 .....	76.65	43.87
1897 .....	80.67	50.86

Allowing for the fact that the female portion of the school population in Japan is more likely to be detained from school attendance by sickness than the male, yet it remains that poverty and sickness are reported to keep out of school 29.81 per cent more girls than boys. This is probably accounted for by the fact that in the far east the boy receives the preference in the family plans for schooling, as in other matters.

#### ATTITUDE OF THE PEOPLE.

An important element in the success or failure of a national system of education is the attitude of the public toward the system. This is especially true where a central government imposes a system covering a whole country. The attitude of the Japanese can be tested by concrete examples. This oriental people has demonstrated its faith in the new education by voluntary contributions of money.

In 1880 Miss Bird wrote that during the preceding five years the voluntary contributions of the Japanese people toward popular education amounted to £1,700,000.<sup>2</sup>

<sup>1</sup> Japanese Government Report, 1890, pp. 99-100; 1895, pp. 35-36; 1896, pp. 44-45.

<sup>2</sup> Unbeaten Tracks in Japan, p. 330.

DIAGRAM No. 2.—Per cent of school population under instruction. By years, 1873-1896.

*Voluntary gifts to public school fund.*

	Yen.
1890, gifts amounted to .....	<sup>1</sup> 457,386.25
1895, gifts amounted to .....	<sup>2</sup> 493,046.00
1896, gifts amounted to .....	<sup>3</sup> 765,422.00

In addition to gifts of money, during one year the people contributed for educational purposes 30,638 tsubo<sup>4</sup> of land, 14,023 books, and 15,707 pieces of apparatus.

## TUITION FEES AND TAXES.

It is interesting to note the practical working of tuition fees. The free gifts of money toward popular education were in addition to the taxes for the same purpose. The fixed fee in 1896 for the ordinary elementary schools was 62 sen per month (about 30 cents), and in the higher elementary schools the fee was 22.8 sen per month.

*Pupils and tuition fees, 1896.*

Total number of pupils .....	4,615,842
Free tuition .....	265,629
Fees remitted:	
Part .....	118,979
Whole .....	113,514

A large majority, therefore, of the Japanese pupils paid the regular tuition fee. Parents are allowed to pay in kind, or in labor, where tuition fees are remitted.<sup>5</sup>

The Government figures on fees and taxes do not seem clear. They include other branches of public education than the elementary schools. But as the fees and taxes cover the same items, a fair comparison may be made.

*Fees and taxes, 1896.<sup>6</sup>*

	Yen.
Fees .....	3,396,167
Taxes .....	10,037,319
Gifts .....	765,422

It may be said roughly that in support of popular education in Japan the gifts of the people in money are more than one-fifth the amount realized from fees, and that the latter are about one-third as much as the amount of the local taxes for education. In 1890, of the expenses of 1,998 schools more than half was met by fees, gifts, and rents, the rest being met by taxation.

In this connection, it is interesting to note that in England a law went into effect on September 1, 1891, which pledged a grant from

<sup>1</sup> Japanese Government Report, 1890, p. 98.

<sup>2</sup> *Ibid.*, 1895, pp. 115 and 121.

<sup>3</sup> *Ibid.*, 1896, pp. 224-225.

<sup>4</sup> The tsubo is about 120 acres.

<sup>5</sup> *Outlines of Modern Education in Japan*, p. 23.

<sup>6</sup> Japanese Government Report, 1896, pp. 130-133, 226-227; Ordinances, Nos. VII and VIII, on School Fees.

Government funds of 10 shillings a year for each child over 5 and under 14 years who was in attendance at school. It was estimated on the average attendance, and thus made two-thirds of the English elementary schools practically "free schools." In America free elementary schools are fundamental in the educational policy.

#### SUBJECTS TAUGHT IN ELEMENTARY SCHOOLS.

In the remodeling of the school system in 1890, the division into "ordinary" and "higher" was made. The subjects prescribed for ordinary elementary schools were the following: Morals, reading, composition, writing, arithmetic, and gymnastics, or (in place of the latter) Japanese geography. Japanese history, drawing, singing, and manual work were elective. In the higher elementary schools the following subjects were to be taught: The first five as in the grade below, and, besides, Japanese geography, Japanese history, foreign geography, science, drawing, singing, and gymnastics were compulsory. The number of hours of instruction in the ordinary school were not to be less than eighteen nor more than thirty per week. By Imperial ordinance it was decreed that neither teachers nor directors of schools shall inflict corporal punishment on the scholars.<sup>1</sup>

#### TEACHERS AND NORMAL SCHOOLS.

A matter of prime importance and of continual and perplexing difficulty is the training of suitable teachers to instruct the millions of pupils who flock to the Government schools. The qualifications must be radically different from those known under the old régime of Chinese learning. The code was promulgated in 1872, and in 1873-74 eight normal schools were doing their best to qualify teachers. The Government required that all teachers should either pass set examinations or be the possessors of normal-school certificates.<sup>2</sup>

#### *Normal-school statistics.*<sup>3</sup>

	1885.	1890.	1895.	1897.
Normal schools .....	57	47	47	47
Male teachers .....	683	579	633	677
Female teachers .....	58	45	45	43
Male pupils .....	6,702	4,410	5,398	6,201
Female pupils .....	1,005	885	720	720
Expenditure .....	551,195	800,000	816,366	942,598

Besides this showing it is to be noted that in 1890 a "higher female normal school" and a "higher normal school" were established in Tokyo. In 1896 there were 106 students in this advanced normal

<sup>1</sup> Imperial ordinance, 1890, art. 63.

<sup>2</sup> *Ibid.*, articles 54 and 55; *Outlines of Modern Education in Japan*, pp. 3 and 182; *Japanese Education*, p. 23.

<sup>3</sup> *Japanese Government Reports*. 1885, 1890, 1895, 1897.

school for women, and 228 students in the corresponding school for men.

That the Japanese were intent on producing capable teachers was seen in the fact that in 1890 the expenditure per student in normal schools was 151 yen, while in the middle schools of the same date the expenditure was 30 yen per pupil, and in the elementary schools it was 2.42 yen per pupil.<sup>1</sup>

In 1896, out of 58,256 regular teachers in Government schools, 16,996 were graduates of normal schools.<sup>2</sup> This does not count in private schools.

By referring to the table immediately preceding, it will be observed that in the Japanese normal schools men greatly predominate, the situation being the reverse of that found in America.<sup>3</sup> The regular course of study in the normal schools requires thirty-four hours a week for a period of four years. The subjects are stated as: Morals, history and principles of education, Japanese language, Chinese literature, history of Japan, foreign history, Japanese and foreign geography, mathematics (arithmetic, geometry, bookkeeping, algebra), physics, chemistry, botany, zoology, physiology, mineralogy, writing (Chinese, and Japanese running hand), music, gymnastics, foreign languages (reading, grammar, conversation, writing), agriculture, political economy, and manual work.<sup>4</sup>

There still remains to be mentioned the total number of teachers employed in the schools.

	1885.	1890.	1895.	1896.
Total number of teachers.....	99,510	67,699	73,160	76,039
Average number pupils to each teacher.....	31	46	50	51
Average salary of regular teachers (yen).....	90.67	99.14	-----	-----

In 1897 the total number of teachers, men and women, was increased to 79,274, but was yet 13,620 short of the number called for by the regulations. This inability to secure an adequate teaching staff calls attention to the fact that the average monthly salary in 1897 for male primary teachers was about 13 yen, and for female teachers about 10 yen. Though this was a larger amount than in other years, yet there has been much just criticism of the educational authorities, on the ground that the primary schools will never attain the proficiency desired until the salary more nearly corresponds to the importance of the duties required of the teacher.

<sup>1</sup> Japanese Government Report, 1890, p. 95.

<sup>2</sup> Ibid, p. 39.

<sup>3</sup> United States Education Report, 1892, pp. 104-105.

<sup>4</sup> Outlines of Modern Education in Japan, pp. 60-86.

*Teachers in public elementary schools, classified by age.*

Age.	Graduates of normal schools.	Otherwise licensed.	Total.
Under 20.....	163	1,877	2,040
Between 20 and 25.....	3,776	7,645	11,421
Between 25 and 30.....	5,120	11,918	17,038
Between 30 and 35.....	4,445	8,732	13,177
Between 35 and 40.....	1,980	4,375	6,355
Between 40 and 45.....	931	3,058	3,989
Between 45 and 50.....	380	1,765	2,145
Between 50 and 55.....	130	1,050	1,180
Between 55 and 60.....	51	515	566
60 and upward.....	20	325	345
Grand total.....	16,996	41,260	58,256

It is seen from this table that almost three-fourths of the teachers who are normal graduates are between the ages of 25 and 45—the most effective teaching period. Over half of the teachers without normal training are between 25 and 45 years of age.

DIAGRAM NO. 3.—*Ages of teachers in public elementary schools (1896).*

Turning from the ages of teachers to the question of teachers' qualifications, we present the following table showing the number of applicants and of those who passed the prescribed tests for licenses as elementary school-teachers, conducted by local authorities (1896):

	Number of applicants.	Number who passed the prescribed tests.
<b>REGULAR TEACHERS.</b>		
For general subjects in elementary schools.....	{ 2,842	1,855
For general subjects in ordinary elementary schools.....	{ a 2,075	a 2,068
For special subjects in elementary schools.....	{ 9,555	5,362
	{ a 130	a 130
	{ 878	565
Total.....	{ 13,276	7,792
	{ a 2,205	a 2,198
<b>ASSISTANT TEACHERS.</b>		
For general subjects in elementary schools.....	{ 1,409	753
	{ a 44	a 44
For general subjects in ordinary elementary schools.....	{ 11,243	4,981
	{ a 15	a 15
For special subjects in elementary schools.....	{ 1,678	1,023
Total.....	{ 14,330	6,757
	{ a 59	a 59
Grand total.....	{ 27,606	14,539
	{ a 2,264	a 2,257

a Normal graduates.

An examination of the above table furnishes another argument for the normal school. There were 13,276 applicants for regular licenses who had not been through the normal schools. Of these 5,494 failed to pass the examinations. Of the 2,200 normal graduates who took examinations all but 7 passed and received licenses. Of the 14,330 applicants for assistants' places who had had no normal privileges 7,573, or over half, failed to pass, but all the 59 normal graduates received permission to teach. That is, of all normal applicants only 7 were plucked, while in the other class 13,067 were plucked, or almost half who attempted the examinations without previously taking normal courses.

An interesting comparison may be made between the status of normal educated-teachers in the educational systems of Germany, Switzerland, New England, and Japan. Considering the very proficient normal schools of the two former countries, the showing of the latter is not discouraging.

DIAGRAM NO. 4.—*Proportion of school-teachers who are normal graduates.*

Japan is a fraction of a per cent in advance of New England, while both are far behind Germany and Switzerland. In these latter countries all the elementary school-teachers are the product of the normal schools. This points to the reason why Japan of late has drawn more help from Germany than from America for her normal-school system.<sup>1</sup>

*Elementary education in Japan and in other countries.*

	Population.	School attendance.
Japan <i>a</i> .....	43,045,906	4,338,069
Great Britain <i>b</i> .....	33,821,415	5,791,211
France <i>c</i> .....	38,095,156	5,556,470
India <i>d</i> .....	221,172,952	3,686,052
United States <i>e</i> .....	66,087,909	13,510,719

*a* Statistics for 1896.

*b* United States Education Report, 1892-93, vol. 1, pp. 203-207.

*c* A. Tolman Smith in same report, pp. 219-224. School attendance is for France and Algiers.

*d* J. A. Baines, C. S. I., quoted in United States Education Report, 1892-93, vol. 1, pp. 261-278. The population includes only British provinces and those native states under British rule.

*e* For 1892-93, United States Education Report, p. 23.

<sup>1</sup> Dr. L. R. Klemm in United States Education Report, 1891-92, vol. 1, pp. 155-156.

In other words, the per cent of the population that was under instruction in elementary schools at the time the figures were taken is as follows:

Japan, 10 per cent; Great Britain, 15 per cent; France, 14.5 per cent; India, 1.66 per cent; and United States, 20.4 per cent.

DIAGRAM No. 5.—*Per cent of population attending elementary schools.*

## 2. SECONDARY SCHOOLS.

The English equivalent to the Japanese name for secondary schools is "ordinary middle schools," and it is these of which mention will now be made. The ordinary middle schools of Japan occupy a place corresponding to the last year of the grammar and first two of the high schools and academies of America.

They were first defined in the code of 1872, and in 1888 the division was made into ordinary and higher middle schools.<sup>1</sup> The latter were segregated and finally became the present higher schools (or colleges). The law provides that ordinary middle schools must be established either by the cities or by private individuals. There are 121 such institutions enrolling 40,577 students. Of the total, 20 schools are of "private" origin.

### COURSES OF STUDY.

The course of study extends over five years. Besides the general studies, which entirely engage the pupil's attention up to the fourth year, there is from there on an important elective. The middle schools have a double purpose: (1) To fit students for the "higher schools," or colleges, and (2) to prepare them to immediately enter "practical pursuits." If the pupil has the latter object in mind, from the beginning of his fourth year he may elect a supplementary technical course. Provision is also made for the introduction of technical studies during the entire five years of study where the local authorities deem it prudent. In such cases courses in agriculture, industry, and commerce are provided. It should be noted that the Japanese lay the foundation for their technical education in the preparatory institutions. The required hours appear to be twenty-eight per week during the course.<sup>2</sup>

<sup>1</sup> Outlines of Modern Education in Japan, p. 8.

<sup>2</sup> Japanese Government Report, 1890.

*Curriculum of the ordinary middle school.<sup>1</sup>*

Subject.	Hours per week.	Number of years.
1. Ethics .....	1	4
2. Japanese language and Chinese literature .....	5	4
3. First foreign language (English) .....	5 to 7	4
4. Second foreign language (German or French) .....	3 to 4	2 (last).
5. Geography of the world .....	1 to 2	4
6. Japanese and foreign history .....	1 to 2	4
7. Mathematics: Geometry, review arithmetic, algebra, etc., advanced algebra, trigonometry, etc. ....	1 to 3	3
8. Natural history: Physiology, hygiene, zoology, botany .....	1 to 3	3
9. Physics, chemistry, and electricity .....	1	1 (2d).
	2	1 (3d).
	3	1 (4th).
10. Writing .....	2	1 (1st).
	1	1 (2d).
	2	3
11. Drawing .....	1	1
12. Singing .....	2	2
13. Gymnastics .....	3 to 5	4

It appears that the subject most insisted on in the secondary schools is the English language; that the Japanese language and Chinese literature, studied as related themes, are second; gymnastics receives more attention than mathematics or history, and far more than ethics. The explanation of the anomaly is in the fact that through training of the body Japan hopes to repair the physical defects of the people. Considering the facts in the case, this seems an eminently wise provision.

*Status of ordinary middle schools.*

[From various reports.]

Year.	Schools.			Teachers.			Pupils.		
	Public.	Private.	Total.	Public.	Private.	Total.	Public.	Private.	Total.
1885 .....	105	2	107	1,030	20	1,040	14,747	301	15,048
1890 .....	44	11	55	580	98	678	9,982	1,633	11,620
1896 .....	a 99	21	120	1,367	342	1,719	33,915	6,662	40,577
1897 .....			155			2,180			52,442

a Twenty-one of these were branch schools.

This table points to the fact that the weeding-out process from 1885 to 1890 reduced the middle schools almost half. Then began the building-up process until in 1896 there were more schools than in 1885, with nearly 700 more teachers and 25,000 more pupils than at the earlier date. The private schools are seen to be fewer in number, and smaller in teaching force and in attendance than the public schools. But on closer examination it is seen that the average number of teachers in each private school is 16, while in each public school the average number is 13.8. The average number of pupils to each teacher in private schools is 19.4, while in the public schools the average number is 24.8. Thus we conclude that though inferior in number the private schools are better equipped in their teaching force.

<sup>1</sup> Japanese Government Report, 1890.

DIAGRAM NO. 6.—*Graduates of middle schools and their occupations (1896).*

## WHAT BECOMES OF THE GRADUATES?

The results of the secondary-school system may be tested by inquiring into the occupations of those who graduate therefrom. The Government has taken pains to do this, and the accompanying chart illustrates the result.

The whole circle stands for the total number who finished the course of the ordinary middle schools in 1896. It will be seen that three-fifths entered higher institutions, that one-eleventh entered the army, and that one twenty-eighth became teachers.

## 3. HIGHER SCHOOLS.

Having finished with preparatory and secondary education, we take up with higher schools the consideration of higher education in Japan. The Japanese word "gakko" may be translated "school" or "college;" either English word is its equivalent. In the English phraseology adopted by the department of state for education for

the Japanese terms used, the German idea was followed. And thus the higher schools in Japan are not the American high schools, but more like the American colleges. The Japanese avoid calling them "colleges," however, in order to use that word for the colleges of the universities; but, again, these are quite different from the colleges of the universities in Great Britain.

In the beginning of the educational renaissance in Japan these higher schools were called higher middle schools, but in 1895 they were dignified with the shorter title. They were designed for advanced work, and the youth who entered them set his face toward scholarship.<sup>1</sup> The higher female schools (colleges) were an interesting contemporaneous development. They will be treated in Section IV, under the heading "Government education and the advancement of women."

#### COURSES OF STUDY.

The courses of study are not uniform in the Government higher schools.

The same grade of work seems to be required, but the courses are different. The "third higher school" has departments of law, medicine, and engineering, its advanced courses constituting the beginning of Kyoto University. In the first, second, fourth, and fifth higher schools greater emphasis is laid on the general preparatory courses for the university, but each has a medical department. The sixth higher school gives itself entirely to courses leading to the university. The period of study in the departments of law, medicine, or engineering is four years in length. In the university-fitting courses the time spent is three years.

The Government has fixed the standard of entrance examination and the requirements for graduation. In 1895 66 per cent of those who applied were received into the higher schools; in 1896 56 per cent were admitted.

No regular degrees are given by higher schools. The fees vary according to the courses followed.<sup>2</sup> The number of holidays, not including Sundays, shall not exceed ninety, says an imperial decree of 1890.<sup>3</sup> Gymnasiums are to be provided by the Government.<sup>4</sup>

#### STATUS OF THE HIGHER SCHOOLS.

An interesting classification was made in 1890 of the students in the various higher schools. Of the total attendance, 7 were nobles, 2,049 were from the former military class, and 1,926 were commoners.<sup>5</sup>

The following table shows that the Japanese hold most of the professorships, there being but 12 foreigners in 1896 in the faculties of

<sup>1</sup> Outlines of Modern Education in Japan, pp. 8, 92-111. Japanese Government Report, 1895, p. 59. *Ibid.*, 1896, p. 69.

<sup>2</sup> Japanese Government Report, 1895, pp. 59, 60; *Ibid.*, 1896, pp. 69-71.

<sup>3</sup> Imperial ordinance, 1890, Art. XIV.

<sup>4</sup> *Ibid.*, Art. XVII.

<sup>5</sup> Japanese Government Report, 1890, pp. 62, 63.

these institutions, as against 277 Japanese. No Japanese is expected to hold a professorship unless he has at least a degree from one of the university colleges.<sup>1</sup> There is 1 student in the higher schools to about 10,000 of the population. The expenditure for each institution is 62,162 yen, or something like \$31,000 (gold) per year.

*Statistics of higher schools.*

Year.	Schools.	Professors.		Students.	Expenditure.
		Japanese.	Foreign.		
1890.....	7	320	15	4,356	Yen. 433,757.83
1895.....	7	264	11	4,289	264,901.00
1896.....	6	277	12	4,231	372,978.00

It is interesting to note the choice of studies made by the students in this branch of the educational system. In 1896 in the six higher schools there were 4,231 students. Of these, 55 were in law courses, 127 in engineering, 1,469 in medicine, and 2,580 in the general courses leading to the university. In 1895 the same preponderance of attendance in general and medical courses was recorded.

#### 4. UNIVERSITIES.

##### DEVELOPMENT OF THE UNIVERSITY IDEA IN JAPAN.

The most remarkable factor in the Japanese educational system is the university. There are at present two universities—one in Tokyo and another in Kyoto. As the latter is not fully developed, we shall limit our investigation to the Imperial Tokyo University. This university grew out of the foreign-language school revived in Tokyo in the restless days of the restoration. Dr. Verbeck made the development of the institution his special care.<sup>2</sup> In 1877 the present university was organized under the name of Tokyo University.<sup>3</sup> From 1877 to 1885 the university had the four departments of law, science, medicine, and literature, and was quite largely on the American plan. In 1886 the university was remodeled, new buildings were built, and a main department of engineering was added. In 1890 a college of agriculture was organized. The university at present consists of a university hall, six colleges, library, botanical garden, astronomical observatory, seaside laboratory, and two hospitals. The university from the first has stood for "original investigation," and may be said to have largely swung over to the German model.<sup>4</sup> It is stated that in 1891 the entrance examinations in Tokyo University were severer than those at Harvard University.<sup>5</sup>

<sup>1</sup> Outlines of Modern Education in Japan, p. 182.

<sup>2</sup> Japanese Education, p. 29; Japan Mail, vol. 13, p. 230.

<sup>3</sup> Outlines of Modern Education in Japan, p. 2.

<sup>4</sup> Japanese Government Report, 1885, p. 44; 1890, p. 65; Imperial Ordinance No. 3, art. 1, sec. 2; Intercourse of United States and Japan, p. 120.

<sup>5</sup> Editorial in Japan Mail, Nov. 7, 1891. Mr. Izawa quoted.

## UNIVERSITY CONTROL.

The officers of the university are as follows: (1) President (chokumin), (2) counselors and secretaries (sonin), (3) clerks (hannin). The counselors are appointed by the minister of state for education—two from the faculty of each college. They serve for five years and have the power to determine the curriculum.

In each college of the university there is the following organization: (1) Director (sonin), (2) one chief professor, (3) professors, (4) assistant professors, (5) superintendents of dormitories, and (6) clerks.<sup>1</sup>

## PROFESSORS ON VARIOUS FACULTIES.

In 1885 there were 154 professors in the Tokyo University, of whom 11 were foreigners. In 1895 16 foreigners were employed.<sup>2</sup>

The number of professors connected with the various colleges has been as follows:

Year.	Law.	Medicine.	Engineering.	Literature.	Science.	Agriculture.	Total.
1885.....	26	46	19	28	35	0	154
1895.....	22	30	35	25	18	31	161

In 1890 there were more foreign instructors than in either 1885 or in 1895. They were scattered among the various faculties of the university, as follows:<sup>3</sup>

College.	Professors.	
	Native.	Foreign.
Law.....	14	5
Science.....	29	2
Engineering.....	31	4
Medicine.....	73	2
Literature.....	14	5
Agriculture.....	41	7
Total.....	202	25

This table gives prominence to the greatly increased medical faculty in 1890, in comparison with 1885 and 1895, as well as in comparison with the other faculties in 1890. Literature and law each have 19 professors, their faculties being the smallest upon the list.

## STUDENTS AND GRADUATES OF TOKYO UNIVERSITY.

The attendance at the university has shown a steady and encouraging increase, where attainment has been the only condition of success. A comparative table will present the facts in a convenient form for examination.<sup>4</sup>

<sup>1</sup> Imperial Ordinance on Universities No. 3.

<sup>2</sup> Japanese Government Report, 1885, p. 44; *ibid.*, 1895, pp. 66-70.

<sup>3</sup> *Ibid.*, 1890, pp. 65-68.

<sup>4</sup> Compiled from Japanese Government Reports, for 1885, p. 44; for 1890, pp. 65-68; for 1895, p. 68; for 1896, p. 79.

*Number of students, Tokyo University.*

College.	1885.	1890.	1895.	1896.	1897.
University Hall .....	0	47	105	146	174
Law .....	217	301	472	551	737
Science .....	43	77	102	105	105
Engineering .....	30	106	295	345	385
Medicine .....	726	188	178	223	297
Literature .....	129	88	219	248	273
Agriculture .....	0	485	249	215	232
Elective .....	73	0	0	0	0
Total .....	1,218	1,312	1,620	1,833	2,208

An examination of this table reveals the drift of university studies in Japan. In 1885, when the idea was a newer one, the medical college was receiving an abnormally large per cent of the students, it being three times as large as the next largest college. At that date the Science Hall was largely neglected, as was engineering, while literature was not holding its own.

In 1890, the University Hall could be reported with 47 students at work; science and engineering make a gain; literature loses; but the newly established college of agriculture has jumped into first place, while medicine falls to third place. It is noticed that after 1890 "elective studies," which could not be classified in any one college, are no longer reported.

In the next five years university hall more than doubles its workers, law continues to increase and is in the lead by over 200 students, science and engineering now appear nearly as strong as the other colleges, and agriculture has dropped back into a normal position. The most marked increase is in the college of literature, which in 1896 is abreast of the other colleges.

In the last report the total attendance at the university is seen to be 2,208, with law the largest of the colleges. Medicine, literature, and engineering more than maintain their own. The following comparison of the attendance at the university colleges is brought down some two years in advance of the last Government report. It covers the more recent years and deals with the graduates of the various colleges, showing year by year the number who finished various courses.

*Per cent of graduates in various courses.*

	1894.	1895.	1896.	1897.	1898.	Average.
Law .....	35	38	31	24	30	31
Medicine .....	10	11	9	10	9	10
Engineering .....	19	21	26	28	31	26
Literature .....	10	11	16	22	18	16
Science .....	6	8	6	10	7	7
Agriculture .....	20	11	12	6	4	10
Total .....	100	100	100	100	100	100

In this comparison of the graduates for five years, including the year 1898, for each 100 students graduated law has furnished 31, engineering 26, literature 16, agriculture 10, medicine 10, and science 7. Engineering makes the most steady gain during the five years, and agriculture seems to be constantly losing. Science is the weakest of them all. The significance of the growth or decline of the technical courses will be referred to in the succeeding division on technical education.

DIAGRAM 7.—Occupations of the 308 graduates, Imperial University, 1896.

From the college of law during these five years 211 have graduated from the English law course, 13 from the French, and 40 from the German. The English law course greatly predominates. In the college of literature the following courses, in the order named, have sent out the most graduates: Philosophy, Japanese history, general history, Chinese literature; English literature and German literature have a limited following.

The total number of graduates from the Imperial Tokyo University,

including the 353 of 1898, is 3,405. An analysis of the number contributed by each college is not quite fair, as some of the colleges are of later origin than others. However, the following is the total number graduated from each college of the university from the beginning through 1898: Law has 950 graduates; engineering, 775; medicine, 619; agriculture, 436; literature, 319, and science, 306.<sup>1</sup>

In regard to the question of what becomes of the graduates of the university, the accompanying diagram (No. 7) explains itself.

#### UNIVERSITY EXPENDITURE.

The university derives its support directly from the National Government. It is the first of the educational department's institutions. The low-grade schools draw their support, on the other hand, from local taxes, etc. In 1885 the total expenditure of the university and its colleges was 366,458.28 yen; in 1895 the amount was 640,269.50 yen. It is instructive to note the comparative expense of the university hall and the various colleges.

#### *Tokyo University expenditure, 1895.*<sup>2</sup>

	Yen.
University hall .....	54,812
College of law .....	47,463
College of science .....	69,000
College of engineering .....	74,094
College of medicine .....	259,902
College of literature .....	57,633
College of agriculture .....	77,365
Total .....	640,269

The college of medicine absorbed more than three times the amount of money allowed to any other of the colleges of the university. In this regard it follows its German prototype.<sup>3</sup>

#### THE UNIVERSITY LIBRARY.

The library of the university is for the use of professors and students, and is distinct from the public library of Tokyo. It contains a total of 243,669 volumes. Of these, 136,926 are in the Japanese and Chinese "character," and 106,743 are in English and other foreign languages. The constant growth of the library is attested by the fact that from 1895 to 1896 over 5,000 Japanese and Chinese volumes and over 3,000 foreign books were added to the shelves.<sup>4</sup>

#### THE CURRICULUM OF THE UNIVERSITY.

*Length and variety of courses.*—The course of study in university hall is five years in length; in the college of medicine four years' work

<sup>1</sup> Japan Times, July 15, 1898.

<sup>2</sup> Japanese Government Report, 1895, p. 18.

<sup>3</sup> Fr. Paulsen, on German universities, in United States Education Report, 1891-92, vol. 1, p. 273

<sup>4</sup> Japanese Government Report, 1896, pp. 77, 78; *Ibid.*, 1895, p. 131.

is required; in law, however, no length of time is prescribed, but to graduate the student must successfully pass three stated examinations for each course; in the colleges of literature, engineering, science, and agriculture three years is the prescribed period of study.

In university hall the advanced post-graduate work covers essentially the six general subjects for which the colleges stand. The courses of study in the college of law are the following: Law, politics; post-graduate course, elective course. In the college of medicine: Medicine, pharmacy; post-graduate course, course of state medicine, elective course. In the college of engineering: Civil engineering, mechanical engineering, naval architecture, technology of arms, electrical engineering, architecture, applied chemistry, mining and metallurgy; post-graduate course, elective course. In the college of literature courses are offered in philosophy, Japanese literature, Chinese literature, Japanese history, history, philology, English literature, German literature, French literature; post-graduate course, elective course. In the college of science the following courses appear: Mathematics, astronomy, physics, chemistry, zoology and botany, geology; post-graduate course, elective course. The college of agriculture enrolls students in the following courses: Agriculture, agricultural chemistry, forestry, veterinary science; post-graduate course, elective course; and also there is offered a "junior" course in agriculture, forestry, and veterinary science. There are therefore 33 regular courses provided at the colleges of the university in which students may compete for honors, not counting "elective" and "post-graduate" courses.

*Degrees.*—The highest degree is conferred on those who successfully complete the prescribed work in university hall. No student can pass into university hall until he has finished in the college of his choice. The student is required to spend five years in study after he enters university hall, two of these years as a resident post-graduate of the college at which he finished. At the completion of this five-year course he may secure the degree of hakushi, a doctor's degree. Those who notably distinguish themselves in university hall may be honored with the daihakushi. This honor is conferred by the cabinet only after the council of hakushi (doctors) have voted to recommend the candidate. Daihakushi means literally "great doctor." Upon the completion of the course in one of the colleges the degree of gakushi was formerly conferred on the student.<sup>1</sup>

#### GENERAL COMMENT.

One who has been thrown into association with Japanese university men is impressed with the intense earnestness with which they essay

<sup>1</sup> Outlines of Modern Education in Japan, p. 117. Government Report, 1895, p. 66; 1896, p. 77; Imperial Ordinance No. 13 (on degrees); No. 3, Arts. II, III, IV (on university). Imperial Ordinances, pp. 151-153.

the work before them. The pride which they take in their university is based upon the thought that as the pinnacle of Japanese education it ranks with many of the great seats of learning in other lands.

Like the German universities, the Imperial Tokyo University is a compact whole. The colleges do not stand apart by themselves; the individuality of the university is strikingly apparent. The observation is more often, "He is a university man;" not, as in England, "He finished at Balliol." The natural tendency of Japanese thought makes for the centralization of university management and life.

The students are drawn from all classes of society, as in America and Germany. There seems to be no special class of men who were predestinated for the university. The Japanese higher education has, however, not been long enough in the field to permeate the nation. If the past thirty years might be taken as a basis, one may look forward to the time in Japan when, as in Scotland, the universities may claim 1 from every 1,000 of the population; or when, as in Scotland, 1 man out of each 500 will have a bona fide university degree.<sup>1</sup>

#### 5. TECHNICAL EDUCATION.

The significance of Japanese technical education is no better seen than in the suggestion seriously advanced in London that England copy the Japanese technical schools. Mrs. Bishop, that experienced traveler, remarked in 1880 that, in the opinion of many competent judges, Tokyo had "the most complete and best-equipped engineering college in the world."<sup>2</sup> The New York Independent remarks: "Japan has had little difficulty in establishing high standards for admission and long terms of professional studies."<sup>2</sup>

#### NUMBER OF SCIENTIFIC SCHOOLS.

The Japanese possess great adaptability for what is sometimes called "practical education." There were, in 1895, in Japan 89 scientific schools, 1 military academy, 1 naval academy, 1 college of commerce, 1 technical institute, 52 commercial colleges, 8 telegraphic schools, 11 agricultural schools, 9 law colleges, 6 medical colleges, 3 veterinary colleges, and 11 mathematical and engineering colleges.<sup>3</sup>

#### ENGINEERING COLLEGE OF THE UNIVERSITY.

The highest grade of technical teaching is found in the Tokyo University, and in university hall the most advanced work is naturally done. In 1896 there were 37 engineering students taking the doctor's course in university hall, as compared to 19 scientific and 47 literature students.

<sup>1</sup> Editorial in Japan Mail, August 22, 1891. Fr. Paulsen, U. S. Education Report, 1891-92, vol. 1, pp. 276, 321.

<sup>2</sup> The Independent, May 12, 1898. Unbeaten Tracks in Japan, vol. 1, p. 188.

<sup>3</sup> Yankees of the East, vol. 2, p. 393.

In the college of engineering nine courses are provided, viz, civil engineering, mechanical engineering, naval architecture, technology of arms, electrical engineering, architecture, applied chemistry, technology of explosives, and mining and metallurgy.<sup>1</sup>

The course of study in the engineering college of the university extends over three years, and in university hall over five years in addition. The 360 recent graduates from the engineering college are distributed among the various courses as follows:

Civil engineering .....	104
Mechanical engineering .....	62
Metallurgy and mining .....	65
Electrical engineering .....	50
Chemical technology .....	36
Naval architecture .....	22
Architecture .....	21

The engineering courses have grown in popularity very rapidly, graduating now from two to ten fold more students than five years ago.<sup>2</sup>

The attendance at the engineering college has made a steady growth. Being 30 in 1885, 106 in 1890, 295 in 1895, 345 in 1896, it reached 385 in 1897. Civil engineering, mechanical engineering, mining engineering, and electrical engineering, in the order named, claimed the largest classes in 1896.<sup>3</sup>

#### TECHNICAL SCHOOLS.

*Lower-grade schools.*—We now turn from the advanced work in the university and its colleges to the schools which are classified in Japan as technical schools. They may be grouped as follows:<sup>4</sup>

	Schools.	Profes- sors.	Stu- dents.
Agriculture .....	10	64	578
Simple agriculture .....	27	117	1,781
Industry .....	7	90	1,624
Commerce .....	11	125	2,917
Simple commerce .....	5	28	704
Total .....	60	424	7,604

In addition to these ordinary technical schools, there are 5 institutions of particular note, viz, the higher commercial school, the Tokyo technical school, the Sapporo agricultural school, the Tokyo fine arts school, and the Osaka technical school.

Since Japanese commerce aspired to world-wide proportions no more interesting institution has been developed than the—

*Higher commercial school.*—It deals chiefly with the higher branches of commerce, and fits its students to enter responsible positions in

<sup>1</sup> Japanese Government Report, 1896, pp. 76-81.

<sup>2</sup> Japan Times, July 21, 1898.

<sup>3</sup> Japanese Government Report, 1896, pp. 77-83.

<sup>4</sup> *Ibid.*, p. 98.

commercial affairs, or to become experts for commercial houses. The arrangement of the course is such as to afford a preparatory, a main, and a post-graduate course. One year is required in the first, three in the second, and one in the third. In the main course special stress is placed on civil law, commercial law, political economy, statistics, financial administration, commercial science, commercial practice, commercial geography, and commercial history and industry.

There were, in 1896, 159 students in the preparatory course and 265 in the main course, or 424 as a total attendance at the higher commercial school. The following year the attendance reached 736.

*Tokyo technical school.*—The name of this institution does not point out its distinguishing characteristics nor its close relationship to the trades. The courses of study include electrical mechanics, electrical chemistry, industrial economy, industrial hygiene, dyeing, and weaving. The primary object of instruction is to fit men to enter factories as experts. There is a constant and pressing demand for its graduates by manufacturers. Manufacturing in Japan is of comparatively recent date, and it still being in the formative state, these students are largely instrumental in its development. The workshops of this technical school have attracted general attention, for in them the students have done original work of value for the promotion of manufacturing in Japan.<sup>1</sup> Experiments in glazing pottery through the use of coal resulted in the glaziers of Japan changing their baking furnace. A new blue dye, superior to anything known in Japan or Britain, was invented and will be of great value to the weaving industry. The students devised and operated a new method of weaving certain kinds of silk. In the course in mechanics successful results were achieved in testing petroleum engines and determining the horsepower developed under various circumstances. Steam boilers, rollers, and grinding machines were constructed in the workshops.

In connection with the Tokyo technical school there is an apprentice school for the sons of men employed in wood or metal work. Instruction is given in carpentering, joinery, wood modeling, casting, forging, finishing, and work in metal plates. The number of students in the technical school is 249, and in the apprentice school 107.

There are in addition fifteen apprentice schools in various sections of the country, having 1,768 students. They are devoted largely to the study of dyeing, weaving, embroidery, tobacco manufacture, woodwork, lacquer, and porcelain.

*Training of technical teachers.*—In addition to the training for teaching which students receive in the regular courses of the engineering college, the higher commercial school, and the Tokyo technical school, the Japanese have thought it expedient to have a special institute for training teachers for the lower technical schools. This institute for training technical teachers is under the control of the

<sup>1</sup> Government reports furnish the basis of these facts and those succeeding.

director of the Tokyo technical school. The courses of study partly coincide with the course of the latter institution, but as a whole cover the ground that would naturally be expected. There are 76 students under training to be technical teachers.

*Osaka technical school.*—Osaka is the Chicago of Japan. It is not strange therefore that in this center of industry there should be established a high-grade technical school. The courses are four years long, but as the school is new it has scarcely reached full development. There are 112 students.

The beginnings of technical education in Japan are found in the elementary schools, where definite instruction is offered in courses in commerce and industry. In the middle schools technical courses are more clearly outlined, and precise work is done. In the higher schools technical instruction of a high order is given. In the colleges of the university and in university hall the student carries his technical education to an advanced stage. Thus from the primary class to the courses for doctor's honors Japan has provided technical education.

In addition to the above, there are the apprentice schools, the special technical schools, and colleges, which afford exceptional additional opportunities.

#### 6. AGRICULTURAL EDUCATION.<sup>1</sup>

While technical education holds an important place in New Japan, and while medical, legal, and literary proficiency are essential to a civilized nation, yet it remains to be said that agricultural education should be a subject of interest to a larger proportion of the population of Japan than any one of the other branches mentioned.

##### AGRICULTURAL COLLEGE OF THE UNIVERSITY.

In the Imperial University double provision is made for advanced agricultural study in the college of that name and in university hall. In the doctor's course in university hall thirteen students are working for special honors in agriculture. In the college of agriculture there are 215 students, and the college was allowed 82,070 yen for the year's expenses. The students are divided among the courses as follows: Agriculture, 20; agricultural chemistry, 14; forestry, 14; veterinary science, 3; post-graduate courses, 3; junior course, 157.

But after seeing Japanese farming first-hand one has the conviction that Japan needs, besides the few advanced specialists, many students who know the fundamentals and will become the practical leaders of the people in this matter. Agriculture in Japan, with its cramped paddy fields, is not on the surface much like that pursued in the meadows, fields, and plains of America; yet Japan needs the science practically applied more than does a Western land.

---

<sup>1</sup>From Japanese Government reports.

## THE SAPPORO AGRICULTURAL SCHOOL.

This thoroughly equipped institution has long been one of the prominent colleges of Japan. It is designed to give both practical and theoretical training in agriculture and engineering, the attendance at the former course greatly predominating. The farms connected with the school are extensive and valuable. In 1896, 10,110,000 tsubo of land (84,250 acres) were added to the property of the institution. Besides the main courses, which cover four years and which enroll the majority of the students, there are "preparatory" and "agricultural training" courses. The college has 189 students, 18 professors, and graduated in 1896 18 men from the major courses and 20 from the minor. The state provides 12 free scholarships. The regular tuition fee is 15 yen per year for the main courses and 6 yen for the preparatory. This agricultural college has a library of 19,736 volumes.

## ELEMENTARY AGRICULTURAL COURSES.

In addition to the advanced courses offered at Tokyo and Sapporo, elementary agricultural courses are offered in the higher elementary schools. The length of the higher elementary course varies in different sections of Japan from two to four years. There has been a great increase in the number of schools which avail themselves of the opportunity to enroll agricultural classes. In 1895 such courses were given in 154 higher elementary schools; in 1896 the number had increased to 216 schools.

There are also a number of agricultural schools of inferior grade which should do an enlarged work as the study of agriculture becomes more and more necessary to the prosperity of Japan.

## 7. THE EDUCATION SYSTEM AND GOVERNMENT CONTROL.

The department of education was established in 1872 as one of the eight departments of the Imperial Government. The department was controlled by the following officers: Three chokunin, 19 sonin, 72 hannin, and 115 yatoi.<sup>1</sup> These correspond to chairman, directors, clerks, etc.

## FINANCIAL RESPONSIBILITY OF THE GOVERNMENT.

The national bureau of education has no responsibility for the support of elementary or middle schools. These derive their support directly from the people of the Fu, Ken, or Gun. The department is responsible, however, not only for its own maintenance, but also for the maintenance of all higher Government education. Taking the figures for 1896-97, the department of education spent 618,020 yen on

---

<sup>1</sup> Outlines of Modern Education in Japan, p. 8.

the Imperial University, 64,684 yen on the higher normal school, 36,752 yen on the higher normal school for females, 39,796 yen on the higher commercial school, 372,978 yen on the six higher schools, 155,409 yen for technical education, aside from that spent on the university for this purpose, and 38,179 yen for directors of normal schools.<sup>1</sup>

Taking into account the various other institutions which the department controls, its total expenditure for 1896 was 1,738,092 yen. The diet early in 1899 passed a special bill which took from the imperial treasury 10,000,000 yen for the encouragement of primary education. This amount comes from the national resources. The public-school expenditure for Fu and Ken, on the other hand, amounted to 15,526,101 yen. Including the department of education, the expenditure from the national treasury for education in 1897 was 2,945,167 yen, which is more than double the amount spent four years previously. This same year the educational expenditure provided by the people was 18,669,049 yen. Thus the cost of State education has reached the annual figure of over 21,500,000 yen (about \$10,500,000 gold).

#### THE EDUCATIONAL CABINET.

The present organization of the department of state for education provides for an educational minister and one vice-minister. The educational cabinet has seven distinct departments: Treasury, public documents, compilation, teachers' licenses, teachers' pensions, reports, and records. The work is very onerous. It includes: (1) The appointment, promotion, dismissal, and ranking of public school officials; (2) the proper licensing and classifying of teachers; (3) examination of books and charts; (4) composition or compilation of books; (5) adjusting of pensions for teachers or the families of deceased teachers; (6) questions relating to foreigners in the employ of the department; (7) the placing and support of Japanese students in foreign lands; (8) the consideration of petitions sent to the department; and (9) the financial relationships of all these matters to the public treasury.<sup>2</sup>

#### BUREAU OF SPECIAL SCHOOL AFFAIRS.

Within the department of education are two bureaus. The one on special school affairs has special obligations toward the imperial universities, higher schools, and middle schools. Reference libraries and astronomical laboratories fall under its jurisdiction. It concerns itself with degrees and encourages arts and sciences. The "academy" and scientific societies are its care. Its connection is intimate with these varied and important interests.

<sup>1</sup> Japanese Government Report, 1899, p. 20; 1896, p. 23.

<sup>2</sup> Imperial ordinance, No. 93.

## BUREAU OF GENERAL SCHOOL AFFAIRS.

This bureau has distinct duties to perform in the supervision of government education. It is responsible for the policy pursued in regard to normal schools, elementary schools, higher female schools, kindergartens, popular libraries, popular education, school attendance, school committees, and school directors of cities, towns, and villages. The bureau of general school affairs had responsibilities distinct from those falling to the bureau of special school affairs, as is seen by a careful comparison of the preceding two paragraphs.

## SECTION IV.—GOVERNMENT EDUCATION AND THE ADVANCEMENT OF WOMEN.

During the feudal era of Japanese history no provision was made by the State for the education of women. This explains much in regard to the subordinate position which women held in Japanese life. It may be pointed out that the position of women in Japan during the feudal era was in strong contrast to that of the age of chivalry in Europe; and Buddhism and Confucianism are rightly charged by Japanese with being the false teachers of the nation.<sup>1</sup>

That interesting Japanese document, *The Great Learning for Women*, sets forth authoritatively the former attitude of the nation toward women's education. It says: "The five worst maladies that affect the female mind are indocility, discontent, slander, jealousy, and silliness. Without doubt these five maladies affect seven or eight out of every ten women." And then it proceeds to lay down the law, "Such is the stupidity of her character that it is incumbent on her in every particular to distrust herself and to obey her husband."<sup>2</sup> Such was the intolerable insolence shown toward the mental development of Japanese women in general up to the time of the Restoration, about the middle of the present century.

General Kuroda, head of what was then the colonial department of the Government, advised that a few young women of good families be sent to the United States to be educated. The Emperor approved this plan, and in 1871 they were authorized to go. The Emperor said, among other things, "Women, therefore, have had no position socially, because it was considered that they were without understanding; but if educated and intelligent, they should have due respect."<sup>3</sup> The head of the nation acknowledged that "it was considered that they [women] were without understanding." Yet Japan studiously set on foot a great social revolution in giving women an education. A year after the Emperor had given permission to Japa-

<sup>1</sup> Intercourse of the United States and Japan, p. 179; Outlines of Modern Education in Japan, p. 135.

<sup>2</sup> *The Great Learning for Women*; see *Things Japanese*, p. 454-463, and the *American Missionary in Japan*, p. 176.

<sup>3</sup> Intercourse of the United States and Japan, pp. 180, 181.

nese young women to study in America Marquis Ito, a member of the world's embassy, speaking in San Francisco, said: "By educating our women we hope to insure greater intelligence in future generations. With this end in view, our maidens have already commenced to come to you for their education."<sup>1</sup>

The example of missionary educators in Japan had a powerful influence on the Government in the days when woman's education was a mooted question. As early as 1867 Mrs. Dr. Hepburn was teaching Japanese girls at Yokohama. In 1870 Mrs. Carrothers began her work in Tokyo. Miss Kidder took up Mrs. Hepburn's work in Yokohama, and the Ferris Seminary was established. When the Kobe Girls' College was planted in 1875, the Japanese gave \$1,000 toward the first building. This Kobe College for women has had a remarkable history and is the foremost Christian college for women in Japan. There is also a large advanced girls' college in Nagasaki. So great was the interest aroused by missionary teachers and others that the Empress Haruku came forward as a prominent patroness of higher education for Japanese women.<sup>2</sup>

In 1890 there were 51 girls' schools under missionary control, with a total attendance of 4,249.<sup>3</sup>

So keen was the interest taken in woman's education and so radical was the change of opinion in regard to its advisability that the minister of state for education said, in his official report of 1890, "In short, female education is the source from which general education should be diffused over the whole country."<sup>4</sup> The peeresses' school had 364 daughters of the nobility under instruction in 1893, the elementary course of study being six years and the middle course six years.

We must now note the effect of the new educational policy in regard to woman's education. In the elementary school system the obligation has been equally imposed on boys and girls to attend school. The system was organized in 1872, and the national education of women began. In 1885 there were 942,786 girls in the common schools; in 1890 the number reached 1,067,699, and in 1895 1,459,972 Japanese girls were receiving instruction in the elementary branches. This meant a very great advance, and though by itself it is encouraging, yet the following comparison shows that only a beginning had been made:

Of the total number of girls who should have been in school in 1890, but 31.13 per cent were in attendance; in 1895 the per cent had risen to 43.87, and in 1896 to 47.54 per cent, so that in 1896 still not one-half of those girls who should have been in school, under the law, were there. The difficulty of making the people actually appreciate

<sup>1</sup> Japanese in America, p. 14.

<sup>2</sup> History of Missions in Japan, Verbeck, pp. 45 and 143; Unbeaten Tracks in Japan, vol. 2, p. 333.

<sup>3</sup> An American Missionary in Japan, p. 182.

<sup>4</sup> Japanese Government Report, 1890, pp. 45, 46.

the value of female education is strikingly shown by the fact that in 1896 79 per cent of the boys of school age were under instruction, but only 47.54 per cent of the girls.

In the 47 normal schools of Japan male teachers and male students greatly predominate. In 1896 there were 5,609 men and 738 women studying to be teachers. An interesting examination may be made of the higher female normal school, an institution established by the Government for advanced work. This female normal school is in four distinct sections: (1) the higher normal school proper; (2) a higher female school; (3) an elementary school; and (4) a kindergarten. The result of this plan is that the students in the advanced normal school get regular practical training in teaching in the other three schools simultaneously with their theoretical instruction. The total number of pupils is 1,094, and they are divided as follows: <sup>1</sup>

Higher female normal school (main course).....	132
Higher female school.....	354
Elementary female school.....	393
Kindergarten.....	215

The opportunity was given Japanese women to take advantage of higher government education if they so desired, and the higher female schools were established for the purpose. The following table has been compiled by the writer to show the comparative status of these institutions: <sup>2</sup>

*Higher female schools.*

Year.	Schools.			Teachers.				Stu- dents.
	Government.	Private.	Total.	Native men.	Native women.	For- eigners.	Total.	
1885.....	9	(a)	9	22	50	(a)	72	616
1890.....	8	22	30	139	153	19	311	3,115
1895.....	8	6	14	82	92	.....	173	2,575

a Not reported.

An examination of the tabular statement shows that between 1885 and 1890 the number of private higher schools for women greatly increased, and from 1890 to 1895 they greatly decreased. But the Government institutions maintained a steady growth in teaching force and young women in attendance. In 1895 there were over 2,500 young women in the 14 higher schools established for them. It is noticed that in 1890, 19 foreign teachers are reported, but none in 1895. The foreign teachers were women, and in 1893 Japanese teachers were substituted for them.

It is interesting to inquire into the course of study pursued in the higher schools for women. We find that the course extends over five

<sup>1</sup> Japanese Government Report, 1896, pp. 60-64.

<sup>2</sup> Ibid., 1885, pp. 52, 53; 1890, pp. 64, 65; 1895, pp. 62-64.

years, with twenty-four hours of required work each week. The subjects of study may be summarized as follows:<sup>1</sup>

Morals .....	1 hour a week for 5 years.		
Japanese language.....	4 hours a week for 5 years.		
English language.....	6 hours a week for 5 years.

It must be granted that, considering the former status in Japan of education for women, these efforts to provide modern education were painstaking and fruitful. But there is still much to be accomplished. The minister of state for education wrote, in 1885, that "in general, female education was not making satisfactory progress."<sup>2</sup> In 1890 he again called attention to the matter, saying: "If those concerned in educational matters were to direct their efforts to the development of female education, a great and general improvement could be reasonably looked for in a few years."<sup>3</sup>

Although the education of women in Japan is now and is to continue one of the great questions to be reckoned with in forecasting the Japan of the future, yet it is fair to notice the criticisms that have been made on the effect of Western schemes of education.

A condensed statement in the *Japan Mail* seems to present the criticisms of the opposition: "Vitiating tastes, loss of refinement of manner, undue forwardness, conceit, unfitness for the duties of married life, and in some cases looseness of morals are alleged to be the fruits of modern training."<sup>4</sup> It is granted that, in every country, the school may fail to make a philosopher of a dunce or to make a Dorcas of a Deborah; it undoubtedly has "turned" many heads, male as well as female; but judging the school by its average product, it does not deserve the sweeping criticism quoted. Western education in Japan inevitably changes the social status of women; with this change comes the overturn of many former customs. A new day is coming in Japan different from that which Professor Chamberlin described: "At the present moment the greatest duchess or marchioness in the land is still her husband's drudge. She fetches and carries for him; bows down humbly in the hall when her lord sallies forth; waits upon him at his meals."<sup>5</sup> There must be a readjustment to the better state of

affairs, but not the loss of a single essential element in woman's strength or usefulness to the state, to the family, or to herself.

One who has given more than a superficial glance to woman's education finds much to praise in the effort now making in Japan. Miss Bacon's picture was drawn by one who shared the life of the Japanese girls in a prominent school.

The objections made to the more advanced education of women in Japan have a striking similarity to those formerly so insisted on in America and England. The best answer to them is the quiet answer which education, year by year, is itself giving. Criticism serves to prune the educational tree, but does not cut it down. Each year of its growth means larger and better fruitage.

## CHAPTER VII.

### CLASSIFICATION AND PROMOTION OF PUPILS. •

---

CONTENTS.—The St. Louis system, as set forth in the St. Louis School Reports, 1869-1874—The Elizabeth (N. J.) plan of grading, by Supt. Wm. J. Shearer—The Seattle plan of promotion and classification, by Supt. Frank J. Barnard—Plan of the North-side schools of Denver, by Supt. J. H. Van Sickle—Promotion in the grammar schools of Cambridge (Mass.), by Supt. Francis Cogswell—Report on the grading and promotion of pupils, by John T. Prince, agent of the Massachusetts State Board of Education.

#### I.—THE DEVELOPMENT OF THE SHORT-INTERVAL SYSTEM IN ST. LOUIS.<sup>1</sup>

---

FROM THE ST. LOUIS SCHOOL REPORT OF 1868-69. BY W. T. HARRIS.

*Advantages of the graded system.*

By the graded system I understand that in which the course of study is carefully arranged in accordance with the natural order of succession in the several branches; lowest in the course, the most elementary studies, followed by those that rank next in complexity, and unfold directly from the preceding, each study so graded as to advance in due proportion to all the others. At a certain stage of the pupil's progress in reading he is allowed to take up arithmetic; soon after that, geography, then grammar, then history. No branch of instruction is to come in before the requisite advance is made in those studies which are introductory to it. With this careful arrangement of the course of study there is also proper classification of pupils. The gradation of the course of study makes this possible. All pupils at a certain stage of advancement in a given branch are in the same class throughout all the others. When the course of study and classification is not thus fixed, there is more or less abnormal culture going on; some pupils taking up studies without learning the rudimentary presuppositions; some pupils studying Latin and algebra before they know English grammar and ordinary arithmetic. The regularity and consequent simplicity introduced into the school system by gradation and classification increases the power of the teacher incalculably. Instead of infinitesimal subdivisions of his school, amounting almost to the making of a class for each individual in each branch, and the consequent reduction of the teacher to the office of private tutor to each pupil, in the graded-school system a few classes comprise all the pupils of the school. The consequence is that the corps of teachers divide their labor, each taking two classes nearly of the same grade, and are able to concentrate all their energies on one point. The class can have thirty to forty minutes' time for recitation, whereas, if unclassified, each individual could get two minutes, more or less. But the teacher trains all to the habit of close attention throughout the recitation, so that each individual not only gets

---

<sup>1</sup> From the St. Louis school reports issued during the superintendency of W. T. Harris.

his thirty minutes as certainly as though he were the sole member of the class, but he gets far more. The stimulating effect of the exhibition afforded by the struggles of his fellows is the most valuable part. He sees his fellow pupils all striving for the same goal as himself; the lessons of their failures and success give him insight into his own, and deepen indefinitely the impression made by his private study in preparing his lessons. The complete dissipation of all the energy and faculty of the teacher by the nonclassified scheme renders him unable to produce any grand effect with his school, as a whole, and thus each pupil loses that important culture derived from mingling his individuality with that of the whole, subordinating his own caprices to the will of the community, and finding his pleasure in the effect produced by the organism of which he is a member.

These advantages of the graded-school system are obvious, and the result of their discovery and application is that all celebrated schools, both public and private, are graded in accordance with this scheme. No system of schools, supervised by one head, is possible without such grading—the results of one teacher could never be compared with those of another.

*Disadvantages of the graded system.*

On the other hand, there is a defect in the graded system which, though not often named and defined by educators, is nevertheless felt by the community at large. What I refer to is not the usual objection made—"that under the system named the work of the schoolroom becomes monotonous and like a treadmill; that it serves as a kind of Procrustean bed to hold back the talented pupil, while it does not benefit his dull companion"—for this can be avoided very easily by a system of promotions; the pupil is stimulated and encouraged by this. The obverse side is the worst—the discouragement produced by placing pupils in lower classes is the disastrous phase of the subject. The pupil who tries his best and then fails is deeply injured, and is apt to endeavor to preserve his self-respect by some sort of subterfuge. He accuses his teacher of partiality, it may be, or attributes the good success of his companions to the assistance of others. The root of all bitterness is loss of self-respect; the man or child who goes about thinking himself shut out from participation in the highest by his own natural incapacity is like one inclosed in a tomb while yet living. It is easy to see that this is the source of most of the difficulties which the graded-school system has to meet and overcome.

In the first place, there is difference in capacity; the temperaments differ; the relative mental endowments differ; tastes differ. And yet, in the graded school all are to be compared with the same standard. It is not surprising that evil consequences arise. The pupil is "sent over his course" again and again, falling back from class to class. He becomes stolid and lifeless, and reminds one never so much of the burnt-out coal in the grate which we name a "clinker." The teacher loses all patience: "The majority of the class can not be kept back on your account alone."

The closer the grading the better the classification is, and the fewer the "clinkers" developed; i. e., if the classification is made right at the beginning. For where widely different attainments meet in the same class it must needs happen that some will find the lesson that is adapted to the average of the class too easy, others will find it too hard. On the other hand, the severity of the teacher may contribute largely to swell the unfortunate class of pupils referred to. While severity may at times arouse latent energy, it as frequently closes up entirely that unfolding of the faculties which requires a genial, sunshiny surrounding as much as does the bloom of a plant.

When municipal governments are expending large sums for infirmaries and asylums, realizing the Christian humanitarian principle in the State, it is certainly

inconsistent to neglect a class of pupils and allow them to make shipwreck of their educational hopes. And yet it must be confessed that a large percentum of the pupils in our graded schools, after falling behind their classes, get discouraged and go, a few to private schools, most of them into spheres of manual labor or mercantile business, and forever renounce an education that would fit them to rise to the higher walks of life. Society recognizes its duty to care specially for all who are unable to direct their own activity in the regular channels of industry. It provides for the poor, nurses the indigent sick in its hospitals, and furnishes a retreat for its insane. In order that the inducement to educate the children may be as strong as possible for the parent, he is taxed by the laws for the support of schools, in proportion to his estate, and free schools are opened for all, rich and poor. But this is not enough. The school system must be made effective in the highest sense, and special provision must be made for weak or abnormal minds. The educational system should have in it the means of correcting any tendencies in the wrong direction.

*The remedy—A special school.*

The evils here spoken of may be remedied only by great care on the part of the teacher as to the habits or methods of study which the pupil has. For the reason that the evil becomes serious only in those grades as high as the grammar school, and is manifested chiefly in the class that passes from the district schools to the high school, it is clear that special classes should be made for such pupils. The regular class can not be kept back for them, nor will it do to degrade them to a lower. Accordingly, when the class is promoted as a whole on examination, one part can go to the high school, one part to the special school, where skillful teachers supervise and correct the habits of study, taking a slow course in the higher branches. Gradually the mental self-reliance increases, and the ability to overcome the full-length lesson is acquired. The pupil is then to be transferred to the high school. On this basis, and to test the truth of this theory, the board have, by a recent act (at the August meeting, 1869), established the "intermediate school." Its results will furnish data on which safe future action may be based.<sup>1</sup>

Public schools have generally been noted for thoroughness. This has been claimed as their greatest merit. Certain it is that very high percentages are required of pupils before promoting them to the next higher grade in the course. It has not been sufficiently considered that there is a limit to the thoroughness desirable; that the time consumed in securing such high standards of thoroughness would have been better used by the pupil in mastering higher methods. Instead of solving the problem of higher arithmetic by arithmetical methods, he could more wisely have "flanked" them through algebra and trigonometry, and these latter studies would have opened up to him new worlds in mathematics. Instead of pursuing topographical geography to exhaustive minuteness, his time would be better employed in mastering physical and commercial geography; and so, instead of exhausting a "compendious treatise on English grammar," after acquiring its general outlines, a few months' study of Latin would give him the culture requisite to make a grammar for himself.

---

<sup>1</sup>At the date this report goes to press the experiment has progressed far enough to justify its establishment. Of the 80 pupils admitted, the greater number were those from the district schools who failed to make the requisite per cent to enter the high school; some were from private schools, and had made more or less progress in the higher English branches or the languages. The result thus far has been such as to encourage the most sanguine hopes. Most were found to have bad habits of study, and these have been improved surprisingly; others were good scholars, but had not been quite long enough in the district schools to fit them for the high school. This class has saved a year's study in the grammar schools, thus seeming to prove that the standard of perfection in the lower branches was unnecessarily high. The name "intermediate school" is not appropriate, inasmuch as it does not convey a correct impression regarding the character of the institution.

This point is the most important one involved in the present discussion. To what extent should thoroughness be relied on and to what extent should the advance be made by means of higher methods? Have not public schools held too exclusively to the former appliance, and thereby engendered the defect to which attention is here called? Private schools sometimes rely too exclusively on the latter appliance, and in that case tend to produce smatterers. The true course, it seems, should use both appliances in their due proportion, and this can be determined by experience. This due proportion will be found when no pupil is kept using a lower method of solution after he is able readily to acquire the higher one. It is clear that too much attention can not be given to the formation of correct habits of study. But the discussion of the dangerous tendencies of the graded system should not lead one to suppose for a moment that the evils balance the good; for even where they are most injurious the positive benefits of grading predominate. In fact, most of what are called the evils of graded schools result from the lack of sufficient grading rather than from too much of it.

FROM THE ST. LOUIS SCHOOL REPORT OF 1871-72, BY W. T. HARRIS, SUPERINTENDENT.

The high-school course is divided into four classes, the work laid down for each occupying one year in its accomplishment. The fact that each high-school class is expected to begin its work in September and complete it in June indicates at once the condition of things that I have already alluded to in this report. Such a course of study is "nailed to the calendar," and its progress is rigid and determined by the lapse of time and not by the progress of the pupil. If a pupil is sick and unable to attend school for ten weeks, he finds, on his return, that there is no class just ready to admit him. The class which he left is now ten weeks in advance of him, and to make up this work and at the same time to do the regular work of the class is too difficult. If it were possible, it would prove a superiority of individual work over work in a class. The pupil is probably obliged to enter the next class below, but this class is thirty weeks behind his present acquirements, and his ten weeks' sickness has thus cost him a year's progress. On entering the lower class, however, he finds himself going over familiar ground and gets careless in his work. By the time his present class arrives at the work from which he was broken off by sickness the previous year he has acquired a loose habit of study, and is likely to fail on the first difficult study that he encounters. Two failures are pretty sure to complete his discouragement and cause him to leave school. Another case: A pupil, for some reason, is not quite able at the close of the year to pass the standard for admission to the next class, and is accordingly obliged to join the class below. He is set back just one year at once. He might have lacked five weeks' study or ten weeks' study—scarcely more than this—of completing the work of his class. But for this he is obliged to lose nearly a year more than was really necessary. It must be remembered that these are not isolated instances, but that the number of each class who ought to be separated, for one reason or another, from the part of the class that does the work of the grade thoroughly is about one-third of the entire number. In order to avoid this evil of putting back pupils, there is a strong temptation to let them pass on at a low standard. The consequence of such a course is that each class is impeded in its work by the presence of a number who are not equal to the performance of their tasks.

These evils are not confined to the classes of the high school; they extend to the higher classes of the district schools. -Inasmuch as the examination for admission to the high school is to occur in June, the first grade's work of the district school must be completed at that time, and hence must be commenced in September of each year. This fact in turn influences the time of beginning and completing the work of the second grade. The tendency of all this is to produce a system of classification throughout the entire course of the district schools similar to that in the high school. In this case classes would follow each other at intervals of a

year, and the difficulty of properly assigning those who should be classified in grades between those established exists throughout the entire system. In many sections of the country—in Ohio and New York, for example—this very practice prevails. A promotion takes place once or twice a year, on occasion of a general written examination by the superintendent. Those who “pass” go on; those who fail fall back to the lower class or leave school altogether. Such a system of grading and classification must be regarded as only one step above the system of unclassified schools. In our St. Louis schools the classification is so arranged in the lower grades of the district schools that classes follow each other at intervals of about six weeks. Should it be necessary to put back a pupil to a lower class, he finds it at just that stage of progress which will enable him to review and strengthen those portions of his course that need it. But this system allows of another advantage. As the highest class loses numbers by promotion, graduation, or otherwise, its ranks are filled with the best pupils from the next lower class. The latter is again recruited by promotion of the best from the next one below it. This process is continued to the lowest class in school. After such a promotion has been made the account stands thus: Each class has sent forward perhaps one-third of its pupils (the best ones) to the next one above it, and has received the best third of the pupils from the class below. There has been no degradation of pupils. What can be said is that two-thirds of each class (including all the fair and middling scholars) were left, and a few of the foremost in rank of those below them admitted with them. Within less than a half-year’s work the studious and brilliant pupils will work up to the top of the class. There will always be differences of native power as well as of previous acquirement. Before a half a year has elapsed the two-thirds of a given class who pass for “fair and middling” scholars will be overtaken and, in some instances, surpassed by the brilliant pupils admitted from the lower class. A change of the kind I have mentioned, amounting to a readjustment of all the classes, is desirable as often as four times a year. If made, it will entirely prevent the collection, in any one class, of the dull and incapable scholars.

These, for the most part, are pupils who have not become thoroughly aroused, or, more frequently, such as have become discouraged by degradation in rank. Their defect is not primarily intellectual, but moral; they have feeble wills. It is very rare that a pupil has so dull an intellect that he can not, if he possess a resolute will, accomplish any intellectual feat whatever by the aid of industry alone. Those who fail do so through lack of courage or of perseverance. This furnishes the strongest ground of all against manipulating the system of classification in such a manner as to make those who are not promoted feel that they are degraded. By the method here described I think the minimum of discouragement is reached. Two-thirds or more of the class—enough to preserve the identity of the class—remain after any reclassification, and, as this embraces many fair scholars, none need feel that they have been slighted. The change made has elevated the fair in rank to the highest rank in class and those who were poor to the rank of fair—at least for a time. Stimulated by this, they frequently increase in self-respect and develop powers that had hitherto lain dormant.

In what has been said the danger of collecting many poor pupils in the same class has been indicated. Our experiments have, I think, fully demonstrated that such a system is pernicious. Some years ago I recommended the establishment of an intermediate school for the purpose of classifying those pupils who fell short of the standard for admission to the high school and yet who were so far advanced as to be greatly injured by setting back a year, and classifying them with pupils of the next grade. The experiment was continued for two years. It was found that the so-called brilliant pupils, those full of courage and resolution, even if admitted on a very low per cent (I admitted on trial some of this character who made only from 30 to 40 per cent), were soon able to work their way to the top of their

classes and to acquit themselves creditably. But those of enfeebled wills, having lost self-confidence or having become listless through disgust, were very slow in manifesting improvement. The practice of giving them short lessons was tried with some success, but a cloud hung over them and hangs over them still. (Some of them have been two years and a half in getting through one year's work of the high-school course, and are not able yet to pass their examination at the time this report goes to press, March, 1873.) I think that many of these pupils would have done better if they had been reclassified periodically, in the manner described, with fresh and ambitious pupils pushing up from below. I once compared these pupils to "clinkers," or pieces of coal that do not readily kindle except in a very hot fire, and generally go out before all the carbon is consumed. The "clinkers" are found in our bituminous coal, and need to be burned twice in a hot fire. These pupils, so far as they have any influence, tend to dampen the ardor of others.

Their atmosphere is contagious, and they discourage the teacher and the other pupils when they are numerous in any one class. By the plan of frequent reclassification throughout the school, from the lowest class to the highest, is prevented the collection of these unfortunate pupils in one class. But if reclassification is carried on in any of the higher schools alone the result is to sift down this demoralized element of the school into a class by itself. Hence, whenever any change is made in the higher schools, a promotion of the brilliant pupils should be made from the district schools to compensate. (The board changed the rule for admission to the high school in February, 1873, so as to give an opportunity for the examination of applicants for admission quarterly. This will accommodate the district schools perfectly. There may be enough classes found in the first and second grades to reduce the interval between them to one quarter. Moreover, in the high school the divisions of any one class may be separated at intervals of the same length. At least this may be done with the classes of the first and second years of the high-school course.) \* \* \*

There is needed some general plan by which the course of study in our higher grades may be made more elastic, better adapted to the capacities of pupils. The constant danger of all graded systems is that they are liable to become Procrustes' beds. Take the work laid out for any class in our schools—it should be found exactly adapted to the capacities of the average pupil of the grade. The tendency of the teacher of energy and ability is to raise this standard up to what the best pupils can do and to bring sufficient pressure upon the pupils of average or less than average ability to compel them to keep up. In many instances pupils are overworked by this process. Doubtless it more frequently occurs that the teacher grades her lessons by what the poor scholars can do, and the best ones are not given enough to try their powers. In the lower grades this difficulty is not serious, for the reason that the work of reclassification goes on more actively. In the higher grades it is more serious, and there should be some modification of the course of study by which pupils whose rank in the regular course is above a certain per cent should have the privilege of electing some one branch of study which they may carry on in the class above.

FROM THE ST. LOUIS SCHOOL REPORT OF 1871-72, BY W. T. HARRIS, SUPERINTENDENT.

Whenever the sizes of the schools have been such as to admit of it, a system of classification has been introduced, and the immediate consequences have been: (a) great increase in the length of recitation; (b) far more thoroughness in the discussion of the lesson, sifting the different statements, and probing the meaning of the same; (c) great stimulation of the mental activity of the pupil through trial and competition with other members of his class. These three advantages can scarcely be overestimated. They multiply the teacher's power just as organization improves the strength of an army. In the unclassified system the teacher

is only a private tutor, and the fewer pupils he has the better for each and all. In the classified system the proper quota of pupils is a potent instrument in the hands of the teacher, and he uses the whole class to correct and stimulate each one in it. The lesson, as recited and discussed by and before the class, gets all its phases stated, restated, and criticized as never could be done in the case of a single pupil with a private tutor. The presence of the class arouses the teacher to a high pitch of energy, and each individual in the class is excited by the presence of the teacher and the rest of the class. These circumstances account for the high estimation in which the graded system is everywhere held. So many good things have a tendency to hide some very serious defects. Such defects, already alluded to in speaking of the high school, will be discussed in a summary manner here.

The tendency of all classification is to unite pupils of widely different attainments. Especially is this found in the small schools. The consequence is that the lesson is too long for some and too short for others. The best pupils in the class are not tried to the full extent of their ability. They consequently lose, in some degree, the discipline which they should gain. The poorest pupils of the class are strained to the utmost. They are dragged, as it were, over the ground without having time to digest it as they should. This develops the result that the overworked pupils are frequently discouraged and drop out of the class and likely enough out of the school altogether. In large systems of schools, where classification is very perfect, the evil here spoken of need not occur to a serious degree. But it does occur very frequently from the fact that the course of study is laid out in grades (ten, more or less, in number), and all pupils are classified or graded so that each belongs to one of these grades. All pupils in the grade must be in the same degree of advancement at about the same time. The result is that the school is classified in such a way that there are ten classes separated by intervals of from five to ten months' work. Then promotion is made from one grade to another at set times, annually or semiannually. All who pass the examination commence the work of the next grade; all who do not, continue until the next examination in the work of the grade through which they have just passed.

The effect of this is well known to all teachers who have made experiments in this direction. Both parent and pupil feel very keenly the time lost. The pupil must have been over much of the work of the year, perhaps nine-tenths or three-quarters, or perhaps only one-half of it. Yet what he has done entitles him to an advanced position over his fellow-pupils of the next class below him. If he returns to school after being thrust back a year for his lack of less than half a year, he appears in the ranks of a class who were a year's work behind him. He has lost his ambition; he is some time in the class before they come to work that is difficult enough to arouse him to the exertion of his full energies. Meanwhile he has lost his discipline for hard study, and he is very likely to break down a second time on the work of the year. A second failure for promotion is nearly sure to cause withdrawal from school. The parent has lost faith in the talent of his child and puts him into business or apprentices him to a trade. The youth has lost his own confidence in himself, and is stunted for intellectual growth for the rest of his life.

Was there any advantage in this kind of grading? How could it otherwise have transpired? Instead of the Procrustean bed of grades, the pupils should have been classified into classes of thirty or less each. These classes in all large schools would be separated by intervals of about five weeks' work. As often as these classes, any of them, become too small by the withdrawal of pupils or too large by the assignment to them of newcomers, there should be a new formation of classes. The best pupils of one class are to be sent up to the next, the best from the next below are to be promoted and joined with the pupils remaining. Those not promoted are now united with the best of the class that is five weeks' work behind them. The degradation is scarcely felt. It is rather called, in both cases,

a promotion of the best ones, not a degrading of the poorest. It is a process of cutting up the school into classes anew, and, as a matter of fact, the pupils need not have changed rooms to any very great extent.

A set time for examination and promotion is injurious just in the ratio of its infrequency. Annual examinations for promotion and a discontinuance of promotions at other times is an extremely pernicious system, and occasions serious injury to the higher grades of our schools. It is evident that the further advanced the pupil the more unfavorably will it affect him; and yet in our schools throughout the country the system is so arranged that this Procrustean device applies more especially to the advanced pupils. In how many of our cities is there promotion to the high school oftener than once per year? What becomes of the pupils who lack 1 per centum of making the standard required? Are they not sent over the work of the highest grade of the grammar schools again, and thus made to occupy a year in doing what they might do in one-fourth of that time? And do they not leave school at this crisis more than at any other time in the whole course? Are not our high schools arranged in grades or classes just one year apart in their work? And is all this necessary? Not, certainly, where there are pupils enough to make two or more divisions of thirty pupils each. If the pupils from the highest grade of the grammar schools had been classified according to their rank in the examination, the first thirty would have formed the highest division of the high-school work, the next thirty the second division, and so through those who had made a reasonable standard. Then would have come the highest thirty pupils in rank of those not admitted, who should be admitted to a central school and conditioned to five weeks' work on the studies of the first grade of the grammar school, and then examined again; the next thirty to a longer period, and so on. Pupils thrown back five weeks, and then classified with their own fellows who had been unsuccessful, would find the hardship a very trivial one, and would scarcely think of leaving school.

For schools where the number in any grade fell short of the requisite thirty wherewith to form a new division, of course this plan of subdivision could not be carried out. But so far as the first [highest] grade of the grammar school is concerned this would rarely happen, and still less likely would it occur with classes below the highest grade.

The principle is clearly this: Not a Procrustean bed of grades on which the school is to be stretched so as to reduce the number of grades of advancement to ten or any other special number, but a thorough classification of all the pupils into classes on a certain quota as a basis, whether this be thirty or twenty-five, or whatever other number is considered the best. The endeavor will be to have the classes separated by as small an interval as possible; but four, six, or even ten weeks' work is small enough for all practical purposes; and in order to make this arrangement uniform the pupils in upper grades, when too few to form classes with the required quota, should be brought together in central schools; and this principle should be applied as far as possible; if the highest grade in the high school consisted of sixty pupils or more, the division of it into two classes would be required.

This process of continual readjustment of classification in our schools will render the whole system elastic and mobile. Like the current of a river, there will be everywhere forward motion—in the middle the current is more rapid, at the sides the current flows more slowly. The work of the grade laid down for a year's study will be accomplished in three or three and a half quarters by the brightest; by the dullest and slowest in five quarters. There will be no temptation to push on a slow pupil or drag him beyond his powers; no temptation to promote a pupil to a new grade's work before thoroughly completing what is below him.

By this plan would be checked a pernicious system of holding back pupils from

examination for the high school, simply for the purpose of gaining a reputation for the school through the high per cent of its pupils in the competitive examination.

Doubtless there is a certain degree of thoroughness requisite in the lower branches before the pupil can profitably take up the studies of the next higher grade. After attaining this per cent it is possible to keep the pupil drilling over the lower work, in order to secure a certain mechanical thoroughness, so long as to waste much time that might be better expended for the pupil's culture and growth on the higher studies.

There are still some points on which doubts may rest. For example, it may be urged that this system would cause a collection of the dull and stupid pupils into classes by themselves, a deplorable result. But this is one of the evils which this system is adapted to correct. The fact that the best pupils from below are allowed to rise through the masses above them as fast as their ability can carry them is surely not likely to prevent the slower pupils, who are their companions, from exerting all their energies and making considerable progress. The stream of bright pupils from below is inexhaustible. From the primary grades it ascends, continually passing fixed points or points that move on more slowly. In every class there will be its quota of bright pupils, some leading the class, and some just sustaining themselves in it, having recently joined it. But in the old system all the bright pupils had attained the top of the class and the dull ones had fallen hopelessly to the bottom long before the needed reclassification took place.

Another may urge that this system causes so rapid a change from teacher to teacher that the very important personal influence of the teacher is materially impaired. But under this system in the higher grades the pupil would hardly change teachers oftener than once or twice per year, and a change as often as this is desirable for the healthy individual culture of the child. The school should not be a family influence exclusively. It is the transition to civil society; consequently the pupil must change teachers often enough to correct any one-sided tendencies of social culture that he may be liable to acquire from the individual teacher. For it must be remembered that reclassification of a whole school of 700 pupils, distributed through 12 rooms, does not imply a change of teachers on a part of more than one-sixth of the pupils, even when one-third of the best pupils in each class are promoted to the next higher. Each teacher having two classes (or, in the lower grades, three classes) will have one-third of the pupils from her advanced class promoted to the lower class in the next room above; she will likewise receive from the next room below one-third of the pupils from the advanced class there. In her own room, one-third of the pupils will be promoted from her second to her first class, but will still remain under the same teacher. In fact, she will have promoted to the next room one-sixth of her pupils, and have received one sixth from the next lower room—that is to say, in case one-third is promoted from each class; but, practically, this is the maximum, and in ordinary cases a less proportion of the class will be transferred. If reclassification is instituted four times per year, and on each occasion one-sixth of the pupils are promoted to the next room, it will follow that each pupil will be taught one year and a half by the same teacher. But, as frequent transfer is necessary in some schools, to make up for depletion of pupils in higher grades, it will happen that this period will be reduced one-half or two-thirds.

In small towns where the high-school classes do not number over thirty pupils each, such subdivision as I have here described can not be accomplished. But in such places there is ample occasion to apply this system to the district schools, which frequently suffer more than the high school from the wide intervals between the higher classes. Transfer of the same to the high school as a preparatory class, or to intermediate schools, will be found a salutary measure. Hence, the Cincinnati

plan of intermediate schools is an excellent one for purposes of classification. In small towns not only the regular high-school pupils are to be sent to the central institution, but also the higher grades of the district schools whenever the classes are too small for economical instruction. These may form a "preparatory department" and can be graded into divisions of thirty pupils each, in such a manner that there is an interval of ten weeks or less between each and the next higher. But whenever transfer and promotion take place in this school there should be at the same time promotion from the grammar school in order to prevent the isolation of the dull pupils in the lowest class of the school; when the best pupils are promoted from any one division their places should be made good by the best pupils promoted from the class below. The psychological effect of successful competition has been alluded to before. The moderate scholars of a higher class may find themselves at an advantage as compared with the best pupils newly promoted from the class below, and are likely to take fresh courage.

The question may arise, Do these pupils who are promoted from one class to the next omit that portion of their studies gone over in the interval of time between the two classes? It is expected that this will be taken up by a review of the ground embraced in the mentioned interval.

FROM THE ST. LOUIS SCHOOL REPORT OF 1872-73, BY W. T. HARRIS, SUPERINTENDENT.

Last year I alluded to our plan of promotion from class to class, and to the elasticity that prevails here in regard to grading. Briefly stated, the theory of our plan is as follows:

1. There is great difference among pupils in the capacity to learn. Children who enter school at 8 years of age, can, on an average, make nearly double the progress in primary work that pupils of 5 years of age can make. Bright, nervous children will make far more rapid progress than children who are stolid and dull.

2. The school must provide for this difference in rates of progress by frequent reclassification; otherwise the school will become a lifeless machine, a Procrustean bed. It must be understood that when bright scholars are kept back for dull ones they acquire loose, careless habits of study; and when pupils of slower temperaments are strained to keep pace with quick and bright ones they become discouraged and demoralized.

3. Besides difference in temperament, there is difference in regard to amount and regularity of attendance upon school. Some pupils are detained from school by sickness; some by the necessity of working for a living. Three months a year is all that can be afforded by the poorest people after the child is able to work. New arrivals in the city or departures from the city occasion a fragmentary participation in the privileges of the school. Moreover, it is a singular fact that nearly one-half of the youngest pupils begin their school life in the spring, having arrived at school age too late the previous fall to enter before the inclement weather sets in. The number of pupils belonging to the school at any one time in St. Louis is two-thirds of the entire number enrolled for the year. Hence the accession and loss of pupils during the year equal 50 per cent, or one-half of the average number belonging to school. It should be stated that the statistics of a large majority of other cities show a greater fluctuation than this. The general character of this accession and loss may be stated thus: In the lower grades there is continual accession, in the upper grades continual withdrawal of pupils.

4. Combining these two inequalities or differences with a view to restoring equilibrium—the continually developing difference of rate of progress in studies between pupils of the same class with the continually developing inequality of size of classes (in upper grades decreasing, in the lower grades increasing in size)—it is evident that provision must be made for promotion of the pupils who make

rapid progress, and that this promotion will at the same time restore the proper quota of pupils to the teachers of the higher grades. A promotion made once in ten weeks, or once in a "quarter" or "term," will generally suffice to keep the school in a state of equilibrium.

5. It is clear that frequent promotion should not be made by classes. The few best ones in the class should be united with the class above—it will seem a reward or a recognition of their excellence. After such promotion has been made through all or nearly all of the classes from the lowest, each class will find itself composed of its fair, average, and poor scholars, together with a few of the best from the next lower class in place of the few that it has lost by promotion. For a while, at least, the average and fair scholars in the class will have the stimulus of being the best in the class. The poor ones will rank as "middling," and the new pupils will begin as the poorest and slowly work up toward the top of the class. The advantage to the self-respect of the slower pupils which comes from standing in relation to their classmates as abler and better informed is not to be lost sight of.

6. Classification in a school is never absolute. No two pupils are of exactly the same degree of progress. The entire number in the school may be ranked from the highest to the lowest, and there will be found no wide gaps indicating a natural separation into classes, but the best of the next class below would stand very near the poorest of the class above, no matter where a division were to be made. In dividing into classes, therefore, the proper number in the class is first to be considered, and next the qualifications. But it will not do, even for the sake of having a class of proper size, to combine pupils of widely differing attainments. As indicated in the above table, the numbers in the various years of the course vary nearly as follows:

First year.....	30	Fifth year.....	7
Second year.....	21	Sixth year.....	4½
Third year.....	20	Seventh year.....	2½
Fourth year.....	12	High school.....	3

Provided the classes in the higher grades are to be of normal size, it is clear that the chances for proper grading are only one-seventh to one-tenth as good in them as in the lowest grade. The only remedy for this is to bring together the pupils of the higher grades into fewer schools. There may be very many schools with the lower four grades. There should be only five rooms devoted to instruction of pupils of the sixth year in the course where there are 30 devoted to the lowest grade, or 91 rooms devoted to the five lower years' work. With us those schools giving instruction to pupils in the seventh or highest year of the district school course<sup>1</sup> are called "first-class" schools. For purposes of proper grading and classification, there should be one of these for each district enrolling 4,000 pupils per annum, or for an average attendance of 2,500 pupils. Ten such schools would answer our purpose at present. As we have 15 we ought not to increase our number for five years.

7. As systems of schools are generally organized, the higher priced and most experienced teachers have charge of the upper grades of pupils. As their classes suffer depletion throughout the year, unless there is some regular mode of transferring new pupils to the care of those teachers, they will have very small classes the latter half of each year. Thus, while the poorer class of teachers are overburdened, the ablest and best-paid teachers have less than their quota of pupils. It is clear that the policy should be to bring as many pupils as possible under the ablest and best-paid teachers. The practice of frequent transfer of pupils is better for this purpose than the custom of transferring in bulk once per year.

<sup>1</sup>At a late meeting of superintendents of western cities (held in November, 1873), it was agreed to adopt a system of eight grades for the work of the district schools, each grade corresponding to a year's work and accordingly subdivided into quarters. The cities of Toledo, Cleveland, Detroit, Cincinnati, Memphis, St. Louis, and Chicago have adopted this standard.

8. The system of frequent transfer does not affect the individual pupil any oftener, on an average, than the system of transfer once a year. The bright pupils, it is true, have frequent opportunity to advance. The system is elastic for them. The slow pupils advance only when ready. The system discards one general epoch of transfer and reclassification at the close of the year, and adopts instead four or more partial transfers so arranged as to accommodate the twofold demand—first, that the ablest pupils shall not be kept back; second, that the ablest and highest-paid teachers shall, at all times, have their full quota of pupils. In the lowest grade, where several rooms in the same building are filled with pupils not advanced beyond the first year of their course, the bright pupil will change teachers perhaps three or four times in the year. In the higher grades the pupil will remain a year or more under each teacher.

9. How to provide for the necessary process of reclassification and transfer from room to room with the minimum of discouragement and consequent injury to that half of the pupils who fall below the average of attainment is the serious question. If the sifting of each class for the advantage of the best ones is accompanied with "dropping" the few poorest ones into the class below, we have the maximum of injury. The class, as a whole, is not stimulated, but only frightened at the degradation of the few hindmost. Those actually "dropped" are really disheartened. Besides, such sifting down tends to create a movement toward the lower departments instead of toward the higher departments where the vacancies are. When the opposite policy is followed, of promoting the few best instead of degrading the few poorest, the maximum of encouragement is attained. Sift up and not sift down. The school should be a living process, continually readjusting and adapting itself to the want of the organization as well as to the capacities of the pupils.

10. How if the upper classes are quite small and yet the intervals are very large in regard to advancement—in other words, what if the more advanced pupils are very few? Central schools should absorb all the pupils of higher grade, leaving to the other schools only such grades as they find it possible to provide with good classification. Without such combination with central schools, economy and perfect classification are impossible. Small classes and small provision for differences in capacity among pupils naturally result.

11. When promotion is made only once a year into the high school, the district schools are compelled to adapt their upper classes to this condition of things, and accordingly make the work of the first grade begin at the beginning of the year and end with its close. The second grade, likewise, must fall into the same trammels. If a class should finish the work of the second grade before the close of the year, it must not take up first-grade work until the beginning of the next year, and if, at the commencement of the scholastic year a class of the second grade has not quite finished its work, it is generally put at once into the work of the first grade, although unprepared. The only alternative would be to let it work a year longer on second-grade studies. The utter want of elasticity in the classification of the upper grades of the district schools, arising from the lack of frequent promotions to the high school, works violence continually to the interests of one-third of the pupils. All those delayed through sickness, the necessities of poverty, or inactive temperaments, either fall back a whole year, or else in a vain endeavor to make up their deficiency, overwork themselves or get discouraged.

12. The advantages of frequent reclassification are, in brief—

(a) *Economy*.—Filling up the classes of the ablest and best-paid teachers and making room in the lower grades for new pupils constantly applying.

(b) *Rapid progress*.—The pupils that learn readily are allowed to move forward as fast as their abilities permit, the slower pupils and those irregular in attendance neither allowed to hold back the more fortunate ones, nor obliged to overwork and cram in order to keep up.

The disadvantages alleged are confined to the practice of changing teachers too frequently. To these it is sufficient to reply by a question: Is it desirable to keep a pupil back in his studies simply in order that he may recite for a long time to the same teacher? Every superintendent knows that a change of teachers brings the pupil in contact with a new individuality, prevents the danger of warping the development of character in the pupil, and is desirable oftener than once a year in the lower grades, and at least once a year in the higher grades—where the teachers are maturer and more highly cultured—until the pupil reaches the high school, where he recites daily to three or more teachers.

FROM THE ST. LOUIS SCHOOL REPORT OF 1873-74, BY W. T. HARRIS, SUPERINTENDENT.

The theory of grading and classification set forth and defended in my annual report for 1871-72 has provoked more discussion among the leading educators of the country than I anticipated. Criticism has generally been favorable, but in some quarters strong protests have been made against it by very intelligent men. I believe, however, that a complete statement of the method of reclassification, embodying all of its details, will prove the objections made to be groundless. I propose, therefore, here to present the subject anew, and endeavor to consider the alleged defects in a candid manner.

At the National Educational Association in Detroit for 1874 Hon. E. E. White, of Ohio, made the following statement and defense of the position:

The pupils in the graded schools are divided into classes, and to secure necessary economy these classes are made as large as practicable. The fewer the number of pupils embraced in the system, the fewer must be the number of classes, and, as a consequence, the greater must be the inequality in the attainments and capacity of the members of each class, and hence the greater the difficulty of the problem now under consideration. If the teacher of a class adapt his instruction and requirements to the maximum capacity of his pupils, the great majority are hurried over their studies and receive a superficial and imperfect training. If he adapt his class work to the minimum capacity of the class, the great majority are held back, and, as a consequence, not only sacrifice time and opportunity, but fall into careless and indolent habits of study. The remaining course is for the teacher to adapt his class work to the medium or average capacity of his pupils, with such special attention to the more and the less advanced pupils as may meet, to some extent, their wants. But here comes in the "per cent system," with its demands. That the class, as a whole, may attain a high average per cent, it is necessary that the lowest members of it may reach a good standard, and this results in the holding back of the bright and industrious pupils until by iteration and reiteration the dull and indolent may be brought to the required standard. The amount of time and talent thus wasted in some graded schools is very great. This is not always evident to the teacher, since the brightest pupils, being chained to the dullest, soon learn to keep step, scarcely showing their ability to advance more rapidly. This difficulty is greatly aggravated when classes are promoted en masse from grade to grade, the pupils being thus chained to each other year after year, or throughout the course—an efficient process for reducing pupils to the level of mediocrity.

The statement of these difficulties suggests their partial remedy. The brighter and more capable pupils in each class must have the opportunity to work away from the less capable, and to step forward into a higher class, when the difference between them and their lower classmates becomes too great for a profitable union in the same class. To this end there must be a proper interval between the successive classes, and the reclassification of pupils must be made with corresponding frequency.

Experience alone can determine what this interval should be and the frequency with which pupils should be promoted. It is possible that both of these facts may depend somewhat on the number of pupils included in a graded system, a much more complete classification being possible in large cities than in small towns. While this may be true, it is believed by many experienced superintendents and other intelligent observers that the universal experience of graded schools condemns the prevalent practice of promoting pupils but once a year, with a year's interval between the classes. This wide interval is a serious obstacle in the way of a needed

reclassification of pupils. The more capable pupils can not be transferred to a higher class, since this obliges them to go over the ground of two years in one—a task successfully performed by very few pupils—and the less advanced pupils can not be put back into a lower class without serious loss in time and ambition, if they are not withdrawn from school. It may be well for a few pupils in any system of graded schools to spend an entire year in reviewing the previous year's work, but these exceptional cases are usually the result of an unwise attempt to hold pupils too long together. Large classes of young pupils can not be kept together, even for one year, without serious loss both to those who are held back and to those who are unduly hurried. What is needed is a system of classification and promotion that shall provide for the breaking of classes, at least twice a year, with a transfer of the more advanced pupils and their union with the less advanced pupils of the next higher class, and also with special transfers of bright pupils from class to class as often as may be necessary, and special provisions for pupils deficient in some branch of study.

We are aware that the system of annual promotions has special advantages. It reduces the number of classes in the smaller cities and towns, and it saves labor and trouble, especially when classes are promoted in a body, on a minimum standard. It is undoubtedly true that a Procrustean system which puts pupils in classes, reduces them to the same capacity, and moves them regularly and evenly forward, requires little skill to run it, but this can not compensate for the serious losses involved. The highest good of pupils ought never to be sacrificed to secure a self-adjusting mechanism and uniformity of results.

Superintendent Stevenson, of Columbus, Ohio, in his report for 1873-74, discusses the question in an attitude somewhat hostile to the plan of frequent reclassification. He says:

The course of study assumes one year for the completion of the studies in each grade, and an annual transfer of pupils from grade to grade. The amount of work to be done each year is the maximum for the pupils of average capacity whose attendance upon the school is the average number of days a child of ordinary health may be present during the year. Dull scholars often make up what is lost in natural ability by regular attendance and industry, and bright scholars lose by irregularity of attendance and indolence what they gain by quickness to learn, so that the larger number of promotions can be and are justly and satisfactorily made at the close of the year.

But differences in the ages and the capacity of children entering the school must in many cases be provided for in the classification. To make such provision no classification can be absolute; it must undergo changes from the beginning to the end of the year. A child of 10 years of age having a healthy body and vigorous mind will do more or is capable of doing more study than a feeble child of 8 years of age; and a bright child whose parents take some pains in home training, who is regular in his attendance, will do much more in a year than the dull child who is neglected at home, and whose attendance is interfered with by the necessities at home or by bad health. It is also true that pupils of the greatest ability have frequently less power of application than those less brilliant. What one gains by ability the others gain by industry and effort. For example, ability is equalized by industry; regular attendance, by irregular; health, by illness; age, by home training; attention, by inattention. These are important factors which must be considered in the solution of the great problem of classification.

By observing closely the progress of children in public schools for a series of years I have arrived at the following results: In a graded school in which the course of study is made for the average pupil, about 5 per cent will show strength enough to be advanced during the year, and about 10 per cent will fall behind the remaining 95 per cent of the class. This varies a little in the lower and higher grades, but it is a fair and approximately correct average for a course of study requiring eight years for its completion. The question then is, What is to be done with this 15 per cent of scholars? Every teacher will answer, Let the 5 per cent go to the next higher grade, and do not permit the 10 per cent to interfere with the progress of the class. Five per cent of the 10 can, without injury to themselves, by a little extra effort be worked up to the proper standard, and the remaining 5 per cent ought for their own good to pass over the work of the grade again, or so much of the work as will prepare for the next higher. I can not condemn in too strong terms the recommendation of those theorists who would gather into one class or grade all the bright ones, and the dull ones into another—that is, make the basis of classification upon the estimated ability of the pupils, rather than upon what they do; for it is the rule, rather than the exception, that the dull scholars win the race in the long run. The separation of the dull and bright scholars into different classes is unjust and injuri-

ous—unjust, because the keenest discrimination can not always discover the slumbering mental power of many children, nor ascertain the outside influences which detract from the manifestations of intellectual ability by the child; injurious, because the dull scholars are deprived of the highest possible standard by which to measure themselves intellectually and the competition which is necessary to excite interest and enthusiasm. To meet this theory, viz, that the bright scholars should not be chained to the dull ones, promotions of classes in many schools are made semi-annually. The arguments in favor of frequent promotions are, first, the interval between the classes being short, those who fail to reach the required standard for promotion will lose less time; second, it gives an opportunity to the bright and industrious scholars to break away from their dull and indolent associates; third, it brings the scholars in contact with a greater number of teachers. The objections to frequent promotions by classes are, first, frequent changes of teachers; second, the best interests of the majority are sacrificed for the benefit of a very small minority; third, there is no real advantage gained for those who are promoted, either in time or opportunity for more rapid advancement. These objections are worthy of careful consideration. The teacher, in an interval much shorter than a year, can not become acquainted with the individuality of her pupils, their strong and weak points, their susceptibilities, their physical and intellectual powers, and the outside forces which more or less control their education and character. The teacher ought to know her pupils thoroughly. This takes time. Will not children do better work and make more rapid progress with a teacher who has had time enough to win their confidence and love than they would with one whose name they scarcely know and whose warm sympathy they have never felt?

Why make a reclassification of a whole school three or four times a year because 15 per cent have failed to reach a fixed standard at the end of every three, four, or six months, to the disadvantage of the 85 per cent? The amount of work to be done by the pupil in a year is the same whether it is divided into quarters, halves, or a year, with a promotion at the end of each period.

The plan of promotions in the schools of this city has been by classes annually, except in the lowest, primary grade, in which promotions are made semiannually, to accommodate the new pupils entering in the spring, and by individuals at any time during the term, whenever they are found qualified for a higher grade. A pupil passing into a higher grade at the end of five months finds no difficulty in making up the subjects omitted in connection with the reviews of the class if he is apt and diligent. In the practical working of a system of schools this plan secures all the advantages of frequent promotions with none of the disadvantages of the plan of yearly transfers. In short, it has all the flexibility that the varying circumstances and the differences in children require.

His condemnation of the theory or system which brings together all the bright ones into classes by themselves, and collects the dull ones in a similar manner, is not too strong, in my opinion. I have seen the bad effects of this often. He limits his objection to the system of reclassification recommended here by specifying "promotion by classes." In my discussion of the subject last year I remarked, in view of much evidence of misunderstanding on this point (Report, 1872-73, p. 25, section 5):

It is clear that frequent promotion should not be made by classes. The few best ones in the classes should be united with the class above—it will seem a reward or a recognition of their excellence. After such promotion has been made through all or nearly all of the classes from the lowest, each class will find itself composed of its fair, average, and poor scholars, together with a few of the best from the next lower class in the place of the few that it has lost by promotion. For a while at least the average and fair scholars in the class will have the stimulus which arises from the consciousness of being the best in the class. The poor ones will rank as "middling," and the new pupils will begin as the poorest and slowly work up toward the top of the class.

It seems that in Columbus about 5 per cent of the pupils "show strength enough to be advanced during the year." One in every twenty pupils has so strong need of promotion that it is found best to place him in the class above, although that class is a full year in advance. If so many are benefited by a leap over so large an interval, it is difficult to see why 10, 20, or 30 per cent of the pupils could not be profited by promotions to classes thirty, twenty, or ten weeks in advance. And if 10 per cent fall behind into classes a year lower in the course of study, it admits of doubt whether they and many more besides would not have been better pro-

vided for by assigning them to classes ten or twenty weeks lower in the course. The other objections will be noticed in their proper place.

It will be noted that Mr. Stevenson believes in promoting "by classes, annually (semiannually in the lowest primary grade), and by individuals at any time during the term, whenever they are found qualified for a higher grade." "Promoting by classes" evidently refers to changing the work of the class from the course of study laid down for one year or grade to the work of the next year or grade, while "by individuals" refers to actual reclassification.

"Promotion by classes" may be from day to day, or month to month, or year to year, or once in four years, according to the arbitrary standard of division adopted by the one who makes out his course of study. Whenever the teacher sets a new lesson she promotes "by class" to a new stage in the course of study. Whenever one ten weeks' work is accomplished, and a new one begins, there is a promotion "by class," although neither the teacher nor the pupils make any note of it. The course of study with us is subdivided so as to show the average amount of work for ten weeks. Many years ago no accurate measure of the time required to go over the course of study in its various stages was kept in this city, and as a consequence the expression "promotion by class" would not have been used with reference to entering upon the work of a new year, but might have been applied to the promotion of a class to a new text-book, or from one school building to another, or from one room to another in the same school, or, finally, from the district school to the high school. Possibly, also, "promotion by class" refers to the change of teacher, in Columbus. But at all events it is not "reclassification" in the sense that term is used in this report. The promotion "by individuals," since it must refer to a change from one class to another, is a reclassification, and this must happen quite frequently even in a school where only 15 per cent of the pupils are thus changed in the course of a year.

Superintendent Stone, of Springfield, Mass., presents his view of this matter, in his report for 1874, thus:

The perfection of school organization, as I understand it, is reached when every pupil has a chance to do his best. This can be accomplished only by judicious grading; but schools are frequently graded so mechanically that they fall far short of the highest efficiency. In this way arises the objection, sometimes made, that work in graded schools is slow, and that pupils are not unfrequently hindered, rather than carried forward, in their progress. It must be acknowledged that unless grading is done strictly according to proficiency and ability, the advantages claimed for it are not attained. The mistake most frequently made in grading a school is in supposing that a class once formed can be continued for a considerable length of time without any promotions or other changes. It can hardly be expected that 50 pupils, even of similar proficiency, at the commencement of a school year, can be placed in a room and kept profitably employed there for a twelvemonth upon the same amount of school work. A difference in ability will soon develop itself, and then if the rate of progress is graduated to the average, or, as is sometimes done, to the minimum capacity of the class, those who are able to do more will soon find themselves with considerable unoccupied time upon their hands. Such a result is especially to be deprecated; for it is an important principle to be borne in mind that pupils do not study to the best advantage, nor accomplish their greatest and best work, unless they feel the necessity of constant effort. They ought not to be hurried, but they should feel that they can not be idle without incurring the danger of falling into the ranks of the laggards and the drones. Persons of active minds must have employment of some kind, and if they do not find sufficient legitimate work in school, they often, from mere restlessness, occasion the teacher much trouble in the way of discipline, or become disgusted and leave school altogether. Their minds are dwarfed if they remain under such circumstances; they have little enjoyment in their work, and it is not strange they lose their patience and their interest.

Various plans are proposed and tried for the solution of this difficulty. That of dividing and subdividing pupils of a single room into numerous small classes is, perhaps, the most objectionable, the time allowed to be devoted to each class being wholly insufficient for anything like thorough and satisfactory work.

Another plan is an entire reconstruction and classification of all the grades four

times a year. Whatever may be said in favor of such a course, neither theory nor practice gives it a strong indorsement. While it may bring those of the same proficiency together at each classification, a term of ten weeks does not allow sufficient acquaintance to be formed between teacher and pupil to enable both to work to the best advantage before a recast of the school introduces a new class, or one for the most part new. Such frequent changes are found to produce constant confusion, and the advantages of continuous methodical work are almost entirely lost.

Our own schools, as I regard them, seem to need a more discriminating classification at the commencement of the school year, and afterwards more frequent individual promotions. When a class is formed every pupil should be placed there who is able or who can possibly be induced to do the work of the class, no matter how many grades such pupils overleap or what may be their ages. As the class progresses, those who seem capable of advancing faster and are willing to make an extra effort should from time to time be promoted to the next higher class or grade, provided that it seems probable that such pupils can bridge over the interval thus passed in a reasonable length of time. Where such opportunities for promotion are constantly before the school a laudable ambition for respectable progress is kept up and more and better work is accomplished. At the commencement of the spring term, in April, a reclassification of the lower primary grades may be desirable, as a considerable accession of new pupils is made at that time to those schools. I would also advise that at the same time, three months before the close of the year, a thorough examination be made, in the upper grades of the grammar schools, of those individual cases who seem capable of advancement, that they may be allowed promotion, and thereby gain a year in their course, especially when the age of the pupil seems to render such a step desirable.

Such a system of classification and promotion, carefully watched and carried as far as the health and ability of the pupil will admit, and assuredly no further, will, I feel confident, greatly increase the efficiency of schools. In this way many a disheartened pupil will be incited to interest and effort; many who have despaired of promotion will look forward with hope; many who have anticipated leaving school in the middle grades will be induced to go further; and many, very many, I hope, will be able and willing to go beyond the grammar-school grade and join the classes in the high school—the highest public educational good in our city now within reach of its children and youth.

The plan of "dividing and subdividing the pupils of a single room into numerous small classes," spoken of above as the "most objectionable," is the plan adopted in ungraded schools and for the numerous class of small country schools. While the plan is very objectionable, it is difficult to suggest anything better for the small schools in thinly settled districts of the country. In the lowest primary classes of a city school, where the recitation should not exceed twenty minutes in length, the teacher may profitably divide her 60 pupils into three or even four classes. But in the grammar school there should not be more than two classes of 24 pupils each. "Reclassification of all the grades four times in a year," if it had the effect described, of changing at each time the majority of the pupils from one teacher to another, would certainly fail of "strong indorsement," or at least ought to fail of it. When we read, however, of the "frequent individual promotions" and of the "reclassification of the lower primary grades" at the commencement of the spring and fall terms, we find that the kind of "reclassification" we advocate here is practiced and strongly indorsed in Springfield.

The school committee of Worcester, Mass., present the following remarks on this topic in their recent report on the suggestions made by the mayor of that city:

It should also be borne in mind that any system of grading is necessarily imperfect. The differences between our scholars are not a series of regular and abrupt steps according to the theory of our grades. There are wide differences of attainment by study of physical and mental capacity and of disposition and home influence. In truth, these differences might be more fittingly compared to the slope of a mountain ridge than to either a stairway or an inclined plane; and, if we rightly understand the remarks of the mayor, it is these differences that form the basis of his criticism upon our system of grading. But precisely the same criticism may be made upon the ordinary classification of scholars in an ungraded school; and until the city of Worcester can afford to furnish to each scholar a private tutor espe-

cially adapted to the scholar's needs, we are not prepared to recommend the abolition of grading and classification in our schools.

But it is no doubt true that a series of graded schools needs constant supervision and regrading. Many teachers seem unwilling to promote their best scholars except at the termination of the year, and, therefore, some special provision for discovery of cases of exceptional merit and their more rapid advancement is necessary.

The ordinary and regular operation of our system results in the promotion or advancement of the scholars one grade each year. The average Worcester scholar performs the work assigned for him to do with an indifferent sort of success, and is regularly promoted.

But there are cases of exceptional dullness and absence, where the work is not done; and there are exceptional cases of meritorious achievement, when promotions might and ought to be made more rapidly than our system in its ordinary working provides for. It is the latter which we suppose the mayor to have had in mind when he called attention to semiannual promotions. Agreeing with the spirit rather than the strict letter of his recommendation, we favor promotions in cases of exceptional merit, at whatever time of year it may be discovered, and recommend the breaking of all rules, if need be, to get at them and do justice by them.

When the present plan of placing each school building under charge of one master or principal was adopted, it was expected that the principals, having all the scholars in the building directly under their own eye, would readily discover and rapidly advance superior merit. Has this expectation been as fully borne out by results as we had right to hope it would be? Do the principals make themselves personally as familiar with the scholarship of each scholar as they might and ought? It seems to us that we have a right to expect that all principals having an assistant in their own room will make frequent visits to each room, hear recitations, and give instruction in each, and make personal examination to such an extent as to become perfectly familiar with the attainments of every scholar and be prepared at any time to advance the deserving. It is believed that they have abundant time to do this.

We have in mind the case of six scholars at the beginning of the present year promoted from the sixth to the eighth grade, and to-day they are among the very best scholars of that grade. Nothing can be more certain than that it would have been a great injustice to have kept back those six scholars in the seventh grade during the present year.

The provisions of Chapter VII of the rules and regulations of this board well define the duties and confer ample powers upon "principals and assistants" with regard to promotions, and the only change we see reason to recommend is the addition of a rule requiring assistants to make reports to principals, and principals to superintendents, at the end of each term, whether there are any scholars in their school that ought to be promoted; and if so, why they are not promoted.

Superintendent Harrington, of New Bedford, attacks very earnestly the proposed plan of reclassification, and takes a far more radical position of hostility than any other opponent. His first and chief objection to the system is against the supposed frequent change of teachers necessitated by it, and the consequent injury to the thoroughness of the instruction and the healthfulness of the discipline. He very justly contends that the teacher must have time to get acquainted with his pupils and to plan and carry out a systematic whole of methods and processes carefully arranged, so as to produce important mental and moral results. Perhaps a sufficient reply to this will be found in the subsequent demonstration of the fact that the change of teachers need not and does not occur any oftener under this system than under the system its opponents advocate. But Mr. Harrington seems, like some other opponents, to understand the effect of "reclassification four times a year" to be the change of teachers four times a year. With such a mistaken view of the system, one can not be surprised that he opposes it.

But he proceeds to indicate his hostility to all systems "in which promotions make one of the customary instrumentalities of influence and progress." "The course of study," according to him, should be "so adjusted as to meet the intellectual demands of a scholar at every step of his progress, following him along until, at 14 years of age, he has compassed a full schedule of elementary study." "Although the well-constructed manual of study presents only the minimum of

requirement," he asks: "Do we not expect that minimum to serve only as a skeleton, which the teacher is to clothe with flesh and blood and round out into full proportions, so as to meet the expectations of the ambitious, satisfy the cravings of the intellectual, and occupy the time of the most proficient?" "The school in which promotions are a customary instrumentality must be addressing itself all the time to mediocrity alone, on a comparatively low level of purpose without stimuli to create a healthful *esprit de corps*, and wanting in the characteristics of vigorous, intellectual life." "Promotions are not provided for in our system—are not asked for—could have no legitimate place. The best scholars, all throughout our grades, find constant and delightful occupation."

By this we are to understand that a vastly superior plan to the one which sifts and classifies and is attentive to close grading has been discovered, and this plan makes pupils and parents indifferent to the grading and classification of the school. It makes no difference how unequal the powers of those who are in the same class—the gifted and mature pupil can use his time in full, while the poorest pupil does as much. "This condition of things, rendering it possible to occupy the time of the superior scholars in fruitful study, and also to give the poorer ones a good, wholesome stint which they can accomplish without any undue strain or forcing, while all at the same time work together as a class, is brought about by an adjustment of the studies, which may be described in a homely way as 'a circle within a circle.' The inner circle represents the essential fundamental work which is prescribed to be thoroughly accomplished by all the class. The outer circle represents a broader field of study, either illustrative of or supplementary to that of the inner circle, which all are expected nominally to engage in, *but from any test work as to which the weaker minded can quietly be released just in proportion to their incompetency to master it.*"

I have italicized the last clause in order to draw special attention to it. "The result," he continues, "amply justifies our method. It is as admirable as it is astonishing to find, by letting the poor scholars work along side by side with their original mates, not souring them by rebuffs, not destroying their self-respect or paralyzing their ambition by keeping them back, how much they will gradually acquire, how often, indeed, their indifference becomes charmed away, their dormant faculties aroused to activity, and an honorable career substituted for one of neglect and demerit." Finally, he concludes that the best plan is "to continue the class of scholars under the selfsame teacher through all the four years of progress after entering the grammar school up to the graduating grade." He intimates that the schools under his charge "have comparatively little to do with percentages. We do not believe in them in connection with either large schools or little schools. We believe that a system of marking and per cents exerts a depressing influence over school work. We have stated written examinations (four times a year) at which, for specific purposes, the papers are marked and the per cents obtained. Beyond that we trust in less artificial stimuli to give spirit and life to our schools."

The repudiation of all class records by which the individual pupil and his parents can be provided periodically with a faithful statement of the amount of work done by said pupil, would seem to be quite in harmony with the system described as existing in New Bedford. While I am far from denying that the "let alone" (*laissez faire*) theory of school management will permit some very good work to exist, my experience with very much of it in my youth, beginning with the "red schoolhouse" in the woods and extending through several of the private schools called "academies," forces me to say that I believe that under it there is a wholesale slaughter of the time and opportunity of well-disposed youth. I shall never forget the epoch made in my life upon emerging from this régime and entering the Phillips Academy at Andover, then under Dr. S. H. Taylor. Here a class

record was kept, and students were held accountable for the use of their time and opportunities. I can not but believe that the system practiced at Andover does the utmost to develop responsible beings, and to transmute the pulpy substance of impulse and inclination—the undisciplined will—into a self-controlled will, a directive intelligence that can reinforce the moments by the hours and accomplish something in the world.

Most persons that I have known brought up under the *laissez faire* system have seemed to lapse away in after life, and recede from the promise which their school life gave, while the strong characters have emanated from the throng of those who were held to a strict responsibility in their school life. A system which classifies the weak and incompetent with the strong and genial minded, and when they diverge in the amount of work accomplished under its instruction—as they certainly will diverge under any instruction which is anything other than an opiate, a paralyzer of the will—still retains them in the same class and relaxes its hold so as to release the weak from the normal responsibility, will be found in nearly every case to be productive of injury to the growth of character in both weak and strong. If pupils of all classes are to be held to a strict accountability for their work there must be a careful system of classification.

I am aware of the difficulty of making any statements regarding schools without the probability of being misunderstood, even by those well versed in educational affairs. When we undertake to describe a system or method, we assume a certain status of things as existing; probably we take for granted that the reader or listener has in mind the organization of the schools in which we are working. If the reader or listener happens to be acquainted with a radically different system only, his attempt to construe our words results in ludicrous misconceptions. Few people have any adequate idea of the diversity that really exists in our public educational systems in the United States. Not to speak of the difference of public school methods from those of private or parochial schools, one may find variety enough within the public schools to explain how such misunderstandings arise. It is not sufficient to state a system in words which have become technical in a particular locality.

The reader of a different locality will read such words attentively, but will put his own construction upon them. An example of this has been seen in the different interpretations given to the words "promotion" and "reclassification," used by different writers in different senses, and sometimes by the same writer in the same sentence in two meanings. "Promotion" may mean change of class (*a*) from one book to a higher one; or (*b*) from one room to another; or (*c*) from one teacher to another; or (*d*) from one school to another; or (*e*) from the quantum of work prescribed for one limited time (primary or grammar department, year or grade, term or quarter, week, or single lesson). Or, again, it may refer to the change of a pupil from a lower class to a more advanced one, etc. "Reclassification" may be used to signify some one of many phases appertaining to the organization of a school. The transfer of a single pupil from one class to a higher or lower one is a reclassification. It is not strictly correct to apply the term "reclassification" to the transfer of a whole class from one school, teacher, room, book, or grade of work to another; and yet much confusion arises from such application.

In order, therefore, to make this discussion explicit, it will be necessary to have constant reference to systems that stand in contrast to our own, while we are attempting to give an account of it in a report.

1. The germinal school organization out of which all varieties have grown is the country school of one room and one teacher, with from 10 to 60 or more pupils of all ages and degrees of advancement, from the stripling of 4 years, who begins at the alphabet, up to the young man of 21, who is likely to study algebra, or Latin, or natural philosophy. The difference in qualifications ranges through

eight or ten years of study. If classes are to be made they are likely to be made on the accidental fact that some of the pupils bring to school the same text-books; in the same arithmetic, the same reader, or geography, or grammar, a class being formed with little regard to the difference in advancement of its members. Not seldom it happens that those of like advancement in the country school happen to have different text-books, and for that reason alone are assigned to different classes and mated with other pupils of very inferior attainments, who have the same book. Thus it happens that the function of the teacher in the country school becomes chiefly one of keeping order and hearing lessons, without being able to find time to teach or explain anything, or to become acquainted with the obstacles that arise in the minds of his pupils.

His number of recitations per day averages from twenty-five to fifty, and their length varies from two minutes to twenty or thirty, but averaging only five or ten minutes apiece. But the same teacher may remain in the school for years, although this is not usually the case. The pupils then may avoid frequent changes of teachers. A pupil might spend several years under the same teacher. There is no division of labor in this rudimentary type of school, and it is obvious that the continuance under the same teacher possesses but little more advantage than the antiquated process by which a gun was made throughout—lock, stock, and barrel—by one gunsmith, has over the division-of-labor system in the Springfield Armory, or the watch manufactories at Waltham or Elgin, where each manipulation has a different workman to perform it. With small schools of this character which range through so wide differences in age and acquirements in their pupils, but little can be done other than to secure discipline, and lay special stress upon individual industry. Uniformity of text-books (now generally established by State laws) renders possible some degree of classification, but at best such classification is very imperfect for the reason that there can be little transferring from one class to another in case of differences of ability.

2. When the country school grows to be a village school, and the number of pupils increases to 60 or 100, two rooms are opened and two teachers employed. Division of labor may begin here. Primary and grammar department is instituted, and the range of acquirement in each room may be four years by the course of study. Fewer classes and larger ones allow the teacher twice the length of time for each recitation, and he can begin to lay some stress on instruction. The advantages of class recitation over individual instruction begin to appear at this point. Individual instruction is good where the teacher can devote to it as much time as to an ordinary recitation, but it is inferior to class recitation even then. The class should consist of not less than 10 nor more than 30. The length of recitation should vary from fifteen or twenty minutes in the primary grades to thirty or forty minutes in the grammar department. During recitation there should be the most vivid and constant attention on the part of all the pupils. It is obvious that this can be obtained in the primary grades only for a short time. With increasing discipline and the strength that comes of years' practice, the recitation hour can be lengthened.

That a properly conducted class recitation is of far greater value than individual instruction is obvious from the consideration that the contents of the lesson are stated over and over by different pupils of the class, criticised and discussed, illustrated from the experience of different pupils, and the pupil has the advantage of seeing how his fellows encounter and surmount such difficulties as he himself meets. What we see in the experience of others, our equals, becomes at once our experience by adoption, and it saves us from the pain and consumption of time necessary to acquire its wisdom through personal adventure. Hence education is essentially to be carried on in the form of community. The school is and must be a community; no private tutoring can educate as the school can. But it is evi-

dent that the school best subserves this purpose when it classifies so that each one meets his equals in the recitation. Great inferiority or great superiority in his fellows mars the force of the lesson which he learns from seeing their work.

The village school of two rooms, as contrasted with the country school of one room, exhibits to us the beginnings of classification and proper recitation. It does hardly more than this. Its separation of the four years of primary work from the four years of grammar-school work is a great, but only one, step.

3. When a village comes to have 500 or 1,000 children living within a small area so that they can be brought into a central school of eight to twenty rooms, new developments become possible in grading and classification. Usually the primary work is kept localized in small schools, while only the advanced pupils are brought together into the central school. This is just and proper. The ratio of younger pupils to older ones is large. In St. Louis there were last year, in every 100 pupils, 37 in the first year's work; 17 in the second year;  $16\frac{1}{2}$  in the third year; 12 in the fourth year; 7 in the fifth year;  $4\frac{1}{2}$  in the sixth year; 3 in the seventh year, and 3 in the entire four years' course of the high school. Counting the lowest three years of the course as primary work, we have over 70 per cent of all the pupils in the schools in the primary department, and only about 26 per cent in the grammar department. In Eastern cities, where education for a long time has done its work, the ratio is much more favorable to the higher departments than with us. From these facts it is clear that in order to secure as good results in classification of grammar-school pupils, as with primary pupils, the former must be brought together in about one-fourth as many schools as the latter. To explain: There are, in the school children of a given community, about one-half as many in the grammar-school department as in the primary. The recitations of the primary pupils should be about two-thirds the length of those in the grammar department, by reason of the undisciplined power of attention of the former. The number of recitations in the primary department will average three-fourths of the number to each class in the grammar department. Hence it is that the number of pupils to each teacher in the grammar department must be considerably less—two-thirds of the number assigned to each teacher in the primary department. The teacher in the primary department can manage and instruct 72 pupils with greater efficiency than the teacher of the grammar department can manage 48 pupils. In the small primary schools located in the different neighborhoods, therefore, the primary teacher may easily manage three or four classes of pupils. These may represent a difference in advancement twice as great as that in any single room of the grammar department.

The question of the proper number of classes to be assigned to a teacher arises in this grade of schools. No one would think of organizing a country school or the 2-room village school on the basis of one class to a room. It is first in the central or "graded" school, with its 8 to 12 rooms, that the question arises of reducing the classes in number so that each teacher shall have charge of one only. According to our St. Louis system the teachers in the grammar department (fifth, sixth, seventh, and eighth years of the pupil's course at school) have two classes each, and one is engaged in study while the other recites. In the primary department three and even four small classes are formed by the teacher of each room. In these remarks it is taken for granted that the style of building is not the old-fashioned type of a large study room, presided over by a principal and with small recitation rooms opening out from it, in which the assistants hear the classes recite, when sent to them from the large room. This type of schoolhouse, invented for the purposes of the Lancasterian system, has gone out of date. Since 1848 the plan has been adopted of assigning each teacher a room about 32 feet square, with 48 to 64 pupils, who do not leave the room for study or recitation, both being conducted by the teacher in charge of the room.

The gain in humanizing the pupils and in rendering a milder discipline possible has been very great under this system. Formerly the assistant teachers had little to do with the discipline, which was enforced almost entirely by the principal, who, on the other hand, not learning to know the pupils through their recitations, had to govern them through external authority rather than through the subtle influences which one can wield who knows the characters of his pupils thoroughly. The objections to the plan of having only one class under each teacher are these: (a) It makes the class too large, so that either the recitation must be too long or else its members can not all share in the recitation; (b) it wastes the possibilities of classification by requiring the whole room to take the same lessons, when, if divided into two classes, one in advance of the other, the class intervals could be lessened one-half throughout the whole school, and as a consequence transfer from one class to another be rendered easier; (c) it is apt to destroy the force of the recitations, because the teacher while not hearing a recitation is helping scholars to learn their lessons or solve difficulties, and thus, to a greater or less extent, distracting the attention of the pupils from work which they ought to perform by themselves and with all possible self-concentration and self-reliance, the consequence being that the work of criticism and analysis that should come up in the recitation is anticipated by the ill-timed assistance of the teacher during study hours; hence a tendency to obliterate the lines between study hours and recitation hours and to confound them.

If, then, we suppose that our village "graded school" is organized so as to give each teacher a room with two classes, the class intervals will be about as follows: Eight rooms devoted to grammar-school work (the second four years' course for the district schools) and 400 pupils in attendance; of these pupils one class would be in the eighth or last year of the course—30 pupils; three classes in the seventh year, the advanced class one-half year behind the highest class in school, the second and third classes, respectively, in the first and second quarters of the seventh year's course—70 pupils; four classes in the sixth year's work, one in each quarter's work of the course—110 pupils; seven classes in the fifth year's work, the class intervals being from five to ten weeks—190 pupils.

The following scheme would indicate the rooms, classes, and grade of advancement of the pupils in this "graded school:"

Room.	First-class pupils.	Course of study.		Second-class pupils.	Course of study.	
		Year.	Quarter.		Year.	Quarter.
I.....	30	VIII	Second	-----	-----	-----
II.....	20	VII	Third	25	VII	Second.
III.....	25	VII	First	25	VI	Fourth.
IV.....	25	VI	Third	30	VI	Second.
V.....	30	VI	First	25	V	Fourth.
VI.....	25	V	Third	30	V	Third.
VII.....	25	V	Second	30	V	Second.
VIII.....	25	V	First	30	V	First.

We have not indicated a high-school course in this school system. Its normal size would be about 70 pupils. These, dividing into four classes to correspond to the four years' course, could not be subdivided, for subdivision of classes ought not to take place unless the number in the class is greater than 30, except in those cases where the class intervals would be greater than one year. In the above graded-school course perhaps it would be found necessary to subdivide the class of 30 who are in the eighth year or grade.

In order to explain my use of the technical expressions "year" and "quarter" I will state that at the National Educational Association in August, 1874, a conventional grading scheme was adopted by the school superintendents in order to

measure the progress in the course of study and afford a convenient technique for expressing it:

District-school course.								High-school course.			
Primary-school department.				Grammar-school department.							
I year or grade.	II year or grade.	III year or grade.	IV year or grade.	V year or grade.	VI year or grade.	VII year or grade.	VIII year or grade.	I year or class.	II year or class.	III year or class.	IV year or senior class.

4. The per cent of pupils in the entire system that are enrolled in the high-school course of study varies from 2 to 5 per cent (Chicago, 2 per cent; St. Louis, 2½ per cent; New Bedford, 4 per cent; Boston, 5 per cent). Hence in school systems enrolling 5,000 pupils and upward per annum the high school enrolls 200 or more pupils, as the percentage of high-school pupils is usually larger for small cities. The ratio of pupils who enter the high school and remain to enter the second year is 57 per cent; to enter the third year, 36 per cent; to enter the senior class, 25 per cent. At this ratio there would be about 100 pupils in the class entering the high school. These could not all recite in one class, and would be divided into three or perhaps four divisions. According to our principle: "Have as many degrees of advancement in a school as there are different classes or divisions for recitations." We may accordingly find our high-school classes ranking as follows:

I. Senior class .....	24 members, one division.
II. Third-year class .....	36 members, two divisions, half-year intervals.
III. Second-year class .....	53 members, two divisions, half-year intervals.
IV. First-year class .....	90 members, three divisions, quarter to half year intervals.

The only ground that can be alleged for desiring to avoid these class intervals and reduce all to the standard of the year interval is found in the fact that the high-school course usually admits elective courses or studies which are not difficult to arrange when the class is so large that a full division can be made up on any one of the elective studies or courses, but with a small class split up by election of various courses, the arrangement becomes impossible without an extremely large and expensive corps of teachers. This objection may be met by curtailing the elective studies and constructing a rational course of study. Such an attempt has been made by the committee on course of study in our schools. All pupils are obliged to take Latin during the first two years of the high-school course. Election of studies is allowed to some extent, but is limited by a rule prescribing the minimum number that may form a class in an elective study.

In this organization of schools the plan of class intervals of less than a year may exist in all the classes except the highest. When the number in the high-school course exceeds 500, the senior class will consist of two or more divisions and should graduate at intervals of half a year. The matter of graduation from the high school is not, however, so important. It is easy to bring all the divisions together in the third year of the course by adding something to the extremely valuable culture studies of that year, so that those who get ready to take the studies of the senior class before the close of the year may take up an extra amount of work to occupy them until the end of the year.

For the first two years of the high-school course the class intervals should by all means be less than a year if those classes are subdivided into two or more divisions.

The question may arise, How shall we introduce the plan of shorter class inter-

vals into the high school? This question would be asked in the presence of a system whose course of study has been rigidly "nailed to the calendar," so that each pupil was supposed to complete the work of his grade just at the time of the annual examination and at no other time; and if he lacked some little time of completing his year's work—say one week or one month—then he should simply be consigned to the next class below and continue a year longer on the work of the grade. Attention must be called to the fact that this correspondence of the progress of the class in the course of study with the calendar indicates violence. Such correspondence is not natural and can not be reached or maintained, except by holding back pupils already advanced or by cramming pupils who are not up to the standard. If the natural causes are allowed to work, class intervals will appear everywhere, so that no two divisions will be at the same degree of advancement in their work. What I would lay stress on is this: Never try to bring the degree of advancement of any two classes or divisions to the same exact standard or to standards exactly a year or multiple of years apart. Rather encourage the organization of classes at intervals of less than a year apart, so that reorganization of classes for economical reasons, or for purposes of better classification, may be made at any time without inconvenience. This can be done easily when the classes are only six or ten weeks apart, but not easily when they are a year apart.

The actual test of advancement of a pupil is maturity or ability to go on with the work given him. It is safe to say that even in a country school of 60 pupils there are no two of exactly the same advancement, although it is probable that there are eight years of school work between the advancement of the highest and that of the lowest. Now, classification is at all times a merely relative and arbitrary affair. In the school of 60 the first class in arithmetic may include any number from 1 to 10, perhaps. If it has 10, it is likely that there will be a difference in qualifications of from two to three years in actual advancement, and the consequence will be that while the lowest will be dragged beyond their powers, if they are really compelled to do the work, the most advanced will feel no pressure except that of their own caprice. Without looking at their lessons, they will easily lead the class. Hence they will lose that valuable discipline of the will which comes of a feeling of responsibility and the necessity of making persistent and regular exertions.

The ever-repeated experience in such schools is the loss of all hold on the pupil's mental habits by the teacher except what he can get by a little individual instruction. Classification in large schools, though still arbitrary, becomes approximately exact. It always happens that there is no strongly marked line between the lowest of the class and the highest of the class next below. Where there is a year's interval of school work between the classes, it always happens that the interval between the highest and lowest in the class is less than the interval between the lowest in rank of the upper class and the highest in rank of the lower. Bearing in mind this relative nature of classification, one can easily see the importance of having small intervals between classes. The question of economy here meets the question of classification. The classes ought not to be below a certain size; 20 to 30 pupils should be in each class; the less the intervals between them the better. In a country school of 40 pupils of all grades the size of classes is so seriously limited by intervals of advancement that little else than individual instruction is the result, and the time and energy of the teacher is dissipated.

In enumerating the causes which tend to render frequent reclassification necessary, I would lay stress upon the following:

(a) Irregularity of attendance caused by sickness, by necessity of working for a living, by change of residence. To show the prevalence of this irregularity, I

have taken at random the following statistics from such sources as are before me:

City.	Per cent of attendance of pupils of number enrolled.	City.	Per cent of attendance of pupils of number enrolled.
Boston.....	89	Louisville.....	64
New Haven.....	80	Cleveland.....	63
Richmond (Va.).....	76	Milwaukee.....	63
New Bedford.....	75	Chicago.....	61
Providence.....	74	Pittsburg.....	60
Washington.....	74	Newark.....	58
Columbus (Ohio).....	72	Rochester.....	56
St. Louis.....	67	Kansas City.....	55
Syracuse.....	66	Albany.....	54
Detroit.....	66	Baltimore.....	54
Indianapolis.....	65	New York.....	54
Worcester.....	64	Jersey City.....	48

About two-thirds of the entire number are in attendance at a given time, it would seem. Upon return to school, after a period of absence, the pupil has the opportunity of falling back into a class one year behind or of overtaking the class he left by making extraordinary effort.

(b) Time of commencing school. Nearly one-half of the youngest pupils begin their school life in the spring instead of the fall, and consequently their class interval is three-fourths of a year behind the class that entered in the fall before.

(c) Then there is the difference in temperament and character—the slow and the swift, the weak and the strong, the careless and the earnest, the mature and the immature, the industrious and the indolent. Start all together, and these causes will soon make a great difference.

It is evident that with small class intervals reassignment of any of these pupils who have lost their standing in their classes is an easy matter. The system of small class intervals only takes advantage of the necessary division into classes, and would not have new divisions formed simply for the sake of making short intervals. Pupils who are irregular in attendance, or who begin school in the middle of the year, or who are immature, have to be dealt with even under the old systems, and is it possible to deal with them satisfactorily? They form nearly or quite one-third of all the pupils enrolled.

There is a perpetual diminution of pupils in the higher grades, occasioned by final withdrawal from school, and, on the other hand, there is a perpetual accession of numbers from below. Not to readjust periodically would leave the classes of the high-priced and most experienced teachers very small, while the classes of the teachers of least experience and smallest salaries would be filled to overflowing, and it often happens that pupils are refused for want of room in these grades when there is much room in the upper grades.

Instead of adjusting this at the end of the year, let it be done as often as needed by promoting a few of the best pupils in each class to the next higher. This will not (a) isolate the poor pupils by themselves, for into each class the best pupils will come from below; (b) nor will it fill the upper classes with brilliant, superficial, precocious children, for the test of promotion will be maturity—ability to do the work of the higher class, and if any other standard is used the evil will speedily correct itself, inasmuch as the immature pupils thus promoted will remain at the bottom of the higher class, and will not get promoted again until after they are rejoined by the rest of their class; (c) nor will it on an average cause pupils to change teachers any oftener than the old system. In fact, unless withdrawal from school in the upper grades makes room for the transfer of pupils, they can not be transferred from one teacher to another, but the readjustment must be

effected in part by assigning incompetent pupils to lower classes. The actual depletion of upper grades, including the high school, however, is sufficient to allow of the "sifting-up process" to a sufficient degree to make all needed adjustments. If each teacher has two classes and one-fourth of each class is promoted and joined to the next every ten weeks, the average stay of each pupil in her room will be two years; if one-third is promoted each time, one year and a half will be the average stay under each teacher. The maturest and ablest pupils will stay a less time than the average, while the immature and weak will stay for a longer time. The maturest and ablest pupils need less individual help and less psychological study of their idiosyncrasies on the part of the teacher.

Of course it is understood that these promotions are followed by a review of studies on the part of all classes into which promotions are made. Frequent reviews are essential to thorough work and essential to teach pupils how to study.

Under this system of small class intervals and frequent opportunities for promotion, there is not so much high pressure and cramming, nor, consequently, so much danger to the health of pupils. If the pupil does not get into the high school on this occasion, ten weeks more are soon passed, and a review of his studies for that length of time will not seem unreasonable. If he is very thorough, he will overtake many of his former companions who will lose ten weeks, for one cause or another, in their future course.

This frequency of examinations for admission to the high school is not based on the expectation that every grammar school will graduate a class each quarter, for that would indeed imply too much change of teachers; but each grammar school will send one or two classes a year and at such times in the year as they are prepared, at one time, at the close of the first quarter; and then again perhaps at the close of the third quarter, just as it may happen; but there will be enough pupils admitted to the high school at the close of each quarter to form one or more new divisions.

Reclassification does not mean a thorough reorganization of classes. It may take place on the promotion of one, two, or a dozen pupils from one class to the next. The system here recommended is designed purposely to prevent such complete reorganizations as are necessary when a class changes teachers and is divided and united with other classes. It substitutes a gradual process for such violent measures.

This system has been in practice in St. Louis and Chicago and other Western cities, so far as lower grades are concerned, for at least twenty years. The effect of the high-school examination coming once a year was, however, to prevent the application of the system in the highest grades of the district school. The object of the present discussion is to bring out the merits of the system as one to be universally applied throughout all grades of common schools.

FROM THE ST. LOUIS SCHOOL REPORT OF 1874-75, BY W. T. HARRIS, SUPERINTENDENT.

In St. Louis there is no attempt to bring all classes within the same grade to one standard of advancement, so that, e. g., in January, all pupils within a given grade shall have arrived at just the same point in a study. At all times there are new classes just beginning the work of a grade, or year's work, in some one of our schools. The classes are not separated by intervals of one year in their work, but by irregular intervals varying from six weeks to twenty. It is considered desirable to have these intervals small, so that reclassification may be more easily managed. Pupils who fall behind their class for any reason (such as absence, lack of physical strength, or of mental ability) may be reclassified with the next lower class without falling back a year and thereby becoming discouraged. Pupils who are unusually bright or mature may be promoted to the class above, or form

new classes with the slower pupils of the class above who need to review their work. Thus it happens that in a district school there is a continued process going on, the elements of which are as follows: (1) The older and more advanced pupils are leaving school for business or other causes. This depletes the classes of the most skillful and best paid teachers who are usually placed in charge of the most advanced pupils. Again, there is at all times of the year an influx into the lower grades of pupils who have just completed their sixth or seventh year and are now anxious to begin their school career. Thus the pupils in the primary rooms of our schools tend continually to be overcrowded. (2) To correct this continued tendency which overcrowds the rooms of the least skillful and poorest paid teachers and gives small quotas of pupils to the most skillful and best paid teachers, from time to time (usually once in ten weeks, but oftener in some schools), each class is sifted and its most promising pupils united with what remains of the next higher class (i. e., with the not-promising portion of it—those who, for absence, or dull intellect, or weak wills, fail to keep up with the best). (3) To make room for this transfer, a portion of the highest class is sent to the branch high schools. (4) The number changed from class to class is usually small. The disturbance in classes is very slight, compared with the advantages gained by the teacher in being relieved of the necessity to drive the laggards and drill and cram them to make them keep up with the average of the class. The teacher was once obliged to spend most of her time upon the dull ones in the useless endeavor to force them to make up lost time or to equal the strides of the more mature, more regular, or more brilliantly gifted pupils, and, of course, these latter pupils lost proportionately, and the net result of the process was to overwork the incompetent and to hold back the competent ones. The teacher, in the vain effort to hold together the extremes of her class, separating more widely every day till the end of the year, became cross and petulant, and sank continually into the abyss of drill-machine pedagogy.

Under our present system we can make room, when needed, in the lower grades, and fill up the classes of our skillful and high-priced teachers.

---

## II. THE ELIZABETH PLAN OF GRADING.

BY WILLIAM J. SHEARER, SUPERINTENDENT OF SCHOOLS, ELIZABETH, N. J.<sup>1</sup>

Of the many difficult problems which confront those who are responsible for the organization and administration of the schools, no other one is more perplexing than this one of grading. No other one affects more vitally the present and future welfare of the pupils in the schools. No other one is of such interest to the parents who are solicitous for the progress of their children. No other one is of more immediate interest to the principals and teachers who have been compelled to work under the present mediæval plan, which has long since outlived its usefulness. No other one is such a source of worryment to conscientious superintendents who realize that the system of grading, which was intended faithfully to serve the children, has become their tyrannical master.

All must admit that teachers vary greatly in knowledge, power, skill, and many other ways affecting their efficiency. None dare deny that the children of every grade differ widely in age, in acquirements, in aptitude, in physical endurance, in power of attention, in their rate of mental development, in the time of entering school, in the regularity of attendance, and in many other ways influencing their progress; yet, because of the manner of grading and promoting, the graded school

<sup>1</sup>From the Proceedings of the Department of Superintendence of the National Educational Association, at its meeting in Chattanooga, Tenn., February 22-24, 1893.

tends to keep all of the same grade in intellectual lock-step, not only month after month, but year after year for their whole school lives. Children are not alike in ability or in any other way, and God never intended that we should be held responsible for making them alike. Why, then, should we put them in so-called "educational mills" and attempt to grind them out alike, crushing out that individuality which He meant should be a guide to their education and usefulness, and not a hindrance thereto? Is there any reason why we should labor to produce uniformity of tastes, of character, of aspirations, of ability? Is not individuality of more importance than evenness of grading? Is it not the divinity of the child? Should it not be watched for and discovered, that it may be carefully studied and lovingly guarded? Does not biography teach us that those only have become distinguished who have developed a love for work along certain lines? Is it not time we stop finding fault with teachers because, in spite of all these mentioned differences and many more unmentioned, but not undiscovered ones, they can not produce "symmetrical nonentities?" Should the teacher, limited in power and by conditions, be criticised because she can not overcome the differences predetermined by the Almighty?

Surely it is time that the friends of our grand public schools, which are growing in efficiency at an ever-increasing rate, should speak plainly of the defects of the present system and earnestly work for its improvement.

The Elizabeth plan is not an individual plan, but is the result of an attempt to work out a system which will so combine the advantages of class, group, and individual teaching as to make it possible to suit the instruction to the needs of the individuals and enable each to go just as fast as the work can be done well, and no faster. It is no mere theory, but is a plan which has stood the test of a ten years' trial, and the claims for which are based on the good results which have followed its adoption in several cities under varying and unfavorable conditions. The plan described is in use in every class in the city of Elizabeth, as well as other cities.

#### CHARACTERISTIC FEATURES.

In place of basing the promotion of pupils, in whole or in part, upon a promotion examination, it is determined by the teachers' careful estimate of the pupils' ability to do advanced work. A premium is put upon the character of the work done day by day, rather than upon the amount of "stuffing" which can be done in preparation for the examination. Thus the pupils are furnished a moderate and continuous stimulus instead of an excessive and spasmodic one. The teaching test is a necessary part of all true teaching, but the promotion examination prevents broad and intelligent teaching, makes out of the teacher a grind, and turns out machine pupils. It is not a good test either of the ability of pupils or of teachers. It is a great temptation to deceit and causes many mental wrecks.

Pupils are promoted to advanced work whenever ready for it, instead of being promoted at a time arbitrarily determined. Surely, there is no good reason why the time of year should determine a pupil's promotion to advanced work. All must agree that it should be determined by acquired ability rather than by lapse of time. That, under this plan, it is entirely feasible for pupils to go forward at any time is shown by the fact that, during the past year, 60 per cent of the pupils did so. But for this plan, all these would have had to mark time until the rest were ready to go forward.

Instead of having pupils roughly sorted into large, loosely graded classes, in which the classification must grow more and more unsatisfactory as time passes, those of very nearly equal ability are placed together in a room. In the essential branches the classes are still more accurately graded, according to ability, into small divisions. Extra divisions are made when necessary and are not continued longer than they are needed properly to provide for the important differences in

the pupils. This is done in such a way as not to greatly increase the work of the teachers. The number of divisions in a grade varies with the number of rooms of the same grade in the building, with the importance of the subject, with the efficiency of the teacher, and with other limiting conditions.

The number of divisions in each subject, as well as the places for individual instruction, is also determined by these conditions, after a careful consideration of the subjects in each grade and the records of several thousand pupils in the different grades. The number of pupils in each division also varies with the conditions. The larger the number of pupils to select from, the larger the number that can go together for a time without injury. The aim is to have pupils with others of about equal ability. For the nearer the pupils of a class are in ability and attainments the better can the instruction be suited to their needs, the greater is the power of emulation, the larger the number that can successfully be taught together, the easier it is to hold the attention and fix it upon the subject to be presented, and the better the mental training that can be given. While the usual plan provides for but eight divisions below the high school, this method has from thirty to sixty. In his paper read at the last meeting of the National Educational Association, Dr. Harris said: "Thirty classes between the first and the eighth years are possible in large schools in cities. That all cities do not avail themselves of this possibility is one of the most serious defects in American supervision."

Under the usual plan the distances of the classes from each other, and other unfavorable conditions, make it almost impossible for pupils to pass to higher classes, save at the regular moving times. Yet authorities agree that reclassification is the only way of saving the pupils from the evils of the graded schools. Statistics prove that sooner or later nearly all of the pupils suffer because of this inability of the teachers to reclassify them. Under this plan pupils can easily pass from one division to another at any time, when they are found to be either ahead or behind their companions. The need of reclassification, as well as its feasibility under this plan, is shown by the fact that during the past year almost 70 per cent of the pupils were moved to other divisions between the regular times for promotion. This year an epidemic of measles, etc., has caused not less than 30 per cent of the pupils to lose time. Under the usual plan all these would have to dangle at the foot of the class and lose a year. Under this plan they return and take up the work where they left it, and up to February 16, 1898, 54 per cent had been reclassified, though but a small proportion (about 10 per cent) of these had changed teachers. This was done in such a way as not to hinder, but greatly facilitate, the work of the teachers.

Instead of compelling teachers to take all pupils over a given amount of the course by a given time, this plan allows teachers to advance just as far and as fast as the ability of the pupils will enable them to do the work well, and no faster. Not only do teachers vary greatly in efficiency, but pupils and classes differ in many ways, as before stated; therefore it is an outrage to require the same amount of work of all, regardless of the different conditions. Surely this making of the time limit the same for all is the greatest mistake of our schools, both public and private. Why should any teacher be criticised because she can not furnish the brain cells, health, or conditions which some need to keep up with their more gifted companions?

In place of almost entirely losing sight of the individual this plan demands attention to the peculiar needs of each. Under the usual plan, as the pupils are crowded into large classes, and all are expected to cover the same amount of the course in a given time, the poor teacher is forced to forget that the class is composed of 50 individuals, and to think only of the fact that all must be at a certain place by the time fixed for all to move; therefore she dare not think of the needs of the individual pupils. Under fear of criticism she tries to stuff all with the same amount of indigestible matter in the hope that they will appear big enough

to pass the useless examination for promotion. Fortunately the Almighty has provided the children with good forgetters, and that which would be a mental burden and would result in great injury is soon forgotten. Under this plan attention to the individual is not only encouraged, but required. In the essential branches pupils work in small classes, and also work as individuals at those points where experience has shown there is greatest need of individual work. Thus the teacher comes into close contact with each pupil, than which nothing is more important. For proper mental development there must be this contact of the mind of the teacher with the mind of the pupil; the separate study of its needs and the separate ministering to the needs which are peculiar to it. Only thus can the strong mind of the true teacher come into life-giving contact with the weaker mind of the pupil for the purpose of restraint, guidance, and development. But while the effort is made to secure all the advantages of attention to the individual, care is taken to retain the many advantages of class and group instruction.

Pupils are generally moved forward by companies and no record of their ability, acquirements, or mental, oral, or physical peculiarities is sent with them. Before the new teacher learns these, many of the pupils become discouraged because they are not understood, and for this or other reasons quit school or get but little benefit therefrom. \* \* \* Under this plan, such a record is sent with the pupil that, after a short study, the new teacher has the benefit of all that the previous teachers have been able to learn of the pupil. The record shows not only what the pupils are worth in each branch, but also any defect of vision or hearing, and any other fact which may have a bearing on the character of the work which may reasonably be expected of each. Difficult cases receive special attention, and suggestions as to their management are given for the assistance of their future teachers.

I have mentioned, but briefly, ten characteristics of the plan in use in the city of Elizabeth. Time does not permit even a brief consideration of the individual records of pupils, the extra-promotion blanks, the pupils' reports, the record of work done, the report of principals, management of periods for individual instruction, arrangement of programmes, certificate of time gained, means of making sure of thorough work, and many other devices, which ten years' experience with this plan has proven to be most valuable aids in securing results without asking too much of teachers and without unnecessary risk to the superintendent.

The proper consideration of any one of a score of points mentioned would have required at least as much time as is devoted to this paper. Having spoken briefly, I have necessarily spoken subject to misunderstanding, misrepresentation, and criticism. However, at this time I can do no more than mention some of the beneficial results which have followed the adoption of this plan since its introduction into this particular city a little over two years ago.

#### A FEW OF THE BENEFICIAL RESULTS.

The instruction is accurately suited to the needs of the pupils of each division. That the instruction should be suited, both in matter and method, to the ability and attainment of those to be taught is a fundamental pedagogical axiom, upon which all others depend and with which all others should be in harmony; yet all know that it is violated in each recitation of nearly every school of our land, for the extremes of the classes can not be benefited by the same instruction. Accurate adjustment of the instruction is possible under this plan, for the reason that pupils of nearly equal ability are always together.

The most careless observer of children knows that they love to do what requires a reasonable amount of effort. In idleness only is there misery for pupils and teacher. When the pupils were so closely graded that work suitable to all could

be assigned, the tendency to idleness almost vanished, and the need of punishment was greatly diminished in all classes, and entirely disappeared from many. Under the usual plan, all know that the brighter children are not kept busy; therefore they get into mischief, for the idle brain is still the devil's workshop.

Under the usual plan pupils are not thorough in the work passed over, though they spend far more time than should be required to do more work well. That they should be thorough in the essential work none dare deny. That many are not thorough most teachers of experience are not slow to admit. Under this plan all other things are secondary to thoroughness in the essentials. This is easily secured, for teachers are not expected to take pupils faster than they can do thorough work. It is no longer wondered why pupils went to school so long and knew so little when they stopped.

All know that, under the usual plan, the bright are injured mentally and morally by being held down to the pace of the slowest; the plodders are likewise injured by being continually driven over the work faster than they should go. By this plan the brighter pupils are allowed to move forward as fast as they can do the work thoroughly. The slower ones go no faster than they have the mental ability to do the work well. The mental and moral benefit resulting from this can scarcely be overestimated, and it is perhaps the most valuable result of this plan.

Statistics prove that a much larger proportion of the pupils remains in school until the higher grades are reached. In every grammar school in the city there has been an increase in the proportion of pupils in the higher grades, the average per cent of increase for the different districts being about 10. Surely this is an important matter, for in some cities 90 per cent of the pupils do not reach the grammar grades, and the reports show that 81 per cent of all the pupils in the graded schools of this country are in the four lowest years of a twelve years' course.

On all sides much regret is expressed that so few pupils reach the high school. Less than 2 per cent get to the highest grammar grade. Since this plan of grading was introduced two years ago the number attending the high school has more than doubled, though the course of study has been strengthened.

All deprecate the fact that pupils entering the high school are from 1 to 5 years older than they should be. During the past two years the average age of those entering the Elizabeth High School has decreased more than 1 year, while the classes about to enter will still further reduce this average.

As the schools are generally managed, if any but the very brightest fall but a short distance behind the class, they must stumble along at the foot of the class and lose a year when but a month or two behind. Because of sickness, or some of a hundred other reasons, nearly all of the pupils do lose time, and therefore fail to keep up with their companions. Statistics gathered in different cities show that 80 per cent of the pupils lose from one to four years, and for every 100 pupils in the schools examined there had been from one hundred to three hundred years lost. Under this plan, if pupils fall behind their class, they drop into a class but a short distance behind the one left. As promotion may come at any time, this lost ground is easily recovered. The records in Elizabeth show that, except for absence, very few lose any time.

As under the usual plan it is very hard for pupils to go to advanced work at any other than the time for regular promotions, it is readily understood why but few pupils gain time. Most of those who seem to do so really lose the time later, because they have omitted much essential work. Under this plan 90 per cent of those who go through the primary grades or further will gain from one to four years. The teachers' records of several thousand pupils show that during the past year over 80 per cent of the pupils in Elizabeth gained from one to seven months' time, while the average gain was over three months. This they did without any urging and almost without their knowing it.

In most schools pupils recite nearly all of the time, and there is but little time left for the preparation of lessons in school, where most of the lessons should be prepared. For this reason, either the lessons are not prepared, or they are prepared under the direction of the parents, who should not have to instruct their children, even if they are qualified to do so. With this plan the pupils have more than one-half of their time in school for the preparation of their lessons. Thus they may be prepared under the direction of the teacher, who is best qualified, both by knowledge and experience, to give the pupils the assistance which they should have, and whose duty it is to relieve the parents of this task. Time is provided, both morning and afternoon, for individual help.

Intelligent principals and teachers realize the weakness of the usual plan. More than 90 per cent of the principals and teachers who have worked under this plan have given, in writing, their reasons for preferring it to any other.

As published, these opinions show that the benefits to the teachers are as many and as marked as those reaped by the pupils. When the plan was started, all were opposed to what they thought the plan would be. On all sides interested parents have expressed great satisfaction with the results obtained.

If pupils receive the same amount of instruction as they would under the usual plan, they would get it in much less time. Pupils now average a loss of about two years. Under this plan they will average a gain of not less than two years. Thus there would be saved to the district what it would cost to instruct a pupil for that time. When this is multiplied by the number of pupils, the financial saving becomes apparent. Add to this the amount saved by the lengthening of the pupils' productive lives and the gain is enormous, though not to be compared with the gain in improved mental habits.

---

### III.—THE SEATTLE PLAN OF PROMOTION AND CLASSIFICATION.

BY FRANK J. BARNARD, SUPERINTENDENT OF THE SCHOOLS OF SEATTLE, WASH.

1. The Seattle schools consist of a high school, grammar schools, and primary schools.

2. The high school is divided into four classes, first, second, junior, and senior, each of which, beginning with this year, is subdivided into two "divisions," first and second.

3. The grammar schools are divided into four classes, A, B, C, and D, each of which is subdivided into as many "divisions" of 20 pupils each as the number of pupils enrolled and the number of teachers employed in the different buildings will permit. The divisions are designated first, second, third, fourth, etc.

4. The primary schools are divided into four classes, A, B, C, and D, each of which is similarly subdivided into "divisions," designated first, second, third, fourth, fifth, etc.

Large buildings or districts afford better opportunities for close classification than the smaller ones, the South district having ten "divisions" of D primary pupils taught by five teachers, and higher grades in proportion, while the Mercer district has six divisions of a corresponding class.

The word "year" is not used in the plan of classification for the following reasons:

1. The pupils are classified by "divisions" in strict accordance with their abilities, and as all pursue the same course of study, it is evident that a sixth division of a D primary, for example, will require more time to complete the work outlined for the D primary than will be required by the pupils of the first division, who perhaps may complete the work and begin that of the C primary long before the expiration of the "school year."

2. The school year varies in length from eight to ten months.

As the plan was devised by the writer and introduced in this city some years ago, the following extract from the published Seattle school report for 1891-92, page 64, may serve to more fully explain the details:

The course of study, promotions, and classifications are questions so intimately connected that a discussion of one naturally involves the others.

School men have for years been attempting to answer the questions, "How shall we shorten the course of study?" "How enrich it?" One proposed solution is to almost entirely abolish arithmetic, grammar, and geography, thereby shortening it, and bringing down into the grammar schools such high school studies as German, French, Latin, geometry, algebra, etc., thus "enriching" the course of study below the high school. These solutions are obtained by but one rule, viz, "Save time by the sacrifice of quantity"—that is, win the race by throwing overboard part of the cargo. We all admit that for a large number of our boys and girls eight years is too long a time for the work below the high school. Many could do the work in six years, some in less time, while others, naturally slow, though sure thinkers, would require full eight years.

The questions of time and quantity are entirely different factors. Quantity is the course of study itself, while time is the number of years necessary to complete it. If, then, a certain factor, quantity, made up of more or less arithmetic, grammar, geography, spelling, reading, etc., is required for admission to the high school, why not classify the pupils as to enable them to take the quantity and enter the high school in the shortest possible time? The time of the course of study can thus be shortened for different pupils. Pupils thus enabled to enter the high school in less than eight years take up the enriching studies of German, French, Latin, etc., under the instruction of competent and experienced teachers, but in the high school, not below it—that is to say, the pupils hasten forward toward the "enriching" point, but the "rich" pabulum is not brought down to them.

Such a plan would permit many pupils to complete the entire course of study in the elementary schools and take two years in the high school by the time they are 14 years of age. Pupils having once entered the high school would be apt to remain in school, and that department would thereby be greatly strengthened and enlarged.

How can such a plan be put into practical operation? Stated times for promotions will not accomplish it; semiannual promotions will not solve it.

In my opinion the only solution is to classify pupils strictly according to abilities and qualifications and then allow them to master the quantity (the course of study) in such time as they can do the work well.

To illustrate, suppose there are in a certain school 80 pupils in the A primary grade. I would divide them into four divisions of 20 pupils each, classifying them strictly according to abilities. To one teacher I would give the first and second divisions, to another the third and fourth divisions.

To the teachers and pupils of all the "divisions" I would say: "Now, the theory upon which the course of study for the fourth years is constructed is that it will take one year to complete it, but if you can do the work thoroughly and easily in less time, why do so, and then at once begin the work of the fifth year, overtaking the lowest 'division' of that class, if possible." This means daily promotion. Progress is constant. The "first division" of one class will overtake, for a time work with, but finally pass the lowest "division" of the next higher class, while the lower "divisions" will go steadily forward, many of the pupils "working up" to higher "divisions" of the same class. In schools like the Denny, where there are more than two teachers to a grade, the classification can be still more thorough by having a greater number of "divisions" in each grade.

The accompanying table illustrates the plan:

Classes and divisions.	D primary.										C primary.									
	Months.										Months.									
	Sept.	Oct.	Nov.	Dec.	Jan.	Feb.	Mar.	Apr.	May.	June.	Sept.	Oct.	Nov.	Dec.	Jan.	Feb.	Mar.	Apr.	May.	June.

Classes and divisions.	B grammar.										A grammar.									
	Months.										Months.									
	Sept.	Oct.	Nov.	Dec.	Jan.	Feb.	Mar.	Apr.	May.	June.	Sept.	Oct.	Nov.	Dec.	Jan.	Feb.	Mar.	Apr.	May.	June.
First.....					×															
Second.....												×								
Third.....						×											×			
Fourth.....										×										×
February class.....						×											×			

The crosses (X) represent the different "divisions." The classification of the pupils and the rate of progress given is simply an ideal one, and represents a class entering the first year primary in September, before classification, and its further progress after classification through a course of eight years, individual reclassification being frequent. The progress—i. e., direction of the "divisions" as represented in the table—is from left to right, and the objective point is the high school. The vertical columns, headed by the names of the months, serve to show the relative position of the "divisions" of higher classes, for, while the progress of but one class is here represented, other classes are ahead and behind in the race, and hence their positions are also shown. The rates of progress for the four "divisions" are 10, 11, 12, and 13—i. e., the fourth division is supposed to do ten months' work in ten months, the third division eleven months' work in ten months, and the second division twelve months' work in ten months, and the first division thirteen months' work in ten months. The term or expression "months' work" represents the factor quantity or course of study, and is used as a mere matter of convenience.

If we let the word "mile" represent "months' work," the word "hour" represent "year" (ten months), it being assumed that the journey (course of study) is 80 miles (months) long, the chart will be easily understood. The problem of the first division would then be, "How many hours will it take to complete a journey of 80 miles, traveling at the rate of 13 miles an hour?" Answer. Six and two-thirteenths hours (years). A study of the chart will thus show that the first division will be able to complete the course in six and two-thirteenths years, the second in six and two-thirds years, the third in seven and three-elevenths years, and the fourth in eight years. I am decidedly of the opinion that the rates of progress assumed for the first and second divisions are much too low. The sub-classification of the February class is not given, as its members would soon be able to "work into" different "divisions" of other classes. It will be seen that such a plan of classification affords opportunities for frequent transfers of pupils from higher to lower "divisions," or vice versa. Such a classification of pupils will give those needing it more careful attention, as they will have more of the teacher's time, while those able to think and work more rapidly will be able to go ahead, and not be held back by their less fortunate mates.

The one rule necessary to the complete and perfect success of such a system is, "Study the capacities of each individual pupil." Some minds develop early, others late. The dunce of the class, if kept chained to the "honor pupils," may always remain a dunce, but if unchained, if studied and allowed to study under proper directions and influence, he may become the wonder of the school, the genius of the age.

#### RELIABLE RECORDS NECESSARY.

As, under such a plan, many individual pupils will "work ahead" or "drop back," and entire "divisions" may, with their teachers, be promoted and begin the work of the next class in the middle of the year, a few important items of information should be recorded very carefully and kept ready for use in case of transfers, withdrawals, and statistical comparisons and information.

The following are the most important:

To be recorded in September—

1. Name, age, birthplace, and residence of pupil.
2. Date of first enrollment in lowest division of D primary class.
3. Total months' attendance, all classes and schools from date of first enrollment to date, including temporary absences.
4. Received by present teacher from what division, class, school, and teacher?

To be recorded in June—

5. Total months' attendance from date of enrollment in D primary to date of promotion to present class.
6. Total number of months in course from D primary to and including last class from which promoted, assuming time required for work of each class to be ten months.
7. On above basis, total number of months gained or lost.
8. Assigned for next year to what division, class, school, and teacher.

PROMOTION STATISTICS.

The first practical results of this plan are now in evidence, as many pupils who entered our schools at the time of the adoption of the system (1891-1892) are now in, or about to enter, the high school. Owing to incomplete records during the first few years the summaries given below are not absolutely accurate, but being approximately so, they serve to show the first practical results. (See promotion statistics below.)

Some unexpected results were reported by individual teachers; as, for example, some reported "no promotions during the year," and hence no per cent; while others who promoted a division in October, and keeping the same pupils but doing the work of the next higher class until the end of the year, completed that course of study also, and therefore reported one division as twice promoted in the same year, or 200 per cent. Both reports are technically correct.

REQUIREMENTS FOR PROMOTION.

Primary classes: Average, 70; no study less than 50.

Grammar classes: Average, 80; no study less than 60.

High school: Average, 80; no study less than 65.

The standing of pupils in the grammar and higher primary classes is determined as follows: First month, by written tests, questions prepared by the teacher. Second month, recorded opinion of the teacher, but no written or oral tests except as required in regular lessons and recitations. Third month, one regular recitation in each subject to be in writing once each week and graded and averaged for the month. Such recitations are not to be announced and are to be conducted at irregular intervals and unexpected hours. Fourth month, written tests; questions to be prepared by the principal. Fifth month, same as second month. Sixth month, same as third month. Seventh month, same as first month. Eighth month, same as fourth month. Ninth month, same as third month. Tenth month, same as second month.

#### IV.—PLAN OF THE NORTH-SIDE SCHOOLS OF DENVER.

BY JAMES H. VAN SICKLE, DENVER, COLO.<sup>1</sup>

Local conditions can not be ignored in a scheme of promotion. Conditions affecting the problem in my district are as follows: Large, centrally located buildings, enrolling eight grades; buildings of four to six rooms tributary to the large buildings for the convenience of small children for whom the long walk would be a hardship.

The Chicago plan (each building a law unto itself in the matter of promotions) could not be applied where such an interdependence exists all along from third to sixth grade. The Cambridge double track, or long-and-short course plan, would unduly complicate the machinery. The separation of a class into small, independent groups with separate lessons involves a loss in the scattering of the teacher's effort for which the rapid movement of the strongest group is no adequate compensation.

Our circumstances permit promotion in lower primary grades without regard to fixed dates, but about the third grade we find it best to work toward fixed dates. The half-year interval between classes has proved most serviceable after the fourth grade. We admit two classes to the high school each year. As far as possible, adjustments needed between September and June are made within the room, so that a change of teacher may not be necessitated. The classes or divisions in a room vary in number and relative size. They change in both these respects from time to time, according to circumstances.

It will be seen that this plan, so far, is practically the plan recommended in Circular of Information, No. 7, published by the Bureau of Education in 1891.

After an exhaustive discussion of the class intervals used in seventy cities, we find on page 20 of this circular this statement: "Of the three class intervals above considered (the year, the half year, and the term or quarter), the half year seems to possess the most advantages and the fewest objections, and this is specially true in grades below the high school, possibly excepting the first and second grades, where a shorter interval may be desirable. This interval is sufficiently short to permit needed promotions of individual pupils, and it is sufficiently long to prevent a too frequent readjustment of classes and class work."

This plan is easily understood and easily administered, and therefore likely to be handled by the average school principal with greater effectiveness than a more complicated one. A class interval so long as to prevent frequent reclassifications and irregular promotions and brief reviews is not now generally defended.

My contention is that the short and varying interval in the primary grades, with the half-year interval in the grades above, is a sufficient development of the mechanism of gradation to safeguard individual interests, so far as any mechanism can safeguard them; that, instead of introducing further complications into the machinery of school organization, we shall find a more hopeful field for effort in devising plans for greater flexibility in class management, especially in the grammar grades.

<sup>1</sup> From the Proceedings of the Department of Superintendence of the National Educational Association, at its meeting in Chattanooga, Tenn., February 22-24, 1898.

Even if the members of a class could have at a given time equal knowledge, which is impossible, they would still differ greatly in quickness of comprehension and in working power. This would be equally true of a class of fifteen and of a class of fifty. These differences would manifest themselves in varying degrees according to the changing order of studies during the day. The child who is strong in arithmetic may show less strength in language, while another good in both may need more time in geography or history, and so on in infinite variety; while the average strength of the individuals composing the class may not vary greatly. No matter how carefully we grade, we find these differences.

A recitation, as ordinarily conducted, attempts to secure the attention of all individuals in the reciting class during the entire twenty or thirty or forty minutes assigned to it on the programme. All members of the class attend to the same thing at the same time; though often badly mated in point of speed, they must move at the same pace; the quick wait patiently for the slow; if the pace is rapid enough to keep up the keen edge of interest in the quick, the slow are fairly dragged over the ground; so a compromise is arranged which fits neither. At the first subtle signs of lessening interest the teacher redoubles her exertions in order to chain the wandering eye and check the budding yawn. If she is a teacher of ability, she generally succeeds in this, but at too great a cost in vital force, for the energy put forth by the teacher is out of all proportion to that put forth by the pupils.

The pupils are kept in motion too much by the will power of the teacher; the force is external and temporary, rather than internal and permanent; it tends to produce fitful and spasmodic effort. The pupils attend out of respect for the teacher and from a desire to conform, rather than from any feeling of need. Those naturally quick easily become satisfied with an effort far less than their best. Their time might be employed to better advantage than in listening to repetitions of what they already understand or in spending thirty minutes on what they might do in twenty. Such management makes dawdlers.

The individual plan does not offer an altogether satisfactory remedy even in schools with a smaller assignment of pupils to a teacher than is possible with us. Is it not possible to retain the manifest advantages of the class recitation so often set forth by Dr. Harris, and yet, as the recitation progresses, allow individuals to drop out and do other work more profitable than simply maintaining the semblance of attention?

Feeling that we ought not to put a premium upon the mere act of sitting through a recitation, I have watched with some care for the past three years an experiment in this direction tried in two of our larger buildings. It is an effort to do in a systematic way what a few good teachers here and there have done occasionally. It is, therefore, not an invention, but an adaptation. Some of the purposes kept clearly in view are these: To secure better use of time; to fit each pupil to rely upon his own judgment by often allowing him to share with the teacher the responsibility of deciding what he had better do at a given time; to secure, by means of this individual responsibility, willing effort even on the less agreeable studies, thus keeping the pupil fairly even in his work; to secure more study time in school, where conditions favor concentration, and thus to do away with the necessity of "keeping after school" (staying after school is quite a different matter); to enable a pupil to demonstrate his fitness for special promotion; to secure conditions favorable to enthusiasm in the pursuit of efficiency and knowledge by emphasizing these as ends, instead of placing emphasis upon marks, special seats, or rewards of any kind. The central thought is individual responsibility.

While no two teachers work in exactly the same manner, the plan followed may be stated in a general way as follows: All pupils are held for definite minimum requirements. (In order to afford facilities for greater attainment, each room is provided with its sets of supplementary books and a carefully selected reference

library of from 50 to 75 volumes.) While those pupils for whom the minimum requirement in a given subject is sufficient are mastering a given assignment in that subject, others, capable of doing more, though not yet strong enough in all studies to be able to skip a half year, are, by a process of natural selection, detaching themselves temporarily from the class in order to work on some study in which they are weak, or for broader or deeper study of the topic by means of the reference books, gathering illustrative material, or following out some line of interest approved by the teacher. Those excused may at any time be required to rejoin the recitation to give needed help to others. They are thus continually held responsible for the work in hand. Failure to respond satisfactorily at any time, either in advance or review, is understood to be evidence that the pupil in question had not attained that degree of proficiency which would warrant diverting his attention from the minimum requirement from which he had been temporarily released, and his release is canceled. A few experiences of this kind improve his judgment and make him cautious. He strives to make his acquisitions permanent, not merely for the day. He had better make mistakes early in his estimate of himself and correct them, than to be acting so wholly under prescription that there is no chance for a mistake in this respect. Without this opportunity for self-measurement there is danger that some will develop vanity and conceit, and others excessive timidity, rather than self-respect and confidence. The pupil is in the truest sense educated through occasions for choice.

A pupil may at a given time find the work in arithmetic and geography all that he can do, while at the same time he is making fuller study than some of the rest of a period in history. This he considers a privilege which he works energetically to secure. Another, not so able in history, may get this liberty in some other subject. There will come a time when he may give to the class the benefit of his skill or of his research; thus he has an immediate motive, partly selfish, but not wholly so. He is giving to others. His success awakens a desire in others to be able to make creditable contributions of the same kind; thus all are stimulated to do independent work in spare moments and to find spare moments for independent work. They learn how to find things in books. This is perhaps the most useful single accomplishment that we can cultivate in a child. Books must always be his chief reliance after leaving school.

In a class fairly well graded each pupil will have some study from which it will be safe to release him partially now and then. Thus all get some encouragement from the plan. It secures energetic work without stimulating a hothouse growth. The motive it holds out is a permanent motive and a worthy one.

It is not a plan for hurrying pupils through the grades. This class presents an even front when entering upon a new division or lesson unit of any study. The development work is done with the whole class. One goes no faster than another, but he gets more. One describes a larger circle than another, or, to use an agricultural expression, cuts a wider swath. It is not so much to the pupil's advantage to go through the grades rapidly as to get all that he is capable of getting while he is going through.

The plan tends to even up the pupil in the various studies, since making pleasant excursions in favorite studies is conditioned upon fair attainment in all studies.

It secures for the pupil so much additional study time in school that much less work needs to be carried home, and thus it helps to do away with the idea, prevalent in many homes, that the parents are expected to do the teaching, and that the only duty assumed by the teacher is to check up the work and pass judgment upon its quality.

It allows the teacher to devote time to the less able pupils without robbing the others. The less the brighter pupils depend upon the teacher the better. The aim should be, as rapidly as possible, to make all pupils self-reliant.

It affords opportunity for the development of latent strength, and gives the

teacher a safe basis for determining the fitness of individuals for working with the division a half year in advance. We find that the child irregularly promoted invariably makes an enviable record in the higher class. One hundred and forty-two such promotions have been made in our schools since September last, or  $4\frac{1}{2}$  per cent of all promotions. Five and three-tenths per cent of all pupils now in the grammar grades are where they are by special promotion.

In the eighth-grade class this year, 4 have finished, or will have finished, the eight-year course in less than six years, 7 in six and one-half years, 21 in seven years, and 21 in seven and one-half years. Able pupils are not kept marking time, but are advanced whenever they show the requisite strength. The half-year interval does not prevent this. The year interval would add materially to the difficulty.

In the two buildings in which this plan of class management has been systematically tried there has been apparently greater attention to individual needs than in the other buildings. One hundred and sixty-one pupils finish the work of the eighth grade this year in three buildings. In one building,  $57\frac{1}{2}$  per cent finish in eight years or less; in another,  $62\frac{1}{2}$  per cent, and in the third, the one pursuing the ordinary plan, only  $37\frac{1}{2}$  per cent.

I do not mention any of these figures as showing progress at all remarkable, for, by force of circumstances, in all three of these buildings the school day is cut short for all first-year pupils, each child attending but one-half day. Thus a reasonable allowance would be eight and one-half years to complete the course. The figures seem to indicate, however, that in two buildings the plans are more favorable to individual advancement than those used in the third, since I know of no other conditions affecting one school more favorably than another, such as strength of teaching force, nature of the population, etc.

It is not denied that this plan requires more thought and broader preparation on the part of the teacher than the ordinary class plan. But a teacher whose attention is thus directed constantly toward individual needs inevitably gains so much in skill that after a time, all things considered, the work seems easier than before. There is ample compensation for the energy spent in planning work for those temporarily excused from recitation. These are the active spirits who ordinarily find means to divert themselves at the expense of the good order of the room. Kept fully occupied with self-imposed tasks, they cease to be a disturbing factor. The spirit of the room soon comes to be one of self-control and industry. Repression is no longer needed—only direction. A difficult pupil, new to the plan, soon learns that he can not afford to go counter to public opinion. It is not the teacher, but the spirit of the room, that causes him to settle down to earnest work.

Teachers are hampered by their own training. They have not been accustomed as pupils to any freedom in these directions; hence it does not occur to them that it is possible to give their pupils any freedom. They have little faith in the ability of the pupil to use wisely any freedom.

If, as we glance into a schoolroom, it seems to be in perfect order, every child looking at his book, no one whispering, faces all to the front, teacher's desk and pupils' desks models of neatness, we are pleasantly impressed, and we are inclined to say to ourselves: "That is a good school." Whether it is a good school or not depends upon how these appearances are secured. If every choice of occupation and every movement are dictated by the teacher, the school is a very poor school. The pupils must necessarily grow less and less self-reliant.

Unfortunately, we superintendents, by commending these surface indications, and pronouncing those schools good which have them and little else, have encouraged a vast amount of formalism that absolutely prevents freedom to do the best thing possible for the individual. We thus oblige teachers to cultivate that whole brood of artificial incentives so common everywhere, instead of natural and worthy ones.

In the evolution of our schools, those teachers who most carefully observed these outward forms were counted most successful; they were, therefore, most in demand, and hence the type has persisted. Most of us, and most of the teachers associated with us, have been brought up under the system; hence it is hard to break away from it. It is so easy to measure a teacher by this standard; so hard to take less tangible things into account.

I regard it important that the class interval used in the grammar grades shall be used at least in the earlier years of the high-school course. If the grammar-grade interval is one-half year, and yet pupils are admitted to the high school only in September, a large number must be held back at a time when it is very important that they should move forward.

A larger number of those promoted in January enter the high school than of those promoted in June. They leave the eighth grade on Friday, and begin the work of the ninth on the following Monday. No long vacation, with its many opportunities for a change of purpose, intervenes. Ninety-five per cent of those promoted last month at once took up the high-school work. Only 80 per cent of those promoted last June registered in the high school in September. We find the plan no more expensive than the plan of annual admission, since the classes are so large as to require division. Fewer pupils drop out through discouragement, since failure in any study means only a reasonable review of that one study.

Besides carrying the half-year interval through the twelve grades, we attempt to care for the interests of the individual in the high school by making a large number of studies optional. Any pupil not a candidate for graduation may study any subject which the daily programme will permit. All pupils, to quite an extent, make their own courses. Certain studies are required of all pupils alike if they wish the diploma of the school. Aside from this list, which is relatively small, pupils may choose, with the advice of parents and teachers, those studies which appear best suited to their several needs.

Fixed courses, in which all must do the same amount of work in the same time, do not take account of differences in mental and physical strength. Those who can carry all of the work stay in school; others, becoming discouraged, drop out. We aim to provide for all, "the mentally strong and the mentally weak, the physically strong and the physically weak, the permanent and the transient." Those who can not carry four studies may take three; those who can not carry three may, without the slightest loss of self-respect, limit themselves to two.

The official course of study is an inventory of the studies authorized to be taught, with a statement of the aims of the school, suggestions as to the amount of work a pupil should undertake, the subjects characteristic of certain courses, the proper grouping of studies, etc.

At the close of each half year each pupil receives a certificate showing the studies successfully pursued and the number of periods per week devoted to each. When he gets enough of these certificates to show that the official requirements have been met, he receives the diploma of the school, which bears on its face a record of the subjects pursued and the time devoted to each.

Each pupil may work according to his strength by choosing just the number of studies that his physical and mental ability permits. He may take as long a time to earn his diploma as he needs—five years if necessary; or, if possessed of sufficient physical and mental vigor, he may earn it in three and one-half or three years.

The aim of the pupil's effort is the mastery of distinct subjects of study rather than the maintenance of a general average. The pupil does his work more enthusiastically since the studies are largely of his own choosing. His course may not differ materially from one that would be chosen for him by his teachers, but it makes a vital difference in the spirit with which he undertakes it whether he loads himself with work or is loaded by another.

The plan has been in operation in our school for three years. We have noted that the pupils do more work and better work than formerly. More pupils remain in school to complete a course. The development of natural talent is encouraged. Of 102 graduates (three classes) no two have pursued exactly identical courses.

#### RECAPITULATION.

A class interval less than a half year is desirable in the lower grades.

The class interval may be longer as the pupils become older and able to work more independently.

In the grammar grades and in the high school the half-year interval is satisfactory.

As the mechanism grows more rigid, owing to the necessity of consolidating classes at fixed dates, freedom to make class management flexible steps in to the rescue of the individual.

The pupil is educated by a gradual increase of responsibility, and the accompanying necessity of choice, till finally a most important choice, that of his high-school course, is intrusted to him in part.

#### V.—PROMOTIONS IN THE GRAMMAR SCHOOLS OF CAMBRIDGE, MASS.<sup>1</sup>

The course of study is divided in two ways: (1) Into six sections; (2) into four sections; each section covering a year's work. Pupils taking the course in six years are classified in six grades, called the fourth, fifth, sixth, seventh, eighth, and ninth grades. Those taking it in four years are classified in four grades, called grades

Arrow No. 1 indicates the four years' course; grades A, B, C, D. Arrow No. 2 indicates one of the five years' courses; grades A, B, 7, 8, 9. Arrow No. 3 indicates the other five years' course; grades 4, 5, 6, C, D. Arrow No. 4 indicates the six years' course; grades 4, 5, 6, 7, 8, 9.

A, B, C. and D. When pupils are promoted to the grammar schools they begin the first year's work together. After two or three months they are separated into two divisions.

One division advances more rapidly than the other, and during the year completes one-fourth of the whole course of study. The other division completes one-sixth of the course.

During the second year the pupils in grade B are in the same room with the sixth grade. At the beginning of the year they are five months (one-half the school year) behind those in the sixth grade. After two or three months grade B is able to recite with the sixth grade, and at the end of the year both

<sup>1</sup> From the Cambridge School Report of 1897, prepared by Francis Cogswell, superintendent.

divisions have completed one-half the course of study—the one in two years, and the other in three years. The plan for the last half of the course is the same as for the first half, the grades being known as the seventh, eighth, and ninth in the one case, and as C and D in the other.

There are also two ways of completing the course in five years: (1) Any pupil who has completed one-half the course in two years may at the end of that time be transferred to the seventh grade, and finish the course in three years; (2) any pupil who has completed one-half the course in three years may at the end of that time be transferred to grade C, and finish the course in two years. In both cases these changes can be made without omitting or repeating any part of the course.

It is now six years since the schools were first classified on this plan. During this time 3,065 pupils have graduated from the grammar schools. Of this number, 9 per cent completed the course in four years, 30 per cent in five years, 47 per cent in six years, and 14 per cent in seven years or more.

Of the number who entered the Latin school during the past three years, 21.5 per cent did the work in the grammar schools in four years, 39.8 per cent in five years, and 38.7 per cent in six years. Of those who took the general course in the English high school, 13.8 per cent did the work in the grammar schools in four years, 43.1 per cent in five years, and 43.1 per cent in six years. Of those who took the commercial course in the English high school, 12.1 per cent did the work in the grammar schools in four years, 38.4 per cent in five years, 49.5 per cent in six years. Of those who took the manual training course in the English high school, 9.9 per cent did the work in the grammar schools in four years, 39.5 per cent in five years, and 50.6 per cent in six years.

More than 50 per cent of the pupils entering the high schools did the work in the grammar schools in less than six years, 41 per cent doing it in five years, and 15 per cent in four years. It does not follow, however, that because so many did the work in less than the full time the plan is a good one. It is comparatively easy to carry pupils rapidly over a course of study. The value of the plan is shown rather by the thoroughness with which the work has been done, not in one year only, but in a series of years.

The following table shows how the pupils who completed the course of study in the Cambridge grammar schools in four years and in five years sustained themselves during the first year in the high schools, the results being compared with those of the pupils who were six years in the grammar schools:

*Record of three different classes, first year in high schools.*

	Four years in grammar schools (av- erage per cents in high schools).	Five years in grammar schools (av- erage per cents in high schools).	Six years in grammar schools (av- erage per cents in high schools).

Class of 1897.....	79.3	72.8	66.9
Class of 1896.....	80.4	77.0	71.6
Class of 1895.....	78.7	78.9	76.4
Average for three years.....	79.4	76.2	71.6
Per cent of whole number of pupils in the classes.....	21.5	39.8	38.7
<i>In the English high, general course.</i>			
Class of 1897.....	79.7	78.7	72.2
Class of 1896.....	85.9	75.1	76.4
Class of 1895.....	77.3	76.2	73.4
Average for three years.....	80.9	76.6	74.0
Per cent of whole number of pupils in the classes.....	13.8	43.1	43.1

*Record of three different classes, first year in high schools—Continued.*

	Four years in grammar schools (av- erage per cents in high schools).	Five years in grammar schools (av- erage per cents in high schools).	Six years in grammar schools (av- erage per cents in high schools).
<i>In the English high, commercial course.</i>			
Class of 1897	76.3	69.0	69.3
Class of 1898	74.8	70.9	68.4
Class of 1899	73.7	73.5	69.8
Average for three years	74.9	71.1	69.1
Per cent of whole number of pupils in the classes	12.1	38.4	49.5
<i>In the manual training course.</i>			
Class of 1897	78.6	67.2	61.7
Class of 1898	79.2	63.5	65.2
Class of 1899	72.6	65.4	65.9
Average for three years	78.8	65.3	64.2
Per cent of whole number of pupils in the classes	9.9	39.5	50.6

From this table it appears that the average per cent during the first year in the high schools of the pupils who were four years in the grammar schools was higher than the per cent of those who were five years in the grammar schools, and that the per cent of those who were five years in the grammar schools was higher than the per cent of those who were six years in the grammar schools.

This does not show that even these pupils were prepared for the work in the high schools. It does show that if these pupils ought to have remained longer in the grammar schools those who spent six years in the grammar schools should have remained still longer, and it also emphasizes the fact that no classification should ever be made that does not provide either for the more rapid advancement of a part of the pupils, or for additional work for those able to do it.

The appointment of a special teacher for each of the grammar schools was an important factor in the success of this plan. In the opinion of the superintendent it was not only a wise measure on the part of the committee, but an economical one. In all but one of our grammar schools there are at least eleven classes occupying separate rooms. If through the efforts of the special teacher only four pupils are promoted from each class who otherwise would spend two years in the same grade, the salary of the special teacher does not add to the cost of the schools, for when a pupil spends two years in a grade it costs twice as much for his instruction in that grade as when he spends one year. If, in addition to this, the special teacher is enabled to help four other pupils from each class to shorten their course by one or two years, the employment of a special teacher is a gain, not only to the pupils in the saving of time, but to the city from a financial point of view.

These statements in regard to the financial side of the question should be modified in a measure. They are made on the basis that pupils remain in the grammar schools until the work is completed.

In connection with this the superintendent desires again to express his conviction that a special teacher could render important service in each of the high schools. It is not expected that efforts would be made to carry pupils over the course more rapidly, certainly not in the English high school, but to render such aid to faithful pupils, in addition to that given by the regular teachers, as will enable them to do their work successfully.

More than 400 pupils enter these schools each year. They come from all parts of the city and from homes representing all conditions of life. Many of these pupils have no one at home to render them assistance, and it is not strange that with new studies and new surroundings they become discouraged and disheartened and leave school. Some of these would be saved from failure by the aid and influence of a special teacher.

## VI. THE GRADING AND PROMOTION OF PUPILS.

REPORT OF JOHN T. PRINCE, AGENT OF THE MASSACHUSETTS STATE BOARD OF EDUCATION.<sup>1</sup>

There is no question of school organization at present more important than that of a proper adjustment of conditions to the needs of individual pupils. The assumption upon which most courses of study seemed to be based, that just so much ground must be gone over with equal thoroughness by all pupils in the same time, is the greatest bane of our public school system. The courses in use are probably intended to meet the needs and capacity of pupils of average ability. Such, however, is the difference of ability between the brightest third and the dullest third of almost every class of pupils, that the work thus required is enfeebling to one part while it is discouraging or unduly excessive to the other. To neither group is there the stimulus of success with effort. To one group there is success without effort; to the other there is effort without success. The difficulty, it is feared, is enhanced by the want of ability or inclination on the part of many teachers to adapt each lesson's requirements to the capacity of individual members of the class.

There are some signs of reaction against a system which encourages or permits a dead uniformity of ability and effort. The only fear is that the opposite extreme of individualism will be sought as a remedy. As between the practice by which forty or fifty pupils of all degrees of ability are required to do the same work with nearly equal efficiency, and a return to individual teaching such as was carried on in ungraded schools forty years ago, there is but little choice, although the ill effects of the two practices must be felt in widely different ways. But a choice between these extremes of practice ought not to be necessary. No more useful service can be rendered the public schools than that of devising ways by which the benefits of a class system of teaching will be secured, and at the same time such an adjustment of work be made as will permit pupils of varied abilities to do the most for themselves. To this task many educators have given much time and effort of late. Out of all the plans that have been devised, there should be found some which can be readily adapted to any conditions that are likely to exist. It is evident that no one scheme will do for all. A classification which can be made in large schools should not be made in small ones, and a system of promotion that is feasible in small ungraded schools would be wholly inoperative in large graded ones.

In responses to letters of inquiry to prominent school superintendents throughout the country, concerning plans of classification and promotion, over eighty replies have been received, from which the following facts and conclusions are gathered:

The written examination as the sole means of ascertaining the pupil's fitness for promotion seems to be passing away. Out of the entire number of places reported, there are but seven in which entrance to the high school is determined solely by examinations, and only two in which promotions from grade to grade in grammar schools are so determined. It is pleasant also to record the fact that in only four cities is the determining element for admission to the high school the superintendent's examination alone. The teacher's judgment alone generally determines the class in which pupils of the primary schools are placed. Promotions from grade to grade in the grammar schools of about two-thirds of the places reported are based upon the combined judgment of the class teacher and that of the superintendent or principal. In a few instances the examination by the superintendent or principal is made the determining element in all doubtful cases only, or cases in which the teacher is not able to decide.

<sup>1</sup> Massachusetts School Report, 1896-97, pp. 297-314.

The intervals between classes or grades in about two-thirds of the cities and towns reporting are one year. In the other third the intervals are one-half year or less. In the Report of the Commissioner of Education for 1890-91 returns from 465 cities and towns of over 4,000 inhabitants show the proportion of short intervals to be much greater than this. Several places report shorter intervals for the primary schools than for the grammar schools.

The methods of promotion will first be considered of those places in which the intervals between the classes are one year.

In about one-half of the cities and towns reporting, special provision is made for individual promotions or promotions out of course. Where no such provision is made there are reported either few individual promotions or none at all. Quite a number of superintendents report that the matter is left with teachers, with the request that pupils be promoted whenever they are qualified; but in such cases there is either no report of the number of individual promotions, or else the number of such promotions is so small they may be said to be rare exceptions. A few superintendents seem opposed to double promotions on the ground that some portion of the course is either done slightly or else entirely omitted, or, as one superintendent says, "Good pupils are spoiled by being advanced beyond their depth merely because they are bright."

Where special provision is made for advancing pupils out of course the widest difference of practice and of results is reported. In some cases the teachers are asked to report all pupils who by superior scholarship or by maturity are deserving of promotion out of course. A list of such pupils is kept by the principal or superintendent, and special facilities are afforded those who desire to be advanced. A few superintendents cause each grade to be divided into two sections, according to scholarship, thus enabling pupils to pass more easily from one grade to another during the year. In the primary schools the pupils of a single class or grade are sometimes divided into three sections or groups in the same way. In one city where the latter plan is followed a modified form of the monitorial system is followed, in which the larger pupils from the highest grades often hear pupils of the lower grades in reading, either individually or in groups of two or three.

The group system of classification is carried out still further in a few towns, as in Leominster, Mass., whose superintendent reports as follows:

In the lowest grades we divide pupils into four or five groups, higher grades into three and sometimes possibly only two. Pupils pass readily from one group to the next higher without the so-called "jump," whereby a certain amount of work is always lost. Pupils in the most advanced group in a room are doing about the same work as pupils in the lowest division or group of the next higher room. This enables pupils to go readily from one group to another, and at the same time also from one room to another.

Several cities and a few towns report the opening of an ungraded school in each of the large graded-school buildings. In this school are placed backward pupils or pupils who can not be readily classified in existing classes. Here, too, are pupils who are trying to get into a higher grade. The superintendents in their letters and reports speak in unqualified terms of the great good accomplished by the establishment of these ungraded schools. In some places the same end is reached by one or more assistants going from school to school in a building to assist backward pupils or pupils who are trying to get into an advanced division.

A number of superintendents whose schools have the one-year interval between the classes report a plan of dividing the classes into small sections in two or three essential subjects, and of permitting pupils who do especially well in these subjects to be pushed forward. Elizabeth, N. J., is a conspicuous example of this kind of classification. Here a class or grade of pupils is divided into three or four divisions in each of the most important subjects, as arithmetic and grammar, the divisions going forward as rapidly as they are able to, and continuing their pace even

after the grade promotions are made. "Thoroughness in essentials" is made the motto. Individual promotions are made generally at the end of each month, but it is understood that any pupil may be advanced as soon as he shows that he can do more for himself in another division. A complete record of every pupil is kept, which shows the exact amount and character of the work done, the pupil's characteristics, etc. This is a kind of life-book, such as is made in the French schools, and is passed on from teacher to teacher, as the pupil advances. Last year's statistics show that 23 per cent of the pupils earned irregular promotions, and that 60 per cent of them were reclassified during the year and placed where they could do better work.

Of other plans followed in schools having one-year intervals between the classes, a few will be given somewhat in detail.

The plan pursued in Cambridge, Mass., deals only with the grammar-school course, which is supposed to cover six years' time of pupils of average ability. A few weeks after the pupils enter the grammar school, in September, they are separated into two divisions, according to ability, one division called Grade A, and the other division called fourth grade. The pupils of Grade A move forward with the aim of completing the prescribed grammar-school course in four years, succeeding grades being called B, C, and D. The pupils of the fourth grade go forward more slowly, aiming to do each year only one-sixth of the work prescribed for the grammar school. The grades of these pupils in succeeding years are known as fifth, sixth, seventh, eighth, and ninth. At the beginning of the second year the pupils of what was Grade A, now called Grade B, go into a room with pupils of the sixth grade. During the first part of the year the pupils of the sixth grade are in advance of the pupils of Grade B, but, owing to the superior ability of the latter division, they all come together during the latter part of the year. At the beginning of the third year precisely the same conditions exist as existed at the beginning of the first year. The pupils of Grade C recite with the pupils of the seventh grade for a few weeks, when a readjustment is made, the abler pupils moving on at a pace sufficiently rapid to finish the course in two years, leaving the others to finish it in three years.

The fifth-grade pupils are alone in a room under one teacher during an entire year; the same is true of the eighth-grade pupils. In all other rooms there are two grades or divisions, one belonging to the four years' course and the other to the six years' course.

A pupil who begins with the fourth grade and remains in the slower division to the end of the course will graduate in six years, unless he has to repeat; a pupil who begins with Grade A and remains in the more rapid divisions to the end of the course will graduate in four years; a pupil at the end of the sixth grade or of Grade B may go on with a division which will enable him to complete the course in five years. Thus it will be seen that the entire course of study may be finished in four, five, or six years, depending upon the strength or ability of the pupils, and all without the omission or repetition of any part of the course.

All promotions both from the grammar to the high school and from grade to grade are made by the class teachers, under the direction of the principal and superintendent. No preannounced examinations are given, but there are frequent written reviews given by the teacher, the results of which help to determine the fitness of pupils to go forward. \* \* \*

To the criticism that this plan of classification can be used only in large systems of schools or in large buildings, it may be said that in one of the Cambridge schools, where the plan is in full and successful operation, there are only 330 pupils distributed in 6 rooms, 1 room having 80 pupils, with 2 teachers. Of the present graduating class, numbering 50 pupils, 4 will probably have completed the nine years' course in six years at the time of graduation, 12 in seven years, 16 in eight

years, 15 in nine years, and 3 in ten years. Principal Cutter of this school says of the plan:

It is my belief that the plan can be successfully carried out in a school requiring but four or three teachers. There is more than one way to bring about a desired result. The 18 pupils who were last year in Grade A entered in September the same room with Grade VI, and are now well abreast of the pupils of this grade. The same thing is true of the 10 pupils of Grade C in joining the ninth grade. In neither case is there a pupil who is now failing to sustain himself with credit. I am a hearty believer in the scheme; and it can no longer be said that in a graded system the brighter pupils must be kept marking time to the pace of the slower ones.

Added testimony to the adaptation of this plan to a small system of schools is found in Middleboro, Mass., whose enrollment of pupils is about 1,100, the enrollment in the three buildings where the plan is in operation being 474, with 11 teachers. Of the present graduating class, numbering 50, about 15 will complete the course in one year less than the prescribed time. Concerning the advantages that may be claimed for the Cambridge plan, Superintendent Jacoby writes as follows:

1. It gives pupils an opportunity to do the grammar-school work in four, five, or six years without omitting any essential part of the work.
2. It enables pupils to better use their ability and time.
3. It permits the grouping of pupils of the same degree of advancement, thus making the conditions for successful work more favorable.
4. It does not complicate or destroy the organization of the schools.

In Woburn, Mass., a plan of "double promotions" has been in operation for some years, and has been attended with good results. In the primary schools the interval between classes is made short by dividing the pupils into small sections. As there are three or more sections in each room, the class intervals are so short as to permit frequent changes, the section rather than the grade being the unit of promotion.

The nominal time for the completion of the primary school course is three years, but many complete it in much less time. In each of the grammar grades the essential features of the entire work prescribed for the year are taken during the first half year, and those pupils who have successfully performed the work, especially in language and arithmetic, at the end of the half year, are promoted to the next higher grade. During the second half year a more minute study of the topics in language and arithmetic already pursued is made, by which an opportunity is afforded for new pupils to do the work of the grade, and for those who have done it imperfectly to review it. By this plan bright pupils are given the opportunity of passing through two grades in one year. The number of pupils who won mid-year promotions last year in the grammar grades was 129, of whom 104 received a second promotion at the end of the year. The number of mid-year promotions in 1895 in the same grades was 315. Of this number all but 78 were again promoted at the end of the year. The present total enrollment in the ninth grade is 145. Of these, 3 have completed the nine years' course in six years, 10 in seven years, 33 in eight years, and 99 in nine or more years.

Some possible objections to the plan are met by Superintendent Emerson, who says:

The conditions of promotion in every case are punctual and constant attendance, high rank, good conduct, good health, and the consent of parents.

And again:

This special adjustment of the work in language and arithmetic is necessary on account of the nature of these subjects, each principle being so related to those that precede it that the pupil is obliged to carry in his mind a general outline of the entire subject. This is not true of the other branches of study, such as geography, history, spelling, etc. It is of little moment which hemisphere is studied first, which continent shall have the precedence, or in what order the countries of a given continent are studied.

In Keene, N. H., a plan has been in operation for three years which embodies some features of plans already described. Its resemblance to the Cambridge plan consists in the division of two grades into A and B sections, one of which goes forward at a more rapid pace than the other, with opportunity for pupils to cover a six years' course in four or five years. Its plan of reviews at stated times for the convenience of those who omit some portions of the work, as well as for those who need more drill in the subjects reviewed, resembles in some respects one of the essential features of the Woburn plan. In the Keene plan, the A or advancing divisions do not work ahead in all subjects, but only in those subjects in which consecutive work is necessary, as grammar and arithmetic, the plan resembling in one important respect those followed in both Elizabeth and Woburn. There are other features of the Keene plan which are unique, and show the value of skilful planning and careful oversight. There are ten grades below the high school. Of 1,056 pupils belonging last year, 48 special promotions were made during the year. In the present graduating class of 84 in the grammar school, 14 will have completed the course in nine years, 4 in eight years, and 1 in seven years.

The reports of plans of promotions in schools having short intervals between the classes are almost as varied as those already referred to. In nearly all of these schools the reported number of double promotions during the past year far exceeds the number reported from schools where class intervals are one year in length, the percentage of such promotions, based upon the number of pupils enrolled, ranging from 3 to 30 per cent. In a majority of this class of schools there are twenty-week intervals between the classes, regular promotions being made twice a year. When two sections twenty weeks apart recite in the same room to the same teacher, transfers from the lower to the higher divisions are said to be comparatively easy to make. Sometimes the classes, especially when they are large, are separated into two or more divisions, making the intervals between the divisions only ten or twelve weeks. This arrangement is not unlike that which is made in several cities and towns by which all the pupils are divided into small sections according to attainments, with provision for promotions at the end of eight, ten, or twelve weeks. There are some differences in the details of plans followed, but in general the principle recognized is the same, which is to make as short intervals between the classes as possible, with frequent promotions. This principle was applied in the classification of the elementary schools of St. Louis, twenty-five years ago, under the direction of Dr. Harris, now Commissioner of Education. \* \* \*

Of the cities in this country which have adopted this plan in whole or in part, Dayton, Ohio, may be mentioned as a conspicuous example. Of the plan in Dayton, Superintendent White writes:

The aim is to have from 30 to 35 pupils in each room. The work is assigned for the year by grades. The pupils of each grade are assigned to rooms, as before stated, commencing with the one having the highest standing, and so on down to the end. In districts where there are several rooms of the same grade it makes classification very close, and enables the teacher to present the work to each class in such a manner as to be within the comprehension of each individual child. Each of these rooms is again divided into two classes, according to standing, and the work is presented to the two groups separately. When the work for the ensuing year is completed, the pupils of any group, or any particular pupil in the group, may be advanced to the next higher grade at any time within the year.

We are trying to preserve the class organization and retain the benefits of class instruction at the same time that we are utilizing the individual instruction of pupils.

Our teachers, principals, patrons, pupils, and board of education take kindly to the new arrangement, and the work of the schools is perhaps more harmonious than it has ever been in its history. This arrangement takes closer and more methodical supervision, and a great deal of patient, skilful work on the part of those in authority, but we anticipate for it very gratifying results.

It is asserted by some that this plan is only adapted to the schools of large cities or to schools of large size. Two cities of small size report that they are following the plan essentially with success—Le Mars, Iowa, and Centralia, Ill. Of the work in Le Mars, Superintendent Coleman writes:

Our class intervals are short. In the primaries they are from six to eight weeks, in the grammar grades from eight to twelve. At intervals varying somewhat each class is reviewed back to the next lower class; but all pupils very strong in the work, as indicated by the recommendation of the teacher, are excused from said review and are promoted to the class that reviews to meet them. Our rate of progress between these reviews is determined largely by the ability of the stronger members of the class, as we expect the others to review soon. This is our sixth year on this plan, and we find an increasingly large number of pupils ready for the promotions.

We have admitted three classes into our high school this year, one in September, one the 1st of November, and one in December. There are 49 pupils in these three classes, and 5 of them took ten years to complete their preparation for the high school; 5 took nine years; 8 took eight years; 13 took seven years; 15 took six years; 2 took five years; and 1 took four years.

In the Centralia school 425 pupils, or over 30 per cent, out of 1,374, the whole number belonging, were promoted out of course last year. Of the plan pursued Superintendent Mather says:

Our system of promotion has to do largely with the individual pupil. Each grade is divided into A and B sections. No grade in the system is more than six weeks, or seven, beyond the next lower. When a pupil, in the judgment of the teachers, is able to do the work of the grade beyond, he is promoted to it. With my strong teachers, those of good judgment, I permit the recommendation to take the place of an examination. Every month and many times every week pupils are promoted. By keeping the grades thus far apart the school is not disorganized, and sufficient encouragement is given to all pupils.

Thus far I have given somewhat in detail the plans of grading and promotion culled from letters and reports which are in actual operation in this country. They express in forcible terms the feeling of opposition quite generally felt in progressive centers to the lock-step marching by platoons from grade to grade, which still characterizes the practice of grading and promotions in many schools of both hemispheres.

In all the examples given there is doubtless much that is good. It is evident, owing to various circumstances, that no one plan is suited to all places; and yet it is possible to select certain common elements of excellence, and from them derive some principles of value to all who are seeking to solve the difficult problem of making such grading and promotions as will give individual pupils the largest measure of opportunity. To these principles I will add some conclusions of my own, based upon experience and observation, and upon opinions from trustworthy sources.

1. First, as to length of intervals between the classes. It is significant, that although in my recent inquiry only about one-third of the places reported shorter intervals than one year, and in the investigation made by Commissioner Harris in 1893 the proportion of places having short intervals was but a little greater, the opinions of superintendents as shown in the latter investigation very generally favored the shorter interval; only 65 out of 465 reporting as being in favor of the one-year interval. I place, therefore, first, among the principles of grading, the making of as short intervals between the classes as circumstances will permit. In a collection of children numbering 100 or more the gradation should be of such a kind as to permit intervals of one half year or less in at least two branches of study; and where the number of children is more than 200, such intervals may profitably exist in nearly all the required studies. Where the numbers warrant it, as in buildings having 400 or more pupils, the intervals should be nine or ten weeks in all subjects, and may be less than that in some subjects. Where the number of pupils covering the entire course must be placed under the charge of

two teachers, their distribution will depend upon circumstances, such as the relative number of advanced pupils, number of beginners, etc. But generally it may be said that a little more than half of the work usually assigned to the course should be given to the primary teacher, and the rest to the grammar school teacher. An arrangement of classes in both rooms should be made by which the intervals are less than one year between classes in sequential subjects, like reading and numbers in the lower grades and arithmetic and grammar in the upper grades. With such classification pupils should be permitted to recite in an advanced division in any one or two subjects, whenever they show ability to do the work of that division, with a view of working up into a higher grade in all subjects.

2. Where the work of one teacher must cover the entire course, close gradation in all subjects should be avoided. The pupils may be heard together or in two or three divisions in all subjects whose parts are not closely dependent, like language, nature study, geography, and history. In other subjects, as arithmetic, grammar, and some parts of reading, the school should be divided into four or more divisions. Pupils should be permitted to recite in any division or in any subject in which they can do the most for themselves, and be permitted to pass from one division to another whenever they show that it is for their advantage to do so. The more advanced divisions in some subjects may be heard two or three times a week, with correspondingly long lessons assigned if they are full-time subjects. The number of daily recitations in rural schools will depend upon circumstances, but should not exceed twenty.

3. The course of studies as far as possible should be made so as to assist the teacher in adapting the work assigned and called for to the abilities of all pupils in every class. This can be done by designating important or principal features which must be taken by all for a proper understanding of the subjects, and by suggesting supplementary work that may be done profitably by pupils after they have acquired the necessary portions, and while they are waiting for others who have not acquired them.

4. Regular times of grade or class promotions are desirable, with special arrangements for the promotion of individual pupils or of sections of pupils whenever they show their ability to perform the work of a subsequent grade. A specific plan for irregular as well as for regular promotions should be made and carried out by the principal or superintendent. As a rule, merely general directions or a reliance upon the judgment of the teachers to promote pupils out of course is not sufficient to meet the requirements of all cases.

5. "Double promotions," where the intervals between the classes are one year or more, or where there is no arrangement by which the work in sequential subjects of all grades is covered, may be a benefit to some pupils in the saving of time, but are likely to be attended with dangers that do not offset the benefit gained. If the course of studies is what it should be, there is, in "skipping" a portion of the work, a loss which can not be easily made up.

6. Pupils should not be heard in recitation together in all subjects, but should be separated into two or more divisions, one division of pupils being given an opportunity for study while others are reciting. In some exercises all the pupils of a grade may recite together, as in penmanship, and some kinds of language and nature study in the lower grades, and in some forms of written and oral reviews in the upper grades. In some subjects, like arithmetic and grammar, at least three divisions of a class may with profit be made. In large buildings the divisions may be distributed in the rooms on the basis of those subjects in which the shorter interval is made; that is, two or three divisions in arithmetic, constituting one class or grade, may be placed together in one room.

7. Promotions from grade to grade should not depend upon examinations made by a person other than the class teacher. In general, the class teacher should

determine the promotion or nonpromotion of all pupils whose ability or non-ability to perform the work of the subsequent grade is unquestioned by her. The place of all other pupils should be determined by the principal or superintendent, by means of examinations and such other evidence of their ability and needs as is attainable.

8. Provisions should be made in the course of studies for reviews at such times and in such subjects as will permit rapidly advancing pupils to lose no part of the work outlined in the course.

9. Wherever it can be done, the help of one or more assistant teachers should be secured, whose special work will be to give assistance to backward pupils, or to pupils who are endeavoring to work up into a higher division or grade.

10. For the purpose of knowing the characteristics and needs of individual pupils, a teacher should be in charge of the same class of pupils for at least one year. In some cases, where pupils are promoted out of course from one room to another, the time of such pupils with one teacher might be less than a year.

11. Although the number of pupils to a teacher has not been a special object of inquiry in this investigation, it has been brought out incidentally that attention to the needs of individual pupils demands that in no case should there be more than forty pupils to a teacher; and that, where the ages and attainments of pupils are widely different, as in so-called ungraded schools, no teacher should have more than twenty-five pupils.

## CHAPTER VIII.

### THE DEVELOPMENT OF THE COMMON SCHOOL IN THE WESTERN STATES FROM 1830 TO 1865.

By Rev. A. D. MAYO.

---

#### OHIO.

The State of Ohio was the first Commonwealth in which the characteristic experiment of the new American republican civilization, the training of a population representing "all sorts and conditions of people" in the supreme art of living together in freedom and union, justice and equality of civil rights, as members of a democratic order of society and government, was tried under the conditions of national life. The widely differentiated immigrant populations that swarmed into the central region of the old Atlantic colonies were for many generations so kept apart by the semifeudal type of some of the original settlements and the obstinate antagonisms of class, creed, language, and manners as they existed two centuries ago in all, that the real union of their people came slowly, and even yet in some localities may be said to be incomplete. The new colonies of Kentucky and Tennessee, that were formed anterior to that of Ohio, were for many years reproductions of the more enterprising and energetic side of the States of Virginia and North Carolina, and until 1860 retained an almost exclusively "native American" population. But the new State of Ohio began its life at the opening of the century under the inspiring influence of a national life of the republican type. In the constitution and laws of the new State there was "no respect of persons," as by the original compact the existence of negro slavery was forever to be kept outside its borders.

During the half century from its settlement to 1840 a population of 1,500,000 had been reared or received on its 40,000 square miles of territory. Probably no State, ancient or modern, had ever received within so short a period 50,000 people of such energetic mold and in many ways so widely varied as the Territory of Ohio at its admission to the Union in 1803. These people had come in groups from every portion of the Union and every civilized nation. They settled oftentimes in places far apart, and each of these outposts in the new country became a practical training school of executive life. In every new county seat was found a cluster of families which the superior class of the Commonwealth is now proud to honor as its ancestors. Thus in Ohio it may be said that there never has been an especially wealthy or favored class. The majority of the original settlers were an enterprising and intensely practical body of people, seeking new homes in a new land, then farther from the great centers of civilization than any portion of Christendom is from its chief metropolitan cities to-day. It was under these favorable circumstances that this great experiment of the making of the final American people under national auspices was first to be tried, and the success of Ohio during the first half century of its existence became an object lesson for the making of the new republic beyond the Alleghenies.

But so difficult was this experiment at the best that, even with this "new deal" in human affairs, the process of assimilation and the achievement of a harmonious civic life was slow, halting, and often lapsing into reaction. It was not till the memorable crisis of 1860-1865, when the imperious call to stand up for the nation of which Ohio was almost the first-born and most lusty child, rallied her 2,000,000 people in an overwhelming majority to do battle for the Union, that the new Commonwealth was really awakened to a consciousness of her own power. It was then seen what a training school of executive ability of the American republican order this isolated, intense, and perplexing life of the past half century had been. From that day Ohio has stood before the world as the most remarkable object lesson of the development of a democratic State within the memory of two generations in modern history.

But in no direction were the especial disadvantages of this great training school of civics more evident than in the original attempts of the people of Ohio at the literary schooling of her children and youth during the first half century of her existence, from 1790 till 1840. Although favored with the most bountiful gifts of public-school lands ever bestowed on a new Commonwealth, the people of Ohio were in no favorable condition to use or even to appreciate their great opportunity. The result was that, even until 1838, when Samuel Lewis, Nathan Guilford, and Calvin Stowe appear as the first prominent leaders of the common-school movement, the educational life of the State was practically "a thing of shreds and patches." There was doubtless a larger amount of school-keeping and more good school-keeping in the State than the somewhat fastidious estimates of the leading educators of a later period, who have written its history, are willing to allow. Especially was this the case in the southeastern and northeastern portions of the State, largely settled from New England and New York, where the people brought along in their immigrant wagons the idea of the educational facilities at home. The log schoolhouse rose with the church and the home, and either by the little public schools or private arrangements the children were kept above "the barbarism of ignorance."

In other localities, peopled by immigrants from the States where the educational opportunities were largely utilized by the favored class, with great illiteracy among the masses, the work went on more slowly. Yet even there the good seed was widely sown. The successive attempts in 1821, 1828, 1829, and 1831 to build up a common school on the foundations of "hay, straw, and stubble" that were then on the ground emphatically had at last awakened the attention of the people and prepared the State for better things. The partial interest of the more prosperous class in every community and the insatiable greed of private land ownership, which had almost wrecked the splendid school-land fund, had greatly retarded the progress.

So, when Samuel Lewis, after years of agitation, was installed as first State superintendent of public schools in 1837, he found himself in the position of a lonely observer on a mountain summit overlooking an almost unknown country. What might be called, by a figure of speech, the common-school system of Ohio was a medley of isolated school districts, working in an almost absolute and jealous independence of each other through an annual school term of a few months, with no real examination of teachers, no effective supervision, no official knowledge of what they were about. Only the one considerable city of the State, Cincinnati, was attempting a proper graded scheme of public education. The school laws of the Commonwealth were a legal jungle; the general situation almost impossible of comprehension; and everywhere groups of influential and well-to-do people were resisting the step already taken as a dangerous experiment not to be tolerated.

With all his optimism and enthusiasm, Mr. Lewis, at the first glance at his work, felt a sinking of the heart and "consulted with the executive on the propriety of

assuming the office." That he did accept and toil like a hero through four tremendous years, until the labor wrecked his health and left him a restless invalid during the remainder of his life, is one of the reasons why the Buckeye State thenceforth in its educational affairs "thanked God and took courage."

Superintendent Lewis was at once confronted by the enormous difficulty of obtaining any satisfactory view of the real state of educational affairs. The county authorities, whose duty it was to make returns of the schools to the State government, persisted with the magnificent official "independence" characteristic of the new American civilization in an obstinate neglect of the matter, or in such a perfunctory or ignorant performance as left their reports of no real value. Even the charge for the postage of circulars to stir up this class of easy-going officials, for which there was no authority in the law and which would swamp the new superintendent financially, made the prospect almost hopeless. He therefore, in the true spirit of the missionary, mounted his horse and, in this laborious way, traversed the State, seeing with his own eyes what sort of schools the people were supporting; talking with everybody; lecturing in his own earnest and familiar way; collecting the facts by which to shape the policy of the future.

He found what accounted for the late movement in behalf of education—that everywhere the teachers were his advocates. He reports that "the education of the masses is a marked feature in all discussions and reports. Nothing will rally the people more readily than the discussion of subjects connected with education." "The city of Cincinnati seems to be almost the only place where common-school instruction proper is furnished and where the means of public instruction are free to all, rich and poor, on equal terms." The new capital city of Columbus was just beginning to build up what has since become its splendid system of public instruction; "but even there the provision is not half enough, and the schools have from fifty to eighty children to the teacher." The superintendent inclined to the belief that the common schools were better in the country than in the villages and cities, as in the rural districts the humble allowance of public funds, supplemented by a rate bill and personal gifts, was comparatively a better outfit than in the cities, where the wealthy and well-to-do families patronized the private seminaries and left the common school to become a "common affair," satisfactory to nobody.

Without following the superintendent in his elaborate statement of the defects of the common school and his eloquent presentation of its absolute needs, we learn that out of the confused and conflicting materials on his official table he pictures this résumé of the situation: From the 62 counties and 1,129 townships of the State, 7,033 districts had, after a fashion, reported. There were 492,837 children and youths of school age, 4 to 21, in the State, of whom 227,805 had been enrolled in the common schools during the year. Of the 146,440 reported, 84,296 had been in school less and 62,144 more than four months. There were 4,336 public and 2,175 private schools, 6,511 in all, taught by 7,962 teachers, of whom 4,757 were men. The entire cost of the schools, from all sources, was \$438,937 for public and \$148,000 for private schools. There were 4,378 schoolhouses. The school fund, built up from three partial and one general school land fund—the Virginia military fund, United States military fund, and Connecticut western reserve school fund—and the proceeds of saline properties, was \$1,153,239, with an income of \$68,716. The prospect of future sales of school lands warranted the prophecy of a school fund of \$2,423,230 and a permanent income of \$88,736. The State school tax of  $1\frac{1}{2}$  mills on a dollar, with the probable increase of taxable property and the addition of the income of the portion of the United States surplus revenue dedicated to education, and other sums, swelled the full amount to \$436,937, less than a dollar to each of the entire school population, and little short of \$2 per capita for the number enrolled in the schools.

One of the most aggravating duties of Superintendent Lewis was the examination of the condition of the school lands of the State. There is no more melancholy,

and certainly no more confusing, chapter in American history than the record of the amazing waste of this great national gift to the people of Ohio, as related in the reports of Superintendent Lewis and condensed in the statement of President Eli F. Tappan, of Kenyon College, in his contribution to the valuable centennial volume of 1875, entitled "Education in Ohio."

We shall not burden these pages with a republication of this record. The history of the management of the school-land funds of Ohio has been probably the most remarkable contribution made, even by this great executive State, to the illustration of the science of "how not to do it" in public affairs. The "long and short of it" seems to be that there were, even as late as 1875, "823 distinct funds in the State of Ohio held in trust for the use of the common schools." Three were large: The Connecticut western reserve, the Virginia military reserve, and the United States surplus revenue funds. The rest were for early township and special township funds in about three-fifths of the State. Those within the sixteenth section in 1875 amounted to \$3,534,826. It is unnecessary to repeat the story of the scandalous plundering by which the large university fund of the State was practically wrecked; so that until twenty-five years ago there had been no serious and persistent attempt to establish a State university of the type found in all the remaining Western States, and none to found even one State normal school to the present day.

It is impossible to estimate the amount lost by what would seem to be, at the best, the most careless handling of a precious trust. One of the causes of this was the fact that the mass of people who through the first generation flowed into Ohio were poor and depended greatly on the low price of public lands for a start in life. Without the education acquired by the administration of the present homestead laws, they were chiefly interested at first in getting the lands at a nominal rate and in sending members to the legislature who would resist every attempt to wrest the children's patrimony from the hands of their hard-working and anxious parents. As it was, the labors of Superintendent Lewis are said to have saved to the State hundreds of thousands of dollars by the attention awakened to the subject even as late as 1838.

After the three reports of such a mentor as Samuel Lewis in the chair of State school superintendency, the people of Ohio evidently desired a "vacation," and on his retirement, in 1840, repealed the act establishing a State superintendency and assigned the duties of the office to the secretary of state. His efforts had saved the important school law of 1838, by which "a State school fund of \$200,000 was established, a county tax of 2 mills on the dollar had been imposed, local taxes for building schoolhouses were levied, and reports from teachers and school authorities required." The statistics accompanying his last report showed that a firm hand had been at the helm and the people were responding to the call of a true leader. In 1839, 13,049 common schools were taught by 12,860 teachers, with an attendance of 453,427 scholars, an average of four months' schooling in each district, 35 pupils in a school, and an entire expenditure of nearly \$1,000,000. The retiring superintendent declares that the coming year will show "an excess of educational work of one-third above the amount now effected." To this must be added the cost of private schools, of which there were a great number in every part of the State.

In 1838 it was reported that the city of Cincinnati was the educational center of the Valley of the Mississippi, and that several of the smaller cities were doing good work in popular education. Of colleges, we hear of Kenyon (Episcopal) at Gambier; the Miami and Ohio State Universities, at Oxford and Athens, established from the remains of the State University fund; the Medical College of Cincinnati and the Woodward College, now the Woodward High School, of that city, with a number of denominational schools and academies; the Western Literary Institution and College of Professional Teachers, a sort of premonition of

the present Chatauqua Circle, which included the superior teachers of the Ohio and Mississippi valleys, and the Mechanics' Institute of Cincinnati. There was also a school in Cincinnati established to teach the English language to immigrants from the non-English-speaking countries of Europe, of which Hon. Belamy Storer was president. Between 1836 and 1840 the public schools of Cincinnati, established in 1828, had been brought into what was then regarded the graded system of instruction, under the first special school act passed in the State, and by 1847 a proper high-school clause was added to the statute. Cleveland followed in 1837-1840. Within fifteen years Dayton, Columbus, and several other cities had begun the organization of a graded system, Columbus being the first to appoint a city superintendent of schools, in the person of Dr. Asa D. Lord, in 1847. In 1847 what was called the "Akron school law" was passed—a special act for a more complete method of grading the public schools of that new and enterprising city. In 1848 this special act was made general for the schools in cities and towns. In 1849 the same law was extended to incorporated townships. Some 70 cities and towns organized their schools on the graded plan during the few years following the enactment of the general law of 1849. The new habit of appointing superintendents of graded schools became common. In this way the common schools of the cities and larger villages had improved. In 1840 the remark of Hon. James H. Perkins in regard to the style and quality of many of these schools seems to have "hit the nail on the head"—"teach the pupils to use their eyes as well as their ears."

The five years succeeding the retirement of Superintendent Lewis, 1840-1845, are by common consent regarded a period of reaction in the common-school affairs of the State. This was certainly not due to the able men who occupied the governor's chair, all of whom—Wilson Shannon, Thomas Corwin, and Mordecai Bartley—in their successive messages repeatedly urged the claims of popular education upon a careless or hostile legislature. Without exception they advised a reestablishment of the office of State superintendent and a normal school for teachers. Secretary of State William Trevitt in 1841 presented a forcible report indorsing the ideas of Lewis, and especially urging the better training of teachers, quoting liberally from Horace Mann, Henry Barnard, Dr. William E. Channing, and other Eastern authorities. But under the three years' administration of Secretary of State J. Sloane, 1842-1844, the legislature received only a muddle of imperfect statistics, with a few pages of educational platitudes. Meanwhile the common schools steadily declined in public estimation, and the enthusiasm regarding them seems to have been confined chiefly to the teachers' associations.

Perhaps the most notable element in the administration of education during this period was the passage of the law authorizing common schools to be taught in foreign languages for the instruction of the children of the large body of European people then coming to the State. The State of Ohio seems to have persisted in yielding to this demand, especially for the teaching of the German language in common schools, beyond the habit of other Western States and cities containing a larger population of these people. This policy, possibly for a time at its inception a convenience, has not proved a success, either from an educational or civic point of view, and in several of the larger cities of Ohio has become at different times a cause of discord and of the formation of parties on lines of nationality, the most dangerous form of "offensive partisanship" that can threaten an American republican State. Meanwhile, one legislature abridged the State appropriation for schools and another withdrew a large portion of the United States surplus revenue fund from the children's use. The State evidently felt the need of a strong hand at the educational helm.

That strong hand appeared in the election of Hon. Samuel Galloway to the post of secretary of state and superintendent of public instruction in the year 1844. His first report, January, 1845, was a fierce searchlight flashed down into the

confused realm that the common school was fast becoming under the studied neglect of its advocates. Although the public officials connected with the school laws exceeded the number charged with the administration of any other interest of the Commonwealth, no important business, public or private, in the State seems to have been handled in a manner so shiftless and disheartening as its chief concern, the education of the children.

The new superintendent printed "a partial exhibit drawn from the imperfect returns of the past five years," by which the number of schools in a large district of the State was seen to have decreased 1,000, the teachers 500; the scholars from 150,402 to 48,870, and the cost of building schoolhouses from \$62,000 to \$17,000. Superintendent Galloway writes:

Not one-half of the statistics ascertainable by appropriate diligence in the discharge of duty have been reported. There are in the State 7,000 districts, 13,000 teachers, and 460,000 scholars connected with more than 13,000 common schools, and yet these and many other important facts can only be reached by calculations upon the very imperfect data furnished. Only 45 counties, less than two-thirds the whole number, have been reported during the year. Not more than this proportion was reported for the last four years; and all the returns, with three or four exceptions, for the period have been incomplete and unsatisfactory.

He compares this gross negligence unfavorably with the spirit of other States now in the full tide of reform under the impetus of the great educational revival of the period:

No other interest of the State has been so shamefully neglected; and any other treated with the same chilling indifference would have perished. \* \* \* The system as conducted to many would appear as a mere experiment to ascertain whether it be possible to educate the youth of Ohio without the agency of superior intellectual power breathing its inspiration over every important process for the accomplishment without the application of moral force and without the creation of adequate and even acting motives. The principal obstacles are the inefficiency of township and district superintendents, the incompetency of teachers, and the absence of active sympathy and interest on the part of parents and patrons.

The chief of these is the incompetency of teachers. "The schoolmaster has borne the disgrace of unrequited toil, and the life one of reproach rather than distinction." The superintendent doubts the efficacy or expediency of normal schools, but urges the establishment of county superintendency in place of the perfunctory and heartless service of the average county auditor, who was then the only public official that occupied that important place. He declares the act by which the State superintendency of schools was abolished in 1840 "a disastrous movement to the cause of common schools." He enlarges on the importance of district school libraries. He says, "We have now reached a crisis in popular education fraught with untold consequences."

The census of 1840 showed that there were in the State of Ohio more than 35,000 adults and more than 100,000 children between the ages of 4 and 20 unable to read and write. In 1846 Superintendent Galloway returns to the charge, more indignant in spirit and scornful in rhetoric, illustrating the saying of Emerson, "Exaggeration is the soul of eloquence;" yet pointing by its very intensity of eloquent exaggeration to a deeply seated disease of the body politic. "This vital interest (in popular education) is conspicuous by the loneliness of its destitution. It has been exiled from an honorable companionship in the family of State interests, and has been thrown out like a poor, despised foundling, half child and half fool, to beg for protection." He finds a hopeful sign in the willingness of the educational public to follow a new and inspiring leadership, and in the growth of city systems of graded schools, as in Cincinnati, Cleveland, and other important educational centers; in the springing up of teachers' associations and institutions, and more enthusiasm manifested by the county officials. He censures the legislative enactment that, in 1839, authorized the county authorities to reduce the tax for schools at their discretion.

He finds a reason for the loss of interest in public education by reference to the fact that "the State funds are lavished, with a ruinous prodigality, upon measures of doubtful expediency, and many of our counties are vying with each other in a competition of skill and success in fleecing the people for all kinds of improvement except intellectual and moral." It has been often observed in our country that a period of great financial inflation and popular absorption in material "public improvements" is not especially favorable to educational progress, while the years that are financially the most disastrous crowd the schools and colleges with children and youth who are no longer at work for money-making or family support. He again urges the appointment of county superintendents, and supplements all his recommendations by reference to a series of similar agencies in the more eastern States of the Republic. There were now 50,000 adult citizens and 150,000 children of school age in Ohio entirely illiterate.

The brave superintendent waxes even more indignant as the years go on. He opens his report of 1847 by the contemptuous sentences:

If Ohio occupied the commanding position in educational interests which her resources and rank justify and demand, it would be more pleasant to prepare and contemplate the true report of her condition. The education of our youth has, however, been so shamefully neglected that no one can consider it a pleasant task to abase his own pride or the honor of his own State by painting a truthful picture—one so disreputable to the highest glory of an enlightened people.

Despite the renewed attempts to galvanize the slumbering officials of the schools, "their sluggishness has increased."

The trouble is apathy unmixed with enmity, and from that fact the superintendent draws the inference that "the tone of public sentiment in regard to the necessity and utility of a system of general education is healthful and patriotic." The growth of teachers' associations and institutes and of the graded schools in the larger places are items of encouragement. He welcomes the advent of Hon. Henry Barnard, of Connecticut, who has promised to come to the State to labor in the good cause.

The superintendent estimates that by a wise administration the school-land fund of the State would amount to \$8,000,000 or \$10,000,000. Much of the land was leased between 1810 and 1820, at a very low figure, for ninety-nine years, with privilege of a renewal, though subject to revaluation every twenty or thirty years, with an increment of interest. But by the law of 1827, which the superintendent denounces as "plunder," tenants, under a loose arrangement, were permitted to surrender their leases and, on the payment of the amount of the original appraisal, obtain deeds in fee simple. In many cases lands worth \$40 and \$50 per acre were sold for \$4 and \$6, and many townships in this way suffered a great loss. The chronic maladies of unsuitable schoolhouses, irregular attendance, the manipulations of school districts, and frequent change of teachers are emphasized by the characteristic eloquence and satire of the superintendent. His picture of the inefficiency of teachers in entire counties of the State reads like a caricature of school-keeping. Like so many of the eminent educators of Ohio, he distrusts and disparages the experiment of Eastern normal schools and relies on county supervision, teachers' institutes, and general enthusiasm for lifting the profession up to a commendable rank. But as institutes had been established in but 10 counties of the State and less than 1,000 of the 12,000 teachers had been instructed therein, it would hardly seem a brilliant prospect to look to this agency for the immediate general uplift so imperiously demanded.

It is unnecessary to follow this earnest and eloquent advocate of better things in the common schools of Ohio, Superintendent Galloway, through his three remaining reports for 1848, 1849, and 1850. In all these he introduces more largely the testimony of the leading educators of the State in behalf of his own recommendations. In the report for 1849 he appears to have been converted to the idea of a

State normal school, and presents it as a measure on which all the friends of education can unite.

In 1848 the persistent neglect of teachers and school officials in the making of returns at last brought the legislature to the point of passing a stringent act on this subject, which, if enforced, would have at once brought to the statehouse a full report of what was being done in the schoolhouses of the Commonwealth.

In 1851 Supt. Henry R. King informs the legislature that "reports have been received from all the counties except eight, more or less complete." Yet the situation in the whole State was very far from being satisfactory.

Meanwhile the progressive element among the teachers and friends of education had not been inactive. The teachers formed a State association at Akron in 1847, with Superintendent Galloway as president. A group of able and devoted schoolmen appeared, especially from northern Ohio, whose success in institutes, public lectures, and that lobbying "for righteousness sake," which is responsible for the majority of good legislation, was steadily telling in an improved public spirit. Messrs. A. D. Lord, Lorin Andrews, M. F. Cowdry, H. H. Barney, and others were rapidly gaining the ear of thoughtful people. The agitation for normal schools was more intense and widespread. A private seminary of this sort was established in Richland, Lake County, by Messrs. Nelson Slater and A. D. Lord and sent forth a group of young men who afterwards did good educational service in the State.

In 1846 Prof. A. D. Lord published, at Richland, the first number of the Ohio School Journal, which, removed to Columbus, for many years remained one of the best journals of education in the country. Several additional periodical publications appeared. A permissive act was passed in 1847 by which counties might create the office of superintendent of education by vote of the electors of the various school districts. This act, at first applying to a number of counties, was extended to the entire State. But so obstinate was the public sentiment against even this mild form of "concentration" that only one county availed itself of the opportunity.

The most important addition to the school law was the act of 1847, "for the support and regulation of common schools in the town of Akron." It authorized the special organization of a thorough graded-school system, with a school board of 6 directors, 2 elected annually, to serve for three years. This body was required to establish within the school district of Akron six or more primary schools and a central grammar school. The town council was required to respond to the estimate of this body of school managers for buildings and the support of the schools by a levy of 4 mills on a dollar of the entire public valuation. By subsequent legislation, in 1848, 1849, and 1850, this provision was extended to the entire State, authorizing any township by a vote of the electors to impose a tax not to exceed 4 mills on a dollar, and a rate bill permitted to fill out a deficit, the schools to continue thirty-six to forty-four weeks in a year. Under this act the larger towns and cities, and even township districts generally, rallied for the establishment of graded schools and appointed superintendents. One clause of this act authorized the appointment of a board of school examiners, who were also inspectors and visitors of the schools.

It may be that this early facility of securing the advantages of superior education in the cities, villages, and the more progressive townships of Ohio distracted the attention of the educators from the open country and somewhat accounts for the fact that the rural portion of the State has always educationally lagged behind; even the State of Indiana, that came later into the work of popular education, being further advanced in the vigorous administration in country schools than its older and more wealthy, populous, and powerful neighbor, Ohio. A measure passed for the separate education of colored youth at the expense of the colored taxpayer alone in 1848-49 was afterwards amended to admit the colored contingent,

still in separate schools, to all the opportunities of education. In 1855 there were 88 schools of colored youth in the State. A law was also passed for the encouragement of teachers' institutes, with a moderate fund for their support. In 1854 the State commissioners codified the numerous laws respecting fees to be appropriated to the school fund, which, with personal property escheating to the State and the income of 25,750 acres of swamp lands, made a not inconsiderable addition to the growing common-school fund of the Commonwealth.

In 1850 a constitutional convention was held at Columbus and Cincinnati, in which the whole subject of education was considered. An attempt to investigate the history of the school fund derived from the portion of the national surplus revenue distributed to Ohio was dropped. The standing committee on education reported an educational clause of the new constitution, providing for the election by the people of a State superintendent and necessary assistants; also "the prosecution of moral, intellectual, scientific, and agricultural improvements;" the preservation of the State school fund; a permission by taxation and other means, in addition to the income of the State fund, for a thorough and efficient system of public schools for all children in the State, and providing that "no religious sect or party shall have exclusive right to or control of any part of the common-school fund of the State." This broad and thorough provision failed to commend itself to the convention, which contented itself with enacting as Article VI the following:

SECTION 1. The principal of all funds arising from the sale or other disposition of lands or other property granted or intrusted to this State for educational or religious purposes shall forever be preserved inviolate and undiminished; and the income arising therefrom shall be faithfully applied to the specific objects of the original grants and appropriations.

SEC. 2. The general assembly shall make such provisions by taxation or otherwise as, with the income arising from the school trust fund, will secure a thorough and effective system of common schools throughout the State, but no religious or other sect or sects shall ever have any exclusive right to or control of any part of the school funds of the State.

This is sufficiently indefinite to admit of abuses without number; but happily the good sense and growing educational spirit of the people of Ohio have hitherto saved the Commonwealth from the rule of the concentrated body that from the first has had control of the legislature of this powerful Commonwealth.

To what we can attribute this peculiar tendency at the statehouse is a question that has staggered more than one of the able and zealous Ohio educators who, elected as State superintendent of schools, has found the contact with the lawmaking body a constant temptation to educational paralysis. Perhaps it is to be attributed largely to the slow and still imperfect fusion of the population hitherto referred to.

Another constant hindrance to the complete development of the common school in all its departments, especially in the normal school and the State university, is the violence of political party spirit among the foremost leaders of public life. The separation between the North and South, which increased with unabated energy from 1830 to 1860, was repeated by a corresponding difference between the northern and southern sections of Ohio, peopled from the old New England and Middle and the Southern States. This radical difference in political principle and policy ramified into a separation on all local questions of county, city, and township administration. No American State has probably suffered and does yet suffer more from this disturbing element of political partisanship in education than Ohio, now, after the memorable experiences of the civil-war period, lifted to rival New York in the periodical contest for political supremacy in the Union.

But despite these and similar hindrances to the progress of educational reform, the successor of Superintendent Galloway, Mr. Henry A. King, in his first report in 1851 was able to put on a more cheerful demeanor in dealing with these troubles

than his own successors. The long contest for obtaining more complete returns had only been partially successful. The opportunity for the establishment of district-school libraries had not been largely accepted. The permissive law for the election of city superintendents had only taken effect in the city of Ashtabula. An important addition to the acquirements of teachers in district schools appears in the addition to the course of study of grammar and geography, and it is a significant indication of the narrow qualifications of the teachers in many schools that the repeal of this requirement was often desired from the difficulty of obtaining teachers competent to deal with these difficult sciences.

A great step forward was, however, taken in 1850 by a law establishing a State board of education, to be composed of five members, holding office for one, two, three, four, and five years, one, to be styled superintendent of common schools, to reside at the capital and for a year perform the duties of the office; the district schools to report to the superintendent and the latter to the legislature; the signature of the district superintendent to be attached to all certificates of teachers in his district; a fee of a dollar for licensing teachers from a competent authority to teach in any county of the State, which fee would also entitle them to receive the State school journal, and attend teachers' institutes and normal classes free of charge; while the moneys thus collected would pay the expenses of the new board, which in no event was to become a charge upon the State treasury. This ill-digested scheme, which would rob the State superintendent of all practical power through the brevity of his term of office and throw the entire expense of State supervision on the teachers of the State, never received even the compliment of being put in execution by the appointment of a superintendent, and is only known as another article of dilapidated legislative furniture, lumbering the crowded attic of the common-school statutes of Ohio; a fair tribute to the skill of the legislature in the noble art of "how not to do it." The State appropriation in 1850 of \$297,000 was its contribution to the schooling of the children. This sum was declared painfully insufficient; as, with the addition of local taxation, it gave to the more favored counties but \$2.23, in many counties but 75 cents, and in several 45, 39, and 38 cents for each youth.

The second report of Superintendent King in 1851 is a long and able document, written with a full comprehension of the situation and in an admirable spirit, giving a new interest to the somewhat monotonous presentation of deficiencies so long established as to be numbered among the venerable relics of a departed generation. The superintendent deploras the fact that "in probably a majority of the counties the common schools are in a languishing condition. A most profound apathy and indifference on the subject of education generally prevails in many of the counties, and all the evils, so long tolerated, still prevail; and some of these counties are the most advanced in respect to population and of commercial as well as agricultural wealth." The defects of the returns are dwelt upon with illustrations that seem almost incredible. The attendance on the schools does not seem to have materially increased for several years, being 245,000, and the entire expenditure \$587,000.

The legislature had pursued its usual policy of "sewing new cloth on an old garment" by several additions to the school laws in 1850-51. The general school fund for annual distribution had reached \$300,000. Another step forward was an act for compelling city councils to lay a tax of not less than 1 mill on the dollar. This would raise a larger sum than the 2-mill tax of 1833, as the total valuation of the State in 1850 was \$452,000,000, and would give \$450,000 to the schools. If this rate of taxation could be maintained, the superintendent estimated that by 1853 the State would expend \$1,000,000 annually on the common schools. Union schools were required to report to the State authorities. The most encouraging phase of the school life of the year was the appointment by the State Teachers' Association, in September, of Mr. Lorin Andrews, one of the foremost educators

of the State, as a traveling agent for awakening a new life to the common schools. This was continued during three years, Mr. Lord succeeding Mr. Andrews. Here was again demonstrated the fact, so forcibly stated by Secretary Barnas Sears, of Massachusetts, that the mass of the people in any State never read the appeals of their own public officials on education, and are to be moved only by the power of a living voice inspired with its great theme. It would be interesting to know how many voters in the State of Ohio during the administration of State Supt. Samuel Galloway read or even heard of the earnest and powerful appeals that stir our blood at the distance of half a century, when read out of the dusty volumes of State reports in the capitol at Columbus or in the library of the United States Bureau of Education at Washington.

The superintendent gave an elaborate account of the school system as it then existed. He especially enforces the amazing fact that the 64,000 public-school officials in Ohio were let loose amid a labyrinth of legislation which it would "puzzle a Philadelphia lawyer" to read into shape. He recommends a speedy codification and revision of the school laws as of the first importance to the welfare of the school system.

The report of Mr. Lorin Andrews, the agent of the State Teachers' Association, as chairman of its executive board, accompanied this document, and was the most important paper that had been given to the educational public of Ohio since the retirement of Supt. Samuel Lewis fifteen years before. In this, the story of the devoted service of the superior teachers of the State who, despite the slow movement of the legislature, had pushed on the great work of a revival of the common school, is forcibly told. During the past year 200 practical educational addresses had been delivered to 60,000 people in all parts of the State. Seventy towns and cities had established free graded schools, more than 50 having been organized during the past three years. Thirty new towns had been visited during the past year. These graded schools were a great power for good, supplying to a certain degree the pressing call for competent teachers, and being centers of educational reform wherever established. During the year 41 institutes for teachers had been held, attended by more than 3,000 teachers. In these institutes resolutions had been passed demanding a permanent system of State supervision with a superintendent of education. A great deal was hoped from the coming session of the legislature, the first assembled under the new constitution of the State, and it was declared that "should the legislature fail to satisfy these just expectations, a strong public sentiment will be grievously outraged."

In 1853-54 Hon. Mr. Trevitt was elected secretary of state and superintendent of schools. His first communication announced that the important changes being made in the school laws of the State by the legislature in session rendered it impossible to make a detailed report. His second report, for 1854, was anticipated by the passage of the law establishing the office of State commissioner of education. As this official had not been elected, the common-school system was "set adrift for a period of ten months, with no special direction from the statehouse."

The school law of 1853 was passed after running the gauntlet of two sessions of the legislature, a test of public opinion represented by the leading press of the State, and a debate more protracted and searching than had ever been held in the legislature of Ohio on the subject of common schools. The result was reached on March 14, 1853. The new law contained 69 sections, two-thirds of which were a compilation of existing legislation.

The new portions were:

1. In lieu of the complicated system of city and local legislation, the law provided for a tax of 2 mills on the dollar upon the valuation of the entire taxable property of the State, to be "annually distributed to the several counties of the State in proportion to the enumeration of the scholars, and applied exclusively to the support for common schools." This supplied an annual fund of \$1,208,383.84.

An important feature of the act was the recognition of the principle that the property of the State should educate the children of the State, at least to the extent of a general tax. Of course, the more wealthy counties and cities opposed this as an injustice, and at different times the grossest frauds have been perpetrated in the taking of the school census. But a great American city is the depository of millions of dollars not owned by its inhabitants, placed there for safe-keeping and investment by the people of all sections, and it is no more than just that this property should be taxed for the benefit of all the children of the Commonwealth.

2. A provision that the township board of education should consist of the chairmen of all the boards elected by the school districts was a return to the discarded district system of the East, which has wrought so much mischief. But it suited well the taste of the heterogeneous people of a State like Ohio, so jealous of centralization that it has never given to its governor a power of veto on any act of the legislature. The neighboring State of Indiana has demonstrated its superior wisdom by its admirable system of country schools.

3. Adequate provision was made to establish schools for the German and colored people.

4. Every township board might appoint one of its numbers to a practical superintendency, with proper compensation.

5. A great advance was made in this law, which, for the first time, abolished the rate bill and made education free to all the children in the Commonwealth.

6. One-tenth of a mill on the entire valuation of the State was levied as an annual fund for providing school buildings and apparatus for all the common schools.

7. A separate department of education was established, to be presided over by a State commissioner of common schools. Elected for three years, he was to receive a salary of \$1,500; to spend ten days in each of the nine judicial districts of the State, and to perform all the duties usually vested in such a public functionary.

8. Boards of school examiners were appointed by the judge of probate, three in number, to serve for two years.

The inevitable reaction against a law so far in advance of previous legislation seems to have spent itself in the reduction, in 1854, of the 2-mill State tax to 1½ mills. But as the valuation of the State was constantly increasing, this provision secured to the schools a larger amount, \$1,208,283, than the \$1,118,089 from the 2-mill tax in 1853. The State levy for schools was also reduced one-fourth. A formidable demonstration in the legislature against the office of school commissioner, with other reactionary propositions, failed to materially impair the force of the new statute. The educational public of the State came to the rescue in an earnest defense of the new legislation, and in 1854 the school department was reorganized by the election of Hon. H. H. Barry, of Cincinnati, to the office of State commissioner of common schools.

It was a fortunate election that placed Mr. H. H. Barry, of Cincinnati, in the chair of State superintendency of common schools in the autumn of 1853. His administration of three years, extending to 1857, was signalized by a vigor and tact not always visible in this official. His position was one of great difficulty. Although the revised school law of 1853 doubtless represented the deliberate convictions of the thoughtful educational public of the State, yet there is no Commonwealth where the violent and persistent agitation of an active opposition party to all reforms in education and advanced political ideals and methods has been more obstinate than in Ohio. It was inevitable that the reactionary local, selfish, and sectarian elements which had so long retarded the progress of popular education in the State should be exasperated to a furious opposition against such measures as the establishment of schools absolutely free; a complete State and improved local method of supervision; the encouragement of free union, graded, and high

schools; a general State tax for all children, and the subsidizing of free-school district libraries. Much of the time and a large portion of the very able reports of the new superintendent were devoted to an elaborate history of common schools in Ohio and other States and the defense of such commonplace propositions as were implied in the new features of the school law.

But he well understood that the true policy of an educational reformer in public station is not to defend his own personality or his office, or to repel or parry the assaults of the opponents of free education. He therefore boldly struck out on new lines, and in pages of eloquent and unanswerable writing demonstrated the necessity and uses of normal schools, the township system of organization, and improved methods of organization, discipline, and instruction in all varieties of schools. And that all this might not fall on the dull ears of legislators, whom he describes as "the gentlemen who vote aye and no, read nothing, and think less," he went forth as the apostle of an educational revival. He visited 40 counties in one year, making 70 addresses and holding valuable counsel with great numbers of influential people. His salary of \$1,500 was depleted by the entire lack of provision for traveling expenses and clerk hire. But he took the position, "No man but a man of wealth and a bachelor can afford to hold this office." He was indebted to the learned and laborious officials of the State library for the only assistance he received.

In 1854, on assuming his office, he complained that the returns from the counties "only furnished the elements of calculation as to what the statistics probably (not what they actually) are." He accounts for the comparatively slow progress of popular education during the past fifty years by saying: "Our history, until recently, was that of a pioneer people, subduing dense forests and bending their utmost energies to establish communication between frontier settlements and the open markets of the world. The wilderness and the war of 1812 engrossed all regards and all resources, until a second generation appeared upon the stage of action." But in contemplating the steady progress from the salient periods of the forward movement—1821, 1825, 1836, 1837, 1838, 1845, 1853—he finds cause for congratulation and evidence of the growing and deep-seated determination of the people of the State to secure the best in education, as in all things else, for the new Commonwealth. The new departure in 1853 was indeed a great forward step, which needed a vigorous, tactful, and obstinate defense to hold. But it was held, and from that day no very important reaction has taken place, although it must be said that the school system of Ohio nearly half a century later, when the State has become celebrated for a superior military and political position in the reconstructed Union, is still deficient in essential features of supervision and a proper system of State normal schools.

The student of the educational history of Ohio from 1853 to 1896 can not fail to notice the inefficiency of the system of State superintendency for lack of a proper connecting link between the higher and lower class of school officials. The office of State commissioner of education has been held by a succession of men not inferior as educators and administrators of city and local systems of schools to any in the country. But at the summit of State educational authority the occupant of the office seems to become half paralyzed. He is then brought in contact with a legislature so largely under the influence of an elective local school system, and the sentiment is still so indifferent and often antagonistic, that no general scheme of educational reform seems of possible adoption. The maxim of Washington, "Influence is not government," has been fully illustrated in the educational history of Ohio.

This gain—and, as far as concerns the large number of village and city systems, there had been a marvelous gain—was greatly due to the influence of the able and devoted educators of both sexes and the common-school public of the special locali-

ties. But while again and again it has been declared that this or that community was a model of good school-keeping, the lack of an adequate power to direct and lead the cause of popular education has left the legislature at the mercy of powerful private combinations, the "shrieks of locality," the jealousies and schemes of sects, classes, and individuals, and all the heterogeneous elements of a State so great and powerful. In 1851-1857, during the administration of Superintendent Barry, all these tendencies were exaggerated well-nigh to fury by the steady rise of the war cloud over the land and the determined effort to make the Northwest, especially the States bordering on the Ohio River, a barrier to the success of the Union cause in the coming disruption.

One of the features of the new school law fiercely debated was the provision for the distribution of the avails of the State tax for education on the basis of the school population. By this, 28 counties raised more than came back to them on the final distribution—Cincinnati (Hamilton County), \$72,000, and other counties ranging downward from this large sum to \$12,000, \$9,000, \$7,000, \$6,000, \$4,000, \$3,000, \$1,000, \$500. The commissioner availed himself of this complaint to set forth the fundamental idea of the common school, that the property of a State shall educate the children of a State. He quoted liberally from other States, especially from New York, which sent forth \$200,000 in excess of its own portion of the State taxation for the upbuilding of education in the poorer counties. In Ohio 60 of the counties received the excess of the remaining 28, to the extent of more than \$150,000. Although this method of distribution is a temptation to an overestimate of the school population of a city, of which there have been occasional instances, yet it is so manifestly just that it still prevails. The Massachusetts system, by which \$10,000,000 are annually raised by local taxation in the towns and cities of the State, until recently without a State tax, is now in a fair way of being remodeled by a large increase of the State fund and a moderate, though steadily increasing, sum raised by general taxation.

The commissioner refers again to the establishment of township boards of education with power to control the affairs of an entire district. The township board, composed of delegates from the school district boards, was no competent arrangement for the central function of administration. It virtually placed the motive power of the system of common schools in the hands of 1,500 local boards of education, each "ganging its own gait" according to its more or less enlightened idea of what it was elected to do.

The arrangement for district school libraries had practically "gone to the bad" on the reef of extreme school district control. Instead of founding a town library accessible to all, under proper control, the books were doled out in small packages among the little separate school districts. In some places they were not used at all; in others they were divided among the families with no fixed plan of distribution. The result was set forth fully a few years later by Acting State Supt. Emerson W. Keyes, of New York, and its practical effect was to destroy this beneficent provision for the children of the people. The neighboring State of Indiana was already profiting by this and other mistakes of its older sisters in not only taking good care of its common-school funds, but establishing a city and township supervision, which has proved an efficient cause of the great success of the country district school in the State in later years.

The teachers of the State, acting through the State association, nobly supported the progressive policy of the commissioner. Their agency, maintained for four years as a substitute for State supervision, was suspended in 1855. There were 18 institutes for teachers, receiving merely a small fund from the State. One hundred towns and cities had established the graded school system.

In 1855 a proposition to establish a private normal school by Mr. Cyrus McNeely, of Harmer County, coupled with a donation of \$11,000 worth of buildings, was accepted by the State Teachers' Association, assembled at Cleveland, with a pledge

of \$10,000 toward its support. But the experiment failed in this shape, and, after a hopeless attempt to obtain a subsidy from the legislature, the institution returned to its original foundation and as a private seminary continued for many years to do good service of its kind, some 5,000 pupils having passed through its halls during the subsequent twenty-five years. In 1855 a similar experiment in southwestern Ohio, under the leadership of Mr. A. J. Rickoff, John Hancock, and other eminent educators, for opening an institution at Oxford resulted in placing what became, after an unsuccessful attempt at management by a corporation, the private "National Normal School," at Lebanon, Ohio. Under the enterprising and devoted superintendence of the Holbrook family, this seminary won a national reputation among the permanent institutions of the Northwest. Another experiment was the "Western Reserve Normal School," in Erie County, which in 1858 was reorganized from an academy established in 1831-32. A number of successors, more or less important, have followed these experiments at private normal school keeping in Ohio, especially after the close of the civil war. The city normal or training school, especially for elementary women teachers, according to the plan developed at the Oswego, N. Y., State Normal School, came to Ohio at a later date, and, with the establishment of a department of pedagogy in the Ohio University, at Athens, still represents all the public organization outside the Teachers' Institute which this great State has yet afforded to the training of teachers. It should be said that this policy of the legislature of relying chiefly on private enterprise for this great public duty has been in opposition to the almost unanimous opinion of the Ohio school men and educators of national reputation from the days of Samuel Lewis to the present hour.

In 1857 Mr. Anson Smyth was elected as successor to Mr. Barry to the office of State commissioner of common schools. Mr. Smyth had formerly served as superintendent of common schools at Toledo, Ohio, and as editor of the Ohio State Journal of Education for several years. His administration was distinguished by a devoted and intelligent application to the educational needs of the Commonwealth rarely found in his position. Notwithstanding the meager salary of the office, \$1,500 per annum, with no provision for clerk hire or traveling expenses, and with a large amount of work beyond the sphere of his official obligation, the commissioner could say at the close of his stewardship in 1860:

I have spent four hundred days in visitations through the State; have traveled 20,000 miles in the discharge of these duties; have addressed not far from 400 educational meetings, large and small; have visited every one of our 88 counties, many of them more than once, and have formed the personal acquaintance of a large proportion of the active friends of education through the State. I think it highly probable that I have seen more of Ohio and addressed a greater number of its people than any other one of its citizens.

Certainly these great labors were supplemented by a corresponding fidelity of the commissioner in his office. No series of Ohio State reports up to that date will bear comparison with the elaborate documents put forth by Commissioner Smyth. It only needed that they should be read, or, as he constantly reminded the people, that an effective group of agents of the educational department should be kept in motion through the State to enforce the important truths so intelligently and eloquently presented, to insure a more rapid development, especially of the normal-school system. But thus far the results of the common-school revival originated by Lewis and his contemporaries a quarter of a century before had been chiefly realized in the building up of a system of graded and union schools in a large number of the considerable villages and cities, while the obstinate jealousies and local ambitions of the countryside still held back the rural districts from the enjoyment of the good time already come.

In his first report Commissioner Smyth calls attention to one of the most serious defects of the Ohio school system—the utter absence in the legislation of the

State of anything approaching either a compulsory educative or a juvenile vagrant law. In 1857 the whole number of persons of school age in Ohio was 838,000; the number enrolled, 603,000, and the average daily attendance (the real test of the merits of a school system) 351,000. After all suitable allowance, the commissioner asserts that 300,000 children and youth who ought to be educated are not in attendance at any school. The diplomatic way in which he refers to the school laws of Massachusetts in both these respects suggests the popular pride in that glorious independence which is not only the "hiding place of power," but also a flowing well of weakness and disorder, especially in so many of our new American communities.

The careless and improvident way in which the provisions for district school libraries had been administered had persuaded the legislature to suspend and had furnished the commissioner an excuse for the abolition of the system. It was not abolished, but in many parts of the State it remained virtually a dead letter. Still, a ruling of Commissioner Barry that a city might concentrate its district libraries laid the foundation, not only in Cincinnati, but in several of the larger towns and cities of the public libraries, which have been a great educational feature of the municipal life of Ohio.

In 1858 the commissioner bears a deserved public testimony to the services of the State Teachers' Association during the period of reformed school-keeping upon which the Commonwealth had entered in 1853. Organized in 1847, its meetings concentrated the best judgment of the superior teaching class and were really the soul of the executive force at work in behalf of the common schools. Through the support of the teachers' institutes, and especially the labors of Agents Andrews and Lord, sent through the State, it had become a mine of information and a perpetual goad of progress to the legislature. All this work had been done with no aid from the legislature and at the expense of a large amount of money to the teachers, who were then, as now, the most poorly paid professional class in the country.

The commissioner constantly kept before the people the need of a better school supervision for the counties and larger districts of the State. An attempt to give to each of the county boards of school examiners a function as school visitor, with some of the duties usually belonging to such an official, failed, and the commissioner at Columbus was still compelled to "make a long arm of it" in reaching down to the township, practically to the school district boards, in 1,600 little communities.

In 1859 the supreme court of the State made a decision affecting the 14,000 colored children and youth of Ohio: that children five-eighths white and three-eighths colored were not permitted to attend the public schools established for white youth. It is only within the last four years that the common schools of Ohio have been open and free to all its children and youth.

In 1860 the commissioner calls attention to the increase of free high schools in the State. When the school law of 1853 was enacted there were but 20 in Ohio. There were 161 in 1860, with 319 teachers and 13,183 pupils. There were 20,000 public school teachers in the State in 1860, almost equally divided between men and women, of whom one-half held certificates of not more than six months' duration, while but a few held certificates of the highest grade, good for two years. Three thousand of the teachers had come from the Eastern States, chiefly from New England and New York, while a majority in the rural schools were of Ohio birth and education. The colleges of the State produced but few professional, though many temporary, teachers, and 2,000 of the 20,000 had been students in some department of a so-called college. Oberlin; Antioch, founded by Horace Mann; Hiram, where James A. Garfield was president; and Delaware are mentioned as especially noticeable in this respect. The local private normal schools furnished but 500 teachers per annum and the free high schools but 1,500. Hence the remaining 12,000 common school teachers of the State were prepared chiefly

in the district schools. In contrast to Massachusetts, New Jersey, Connecticut, New York, Pennsylvania, Rhode Island, Michigan, Illinois, Minnesota, and Wisconsin, "Ohio stands almost alone among our Northern States in doing nothing for the training of teachers." Some twenty teachers' and normal institutes had been held in the State during the past four years, which, to a very limited extent, had been subsidized by public funds.

Commissioner Smyth held the office two years longer, until 1860. At this period, the limit of our present record, it is interesting to note the condition of popular education in Ohio. The State was now receiving, from all sources, the annual income of \$3,694,527.83 for educational purposes. Of this there had been expended in 1860 \$753,852.94, there being a balance on hand from the preceding year. For all educational purposes there was expended in 1860 \$2,834,064.40. There were in the State 912,960 children and youth between 5 and 21, of whom 717,726 were enrolled in common schools, with an average daily attendance of 425,033. These were gathered in 1,672 school districts and 13,899 schools. The average length of the term was six months and six days, and of the high schools eight months and sixteen days. Twenty-one thousand three hundred and sixty teachers were employed, the men exceeding the women by nearly 1,000. The average wages of teachers were, in high schools, men \$61.12 and women \$34.08 per month; in common schools, \$27.81 and \$16.05. There were 10,570 schoolhouses in the State, valued at \$4,794,395. Two thousand of the male teachers enlisted in the Union Army in 1861, among whom a large number afterwards were distinguished in military and civic life.

With the drawback of that complete organization without which no American Commonwealth can be expected to do its best in popular education, the State of Ohio during the thirty years from 1830 to 1860, the period of the great revival of the American common school, had illustrated the power and persistence of an American people to survey and open the highway to the summit of republican society for every child through the open door of the common school. And of no body of educators in the Union can it be said with greater emphasis than of the leading school men and women of Ohio that on their heads should repose the wreath of honor for this great achievement. Few of the eminent public men of Ohio have at any time been conspicuous in their advocacy of the people's common school, although none, perhaps, found in open dissent. The Ohio legislature has always been among the most difficult in the Northern States to be moved in the interest of radical school reform. For what has been done the State and people have been chiefly indebted to this class of able, progressive, and persistent men and women teachers and lay friends, who, "through evil report and good report," have held up the banner of universal education. And to them will the future historian of this great Commonwealth refer as, beyond any other class, the authors of the important position now occupied by Ohio among the States of the Republic.

#### INDIANA.

In a volume prepared and published under the sanction of the State by Hon. James H. Smart, A. M., now president of the State Agricultural and Mechanical University, at Lafayette, Ind., to accompany the exhibit of that State at the international exposition in Philadelphia, 1876, we find the following statement:

It was not until after the adoption of the new constitution, in 1851, that any positive legislation was obtained for the establishment of common schools entirely free and under the exclusive management of the State. \* \* \* The new constitutional provision for the establishment of "a general and uniform system of common schools, wherein tuition shall be without charge and equally open to all," was accepted by a majority vote of more than 80,000. The statutory form and expression given to the new constitutional provision, entitled "An act to provide for a general and uniform system of common schools and school libraries," approved

June 14, 1852, was the first law which made it possible to build up a system of State schools worthy the name and the first step toward putting into execution the constitutional provision provided thirty-six years before.

The constitution of 1851, before mentioned, contains the following provisions relating to education:

The general assembly shall not pass local or special laws providing for supporting common schools and for the preservation of school funds. [Article IV, section 22.]

#### ARTICLE VII.—EDUCATION.

SECTION 1. Knowledge and learning generally diffused throughout a community being essential to the preservation of a free government, it shall be the duty of the general assembly to encourage by all suitable means moral, intellectual, scientific, and agricultural improvement, and to provide by law for a general and uniform system of schools wherein tuition shall be without charge and equally to all.

SEC. 2. The common-school fund shall consist of the Congressional township fund and the lands belonging thereto; the surplus revenue fund; the saline fund and the lands belonging thereto; the bank-tax fund, and the fund arising from the one hundred and fourteenth section of the State Bank of Indiana; the fund to be derived from the sale of county seminaries, and the money and property heretofore held for such seminaries; from the fines assessed for breaches of the penal laws of the State, and for all forfeitures which may accrue; all lands and other estates which shall escheat to the State for the want of heirs or kindred entitled to the inheritance; all lands that have been, or may hereafter be, granted to the State, where no special purpose is expressed in the grant, and the proceeds of the sales thereof, including the proceeds of the sales of the swamp lands granted to the State of Indiana by the act of Congress of 28th of September, 1850, after deducting the expense of selecting and draining the same; taxes on the property of corporations that may be assessed by the general assembly for common-school purposes.

SEC. 3. The principal of the common-school fund shall remain a perpetual fund, which may be increased, but shall never be diminished; and the income thereof shall be inviolably appropriated to the support of common schools, and to no other purpose whatever.

SEC. 4. The general assembly shall invest in some safe and profitable manner all such portions of the common-school fund as have not heretofore been intrusted to the several counties, and shall make provision by law for the distribution among the several counties of the interest thereof.

SEC. 5. If any county shall fail to demand its proportion of such interest for common-school purposes, the same shall be reinvested for the benefit of such county.

SEC. 6. The several counties shall be held liable for the preservation of so much of the said fund as may be intrusted to them and for the payment of the annual interest thereon.

SEC. 7. All trust funds held by the State shall remain inviolate and be faithfully and exclusively applied to the purposes for which the trust was created.

SEC. 8. The general assembly shall provide for the election by the voters of the State of a State superintendent of public instruction, who shall hold his office for two years and whose duties and compensation shall be prescribed by law.

#### ARTICLE X.—FINANCE.

SECTION 1. The general assembly shall provide by law for a uniform and equal rate of assessment and taxation, and shall prescribe such regulations as shall secure a just valuation for taxation of all property, both real and personal, excepting such only for municipal, educational, literary, scientific, religious, or charitable purposes as may be especially exempted by law.

At this time, 1852, the State of Indiana was 36 years old as a Commonwealth, having been settled in 1816. In area it is an empire of 33,809 square miles, with a population increasing from 5,641 in 1800 to 243,031 in 1830, 685,866 in 1840, and 988,416 in 1850. At the breaking out of the civil war, in 1861, the population was 1,350,428. Growing States, like young children, are sometimes affected with alarming signs of structural weakness. The rapid growth of this great Commonwealth of the West was shadowed by the illiteracy in which for a brief period it surpassed all States of the North, with only three in the South lower in the scale. In 1851,

at the adoption of the new constitution, there were more than 70,000 adult persons in Indiana unable to read. Four years later 76,600 above 10 years of age were illiterate to that degree and twice that number reported by the census as unable to write. The large contingent of population from the uneducated class of the South and the considerable number of ignorant foreign immigrants account for this condition of affairs and the slow educational movement of the State previous to 1850.

But when the wave of the great revival struck Indiana in 1851 it was with no uncertain shock. The new constitution and the school law of 1852 stand out in the early Western legislation on education as beyond question the most advanced and comprehensive of all the new States. The fundamental principles that the property of the State shall educate the children and that all common schools shall be free; the school levy of ten cents in every \$100; the consolidation and careful management by the State of all school funds; the declaration that each township shall be an educational unit and its trustees (the New England "selectmen") shall also have complete control of educational affairs, with power to build schoolhouses and grade the schools; the holding of the counties responsible for the preservation of the school fund and the use of the interest thereof; the establishment of a State board of education, consisting of a superintendent of public instruction elected by the people, the governor, secretary, treasurer, and auditor of the State; the establishment of a uniform series of schoolbooks; a workable system of township school libraries, under the direction of the State board of education and supported by a tax of one-fourth of 1 mill on each \$1 and a poll tax of twenty-five cents; the making of cities and important towns school corporations independent of the township of which they are a part, with full power to establish graded schools and levy taxes additional to the public funds; the right of any township to vote a local tax for all school purposes of fifty cents on each \$100 and fifty cents on each poll;—here was a new departure by a new State hitherto known as a laggard in the rear of the national educational procession that inspired the friends of the common school within and without its bounds with enthusiastic expectations.

It is possible that in this the constitution makers and the legislature struck a mark too high for the immediate success attempted. The movement that culminated in this action was to a larger extent than in some other States in charge of a body of very intelligent and progressive educators. Several of them were connected with the colleges established by Eastern missionary zeal and money. Especially do the historians mention Caleb Mills, a native of New Hampshire, a professor of Wabash College, afterwards superintendent of public instruction, as an influential advocate of the common school. For several years he had literally belabored the legislature and the people of the State with educational facts, appeals, and memorials. From the earliest period the State had been fortunate in the number of strong and liberal schoolmen connected with its colleges, seminaries, and denominational schools. As early as 1826 Francis Joseph Nicholas Neef, an associate of Pestalozzi, at Berne, Switzerland, came to New Harmony, Ind., and established a school founded on the philosophy and methods of his great master. One of his instructors was Robert Dale Owen, and the school had the powerful influence of William Maclane and Thomas Say, the distinguished naturalist. Among the pupils of Neef was the future Admiral Farragut. Neef published several treatises on "The New Education," then first known in this phase of its application in the country. The first three State superintendents of public instruction, Larrabee, Mills, and Riggs, were natives of Maine, New Hampshire, and New York. With such influences behind the movement it is not remarkable that the Indiana constitutional convention of 1851 and the legislature of 1852 gave to the whole country assurance of a brilliant educational career for the Hoosier State.

The reaction came. Not from the people, but through several decisions of the

courts impeaching the constitutionality of the provisions for township unity and the establishing of graded schools. For the ensuing ten years the educational public in Indiana was greatly involved in the contentions provoked by these adverse decisions. Several of the reports of the superintendents of public instruction during this period are almost entirely occupied with the arguments and explanations connected with these important fundamental principles of the revival movement. It was not until the close of the civil war, which, in more ways than one, had lifted Indiana to its present rank as one of the foremost of American Commonwealths, that all these obstacles were swept away by the rising educational spirit of the State. Then came the establishment of the teachers' institute, the State normal school, and the development of the two State universities, which built the highway by which the Commonwealth has mounted to its present exalted position.

One of the most important agencies here, as in Ohio, for the informing of the public mind, the lobby for righteousness in the legislature, and the constant improvement of the profession was the State Teachers' Association, organized at this juncture in 1854. It was preceded and flanked by associations in the different counties. Indeed, these associations were the pioneers of the teachers' institutes, which, after 1865, largely took their place. At the organization of the State Teachers' Association at Indianapolis, in 1854, 178 members appeared, representing 38 counties. Horace Mann, then president of Antioch College, Ohio; E. D. Mansfield, the veteran journalist of the West, and Dr. Robert Breckinridge, whose heroic fight for the children had saved the State school fund of Kentucky from its despoilers, attended and made inspiring addresses. The list of the presidents of this association for many subsequent years contains the names of the most celebrated educators of the State.

The school institute was first heard of in Indiana in 1843, and continued in 1849, 1850, 1851, and 1852, with an increasing attendance. It held on as an annual visitor under able management till 1865, and the movement for the establishment of the State normal school at Terre Haute was largely due to its influence. Until 1865 all the work was done at the expense of the teachers. Township institutes were also in vogue, and were regarded so important that in 1873 the State provided that one Saturday in each school month "should be devoted to township institutes and model schools for the improvement of teachers." State institutes, first under the direction of the State Teachers' Association, were established in 1865, and finally passed under the management of the State board of education.

The administration of the township library in Indiana was far more successful than in Ohio, because it was a township and not a district institution. In 1854 \$147,000 was expended in the distribution of 143,000 volumes. In 1853 100,000 additional volumes were purchased at an expense of \$110,000. It is doubtful if this movement in any State has ever realized the high expectations of its projectors. But one important result has been the impetus it undeniably gave to the establishment of the present town and city libraries that are now becoming a vital element in our educational life, both in furnishing good reading to the people and a guide for the new generation in its perilous journey through the literary wilderness of the coming years.

One of the earliest acts of the State association of teachers was to arrange for the publication of a journal of education. In 1854 it was undertaken, in charge of a group of educators. After the usual varied experience of such ventures in other States, the Indiana Journal of Education became the property of Prof. W. E. Bell, a pupil of Horace Mann, in Antioch College, and one of the successful teachers and institute workers of the State. Under his administration it has become one of the few educational journals of permanent value in the country and largely monopolizes the field of educational journalism in the State.

The Indiana University, established provisionally in 1804 at Vincennes and in

1820 in Monroe County, was opened in 1825. Rev. B. R. Hall, of Connecticut, was its first president, serving the Territory at a salary of \$150, afterwards raised to \$400 a year, with a professorship of mathematics and physical sciences at \$300. In 1828 it was declared a full college by the legislature, and Dr. Andrew Wylie presided over it till 1851. A crisis in its life was the destruction of the buildings by fire in 1854, and the crippling of its funds by a lawsuit against the Vincennes University. But these hindrances only confirmed the spirit of its advocates and made new friends in the State and nation. An additional grant of lands by Congress, and State aid, with the erection of new buildings at Bloomington in 1853, gave it the upward pace it has ever since held among the more successful State universities of the country. A dozen schools under the title of college or university were in operation in Indiana during the period now under consideration previous to 1860. The State agricultural and mechanical college, endowed by the Congressional land grant of 1862 and the munificence of John Purdue, was not established until ten years later. Several of these colleges and academies achieved a national reputation, and from their early establishment doubtless came much of the influence that finally lifted Indiana above her low estate of common-school instruction previous to the constitutional provision and the law of 1851-52.

The State was fortunate in the election, by popular vote, of two notable educators to the new office of the superintendent of public instruction, from 1852 to 1860. The first superintendent was William C. Larrabee, who held the office from 1852 to 1854 and by reelection from 1856 till 1859, near the period of his death. Mr. Larrabee was born and educated in the State of Maine, from 1803 to 1823, and after a successful career as a teacher in his native State, Connecticut, and New York, where, as principal of a Methodist seminary at Cazenovia, Oneida County, he educated 7 college presidents, 27 principals of seminaries, and 12 editors of religious periodicals, he came to Indiana in 1841, as professor of Asbury University, an author of books and contributor to various periodicals. In 1852, at the age of 50, he was elected first State superintendent of public instruction of Indiana.

His first two reports, 1853-54, were largely devoted to the explanation and defense of the new system of schools he was elected to supervise. As the local officials who were required to make returns to the statehouse did not then exist, he was debarred from any elaborate dealing with the unreliable piles of figures called school statistics in those days. He asserts, we know not by what authority, that Indiana already pays for the support of her asylums for the deaf, dumb, and blind "more than any State in this Union has done." He exults over the abolition of the rate bill, and declares this feature especially characteristic of the people of Indiana. It was certainly a forward step, as was the substitution of the township for the district system of rural school organization, that still held on with a death grip in all the Eastern States. He tells the story of a citizen of the State who sent his daughters to a female academy, away from home, and, after a year, feeling that they had been schooled out of sympathy with their old companions, established a free school with the money he was paying at the seminary, engaged a superior teacher, and had the satisfaction of educating the youth of the entire neighborhood into the art of living together. He closes an eloquent plea for union in the people's schoolhouse, with the fervent ejaculation, "Blessed be he who invented female teachers." He disposes at once of the popular expectation that he should be a traveling pedagogue, by showing that it would require sixteen years to spend one day in each school district, and three years to visit every township. But, according to his physical ability, he faced the ordeal and invoked the sympathy, aid, and comfort of all good Christian people in his great work.

One of his most valuable pages is devoted to an exhortation to all young aspirants for political distinction to enter the field as advocates of universal education, "as the cause is now certain to be popular as well as right in the years to come." He announces the fact that two of the colleges in the State have now a normal

department, and all are looking that way. The State school fund already consisted of, first, the Congressional township land endowment, \$1,608,000; second, the Congressional surplus revenue fund, \$553,000; third, the saline lands, salt springs given to the State by the General Government, \$61,270; fourth, the bank-tax fund, whereby 12½ cents on every share of stock held by individuals should be deducted from the dividends of the State Bank of Indiana, \$57,000. Accordingly, the State, in 1852, had a total educational fund of \$2,278,588, with an income, at 7 per cent, of \$159,501. This has been largely increased, until the State now has one of the largest school funds in the Union, exceeding that of any of the original thirteen States.

The number of children and youth in the State between 5 and 21 was estimated at 414,000, and this would give 35 cents per annum of the school moneys to each person of school age; \$21 a year to support a school of 60, and \$35 for 100 pupils. The new school law, providing for a tax of 10 cents on \$100, furnished about \$200,000, a total of \$344,000—83 cents to each child. Under the law \$400 would be allotted to each township, enough to support four good schools, taught by men at the ruling price, for ten months in the year. The superintendent estimates the possibilities of the State school fund at \$5,000,000. He explained the large illiteracy of the State on the plea of the immigration of large numbers of ignorant foreigners, and of the illiterate class of Southern people who had come especially to the southern portion of the State.

His description of the average country schoolhouse reminds us of a good deal in all the States, old and new, as revealed by the search light of the great revival from 1830 to 1830. The superintendent devotes a generous portion of his report to a description of the improved methods of instruction, the advance of school discipline of the more humane sort, and the need of an educational revival. Several of the larger towns of the State had already begun the work of establishing graded schools.

In 1854 it was announced that a pamphlet containing the new school law had been prepared for general circulation, with proper explanation. The superintendent administers a vigorous and illuminating exhortation to the township trustees (corresponding to the New England "selectmen"), who by the statute had the care of the public schools added to their other duties, a plan that was soon demonstrated to work badly, and asserts that Indiana has been "the first State to abolish the old district system." His exultation was a little premature, for by subsequent reactionary legislation there came a falling away from this provision. The general survey for the year was almost as encouraging as the year previous.

The State school report for 1855 was made by Caleb Mills, second superintendent of public instruction. Mr. Mills was a native of New Hampshire, a graduate of Dartmouth College, in 1828, and of Andover Theological Seminary. In 1833 he became president of the Preparatory School at Crawfordsville, Ind., that ripened into Wabash College, where he served as professor of Greek and Latin literature. For years, in this position, he had written largely and ably in support of public schools under the title of "An Address to the Legislature," and his labors were credited with being influential in the final result of a practical system of common-school education in 1852. In 1854 he was chosen superintendent of public instruction, and during his official term of two years and three months was thus employed, returning to his college professorship at the close of his public service.

During the first year of his administration a decision of the courts came "like a sirocco of selfishness," withering the hopes of the graded schools that had risen in several of the larger towns. But the superintendent finds hope in the organization of the State Teachers' Association. The statistics of the school life of the State were slowly coming to the front. There were 91 counties, 938 townships, and 95 corporate towns and localities in the State. The valuation of property in Indiana was \$290,418,148. There were 3,098 teachers and 455,000 persons of school

age. Notwithstanding the enthusiastic estimates of Superintendent Larrabee, the actual average school term was but two and one-half months. Superintendent Mills estimates that \$1,000,000 would be required to support a six-months free school in Indiana. He storms at the legislature in high rhetorical fashion for its neglect to furnish the means to work the admirable State school system of education, still only on paper. "Nothing has contributed to bring the system into disrepute so much as its inefficiency." He believes the people only need to be appealed to and given a chance to manifest their spirit by amending this unsatisfactory condition.

In the second report, 1857, Superintendent Mills renews the good fight with a zeal not easily dampened by the discouragements of the situation. He takes fresh hope from the experience of the past year. He insists on the necessity of a six-months school, even if not entirely free, and warns the people of the folly of placing the sacred interest of the children in the hands of indifferent and incompetent officials. He elaborates a system of township schools, practical and easy of management, provided the necessary amount of money could be had to move the present inert mass.

In a subsequent report the superintendent broaches the idea of a group of associate superintendents, corresponding to the agents of the board of education in several of the States, to traverse the Commonwealth and wake up and inform the people. He urges the establishment of several normal schools and teachers' institutes. He advocates a system of State supervision of all colleges and a board of regents, and in each a State professor of literature and civic studies. Before the revival of the common school there had been expended in private institutions \$183,000 in buildings and \$285,000 had been paid for the instruction of 7,920 students. There was an investment of \$325,000 in their present endowments; 25,000 pupils were now in these seminaries. From this body of students the State was receiving service as superior teachers in all varieties of schools. He also urges a speedy establishment of a school of reform.

In the two years of the service of Superintendent Mills the common-school interest had been substantially extended. The number of scholars had increased 35,000, the fund distributed to the counties \$54,000; 1,000 additional districts and schools had reported, and the average length of the school term had risen to nearly four months. Six hundred and fifty schoolhouses had been built in 1856, 1,241 in two years, at a cost of \$796,000. More money and better teachers were the crying needs of the schools. An important address to youth was bound up with this earnest and energetic report; also a catalogue of the books furnished to township libraries.

In 1858-59 Superintendent Larrabee was reelected, and served with his usual vigor. A large portion of his two reports is given to elaborate discussions of the adverse decisions of the courts which had well-nigh paralyzed some of the most important features of the system inaugurated in 1852. His conclusion is that "a radical and thorough revision of the law, or such a change in its construction as will enable us either to render the system more effective or to substitute therefor a new system on different principles" is necessary. The legislature had continued at its old work of "tinkering" the law, and had deprived the present statute of some of its most valuable features.

In his report of 1853 Superintendent Larrabee states the radical defects of the school law of 1852. It committed the unpardonable offense in a new American State of removing the system of public education too far from the immediate control of the people. "The people," he says, "had no direct influence on the management of their schools, and could make improvements and correct abuses only by the slow process of changing their trustees, or the indirect method of appeal to the county auditor and the State superintendent." The school funds were collected and distributed to the townships in proportion to their school population.

Just how a community could manage its schools without the agency of trustees and some local method of administration does not appear. The trouble seems to have been in the abolishing of the district system, at once the most popular and most mischievous of all the features of the common-school system fought over during the past one hundred years. In 1855 the legislature had made "a thorough revision of the law, by which the theory and practice of the system were greatly modified." Another revision was planned. The superintendent points out that several features of the revised law of 1855 are "utterly impracticable." The habit of giving the State treasurer such power for ordinary current expenses is fatal to the school system. A chapter of the revised statutes retains the old district without abolishing the township system. A new official, called a director, is provided for. A competent organization of each school district is allowed, to which is assigned certain regulations limiting the power of the township trustees.

In short, it appears that a movement of reaction had captured the public-school system and entangled it again in a maze of contradictory legislation, which "furnished endless sources of conflict to trustees, people, and director." The upshot of the matter seems to be that, while the State had twice the amount of money at hand to school the children of any previous year—\$750,000—the restless agitation for personal rights had so demoralized the entire machinery of the system that the superintendent found himself called to do a score of impossible things while involved in the perpetual complaints of quarrelsome townships and districts.

In 1859 Mr. Samuel L. Rugg was elected State superintendent of public instruction and held the office till 1861, and subsequently from 1863 to 1865. Mr. Rugg was a native of the State of New York, born in 1805, and in 1836 removed to Indiana, where he became a prominent man in the development of two counties and their representative in the State senate. His administration during both terms covers the years of the civil war. Indiana, probably more than any other Northern State of the Union, during this period was distracted by the agitation of hostile political elements, at times almost reaching the crisis of a home conflict of arms. The superintendent advises that an additional executive board be composed of the school examiners of the counties, to fill up the gap between the State superintendent and the township trustees and director. The experiment of the school "director," who seemed to be used chiefly to worry the township trustees in the administration of educational affairs, and whose actual success in relieving the State superintendent was inappreciable, appears to have been a failure. The superintendent speaks out with confidence on the necessity of a system of normal schools.

In 1861 the State was under the vigorous administration of Governor Oliver P. Morton, with Mr. Rugg still serving as superintendent of public instruction. Here, at the limit of our present record, it is encouraging to contemplate the advance that had been made during the past decade, despite the acknowledged weakness of the system and the embarrassing changes of the school laws and popular discontent therewith. There were now 512,000 children and youth of school age in Indiana; 7,300 school districts; 6,933 primary and 78 high schools; an average school attendance of 215,000, with an enrollment of 278,000 pupils; 7,000 teachers; 1 State university; \$544,980 appropriated for public instruction, and the total school revenue \$1,376,425, with a school fund of \$600,000 provided for by law; \$324,000 had been expended on schoolhouses during the past year; 11,800 pupils in the State were attending select schools.

No State of the Union was more agitated by the civil war than Indiana. But out of this fierce contention was evolved the splendid demonstration of patriotism that so distinguished the Commonwealth in the hour of the nation's peril. The return of peace was signalized here, as everywhere through the Northwest, by the great awakening of the educational spirit, which has borne this important section of the country as on the waves of a swelling flood to its present exalted position in the administration of its system of public instruction.

## ILLINOIS.

In 1818, on its admission to the Union, the State of Illinois, with an area of 53,000 square miles and a population of 55,000, placed in the ordinance accompanying its constitution the following recognition of education:

Whereas the Congress of the United States, in an act entitled "An act to enable the people of the Illinois Territory to form a constitution and State government and for the admission of such State into the Union on an equal footing with the original States," passed the 18th of April, 1818, has offered to this convention for their free acceptance or rejection the following propositions, which, if accepted by the convention, are to be obligatory upon the United States, viz:

First. That section numbered 16 in every township, and, when such section has been sold or otherwise disposed of, other lands equivalent thereto and as contiguous as may be, shall be granted to the State for the use of the inhabitants of such township for the use of schools. \* \* \*

Third. That 5 per cent of the net proceeds of the land lying within such State and which shall be sold by Congress from and after the 1st day of January, 1819, after deducting all expense incident to the same, shall be reserved for the purpose following, viz: Two-fifths to be disbursed under the direction of Congress in making roads leading to the State, the residue to be appropriated by the legislature of the State for the encouragement of learning, of which one-sixth part shall be exclusively bestowed on a college or university.

Fourth. That thirty-six sections, or one entire township, which shall be designated by the President of the United States, together with the one heretofore reserved for that purpose, shall be reserved for the use of a seminary of learning and vested in the legislature of the said State, to be appropriated solely to the use of such seminary by the said legislature.

\* \* \* \* \*

Therefore, this convention, on behalf of and by the authority of the people of the State, do accept the foregoing propositions; \* \* \* and this convention do further ordain and declare that the forgoing ordinance shall not be revoked without the consent of the United States.

In 1848 this action was confirmed by the following provision in Article IX, sections 3 and 5, of the revised constitution:

ART. IX, SEC. 3. The property of the State and counties, both real and personal, and such other property as the general assembly may deem necessary for school, religious, and charitable purposes, may be exempted from taxation.

SEC. 5. The corporate authorities of counties, townships, school districts, cities, towns, and villages may be vested with power to assess and collect taxes for corporate purposes, such taxes to be uniform with respect to persons and property within the jurisdiction of the body imposing the same. And the general assembly shall require that all the property within the limits of municipal corporations belonging to individuals shall be taxed for the payment of debts contracted under authority of law.

In a former essay it has been shown through what difficulties and clouds of opposition the State of Illinois made its way up to the school law of 1854, which was the corner stone of the structure which renders the State so conspicuous in its educational affairs. A most instructive volume will yet be written by some of the ambitious graduates of one of her universities to commemorate the long and devoted efforts of her foremost teachers through educational associations, State legislatures, ladies' education societies, teachers' institutes, and gatherings of the friends of popular education at all the centers of public influence through an entire generation to bring the widely dispersed and conflicting elements of her population to face the most vital problem of our American society, the education of the children. In the report of one of those meetings we read the names of Stephen A. Douglas, acting secretary, and Abraham Lincoln, attending delegate. One of the most potent and influential of all these special agencies was the new college of Illinois, founded as an elementary school at Jacksonville as early as 1826, when the State had a population of only 130,000, by a missionary from Andover Theological Seminary, Massachusetts, and taken up later by a devoted

band of young men from Yale College, Connecticut. This, the only college in the State founded on an undenominational basis, under the presidency of Rev. Edward Beecher, threw its entire influence on the side of the common school. One by one these separate demonstrations persuaded the legislature to patch up again its medley of school legislation, itself "a thing of shreds and patches." But no law prior to 1854 was strong enough to bring the State into any harmony of action.

As early as 1847, the secretary of state and ex-officio superintendent of schools, exposed what was still, after the great revival of the common school had been ten years on its triumphant progress in the East, the feeble condition of public instruction in this rapidly growing Commonwealth. He reports that after a rousing circular addressed to the school commissioners of each of the 99 counties of the State, he received a reply from only 57. The meager returns from these officials were explained by them on the ground of the indifference and often incapacity of the township officials. He declares that this condition of affairs "shows a most lamentable apathy and want of interest in the cause of education throughout the State." "Notwithstanding our statute books have been encumbered with school laws, no one of them has ever been carried into vigorous and effective operation." The legislature that enacted the last of these ineffective statutes "forgot that a great desideratum of every such law should be to combine efficiency with economy." Its lack of wisdom appeared in burdening the already overtaxed office of secretary of state with the confused and enormous affairs of the education of a Commonwealth as large as a European kingdom. The superintendent insists on the necessity of personal contact with the people as the sole condition of their awakening to the obligations and perils of the situation. He says:

While the people are wrought up into a kind of political frenzy, the great question of the preparation of youth for the proper exercise of political privileges seems to have been forgotten, and the very pillar upon which our perditionary rest and on whose strength alone we can hope for their security and perpetuity is passed by almost in silence.

He recognizes the value of local associations, county conventions, and frequent meetings of the influential friends of education in what has already been achieved and urges a greater interest in public affairs. After this fashion he goes on, ranging through the usual topics of incompetent teachers, poor schoolhouses, the need of district libraries, normal schools, institutes, etc., all of which was probably not read by half the "fathers of the State" in legislature assembled. He also deals with numbers of wealthy people who so generally oppose taxation for schools to which they do not propose to send their own children. The school statistics of the year were only furnished in an imperfect form for half the counties of the State.

A year later, 1849, Hon. H. S. Cooley, secretary of state, reports that "no system of schools in Illinois has as yet received the benefit of a complete and satisfactory experiment to test its capacity." The fundamental condition "that the mind of the whole people should be informed with a proper sense of the importance of education" had not yet been secured. Temporary and provisional laws have had their day. "Qualified, practical, and paid school officials were required by law to furnish necessary information and assistance, and whose duty it should be to promote the public prosperity by their devotion to the educational interests of the community." A secretary of state, with a salary of \$800 a year, and the duties of half a dozen men flung upon his shoulders, is no man to lift this additional burden of the people's schooling for American citizenship. After doing his best, not one-half the schools of the State have responded or made any satisfactory report. "While the free schools of Chicago, Quincy, and many other towns are not surpassed for their perfection and efficiency by those of any other State in this part of the Union," the lack of individual enterprise, which has wrought so powerfully

in these localities, is responsible for the low estate of large portions of the Commonwealth. "The State is not supplied with one-half the number of qualified teachers to instruct the schools that should be in operation." The secretary pleads for the separation of the important office of school commissioner, State, county, and township, from that of some other already overburdened official. He outlines a series of amendments to the school law that would place the school system on a secure foundation.

It would be unprofitable to follow in the train of educational reports of this character which fill up the years from 1849 to 1854. Suffice to say that long and aggressive agitation by the progressive friends of popular education at last brought the tardy legislators to the point of providing for the position of State superintendent of public instruction in 1854. Mr. Ninian Edwards was the occupant of the office for the first two years. The most important action of the new superintendent seems to have been the drawing up of a new school statute, by direction of the legislature, which was offered as a portion of his report in 1854. This was preceded by the first successful attempt to exhibit the educational statistics of the State.

The total amount of the State school fund was \$952,000, the interest on which was \$57,000. By this time 79 of the 99 counties of the State, after their leisurely fashion, had made partial returns, from which it was ascertained that all the school funds of the Commonwealth, State, county, township, etc., with the remainder of the unsold school lands, amounted to \$2,954,000, and the total interest available for the support of common schools was \$196,281. Another \$43,000 was appropriated for schoolhouse building and furnishings. In these 79 counties there were, in 1854, 4,215 schools, taught by some 4,000 teachers, at \$25 for men and \$15 for women per month. In 1850 there were 496,000 white children in the State under the age of 21. Of these 407,000 were in the 79 counties; 136,000 were enrolled, with no estimate of age or daily attendance. The schools were in session six months in the year. In these counties \$308,000 was expended for public education.

The new superintendent, in eloquent and practical style, explains the full meaning of a system of free education for the State as a preparation for the bill he offers for the consideration of the legislature. This bill, with the usual modifications, became the first law that really gave a workable system of common schools to the State of Illinois, thirty-six years after its admission as a State of the Union. It provided for the biennial election of a State superintendent of public instruction, with the official duties and responsibilities belonging to that official in a new American State, and a commissioner of education for each county, elected by the directors of the local boards of education. This county commissioner should be a practical school man to meet the severe demands of the law. Each township in the State was required to elect a school board of five directors, who should attend to all the duties usually assigned to officials of this description, establish common schools for six months in the year, buy lots and build schoolhouses, supervise the schools, and visit and advise as occasion might demand, elect and contract with teachers, grade the schools as might seem most suitable, if necessary provide for the schooling in private seminaries of the secondary education at the public expense, and make due report to the county officials and the State.

The county commissioners might encourage the formation of teachers' associations and institutes. Two additional examiners of teachers should be elected for two years each by the school directors of each county to aid the county commissioner in the examination of teachers, etc. The township board of education should have the general power of fixing the appropriation for schooling the children and imposing a tax on all property for purposes additional to the ordinary payment of teachers' wages. The scheme permitted the towns and cities to come in under a special law, establish schools for colored children and youth, with

other provisions. In short, here was a school law presented to the legislature in advance of that in almost any State of the Union for the use of a State not yet fifty years old, peculiar in its elements of population, inexperienced in public education, and hitherto unwilling to support anything that could be called a satisfactory system of public instruction.

Four years later, Supt. W. H. Powell complains in strong language against the confused and impracticable character of the school laws then in operation. He declared that "no State has ever succeeded by the use of such a mongrel plan." But whatever may have been the defects of this law, it certainly left the State free to express its determination to educate the people. In 1858 there were 10,233 public schools in session five and six months of the year, taught by 5,000 men and 3,000 women, with 440,000 pupils "in attendance;" about half the number of persons of legal school age under 21—803,000. There were 850 school-district libraries, 8,15½ school districts in 98 counties, in several hundred of which no school had been kept. Fifty-two teachers' institutes had been held at an expense for each of \$100. There were in the State 530 private schools, with 10,000 pupils, and 302 graded public schools. One hundred and twenty-seven students were in attendance on the State university; 58 academies and seminaries and 21 colleges filled out the catalogue of schools. The entire cost of public schools was \$2,128,793. In short, under the operations of the school law of 1855, the State had expended in two years the sum of \$3,703,635 in its public schools. The great revival of popular education had at last struck the new Northwest, hereafter not to recede.

The superintendent bears cheerful testimony to the influence of the teachers of the academical and collegiate institutions of the State in behalf of the common schools. The most successful of these institutions were established by the representatives of States that had already invested largely in the common-school experiment and understood what so many college presidents have not yet found out, that the broadest education of the masses by the State is the best guaranty for the development of the secondary and higher schools all the way up. The superintendent exposes the weakness in the position of the county school commissioners working without compensation and, of course, with neglect of their duties, and proposes a general system of county supervision by well-paid and competent officials. One-third of the school districts of the State have voluntarily supplied themselves with school libraries.

The State normal school had been established, on paper, in 1858, after a thorough discussion of the results of the movement by numerous teachers' associations and the emphatic support of the first two superintendents of public instruction.

A generous endowment of \$300,000 was made by the legislature, and the town of Bloomington, county of McLane, supplemented this by an offer of \$140,000. A building was projected, said to be the finest erected in the Union for such a purpose, at an expense of \$80,000, and the classes removed to it in 1860. The furnishing of the building was in superior style, and the library of the State Historical Society was set up there. Prof. C. E. Hovey, called from the presidency of the Union School of Peoria, was the first principal. After two years he retired into the service of the Army of the Union, and his place was filled by Rev. Richard Edwards, so long and honorably known for his valuable services in the new education of the Northwest. A model school with instruction in several grades was at once made a department of the Normal University.

Superintendent Powell sums up the results of the common-school movement during the first two years of the new régime as follows: 1. The establishment of the State Normal University. 2. The organization of the district-school library in 1,000 districts. 3. The building of 3,000 new schoolhouses. 4. The support of free schools for nearly seven months in the year in nearly all the school districts of the State. 5. The addition of 200 new school districts. 6. The organization of

50 teachers' institutes. 7. The changing of two-thirds of the private academies and seminaries into public graded schools. 8. A great improvement in school furniture and apparatus. 9. "The awakening and building up of an all-powerful and constantly growing public opinion in all portions of the State, especially in the southern, in favor of public education, which has had no parallel in the history of the country." He predicts that if the next two years follow this example, Illinois will be educationally second in public-school eminence to no State in the Union.

An interesting feature of this great advancement in the cause of public education is the development of the school system in the city of Chicago. As late as 1834, near the time when Massachusetts woke up after a common-school experiment of two hundred years to the educational movement of the new time, the village of Chicago by the lake side began its illustrious educational career through the establishment of its first common schools. The school lands, donated to the township by the General Government, had been sold and the avails turned over to a board which had established a district school in the basement of a church. Other townships united to raise this to a sort of semipublic training school for teachers and such children as attended. In this somewhat undefined way the number of schools increased to seven in 1835. In that year, under a special law that encouraged the formation of school districts, the charge of the fund was delivered into the hands of four of these. In 1837 Chicago became a city, and the common council was made commissioners of schools. They were required to appoint a body of inspectors, five to twelve, and did appoint ten in 1837. In 1839, by special act of the legislature, the foundation of the present system of common schools of Chicago was laid. Seven inspectors and three trustees of each of the new districts were appointed.

At this period Chicago was a place of 4,800 population, and its schools were taught by four masters, working at \$33.33 per month, eleven months of the year, five and one-half days of the week. A tax of 2 mills on the dollar was levied and schoolhouses built to supply the demand for a constantly increasing population. In 1850 there were 4 male and 20 female teachers, and the city had a population of 30,000. A system of Saturday institutes was organized for the instruction of the teachers. In 1854 the office of city superintendent was created, and the first superintendent was Mr. John C. Dore. The development was steady. A high school was established, and efforts were made to bring superior teachers to the city. In 1855 there were 7 grammar schools, 35 teachers, and 3,000 pupils for a city of 70,000 people, with a property valuation of \$24,000,000.

In 1856 Mr. W. H. Wells, principal of the Westfield State Normal School of Massachusetts, was invited to the superintendency of the Chicago system of schools. At this time it was estimated that at least 3,000 children in the city were destitute of the means of education. The new superintendent labored to overcome this and the extremely transient character of a school attendance which made school-teaching almost the endless shouting after a throng rushing through a turnpike gate. A high-school building, at a cost of \$50,000, was erected to accommodate 350 pupils, and the school was made coeducational under the principalship of Mr. Charles A. Dupee, a graduate of Yale College. A normal department was attached, with an attendance of 40 girls.

Like other new cities of the West, the city of Chicago suffered great loss by the premature sale of its school lands. As early as 1835 all but four of the original blocks of this property, "against the protest of 95 per cent of the people of Chicago," was sold for \$38,865, on credits of one, two, and three years. This property in 1860 was valued at \$12,000,000, and, if now owned by the city at its present valuation, would enable Chicago to support the most extended municipal system of education in the Union. The remaining four blocks, in 1860, were rated at \$700,000. In 1839 the school fund of the city was taken from the superior body of the city

commissioners and intrusted to the city council. Under the wise administration of an agent of this board, for thirteen years, it was saved from utter destruction, and in 1860 was estimated in the neighborhood of \$1,000,000. In 1860 Chicago was the largest city in the West, except St. Louis, which had undergone a similar experience in the official plunder of its valuable school lands. In 1858 Chicago expended \$62,000 on its system of public instruction.

It was a great, good Providence that left the new public-school system of Illinois, at the breaking out of the civil war, buttressed by the services, in commanding positions, of three men of such admirable quality as Newton Bateman, State superintendent of public instruction; William H. Wells, superintendent of the common schools of Chicago; and Richard Edwards, principal of the State Normal University at Bloomington.

The biennial report of Superintendent Bateman, in 1860, was one of the ablest up to that time presented to any Western legislature, ranking with those of Horace Mann and Henry Barnard in grasp of the subject, completeness of its statistics, and the discussion of the methods of pushing the great reform in the common schools, to whose appreciation the State had finally come; a late but no less a powerful and enthusiastic advocate. With a wise diagnosis of the public opinion of the State, the superintendent set himself at once to correct a mistaken idea of the school system and laws that so impeded the progress of the good cause, and succeeded to the extent that he soon reduced the complainants to the minority composed of the inevitable professional critics and chronic grumblers that "we always have with us." With a keen sense of the defects of the new school law, especially its complicated and cumbrous method of administration, Superintendent Bateman advised against radical attempts to change it in the face of the rising agitation of the public mind on the salvation of the Union. His entire analysis of the methods of primary instruction was one of the first, and remains one of the best, presentations addressed to an American legislature in advocacy of the new education. He urged the important matters of improved school administration and the State Normal University with great zeal, earnestness, and discretion. Dr. Bateman held the office of State superintendent of instruction during the civil war, and afterwards served in a variety of important offices, including the presidency of Knox College and the State Normal University.

Superintendent Bateman was a native of the State of New Jersey and, like so many of the most celebrated public characters of the country, rose to his distinguished position as one of the leaders of the new education in the Western States through years of effort and sacrifices almost incredible. He was taken to Illinois as a child of 10 years, and, like Horace Mann, at 16 had only the rudiments of a very common education. But by persistent effort at self-help he pushed his way through Illinois College at Jacksonville and Lane Theological Seminary, Ohio, where he obtained great help and encouragement from its president, Dr. Lyman Beecher. For a time engaged in the very useful and educating pursuit of a traveling agent, he began his career as teacher at St. Louis in a public school in 1845. From this he rose in rapid succession to the positions of professor of mathematics in St. Charles College, Missouri; the head of the free public school of Jacksonville, Ill., including the office of principal of the high school, in which he fitted more than a hundred students for college. In 1858 he became principal of the Jacksonville Female Academy and served four years as city superintendent of schools. In 1854 he was one of the founders of the Illinois State Teachers' Association and became a very popular editor of the Illinois Teacher and State Educational Agent, in the service of the association. In 1859 he was chosen as State superintendent of public instruction and served with distinguished ability and success through the dark days of the civil war.

It is impossible to realize the value of such a man in these difficult posts of educational administration at a crisis in the common-school affairs so perilous as

when the great sacrifices of patriotic obligation were naturally made the excuse for the neglect of that education of the whole people on which is founded the entire development of good citizenship. Dr. Bateman appears again in the State of Illinois and the Northwest during the important educational movement of the past thirty years. Three years previous to his election to the office of State superintendent of public instruction the city of Chicago had also gained a prize in the call of Mr. William H. Wells, of Connecticut, to the office of city superintendent of common schools. For twenty years, 1834 to 1854, the common schools of Chicago had been making their way upward against all the obstacles which beset an institution outside the domain of the few materialistic interests which dominate the beginnings of a great American town. Once, in 1838, the almost fatal blow of the plunder of the school lands of the city, by which a property in 1860 worth \$12,000,000 was disposed of for \$38,000, threatened the destruction of the infant enterprise. Indeed, until the city superintendency was first established, in 1854, the schools were involved in all the diseases that threaten the life of any young institution without a head. In 1836 Mr. Wells was called from the principalship of the State Normal School at Westfield, Mass., to this most important and laborious position.

William Henry Wells was a native of Connecticut, born in 1812, the son of a plain farmer, and, like so many New England boys of that day, earned his education by the sweat of his brow as well as the sweat of the brain. After a disappointment in his projected occupation, his genius for instruction was developed in the country district school of the period, as a teacher in secondary schools in Hartford, Conn., and in the private normal school of Dr. S. R. Hall, at Andover, Mass., where he remained eleven years; at Phillips Academy, Andover, and in the Putnam free school, of Newburyport, Mass., where he laid the foundations of his future eminence. As an institute conductor and worker in teachers' associations and serving as president of the Massachusetts Teachers' Association, he became widely known. In 1854 he was called to the principalship of the State Normal School, at Westfield, Mass., and for two years served with great success in this seminary, afterwards celebrated by the long mastership of Dr. John W. Dickinson, for seventeen years secretary of the Massachusetts State board of education. He went to Chicago at a critical period in the educational affairs of that growing city. His first work was the building up of the free high school and rearranging the primary department of instruction. His constructive ability and activity, reinforced by his long experience in all varieties of instruction, made his administration all that could be desired for the permanent planting of the schools of a great Western American city. He was also known as the author of an English grammar, which had a circulation of 300,000 copies. The breaking out of the civil war found him at this most important point and the rudder of the school ship was in safe hands through these tempestuous years.

The State was no less indebted to the two remarkable men who founded the Normal University at Bloomington and presided over its beginnings from 1858 until the close of the war period—President C. E. Hovey and Richard Edwards.

Charles Edward Hovey was born in Vermont in 1827, of one of the class of New England farmers of half a century ago from whom went forth a host of men and women second to none in the country in ability, worth, and distinguished services during the period of which we now write. At the age of 25 he graduated from Dartmouth College, having taught district schools at vacation to "keep the pot boiling," and after his graduation he became principal of the free high school at Framingham, Mass. In 1854 he removed to Peoria, Ill., where he became, first, principal, and, afterwards, superintendent of the new free schools of that city. He wisely took along a "helpmeet for him" in the person of Miss Harriet F. Spofford, of Andover, Mass., a lady whose excellent family descent was reinforced by an enviable reputation made, on her own account, as assistant teacher in Peoria.

As the wife of Mr. Hovey, after a long and successful career as teacher, this lady finally became the chief among the group of excellent and accomplished women gathered around Hon. John Eaton, through the organization and development of the United States Bureau of Education at Washington, D. C. Mrs. Hovey still (1900) occupies a most responsible position under the United States Commissioner of Education.

In his new post, at Peoria, Superintendent Hovey at once came to the front among the group of hard workers and hard fighters for the children. His influence was felt, not only in placing the schools of the city on a firm foundation, but at the statehouse, in advocacy of the series of measures that culminated in the revised school system of 1856. He became widely known as a popular lecturer on education; the president of the Illinois State Teachers' Association; the successful manager of the Illinois Teachers' Journal, and an influential advocate of the establishment of the State Normal University. In 1857 he was appointed to visit the normal schools of the East. In October of the same year, with one assistant and a handful of pupils, he laid the foundation of one of the most successful of this type of institutions in the country. The city of Peoria failed in its effort to bring the State Normal University to itself, but contributed its able and devoted principal to the general welfare. Under the vigorous administration of President Hovey, the State Normal University, in 1858, found itself in possession of the most conspicuous normal-school building then in the Union, erected at a cost of \$150,000, combining the arrangements for a State university and normal seminary of the first class. The first report of the new president was a document of unusual ability, both in its pedagogic and administrative suggestions. His career as educator was interrupted by the call of patriotism. He organized a regiment from the students and teachers of the university, and served with distinction in the Union Army, till disabled by wounds for further service in the war.

But his place at Bloomington was at once taken by an educator whose services have been conspicuous during the entire generation subsequent to the civil war. Mr. Richard Edwards was born in Massachusetts in 1822. At the age of 10 he was taken by his father, a mechanic in humble circumstances, to northern Ohio, where, until the age of 21, he worked as farmer and house carpenter, with only the education of the common school of the period. At 21 he became a country district school-teacher at \$11 a month and "board round." Hearing of the Massachusetts normal schools, he made his way to that State, and by the aid of Rev. Samuel J. May and President Nicholas Tillinghast, then at the head of the Lexington and Bridgewater normal schools, he entered the latter, where he attended to his studies, with schoolmastering during vacations. A year at the Rensselaer Polytechnic Institute, at Troy, N. Y., and a term of service as civil engineer in Boston were followed by his appointment as assistant in the State Normal School at Bridgewater, Mass., where he spent five years of arduous labor through the declining health of President Tillinghast. In 1854 he was appointed to the presidency of the new State Normal School for Girls at Salem, Mass., and in 1857 was invited to St. Louis, Mo., to take in charge the new City Training School for Teachers. Leaving this position, in 1861 he accepted an invitation to the place made vacant by President Hovey, and remained in Bloomington at the head of the State University of Illinois during the civil war. He became president of the State Teachers' Association; was everywhere welcomed as a lecturer on education; edited the Illinois Teacher, and was the author of a series of school books. In 1863 he received an honorary degree from Harvard College. By the loss of the State University fund of Illinois, the normal seminary at first was dedicated as a State university. But the reception of the agricultural and mechanical land fund from Congress in 1862 enabled the Commonwealth to establish the important State University at Champaign. The subsequent history of Dr. Edwards and the

Normal University of Illinois was prolonged until the later period of the great revival of public education that followed the auspicious close of the civil war.

Only the limitation of space thrown around an essay of the present character prevents the further commemoration of others of the faithful leaders of education, men and women, who, during the period now under consideration, 1830-1835, bravely fought the battle against the indifference and open hostility of opponents and lifted it through every grade to the conspicuous place it occupied at the close of this period. The State of Illinois owes much to the labors of its teachers and educators in the creation of the powerful and intelligent educational public that achieved the remarkable results for universal education through the memorable decade from 1850 to 1860.

### MICHIGAN.

The movement known as the great revival of the American common school originated in New England early in the decade 1830-1840, and was especially influential in this northeastern group of common-school States, under the remarkable leadership of Horace Mann, Henry Barnard, and others only less celebrated as educators and publicists. Outside of New England its more immediate results were felt at first in the western portion of New York, largely settled from New England and dominated by the common-school sentiment of the old Northeast. Moving westward on the lines of latitude which have indicated the dominating influence of the New England occupation and ideas, it became a powerful agency in the somewhat tardy development of the American system of universal education in the then original States of the Northwest—Ohio, Indiana, and Illinois. But in all these new Commonwealths the reform was greatly hindered by their mixture of population; especially the great number of people who occupied their southern counties, coming from States where the common school did not then exist, and the great educational revival was to be postponed for another generation. The history of these States, with that of the central Commonwealths—Pennsylvania, Maryland, New Jersey, and Delaware—has already shown the influence of these elements of reaction in the very gradual way by which their present systems of public instruction were wrought out.

But it was the great good fortune of one State of the Northwest—Michigan—that its birthday fell upon the year ever memorable for the establishment of the Massachusetts board of education and the appointment of Horace Mann as its secretary. The Territory of Michigan, unlike all the vast area of the Northwest east of the Mississippi, since the States of Ohio, Indiana, and Illinois, dates from 1805. Its development was retarded by the almost inaccessible character of the far-off country, and the original settlement by a peculiar people from the Canadian French element, and by an almost constant warfare with the Indian tribes, until the close of the war of 1812-1814. In 1817, when Lewis Cass was appointed governor, the Territory had but 6,000 people, and Detroit was only a village.

Indeed, it was not until the opening of the New York and Erie Canal, in 1826, and the subsequent establishment of steam navigation between Buffalo and Detroit, that the great wave of immigration from the old East, which had already made New York west of Utica a new New England and given a definite character to northern Ohio, surged in. It was only in 1825 that the State was divided into townships. By 1830 Michigan had a population of 32,000, and in 1837 of 212,000, scattered over a territory of 58,915 square miles, largely a wilderness of heavily timbered and swamp lands, its wonderful mineral region still in hiding along the shores of its great northern lakes. At the admission of the State to the Union, at this date, Detroit had 8,000 people and there were half a dozen growing towns, like Ann Arbor, Marshall, Monroe, and Ypsilanti, while it was still believed that

the large area in the southern center of the State was an everglade, practically uninhabitable and only to be developed at such a cost of health and life as made the settlement of this, one of the great Commonwealths of the West, relatively more destructive to human life than the subsequent toll of the civil war.

The cause of universal education in the American sense had nothing to expect from the original French settlers of the southeastern margin of the State. Good Father Richard and his faithful Catholic coloborers did their duty as they saw it. But they could not persuade the Territory to permanently endow or subsidize their little parochial schools. By 1817 the official class, as heretofore described, made a movement to establish what was practically a Territorial board of education, an arrangement which, under the name of "university," proposed to take cognizance of all public schools. This scheme, which, probably suggested by the previous similar attempts of the States of New York and Georgia, placed the entire administration of public education in the hands of a great university board, came to little save the establishment of a few schools, although it boldly demanded an assessment of 15 per cent of the public tax list for its support. Its unpronounceable name, "Catholepistemiad," and the classic nomenclature of the departments of its imaginary university suggest the previous emptying of an old-time classical dictionary over the interminable area of woods and swamps of the wild Northwest. Notwithstanding three sections of land were granted to "The College of Detroit," with subsequent sections of public-school lands, little was accomplished. A second attempt was made to establish a "university," with John Biddle, governor, and twenty assistant trustees. But this was little more than a corporation on paper, advertised to do all possible things in behalf of the education of the children. Its operations were largely directed to the management of the school lands of the Territory.

It was ten years from this original movement before the foremost people of the Territory realized that not a "university" but a system of common or primary schools had been all the time the radical need of the coming generation. In 1827 the first common-school act was passed. This was almost verbally a copy of the original colonial statute of Massachusetts enacted in 1647, and provided for the primary schooling of the children by local taxation, and for the secondary education under the title of grammar schools, which would teach the Latin, French, and English languages. The original New England penalty was held over all disobedient communities. This law was supplemented by the action of Congress in 1823, requiring the governor and council of the Territory to take the school lands in charge and secure them, if possible, from the waste that had so largely crippled the educational movement in Ohio, Indiana, and Illinois. But the subsequent repeal of the laws of 1827-28 and the passage of the new act for a general superintendency of schools seemed to have had but small result until the constitutional convention of 1835 took up the matter in earnest. The constitution contains the following ordinance:

Ordinance adopted by the convention which framed the constitution of Michigan in 1835.

Be it ordained by the convention assembled to form a constitution for the State of Michigan, in behalf and by authority of the people of said State, that the following propositions be submitted to the Congress of the United States, which, if assented to by that body, shall be obligatory on this State:

First. Section numbered sixteen in every surveyed township of the public lands, and where such section has been sold or otherwise disposed of, other lands equivalent thereto, and as contiguous as may be, shall be granted to the State for the use of schools.

Second. The seventy-two sections of land set apart and reserved for the use and support of a university, by an act of Congress approved on the 20th day of May, 1836, entitled "An act concerning a seminary of learning in the Territory of Michigan," shall, together with such further quantities as may be agreed upon by Con-

gress, be conveyed to the State, and shall be appropriated solely to the use and support of such university, in such manner as the legislature may prescribe.

The cause of education was secured by the following provision in the constitution of Michigan, January 26, 1837:

#### ARTICLE X.—EDUCATION.

SEC. 1. The governor shall nominate and, by and with the advice and consent of the legislature in joint vote, shall appoint a superintendent of public instruction, who shall hold his office for two years and whose duties shall be prescribed by law.

SEC. 2. The legislature shall encourage by all suitable means the promotion of intellectual, scientific, and agricultural improvement. The proceeds of all lands that have been or hereafter may be granted by the United States to this State for the support of schools, which shall hereafter be sold or disposed of, shall be and remain a perpetual fund, the interest of which, together with the rents of all such unsold lands, shall be inviolably appropriated to the support of schools throughout the State.

SEC. 3. The legislature shall provide for a system of common schools, by which a school shall be kept up and supported in each school district at least three months in every year; and any school district neglecting to keep up and support such school may be deprived of its equal proportion of the interest of the public fund.

SEC. 4. As soon as the circumstances of the State will permit, the legislature shall provide for the establishment of libraries, one at least in each township; and the money which shall be paid by persons as an equivalent for exemption from military duty, and the clear proceeds of all fines assessed in the several counties for any breach of the penal laws, shall be exclusively applied to the support of said libraries.

SEC. 5. The legislature shall take measures for the protection, improvement, or other disposition of such lands as have been, or may hereafter be, reserved or granted by the United States to this State for the support of a university, and the funds accruing from the rents or sale of such lands, or from any other source, for the purpose aforesaid, shall be and remain a permanent fund for the support of said university, with such branches as the public convenience may hereafter demand, for the promotion of literature, the arts and sciences, and as may be authorized by the terms of such grant. And it shall be the duty of the legislature, as soon as may be, to provide effectual means for the improvement and permanent security of the funds of said university.

The interesting story has already been told of Isaac Crary, who, as chairman of the committee on education in the constitutional convention, was largely responsible for the framing of this provision. Also of the previous efforts of Rev. John D. Pierce, who, from the year 1831, when he appeared in the Territory of Michigan as an agent of the Home Missionary Society, had been an indefatigable advocate of the educational system by which he was schooled in New Hampshire, Massachusetts, Rhode Island, and New York. It was only a logical necessity that led the people of the new State to demand the appointment of this great friend of the children as the first State superintendent of common schools of Michigan, and his retention in this important position during the subsequent five years, till 1842.

It is perhaps a pardonable pride in these leaders of the educational movement at the beginning of the Commonwealth of Michigan which leads their local historians to disown their indebtedness to the older common-school system of the East and claim that here was set up an independent scheme of popular instruction, based on the Prussian system; or that Dr. Pierce was the first man in the country to hold the office of State superintendent of education. It is true that Crary and his friend Pierce, like all the prominent educators of that day, were greatly interested in the accounts of the Prussian system of education, then recently given to the country by the translation of M. Victor Cousin's report and the later accounts of several Americans, especially Dr. Calvin Stowe's to the legislature of the neighboring State of Ohio. But there was nothing in the system recommended by Superintendent Pierce and adopted in the main for the first legislature of the State that distinguished it from the American system as developed through the previous two hundred years.

Indeed, the government of Lewis Cass, a native of New Hampshire, seems to have inaugurated the first movement for popular, as distinguished from private and classical, education in the Territory. The university schemes of 1817 and 1821 were evidently suggested by the earlier provisions of New York for a "board of regents for the university," and of Georgia for a general system of public instruction, under the name of the "University of Georgia," both of which antedated the movement in Michigan by a full generation. Both Crary and Pierce were natives of New England and graduates of Eastern colleges. The more influential class of the people of Michigan in 1835 was from the New England States, originally, and later from the same people broadened and trained by their experience in settling western New York and northern Ohio. When required to prepare a complete plan for the education of the people of the new State of Michigan, Superintendent Pierce consulted Governors Marcy, of New York, Everett, of Massachusetts, and many others of the leading public and school men of the East. His ideas of the university could all be derived from Harvard and the "University of Virginia," which may be called the mother of all the State universities established after the year 1820.

As early as 1812 New York had established the office of State superintendent of education, and afterwards practically continued it in—for that State—a most efficient way, by combining its duties with those of secretary of state; an office at the time in New York of commanding importance and held in succession by a series of the foremost statesmen of the Empire State. The State of Ohio had called Samuel Lewis to the same position at an earlier period than the admission of Michigan to the Union. It was true that Dr. Pierce and some of his immediate successors seemed to have cherished an idea of their position as somehow equivalent to that of the Prussian minister of education. The experiment was tried in the appointment of Pierce to place the entire educational affairs of the Commonwealth, even the denominational and private schools, under his control. But the good sense of the people of Michigan soon rejected the notion of a European continental minister of education presiding over the entire school affairs of a new American State, on a salary of \$500 a year.

It was natural and fit that on the first real venture at a general system of public instruction, the people of Michigan should turn to the two men whom all recognized as educational leaders. But the experience of the ensuing fifteen years revealed the impossibility of attempting to blend the educational methods of the Prussia of half a century ago, with the imperious necessities of a new western American Commonwealth. The appointment of a State superintendent of public instruction was taken from the governor and senate and the office filled by popular election for two years by the revised constitution of 1850. Before that year the State university was placed in charge of a board of regents, first appointed and afterwards elected. The normal school and the agricultural college were put in charge of the State board of education, of which the State superintendent was only a member. The superintendent of schools in Michigan at present is in no way a different functionary from his colaborer in other States, and no American Commonwealth is now farther removed from the concentrated educational method of the European centralized governments than Michigan.

Every State superintendent of education in Michigan until the year 1878 was a native-born and educated son of New England or of New York; till then the most prominent centers of common school life. The first president of the university was a distinguished educator born in New York, and both his successors, Presidents Haven and Angell, were prominent in the East before they were called to the head of the university.

The real educational advantage of Michigan was that at the inauguration of the great revival of the common school in New England and New York, in 1830-1840, her leading educators and the influential majority of her people were in such close

educational sympathy with the leaders of the great reform in the Northeast that here, even beyond the older States, was found a soil where the ideas of Mann and Barnard and their great contemporaries could be planted as in a fertile seed field and grow without conflict or serious hindrance. With the exception of the usual mistakes in the attempt at the popular administration of education, a loss of university funds from the coming on of a financial panic and the consequent fluctuation in property values, the long-drawn-out quarrel over the recognition of the homeopathic college of medicine as a subject of State support, and the unfortunate treatment of the first university president, Dr. Henry Tappan, no American State has gone on, from first to last, with so little friction to such a recognized educational superiority. And all this not because the educational system of Michigan ever was or is now the reproduction of the Prussian, but one of the most complete developments of the American system, as developed through the practical experience of more than two centuries, and modified and amended by the incorporation of every valuable idea and method from everywhere that could be conformed to the American ideal of society and government.

One important change concerning the administration of school lands was incorporated in the ordinance of 1835. The States of Ohio, Indiana, and Illinois had adopted the practice of leaving to each township the management of the sixteenth section of school lands received from the National Government. The result was a prodigious waste of the children's patrimony. The State of Ohio never received the advantages anticipated from this munificent bequest. By using all this accumulation of gifts for common and university schools as one great fund, administered by the whole people for the common good, the State of Michigan originated a most valuable new departure at an early period, which has been of inestimable value to the States adopting it. Although there was a great decline in the value of these lands soon after the admission of the State to the Union, involving sacrifices which reduced the estimated endowment of the university a full half, yet within fifteen years of this period the State possessed a school fund of \$1,000,000, which has been largely increased as the years have gone on.

As far as the question of the elementary common schooling was concerned, the plan submitted by Superintendent Pierce was adopted. It provided for a system of public instruction in districts, with proper officials for the management of the schools; for the sale of school lands by the State superintendent and their proper investment in a permanent fund, the income to be distributed among the districts on the basis of the school population, with other moneys from the appropriation of the amounts of fees, fines for breaches of the peace, and military exemptions; the power of voting a small annual sum for a school library; the establishment of a board of school inspectors; the State funds to be distributed for the schooling of all children between the ages of 5 and 17. A tax was levied in every district for instruction, building, fuel, etc., the local contribution to be equal to the amount received by the State. The school law was drawn with great elaboration, and could it have been thoroughly enforced would have founded a system of district elementary schools, free during three months in the year and afterwards supported by a rate bill, adequate to the early necessities of the new Commonwealth. At the close of the administration of Superintendent Pierce the State had a population of 210,000, a school population from 5 to 18 of 65,000, although the State authorities assert that "not half the school-attending children are in the habit of attending regularly, summer or winter." The schools were in operation, on an average, four and one-half months in the year.

The plan suggested by the superintendent for the organization of the secondary education was a system of academical branches of the university. Any county of adequate size could have a "branch" on condition of its furnishing suitable school buildings and the appointment by the county supervisors of an official board of six members, who, with one appointed by the State superintendent, should con-

stitute the academical board. Of this board four were to be selected from the officials of the county. This board could appoint teachers and generally manage the school. A committee of three visitors, two appointed by the State superintendent and one by the supervisors, was empowered to inspect the school and report its condition to the State authorities. The county was required to raise a sum equal to the appropriation from the university fund. This "branch," in the imagination of its founders a reproduction of the German gymnasium of half a century ago, was to be organized in three departments—a teachers' course of three years and an English and a classical department. Only the teachers' course was free, and that on condition of every graduate teaching four years. In the English department tuition was to be \$10, and in the classical \$12. A State appropriation of \$500 for schoolbooks and apparatus was provided.

The university, which was to be the crown of the entire system, was to be governed by a large board of regents, consisting of the governor, lieutenant-governor, chief and associate justices, chancellor of the State and university, and twelve additional members appointed for four years by the legislature. There were to be three departments—(1) literature, (2) law, and (3) medicine. The faculty should consist of 15 professors of the first, 5 of the second, and 6 of the third department—26 in all. While the instruction and government of the departments was to be committed to the faculties thereof, the regents were to be the final authority in regulating the course of instruction and providing books and materials. A board of five visitors was to be appointed by the State superintendent. In his enthusiasm at the attempt to set up a German university in a new State of 200,000 people the good superintendent beholds the day in vision when "the institution would be an anomaly in the history of learning, a university of the first order, open to all, the instruction free." He estimated that the university fund would supply \$50,000 a year—\$25,000 for the support of the "branches" and \$25,000 for the central college. The importance of a department of medicine and law was urged.

In the treatment of the most delicate topic connected with the university—the religious question—the superintendent takes the broad American ground of absolute independence from all entangling alliance by the state with ecclesiastical affairs; there should be no religious test for students or teachers; but he was compelled somewhat to placate the different religious sects, which at the opening of the great West were so powerful an element of opposition to the support of an unsectarian university by the State. He proposed to meet this condition by the appointment of a professorship of worship, which should represent the Christian religion in its general unsectarian aspect, the occupant of the chair to deliver lectures and conduct a course of instruction on the broad ground of religion and morality on which all denominations might consent to work in unison. He cited the example of the new university of the city of New York, which supported a professorship of this sort. The scheme was the opinion of a wise and good, in his way a great, man; and through the storm and stress of half a century the University of Michigan has probably justified the prophecy as far as is possible under the present conditions of human nature in a State ruled by a citizenship so varied and sensitive. The State of Michigan may boast that no community on earth has more completely shown that the people can be safely intrusted with the administration of the higher education in a scheme so broad that it includes the training of every competent person of either sex in a great institution, secure from all the restraints on personal liberty that have been hitherto supposed to be essential in every age and land. In this connection the superintendent gives a warning concerning the endowment of private institutions by the State with the university powers. He clearly anticipated the rush upon the legislature for college charters, which has since filled the land beyond the Hudson River with a multitude of institutions bearing the loftiest educational names, conferring the most distinguished

degrees with a free hand, and at intervals claiming a subsidy from the State, although relieved from all dependence on public authority for their administration.

In his interpretation of the powers of the State superintendent of instruction, the new official positively asserted himself as a minister of education of the European type—the executive head of all departments of school life and the court of final appeal on all questions arising out of the school system. The latter power, as far as concerned the decision of cases arising under the school laws, was reserved by the legislature in the general arrangement of the scheme.

But in the first law passed by the legislature under the general system the State University was organized under a board of regents and visitors and provision made at the earliest opportunity to place the institution in fit buildings. By placing the administration of the university in the hands of a board of regents, the first inroad was made upon the undefined powers of the State superintendent of instruction. The branches were at once to be established, each with a department of pedagogy and of agriculture in addition to English and classical learning, but with no power to confer degrees. A superior school for girls was to become a sort of annex to each of the branches as soon as the funds for its establishment could be secured. The site of the central university was to be an estate of 40 acres in the then village of Ann Arbor, which was expected to furnish the ground free of cost. At a subsequent meeting of the legislature the regents were empowered to elect a chancellor of the university, also the president of the board, and arrange for the appointment of professors and the system of instruction.

With this splendid publication of good intention, the new Commonwealth of Michigan embarked on the broad sea of Western American educational life, under a leader, perhaps, in all practical ways, not inferior to any in the group of eminent educators which has served any State in this capacity. But the voyage was not all to be smooth sailing. At once came up the difficult question of the chartering of private and denominational colleges and seminaries with university powers. The new "College of Michigan" was the first applicant. Here the superintendent wisely consulted the most distinguished authorities in American college life, and from Dr. Francis Wayland, Governor Edward Everett, and numerous others received various replies to his questions. His own conclusion was announced to the applicants after the following style: That he was invested by the legislature and the constitution with a sort of indefinite power to require that the institution should report to the State superintendent; make no sectarian religious distinctions in its administration; report, if required, its financial condition to the legislature; and that the private property of the trustees should be liable for all debts beyond the ability of the corporation to liquidate.

The university fund was then supposed to be \$1,000,000, with an annual income of \$70,000. But it was evident that even this was quite insufficient to support a scheme so extended as the central institution and its branches. To meet the emergency a State loan of \$150,000 was voted. The school lands altogether amounted to 1,148,000 acres. Already some 34,000 acres had been disposed of at the rate of \$12 per acre, amounting to a fund of \$411,000, with an income of \$28,825. The superintendent found himself with \$57,651 on hand as the entire sum for launching the new system of public education.

In 1838, 245 townships reported 1,020 school districts with 34,000 children and youth of school age. The regents of the university decided to commence operations by the establishment of eight branches in as many local centers, and appropriated \$8,000 for the support of the teachers in the five actually set up. Only 161 students were enrolled in all; 10 in the normal department. It was estimated that by 1842 40 students would be prepared to enter the university. The girls were still kept waiting outside, and, beyond the elementary schooling, had yet neither part nor lot in the new system of education. Mr. Asa Gray, afterwards

the celebrated American botanist, was the first to receive the title of professor in the new university, and was sent to Europe to purchase a library. During the year 1837 \$7,800 had been expended in the branches, with an estimate of \$10,000 for instruction and \$35,000 for buildings in the central university. The interest of the university fund was \$9,171. The legislature persisted in its demands that every private and denominational seminary should make a full report to the State authorities of its financial and other affairs, a notion that did not commend itself to the good people of Michigan, as these schools did not generally comply.

In 1839 the districts were authorized to continue the sessions of the schools by the passage of a rate bill paid by the parents of the children attending. Four buildings had been erected on the university grounds and a new professor appointed; but the lack of funds was severely felt. A committee appointed by the legislature reported on the danger of leaving the university exposed to the fluctuating minds of that body, and asked that its affairs be administered independently by its own board. It declared the present scheme of a central university and a group of branches as fitting schools too extended; but nothing came of the report, which divided the body to which it was made. In 1840 the Catholic parochial schools of the city of Detroit applied for legislative aid, and a majority of the committee on education recommended it; but no action was taken on the appropriation. Every new legislature took a turn at the school law, changing it in many matters of detail.

In a later report, 1841, the State superintendent refers to the reverses in all financial and industrial matters during the past three years: "We commenced our career when the whole country was in the midst of the wildest scene of speculation, and we have seen it sink in three short years to the lowest state of depression; but the people are coming up bravely to the rescue, and the land is dotted with log schoolhouses." As the result of the last five years' experiment he declares that "No system in the Union, with the exception of that of Massachusetts, is now more complete in its organization or perfect in its parts." From 1836, with a record of 39 townships, 55 school districts, and 2,337 schools, the year 1840 showed the remarkable gain of 324 townships, 1,596 districts, and 49,850 persons of school age. The regents of the university had met the complaint of the churches, that the university was not to be founded on a religious basis, by appointing clergymen to the principalships of five of the seven branches. In two of these, schools for teaching girls, in English only, had been established. The central building of the university was going up, and important collections of many sorts were being put in, among which were 3,700 volumes purchased abroad by Professor Gray.

The financial affairs of the university were assuming a serious aspect, the depression of the hard times nearly preventing the sale of the school lands. It was deemed of the utmost importance that the university should be organized and put in operation within a year. But the prospects were not flattering—\$41,852 had already been expended on the central department and \$10,000 on its branches. The regents asserted that the responsibility for the management of the university should be concentrated on themselves, and the legislature and State superintendent of instruction should be excluded from interference. A legislative report strongly recommended that the State superintendent should be relieved from his financial cares and his duties be confined to the oversight of the public schools, but no action resulted. It was evident that the European idea of a State minister of education, with large and almost despotic powers, was not acceptable to the people of Michigan.

The retirement of Superintendent Pierce from the responsible and confusing duties of first State superintendent of education in Michigan was by no means a loss to the State of the services of this consecrated apostle of universal education.

The most common defect of our American educators in exalted and difficult positions of school administration has not been the lack of good learning, a serious interest in good education, high character, and a fair amount of administrative ability. It has rather been that peculiar aloofness from the common American life which often makes the man or woman of excellent culture, worth, and capacity as one apart from the majority of intelligent and efficient people who are the actual force of every good American community. Especially is this defect a great hindrance to success in a new State, and far more than now in States in the condition of the original five Northern communities half a century ago. We can recall many a man or woman who has "gone West" at the enthusiastic call of responsible educational authorities from a position in the East, when the teacher was not only fortified in the confidence of the community, but had been known to the progressive educators of the Union with perhaps favorable notice from abroad. But in the rapid way in which all things move in a prosperous new country the fatal lack of this element of genial sympathy with our common human nature and a reliable understanding of the conditions and environments of the average school boy and girl soon become apparent.

If the new official had the openness of mind and heart to appreciate his own defect, and, while adhering to his own best views and upholding the broadest and highest idea of education, showed himself the sympathetic friend of the children, teachers, and parents who were his constituency, he probably became one of the most valuable leaders of a growing civilization. But if afflicted with undue personal pride of opinion, or the still more obstinate malady of a chronic consciousness of superiority founded on a fellowship with the cultivated class at home, his influence was soon at an end. Hundreds of excellent men and women during the early development of the educational life of the new Northwest went forth from the older East with joy, and returned exhausted, humiliated, and disgusted at the "lack of appreciation" by the communities they served, whereas the real cause of failure was often the educator himself, who did not and could not really know the people he came to instruct.

In this respect Dr. Pierce was, indeed, a providential man for a critical period in the life of a great Commonwealth. He was born in humble station, in New Hampshire, and worked on a farm till the age of 20, in Worcester, Mass, with eight weeks' schooling a year. At 20 he was fitted for college, like Horace Mann, by a good private teacher. With \$100 saved from the scanty wages of a farm hand and a district schoolmaster, he entered Brown University, Rhode Island, and graduated at 25 in the first grade of his class. A year's study of theology at Princeton, another year as the principal of an academy in Massachusetts, and a few years' pastorate in the most interesting center of the new New England, Oneida County, N. Y., constituted the university in which he was trained for the great service awaiting him beyond the lakes. In 1831 he was sent West, with a roving commission, as a missionary through Illinois and Michigan, to preach the gospel to all people. He went forth gladly, and labored with a zeal and devotion that, through the early death of his beloved and accomplished wife, was lifted to a life long consecration to what may well be called in all the significance of the title, "a ministry of education," which for half a century wrought like a beneficent providence in his adopted State.

It was not his study of the Prussian school system, but his broad and powerful training in the great university of the new American life, that revealed this young man as the providential leader of the new Commonwealth of Michigan to the high place in popular education it now occupies. His service in connection with his friend, Isaac Crary, in placing in the fundamental law of the State the first provision for the general education of the people was the prelude to his appointment to the position of first superintendent of schools of the State. No man

better than himself could realize the difficulties and almost hopeless hindrances to success in that territory of undeveloped resources, vigorous capacities, and untried populations of various class and nationality. The lack of abundant funds to carry out his broad idea of university education appeared in the financial arrangement that reduced the school fund one-half and everywhere stood in the way of public interest in the schools. His own idea of a "minister of education" of the Prussian type was rudely shaken by the very sensible conclusion of the legislature that a State superintendent of education should be relieved of all responsibility for handling the school funds. The board of regents of the university, established by his own suggestion, resented his own connection with the administration of that institution. And the legislature complained that the people had no reliable statistical information of the actual condition of the schools.

But, whatever ground there may have been for these criticisms, Superintendent Pierce was not the man to "sulk in his tent," or withhold himself from active participation in the great work of organizing the educational system of the State. From the time of his retirement from the superintendency, in 1842, at the age of 45, for nearly half a century he was educationally the foremost citizen of the State. He always clung to the work of the Christian ministry—as practiced at that time, by such a man, one of the most valuable schools of practical educational and religious activity. But he continually reappears in the educational field. In 1847 he was sent to the legislature, and in 1850 was a member of the constitutional convention, and in both these positions was influential in the improvement of school affairs. At this crisis the people finally rejected the last vestige of European policy in taking to themselves the election of State superintendent of education and limiting his duties to the direct supervision of the common schools, with indirect relation to the normal and public charitable systems. The supervision of the university was taken from the control of the legislature by placing the selection of the board of regents in the hands of the people through popular election. In this connection, largely by his efforts, the system, after a preliminary experience of rate bills, was declared free at the end of five years. In 1852 he had the satisfaction of delivering the address at the opening of the State Normal School at Ypsilanti, a foundation that had from the first been dear to his heart. He also served as county superintendent, and was a constant visitor at educational assemblies to the later years of his life. One of our own pleasant recollections among the schools of the West is of the meeting with this venerable educational father of a generation at the commencement exercises of the normal school at Ypsilanti, probably one of his last official appearances. It is the remark of so many of our successful American educators that nowhere in the world is found so complete an appreciation of the higher type of ability and devotion to duty as in the great new western America, beyond the Alleghenies, into which Dr. Pierce and such as he went forth in the day of small things, toiled and suffered, and "looked not back from the plow," until "the wilderness and the solitary place were glad and the desert blossomed as the rose."

The years between the organization of the State government, 1835-1837, and the formation of the revised constitution of Michigan, in 1850, were emphatically a period of educational experiment, in which success was all the time shadowed by the partial failure of the magnificent ideals and broad theories entertained by the leaders of the new State system. Many of these were destined to be shattered by collision with the hard and homely facts of life in a new Western commonwealth, or at least postponed until the coming of better times. The people were all the time passing through the successive revolutions in financial affairs almost inevitable to the settlement of a new American State, so attractive as to allure a multitude of settlers, too many of whom were neither in a financial nor social condition to face the peculiar difficulties of the situation. The tide of emigration to Michi-

gan, from the opening of the first direct and easy communication from the East and Europe through the completion of the New York and Lake Erie Canal, in 1826, and the establishment of steamboat navigation on the Great Lakes, lifted the sparsely populated border Territory of 6,000 in 1817, in twenty years, to the comparatively populous Western State of 250,000 in 1837. For a brief season the State magnified itself on the summit of a mountain of material prosperity, only to be plunged into a valley of industrial humiliation, from which it slowly and painfully emerged through many years. The statement of Governor Woodbridge's message to the legislature, in 1841, is a graphic picture of this condition:

The resources upon which so much educational expectation was founded seem liable for present purposes in a great measure to fail us. The overthrow of the general currency of the nation, which has produced so much distress, and the continued process by which the little resource available seems rapidly passing out of the State, have already prostrated all uniform standards of value; and the ruinous diminution in the prices of agricultural products have rendered all real estate of little present worth. School lands, therefore, are no longer sought after by purchasers, and hitherto, in times of great pressure and general distress, the legislature has found it difficult to resist applications for relief and delay of payment on the part of those who have heretofore purchased lands. From this source, therefore, little comparatively has been realized, and the sanguine hopes of the friends of education have been thus far disappointed. The same general cause very naturally affects also the present condition and for a time the future of the university.

It is needless to say that in this financial emergency "history repeated itself," and the party which in every civilized state before and since has proposed to throw overboard the public institutions that make for the higher interest of society to lighten the ship of state, tossing amid the high waves of financial panic, came to the front in Michigan. That this most mischievous combination of all the enemies of republican society did not succeed in their effort to abolish the university and fling wide open the worn-out experiment of subsidizing sectarian and irresponsible private seminaries for the secondary and higher education was largely due to the fact that so large a number of able and progressive men in public office were natives of the States that had already demonstrated the supreme advantages of universal education.

The city of Detroit, which had long remained under the influence of the original occupants of the Territory, did suffer. As late as 1842 the city, then as now the chief town of the State, had under the first district school law been entitled to only \$9,000 annually, and that had been further reduced by the manner in which the money had been distributed. During the years previous to 1842 there had been practically no common schools in the city, for the securities "of the school funds were almost worthless." At this juncture a revolt of the progressive element obtained a reorganization by which the whole city was consolidated as a single school district, and the city council authorized to levy a tax of \$1 for each child between the ages of 5 and 17 for the support of free schools. The school board found "they had everything to create, and that a degree of neglect beyond what they imagined possible had existed from the earliest period in the history of the city in regard to the all-important subject of education." It was found that in the city of 10,000 people, half a century old and with great wealth, where the public authorities had long possessed the absolute right to appropriate funds for public purposes, not a dollar had been appropriated for the purposes of education; that there was but one public schoolhouse in the city, only \$400 invested in a school lot, and no furniture except a pile of old desks and benches. A lot of depreciated paper and this schoolhouse and lot "completed all the provisions which the city of Detroit in this enlightened age had furnished for the support of public schools." There were 3,500 children from 5 to 17 years old in the city, and the school tax amounted to \$3,500, which, with the State subsidy

of \$1,000, gave \$4,500 for schools. Within a year 12 public schools were established at an expense of \$3,400, containing 1,286 pupils, 107 placed in charge of one teacher. An application was made to the legislature for a law authorizing the city government to vote a tax raising \$1,500 a year for the purchase of school lots and the erection of schoolhouses and to borrow \$5,000 additional for this purpose. By the subsequent action of the legislature and its refusal to subsidize the Catholic parochial school system of the city, a foundation was laid for the rapid development of what has become one of the most notable metropolitan systems of common-school instruction in the Union.

It was little short of a public providence that the three State superintendents of public instruction which followed Mr. John D. Pierce from 1842 to 1850 were men of unusual capacity and entire devotion to face the difficulties of this critical epoch. They were all from Eastern and common-school States. Mr. Frederick Sawyer, jr., the immediate successor of Dr. Pierce in 1841, was a native of Cambridge, Mass., and a graduate of Harvard College; a lawyer in partnership with Hon. Jacob M. Howard; afterwards a distinguished public character in the history of the State. Mr. Sawyer was a scholar, gifted with a genius for general popularity; the editor and proprietor of a newspaper; a man of public spirit, and the founder of the young men's society, which, like Dr. Benjamin Franklin's famous club in Philadelphia, kept itself in touch with city reforms. His administration of the office of State superintendent of public instruction seems to have marked the first serious attempt to find out what was really on the ground, the quality of the schools and the actual situation of the educational affairs of the State. His admirable reports called attention to all the defects of the public instruction and aroused and directed an excellent, hopeful spirit to keep alive the belief in the value of public education in the State.

The schools were steadily increasing in number; were in session four and four-sevenths months in the year, and included 50,000 pupils. He urged the importance of attention to the foreign-born element of population and the accommodation of its children in the public schools. He pushed the inquiry to every district concerning the details of school-keeping and thereby laid the foundation of a system of accurate statistics and a vital connection of every locality with the central school authorities. The result of his investigations revealed the same deficiencies as have met us everywhere in a system of schools under inefficient supervision, with inadequate teaching force and a half-hearted community, not yet awakened to demand action to make the system efficient. Mr. Sawyer followed the example of Horace Mann, who, at the other end of the Union, was now "stumping" the State of Massachusetts in the interest of the children, and reports the same discouragements that alternately aroused the indignation and excited the grim humor of the great leader of the revival of the common school.

The State university was meanwhile toiling in mid sea, with small hope of safely completing the voyage on which it had been launched, with such exultant anticipations in 1837. The drop in school securities, and the acts of the legislature for the relief of the purchasers of school lands at high prices, had cut down the annual income one-half. The pledge of the State to provide out of this the payment for services already done, left the corporation with the pittance of \$1,000 to support a new college of 50 students, and 10 professors, burdened with past expenditure and beset on every side with critics and enemies. Several buildings and some respectable collections had been placed on the ground by the aid of the \$100,000 appropriated by the State; but the resources of the university were barely sufficient to pay the interest on that loan. The branches, containing, perhaps, 150 students, though still regarded as essential and, by some, as the main value of the institution, were absorbing a large amount of the available funds. Naturally, the central college had not yet realized the expectation of the

educational public, and for ten years not 300 students had found their way to the half dozen or more schools that figured on paper as "the University of Michigan." But just here it was the great good fortune of the institution that there were on its board of regents men like Henry M. Schoolcraft and others, who insisted, in season and out of season, that the university should be relieved from its dangerous dependence on the whims of a constantly changing legislature, and place it in the hands of its own responsible board. By this change the power held by the State superintendent of schools and the governor, which in an emergency might be exercised for the extinction of the institution, was restricted. But, until the costly experiment of a group of branches was fully abandoned, and the entire authority of administration vested in a board of regents elected by vote of the people, and a president placed at the head of the faculty, there was little but disappointment in the general condition of the institution.

The direction of the common schools of the State during the following seven years, under the administration of Supts. Oliver Cromwell Comstock and Ira Mayhew, are so fully set forth through the interesting record of Supt. F. W. Shearman in 1852, in his volume, *Public Institutions and School Laws*, and in a subsequent publication, *Education in Michigan*, by Deputy Supt. W. L. Smith, in 1880, that it will be unnecessary in this record to do more than follow the steady stream of events in its course to the breaking out of the civil war. After twenty-five years, the common-school system of Michigan was then found equipped with all its present agencies save county supervision, in a condition to hold the confidence of the people and challenge the envy of older States, under the administration of Supt. J. M. Gregory, one of the most capable and successful of the remarkable body of public men who during the past fifty years have been called to the educational direction of our Western American civilization. This may be said, that, outside of occasional lapses into indifference and numerous mistakes, the legislature of the State of Michigan during a period of twenty-five years had responded to the growing demand of the most enlightened and determined educational public of any new Commonwealth at that period with commendable promptness.

At the close of his term of service in Michigan, Mr. Sawyer removed to New Orleans, La., where, for several years, he was connected with the new public-school system in that city. He died at his old home in Cambridge, Mass. His brief administration of two years is remembered in Michigan as one of great practical benefit in bringing order and business methods into a department created on a plan too large and independent to fit the conditions then existing. He did what Dr. Barnas Sears accomplished for the schools of Massachusetts after the splendid career of Horace Mann. Superintendent Sawyer seems to have suggested and put on the way to accomplishment in this new Commonwealth, the Massachusetts of the West, the same policy of reform and reconstruction.

His successor, Mr. Oliver Cromwell Comstock, belonged to that noted class of workers in the upper region of American life designated by Washington when he lauded the New England people for their energy and enterprise in "stirring up things," going everywhere and leaving a good report of themselves wherever they went. He was born in Rhode Island in 1781, of an honored family; but his school life was passed in the Empire State, where he graduated in medicine from the University of New York. He began the practice of medicine at Cayuga Bridge, a sort of landmark between the old and the new New York. He soon drifted into law and politics, became a member of the New York legislature, a judge in the courts, and a member of Congress for two years. He entered the Baptist ministry in 1820, at the age of 39, and continued the practice of his three professions, medicine, divinity, and statesmanship, in New York till 1834. He was Chaplain of the National House of Representatives in Washington and spent

two years in the ministry in Virginia on his way "out West," where he officiated as a pastor of a church in Detroit and afterwards in several of the larger towns of the State. He was appointed to the office of State superintendent of public instruction by Governor Barry, in 1843, and served through one term till 1845. In 1849 he again appeared in the State legislature and closed his life of tremendous and versatile activity in 1860, at the age of 79.

One of the most important acts of the Michigan legislature in 1843 was the establishment of the land office, to which was transferred the charge of the entire public estate, including the school lands. This finally limited the duties of the State superintendent of public instruction to the management of the educational forces, leaving the more appropriate work of the direction of the schools with such men as the people, through legislative action, might place at his disposal. A forward step was taken in the new law compelling every township to assess an annual tax of 1 mill on the dollar of its valuation to be appropriated to the district schools to furnish them with improved facilities for obtaining the means to build schoolhouses and meet other necessary incidental expenses; with the additional help of a rate bill to be paid by the parents of children attending school.

An important feature of Superintendent Comstock's work was the publication of the school laws in pamphlet form. The perpetual "tinkering" with this class of statutes was one of the most serious evils threatening the success of the public-school system in the new States.

In 1844 there were 66,700 children and youth between 4 and 18 in the State, of whom 55,500 were reported as in school. The schools were in session four months of the year. But the 55,000 school children were still a "dissolving view," of whose habits of attendance there seems to have been little reliable information. The university was still under a cloud, although men like Lewis Cass appear on the roll of its board of regents. There were 4 professors and 53 students, with 174 young men in the branches. The legislature passed several acts for the relief of the university in its struggle with the constantly decreasing income from the school lands, which were now held at the price of \$12 per acre. The regents of the university rejoiced in the relief thus afforded, whereby the institution was saved from being closed and allowed the use of the remaining \$30,000 of its bonded debt to the Commonwealth. But apart from this relief the university seems not to have advanced either in the number of its students or the attractions of its opportunities.

In April, 1845, State Superintendent Comstock retired, and his place was taken by Mr. Ira Mayhew. This active and able man was born in New York in 1814, educated in the common schools and academies of his native State, and, at the age of 18, entered upon a long educational career as master of common schools, principal of an academy, and county superintendent of instruction. He came to Michigan in 1843, at the age of 29, and after serving as principal of one of the branches of the university, was appointed State superintendent of public instruction by Governor Barry in 1845, and remained in office through two terms, till 1849. His administration may be fitly designated as "a campaign of education." The State was still engaged in the weary struggle of supporting a group of educational foundations in the university and its branches. The chief duty of the State authorities was apparently to keep the hands of the numerous and zealous denominational and private academies out of the treasury of the Commonwealth. The free high or union graded school was still almost a stranger to the system. The new State superintendent took the field in the primitive fashion, on horseback; visited the people, preaching from town to town the gospel of universal education. He performed an excellent service by a course of lectures before the legislature at the State capitol, which were published at the request of his

hearers, under the title, "Means and Ends of Universal Education." Perhaps in the disordered financial condition of the people a second essay was no less effective for good. This essay became a text-book in the schools; was afterwards revised and republished, and its author established a commercial college in Detroit. He dedicated the first union school in the State, and aided in the organization of the first public school in the upper peninsula.

In 1846 the number of school children had increased to 75,770, with 20,000 between the ages of four and eighteen in no school. After all reasonable deductions there were several thousand children and youths in the State growing up in ignorance. And with the quality of teaching that could be obtained for \$12 for men and \$5.25 for women per month, exclusive of board, it is easy to see that the ideal school system had not yet appeared. The annual expenditure was \$90,000. The entire number of school visitations by district and local boards of officials had been less than half the number of the schools. The number of pupils in the township schools was not one-third the number of children of school age. The statute had provided for the establishment of union schools, the first step toward an effective system of secondary public education. The superintendent urged the establishment of teachers' institutes and associations, a teachers' college, and a State normal school. The attendance on the common schools had increased in 1847 to 77,800. They were in session five months in the year and instructed by 6,500 teachers, at a slight advance in salaries. The organization of the Northwestern Educational Society, including all the States of the Northwest, suggested the formation of a State association of teachers. The legislature prepared a document setting forth the condition of the State university, to counteract the hostile influences still at work against it, only 75 students being included in its calendar.

In 1848 the teachers of Michigan formed a State Teachers' Association. The indefatigable superintendent dwells with pride on the work already accomplished by the system of public instruction. Although but little more than 10 years on the ground, he compares the percentage of illiteracy in the whole country and in the different States with that of Michigan to the decided advantage of his own Commonwealth. In 1840 one white adult person of every 31 of the entire population of the United States was unable to read. In the different States the ratio was 1 in 589 in Connecticut, the lowest, and 1 in 3 in North Carolina, the highest. In Tennessee 1 in 4; in Kentucky 1 in 20; in Georgia, South Carolina, and Arkansas, 1 in 5; in Delaware and Alabama 1 in 6; in Indiana 1 in 7; in Illinois and Wisconsin 1 in 8; in New York 1 in 159; in Massachusetts 1 in 90. The drift of ignorant, foreign immigration had already seriously raised the ratio of illiteracy in some of the Eastern manufacturing States; in Maine 1 in 72; in Vermont 1 in 63. In Michigan the proportion was 1 in 29. In the Union, then of 26 States, 20 were below and only 5 above Michigan in the record of general intelligence. The illiteracy of the State was largely confined to a few counties. In several 1 in 5, 1 in 14, 1 in 22, 1 in 36 of the entire adult population was illiterate. In 8 entire counties not an illiterate citizen was reported. There were 7 counties of this sort in Ohio, while in all New England there were but 2; the 1 in Massachusetts, Franklin. There were 13 counties in which only 1 person over 20 in 4,605 of the entire white population could not read, a fact that could be asserted of no other State in the Union. In 3 counties but 1 in 425 was ignorant. In 1845 1 in 4 of the entire population of the State of Michigan had attended school, but 3 States reporting a larger attendance—Maine, New Hampshire, and Vermont. Massachusetts, Connecticut, and New York were in line with Michigan. In this State forty-six forty-sevenths of the entire school population were in the common schools, the highest proportion of any State of the Union, Ohio coming next below—thirty-six thirty-sevenths. In the 3,000 school districts in the State there were 100,000 children and youths to be

instructed. The question arose, shall the State continue to import common-school teachers from the East, or train its own young people for this important work?

The regents of the university reported that the crisis had come when it must be decided whether the branches could longer be sustained. But 4 now remained, and these could not be supported without harmful results to the university.

In 1849 Governor Ransom reported that twice as much for schools and township libraries on the mill tax had been raised as in any previous year. Thirty cents for each child between 14 and 18 had been appropriated by the State. Three times the sum had been raised at township meetings that ever had been before; in all \$12,000 in advance of any previous year. The entire number attending school was 98,000. A medical department had been established in the university. There were 7 professors, but still less than 100 students. There were 17 private and denominational incorporated literary institutions, of which every one in 1848 complied with the statute requiring a report to the educational authorities of the Commonwealth.

In 1849 Mr. Francis W. Shearman was appointed as successor to Ira Mayhew. The retiring superintendent engaged in literary labors and in 1853 became the principal of Allen Academy. In 1854 he was elected by popular vote, according to the provision of the revised State constitution of 1850, to his old position of State superintendent, which he occupied by a reelection in 1856 till 1859. We shall meet him in the record of these important years in the development of the common schools of Michigan.

Mr. F. W. Shearman was born in 1817 and educated at Hamilton College, Oneida County, N. Y. He removed to Michigan soon after his graduation, at the invitation of Hon. H. R. Schoolcraft, as an assistant in his work connected with the Indians of the Northwest. In 1838 he was appointed editor of the Michigan Journal of Education, the official organ of the department of public instruction. He also held the office of county superintendent and other political positions. In 1849 he was appointed State superintendent of public instruction and afterwards twice elected to the same position by the people, having been for six years the executive head of the public school system of the State at his retirement in 1855. He retained his interest in educational and public affairs, often being called to important official duties, until his death in 1874.

The most important act of the legislature in 1850 was the establishment of a State Normal School, by the appropriation of 25 sections of the Salt Spring public lands. It was to be in charge of a board of education appointed by the governor. The lieutenant-governor and superintendent of public instruction were ex officio members, the latter the president of the board. The institution, as first established, contemplated also a department of instruction in agriculture and the mechanic arts, and in the fundamental laws of the United States and the rights and duties of citizens.

In 1850 Governor Barry reported 102,000 children in the common schools and 72 students in the university, the latter receiving \$12,000. The entire expense of a student, with gratuitous instruction, was from \$70 to \$100 a year. The State Normal School was declared coeducational. The superintendent inclined to favor the subsidizing of academies to fill the gap between the primary schools and the university, and still had confidence in the importance of the university branches. He also brought forward the subject of free public schools. In 1850 there were 448 townships, 2,536 school districts, and 102,900 children in the common schools.

The board of the State normal school proceeded at once to locate this institution, at Ypsilanti. This village had pledged to the State an ample lot for school buildings, a subscription of \$13,700, the use of temporary buildings for the normal

and model schools, and the payment of the model school teachers for five years. A memorial from the State Agricultural Society to the legislature prayed for the establishment of an agricultural college. The State superintendent appealed for an increase of salary and clerk hire; but for many years subsequent to this date the salary of the State superintendent of instruction in Michigan was one of the least generous paid by any State in the North.

The city of Detroit had been rescued from its undesirable educational condition and in 1850 reported 18 public schools in operation, 4 under the charge of male teachers at the rate of \$400 and 12 under women at \$200 per annum; 1 school exclusively for colored children. The schools were in operation eight months in the year.

The most important subject treated by the legislative committee on education was the making the public schools absolutely free to all the children and youth of the State. Three of the Northwestern States, with several in the East, had already taken this step and the pressure from the educational public of Michigan was increasing with every session of the legislature. But the report of the legislative committee set forth the difficulties attending the effort. Both the absolute provision for a general tax of 1 mill on the dollar and the permissive law for an additional tax of \$1 per capita for each child of school age were so constantly evaded that the entire avails amounted only to the small sum of \$22,000, leaving only \$11,000 to be appropriated for the support of the schools. This, with the State appropriation of \$39,000 and the contributions from rate bills of \$29,000, gave only \$80,000 for the schooling of 102,000 pupils five months in the year—some 80 cents per capita. The legislative committee proposed a general tax of 2 mills on the dollar as furnishing the least sum that could meet the urgent necessity. The subject went over, to appear in the deliberations of the convention for revising the constitution of the State, and was there disposed of by a provisional arrangement for declaring the public schools free in five years.

A most conclusive testimony to the interest of the public mind on the subject of education, after an experiment of fifteen years in the working of a complete system extending from the country district school to the state university, is furnished by a careful perusal of the debates in the constitutional convention of 1850. The subject of education occupied the convention during its entire session of fifty days and was discussed with an earnestness and intelligence that might challenge the admiration of any State in the Union. The original leaders of the common-school movement, ex-Supt. J. D. Pierce and Hon. Isaac Crary, were members deeply interested and largely influential in the direction of the debate. The result was the adoption of article 13 of the new constitution in twelve sections.

This constitutional provision, with an amendment adopted in 1861, and other sections bearing upon education, are here quoted:

ART. IV, SEC. 40. No money shall be appropriated or drawn from the treasury for the benefit of any religious sect or society, theological or religious seminary, nor shall property belonging to the State be appropriated for any such purposes.

ART. VIII, SEC. 1. There shall be elected at each general biennial election \* \* \* a superintendent of public instruction \* \* \* for the term of two years. They shall keep their offices at the seat of government, and shall perform such duties as may be prescribed by law.

SEC. 2. Their office shall commence on the 1st day of January, 1853, and of every second year thereafter.

SEC. 3. Whenever a vacancy shall occur in any of the State offices the governor shall fill the same by appointment, by and with the advice and consent of the senate, if in session.

ART. IX, SEC. 1. \* \* \* The superintendent of public instruction shall receive an annual salary of \$1,000.

## ARTICLE XIII.—EDUCATION.

SEC. 1. The superintendent of public instruction shall have the general supervision of public instruction, and his duties shall be prescribed by law.

SEC. 2. The proceeds from the sales of all lands that have been or hereafter may be granted by the United States to the State for educational purposes, and the proceeds of all lands or other property given by individuals or appropriated by the State for like purposes, shall be and remain a perpetual fund, the interest and income of which, together with the rents of all such lands as may remain unsold, shall be inviolably appropriated and annually applied to the specific objects of the original gift, grant, or appropriation.

SEC. 3. All lands the title to which shall fail from a defect of heirs shall escheat to the State, and the interest on the clear proceeds from the sales thereof shall be appropriated exclusively to the support of primary schools.

SEC. 4. The legislature shall, within five years from the adoption of this constitution, provide for and establish a system of primary schools whereby a school shall be kept, without charge for tuition, at least three months in each year in every school district in the State, and all instruction in said schools shall be conducted in the English language.

SEC. 5. A school shall be maintained in each school district at least three months in each year. Any school district neglecting to maintain such school shall be deprived for the ensuing year of its proportion of the income of the primary-school fund and all funds arising from taxes for the support of schools.

SEC. 6. There shall be elected in each judicial circuit, at the time of the election of the judge of such circuit, a regent of the university, whose term of office shall be the same as that of such judge. The regents thus elected shall constitute the board of regents of the University of Michigan.

SEC. 7. The regents of the university and their successors in office shall continue to constitute the body corporate known by the name and title of "The Regents of the University of Michigan."

SEC. 8. The regents of the university shall at their first annual meeting, or as soon thereafter as may be, elect a president of the university, who shall be ex officio a member of their board, with the privilege of speaking but not of voting. He shall preside at the meetings of the regents and be the principal executive officer of the university. The board of regents shall have the general supervision of the university and the direction and control of all expenditures from the university interest fund.

SEC. 9. There shall be elected at the general election in the year 1859 three members of a State board of education—one for two years, one for four years, and one for six years; and at each succeeding biennial election there shall be elected one member of such board, who shall hold his office for six years. The superintendent of public instruction shall be ex officio a member and secretary of such board. The board shall have the general supervision of the State normal school, and their duties shall be prescribed by law.

SEC. 10. Institutions for the benefit of those inhabitants who are deaf, dumb, blind, or insane shall always be fostered and supported.

SEC. 11. The legislature shall encourage the promotion of intellectual, scientific, and agricultural improvement, and shall, as soon as practicable, provide for the establishment of an agricultural school. The legislature may appropriate the twenty-two sections of salt-spring lands now unappropriated, or the money arising from the sale of the same, where such lands have been already sold, and any land which may hereafter be granted or appropriated for such purpose, for the support and maintenance of such school, and may make the same a branch of the university for instruction in agriculture and the natural sciences connected therewith, and place the same under the supervision of regents of the university.

SEC. 12. The legislature shall also provide for the establishment of at least one librarian in each township; and all fines assessed and collected in the several counties and townships for any breach of the penal laws shall be exclusively applied to the support of such libraries.

The amendment adopted in 1861 in place of section 6, as above given, is as follows:

SEC. 6. There shall be elected in the year 1863, and at the time of the election of a justice of the supreme court, eight regents of the university, two of whom shall hold their office for two years, two for four years, two for six years, and two for eight years. They shall enter upon the duties of their office on the 1st of January next succeeding their election. At every regular election of a justice of

the supreme court thereafter there shall be elected two regents, whose term of office shall be eight years. When a vacancy shall occur in the office of regent, it shall be filled by appointment of the governor. The regents thus elected shall constitute the board of regents of the University of Michigan.

It is remembered "that this was the first State constitution to provide that all instruction in the district common school should be conducted in the English language;" also, that this is "believed to be the only one ever put in force that makes the election of the president of a State university obligatory upon a board of regents."

The people of Michigan had indeed shown themselves apt scholars in the school of educational experience. The sharp collisions of educational theories and foreign practices with the actual facts of the situation in fifteen years had swept out from the system every feature in which the American had resembled the Prussian scheme of universal education, which had been attempted and claimed to be adopted in 1837. The organization, support, and supervision of every portion of the school system had gradually been made dependent on the direct vote of the people, who, by the revised constitution, were empowered to elect the State superintendent of public instruction, the board of regents of the university, and the board of education, which, with the State superintendent, was intrusted with the management of the State normal school. All local school authorities were elected by the people, and all proper educational affairs under the constitution were committed to the discretion of the legislature. The attempt to exercise supervision over private and denominational schools had been abandoned, and the proposition to subsidize any school outside the State system repudiated. The organization of the State university, as it developed, was made entirely different from that of other State and private colleges. Its presidents were all eminent educators from the East; well acquainted with the improved methods of all similar existing institutions at home and abroad and their adaptation to the university of a new and rapidly growing Commonwealth. No better illustration of the complete organization and working of the American system of universal education is in existence than is now found in the State of Michigan. The provision in the new constitution for a free common school, at the end of five years, for three months in the year was doubtless the most practical and wise disposal of that question under the conditions in the State.

In 1851 the number of pupils attending the common schools of Michigan had increased to 110,000 of the 132,000 between the ages of 4 and 18. The university had been improved by the erection of extensive buildings for the accommodation of the medical department and the appointment of new professors. Its expenditure amounted to \$16,000. The board of visitors discussed at length the present condition of the university. While its opportunity for free instruction opened its doors to every boy in the State willing to make suitable preparations, they ask the question why the attendance should remain so small, only 50, about the original number for the first ten years, but less than the average for the first five years. The largest class yet graduated had been 23 and the smallest 10, and the entire number of graduates 89. They discussed the recent declarations of President Francis Wayland, of Brown University, Rhode Island, concerning the readjustment of the college curriculum. Of the 2,545 recitations and lectures for the year 1850, 1,691 were confined to the ancient and modern languages and the mathematics and 854 to all other subjects; 1,200 to ancient and modern languages. The university was still wedded to the old-time American college curriculum. It was the unanimous opinion of the regents and visitors that the one imperative necessity of the institution was a competent president to administer its affairs and be the representative to the State and the country of the higher education in Michigan.

Hon. Isaac E. Crary had been placed on the board of education, to which was intrusted the management of the new State normal school. The whole number of school districts in the State was 3,097. One hundred and ten thousand children were in attendance on school, although we are not informed whether the attendance was regular or irregular. There were 1,497 male and 2,612 female teachers. The 1 mill State school tax was raised to 2 mills. The salaries of the professors of the university were \$3,333.30 per term, three terms in the year. The State superintendent of public instruction was given an office in the State library, with a salary of \$1,000 per annum, with some additional duties as custodian of the library.

The sketch of the public schools of the city of Detroit, appended to the report of Superintendent Shannon, is full of interest. Previous to 1841 no such thing as a free school was known in the city. There were 29 private and parochial schools, with an aggregate attendance of 700 in a city of 10,000 people. These pupils were being educated at the rate of \$17 per capita, leaving the remainder of the children of school age, at least 1,300 in number, in no school whatever. In this emergency Dr. Zina Pitcher, well known for his services in connection with the State University, at that time mayor of Detroit, and Samuel Dost, esq., for many years president of the city board of education, stirred up the people to a general effort for reform. The result was the establishment in 1842 of the first system of public instruction in this important city. But great efforts were required to awaken the people from their apathy and to counteract the influence of the sectarian opponents of State education.

The critical point of religion in the schools, after a conflict that threatened to wreck the system, was decided by according to the teachers the privilege of using the Bible in religious exercises, with no attempt at explanation. In 1852 there were 2 union schools, 1 located at the old statehouse; 4 middle and primary schools, besides 1 for colored pupils. There were 4,250 scholars in attendance and \$8,000 expended, the cost being reduced from \$17 to less than \$2 per capita. The system had fairly conquered the enlightened public opinion of the city, and hereafter there was no special obstacle to the development of a State system of public-school education in the beautiful and progressive metropolis of Michigan.

An elaborate history of the university up to date, prepared by Dr. Zina Pitcher, accompanied the report of the superintendent of public instruction for this year. Not the least valuable feature of this invaluable document, issued in 1852, under the auspices of Superintendent Shannon, was a pamphlet of 100 closely printed pages containing the school laws of the State, with elaborate notes.

Indeed, few documents so important to the progress of common-school education in any State have been issued as this volume of 640 pages prepared by the superintendent in 1852. It includes a history of public education in Michigan from the earliest Territorial period with abundant extracts from the messages of governors, the reports of State officials, and other documents illustrating the origin and progress of every department of education. It also includes a generous body of valuable information selected from the reports of the most distinguished educators of all portions of the country.

The administration of Superintendent Shannon was one of the most important, not only in executive ability, but in its relation to the most critical period of the development of the system—the clothing of the citizens of the State with a complete power for the development of universal education. Before this able official left his position, in 1854, every department of the system was provided for, with the exception of the county supervision of the common schools. It only remained that the educational ideas enacted as laws should be made a reality through the influence of the educational public upon the legislature and the

vigorous and enthusiastic administration of those intrusted with its executive functions.

The election of Ira Mayhew in 1855 to the office of State superintendent of public instruction, which he had filled by the appointment of the governor from 1845 to 1849, brought back to the service of the State one of the most truly distinguished of the early educators of Michigan. His administration of four years, by reelection in 1857, carries this record to 1859, the period near the outbreak of the great civil war, which so profoundly agitated the people of the Northwest. Superintendent Mayhew believed in magnifying his office, and his vigorous administration added to its dignity. The low estimation in which it had been held in comparison with other offices, shown by its salary of \$500 per annum until 1849, was now overcome, an honorable place being given it for an office in the State library and the salary raised to \$1,000. In 1855 there were 142,000 children in the schools in session five and six-tenths months, with an average attendance of three and four-tenths months. Five thousand and seventy-eight teachers, of whom 3,478 were women, were employed, and more than \$300,000 annually expended. The superintendent urged the admission of young women to the State university and the establishment of union schools. The State normal school had been a success from the first. At its dedication, in 1852, the main address was made by ex-State Supt. J. D. Pierce; and Prof. A. S. Welch, afterwards president of Iowa Agricultural College, was appointed its first principal, remaining till 1865. In 1855 there were 246 students, of whom 214 were women. At the close of the dedication services a teachers' institute, under the auspices of the State board of education, was held in the buildings, attended for three weeks by 250 teachers, under the direction of Principal Welch. This was followed by a law adopting the teachers' institute as a vital part of the school system. The superintendent of public instruction was authorized to hold institutes of not less than 50, or in some cases 25, teachers, for ten continuous days, for which a subsidy of \$2,000, or not less than \$1,800, was made for every year.

Superintendent Mayhew was very efficient in developing this valuable aid to the department of the teaching class, and declared it "the most popular and inspiring feature of our excellent school system." In 1861 the law provided for a five days' attendance, with an appropriation of \$100, and the number might be increased and the State more readily participate in the undertaking. At the Teachers' Institute in Ypsilanti, in 1852, arrangements were made for organizing a State Teachers' Association, and Principal Welch was elected president. This important association has grown with the growth of the common-school system of the State, and its annual meetings have been the occasion of visits of many of the most celebrated educators from all portions of the country and foreign lands.

But the most notable reform in the educational affairs of Michigan between 1852 and 1860 was the change in the administration of the State University. After an experience of ten years, the cumbrous branches had at last been discontinued and the attention of the regents was concentrated upon the development of the system of union and free high schools as a source of supply for the central college. Up to the period of the revision of the State constitution the board of regents had been appointed by the governor and senate. The consequence was that the first board, which held on till 1852, was, as usual, a body of political and public men, with not a member noted for educational experience. With the best intentions, the affairs of the university were handled in the careless way that always accompanies the intrusting of educational administration to nonexperts. The finances were crippled, the attendance was small, there was no proper head of the faculty, and, at the end of fifteen years and the expenditure of several hundred thousand dollars, the people of the State seemed to have little confidence in

the usefulness of the university. It was simply an obscure college of the old-time type, the instruction concentrated on the classic and foreign languages and mathematics, unprogressive and in no special way superior to other institutions of learning in the State which, under private and denominational management, were still its formidable rivals.

The new State constitution provided for a board of twelve regents, elected by the people and representing several districts, to whom was intrusted the entire financial and educational management of the university. Thus at one stroke the central educational institution of the Commonwealth was separated from the mischievous connection with political affairs and shielded absolutely from the legislative action which was the misfortune of so many similar institutions. The constitution also provided for the immediate election of a president. The new board of regents called to the post the Rev. Henry Tappan, D. D., of New York, who during the ten years of his presidency not only laid the permanent foundations of the university but also fully demonstrated the possibilities of the complete success of the State university system in the new northwest.

Up to this period in Ohio, Indiana, and Illinois the State university had been regarded rather as an interloper among the numerous seminaries and colleges of these States than as a permanent agent of the higher education of the Commonwealth. Up to 1852, under its ineffectual administration, the University of Michigan had seemed only to add another to this list of failures. It was doubtless owing largely to the peculiar characteristics of the people of Michigan, so many of whom came originally from the common-school States of the Union, that this condition of practical failure was not perpetuated. As it was, the educational public at the end of a fair experiment grasped the situation, rescued the administration from the uncertain control of the legislature and the politicians, and placed it in the hands of regents chosen for long terms by popular election, and demanded an effective president.

Dr. Tappan was the fit man for the place and occasion. To a broad culture, a large experience, and a high appreciation of the superior education he added an executive capacity bordering on the despotic, with a peculiar charm of tact and intuitive adaptation to the elements of the new Western civilization amid which he was placed. But at the time when he assumed the presidency the university needed all he was on every side of his energetic manhood. He at once broke up the regular system of a fixed curriculum and adopted what had been partially put in operation thirty years before by President Eliphalet Nott at Union College, New York, more recently remodeled by President Francis Wayland, at Brown University, Rhode Island, and for thirty years in operation in the University of Virginia. The proper idea of a university was virtually secured by a college divided into four departments, science, mathematics, philosophy, and language, all united in the preparatory studies, but separated in the higher grades. The attempt to incorporate the German system of the university and gymnasium in the college system of the United States has always ended in a practical arrangement, with an increasing number of elective courses, and in the West and South a preparatory department as the most convenient feeder to the institution. In 1852 the average status of Michigan University was simply what was regarded in the Eastern States an academical system preparatory to college. The chief addition to the college life of the country and the West, under the lead of the University of Michigan, has been what President Tappan called the uniting of the gymnasium with the university; practically the union of a higher grade academy with a college, which was thus able to admit electives and take on some of the features of the European university organization. It was, in short, a school of the practical educational type, by which the people of the United States, while always ready to adopt the best results of the higher European expe-

rience, have always reserved the right of adapting all methods and theories to their own present condition.

President Tappan also insisted on the appointment of professors for merit, and set his face resolutely against the weak compliance with the sectarian idea of making the faculty of a State university the representative of the different religious sects. He called to the different chairs men of proved ability, of whom one was his immediate successor in the presidency, and another the acting president in the interregnum preceding the appointment of President Angell. By personal effort he was able to give the new scientific department an outfit of necessary apparatus. The medical department was formed and the law school established under the direction of professors like Judges Campbell and Cooley. Meanwhile, by public addresses and frequent appearances before the educational public of the State and the nation, he, for the first time, attracted attention to the University of Michigan.

The people responded to this masterly administration. The first catalogue issued under Dr. Tappan's presidency contained the names of 222 students; four times the number in 1850. At the end of the eleven years of his residence there were in the university 30 teachers and 652 students.

It is not necessary to put on record the reasons for the final severing of the relations between the University of Michigan and its first president in 1863. More than one cause could be assigned for this act of political interference, some of them not complimentary to the board of regents and others located in the continued existence of the hostile influences through which the great leader had literally forced his way to the first grand success in the establishment of a State university in the West. The very qualities which at first were indispensable to this achievement might at last become a positive disqualification for the continuance of a man of his type in the place of chief executive. An American State university can not be administered persistently on any line of positive and relentless opposition to any powerful element of the Commonwealth. Its administration demands eternal vigilance, and, with all other endowments, its president requires among the foremost a tact and administrative wisdom that will disarm opposition and root the institution so firmly in the pride and affections of the educational public that it can not be overset by any gust of revolt. The time had doubtless come when a man of a different type was to be found who could represent this ideal of administration.

Such a man was found in Rev. Erastus O. Haven, D. D., LL. D., who became president of the university in 1863 and held the office six years, retiring with the reputation of a notable success. President Haven afterwards held important positions in other universities and rose to the final eminence of a bishop in the Methodist Episcopal Church.

For several years previous he had been a professor in the university, and came to the higher office with a complete knowledge of the existing conditions and, happily, with the ability to handle the conflicting elements that threatened to embarrass his administration.

The subsequent history of the University of Michigan must be left to future treatment in a record of the history of the American common school from 1860 to the present time.

The provision for an agricultural department in the State Normal School was found to be of no practical use, and a demand for a proper State agricultural college secured the placing in the revised constitution of the State a provision for its establishment. A situation and buildings were obtained on an estate 10 miles from Lansing, the State capital, and \$100,000 was invested in the institution from the sale of the salt-spring lands and the legislative appropriation.

The institution was dedicated, and in 1857 the first State agricultural college in

the Union was set up on a farm of 676 acres, with several spacious buildings, under the direction of the State board of education.

Hon. Joseph R. Willis was appointed president, with a faculty of four professors.

Up to 1861 the new college had "a hard road to travel." Political jealousies and class prejudices fought it at every step, and the necessary legislative appropriations were obtained with great difficulty. But in 1861 the institution was taken from the supervision of the State board of education and placed in charge of the State board of agriculture.

In 1862 the passage of the bill by the Congress of the United States for national aid to agricultural and mechanical education gave to Michigan 240,000 acres of public lands, which furnished an ample income for the support of the college. The retirement of President Willis and appointment of Rev. T. C. Abbott in his place seems to have finally placed the agricultural college on a solid foundation, and it now holds an honorable place among similar institutions in the country.

Although defeated in their attempt to obtain subsidies from the State and baffled in their early rivalry with the university, several colleges and a larger number of seminaries established and supported by the zeal of the different religious denominations of the State were on the ground previous to 1860. Several attempts have been made to connect them in some educational way with the State system of the higher education, but hitherto without result. This fact must be taken into account in the estimate of the educational progress of Michigan previous to the civil war. The system of graded and union schools and their higher grade, the free high school, up to this period in its infancy, was afterwards developed into the most efficient feeder of the university by an arrangement for the acceptance of their graduates without examination from all approved high schools.

The State reform schools and asylums for the deaf, dumb, and blind had already been established in 1860. The good fortune of the educational system of Michigan during the twenty years from its establishment in 1837 till the retirement of Superintendent Mayhew in 1858 culminated in the election of Dr. John M. Gregory to the position of State superintendent of public instruction in 1859.

Dr. Gregory was born in the State of New York, in 1822, and was eminent among the large group of distinguished graduates of Union College under the presidency of Eliphalet Nott. In 1852, at the age of 30, after several years of experience in teaching and preaching, he established a classical school in the city of Detroit. In 1854 he projected the Michigan Journal of Education, of which he was the editor in chief for five years. In 1859 he was elected to the office of State superintendent, which he retained until 1864, when he retired to the presidency of Olivet College; afterwards to the presidency of the Illinois Industrial University. It was indeed fortunate that the State of Michigan, during this period of the civil war, which not only "tried men's souls" but brought a severe strain especially upon the educational organizations of all the new States, should have had at the helm of the school ship a pilot like John M. Gregory. No man among the great number of valuable educators in the new States beyond the Alleghenies has filled a crowded public life with a more enviable reputation. He brought to the work of common-school supervision in Michigan an acquaintance with the improved methods of organization, discipline, and instruction included in the popular phrase "the new education," more thorough and broad than any of his predecessors. The common school had now become a great public interest, and the time was at hand when the final question of the quality as well as the quantity of the education dispensed to the children and youth should be carefully considered. Although during these tremendous years, when the State was pouring forth her best blood for the defense of the Union, there could be no rapid advancement in the outward development of the system, it was much to keep the

great machine together, and amid the excitements of war and politics hold the people up to their obligation to the children, upon whom the results of this revolutionary epoch were sure to fall. Dr. Gregory's six reports, containing 400 pages, apart from their local interest have taken a high place in the present educational literature of the country. No mass of writing on public education in any age or land in practical value and inspiration can surpass the great body of the reports of the State and city superintendents of schools in the United States, the papers read and debates in the numerous associations of educators, legislative reports and addresses, and especially the great debates in the Senate of the United States on national aid to education from 1880 to 1890, during the sixty-five years from the beginning of the great revival of the common school in 1835 to the present day, and here the writings of Dr. Gregory have a unique and permanent value.

In 1860, after twenty-five years of the common school, the State of Michigan could report 4,000 common-school districts, 246,000 children and youth of school age, one-third of the entire people of the State from 4 to 18, with 184,000 in school attendance, 2,000 school-teachers, and 12,000 officials connected with the system; \$467,000 were paid for teachers' wages and nearly \$1,000,000 expended in all the departments of public instruction of the State. There were 430 students in all departments of the State University and 287 in the normal school, largely free and self-supporting.

No American Commonwealth had more and better reasons for rejoicing over the progress of popular education than Michigan, which in half a century had risen from a wilderness to one of the most favored and progressive States of the Republic.

#### WISCONSIN.

On May 28, 1848, the Territory of Wisconsin, a vast wilderness of 56,040 square miles, thinly inhabited by 30,500 people, was admitted to the Union. The constitutional provision for public instruction, dating from May 29, 1848, and here quoted, was one of the most complete and progressive measures yet adopted by any new State:

#### ARTICLE X.—EDUCATION.

SECTION 1. The supervision of public instruction shall be vested in a State superintendent and such other officers as the legislature shall direct. The State superintendent shall be chosen by the qualified electors of the State in such manner as the legislature shall provide. His powers, duties, and compensation shall be prescribed by law: *Provided*, That his compensation shall not exceed the sum of \$1,200 annually.

SEC. 2. The proceeds of all lands that have been or hereafter may be granted by the United States to this State for educational purposes (except the lands heretofore granted for the purposes of a university), and all moneys and the clear proceeds of all property that may accrue to the State by forfeiture or escheat, and all moneys which may be paid as an equivalent for exemption from military duty and the clear proceeds of all fines collected in the several counties for any breach of the penal laws, and all moneys arising from any grant to the State where the purposes of such grant are not specified, and the 500,000 acres of land to which the State is entitled by the provisions of an act of Congress entitled "An act to appropriate the proceeds of the sales of the public lands and to grant preemption rights," approved the 4th day of September, 1841; and also 5 per cent of the net proceeds of the public lands to which the State shall become entitled on her admission to the Union (if Congress shall consent to such appropriation of the two grants last mentioned), shall be set apart as a separate fund to be called the school fund, the interest of which, and all other revenues derived from the school lands, shall be exclusively applied to the following objects, to wit: First. To the support and maintenance of common schools in each school district and the purchase of suitable libraries and apparatus therefor. Second. The residue shall be appropriated to the support and maintenance of academies and normal schools and suitable libraries and apparatus therefor.

SEC. 3. The legislature shall provide by law for the establishment of district schools which shall be as nearly uniform as practicable, and such schools shall be free and without charge for tuition to all children between the ages of 4 and 20 years, and no sectarian instruction shall be allowed therein.

SEC. 4. Each town and city shall be required to raise by tax, annually, for the support of common schools therein, a sum not less than one-half the amount received by such town or city, respectively, for school purposes from the income of the school fund.

SEC. 5. Provision shall be made by law for the distribution of the income of the school fund among the several towns and cities of the State, for the support of common schools therein, in some just proportion to the number of children and youths resident therein between the ages of 4 and 20 years, and no appropriation shall be made from the school fund to any city or town, for the year in which said city or town shall fail to raise such tax, nor to any school district for the year in which a school shall not be maintained at least three months.

SEC. 6. Provision shall be made by law for the establishment of a State university, at or near the seat of the State government, and for connecting with the same, from time to time, such colleges in different parts of the State as the interests of education may require. The proceeds of all lands that have been or may hereafter be granted by the United States to the State for the support of a university shall be and remain a perpetual fund, to be called the "university fund," the interest of which shall be appropriated to the support of the State university, and no sectarian instruction shall be allowed in such university.

SEC. 7. The secretary of state, treasurer, and attorney-general shall constitute a board of commissioners for the sale of the school and university lands and for the investment of the funds arising therefrom. Any two of said commissioners shall be a quorum for the transaction of all business pertaining to the duties of their office.

SEC. 8. Provision shall be made by law for the sale of all school and university lands after they shall have been appraised, and when any portion of such lands shall be sold and the purchase money shall not be paid at time of sale the commissioners shall take security by mortgage upon the land sold for the sum remaining unpaid, with 7 per cent interest thereon, payable annually at the office of the treasurer. The commissioners shall be authorized to execute a good and sufficient conveyance to all purchasers of such lands and to discharge any mortgages taken as security when the sum due thereon shall have been paid. The commissioners shall have power to withhold from sale any portion of such lands when they shall deem it expedient, and shall invest all moneys arising from the sale of such lands as well as all other university and school funds in such manner as the legislature shall provide, and shall give such security for the faithful performance of their duties as may be required by law.

In this elaborate statement did the people of the new commonwealth of Wisconsin record their deliberate purpose to adopt universal education as the chief corner stone of the State:

1. The common school through all its departments, from the elementary district school to the State university, with a normal annex for the training of teachers and a provision for public libraries. 2. That each town or city should raise by tax a sum not less than half the amount received from the State for school purposes, and the neglect to do this should forfeit the rights to share in the distribution of State funds. 3. The schools of all grades should be free to all persons between the ages of 4 and 20. 4. No sectarian religious instruction should be allowed in any public school or in the State university. 5. A State university should be established and a connection be formed between it and "such colleges in different parts of the State as the interests of education may require." But the provision against sectarian instruction in the State university would seem to bar out the public support or subsidizing of any denominational seminary or college. 6. The secretary of State, attorney-general, and treasurer should constitute a board of commissioners for the sale of school and university lands, and the investment of the funds derived therefrom. No constitution hitherto adopted by any State beyond the Alleghenies had so thoroughly embodied the fundamental ideas of the American system of universal education as this of Wisconsin.

Immediately on the admission of the State to the Union a school law was

enacted, in 1848, which rendered inoperative the three different systems of school statutes under which the territory had administered its educational affairs. This law authorized the division of the township into school districts, and the management of local affairs by the people. It provides for reporting of district school affairs, first to the town superintendent, then to the clerk of the county board of supervisors and by him to the State superintendent of public instruction; a provision that made the collection of reliable school statistics a practical impossibility.

The first report of the State superintendent of public instruction, Mr. M. E. Root, in 1849, opens with a notice of this defect, and gives a very unsatisfactory account of the educational condition of the State. Through the partial reports of the 25 counties, 266 towns containing 1,430 whole and 455 fractional districts, were heard from; 350 towns and 102 districts failed to report. It was roughly estimated that there were 46,000 pupils in attendance on the schools, and 80,450 between the ages of 4 and 20. The city of Milwaukee was still a village of 5,000 people. The average term of the schools was 3.93 months, ranging from 12 to 0.33 of a month. In Rock County 75 per cent of a school population was in school, and 54 per cent of the entire number in the State. Male teachers were paid \$15.22 and female \$6.92 a month; \$181,637 was invested in schoolhouses, of which 704 were reported; 36 built of brick, 25 of stone, 296 frame, and 359 log; costing from \$5,000 to 75 cents each. Brown's and Kirkham's grammars, Adams's arithmetic, Sanders's readers, Webster's speaker, and Morse's geography were the favorite text-books. There were 94 incorporated private schools in the State, with 2,357 pupils—2.72 per cent of the entire school population. The State school lands had not yet been sold, and the expenses of the first year's school keeping had been met by taxes on the property of the district and private subscriptions. The State had collected \$17,000 and the local tax amounted to \$27,000—\$44,000 being the entire amount of expenditure for public education.

It was estimated that the 1,523 school sections of public lands if properly sold and invested would produce a school fund of \$5,000,000 and that, by the year 1850, the State would be able to distribute \$30,000 of the income of the fund thus secured. The superintendent announced that the education of the 91,000 children of school age in 1850 at \$3 per capita, would require an income of \$273,000, and by 1860 the income of the State fund would not meet half the expense of the common schools. The new law provides that the township should be divided into school districts, and three school directors should be chosen by popular election for each district; that a school tax providing not less than one-half the sum received from the State should be raised from each district as a condition of sharing in the distribution of the annual income of the general fund; that each town and city should choose by annual election a superintendent of education who should examine and issue certificates to teachers; that orthography, reading, writing, arithmetic and grammar should be taught in all schools. No distinct provision was made for union, graded, or high schools; but, as the law insured an education to every person till the age of 20, the power to organize for the superior grades of instruction was implied, and several of the larger towns of the State at once entered upon the work of grading their schools.

The usual defect of the lack of competent teachers appears in the earnest demand of the State superintendent for the establishment of teachers' seminaries. The State university was empowered by the constitution and laws to establish a department of pedagogy, and the superintendent looks to this source of supply with a misplaced confidence, for the university school lands had already entered on the mischievous career of waste and speculation that delayed for years any efficient development of the institution. Indeed, without the stimulus of the act of 1862, for the endowment of agricultural and mechanical education

by the congressional gift of national public lands, it is not easy to see how the State University of Wisconsin could ever have been established on a substantial foundation. The provisions of the constitution for a department for the "training of elementary instructors," opened at first to young men, but finally to women for five months in the year, including the enjoyment of instruction and lectures by the different faculties and a diploma on graduation, declared that it was the "fundamental idea to make the university subsidiary to the great cause of popular education by making its normal department the nursery of the popular mind, and the central point of union and harmony in the educational interests of the commonwealth." For some reason the university idea was not popular, encountering on the one hand the usual prejudice against the support of the higher education by the State, and on the other the rivalry of the seminaries and colleges already established by the different religious denominations.

One of the most valuable features of this excellent report by Superintendent Root was the published correspondence with a number of the leading educators of the country, including Horace Mann and Henry Barnard, especially concerning union schools. It was shown that by a proper organization of elementary schools, taught by women, with a central township school of higher grade under a master, eight months of instruction could be secured by the judicious use of the present means. If there has been one point on which the judgment of American educators of all sorts has been practically unanimous it is the wasteful and ineffectual system of the dissipation of the school funds of the township among several districts, practically isolated from each other, and without central control, which has been the popular ideal of educational "independence."

An admirable letter from Mr. George B. Emerson of Boston, which accompanies this report, is full of ideas that set forth the best practical methods of teaching. He says "There is no reason why all that is now done in the most costly and select schools should not be done in all the common schools of whole States. There is, on an average, as much capacity among the children of a country village as in those of the foremost city of the world. There is probably more ability to teach among the females to whom the children of the common people are intrusted, than among the men who have charge of the children of the favored classes." He urges the impolicy of the State to give itself up to a uniform style of school-books, since "Schoolbooks may be made in Wisconsin better adapted to the needs of its children than any now in use." There is a fearful waste of time in the false methods of teaching spelling, grammar, and arithmetic. "All time spent in oral spelling is lost." Grammar should be taught orally till the age of 12. In the place of the eternal "ciphering," which is the evil genius of the schools, should be substituted mental arithmetic, and drawing, with the application of school studies to the business of life. He sketches a course of study for the graded and high schools which is a generation in advance of what is now in operation through half the Republic. This testimony of Dr. Emerson, himself a distinguished master of a famous school for the daughters of the most favored class of the then most cultivated city of the Union, is important to the last degree.

Superintendent Root quotes, in the same letter, a passage discussing the selection of text-books to the effect—"Booksellers are a difficult class to get along with, at any rate"—a prophecy of the unspeakable entanglement into which every State of the Union has been involved which has adopted the system of even recommending a uniform system of schoolbooks.

The superintendent strikes at the weak point in the State normal school system in the remark—"The temptation will be to turn out large grists, coarsely and rapidly ground." He recommends institutes of 100 teachers held for ten days in succession. Horace Mann, then in Congress, and a distinguished conductor of teachers' institutes in New York assert that the schools of those States have

been most improved by teachers' institutes and city superintendency. Hon. S. S. Randall, of Cortland, N. Y., the biographer of Thomas Jefferson and superintendent of schools of the State, dilates at length on the importance of county superintendency of education and ascribes the defeat of the first experiment of New York in that line to the neglect of the people to elect suitable men for the office. Mr. J. B. Fowle, of Massachusetts, and Professor Swett, of New York City, are quoted as of the highest professional reputation as conductors of teachers' institutes. This report of Superintendent Root is a most valuable document, including the experience of this official before his election to his position as a fit testimonial to his previous services in the cause of universal education in the Territory.

Superintendent Root remained in office three years longer, until 1853. During the second year of his administration the school term increased 27 per cent, the number of children attending school nearly doubled, and the outlay for public education was nearly quadrupled, reaching the sum of \$149,000. By act of Congress, the State received the gift of the unsold swamp and overflowed lands within its borders—a most valuable benefaction, as out of it was afterward developed the ample normal school fund of the State. The indefatigable superintendent made a tour of the Commonwealth. He visited 15 of the 23 counties, everywhere inspecting schools, making addresses, and forming reliable organizations among the progressive friends of education. He comments almost with contempt upon the quality of the average school. "The great body of the youth of the country continue in school from the age of 5 to 16, and not 1 in 20 of them is qualified by the education he receives there for the transaction of even the ordinary business of life in a respectable manner." The defect is in the incompetency of teachers, the clumsy methods of instruction, and the lack of thorough organization. He returns to his urgent plea for the proper gradation of township schools, and insists on the necessity of some effective system for training teachers. The regents of the university announced that a department of instruction would be opened in 1850, the buildings already being under construction. The superintendent protests against the niggardly provision for his own office, his salary being limited by the constitution of the State to \$1,200, with no allowance for traveling expenses, clerk hire, and the proper furnishings of his official rooms. On retiring from his superintendency, Dr. Root had the satisfaction to announce that, since 1848, the wages of male teachers had advanced 14 and of female 35 per cent; the attendance on the schools had risen from 32,000 to 80,000, and 20 per cent gained in the length of the school term. There were 2,300 schools, with an average of 50 pupils, with twice the number of teachers; the winter schools generally taught by men, and the summer by women. He urged the propriety of a county board of examiners of teachers, and complains of the unreliability and confusion of school statistics.

The office of State superintendent for the coming two years was filled by Mr. A. P. Ladd. The new superintendent opens fire in a vigorous exposure of the condition of the average schoolhouse. According to his description it seems to have been generally located on the same principle as the old-time New England graveyard, on land that could be used for no other purpose. The average length of the school term had reached five and one-half months in 1852. Superintendent Ladd recommends a series of school readers, of course, different from that approved by his predecessor. He also differs from the suggestions of Superintendent Root concerning the establishment of a graded school in each township, thinking it impossible, and suggests what has been, so often advocated, but rarely, if ever, adopted, a general system of county high schools. The common school fund of the State had now reached \$819,000, and the university fund had secured, out of the wreck of its noble land endowment, the meager sum of \$45,000 as the entire capital for inaugurating the higher education of the State.

In 1853 the number of counties in Wisconsin had increased to 45 and there were 97,800 children and youth in regular and irregular school attendance; \$175,000 was annually expended. Of the 2,200 schoolhouses 900 were still built of logs, and but 150 of brick and stone. An interesting controversy between the General and State Governments had sprung up concerning the disposition of the public school lands. The university fund consisted of 72 sections—two entire townships, with some addition of saline lands. The commissioners for the sale and investment of the school lands seemed to have been afflicted by gross incompetency or indifference to the cause of education; their chief interest being, probably, to increase the population of the State by attracting immigration at all hazards. Speculators were absorbing great tracts of this precious estate in quantities from 5,000 to 40,000 acres, and the despoiling of valuable timber lands went on almost unnoticed. But in a State as large as a European kingdom, virtually an all-out-door wilderness, we may not too severely comment on the eagerness of the people to “get out of the woods” into “broad daylight” and find themselves in company with a moderate number of their fellow-beings, as a relief from the perpetual conflict with all sorts and conditions of human nature. But the results were the same in Wisconsin as elsewhere. The children of the early generations of the State were compelled to grow up with a meager outfit, as far as the quantity and quality of schooling was concerned. Still, the great stream of immigration was setting in, like the torrent of the Father of Waters at flood tide, toward the States included in the mighty empire by the Great Lakes.

Superintendent Ladd urges a complete revision of the school laws of the State, and protests against the hopeless overwork and underpay in his own office. He quotes a formidable collection of testimonials concerning the subject of township superintendency from the leading educators of several States, and complains that his suggestions in this and other matters have been neglected by the previous legislature. His second report is almost barren of statistics, being mainly a treatise on schoolhouses, teachers, school government, and superior methods of instruction. The promised effort on the present conduct of the schools, for some reason, was not forthcoming. He had visited 23 counties and assisted in institute work. Although nearly every county was now engaged in this useful enterprise to some extent, the legislature still failed to recognize or encourage it by an appropriation. Owing to the same unwillingness to appropriate money, the State normal school still remained only a promise.

A State teachers' association was formed in 1852. The proposition to establish a county high school never came to a vote. Owing to the lack of funds, the State university was obliged to charge tuition for all studies. The superintendent declares that the public school is still, to a large extent, an object of social distrust and prejudice. “The children of the wealthy seldom enter it, or are early removed to private or denominational institutions of learning.” In the city of Milwaukee, out of a school population of 12,600, but 4,640 were in the public schools, and quite as many in private and church seminaries. But the city of Kenosha educated four-fifths of its 4,000 children in the public schools, paying \$700, and Racine \$800, as salaries of superior teachers. Superintendent Ladd bade farewell to his important office with an urgent plea to parents to interest themselves in the fundamental duty of training their children for good citizenship in the common schools.

In 1854, Mr. H. A. Wight was elected to the State superintendency. He published still another list of schoolbooks, apparently an improvement on previous recommendations; all of them amounting simply to the expression of a hope that the great variety of text-books could be somewhat limited and uniformity somewhat promoted. The serious evil of irregularity of attendance is noticed and reform called for, but with no apparent effort to ascertain the proportion of the

average daily attendance to the enrollment, on which the efficiency of any school system so largely depends. Owing to the refusal of the legislature to afford the needed outfit, the project for a university normal school department still remained a castle in the air. Of 152,000 persons between the ages of 4 and 20, 101,000 were in attendance on the common, and 5,000 in private schools. The report contains an appendix on schoolhouse architecture, with plans. The death of Mr. Wight terminated his occupancy of the office of State superintendent at the end of his first year's service.

His successor was Mr. A. Constantine Barry, who reports, in 1853, that there are 45 organized and 10 unorganized counties in the State, with 468 towns and cities and 3,584 school districts. Of the 186,000 persons of school age, 122,000 were still in school.

The school fund, despite the operations of the "land sharks," had now reached the sum of \$1,897,000. The new superintendent protests that fourteen to sixteen hours' work a day is a hardship from which he and his subordinates should be relieved by a more generous provision for the support of the office. The university at last had made a feeble effort at the establishment of the long-heralded department of instruction, in the assignment of its duties to Professor Reed, the occupant of the chair of English, with an additional stipend of \$500. The head of the university from the first had been President Lathrop, called from the presidency of the University of Missouri.

Superintendent Barry also engaged in an interesting correspondence with President Andrews, of Marietta College, Ohio, and Henry S. Randall, of New York, chiefly on the advantages of county superintendency of schools, and says, with notable common sense, "There is no economy in saving a dollar to each head of a family by a system of common schools in which it will take ten years for its children to obtain the education they get elsewhere in five years." The early superintendents of public instruction in the new Western States were greatly aided by their habit of extensive correspondence with the more experienced educators of the original public-school commonwealths. In his first report Superintendent Barry publishes valuable documents from J. L. Pickard, principal of Plattville Academy—the first appearance of this eminent educator before the educational public of the State and country; from Prof. P. R. Hoey, of Racine, on schoolhouses; Professor Baird, of the Smithsonian Institution, of Washington, D. C., on the study of natural history in common schools; and from the superintendent of instruction in the City of New York, Hon. S. S. Randall.

In his second report (1856) Superintendent Barry publishes a series of circulars addressed to local officials, to obtain more reliable information concerning the condition of the schools. He writes, "from a personal inspection of the schoolhouses in many parts of the State, I know that they are mean and murderous things, the most of them." He urges the establishment of normal schools beyond the meager arrangements at the university, and presses the importance of county supervision and the grading of schools. He blurts out, "We learn from this exhibition of the wages paid to teachers that the man who saws our wood and takes care of our horses and cattle, or the female who presides in the kitchen or dairy, as a general thing receives more per month than the teachers of our children." He writes, in earnest, advising music in the schools; and quotes, at length, from the replies of school officials to a list of searching questions by the superintendent.

The report of 1857 is chiefly devoted to "The presentation of a few thoughts on the general subject of education, and the duties and responsibilities of parents and committees." His promise of a supplement to this document was not performed, and in 1858 Mr. Lyman C. Draper appears in his place.

The administration of Superintendent Draper was eventful as connected with

the appearance of Hon. Henry Barnard in Wisconsin as president of the State University and director of institute work. No Eastern educational character had ever "gone West" with a more magnificent heralding than this great compeer of Horace Mann. It is interesting to contrast the circumstances under which these two veterans in the great revival of the common school left New England during the same decade, memorable in the history of the cause of universal education in the Northwest.

After a dozen years of such work as few men have lived through as first secretary of the Massachusetts Board of Education, and a four years' political "outing" at Washington as a member of Congress, Horace Mann had been left by a conservative lurch in the politics of his State stranded in public life, broken in health, and almost bankrupt in fortune; his only apparent recourse in what appeared to everybody save himself the hopeless task of organizing a college, founded by a religious body absolutely without experience in the management of educational institutions; as a business enterprise doomed to failure from the beginning; an experiment with no public backing and abundant promise of strong opposition. Even to-day some of our notable educational leaders talk of his life at Antioch College as a mistake, and deplore the fact that he had not been willing to "sulk in his tent" until an opening could be found, perhaps, in the presidency of a New England College, or the principalship of one of his own normal schools. But it is doubtful if the removal of any educator during the past fifty years from New England to the West has borne such fruit in the most vital region of the organization of the higher education demanded by a new country, as this latter-day toil and sacrifice of Horace Mann, crowned by the pathetic scene around his death bed on a summer day of 1854.

The coming of Henry Barnard to Wisconsin, on the contrary, was perhaps the most promising in its outlook of any similar event in the history of American education. He came, not from disgust and defeat at home, but at the close of a dozen years of notable service in Connecticut and Rhode Island; widely known from his frequent personal visits and voluminous writings in every portion of the country, and not unknown abroad. He had never mingled in partisan politics, and was in no way obnoxious to the educated evangelical religious people of New England or the West. His mind was of that cosmopolitan structure which, married to a temperament extremely amiable and disposed to see the best everywhere in everybody, gave to its possessor a rare and perilous capacity of exciting great expectations founded on an excessive popularity. His appearance was heralded by an elaborate biographical sketch in the first voluminous report of Superintendent Draper, in which the young Commonwealth seemed to rise up to hail the already veteran educator, who came like the wise men of the East to bear gifts of wisdom and prophecy to its children.

But without any disparagement of the result of his brief career, especially in lifting the teachers' institute to a more vigorous life and gaining a wider publication for his great work, the *American Journal of Education*, it is not easy to discover that the educational affairs of the State or even the university were either greatly stirred by his appearance or especially retarded by his failure from bad health to continue at his post. In fact, Dr. Barnard, considered as an executive educator, even in New England, is now chiefly interesting as a background to his great fame as the foremost literary representative of the American system of universal education. Every term of his public service everywhere seems to have been used largely as a new occasion to put forth another section of that marvelous "story without an end," to which his life, as collector and distributor of the world's educational experience, has been devoted for the last more than sixty years. It was far better that Dr. Barnard should be spared from the failures and inevitable reactions of public opinion to which any man, however eminent,

must have been exposed under similar circumstances, that he might henceforth keep on in the widening highway of American educational journalism and historical investigation on which he had already entered.

Indeed it is not evident that a State like Wisconsin, so liberally endowed with able and practical leaders in all departments of public life, would have been especially benefited by the continued residence of such a guide. The State superintendent of public instruction, Dr. Draper, was certainly a Nestor in the very field where Dr. Barnard was chief. His first report is one of the most valuable educational documents ever put forth in any State: especially interesting as showing the omnivorous reading and eager interest with which the foremost men in this new field of educational effort were gathering in and adapting to home use the theories and experience of all countries. It is a stout volume of 400 pages, filled with information, not only valuable to the legislator (if he often reads such elaborate reports), but an encyclopedia for reference by every student and every public man who aspired to instruct the people on this ever-fresh topic. His correspondence seems only to have been limited by the number and rank of the educators, who replied always with courtesy and often with thoughtful suggestions to his inquiries. His reading was wide, and he spared no tax on the patience of his readers in putting before them the results of his own investigations and experience. His statistics were elaborate; especially from States where the science of educational statistics was already appreciated and cultivated. And if there remained in Wisconsin any considerable class of people who were known beyond their own little home circle as open opponents of the American system of universal education, it might be said of Superintendent Lyman Draper in educational, as of Theodore Parker in theological controversy, by Lowell, that, "He banged his opponents with the whole tree of knowledge torn up by the roots."

But the administration of Superintendent Draper was not alone a literary gift to the cause of education in Wisconsin. During these two years the legislature passed an important law for the establishment of district school libraries, whereby 10 per cent of the entire State appropriation for schools was given for the purchase and distribution in libraries of good books for the children, amounting to \$35,000 for the whole State. His progressive spirit and prodigious energy were all needed to arrest a wave of discouragement that was sweeping over the State, from financial reasons and the falling off of immigration. He published a new edition of the school laws, with annotations and much needed explanations from his own experience. He caused 600 copies of Webster's Unabridged Dictionary to be distributed among the schools. He seems to have wrought in full sympathy with Dr. Barnard in his extended service among the teachers in the institutes. Of a population of 900,000, 175,000 children were gathered into the schools.

The first conclusion by the Western superintendents of public instruction concerning the neglect of the schools by the people appears to be somewhat exaggerated. The legal school age, 4, 5, or 6 to 21, was itself misleading. No State to-day holds any considerable portion of its children in public schools beyond the age of 14. The State of Maine has boasted of the largest per cent of children from 6 to 14 in "average daily attendance in the schools." Even Massachusetts is obliged to account for 20 per cent of absenteeism at that limited age. When Superintendent Draper declared that one-third the children of Wisconsin in 1859 "were growing up in ignorance," he probably meant that one-third of the persons between 4 and 21, at any given date, were not to be found in the schoolroom. But of the large number between 14 and 21 not in school, doubtless many had in some degree been there at an earlier age and were now beginning the life of hard work in a new commonwealth, which was the lot of the average Western boy and girl half a century ago. When he says that there were 1,000

children in one county which were not sent to school because of the poverty of their parents, he touched a permanent cause of the neglect of education by the poorer class of immigrants, who even in the great centers of metropolitan culture would have enslaved their offspring to child labor were it not for the benevolent legislation of several States for the protection of the children against the twin curses of overwork and vagrancy. The most dangerous features in the early years of the common school in the West, as now in the South, were and are the incompetency of teachers and the irregularity of attendance. In a sparsely-settled country, especially in the earlier years of the great Northwest, the difficulties of school attendance, especially in midwinter, were simply appalling. What with uncomfortable schoolhouses, insufficient clothing, long distances, and bad roads, the temptation for parent and child to keep snug at home was almost irresistible. With all these drawbacks the experienced educator of to-day reads with great admiration and often with amazement the inspiring record of the founding and growth of that greatest agency of Western civilization—the common school.

The promotion of Mr. J. L. Pickard from the principalship of an academy to the State superintendency of public instruction, in 1859, which dates the beginning of a career of great usefulness in the most responsible positions, extending through an entire generation, was a great good fortune to the State. His first report, December, 1860, showed that a practical educator was at the helm. The ordinary topics in every document of this description were here treated in such a vital and broad manner as turned attention to the causes of acknowledged defects, with the sober and practical suggestions of at least the beginnings of a reformation. These qualities at once challenged the confidence of the educational public and account for the esteem, amounting to strong personal friendliness, in which Dr. Pickard has always been held in the Northwest. He went to the heart of the matter in exposing the almost incredible ignorance and inexcusable carelessness displayed in the attempt at making up reports by numbers of the local school superintendents. "The reports not infrequently exhibit an average of from fifteen to fifty months of school during the year, or an equally incredible degree of attendance of pupils." "The county clerks simply copy the reports sent them by the town superintendents. The town superintendents copy the reports of the district committees." Even in such "plain sailing" as the enumeration of the children from 4 to 21, and the length of the school term, instances appear of more than twelve months school in a year, a condition that would have been ideal for Horace Mann, who was always longing for "an almanac with more than three hundred and sixty-five days and twelve months in the year." He puts his finger on the source of this chronic shiftlessness in the fact that there are 13,500 officials connected with the present school system of the State; the majority without or receiving only a petty salary. Of these, 5,000 town superintendents and district committees stood nearest the schools. The weakest point in this ceaseless chain that pretends to link the district schoolhouse with the statehouse is the town superintendent. He was a man elected annually, with undefined duties, the chief of which was the examination of teachers and the distribution of school funds to the districts. Superintendent Pickard exposes the sham that this department of school administration has become, and proposes to transfer the examination and certification of teachers to a county superintendent, and the clerical and financial functions to the town clerk. The testimony of the ablest educators of the State and most competent superintendents of the leading States was almost unanimous in the condemnation of this system.

One important topic named by Superintendent Pickard accounts for a great deal of inefficiency in local administration. "The town superintendency is an office that occupies but little time, not enough to interfere sensibly with other

duties, without furnishing compensation that will warrant a suspension of regular business." The era of development in new countries, where every man of ability is expected to answer the call to distribute himself all over the field of public service, soon passes away. All success in local administration, educational or otherwise, is in proportion to the ability of the occupant of the office, and his power to serve the public without the risk of financial ruin to himself. Many of the town superintendents were themselves teachers, and the manifest impropriety of placing one of the schoolmasters of a county town as a "court of last resort" for all his associates would seem to be evident. A careful estimate shows that an effective county superintendency could be established at a trifling excess of expense to that almost wasted on the township superintendency.

The good work of school grading was going on. One town in seventeen in the State reported a high school which, although, of course, not up to a city standard, was still an advance on the ordinary district ungraded arrangement, probably the worst possible. Nine years before there was but one graded school in the State, at Kenosha, and in 1859 the superintendent writes: "Nearly all our cities and many of our villages are now able to say that their schools will not suffer by comparison with those of our older neighbors." Superintendent Pickard seems to have been the first official of the State to fully realize the difference between school enrollment and average attendance, the neglect of which is the stumbling-block of all communities at the first establishment of the common-school system. He writes: "Out of 130,000 scholars registered or enrolled in the schools of the State, only 59½ per cent, 77,090, are actually in the schools. There are in all the schoolhouses seats for only 69½ per cent of the registered scholars, 90,350. The pupils registered from 4 to 6 years of age constitute 16.02 per cent of the whole, from 16 to 20—6.¾ per cent. The tender age of the great mass of school children accounts largely for irregularity of attendance. A better classification of pupils, improved schoolhouses (27 per cent of the whole being registered as 'poor'), and a wholesome revival of interest among multitudes of parents, will alone be an effective cure for these serious defects." The superintendent, during his first administration, inspected 300 schools, delivered 50 addresses, and visited 200 teachers and several hundred town superintendents and district officials, among all classes of schools and varieties of population. He expresses the hope that during the coming year he will be able to reach all the organized counties of the State.

The State school fund in 1860 distributed 64 cents per capita for education and, with the steady growth of population, 25 cents per capita would be the limit. But the increasing wealth of the people would enable them to supply the deficiency in the only reliable way of supporting a system of public education—local taxation. The public school fund in 1860 was \$2,233,546.71, which, at 7 per cent, furnished an income of \$156,348.17. The swamp-land fund had already reached the respectable amount of \$424,591. The prospect was good for a permanent fund of \$3,234,156.

In the well-worn realm of the qualification of teachers, the superintendent puts in one pithy sentence "the conclusion of the whole matter." "The true teacher is not only one agency, but the agency making all other agencies reliable." He urges the adoption of a system of graded certificates as a check on the imposition of the crowd of mercenary and worthless people "who reach the summit of their ambition when they have obtained a legal certificate of qualifications." Teachers' institutes had been held in more than half the counties under the direction of Dr. Henry Barnard, the agent of the normal board of regents. Two thousand teachers had been reached. But one of the chief advantages of the Institute, the superintendent declares, is that it awakens and enforces the desire for permanent normal schools. He gives a guarded approval to the plan advocated by

the State board of regents, of subsidizing the schools that will establish a normal department; an imitation of the exploded New York system that soon came to grief in Wisconsin. He does not believe the university will meet the wants of the people for the extended system of professional instruction that can alone furnish a generation of fit teachers to the common schools.

The State Association of Teachers and the Journal of Education were commended as important agencies for good. A long section of this important report is given to the subject of schoolhouse architecture and furnishing. The system of school libraries he pronounces a failure for the past ten years. Out of 300 schoolhouses visited, the superintendent found no libraries worthy the name, save when the district had added a voluntary tax to the amount received. The legislature of 1859 had passed a new law to establish a permanent township school library fund by a tax of one-tenth mill in the districts and 10 per cent of the school fund. But the succeeding legislature had disagreed on the method of appropriating this fund, and the superintendent makes several suggestions in this line. No part of the report is more valuable than the dozen pages of "general suggestions," in which the superintendent discusses the whole subject of popular education.

At the end of this epoch of the organization of the common-school system of Wisconsin the superintendent and the people had good cause for congratulation. Fifty-six cities and 737 townships were divided into 3,399 whole and 1,827 portions of districts. There were 288,984 children and youth between 4 and 20, an excess of 11,000 males, of whom 194,375 were registered in the common schools, 2,200 under 4 and 2,826 over 20 years of age, making in round numbers an attendance of 200,000.

The schools were in session six and two-elevenths hours in the day, with an average attendance of four and nine-hundredths months. Male teachers were paid \$24.20 and females \$15.30. The entire expenditure for public education was \$573,756.12, of which \$171,460 was paid by the distribution of school funds and \$402,750 raised by public tax. Of the 4,000 schoolhouses, 1,405 were still log and 2,297 frame, their entire valuation, \$1,314,716, averaging \$325; the largest \$3,300 and the least \$12. Three thousand five hundred of these were destitute of maps, 942 of blackboards. There were 1,175 district libraries, containing 35,939 volumes. Six thousand four hundred and seventy-three pupils were found in 161 select and private schools. In no country and at no period in human history has the interest in the free schooling of the masses been awakened as in the settlements of the Western and Pacific States of this Republic during the past fifty years.

In only one particular had the glowing anticipations of the leading educators of Wisconsin been disappointed. The long talked of and expected State university in 1860, twenty-four years after the organization of the Territory, was still little but a "great expectation" struggling with a very limited performance. As early as 1833 a grant of 46,080 acres of land had been made by the General Government to the Territory for a university. Although originally the Territory of Wisconsin included Iowa and Minnesota, outside its present limits, it retained the entire two townships of land when reduced to its present ample estate, which, at first, included the northeast portion of the present Minnesota.

The two defects in the method of locating the university lands were, first, the authority given to locate seventy-two parcels of unoccupied lands in any portion of the State; and, second, the terms of the grant were "for the support," rather than the establishment of a university. To the advantage taken of the former and the persistent indifference of the State for a series of years to the latter may be ascribed the failure of the university idea to materialize itself at all

until 1850, and after that date, for several years, to accomplish anything worthy of note for the higher education of the children and youth.

A board of commissioners was appointed by the legislature in 1839 for the location and management of the university lands. Also, a "board of visitors of the University of Wisconsin," 21 in number, including the governor, secretary of the treasury, judges of the supreme court, and president of the university, was appointed. But, as there was no university to visit, this body was a purely ornamental group of high public dignitaries until 1850.

During the Territorial period the 46,080 acres granted by Congress for the support of a university were located, in 1840, by a committee appointed by the governor, consisting of one competent person in each of the land districts of the State. They began the work, and on the admission of the State to the Union it found itself possessed of what might have been regarded a munificent capital for all desirable purposes connected with the higher education. By a law of 1848 these persons served in each county and, afterwards, as State officials of school and university lands. This committee evidently had in view the peopling of the new State and not the higher education of the children of the people who might come. The appraisal of these lands at an average value of \$2.78 per acre, \$1.13 to \$7.06 in different counties, was the first and well-nigh a fatal blow struck at the heart of the school—its financial basis. The board of valuation had not interested itself with the control of the fund. It was the old story of school lands sacrificed by a mismanagement that bordered on the edge of public plunder; the welfare of the parties and the highest interest of the Commonwealth sacrificed to the doubtful prosperity attendant on a rapid and indiscriminate population. A few half-hearted efforts of the legislature to resist this wholesale plunder were defeated by a popular opinion, which had not been trained to hold the idea of the higher education, but was filled with the greed for cheap land and the glory of a populous State.

The bulk of the university lands was sold at last for \$3 per acre, and the sum of \$150,000 was all that was realized from the 72 sections. The State of Michigan received \$500,000 for a smaller grant, and a wise disposal of this great estate might have given to Wisconsin a much larger sum. A similar grant of 72 sections of saline lands, in 1848, was made, and as there were no such lands in Wisconsin, 72 additional sections were selected in 1854. But the noblest endowment is powerless before a legislature that has not risen to the comprehension of a university and is inflated with the ambition for an early and sensational progress.

The second location of 70 sections followed hard after the first, being sold for \$3 per acre. As if this were not enough, the State invested the funds realized by the sale of the lands by loaning \$500 to any one who would offer a mortgage on real estate. The secretary of state, treasurer, and attorney general were the board in this free and easy scheme, which was well described by the land commissioner of the State, in 1861, as "lending money to men they did not know, taking as security lands they never saw, with no better evidence of their value than the appraisal of two men of whom they knew nothing." Of course this fund "took wings and flew away," and when, in 1861, a more secure method of investment was attempted, an inroad had been made on the property, the extent of which no man was able to fathom. To complete the disorganization, the State loaned \$40,000 to the regents of the university from the principal of the fund, to begin the work of the university buildings, in defiance of the fact that the grant was for the support of the university. By 1860 the income of the university had dwindled to \$5,000 or \$6,000 per year. Meanwhile, by the passage of the Agricultural College act by Congress in 1862, the State came in possession of 240,000 acres of public land.

It was not till 1866, according to the historians of the university, that a different spirit and policy in the people and the legislature laid the foundation of the present State University of Wisconsin.

The board of regents for a series of years had been engaged in working at the hopeless task of making educational "bricks without straw." Soon after the organization of the State government, an act of incorporation was passed and the control of the university vested in a board of regents, in addition to the president, chosen by the legislature, and authorized to elect a chancellor who should be the president of the board. In 1849 an attempt was made to act, although it seemed hopeless. Besides the primary lack of funds, there was no public opinion in the State on which to rely for favorable legislation or for a patronage of any public school of the higher sort. The different religious denominations had duly preempted the soil and were attracting all the student material. The people had taken one great step in the establishment of free elementary education, and were not interested in extending it to the upper story. Besides the exertions and privations attending the first years of the existence and rapid population of a new State, there was one black cloud rising on the Southern horizon and rapidly casting its baleful shadow over the entire North—the coming on of the great civil war. No State exceeded Wisconsin in its enthusiastic devotion to the national idea of "Liberty and Union." It was not remarkable, at a time so perilous, under circumstances so abnormal, that the people did not regard the great obligation of schooling the children as they certainly did in 1866, after the close of the war in favor of union on the basis of universal freedom.

In place of the university, the regents first established a preparatory school in the city of Madison, in a building given, free of rent, under the charge of Prof. John W. Sterling, the good genius of the institution through its period of trial and discouragement, no less than its final success, for thirty-four years. This faithful teacher began his work on a salary of \$500, by teaching a group of boys according to the usual course of study in Eastern colleges, at a tuition fee of \$20 per annum. A chancellor was soon elected, in the person of President John H. Lathrop, of the State University of Missouri, on a salary of \$2,000 a year. A cabinet of natural history was projected and good progress made in its collections under the management of Mr. H. A. Tenney, of Madison.

The original plan of the university included four departments—1, science, literature, and art; 2, law; 3, medicine; 4, the teaching and practice of methods of elementary education. In January, 1850, Chancellor Lathrop was inaugurated, and his attention was especially directed to the fourth department—the training of teachers for the new common schools of the State. Arrangements for the appointment of six new professors were made, but the central work of the school went on under the control of the president, Professor Sterling, and a tutor. In 1850 the effort was made to establish the department of pedagogy, including women as well as men. But the State rebelled against this movement, and the prospects of the university were not flattering. An additional professor was appointed in 1851. The State refunded the corporation money appropriated for buildings, with an additional loan for the first erected. In 1855 a second building was provided for the normal department. Loan after loan for building and the general purposes of the institution only crippled the resources of the university, which now contained about fifty students. The burden was increased by the attempt to establish a department of agriculture and mechanics, and Prof. S. P. Lathrop was given the chairs of chemistry and natural history in 1854.

In 1856 a full corps of instructors was appointed, adding to the general chairs those of medicine, law, natural philosophy, etc. An attempt was made to place the normal department on its feet by the assignment of Prof. Daniel Reed, of the chairs of philosophy and English literature, to this additional work. Two courses

of lectures were the result of this movement, addressed to 18 and 28 students. Up to 1852 the institution had only 46 students, 66 in 1852-53, and in 1858-59, 243, with 8 graduates in each of the years 1859-60.

All this time the university was slowly making its way against the steady opposition of a large class of the people. The legislature had usurped the entire control, giving to the regents and board of visitors only a nominal authority, and was driving the institution through a perpetual deficiency to the verge of bankruptcy. The denominational clergy of all the sects insisted that the university funds should be used to sustain their own institutions. The usual undefined charges of mismanagement, from irresponsible sources, filled the air. The failure of the attempt to establish the great departments of law and medicine added to the discontent. An attempt at a complete reorganization of the university failed in the legislature by a margin so narrow that the regents were forced by popular opinion to adopt a policy of administration similar to the defeated bill. Among these changes were a curriculum more in accord with the elective and practical order of studies, the establishment of the normal department, and the admission of women to the entire university. The result of the reorganization was the resignation of Chancellor Lathrop and his subsequent displacement as professor, the regulation policy of casting a Jonah overboard to save the ship demanding him as the victim.

It was doubtless with the laudable intent of calling to the presidency of the university an eminent educator, wholly unconnected with its past history, that the Hon. Henry Barnard was elected chancellor and agent of the Normal School board to conduct teachers' institutes and deliver educational addresses.

The history of his brief administration of the university has already been told. He wisely avoided any active participation in the university affairs and gave himself, with his usual ardor and success, to the more grateful work of building up the common schools through the improvement of the teachers. His connection with the university and the State was terminated February 18, 1861.

Here we leave the University of Wisconsin during the period of the civil war. The firm and faithful hand at the helm meanwhile was Professor Sterling, dean of the faculty, who acted as the executive officer. Financial embarrassments crippled the resources of the institution and compelled the limitations of expenses to the lowest possible figure. A company of soldiers was quartered in the buildings in 1861. The entire class of 1864 was in the field and no commencement exercises were held. The attendance was reduced to 50 or 60.

Meanwhile the normal department was reorganized in 1863, under the charge of Prof. Charles H. Allen, of Massachusetts. Seventy-six young women put in an appearance, and the interest of the institution seems to have been largely centered in this new departure. The public opposition was stirred up anew by the admission of women not only to the classes in pedagogy, but to nearly all the opportunities of the university. The resignation of Professor Allen, in 1865, was followed by the appointment of ex-Superintendent J. L. Pickard, in 1866. The prospects of the institution were not sufficiently hopeful to warrant his acceptance of the office of chancellor, offered in 1865, and Professor Sterling held on as vice-chancellor until a new act of reorganization, in 1866, placed the institution for the first time on a solid basis. In 1867, under conditions that recalled the great expectations of the past, Dr. Paul A. Chadborne, then president of the Agricultural College of Massachusetts, at Amherst, was called to the chancellorship, which he filled until 1870. The record of this final reorganization and the accompanying success of the University of Wisconsin will best appear in connection with a continued history of the common-school system of the State after the close of the civil war.

## IOWA.

The United States Commissioner of Education, Dr. William T. Harris, in the letter transmitting Circular of Information No. 6, 1893, of the United States Bureau of Education, to the Secretary of the Interior, entitled "Higher education in Iowa," by Leonard F. Parker, professor of history in Iowa College, writes:

Besides the local interest to which such a work appeals there is much in the educational history of Iowa which is instructive to all students and observers of educational progress, since within her limits there has appeared, from the time of the earliest settlements, a noteworthy zeal in founding institutions of learning and in providing instruction for all classes of people.

Indeed, were any well-informed American called to present one of the most convincing arguments in illustration of the American republican order of government and society he would not mistake if he selected the State of Iowa as the object lesson. The governor of the State, in 1860, indorsed the declaration of a former chief magistrate to this effect: "There are not probably 50,914 square miles in one body on the globe that can offer so many broad acres of unrivalled fertility and of such high adaptation for the support of life as the State of Iowa." Until the organization of the Territory in 1838 this vast and splendid estate was variously named. In 1804-1805, it was a portion of the district of Louisiana; of the Territory of Louisiana from 1805 until 1812; from 1812 to 1821 a part of the Territory of Missouri, and, after an interregnum as an unnamed wilderness, in 1833 open, by an arrangement with the Indian possessors, to white settlement; from 1834 to 1836 Iowa was a portion of Michigan and from 1836 to 1838 an annex to Wisconsin; from 1838 to 1846 it was first known as the Territory of Iowa. On December 28, 1846, Iowa was admitted as the twenty-ninth State into the Union, with a population of 102,388.

Under the guidance of the land companies immigration poured into the country like a flood from southern Ohio, Indiana, Illinois, and the northern border of the South; later from Pennsylvania, New England, New York, and northern Ohio, with a large contingent from the more substantial immigrating classes of Europe. From 1840 to 1850 the per cent of increase was 345 and from 1840 to 1860 1,465 per cent, when the new State contained 673,779 inhabitants of almost unmixt white American and European stock. In 1890 Iowa had risen to be one of the more prominent States of the Union, with a population of 2,000,000, and is still moving upon a tide of almost uninterrupted prosperity. With the exception of the Providential interruptions and backsets that are inevitable in a new country, where the most active young people of the world are running over each other in the pursuit of comfort and wealth, this Commonwealth has enjoyed a remarkable reputation for social respectability, peaceful development, and the high administrative ability of its public men. This great personal and political capacity has been shown more than once by its influence upon the ten new States of the Northwest beyond the Mississippi, besides the high character and influence of its representation at Washington.

That a people so thoroughly representative of the better elements of the whole country and the new life of the Republic should, from the first, have been deeply interested in education and, in their own best way, gone about helping themselves to it even before there could be a Territorial organization promised well for the future. It is only necessary to repeat that as soon as there were white people enough to be gathered under a roof there was a school. In 1824 Mr. Berryman Jennings seems to have been the pioneer pedagogue, with "a very large school district, extending to Canada on the north and to the Pacific Ocean on the west, where there are now some thirteen or more States and Territories;" Master Jennings presided over this vast wilderness in his little log schoolhouse near the pres-

ent site of Keokuk, and for a year directed the first "shooting of the young idea" in Iowa.

Before 1838, when the Territory first obtained its own place and name, there are said to have been no less than 40 teachers who taught school in Iowa, in a region now divided into nine of the present counties of the State. The log schoolhouse was the representative of civilization, set up where the settlers halted, and stood for not only the school, but the church and government, the building being used for all public purposes. The first frame schoolhouse in Iowa was built in 1840 and the first brick schoolhouse at the same place ten years later, 1850. In 1862 there were 893 log temples of science in Iowa, with a population of 674,000, whereas in 1854 half the schoolhouses had been of this sort. In 1890 only 30 were reported in the State. These schools were, at first, private ventures and the school buildings generally private property.

In 1835 the Territory of Michigan, of which Iowa was then a part, created the office of superintendent of common schools. But the distant back yard, the new Territory, was none the better for this visitation. Wisconsin, which succeeded Michigan as the nursing mother of Iowa, tried to do more, with more legislation, but with no settled result. In 1838 the legislature established, on paper, an ambitious scheme of "seven seminaries for both sexes, to teach science and literature," all of which turned out educational "castles in the air."

Four days after this effort the legislature voted to establish a college, with the learned and grotesque name of "The Philandrian," besides a manual-labor college at Davenport. This institution, "The Philandrian," was to be established in the town of Denmark, in Des Moines County. It was the private enterprise of a Scotch Presbyterian family from Illinois, which finally went to financial wreck by its zeal in establishing colleges and manual-labor schools. The charter provided for absolute religious freedom in teachers and students. The Leeper family sent to the East to secure 12 young men to establish as many academies as feeders to the Philandrian and the Davenport manual-labor colleges. But the whole scheme, like so many others conceived in the brain of unpractical philanthropy, came to nothing. The seminaries voted into existence by the Territorial legislature fared no better. Neither money nor men, students nor buildings responded to the call. "At that period there were not youth of both sexes of sufficient number and advancement to constitute a collegiate preparatory department or even a high school in all the Territory."

During the independent Territorial existence of Iowa, from 1838 to 1846, there was a decided effort to plant on the soil a system of education. The Territory was increasing in population, from 22,000 in 1838 to 102,000 in 1846, and its Territorial governors, for the day, manifested a commendable zeal in education. The first, Robert Lucas, was a friend of Samuel Lewis, first superintendent of public schools in Ohio, and from 1838 till 1840 had as private clerk Mr. Theodore S. Parvin, formerly an assistant of Superintendent Lewis. In his first message to the Territorial legislature, January, 1838, Governor Lucas urged the immediate establishment of "a well-digested system of common schools." He also recommended the township system, not for the first time, as is suggested, since both Connecticut and Massachusetts began and held on in that way for 100 years before they "fell from grace into the slough of despond" of the isolated district system. The legislature responded with a law which authorized the voters of every district (township) to tax not to exceed \$10 for each person for a system of common-school instruction.

The second legislature enlarged the scope of the statute even to the creation of the office of superintendent of education, which was held for a year by Dr. William Reynolds. An inevitable reaction abolished this office and for several years the Territory waited for a more favorable state of affairs. Still, the larger towns

were moving. Burlington reported seven schools, one of a high grade, and all towns with a sufficient population seem to have acted for themselves without waiting for legislative aid and comfort. On the admission of the State into the Union, in 1846, there were 20,000 children of school age, 5 to 21, 400 school districts, and 100 schoolhouses. Seminaries and rising colleges, as usual in the new States, were rapidly extemporized on paper. During this period the new Commonwealth, following the example of New England 200 years before, established and supported common schools largely by private subscription.

The story of the founding and development of the common-school system in Iowa, with its accompanying institutions, the State university, normal school, and Agricultural College, is told in the circular of information referred to above, by Professor Parker, after a fashion that renders any elaborate treatment of this period almost an impertinence. Although by the title, an essay on "The higher education in Iowa," the author wisely builds up from the foundations in the earliest essays at school keeping in the wilderness, and with admirable conciseness and management of statistics condenses the voluminous educational literature of the period into 50 pages of a most entertaining and deeply interesting educational and historical treatise. It will be all the more unnecessary that the author of the present record should attempt to repeat the events of the period of sixteen years included in this chapter, for until 1858, practically until the opening of the civil war, the State was really experimenting with school systems and methods, and little was accomplished save the demonstration that several ambitious projects and excellent ideas were advanced beyond the popular educational spirit and public ability. It was not until the close of the war period that had summoned the patriotic sons of Iowa to battle for the salvation of the Union that the present system of popular education was fairly organized and committed to the charge of the whole people, a charge kept with a wisdom and persistence in themselves the best argument that "government of the people, by the people, for the people, shall not perish from the earth." In the constitution of 1846 the framers struck a high note of educational ambition. This remarkable document as far as it relates to education is here quoted in full:

FROM THE CONSTITUTION OF IOWA, DECEMBER 28, 1846.

#### EDUCATION AND THE SCHOOLS.

SEC. 1. The educational interest of the State, to include common schools and other educational institutions, shall be under the management of a board of education, which shall consist of the lieutenant-governor, who shall be the presiding officer of the board, and have the casting vote in case of a tie, and one member to be elected from each judicial district of the State.

SEC. 2. No person shall be eligible as a member of said board who shall not have attained the age of twenty-five years and been one year a citizen of the State.

SEC. 3. One member of said board shall be chosen by the qualified electors of each district, and shall hold the office for the term of four years, and until his successor is elected and qualified. After the first election under this constitution the board shall be divided, as nearly as practicable, into two equal classes, and the seats of the first class shall be vacated after the expiration of two years; and one-half of the board shall be chosen every two years thereafter.

SEC. 4. The first session of the board of education shall be held at the seat of government on the first Monday of December after their election, after which the general assembly may fix the time and place of meeting.

SEC. 5. The session of the board shall be limited to twenty days, and but one session shall be held in any one year, except on extraordinary occasions, when, upon the recommendation of two-thirds of the board, the governor may order a special session.

SEC. 6. The board of education shall appoint a secretary, who shall be the executive officer of the board, and perform such duties as may be imposed upon him by the board and laws of the State. They shall keep a journal of their pro-

ceedings, which shall be published and distributed in the same manner as the journals of the general assembly.

SEC. 7. All rules and regulations made by the board shall be published and distributed to the several counties, townships, and school districts, as may be provided for by the board, and when so passed, published, and distributed they shall have the force and effect of law.

SEC. 8. The board of education shall have full power and authority to legislate and make all needful rules and regulations in relation to common schools and other educational institutions that are instituted to receive aid from the school or university fund of this State; but all acts, rules, and regulations of said board may be altered, amended, or repealed by the general assembly, and when so altered, amended, or repealed they shall not be reenacted by the board of education.

SEC. 9. The governor of the State shall be ex officio a member of said board.

SEC. 10. The board shall have power to levy taxes or make appropriations of money. Their contingent expenses shall be provided for by the general assembly.

SEC. 11. The State university shall be established at one place, without branches at any other place, and the university fund shall be applied to that institution, and no other.

SEC. 12. The board of education shall provide for the education of all the youths of the State through a system of common schools; and such schools shall be organized and kept in each school district at least three months in each year. Any district failing for two consecutive years to organize and keep up a school may be deprived of its portion of the school fund.

SEC. 13. The members of the board of education shall receive the same per diem during the time of their session, and mileage going to and returning therefrom, as members of the general assembly.

SEC. 14. A majority of the board shall constitute a quorum for transaction of business; but no rule, regulation, or law for the regulation and government of common schools or other educational institutions shall pass without the concurrence of a majority of all members of the board, which shall be expressed by the yeas and nays on the final passage. The style of all acts of the board shall be: "Be it enacted by the board of education of the State of Iowa."

SEC. 15. At any time after the year 1863, the general assembly shall have power to abolish or reorganize said board of education, and provide for the educational interests of the State in any other manner that to them shall seem best and proper.

#### SECOND. SCHOOL FUNDS AND SCHOOL LANDS.

SEC. 1. The educational and school funds and lands shall be under the control and management of the general assembly of this State.

SEC. 2. The university lands, and the proceeds thereof, and all moneys belonging to said fund shall be a permanent fund for the sole use of the State university. The interest arising from the same shall be annually appropriated for the support and benefit of said university.

SEC. 3. The general assembly shall encourage, by all suitable means, the promotion of intellectual, scientific, moral, and agricultural improvements. The proceeds of all lands that have been or hereafter may be, granted by the United States to this State for the support of schools, which shall hereafter be sold or disposed of, and the five hundred thousand acres of land granted to the new State under an act of Congress, distributing the proceeds of the public lands, among the several States of the Union, approved in the year of our Lord one thousand eight hundred and forty-one, and all estates of deceased persons who may have died without leaving a will or heir, and also such per cent as may have been granted by Congress, on the sale of lands in this State, shall be and remain a perpetual fund, the interest of which, together with all rents of the unsold lands, and such other means as the general assembly may provide, shall be inviolably appropriated to the support of common schools throughout the State.

SEC. 4. The money which may have been or shall be paid by persons as an equivalent for exemption from military duty, and the clear proceeds of all fines collected in the several counties in which such sum is paid, or fine collected among the several school districts of said counties, in proportion to the number of youths subject to enumeration in such districts, to the support of common schools, or the establishment of libraries, as the board of education shall from time to time provide.

SEC. 5. The general assembly shall take measures for the protection, improvement, or other disposition of such lands as have been, or may hereafter be,

reserved or granted by the United States, or any person or persons, to this State, for the use of the university, and the funds accruing from the rents or sale of such lands, or from any other source for the purpose aforesaid, shall be and remain a permanent fund, the interest of which shall be applied to the support of the university, for the promotion of literature, the arts and sciences, as may be authorized by the terms of such grant. And it shall be the duty of the general assembly, as soon as may be, to provide effectual means for the improvement and permanent security of the funds of said university.

SEC. 6. The financial agents of school funds shall be the same that by law receive and control the State and county revenue for other civil purposes, under such regulations as may be provided by law.

SEC. 7. The money subject to the support and maintenance of common schools shall be distributed to the districts, in proportion to the number of youths between the ages of 5 and 21 years, in such manner as may be provided by the general assembly.

The educational provisions of the constitution of Iowa, adopted and ratified in 1857, are the same as the foregoing, except that the verbiage is in a few instances slightly changed without materially changing the sense.

It will be seen that the State board of education of Iowa was made practically a legislature for school purposes, subject to the constitution and the law.

It will be seen that here it was attempted, probably, for the only time in the history of education in this Republic, to establish a proper educational legislature within the political legislature of the State—a board of education, elected by the people, which was authorized to enact laws for the establishment, support, and management of all classes of public schools, from the prairie district to the State University—to impose taxes and to administer, with no interference, save the veto power reserved to the State government, until the year 1864. The board of education of the State of Massachusetts, established in 1837, made illustrious by its first great secretary, Horace Mann, and the names of its distinguished members, had no similar power intrusted to it. It was only an executive body, appointed by the governor, “with the consent of the council,” to administer in a very limited way the small amount of State aid and control that the people of Massachusetts had ever intrusted to their State educational officials. That this arrangement may have been, on the whole, the best for a new State like Iowa, where 100,000 people were scattered over the area of a European kingdom, a people that represented all sections of the country and every civilized land, too much absorbed in getting a personal living and placing their new Commonwealth firmly on its legs to think or act in any very large way for the schooling of the children, is quite possible. The scheme did succeed in securing the election to this board of a body of remarkable men, who, in sympathy with a generous ideal of popular education, brought the State up to the year 1858, when a new constitution and school law gave substance to an all-out-doors condition of affairs. In 1864 this peculiar arrangement was repealed, and the State, for the last thirty years, has gone on after the fashion of an ordinary American commonwealth.

The new constitution was followed by the enactment of the first general school<sup>1</sup> law of the State. This statute, passed in 1847, swept aside all previous enactments, which only represented the notions of the successive legislatures of the different Territories to which Iowa had been attached. It provided for the election of a State superintendent of public instruction, and the general organization and support of district schools in accordance with the provisions of the constitution. The school board does not seem to have been recognized or provided for. The first State superintendent was one of the most distinguished of the early settlers of Iowa and the Northwest.

Mr. James Harlan, at the age of 25, was the people's first choice. He held the office only three months—his election having been declared “invalid” by the courts. But he improved the time with all diligence in awakening the people and inaugurating the movement for the establishment of a State school fund from the

magnificent gift of the national public lands, of which no disposition had yet been made.

His successor from 1848 to 1854 was Mr. Thomas Hart Benton, jr., a nephew of the famous Missouri statesman of that name. As superintendent of public instruction, he held the office for six years, four years as secretary of the board of education. By the ruling of the courts the office of superintendent of public instruction had been merged in that of the secretary of the board of education until 1864. Superintendent Benton was a powerful and discreet leader of the educational public, and he has left his name deeply impressed on the educational history of the State. In 1849 a revised school law was passed which in a more detailed and decisive way defined the obligations of the educational department and provided for an organized system of popular education. Superintendent Benton caused a pamphlet edition of the school laws to be published of 140 pages with notes and comments. He traveled extensively among the people at a time when traveling was the most difficult part of the duties of a public man. He defended the right of the people to the reading of the Bible in the schools on the American ground that the Bible is the handbook of common morality in all civilized lands but with no theological or ecclesiastical intent. He urged permanency of structure in the new schoolhouses that were rising in the State. He was one of the first of the Western superintendents to favor drawing as a common-school study, and collected a valuable library in the office of the superintendent. He was undeniably the father of the progressive educational policy of the new State. Under his administration in her 35 counties Iowa had 1,860 school districts, 50,182 children from 5 to 21, 504 schools attended by 17,350 pupils, supported at an expense of \$25,000. There were 580 teachers, the men being paid \$14.83 and the women \$7.64 per month. Neither a man nor woman of them was reported as hailing from Iowa, many coming from the distant Central and Eastern States. The schools were still partly supported by a rate bill, and negroes were entirely excluded from any enjoyment of the system of public instruction.

Happily for the cause of education the office of governor of the State was held by another of the men of national fame which Iowa has given to the Union—James W. Grimes. In his first message he strikes the keynote of the American system of public instruction in the declaration: "Property is the only legitimate subject of taxation. It has its duties as well as its rights. It needs the conservative influence of education, and should be made to pay for its own protection." He urged the abolition of the rate bill on the ground that it discriminated against the children of the poorer parents. This vigorous beginning was followed by the eminent statesmanlike recommendation to the legislature, in 1856, that "three competent persons be selected to revise all the laws relating to schools and school lands." The governor appointed Horace Mann, then president of Antioch College, Ohio; Amos Deane, of Albany, N. Y., for a brief period president of the Iowa State University, and F. W. Bissell, of Dubuque, as commissioners. But before they had reported the legislature, by statute, authorized the establishment of graded schools, with a high-school department, to be supported by a tax not exceeding 5 mills on the dollar, supplemented by a tuition bill.

The fourth superintendent of public instruction, the third having been removed for mismanagement of the school lands, was Mr. Maturin L. Fisher, who held the post from 1857 till the office was merged in that of secretary of the board of education in 1858. The State school fund had now increased to \$2,300,543.65, and it was believed it would ultimately reach \$5,000,000. There were 84 organized counties, of which 26 appeared in the report of the State superintendent. It was evident that the services of a board of commissioners were required to prepare a system which should be able to tie up the all-out-doors style of school keeping that was going on through the State. With half a million people and all the

world coming in, 175,000 children and youth between 5 and 21, there were but 59,600 inside the 1,330 schoolhouses, half built of logs. There was practically no examination of teachers. According to the report of Superintendent Fisher, "less than half the children are in the schools, and educational affairs are in a very unsatisfactory state." The schools were supported at a cost of \$364,160, of which \$111,839 was from the income of the State school fund. The total amount supplied by the State was \$210,000. It was evidently not a better disposition but a more vigorous administration and a consolidation of the whole system that was "the one thing needful."

Meanwhile, the effort at the building up of the higher education had not been entirely neglected. An increasing number of the larger towns had graded their schools, and were establishing classes that, under the name of "high school departments," could be intrusted with the important duty of training teachers for the increasing number of common schools, and the charter of the State University contained a provision for a department of pedagogics. As early as 1849, the teachers had begun this work by holding the first institute, at Dubuque, conducted by ex-superintendent of Wisconsin, Dr. J. L. Pickard. Superintendent Benton warmly urged the subsidizing of these teachers' institutes upon the legislature. In 1849 there were but 600 teachers in the State, working on salaries of \$14 and \$8 per month. A remarkable group of educators is mentioned, who wrought with great fidelity and success in this field. In 1857 this arrangement was enlarged to the normal institute, in the direction toward the elaborate organization which it has become in the present effective system of normal institutes in Iowa, of several weeks' duration—a proper seminary of instruction, methods, and practice.

The State was fated to pass through the experience of New York and Ohio in long experimenting with private, academical, and collegiate normal departments, and a chair of pedagogy in the State University. It was thirty years from the establishment of the common-school system before the people of Iowa learned that a work so important as the training of common-school teachers can not be safely left to the capricious will and variable opinions of private and denominational academies and colleges, or that a chair in pedagogics in a State university is not a fit substitute for a professional school of instruction. An attempt had been made, in 1849, to establish normal schools under the statute establishing a university. The State was districted into three sections, and three normal schools, on paper, were set up with a grant of \$500, salary for the superintendent. After a somewhat languishing life of these schools which, at best, could be only of the grade of a second-class academy, the attempt was given up.

The national grant of public lands for the support of a University to Iowa, was 46,080 acres. These lands were at first badly located—not in the most valuable situations in the great prairie regions. A law was passed establishing a central college and two branches, the former at Iowa City, the original capital of the State, to be housed in the abandoned State buildings. In 1859 the university fund had reached the sum of \$110,582, and a fortunate sale of school lands in 1860 increased it by \$29,571. The legislature worried over the preposterous scheme of establishing branches of the university at a number of collegiate districts, as at present in Georgia. But the attempt failed, and in 1849 Iowa City was selected, the State buildings left by the new location of the State capital being assigned for the use of the institution. An attempt to carry out the original idea resulted in the establishment, on paper, of two branches at Fairfield and Dubuque.

With this arrangement of a six-in-hand-university team—the central school with its two branches and three normal schools, all under university control, when the State had not the material for one proper group of actual college students—it is not remarkable that success was delayed. In 1855 the school was opened by

the board of regents and continued sixteen weeks. After several unsuccessful attempts to obtain a president for the complete university, Hon. Amos Deane, president of the Albany (N. Y.) Law School, was induced to accept, and, for a brief period, made annual visits to the State in the capacity of chancellor. Six gentlemen were named as members of the university faculty. The organization was of a flexible type, contemplating the education of a child of 12, if a girl, and 14 if a boy, through a preparatory department to an elective course of study for a variety of degrees. The result was a school, in 1856, described by the historian of the Higher Education in Iowa, Professor Parker, then a student, as "a State university with 65 children in the common branches, and a total attendance of 183 students; 83 gentlemen, and 41 ladies—65 in preparatory and 40 in the normal department." As late as 1857-58, there were but 107 pupils in the school, of whom only about 6 per cent were from outside Johnson County, 12 per cent beyond Iowa City. It was recognized by the public as "The High School of Johnson County." Chancellor Deane seemed to have grasped the situation and advised the closing of the school till better times, or a better disposition in the legislature to furnish supplies, and followed his advice by resigning his own position in 1858. His best work had been done in his labors on the committee, with Horace Mann, in framing a system of public-school education for the new State.

The legislature in 1857 appropriated \$13,000 for repairs and a boarding hall. But, with no proper fund to support the university, it was the part of wisdom to close the doors, except to the normal department, from 1858 to 1860. The State had provided 36 scholarships for as many students who, selected from the high schools of the State, were expected to teach as normal graduates. A new board of trustees were chosen, and Prof. D. Franklin Wills was intrusted with the duties of a professorship. There were only \$1,200 available for financial support. Still an enthusiastic body of students gathered at the opening, and with the help of a lady assistant, the good work went on. There were 90 students and 6 graduates in 1859-60. Prof. Silas Totten, D. D., L. L. D., formerly president of Trinity College, Hartford, Conn., was called to the presidency in 1860. But the final establishment of the University of Iowa was made possible by the Congressional grant of public lands for agricultural and mechanical colleges in 1862. An attempt had already been made to establish an agricultural school in the State, but this, with all similar endeavors at a premature movement for the higher education, had come to little.

The first notable revival of the common school in Iowa dates from the administration of Governor James W. Grimes. He secured the appointment of two of the foremost educators of the country, Horace Mann and Amos Deane, both at the time in Western educational service, one as president of Antioch College, Ohio, and the other of the new State University of Iowa, to draw up a plan for the education of the youth of the State. The work was all done by these men, the third member of the commission, Hon. Mr. Bissell, of Dubuque, not serving. It was presented in the form of a school law, with comments and explanations. It included the township plan of districting; a county superintendency; free elementary schools for all the people, including the negroes, and the division of the system into graded, high, and normal schools, up to the State university. The commissioners recommended the original idea of Mr. Jefferson, the establishment of free county high schools, called by the Virginia statesman colleges. It is doubtful if Horace Mann, in all his splendid career, ever did a more valuable work than giving his heart and hand to the preparation of a system for training the youth of what has become one of the most illustrious—if not, indeed, the model one of the—States of our Republic. Certainly Amos Deane contributed largely to the "higher civilization," of which he endeavored to write the history, by his cooperation with his eminent compeer. The governor was in hearty sympathy with the idea of educa-

tion there presented. The chairman of the committee on education in the State senate was an intimate friend of Horace Mann and contributed greatly to the adoption of the ideas of the report in the new school law of 1858.

The State constitution of 1857 seems to have repeated, or, perhaps, first created, the original provision for the legislative board of education; independent, and of final authority, with the exception of the governor's veto power; and having control of the educational funds of the State, with the proviso that, in 1864, the people should have the opportunity of deciding on its continuance. The new school law of 1858 contained this provision. But the legislature, apparently forgetting that in this respect its legislative occupation was gone, enacted an elaborate school law, a portion of which was declared unconstitutional, and it all went back to the board of education for rectification. This was a hindrance at the outset. But the board confirmed several of the most important recommendations of the three commissioners. This board held three annual meetings which were reported as a basis of action to the legislature. Its wisdom was shown in the appointment of Mr. Thomas H. Benton, jr., to a second term of State superintendency of instruction, under the title of "secretary of the State board of education." His office held on through the existence of the State board in this capacity, which terminated in 1863 with the reestablishment of the office of State superintendent of public instruction.

The passage of the law of 1858 was a challenge to the best public spirit in the State. It demanded new effort in the direction of raising school funds. Superintendent Fisher had estimated that no less than \$500,000 a year would be required to work the new scheme with success. The office of county superintendent for the examination of teachers, and the general supervision of the schools, was a new departure and its operation let in "a great wakening light" upon the dark places of pedagogic ignorance and failure. Its fit administration demanded a wisdom and tact hardly to be expected of the 8,000 officials created by it. In the early years of its operation the country was plunged into a civil war that absorbed all the energy, self-sacrifice, and even property of the patriotic people for the preservation of national unity and universal freedom. Probably no greater effort for the defense of the schools against such an overwhelming flood could have been demanded, than was found in a strong body of able and competent men directly responsible to the people, protecting the schools from the agitations and variations of public opinion inevitable to this perilous season of four years. When Secretary Benton laid down his office in the election of 1863, the crisis had passed, and henceforth the system went on "in full tide of successful experiment." The county superintendency seems to have been more successfully managed than in some of the States; in fact, in too many of them it has almost become the most formidable obstacle to improvement. The superintendents were regarded by the people as a strong body of men, and their first meeting in convention at Iowa City in 1858 was declared one of the most important occasions in the early educational history of the State. This high pitch seems to have been maintained, and we hear little but good of the working of the county superintendency system in Iowa.

The experiment of the county high school, except in one instance, seems to have failed, and this plan was dropped from the public-school system at an early date. It probably seemed too much like educating the superior children of a county at "arm's length," and in due course of time the more practical scheme of the city and local free high school came in.

Already, in 1860, several denominational colleges had been established in Iowa and were to a greater or less degree in successful operation.

The Baptists had established Burlington University in 1853 and the Central University of Iowa, at Pella, in 1853, and later, in 1865, Des Moines College, at Des Moines. The Christian denomination founded Oskaloosa College in 1853-1861.

Two colleges had been sustained by the Congregationalists. Iowa College was one of the earliest of this class of institutions, having been founded as early as 1843 by a body of theological students from Andover, Mass., first at Davenport and afterwards at Grinnell. President George F. Magoun assumed the presidency in 1863 and held it till 1884, being one of the most notable of the denominational college presidents of the Northwest. Tabor College was a child of the agitation that shook all the churches on the eve of the civil war, and, unlike the majority of institutions of learning that have been thrown up by great popular excitements, exists in a prosperous condition at the present time. In 1859 the Protestant Episcopal body, under the religious leadership of Bishop Perry, established Griswold College at Davenport.

The Methodists, during the past fifty years one of the most persistent and successful educational churches in the land, established Cornell College, organized as Iowa Conference Seminary in 1853, but reconstructed under its present title in 1857. Iowa Wesleyan University dates from 1855. Simpson College was the child of a movement in 1860. Upper Iowa University also was founded by the same religious body. The Presbyterians "set up their Ebenezer" at Cedar Rapids in 1851, at Coe College, and Lenox began as a collegiate institute in 1856. Parsons College, at Fairfield, was provided for in the will of Lewis B. Parsons in 1855, although not put in operation till a later period.

The United Brethren in 1855 planted Washington College at Muscatine. By 1853 Amity College was founded on an undenominational basis at College Springs.

All these institutions, with many others of the academical sort, were active competitors with the State university for the patronage of the youth of the State, and doubtless postponed for several years the permanent establishment of that institution. Some efforts have been made, especially by Bishop Perry, of the Protestant Episcopal Church, at a union of all colleges with the State university, which would be used chiefly as a university body for examinations and the conferring of degrees. But this plan, although frequently mentioned in the Northwest where the State universities have won their present position through a long contest with private and denominational institutions, has not yet been adopted.

In 1860 a "posting of the educational books" of the new State of Iowa showed a gratifying result of the early and persistent effort of the previous fourteen years of common-school experimenting. There were then 1,013 district townships with 4,656 school districts, 4,929 ungraded, and a large number of graded schools; in average session for three or four months in the year, instructed by 6,374 teachers, receiving \$23 and \$15 per month. The State had a population of more than 600,000, of whom 245,000 were between the ages of 5 and 21. One hundred and sixty-seven thousand were enrolled, and 77,000 were in average attendance instructed at a cost of \$1.06 per month. Of 2,620 schoolhouses, more than half were frame, 220 of brick, 65 of stone, and 844 of logs, valued at \$1,206,340. Thirty-two teachers' institutes were held in the State in 1860. All this was done at the cost of \$656,000; on the average attendance, more than \$8 per capita. The annual income of the State school fund was \$142,000.

With this great record of successful achievement at the end of a good fight of fourteen years, we leave the interesting topic of the development of the common-school system in Iowa up to the opening of the civil war. The even more remarkable development of education in the Commonwealth during the past generation of thirty-seven years belongs to the history of the common-school system of the Northwest since the close of that memorable conflict.

## MINNESOTA.

The romantic history of the immense wilderness now known as the great Commonwealth of Minnesota practically begins with the year 1689, when the adventurer Perot erected a cross, placed thereon the arms of France, and declared the country a portion of the vast domain of Louisiana. Only a few years before, Hennepin, Du Luth, and other enterprising members of several of the great Catholic religious orders had pushed their way up the Mississippi River, and built a fort on the western shore of Lake Pepin. Nearly one hundred years later—1763—the Territory of Wisconsin and a portion of Minnesota were ceded by France to England. But it was not until the year 1800 that the Government of the United States actually came in possession of the region by the operation of Jay's treaty, which closed the British occupation. By the purchase of Louisiana from Napoleon in 1803, what is now Minnesota, Arkansas, Missouri, and Iowa became the Territory of North Louisiana. From this time till 1849 Minnesota was, in turn, a portion of the Territories of Indiana, Michigan, and Wisconsin. Although a bill for the organization of the Territory of Minnesota was offered to Congress in 1846, it was not till 1849 that it appeared as a new candidate for the Territorial preparatory school of American statehood. In that year Hon. Alexander Ramsey appeared as the first governor of the Territory. Within another year St. Paul was designated as the capital, the legislature and courts were set up, and the first newspaper, *The Pioneer*, was established by Mr. Goodhue, a graduate of Amherst College, Massachusetts, who "hove in sight" nine days after the founding of the Territory, with printing press, paper, and type, and inaugurated this great agency of education in the far-off new land.

As late as 1846 the Territory is described as "little better than a wilderness;" best known by the romantic stories of its possibilities as a new Western wonder of the world. In its broad expanse was found the source of the three great rivers—the Mississippi, St. Lawrence, and the Red River of the North—flowing to the Gulf of Mexico, the Atlantic Ocean, and Hudson Bay. The geographer Maury, in an early visit, celebrated "The steel-blue sky, set with diamonds and sparkling with brilliants, and the sublimity of the small hours of the night." The marvelous wealth of waters in its myriad lakes suggested to some of its early discoverers, the name "Undine;" and the remarkable fertility of the lands, with the romance of the Dakota Indians (misnamed Sioux), added to the interest and awakened the imagination of the East and the Old World. In 1848 the Territory still "seemed a wilderness." The white settlers hugged the picturesque shores of the "Father of Waters," although the Territory was named from one of its tributaries, the Minnesota. In 1849 the white population was estimated at 5,000. The first legislature organized nine counties, and American civilization, under the leadership of a remarkable group of men, including Ramsey, Sibley, Rice, and Slater, representing every division of the Union, rose up in its usual attitude beyond the Alleghenies, "claiming the earth."

By 1858 the lusty infant had grown to the stature of a new American Commonwealth, with a population of 136,464 and all the agencies of the American system of universal education on the ground. Up to the formation of the Territory, in 1849, Minnesota had no educational record that would claim the interest of the historian of the common school. Whatever may have been done by the devoted members of the Jesuit and other Catholic explorers of the country, by the British occupants in 1736, or by the wandering companies which succeeded to their function of irregular administration, is only a matter of record in the personal journals and letters and the public documents by which their writers maintained their connection with the mother country.

But the first session of the Territorial legislature, in 1849, was favored with an

elaborate report of the committee on education, prepared by Hon. N. McLeod, and petitions were presented to Congress for immediate action in the usual bestowal of school lands. The Territories of Oregon and Minnesota were especially favored by the new policy of the gift of a double portion of the public domain—the sixteenth and thirty-sixth sections of every township. There were already a few small schools in St. Paul and St. Anthony, of the private and parochial sort, and St. Anthony reports the possession of a library. The Swedish novelist, Fredrika Bremer, whose very readable books were then translated and widely read in the Eastern States, visited Minnesota in 1850, and reports in her usual enthusiastic vein. By act of Congress the Territory was permitted to lease its school lands four years before sale, thus avoiding the great waste of this sacred public domain that had occurred in some of the older States of the Northwest.

In 1853 the Territorial superintendent of public instruction made a report. It is significant that he insists on the legal prevention of common-school districts giving educational degrees. He enlarges on the defects of the dismal barracks that figured as schoolhouses, and recommends Dr. Henry Barnard's treatise on "School Architecture" as a guide to reform. He suggests that every country district schoolhouse should be located in the center of a lot of at least one acre, and draws a pleasing picture of a crowd of happy children breaking loose from the schoolhouse door and "letting off steam" through the usual juvenile riot on the school-grounds. There were three public schools in St. Paul, two in St. Anthony, and half a dozen besides in the Territory. At once the "burning question" that "never will down" appeared in a plea from several of the larger settlements of the State that public subsidies should be given to the church parochial schools of the French Catholic population. But, although recommended by high political authorities, and even legislative indorsement, the proposition was rejected by a vote of two to one, and the Territory of Minnesota began her great career of common-school education, not to be excelled by any of the group of Commonwealths of the new Northwest and the later States of the mountain and Pacific region. But the legislature of the Territory, in its new zeal for education, seems to have gone beyond the ability or disposition of the people to furnish the "sinews of war." In 1857 the Territory, by permission of Congress, was empowered to form a State constitution, and, after a sharp contention between the two political parties then contesting the administration of national affairs, a compromise was effected, and, in 1858, the State was admitted to the Union by the almost unanimous consent of the powers at Washington. The first constitution contains the following provisions for the establishment and support of a system of public education which, with a few amendments of detail, still remains the fundamental educational law of Minnesota:

#### FROM THE CONSTITUTION OF MINNESOTA, MAY 11, 1858.

##### ARTICLE VIII.—SCHOOL FUNDS—EDUCATION AND SCIENCE.

SEC. 1. The stability of a republican form of government depending mainly upon the intelligence of the people, it shall be the duty of the legislature to establish a general and uniform system of public schools.

SEC. 2. The proceeds of such lands as are, or hereafter may be, granted by the United States for the use of schools within each township in this State, shall remain a perpetual school fund to the State, and not more than one-third of said lands may be sold in two years, one-third in five years, and one-third in ten years; but the lands of the greatest valuation shall be sold first: *Provided*, That no portion of the said lands shall be sold otherwise than at public sale. The principal of all funds arising from sales, or other disposition of lands, or other property, granted or intrusted to this State, in each township for educational purposes, shall forever be preserved inviolate and undiminished. And the income arising from the lease or sale of said school lands shall be distributed to the different

townships throughout the State, in proportion to the number of scholars in each township between the ages of 5 and 21 years, and shall be faithfully applied to the specific objects of the original grants or appropriation.

SEC. 3. The legislature shall make such provisions, by taxation or otherwise, as with the income arising from the school fund will secure a thorough and efficient system of public schools in each township in the State.

SEC. 4. The location of the University of Minnesota, as established by existing laws, is hereby confirmed, and said institution is hereby declared to be the University of Minnesota. All the rights, immunities, franchises, and endowments heretofore granted or conferred are hereby perpetuated unto the said university, and all lands which may be granted hereafter by Congress, or other donations, for said university purposes, shall vest in the institution referred to in this section.

To section 2 there was added by amendment in 1875 the following:

ART. VIII, SEC. 2, *added*. Suitable laws shall be enacted by the legislature for the safe investment of the principal of all funds which have heretofore arisen, or which may hereafter arise, from the sale or other disposition of such lands, or the income from such lands occurring in any manner before the sale or disposition thereof, in interest-bearing bonds of the United States, or of the State of Minnesota, issued after the year 1860, or of such other State as the legislature may, by law, from time to time direct.

The first report of the State superintendent of public instruction, Mr. Edward D. Neill, in 1861, deals largely with the exposure of the mistakes of the unduly zealous educational policy during the Territorial period of nine years. In 1851 the State University had been chartered. The board of university regents seems to have taken things into its own hands, and had erected a huge stone college building, containing "50 rooms without windows," involving the university fund in a debt of \$80,000, while, by blundering legislative action, the fund itself had been imperiled.

The university had been organized with a department of law, medicine, and pedagogy, and an early movement had been made to establish a State normal school. The city of Winona had furnished a hall in 1859. Sixty-one pupils had appeared in the second term, and \$5,000 were expended—\$1,500 on the salary of the principal and \$500 for his assistants. The Territorial school law had been revised and the statute of 1861 appears in the report of the superintendent, with stringent comments on its defects. The new State, as usual, had been too easily persuaded into the habit of giving a charter to every school that assumed the title of "college." The superintendent vigorously protests against this policy and declares that "there is not one in operation in the State that in any respect is superior to the high schools and academies of the older States." He proposes that no college charter shall be given to any school that has not an endowment for the support of two professors, and limits its age of admission at least to 14.

The revised school law contains these general provisions: 1. The commissioners of each county may impose a tax of one-fourth of 1 per cent on the ad valorem of valuation for the payment of the salaries of common-school teachers. 2. Twenty-five per cent of all revenues from liquor licenses, and certain legal penalties, shall be appropriated to the same purpose. 3. The consent of two of the three trustees elected by the school districts constitutes a working board. 4. Every tax-paying male citizen is declared a voter in district school elections. Three trustees were to be elected for one year, who are authorized to determine the site for school-houses, and levy a tax for school buildings not to exceed \$300 without the consent of the township supervisors. A tax of \$20 a year could be imposed for the furnishing of school buildings, apparatus, library, etc. 5. The county commissioners were authorized to divide the school money among the districts in proportion to the number of persons of school age—4 to 21. 6. The people of two contiguous districts could unite in an arrangement for a grammar school. 7. The township superintendent of schools was chosen at town meeting, and authorized to divide the township into school districts, examine teachers, and visit the schools.

The State superintendent in his report reveals the vital weakness of the school law, which he declares the attempt to apply legislation only adapted to a wilderness to the needs of a rapidly growing State. He earnestly advocates the substitution of a county superintendency for the present ineffectual method of administration by a board of county commissioners, some of whom, he asserts, could not obtain a certificate as teacher of a common school. Even the appointment of one competent commissioner, with power to act, would be a step forward. He exposes the radical weakness of the school system in the fact that it provides for no vital communication in the matter of administration between the local and State authorities. He urges again the improvement of schoolhouses.

In 1864 Superintendent Blakeley emphasizes the declarations of Superintendent Neill, and comments on the defects of the additional legislation of 1863 that simply provides for a board of county school examiners of teachers, five in number, with no duties except the examination and certification of teachers, and urges again the establishment of a proper county superintendency. His own opinion is fortified by copious testimony from distinguished school authorities of several States. He declares: "There is no accountability to a higher authority on the part of any official from district school trustee to State superintendent." In fact, a teacher armed with a certificate obtained from an examining board, the majority of whom were themselves incompetent to teach a country district school, could defy the entire educational authorities of the State. The provision for the visitation of schools the superintendent pronounces a farce. "The standard of qualification for teachers is lamentably low." There was no method in operation for training teachers, the Normal School at Winona having been suspended by the neglect of the legislature to supply funds, and the teachers' institute not yet on the ground. In 1864 there were forty counties in the State.

But despite these drawbacks from imperfect organization and the preoccupation of the people by the civil war, in which Minnesota was conspicuous for patriotic spirit and the "material aid" of men and money, the educational car had moved on, as by its own inherent motion, with accumulating velocity from year to year. In 1860 372 school districts reported. In 1862 the number had increased to 1,072, and in 1864 to 1,254. In 1863 there were 64,819 persons of school age (4 to 21) in the State, with 22,903 in school attendance. In 1864 \$75,000 was appropriated from the income of the State school fund (23 cents per capita) for the entire school population.

By 1867 the new State of Minnesota, relieved from the great labors and anxieties of the civil war, bounded into the field of educational progress with a will. Of 51 counties 50 reported to the central authorities. There were 2,207 school districts, of which 2,035 had "reported progress." Of 114,421 children and youth of school age, 65,807 were in attendance on school, with an average session of four months. There were 749 male and 1,836 female teachers, receiving an average salary of \$34.65 and \$22.25 per month. The State was expending \$254,986.76 for the salaries of teachers. There were 1,406 schoolhouses. Of the entire expenditure, \$736,532.67, the State contributed \$167,863.50, and the districts raised from local taxes \$295,672.19. Graded schools were appearing in all the considerable towns. The State normal school at Winona had been reestablished, with the already distinguished educator W. M. Phelps as principal, and 8 assistants, 87 students, and a model school of 244, the normal pupils representing 20 different counties of the State. Since 1864 127 had been graduated. A permanent building was in process of erection, at a cost of \$80,000, of which the people of Winona contributed \$20,000. Teachers' institutes were held in 22 counties. The State University buildings were repaired in 1867. The private schools of the State still contained some 5,000 pupils. The system of county superintendency had been firmly established. The State school fund already had reached the sum of

\$1,333,161.69, and in its development will perhaps not be exceeded by any in the Union.

Such a record of a prosperous Commonwealth fashioned out of a vast territory that was declared twenty years before "little better than a wilderness," after a brief Territorial existence of nine years emerging into Statehood only to be involved in the great civil war, and through the sacrifices, losses, and exhausting labors of a revolutionary period never losing its hold on its fundamental interest in popular education, was prophetic of the later history of Minnesota during the thirty years subsequent to 1866. But the record of this remarkable progress from the close of the war even to the present day belongs to the history of the prodigious advancement of the Northwest in all things educational toward the present period of amazing achievement in all the elements of a republican civilization.

### CALIFORNIA.

The eighty-one years from the first recorded settlement of the wilderness of upper California by the Spanish, in 1769, to the admission of the Commonwealth of California as one of the United States, with a population of 90,577 in 1850, are almost barren of interest to the student of the American system of common schools. The first occupation of the country seems to have been for the threefold purpose of obtaining a few safe points for the accommodation of the Pacific coast trade from Lower California and Mexico; to set up a barrier of defense against a possible invasion by the Russian power from the Northwest; and largely as a missionary enterprise, for the conversion of the native tribes, by the zealous members of the Catholic religious orders, whose operations form the romantic and personal element in the early history of so large a portion of the Western Continent.

In 1769 four expeditions by sea and land moved northward from Lower California. One of them claimed the discovery of the Golden Gate, the splendid harbor of the great city of San Francisco. Eighteen years later—1787—there were 9 missions served by 16 priests, which had already obtained that mixture of personal and spiritual control over some 3,000 natives, which in that day was known by the name of conversion to the Christian religion. Each of these missions was practically a settlement in a wilderness, under the control of shrewd and capable leaders who appropriated as much of the adjacent country as could be made useful for their own purpose, and built up there the first approach to civilized society by the substitution of a nominal change of faith and a very real type of bodily servitude for the ruder features of savage life. Thirteen years later, at the beginning of the nineteenth century, the Spanish occupation had increased to 18 mission settlements, with 40 priests and 13,500 native dependents. The real life of the new country was concentrated on the missions. For, though there remained the ostensible commercial and military necessity of defending a vast and unknown frontier against foreign aggression, yet the priesthoods of these different missions were not only the educational leaders, but the sole body of men capable of establishing even the semblance of civilized government in a region so far removed from any center of the world's activity.

The first twenty-two years of the nineteenth century seemed to have wrought little change in the condition of the immense region now included in the present State of California; 118,981 square miles, four times the area of the State of New York, the population in 1890 1,208,071, nearly half of foreign birth. The Spanish population had slowly increased, in 1800 being only 1,800, in 1810 2,300. The overthrow of the Spanish rule and the establishment of the political authority of the Republic of Mexico in 1822 did not materially advance the affairs of this far-off land in the illimitable west. For in 1830 there were but 4,250; in 1840, 5,700, and

in 1856, when the first call resounded over the mountain world that separated it from the United States, there were but 12,000 white people in the entire territory.

But meanwhile enough had happened to practically annihilate the influence of everything that could be called the system of education introduced by the priesthood of the missionary orders. The schooling in the original settlements was of the most primitive and stunted type; scarcely more than was often given to the negro slaves in our own Southern States; indeed, far less stimulating in its character than the intercourse of the more intelligent class of negroes in any large Southern community with the life that circulated around the old plantation or village home. The establishment of the new Republic of Mexico in California was the signal for a revolt among the mission communities that at times only fell short of a civil war from the fact that the settlers were too few in number, and powerless for aggression to defy the central Government. But in a region so far away, and where material resources were so little known, the administration of the home Government could only be perfunctory. The priesthood refused to be reconciled with, and sometimes even to take the oath of fealty to, the Republic; and their influence kept the scattered population of "old settlers" in a state of provoking neutrality. The Government at Mexico virtually dispossessed the missionaries of their large landed properties; emancipated the native converts from a condition of practical slavery; and, by the wavering policy of the provincial governors, divided the people into hostile parties. By 1846 the entire region lay at the mercy of any invader powerful, ambitious, and far-sighted enough to foresee the future of the splendid Pacific empire that has been evolved from a boundless wilderness during the past fifty years. Apart from a few educational foundations and the meager schooling that was required by the gay, lavish, and self-satisfied families of the superior class, there seems to have been nothing that could be called a system of education in all the land.

It is unnecessary to recount the stirring history of the conquest and possession of the territory of California by the United States, which followed the annexation of Texas and the Mexican war. Enough to say that from a thin line of immigration previous to 1846 the American interest became more prominent. Soon after the occupation by the American forces the village of San Francisco arose in 1847 with 459 people, of whom 83 were under the age of 10. The public schools of the city were opened in 1848.

And now came in the turbulent mining era, which first really brought the Territory "before the people." In 1850 California appeared in the Congress of the United States demanding admission to the Union, with a population of nearly 100,000 people, with no previous action of the Government at Washington. Its population was largely of American origin and perhaps more representative of the whole country than that of any State. Two years after its admission to the Union, 1852, there were 264,435 in California—four-fifths American citizens; one-tenth of the entire number children. Although admitted to the Union as a free State without serious home opposition, California at once politically fell into line with the Democratic party, on which the slave power, to its subsequent confusion, so confidently relied. The political complexion of the State, like that of all the original Northwestern Commonwealths until 1856, remained the same; indeed, until the final revolt of the South in 1861. After a brief period of uncertainty the State was finally brought into line with the Union cause, although its political and social tendencies were rather of the Southern than Northern type, and, outside a few centers of population, more of the border type than of either.

For several years after its admission to the Union the great struggle in California appeared to be the endeavor by the well-disposed and executive class to hold society together. The country was little better than a boundless wilderness, twice as large in area as the British Islands, thinly populated with groups of

immigrants, largely governing their own localities according to their own ideas of order or disorder. The history of the vigilant committees in San Francisco and elsewhere need not here be related. Indeed, had it not been from the first a migration of the people of native American sort which abhors civil disorder and insists on good government at all hazards, the era of power and prosperity would have been deferred until another generation.

But below all the fluctuations upon the surface of a growing civilization, the radical intention of the superior class appeared evident. The first constitution of California, adopted September 9, 1850, provided for the education of the people in the following explicit language:

FROM THE CONSTITUTION OF CALIFORNIA, SEPTEMBER 9, 1850.

ARTICLE IX.—EDUCATION.

SEC. 1. The legislature shall provide for the election, by the people, of a superintendent of public instruction, who shall hold his office for three years, and whose duties shall be prescribed by law, and who shall receive such compensation as the legislature shall direct.

SEC. 2. The legislature shall encourage, by all suitable means, the promotion of intellectual, scientific, moral, and agricultural improvements. The proceeds of all land that may be granted by the United States to this State for the support of schools, which may be sold or disposed of, and the 500,000 acres of land granted to the new States, under an act of Congress, distributing the proceeds of the public lands among the several States of the Union, approved A. D. 1841, and all the estate of deceased persons who may have died without leaving a will or heir, and also such per cent as may be granted by Congress on the sale of lands in this State, shall be and remain a perpetual fund, the interest of which, together with all the rents of unsold lands, and such other means as the legislature may provide, shall be inviolably appropriated to the support of common schools throughout the State.

SEC. 3. The legislature shall provide for a system of common schools, by which a school shall be kept up and supported in each district at least three months in every year, and any district neglecting to keep up and support such a school may be deprived of its proportion of the interest of the public fund during such neglect.

SEC. 4. The legislature shall take measures for the protection, improvement, or other disposition of such lands as have been or may hereafter be reserved or granted by the United States or any person or persons to the State for the use of a university; and the funds accruing from rents or sale of such lands, or from any other source, for the purpose aforesaid, shall be and remain a permanent fund, the interest of which shall be applied to the support of said university, with such branches as the public convenience may demand for the promotion of literature, the arts and sciences, as may be authorized by the terms of such grant. And it shall be the duty of the legislature, as soon as may be, to provide effectual means for the improvement and permanent security of the funds of said university.

AMENDMENT TO CONSTITUTION, ADOPTED IN 1862.

ART. IX. SEC. 1. A superintendent of public instruction shall, at the special election for judicial officers to be held in the year 1863, and every four years thereafter at such special elections, be elected by the qualified voters of the State, and shall enter upon the duties of his office on the 1st day of December next after his election.

This document confirms the declaration of many of the most distinguished of the early visitors to the new State that, perhaps, never before was a body of men so remarkable, not only for natural ability and executive faculty, but so fitted by previous educational training, gathered in so rapidly at the beginning of an American Commonwealth. We are not, therefore, surprised to read that in 1853 the people of San Francisco were entertained by a festival of 1,000 school children, each carrying a bouquet of flowers, or that Father Taylor, known as the eloquent

"Sailor Preacher" of Boston, appeared on the scene, full of zeal to inaugurate a campaign of extermination against the rampant unrighteousness that still threatened the life of the new city, and established a church; or that within five years, side by side with much that was discouraging, had grown up a civilization not inferior in many of the essentials of a vigorous practical Christianity to any of the older States.

But it is not difficult to understand that, despite the progressive type of a society that was alive to all good things in many of the strategic points of civilization in California during the first fifteen years of its Statehood, it was no easy task to establish anything like the modern American system of universal education in a country that was essentially a new departure in American social affairs—the beginning of the peculiar civilization that even to-day characterizes our young Pacific empire. The absence of established family life in the mining districts was a great drawback. For several years the civil government, State and municipal, was largely dominated by a class of public men who came from States where the common-school system had never been known outside a few of the larger cities, and whose educational ideas and experience were not of the type of the Northern States. The remainder of the original Spanish and Mexican population had no interest in general education, and, with a considerable class of the American and foreign-born people, were inclined to school their children in family, private, or denominational institutions, largely under the management of their clergy. And through the illimitable rural country the population was yet too sparse and too much driven by the sharp goad of necessity for the ordinary comforts of life to justify the reasonable expectation of the speedy growth of even the elementary country district school.

We must not, therefore, be surprised that for the first ten years of its existence, outside half a dozen of the chief cities, the common school in California was virtually in the condition of an unnaturalized foreign visitor. The reports of several State superintendents of instruction, all of whom appear to be friendly, and one of them very capable, and dead in earnest in their calling, abound in the exposure of the weakness and slow growth of the expensive system.

In the first report State Supt. John G. Marvin declares that for the past three years the constitutional provision for common schools "has been practically a dead letter." No adequate provision has been made to carry out the intent and spirit of that instrument. The school law enacted by the legislature of 1852 he declares "meager in provisions and quite inadequate to start a system of public education." He recommends, first, that a general provision be made for the support of common schools, for which an appropriation of \$50,000 should be made for the then current year, while the towns should be required to contribute as much as they receive from the State; second, a small public tax, since it would be two years before any substantial aid could be expected from the sale of the public school lands, which, indeed, had only yet been partially assigned to the State by Congress; third, a county superintendency of schools; fourth, district school libraries, to meet the great destitution in reading facilities throughout the State; fifth, a provision for the selection of a uniform series of schoolbooks by the State authorities; sixth, Dr. Henry Barnard's treatise on school architecture as a guide in building schoolhouses.

Only 500,000 acres of school land had yet been assigned to the State by Congress. The superintendent calls attention to the swamp and tule lands of the State. He also declares that the usual donation of the sixteenth and thirty-sixth sections of each township for school purposes has not yet been made. The new State had an area of 188,981 square miles, or 120,270,700 acres. There were 4,594 townships, each of which might claim 1,280 acres donated by the General Government for education. This would give the immense area of 5,880,320 acres, which, added to

the original 500,000, would amount to 6,380,320 acres, representing a prospective State school fund of at least \$7,975,400. The superintendent also calls attention to the fact that the State may claim 72 sections of land usually donated by Congress as a university fund, and urges the activity of the State delegation in Congress to secure the prize.

The school law of 1852 had—

First. Accepted and provided for the management of the school lands already assigned by Congress, their sale at \$3 per acre, and the investment of the proceeds in United States 6 per cent stocks.

Second. The school age was fixed from 5 to 18, and the income of the school fund was to be divided among the counties, per capita of their school population, 60 per cent of the money to be appropriated to the payment of teachers' wages, the remainder for building and furnishing schoolhouses. The schools were to be maintained for three months in the year, supported by a tax sufficient to provide one-half the sum appropriated by the State as a condition of receiving public aid. The counties were to distribute the money according to the school attendance in the different districts.

Third. The State superintendent of public instruction was to be chosen by general election, to serve for three years. A county board of school commissioners was to be chosen for three years by popular election, authorized to divide the county into districts, establish and visit the schools, report to the State superintendent, and generally supervise the system.

Fourth. Five hundred persons of school age were required for the establishment of a school district organization, which should have the power to call a meeting of the legal voters to authorize a tax for building schoolhouses, etc., the levy not to exceed one-fourth of 1 per cent of the property valuation. The local management of the district schools was intrusted to this committee.

Fifth. The common schools should be graded as primary, intermediate, grammar, and high.

The new city of San Francisco reported 1,000 children of school age. The city had already established her present system of common schools, under the control of a board of education, with Col. T. J. Nevins as the first superintendent. Thirty-five thousand dollars was appropriated for the support of the system. There were 6,000 children in the State between the ages of 4 and 18. According to the declaration of the State superintendent, "most of these were growing to manhood and womanhood without education or the means of it." The superintendent pleads with the legislature to act promptly for the education of all.

In the second report, 1853, the State superintendent gives the number of persons of school age as 17,821. He says, "Up to this time not a dollar has been distributed by the State for the support of common schools." And there was no prospect of better things until another year. The school law of 1852 is pronounced thoroughly inadequate for the situation. Especially has it failed to deal with the subject of county superintendency. One hundred and fifty thousand acres of school lands have been sold for \$300,000, which will furnish an income of \$22,000 by another year, amounting with the funds on hand to \$50,000. Congress has made the assignment of the two sections of school land to each township. The necessity for a State university is more apparent with every year. The supply of competent teachers in California is more than equal to the demand. Twenty schools had been organized with 3,314 pupils in attendance, supported at an expense of \$28,103.74. San Francisco reported seven school districts, with 2,282 children, 8 men and 6 women teachers, the entire expense having been borne by a special local school tax. The male teachers were paid \$150 and female \$100 per month.

In 1854 Mr. Paul R. Hubbs, as State superintendent, reports: "The whole sub-

ject of education is in a critical state, owing to the defects of existing laws. Thirty-six of the 39 counties have reported 168 schools—214 teachers and 20,075 children, with an average attendance of only 5,751, schooled at a cost of \$272,829. Three-fourths of the children of the State are growing up deprived of learning to read and write. The effects of the legislative sleep, and the great neglect of legislation on this subject, can not fail to be felt in the immoral tendency of society. The State appropriation of 1854 has declined from \$50,000 to \$38,000—not sufficient to pay the salaries of the teachers for one month.” But the people in many parts of the State, notwithstanding, appeared to be stirring. Several institutions of the secondary and higher education and an increasing number of private schools were springing up. The teachers in several of the counties were forming associations. The first educational convention on the Pacific coast had been held, and it revealed a very hopeful spirit among the teachers and friends of education in attendance. The superintendent repeats the urgent advice of his predecessors, although he doubts the practicability of the Northern system of county superintendency.

The fifth report (1856) reveals the fact that the State did not contribute enough to support the 306 teachers two weeks of the six months session of the school. The law of 1852 providing for a school tax of five cents on \$100 was repealed by the legislature of 1853. The large majority of children and youth were still out of school. There was not yet a free school system in the State. The superintendent urges that the school districts be put in more direct control with the State authorities.

A revised school law in 1855 provided for the election of county school superintendents for three and local school district trustees for two years. The county commissioners were authorized to lay a tax of one-quarter of 1 per cent on the valuation for education. No sectarian religious teaching was permitted in the common schools.

In 1858 a more vigorous State administration of popular education appears under the leadership of a new superintendent, Mr. Andrew J. Moulder. He reports 367 schools, with 386 teachers and 35,722 children in attendance, conducted at an expense by the State of \$28,342—\$58.32 for each teacher. He recommends the establishment of teachers' institutes, and a State university conducted on the military system. In his first report he declares, “Nothing but confidence in the intelligence of the legislature to aid in education can prevent a feeling of discouragement, even of despair, at the present condition.” In 1858 there were 432 schools, 517 teachers, 19,000 children, and 400 schoolhouses. The superintendent reads a vigorous educational lecture to the fathers of the State. Of 40,530 children and youth between 4 and 18 but 11,183 are in average attendance on the schools. Only 162 of the 432 schools are in session six months in the year. The State does not distribute one-fourth the sum appropriated for public schools by the city of San Francisco. Not one-third of the teachers are of “the first class.” New California during the past five years had paid \$751,193 to protect her population from criminals and only \$289,183 for common schools; more than \$2 for jails to every \$1 for schoolhouses. There were now 64,000 children in the State, and 2,162 school officials. The school law was being published with commentaries.

In 1859 Superintendent Moulder states that 2,500 school officials had made reports. There were 48,600 children between the ages of 4 and 18 in the State, of whom 23,640 had appeared in school, with only 13,364 in average attendance; 4,082 were in private schools. In 1860 33 schools were in session less than three months in a year, 95 for three months, 125 less than six months, 55 for six months, 75 longer than nine, and 144 from nine to twelve months. During 1859 the private schools increased from 55 to 126. In 1860 there were 649 schools of all sorts in California. Of these 2 were classed as public high and 14 as intermediate,

138 as mixed, and 344 as primary. There were 754 teachers—536 men, 218 women. The total amount expended in 1859 was \$427,033; of this the city and county of San Francisco furnished \$134,731.91; Sacramento, \$40,900; Sonoma, \$28,740.63; San Joaquin, \$25,500; El Dorado, \$16,893; Yuba, \$16,256; Santa Clara, \$15,000. Eight counties with 23,619 children—less than one-half the scholastic population of the State—expended \$289,775—seven-tenths of the school expenditures of the entire commonwealth—\$12.26 per capita. The 33 remaining counties, with 25,075 school population, appropriated \$5.40 per capita. San Francisco expended \$7.34 per capita. Superintendent Moulder “strikes out from the shoulder” in his plain speech to the legislature. He says, “Hug not to your breast the delusion that we have a very good system of schools in operation because, forsooth, they are somewhat better than last year.” The improvements which he advocates are, 1, a State university; 2, State normal schools; 3, teachers’ institutes; 4, a high school in every county; 5, schools of higher grade in every neighborhood; 6, competent and energetic school officials. The examinations of teachers he pronounces “a mere farce,” from the incompetence of so many examining committees. There should be a board of examiners for every county, composed of the county superintendent and competent teachers, and a corresponding board of examiners for the State. Only thus can there be a hope of “ridding the commonwealth of a large class of worthless and illiterate vagabonds” now masquerading as school teachers. The State distributes less than \$2 per capita annually to the school population from 4 to 18. The county tax of one-tenth of 1 per cent does not suffice for a three months’ school term, without regard for schoolhouses. There should be a tax of one-fourth of 1 per cent, “unless the people are willing that their children should grow up young savages.” The rural districts should combine for graded schools. The school boards should keep out of debt. He pleads for the authority to hold a “State teachers’ institute” and offers to deliver free lectures on education, if his traveling expenses can be paid.

The superintendent especially urges that the township school lands, the 16th and 36th sections, shall be consolidated into a State common-school fund, to be distributed per capita among all the children. Up to 1845 the policy had been to give one section to each township of a new State for the exclusive education of its own children. But this policy, which created the greatest disparity of educational opportunity, had later been changed, and the States were authorized to concentrate the township funds into one general fund, to be used by the State for the common schooling of the whole people. In California there was one important exception to the national bounty—in the claim of the General Government to the possession of the extensive areas of mineral lands. The superintendent earnestly favors the establishment of a State university, at first on a military government, as a school of technology. The 46,080 acres donated by Congress for the university fund had been already sold for \$57,600. The legislature proposes that the United States Government should be urged to donate the military buildings at Monterey for the establishment of the State university.

This continual bombardment of the State legislature by the aggressive superintendent of public instruction finally seems to have brought that body to terms. In 1860 the tenth report takes on a more cheerful tone. The superintendent writes: “The school system of California, as now established by us, is, with some inconsiderable defects, all that could be desired by the friends of education.” The local returns were more satisfactory. A full commentary on the school laws had been prepared and sent to 2,800 school officials. Every county of the State had been subdivided into school districts, 523 in all. There were 92,814 children and youth in the State under 21, 57,917 between 4 and 18, of whom 26,993 were in general and 14,954 in average attendance, besides 5,438 in private schools. In the 523 school districts there were 573 public and 157 private

schools. There were 2 high, 29 grammar, 14 intermediate, 219 mixed, and 329 primary public schools in the State, taught by 831 teachers, of whom 526 were men. The average wage of teachers was \$66.72 per month.

The State supplied \$81,108; \$230,529 came from the county tax; \$168,849 from district tax, rate bills, and private contributions; \$480,486 in all. Of this \$311,165 was expended for teachers' wages, \$110,352 for school buildings and furnishings, and \$1,756 for school libraries. The city of San Francisco, in 1860, furnished one-third of the entire expenditure of the State for public education, \$156,407. The superintendent exposes without mercy the great defects of the school system of the State. He is especially severe concerning "the pittance, almost beneath contempt," distributed from the State fund, \$1.40 to each child. The average length of the public-school term in the State was six and four-fifteenths months. The rate bill was still a great obstacle to the development of a system of free education by the people of California.

But much had been achieved during the six years from 1857 to 1863, the limit of the present essay. The school population had increased from 40,000 to 114,600, of whom 70,700 were born in the State. The schools had grown from 316 to 715, and the teaching force from 411 to 962. The school attendance went up from 17,300 to 36,500. Four hundred schoolhouses had been built in six years. The school laws had meanwhile provided, 1, that the trustees of school districts might call meetings of the people to vote a tax to extend the school term and build schoolhouses; 2, the school trustees had been relieved from the burden of paying the salaries of certain county officials; 3, the county school tax had been raised from 10 cents to 25 cents on \$100; 4, county and State boards for the examination of teachers had been provided; 5, the selection of a uniform system of schoolbooks had been given to the State superintendent; 6, the establishment of the teachers' institute; and with all this there had come a general enlargement of view concerning the importance of public education in the State.

By the year 1863 the new spirit thus awakened seems to have prevailed. In the midst of the civil war, which heavily taxed the financial interests of the State, a greatly improved school law had been passed, which changed the tone of discouragement to one of hope. In its provisions was incorporated nearly everything for which the State superintendents for the past thirteen years had earnestly contended. Its main features were: 1. A State board of education, consisting of the governor, State superintendent of instruction, and surveyor-general, required to hold at least two sessions a year, and given a general oversight of the public-school system of the Commonwealth. 2. A State superintendent of instruction, elected by the people for four years, with a salary of \$3,000 and \$1,500 for clerk. His duties were the appropriating of the school moneys according to the school population from 4 to 18; a thorough report of the educational affairs of the Commonwealth to the legislature, with suggestions for the improvement of the system; the supervision of the teachers' institutes of the State, to be held in sessions of from five days to two weeks; the visiting of schools through the State, for which traveling expenses were allowed to the extent of \$1,000, and the presidency of the State board of examiners of teachers. 3. A board of county trustees to examine teachers, distribute State funds, divide the county into school districts, and perform other necessary duties. 4. A county superintendent of schools, elected for two years, to apportion the school funds among the districts, visit the schools, and preside over the county institutes. 5. A board of district school trustees, elected for three years, authorized to administer local school affairs, build schoolhouses, employ teachers, and report to county superintendent; two or more districts might combine for a union school. 6. District taxation for extending the school term, arranging rate bills, etc. 7. Every city or town constituted one school district, though always subject to

division. 8. The State board of examiners, composed of the State superintendent and four assistants, either county superintendents or competent teachers, was authorized to issue certificates for two, three, and four years; a county board of examiners was composed of the county superintendent and two competent experts. 9. The State board of education was authorized to decide upon a series of schoolbooks for general use. 10. A State normal school was provided for under the direction of the State board of education, with the addition of the superintendents of the cities of San Francisco and Sacramento. 11. The entire separation of public schools from complicity with all sectarian, religious, or ecclesiastical entanglements was secured and the public-school funds insured from encroachment from any quarter. 12. Negroes and Indian children were separated from the white race in the public schools, although provided for by a separate arrangement.

Here, at last, despite the remarkable diversity of a population representing the entire civilized world, a mining civilization that for years at times almost defied the control of organized government, a vast extent of open country very imperfectly known to its own inhabitants and sparsely occupied in its rural districts, and the entire Territorial and State life up to 1863 developing amid the tumult of the fierce conflict of sectional politics that finally exploded into civil war, the solid center of society in California had overcome all opposition, and reasonably provided for the education of the children according to the most approved American ideas.

Good things often come to States, as to individuals, in pairs. As if to confirm the purpose of the people of California in their "conclusion of the whole matter," as expressed in the school law of 1863, the Commonwealth was blessed by the election of Mr. John Swett as State superintendent of instruction. Here is the fit place to close the present record, on the threshold of the second period of the great revival in common-school affairs that followed the close of the civil war and the reconstruction of the Union. In California the final establishment of a completely organized common-school system was happily consummated by the appearance on the field of a new State superintendent of instruction, whose name for more than thirty years past has been a household word among the children and youth of the Pacific coast, and whose successful administration of almost every department of public education is bound up with the later history of the common school in California.

## CHAPTER IX.

### THE ROYAL NORMAL COLLEGE FOR THE BLIND, LONDON, TOGETHER WITH INCIDENTS IN THE LIFE OF ITS FOUNDER AND PRESIDENT, DR. F. J. CAMPBELL, A NATIVE OF TENNESSEE, U.S.A.

By Hon. John Eaton, formerly U. S. Commissioner of Education.

The beginnings in education initiated by Americans have by no means been limited to our shores. A very important and interesting movement of this character is a contribution to the education of the blind in our mother country. The blind in all Christian nations have received important consideration. The number of persons in the United States, according to the census of 1890, blind in both eyes was 50,411, of whom 27,983 were males and 22,428 were females. The number of the blind in both eyes in 1,000,000 of population was, for the census of 1890, 805; for 1880, 976; for 1870, 527; for 1860, 403. The following table gives a comparison of the number of blind in both eyes in 1,000,000 of population found in each of the geographical divisions in the censuses of 1890 and 1880:

Geographical divisions.	1890.	1880.
United States .....	805	976
North Atlantic .....	777	970
South Atlantic .....	888	1,105
North Central .....	783	877
South Central .....	895	1,009
Western .....	561	814

The Report of Dr. W. T. Harris, the United States Commissioner of Education, for 1895-96 gives the following statistics of the education of the blind: Number of institutions in United States, 37; instructors, male, 149; female, 242; total, 391; music, 129; industrial department, 106; pupils, male, 1,923; female, 1,707; total, 3,630; kindergarten, 490; vocal music, 1,532; instrumental music, 1,610; graduates in 1895-96, 139; industrial department, 2,386; volumes in library, 77,667; value of scientific apparatus, \$19,325; value of ground and buildings, \$6,250,894; receipts, \$811,874; expenditures, \$980,786.

As many specially interested in this subject will wish these figures in detail, I quote them by geographical divisions:

*North Atlantic Division.*—Number of institutions, 5; instructors, male, 29; female, 76; total, 105; music, 43; industrial department, 26; pupils, male, 478; female, 409; total, 887; kindergarten, 145; vocal music, 439; instrumental music, 440; graduates in 1895-96, 49; industrial department, 799; volumes in library, 29,607; value of scientific apparatus, \$4,000; value of grounds and buildings, \$1,664,635; receipts, \$162,199; expenditures, \$222,831.

*South Atlantic Division.*—Number of institutions, 8; instructors, male, 43; female, 35; total, 78; music, 21; industrial department, 26; pupils, male, 330; female, 293; total, 623; kindergarten, 61; vocal music, 207; instrumental music, 193; graduates in 1895-96, 16; industrial department, 303; volumes in library, 8,402; value of scientific apparatus, \$360; value of grounds and buildings, \$695,000; receipts, \$157,882; expenditures, \$195,025.

*South Central Division.*—Number of institutions, 9; instructors, male, 20; female, 33; total, 53; music, 16; industrial department, 21; pupils, male, 284; female, 282; total, 566; kindergarten, 105; vocal music, 356; instrumental music, 264; graduates in 1895-96, 11; industrial department, 200; volumes in library, 8,630; value of scientific apparatus, \$4,100; value of grounds and buildings, \$537,000; receipts, \$120,960; expenditures, \$133,594.

*North Central Division.*—Number of institutions, 10; instructors, male, 51; female, 84; total, 135; music, 41; industrial department, 28; pupils, male, 754; female, 655; total, 1,409; kindergarten, 167; vocal music, 442; instrumental music, 617; graduates in 1895-96, 59; industrial department, 1,013; volumes in library, 27,658; value of scientific apparatus, \$10,405; value of grounds and buildings, \$2,492,259; receipts, \$331,545; expenditures, \$387,275.

*Western Division.*—Number of institutions, 5; instructors, male, 6; female, 14; total, 20; music, 8; industrial department, 5; pupils, male, 77; female, 68; total, 145; kindergarten, 12; vocal music, 88; instrumental music, 96; graduates in 1895-96, 4; industrial department, 71; volumes in library, 3,370; value of scientific apparatus, \$460; value of grounds and buildings, \$862,000; receipts, \$39,288; expenditures, \$42,061.

It would be interesting to give with similar definiteness the data with regard to the blind and their education in Great Britain. The nearest to this that it is possible to come at the present time is an extract from Dr. Harris's Report, already cited, summarizing the English official data with regard to schools for the blind and deaf. The schools for the blind and deaf are treated together.

The schools for the blind and deaf show an increase. In 1895 there were 79 schools certified, with accommodations for 4,130 children, and there was an actual grant made that year out of the consolidated fund in respect of 3,148 children. This grant is 3 guineas a year for every deaf and dumb child receiving an elementary education, and an additional 2 guineas for every child who receives manual instruction or industrial training. All of the 3,148 children in 1895 received the grant for elementary instruction, but only 1,934 obtained the grant for industrial training, so that the average grant per child that year was £3 8s. For the current year we estimate that the grant will be for 3,148 children, being an average of £3 10s. 9d. per child.

It is impossible to state definitely how many of these persons are blind, but the significant fact is brought out that the children of these two interesting but unfortunate classes are now considered

legally as among the educable youth of the realm and deserving of consideration in the estimates for education at public expense.

At first, even in Christian countries, the education of both the blind and deaf was considered a charity, and the institutions for this purpose were designated asylums. The United States deserve special credit for their early change in this respect and their treatment of the education of the blind and deaf as a debt due to those unfortunate children, the expense of which is as appropriately to be met from the public treasury as is the education of any who are instructed in the public schools of the country. In bringing about this change in Great Britain, great credit is due to the Normal College for the Blind in London and its able and efficient president, Dr. F. J. Campbell, and those who have cooperated with him.

Dr. Campbell was born in Franklin County, Tenn., U. S. A., October 9, 1834. While at play a sharp acacia-tree thorn pierced his eye; inflammation and bad management resulted in total blindness.

The data connected with the foundation, growth, and results of the normal college are not easy to find in any connected form up to date. The following summary is most carefully drawn from various authentic sources. Dr. Campbell's connection with the college came about in this wise: His health having become imperiled by his labors in the Perkins Institute, Boston, U. S. A. (founded and so long cared for by Dr. S. G. Howe and now so efficiently conducted by his son-in-law, Dr. Anagnos), Dr. Campbell and his wife, by the aid of Dr. Howe, Senator Sumner, and Governor Andrew, were enabled to spend a couple of years in the study of music in Germany. On their way back to the United States, they arrived in London January 20, 1871. Dr. Campbell had a letter of introduction from Edward Davidson, of Berlin, to Dr. T. R. Armitage, who had already done much for the blind. He had founded (1868) the British and Foreign Association for the purpose "of promoting the education and employment of the blind by ascertaining what had been done in these respects in this and other countries, by endeavoring to supply deficiencies where these were found to exist, and by attempting to bring about greater harmony of action between the different existing schools and institutions." At that day the poverty of the blind was distressing; the Government had not reached out its hand in support of their education. On the night of Dr. Campbell's arrival in London, a gentleman stepped up to him and said: "You're blind, sir, are you not?" "Yes," replied Dr. Campbell. "Well," the stranger went on, "I am going to a blind tea meeting to-night; would you care to come?" Dr. Campbell answered: "I never heard of a blind tea meeting before; but as there will be blind people there, I shall be delighted to come." Ever on the alert for all that affected the blind, he went. There were some three or four hundred blind men, women, and children present who were treated to tea, bread and butter, cake, etc. Ladies and gentle-

men entertained them with speeches, music, and recitations. Some of the blind took part. At first Dr. Campbell was impressed by the apparent happiness as they expressed gratitude to their benefactors; but by degrees, as he talked with them individually, he found that they were, as a rule, little fitted to care for themselves; that they were indeed objects of charity. He has been known to say that this was one of the most sorrowful evenings he ever spent. He passed a sleepless night and the next morning he informed his wife that they must defer going to America and remain and try and do something for the blind in London. Upon invitation from Dr. Armitage, Dr. Campbell visited him and they went into a full comparison of facts and plans. Dr. Campbell unfolded the idea he had been cherishing of the great national training college for the blind in the United States for which he had suggested a national university. Before parting Dr. Armitage urged him to make London his field of labor rather than America. They visited blind schools and tried to introduce new methods. Sightless as they were, their souls were alive to see the actual condition of this helpless class. They both agreed that an experimental school ought to be attempted. In the May following the two doctors were conferring while walking through Hyde Park. Dr. Armitage suddenly asked Dr. Campbell, "What would it cost for an experimental school for two years?" Dr. Campbell replied, "Three thousand pounds." Dr. Armitage said at once he would give £1,000 if the other £2,000 could be obtained.

Three small houses in Paxton Terrace, near the Crystal Palace, were rented, and on March 1, 1872, an experimental school was opened with two pupils—little boys from Leeds—and by the middle of May the increased attendance required the organization of regular school work with two lady teachers, Miss Green and Miss Faulkner, and a piano tuner, Mr. J. W. Smith; Dr. Campbell giving musical instruction entirely himself in addition to all the other tasks required of him. When asked why he chose to locate near the Crystal Palace, he answered in order that the pupils might have the benefit of the music there. This has been a great advantage from the first.

In 1873 Dr. Campbell was greatly depressed by the loss of his wife, but he did not allow his private sorrows to hinder his public work. He was constantly on the lookout for larger opportunities, and especially for a more favorable site for the school. He was particularly struck with the advantages of the "Mount," on the top of the hill, Westow, Upper Norwood, London. The Duke, then Marquis, of Westminster, visited the school and carefully considered the question of securing the "Mount," and before he left offered to give £1,000 for the purchase of it. Others joined in the effort, and by October pupils were moved to the new location. The enlarged institution has become celebrated throughout the world under the name of the Royal Normal College for the Blind. The location, the plans of the build-

ing, their equipment, all unite in illustrating the advanced, comprehensive, and complete ideas that Dr. Campbell entertains with regard to the education of the blind.

An interesting idea of the spirit and methods of the college is gained from a description of a garden party on the grounds which appeared in the *Weekly Chronicle*. The writer says:

The sight of some 200 blind young men and women, and younger boys and girls, freely going about without guidance, and with the greatest freedom in a crowd, was, to begin with, a surprise. Over the terraces, along the paths, under the trees, by the side of the lake, they walk and they run, singly or in groups, with the utmost certainty and fearlessness. Do you want to find the concert hall, Armitage gymnasium, or swimming bath, the parade ground, the Fawcett gymnasium? Ask the first blind boy or girl you meet, and you will be taken there without any more trouble. But what is there else to be seen? Pleasant as a garden party may be, especially on such a beautiful day as we were favored with, yet a crowd with nothing definite to see or do is soon bored. People get into each other's way, and get tired of each other, and of saying, "How do you do?" and going through the round of social inanities again and again.

Fortunately, we had a pretty large programme before us, to be provided by our young hosts and hostesses, the pupils. First of all, we had to see and hear them in their classes, held for the occasion under the trees in the garden. It would take far too long to tell of all the interesting things here. In the geography class rapid little fingers trace on raised maps the courses of rivers, follow the outlines of coast, touch the tops of mountains, discover towns and cities, and so on, until the visitor, whose weak point is geography, almost dies of envy. There is the class where, by the aid of mysterious metal tablets and pegs, complicated multiplications and divisions by tens of thousands and millions are going on; the class where rhomboids and trapezoids and angles and curves, illustrated with ingenious raised diagrams on wooden pads, are the subjects of conversation; a class where modeling in clay is proceeding; and, most wonderful of all, another class where dictation is getting itself done with the rapidity almost of shorthand. "Click, click," go the styluses, in and out of the perforated frames of metal accurately adjusted, with wonderful dexterity, as each line is read out by the blind lady teacher, who reads passage after passage from the book before her.

Meanwhile, Mr. Alfred Hollins, a distinguished musician, is delighting those who have passed on, as we have now done from the classes, with an organ recital. There follows a concert, consisting of selections from the *Daughter of Jairus*, by the pupils' choir. Taught by ear, do you say? Not at all. The Academy of Music for the Blind would despise such an unscientific method as that. The music itself has been mastered, and has passed by means of those wonderful finger tips into the brain of each boy and girl who is singing.

Now we pass once more to the garden. We come to the skating rink. Here you open your eyes with surprise. Crowds of boys march, wheel, countermarch, along, around, and about the rink with the precision of old soldiers. There a group perform with Indian clubs, others with dumb-bells—a regular series of exercises. How learned, would puzzle one to tell. And more startling than all we have Mr. Guy Campbell performing acrobatic feats with blind boys, who mount on his shoulders and form pyramids three or four tiers high with the amusing nonchalance of professional gymnasts. We do not pretend to have mastered the secret of how they avoid breaking their necks, but we do know there was no accident, not the slightest, nor apparently the risk of one. But is that more surprising than the roller skating that follows? Hardly. Fancy a crowd of boys, all blind, let loose to gambol at their own will and pleasure over a skating rink.

One gets nervous watching them, though one sees every moment how skillfully they are avoiding collision. After this, we only feel a mild surprise when the cycling season sets in, and sightless tricyclists whirl around the track and scatter us right and left. An eight-in-hand cycle is not often seen, but here is one, and we are told that a little time ago a party of students conveyed themselves by means of it and a four-in-hand as far as Derby, where they gave a concert for the benefit of the Railway Orphanage in that town.

It would be an anticlimax to speak of ninepins, swings, rocking boats (the last being an attraction not easy to understand for crowds of little fellows), tilts, rope skipping, or even of rowing.

Each of the five schools into which the normal college is divided has a separate playground with specially adapted walks, rocking boats, rob roys, tilts, swings, etc.

This description gives some idea of the marvelous system which has grown up since the college opened with two little blind boys for scholars.

The year 1887 was marked by the completion of the Fawcett gymnasium, playgrounds, and rinks for roller skating, the important improvements in the Armitage gymnasium and swimming bath, the construction of a number of rob roys, the making of a cycle track in the grounds, the gift of a number of cycles, including a "Rudge" eight-in-hand, on which seven pupils are steered by one seeing person, several four-in-hands, each of which accommodates three pupils and a steersman, and two beautiful boats, each accommodating six rowers. On the opening of the Fawcett memorial Hon. A. J. Mundella, M. P., well known among American educators for his efforts in behalf of education, remarked:

As a member of the royal commission on the blind it has been my duty to inform myself of blind education in Europe, and I have been through nearly all the best blind schools, but I believe that we need not go from home to see the best example of blind instruction, and for physical education there is no blind school which possesses the same advantages as the normal college, or where physical education is so thoroughly carried out and developed. It may seem to some of you that it is a source of enjoyment to the blind, but it is a great deal more than that—it is a condition precedent to all education and all success in the teaching of the blind, because without confidence, courage, and determination to go about freely in the world there is no chance of success for a blind person, and that confidence and courage are given by the playground and gymnasium such as we see here.

He added at that date, "The State is doing nothing for the blind, but I hope this condition of things will not last much longer."

A feature of the physical training at the college was illustrated a few years since by a cycling trip furnished by a friend. Two "Rudge" machines were used—one carrying four, and the other eight persons—one seeing man acting on each machine as steersman. Appropriate halts were made—the whole distance taken being 126 miles. Dr. Campbell often travels on a "cycle" with some member of his family, using the tandem. That he leads in overcoming all the difficulties in

the way of the blind is apparent when it is known that he made a successful ascent of Mont Blanc, being the first blind man to accomplish that feat. He often declares we must not say to the blind, "go," but "come." Pointing to the fact that the blind, as a class, have from 25 to 40 per cent less vitality than seeing persons, he declares that "physical training for them is the lever which gives force to all other education," and that without it the blind man, however excellent his general education, is "like an engine provided with everything necessary excepting motive power." In this department his constant aim is "to develop energy, courage, and independence."

The report of the college for 1892 states that Windermere, recently purchased, contains  $4\frac{1}{2}$  acres, forms one of the most picturesque properties south of the Thames, and adds greatly to the facilities for physical training and the development of physical health. Many are indifferent to the appearance of the surroundings for the blind. On the contrary, Dr. Campbell seeks for their benefit the most impressive scenery. On one occasion the Duke of Westminster, president of the college management, was walking in the lovely and picturesque grounds when he said, "Dr. Campbell, it is terrible to think that you can not see anything of this beautiful view." "Pardon me, Your Grace," replied the Doctor, "I know every spot and every tree; and while you look at the beauties you see, my imagination pictures the scene with beauties beyond my power of expression."

Dr. Campbell has, to a remarkable degree, what Lord Playfair calls the "intoreceptive faculty," which to intelligent blind persons "becomes almost a substitute for sight," as they are able by the description of the things around to believe that they see the objects. In guarding the health of his pupils Dr. Campbell allows no intoxicating drink of any sort to enter the college, and the use of tobacco in all forms is forbidden. On these points Dr. Campbell's quick conscience enforces his scientific convictions. Some of his views are called "American crotchets." The Christian Herald relates that when the Prince of Wales was about to visit the college some of the directors said to the Doctor, "You will have to lay aside your American prejudices and furnish your guests with wine." The Doctor excused himself, and the reply was, "the Prince would think himself insulted if he comes here and no wine were offered him." The Doctor did not argue further, but when the Prince arrived he introduced the subject himself. "I am aware, Your Royal Highness," he said, "that it is usual to have wine provided on such occasions as this, but it is against my principles and those of our institution. I can only offer you the best tea and coffee I could obtain." The Prince not only thanked him, but is reported as saying in London society, "I am glad to know that we have one institution in London which is consistent and will not lay aside its principles, even for a prince."

Dr. Campbell places much stress upon industrial training as a factor

in physical culture. The kindergarten, with its modeling, sewing cards, and paper folding, not only naturally precedes the use of books, but adds to the skill of fingers in making geometrical forms, flowers, vegetables, and animals. The workshop of the college is well equipped and modeled specially after that founded by Dr. Thompson, at Worcester, Mass., U. S. A. In due time industrial training takes on adaptation to definite ends, such as piano tuning, basket making, and the like, peculiarly adapted to the capacities of the blind. Dr. Campbell has been instrumental in the founding of several piano-tuning establishments, in which his pupils have been employed with success. A considerable number have been recognized as tuning experts by large instrumental manufactories, and have found lucrative positions, not only in England, but on the Continent and in distant America and Australia. The work of the college proceeds upon the principle that the blind must do all in their power to help themselves—self-help is the best help—and that for them to succeed in any business or profession they must have an education fully up to that of the seeing who follow the same avocation.

Dr. Campbell often repeats: "A practical education is a blind man's capital." His experience has led him to the conclusion that it requires more effort to obtain thorough systematic work from the blind than from the seeing. Therefore he would require their teachers not only to be more patient, to have more tact and ability, but that they should have a larger reserve of enthusiasm. Under normal conditions it is desirable that young children should have the benefit of home influences in connection with their school training; but he declares blind children are an exception to this rule in a majority of cases. Parents find it easier to attend to their wants than to teach them how to do for themselves; they indulge them and overpraise them without training them either to feed or dress themselves. The overworked mother is grateful if the blind child will sit still in a corner. Dr. Campbell holds, therefore, that the principles of work and the habits of punctuality, regularity, and precision are better cultivated at school. He gains great advantage from the most careful study and intimate knowledge of his pupils. He says: "After a four years' course an intelligent opinion can be formed in regard to their future career." "They will fall naturally into the following categories: (a) A certain number will succeed better in handicraft than in any other calling, and should be drafted into a suitable mechanical school. (b) A few will have special gifts for general business, and should be educated accordingly. (c) A few will have the ambition and ability to prepare for the university, and the special college should afford them the most thorough preparation for the university examinations. (d) Some will have the necessary talent combined with the requisite character and industry to succeed in the musical profession; in addition to a liberal education these should have musical instruction

fully equal to that given to the seeing, in the best schools of music. (e) Some may achieve excellent success as pianoforte tuners; and in the pianoforte-tuning school strict business habits should be cultivated and the same attention to work required as is demanded of seeing workmen in well-regulated pianoforte factories."

In meeting the conditions of the blind the normal school had to give special attention to lower grades of work in order to produce the best results in the highest grades.

The college embraces a preparatory, a grammar and high school, a technical school especially for young men, but affording preparatory technical training to the pupils of the other schools, and an academy of music. The academy of music forms a common bond of union; all, to a greater or less extent, enjoy its opportunities and privileges, while the instruction afforded the professional pupils is equal to the instruction given the seeing in the best conservatories. The course of instruction is outlined as follows: First, physical education, including gymnastics (Swedish, German, and American), dancing, deportment, military drill, swimming, skating, rowing, cycling, and other sports. Second, general education, including, in the preparatory school, kindergarten in all its branches, modeling, technical training, reading, writing, spelling, arithmetic, language lessons, object lessons in various subjects, and Scripture; in the college, literature, history, science, mathematics, Scripture, Latin, French, and a normal class for training school-teachers. Third, the science and practice of music, including the training of music teachers, pianists, organists, choir-masters, and vocalists. Fourth, technical education, including mechanical training and pianoforte tuning. In each department the instruction is directed to the practical end of preparing the blind for self-maintenance.

Special attention is paid to moral and religious training.

#### MUSIC.

Every observation connected with the college brings music into view. Dr. Campbell asserts that music in its various branches when properly taught affords the best and most lucrative employment for the blind. Yet he adds, "Many who have tried to earn a livelihood by music have failed." Their failure, he points out, is due to the following reasons: "1. In the selection of pupils for the profession the musical ear rather than the mental capacity was considered. 2. The physical and intellectual powers of the musical students were not developed. 3. The musical instruction and practice was insufficient, both in quantity and quality. 4. The opportunity of hearing music in its highest forms was not afforded them. 5. They were not trained in the art of teaching, especially in the best method of giving instruction to seeing children." Great attention is given in all departments to voice culture. He adds: "The blind man who intends to follow music as a profession must have a well-disciplined mind, capable of analyzing and dealing with music from an intellectual point of view. If the mental faculties have not been developed and thoroughly disciplined the blind music teacher or organist, however well he may play or sing, will be a failure. Even with superior men-

tal training, the musical instruction must be more thorough, more analytical, more comprehensive than corresponding instruction to seeing persons."

Dr. Campbell's success as a teacher of music has been preeminent, and he has placed great stress in securing for the college teachers of music of the highest eminence. Nothing short of the best methods is tolerated.

#### AID TO OLDER PUPILS.

Nor does Dr. Campbell's care of his pupils cease with their connection with the college. He seeks to remain in touch with them and to place each one who goes out from the college in an appropriate sphere of employment. With respect to one class he stated that thirteen were already provided with future employment. He referred also to an institution for the blind in which as a result of an organized plan for starting the pupils in life the percentage of success was advanced from 10 to 70 or 75 per cent. In order to aid in this purpose the Old Pupils' Guild has been organized in connection with the Royal College. This guild cooperates with the Doctor in finding places for teachers, organists, and musicians and pianoforte tuners and others. The prejudices against the blind entering into the pursuits requiring a high order of skill have manifested themselves in many ways, and often have been difficult to overcome. The thorough work of the college and the standard of merit required before a certificate can be secured have done much to secure recognition for the students going out from its several courses of instruction. The testimony from the most eminent judges on this point is too abundant to be quoted. Archdeacon Farrar declared, after personally inspecting all the various classes: "The general education is sound and thorough to the end. I saw the results of earnest and pleasant instruction intelligently enjoyed, and producing results of which Eton and Harrow might be proud."

A single illustration in the matter of securing places must suffice. Dr. Campbell, in one of the earlier years of the college, heard of a vacancy for an organist in a Scotch town. Having a friend in the place, he wrote him telling him that he had a pupil admirably fitted for the place and urged him to get the post for the blind musician. The reply came, "I am willing to do what I can, but they won't have a blind organist. A meeting is to be held to-morrow to settle the appointment." Instead of being discouraged Dr. Campbell telegraphed, "Please meet me at the station to-morrow morning and arrange for me to attend the meeting." The difficulties to be encountered need not be specified. One man declared, "We are pleased to see you, but we are not going to have a blind organist." "Why?" asked Dr. Campbell. "For one thing, he can not teach the children," was the reply. "Oh, yes, he can," said the Doctor, as he went on

to demonstrate how it could be done. The demonstration interested the committee deeply and they finally agreed to try Dr. Campbell's proposal that the blind organist should come on trial for three months, the Doctor offering to pay his salary should the experiment prove a failure; but the blind musician gave such satisfaction while on trial that a purse of 20 guineas was made up at Christmas time and given him as a mark of appreciation of his work.

The earnings of the pupils of the college during the year 1891, as reported, amounted to £18,000, and each year the returns show a handsome increase.

#### INCIDENTS IN THE LIFE OF DR. CAMPBELL.

These facts indicate something of the power of the man who has accomplished these great results. But what of his training; what of his environment? Franklin County, Tenn., the place of his birth, in 1834, had not by any means the best facilities for education; there was no efficient public school system; the institutions for higher education in the State were in the midst of a great struggle; the opportunities for either general or special education were meager; courses of study in the natural sciences were but little developed; technical and industrial education had hardly been heard of; schools for the blind were just beginning their great work here and there in different States of the Union. We can only glean the facts of his early life from various sources as friends have recorded them or as he now and then has made some allusion to them. Some years ago the author of *John Halifax, Gentleman*, wrote some interesting particulars of his life in *Good Words* under the title of "Light in Darkness." She recalled an incident told her by Dr. Campbell illustrative of the danger to the blind from the sympathy awakened by their misfortunes. His parents were greatly affected by his calamity, and it became the law of the family that he must do exactly as he pleased. In two instances only was he punished, naughty and perverse as he was, and in both of those instances, he said, the punishment was unjust. The first was on an occasion when his two brothers and himself were playing in the barn and began to fight; he begged them to stop, and his voice brought his father to the spot. He was an impulsive man and rushed to punish somebody. It being dark, he caught his blind boy and punished him. The brothers rushed to the rescue crying, "It is Joseph! Poor blind Joseph!" The whole family were in tears, his father quite uncontrollable.

His father having met with heavy losses, all the family were afterwards compelled—father, mother, and children—to work early and late to draw their support from their small farm in the mountains. Joseph, however, was an exception; he was not expected to do anything for fear he would hurt himself. But his father being absent for several weeks, his mother allowed him to have some wood and an

ax to cut it with. When his father returned he was amused to find six cords of wood cut and carefully packed away. His brothers told their father it was Joseph's work, and the next day the father brought a little ax from the village for his use, and after that took great pains to teach his blind boy all sorts of farm work.

Dr. Campbell alludes to the dull times when all the other children were at school. "Oh, the anguish of those dreary, idle days!" he exclaims. "Long before evening I would wander off on the road to the school and sit listening for the far-off voices of those happy boys and girls coming back from their lessons."

It was given out that April 1, 1844, 10 pupils would be received for instruction in the blind school then to be established in Nashville, the capital of Tennessee. Day after day Joseph's father went 5 miles to the village to make arrangements for him, but would come back saying to his wife, "Melinda, I can not do it." His mother, a brave and noble-hearted woman, would answer, "James, we must do it; it is the only thing we have been praying for; we should lose our chance; the school may be soon full, and then"—

It was difficult to secure an outfit for the lad. Finally a sewing bee was held to make his clothes, and he was soon ready to start. A kindly old gentleman volunteered to take him in his buggy to Nashville. His father went with him part of the way riding Joseph's pet horse, and when he said in a choking voice, "Good-bye, Joseph, my son," the boy's courage failed him for the first time, and he earnestly hoped to find the school full. When they arrived in Nashville the old gentleman called from the carriage, "Is this the blind school, and is it full yet?" The answer came "No." Though given in a wonderfully kind voice it sounded to Joseph like a knell. He and his friend were made welcome; he was taken to the schoolroom and the New Testament in embossed letters put into his hand; he was electrified and so eager to begin that the teacher sat down beside him and in three-quarters of an hour the lad had learned the whole alphabet.

These were halcyon days. The family consisted of the earnest teacher, Mr. Churchman, a blind gentleman, his affectionate and kindly wife, and two pupils. All lessons were taken in their private rooms at first; soon more pupils came and regular school work began, especially in music. Dr. Campbell has said that he never could forget his first singing lesson. He had succeeded so well in other studies that his teacher called upon him first; he sounded *A*, and the lad opened his mouth, but, as he says, the result must have been very funny, to judge from the effect it produced on his listeners. He was asked to sing a tune; the teacher hummed a tune for him to imitate—also in vain, and it was declared that he could not tell one tune from another. His case was considered hopeless; he was told he could never learn music, but could only take basket and brush making; piano lessons were regarded as a waste of time and was forbidden; other boys laughed at him; he was left out in the cold.

Joseph determined not to be beaten; he hired one of the boys secretly to give him lessons in music, and practiced whenever he could. Three months after, the music teacher, also blind, accidentally entered the room and asked, "Who is that playing the new lesson so well?" "I, sir," responded Joseph. "You, Joseph?" exclaimed the teacher, "you can't play; come here; what have you learned?" "All that you have taught the other boys, sir," replied Joseph. "Well," said the teacher, "sit down and play the instruction book through from beginning to end." This he did. Fifteen months later he gained the prize for pianoforte playing. The prize was a medal with the inscription "*Musica—lux in tenebris*," and this has been the motto of Dr. Campbell ever since, and is now inscribed over the music hall of the college.

The school could only afford one piano and Joseph had to rise early and practice until 7 in the morning. The winter of 1845 was intensely cold in Nashville; the river was frozen over; they could get no coal in the school for a whole month and had to manage with a single fire. Few lessons were given, but Joseph practiced from 5 to 6 hours daily, working for an hour and then running into the playground and rushing around it ten times, which made a mile, and then returning to his piano again. Thus these early conditions tested and developed the grit that was in him.

Dr. Campbell so often says "I see," and describes with such enthusiasm the appearance of Niagara, the White Mountains, and the Alps, and other scenes which he has visited that people often ask, "Is he really after all totally blind?" "Are you really blind, or are you humbugging?" said Professor Tyndall to him once, seizing his arm as the two sat together on the Alps, so keen was the interest Dr. Campbell manifested in the scene before him. He says of himself that he had seen many beautiful things before he became entirely blind which are indelibly impressed on his memory, such as the beautiful peach tree, the pear, apple, and plum trees, and near by the field of clover filled with brilliant white and red blooms. "To this day," he says, "I often go to my piano in the quiet evening and see it all again—the flowery land of my birth. Then the stars," he continues, "I wonder if the children love the stars as I did? As my sight faded my mother took me out before putting me to bed and made me look up from the piazza." Little by little the curtain was drawn. One night he could see nothing. "Why is it so dark? Why does not God light up the stars for your little boy?" he said. And to this day he recalls the tears that fell on his face as his nurse carried him to bed.

As to the philosophy of the blind seeing, Dr. Campbell says no two persons ever see a thing in the same way; each sees it differently; they talk, each giving a separate idea, and the blind catch the ideas of all, and so really seem to have a power of seeing with other people's eyes, which compensates in a measure for the loss of their own.

Dr. Campbell has sought always to do as nearly as possible as those

seeing do. This is illustrated in his boy life at home. He was fond of hunting and fishing with his brothers—he could ascend the most inaccessible mountain cliffs and became an expert climber. He could climb any tree that he could clasp with his arms. In his boy life in the mountains his chief enemies, he has been accustomed to say, were the snakes. Often he slept unconsciously over them; sometimes to his horror he would step on them. Once when working in the corn-field he took up a large snake in an armful of corn. It struggled to free itself and he threw it violently from him, thus probably saving his life. The snake was killed and he resumed work. He was greatly devoted to the farm animals, especially the horses. His father kept one in particular for him; he says she was a fiery, wide-awake little cob, but if she had been a human being she could not have understood his blindness better. She would come to him anywhere, wait patiently for him to mount, which he would do without saddle or bridle—and though on her mettle, with him she always carefully picked her way; even in the mountains he could trust her implicitly, giving her the reins in difficult places, sure that she would carry him safely through.

His courage and persistence are illustrated by an incident which occurred in connection with an expedition among the mountains for health. He had overworked and the physician ordered rest. With a brother he undertook a mountain expedition. They sheltered themselves in a hut within a few feet of the brow of the mountain. By and by young Joseph learned to clamber up and down this cliff and found ten enormous trees growing there, one above the other, the upper one being only a few feet from the next, the lowest about 200 feet beneath. He planned and proposed what backwoodsmen call a "cataract," and sallied forth axe in hand to attack his first tree, about 4 feet in diameter. His brother laughed at him and suggested that he should ask for help, but he kept at the task himself. At last all was ready. The biggest tree, the one next the hut, was hewn through except a very small bit, and prepared to fall. Naturally the parties were greatly excited; all the success of his plan depended upon the way the trees had been cut, with the view to their falling straight. He examined them one by one and then climbed back to the topmost tree and applied his axe vigorously. Ten minutes more and he heard his brother cry out: "It is going!" "We stepped aside," he says, "lest we should be struck by one of the falling trees. What a turmoil! Tree after tree began to go, each pressing upon the other till the whole of them went thundering down the mountain side. The topmost one finally found a resting place far below."

Another especially illustrative incident of this spirit must be given. The school for the blind to which he belonged was wanting pupils. Parents did not appreciate its advantages and refused to send their children. Young Campbell was requested to make a sort of holiday tour through Tennessee and appeal to parents to send their blind

children. He took a young friend with him; they traveled on horseback, he on his own favorite horse, Nelly. He visited all schools, called upon doctors, clergymen—even blacksmiths, to learn where the blind children were. At the end of a week they had found three to send to Nashville. In order to secure the third, Cornelius Foster, they had to cross the Hiawassa, a mountain torrent.

There were no bridges, only a ferry and a ford, the former being used when the latter was impassable. Nobody told the young men about this, so they rode into the stream and soon found themselves plunged over a dark bank into deep water. It was young Campbell's first experience of the kind. He called to his companion to let the horses go as far as possible and soothing Nelly he sat perfectly still on her back. She neither returned nor tried to climb up the steep bank, but with true instinct swam diagonally until they gained the opposite shore. There the ferryman called to them and explained how they had missed the ford, adding that he would not have crossed as they did for a thousand dollars. They were wet through, but soon dried in the July sun. The little blind boy was found and arrangements made with his parents to take him up back. He was mounted behind Joseph and all three rode back to meet the other boys. The new pupils were forwarded to Nashville, while Campbell and his companions went farther in search of other blind children. One of them, Agnes Jones, lived on Flint Mountain, and to reach her home they had to cross a swift water course 19 times. His companion was no mountaineer, but a city boy, and learning as the darkness approached that there were still 4 miles to go, asked Joseph if he meant to camp out all night. When the deep roll of mountain thunder was heard and a storm pressed suddenly upon them, their horses became unmanageable and they had to dismount to hold them. Total darkness rested upon the mountains, they decided to go back, his companion had declared it was impossible to find the path, so he bade him hold the horses while he, the blind boy, found it and led the way with Nelly ahead. Referring to this incident, he has remarked that he felt no fear but for rattlesnakes, as he knew 30 had just been killed close by. When the path grew smooth they mounted, but his hands, he says, shook so he could scarcely hold the bridle. It continued to rain and his companion declared he could see nothing, so blind Joseph rode away guided by the sound of a waterfall which he heard, but he declares his real trust was in Nelly. They came back to the creek which they had to cross; at first he hesitated, but Nellie did not—his feet went under water and he thought all was lost; but this proved to be the deepest part and they were soon safely over on the opposite side.

Agnes Jones was induced to accompany him and he put her on Nelly's back behind him and carried her 50 miles, when they found another girl, Kate Flemming, who joined them for school.

Many facts illustrate Dr. Campbell's insatiable desire for improve-

ment. Making good progress in his work in the blind school, he prepared to take a course in the University of Nashville, presided over for a quarter of a century or more by Philip Lindsay, D. D. His father's losses rendered aid from that quarter impossible and he felt deeply the stress of poverty. His only hope was his earnings, and he could only earn by giving music lessons. He secured two pupils, daughters of a Mr. Allen. He says that one of these young ladies seated herself by the piano and he sat beside her. "What shall I do?" she said. Now, Mr. Campbell could play brilliant pieces; as a blind boy pianist he had been petted and praised. He says that he thought himself a wonderful musician, but his music had all been learned by ear—not by note. He had never mastered the art of teaching. What did he really know? How was music written; how above all was he to teach a seeing person? Yet he must teach; it was his only way to obtain an education. In his emergency, he said to Miss Allen and her sister that they must just play to him that day and that the next week they would begin regular work. Then he walked off toward the cemetery; the keeper was just locking up, but he let the blind man in. In his depression he went to the monument of General Carroll and sat down on its lowest step. What was he to do even to live? He must earn money to educate himself—considerable money—and his music, which he had depended on, had crumbled away at the first touch; the teacher of the blind school did not know his business. Here was a lesson that greatly influenced his future career. As he sat there in sadness the chilliness of night came on, the city bells mournfully tolled out the hour. Suddenly he thought of the career of the man on whose tomb he sat. Once he was a poor boy like himself, yet by his struggles he became the idolized governor of Tennessee. Young Campbell sprang to his feet with his mind made up. That night, with the promptness that has characterized his life, he went in search of a Mr. Taylor, an Englishman, once a pupil of Moscheles and Mendelssohn, a pianist of great repute, though unfortunate in his private life. His manners were rough and, without asking young Campbell to sit down, he inquired "What do you want?" Campbell stammered out, "Mr. Taylor, I am a fool." "Well, Joseph, my boy," replied Mr. Taylor, I have known that; I have always known it; but it is less your fault than that of your teachers." By the aid of a friend the arrangements for lessons were perfected.

The following day he was seated beside Mr. Taylor at his piano four hours, and the next day the two Misses Allen had their first lesson from him. A year later, when he was just 16 years of age, he was appointed teacher of music in the Tennessee State Institution for the Blind, where he had first been told that he never could learn music.

In those days all instruction for the blind in letters was of an elementary character. Young Campbell longed for the most complete education. The best opportunity at hand was the University of Nash-

ville, already mentioned. Already he aspired not only to all this university could furnish, but to complete his course at Harvard. Instruction at the university increased his expenses, but he added to his income by taking private pupils. The professors at the Nashville University were very helpful, and gave him private lessons. He had to pay persons to read to him, but with all his expenses he was soon saving money, and these savings went to assist a friend in business, whose failure later plunged him into deeper poverty. With his plan of finally studying at Harvard, he went to the Bridgewater (Mass.) Normal School to improve his methods of teaching. Here he met Miss Bond, who afterwards became his wife.

There came an offer from a prosperous female college in the South, and his course was suddenly turned there—and as suddenly turned away by the political disturbances preceding the civil war. The experience he underwent there greatly affected the health of his wife, and she returned for a while to her friends in New England, while he went to the blind institution in Wisconsin to teach music. Her health not recovering in New England, she joined him in the West. Failing to improve there, he returned with her to the East. The journey was accomplished with much difficulty, and he finally secured a private room for his wife in the Massachusetts Hospital. His expenses were heavy, and he suffered great privations, living for several months upon 6 to 10 cents a day; during which time he watched almost constantly by the bedside of his wife. One morning he walked from the hospital to the school for the blind at South Boston, which had been minutely described to him. Doctor Howe saw him as he approached, and he walked so much like a person seeing that Doctor Howe asked: "Why do you wear glasses? You are not blind." To which he replied: "I am blind, Doctor." "I have been following you up Broadway," observed the Doctor, and you turned out when you met ladies as well as I could myself, and when you reached the institution you turned at right angles and directly walked up the stone steps without even putting out your walking stick. How is this possible, if you could not see?" Mr. Campbell adds: "I took off my glasses, and for a minute or more he looked directly into my eyes, and then in a quiet tone said: 'I can not understand it; you can not even see light.'" Mr. Campbell asked for permission to spend a day in the class, but Doctor Howe replied it was not a visiting day. Mr. Campbell claimed he was not a visitor, but a specialist, and desired to see the classes in their every day dress. Permission was given, and he spent something like nine hours, equally divided between the school and the musical departments. As he was about leaving Doctor Howe expressed a desire to know his opinion of the work. "Do you wish my honest opinion?" asked Mr. Campbell. "Certainly," was Doctor Howe's response, "I would scorn a dishonest opinion." Mr. Campbell first pointed out the imperfections as he saw them, showing that they were the fault of the system. Doctor Howe especially urged him

to speak out without reserve. Then he pointed out the importance of higher and more thorough training in music, and the fact that the musical pupils were selected mainly on account of their quick musical ear, and not for their mental capacity. The result was an engagement with Mr. Campbell, who, unwilling to take less than full pay, gave his services to the school for a time. So great was his success that within two years Dr. Howe proposed of his own accord to raise the salary to \$1,600.

The education of the blind ever on his heart, he developed more fully his idea of the introduction of instruction for the blind in higher courses of music into one or more of the leading American universities, but his proposition was not accepted.

Here again Mr. Campbell's strength was overtaxed by the too zealous discharge of his duties. He was told that his lungs were affected, and that he must have a change of climate or his early death would be expected. Mr. Campbell met the threatened calamity in his own peculiar way. He says, although he was a southerner, he immediately learned skating, and spent much time on the ice, and the following spring went into the pine woods of Maine, where he chopped trees until the following autumn, when he returned to his work in restored health. His wife continued an invalid. When his health again gave way, the friends before mentioned urged him to take a European trip. The kindness of Boston friends was shown by the continuance of his salary for a time, and by the Harvard Musical Association giving a grand concert and presenting him with the proceeds. In continental Europe he secured private instruction of the best masters, and studied, especially, the method pursued by them in their various departments. Thus, friendships were formed which have ever since contributed to his success.

These limited details of his life and personal experiences will show how his environment, united with his natural talents, made the man who has so successfully established and conducted the Royal Normal College for the Blind.

The leaders of English public sentiment interested in the blind were able to see the qualities of the man, to appreciate his plans, and to favor and sustain his efforts. The institution has not only affected the lives of those who have been trained within its walls, but has led the way in revolutionizing the sentiment of the country with regard to all who have lost the use of their sight. It is not only seen that they can be self-supporting and self-respecting, that they can have the blessing of the aspirations common to the seeing, but that it is the obligation of the public not to crush their hopes by treating them as a helpless class; in a measure, all the other institutions of the realm have been modified in the direction of the ideas and methods of the Normal College. Here it should be noticed that Doctor Campbell has urged that the blind who are defective in intellectual capac-

ity should not be educated in the same classes or in close relations with those of normal natural capacity.

By degrees it has been seen that the education of the blind should not be treated as a charity, but the expenses should be met as are the expenses of similar grades of education for those who enjoy the full benefits of sight.

Mr. J. G. Fitch, one of England's leading educators, early pointed out how this purpose must be sought. It could not be secured at a leap, but modifications would come by which the blind would be treated by the Government the same as the seeing in the matter of education.

In accordance with this idea Dr. Campbell has sought to arrange that the elementary work of his institution should be taken up by the London school board, and the preparation of teachers by the education department. Of course the aid from county boards, in respect to industrial training, should benefit the blind as well as others. The full realization of these purposes may not be at present satisfactorily accomplished, but the results before the world are impressive.

The total attendance upon the college in 1896, as reported, was 189. The earnings in a single year of those who have had the benefit of its training have been given as high as £18,000 or \$90,000. The value of the grounds and buildings is set down at \$300,000. In the report of the college for 1896 it is said that Windermere and Wilmer, recently purchased, contain  $7\frac{1}{2}$  acres, and with the 9 acres previously in the possession of the college the grounds form one of the most picturesque properties south of the Thames.

Doctor Campbell is constantly acknowledging the aid he has received from his numerous friends and coadjutors. In the report for 1896 he refers in fitting terms to the resignation of Lord Playfair, who held the chairmanship of the executive committee, made vacant by the death of Doctor Armitage in 1890. He repeats with affectionate emphasis the list of those who have cooperated with him; such memorials as the Dr. Armitage memorial and the Fawcett memorial bear testimony to his unceasing regard for those who have rendered great service to the blind. The following list of those who have cooperated with him, or who have been officers of the college, gives most conclusive evidence of the favor with which his efforts have been received by the most eminent persons of the realm.

ROYAL NORMAL COLLEGE AND ACADEMY OF MUSIC FOR THE BLIND.

*Patron.*—Her Most Gracious Majesty the Queen.

*Vice patrons.*—His Royal Highness the Prince of Wales, K. G.; Her Royal Highness the Princess of Wales; His Royal Highness the Duke of Edinburgh, K. G.; Her Royal Imperial Highness the Duchess of Edinburgh; Her Royal Highness the Princess Louise (Marchioness of Lorne); His Royal Highness the Duke of Connaught, K. G., and Her Royal Highness the Princess Frederica.

*President.*—His Grace the Duke of Westminster, K. G.

*Vice-presidents.*—The Marquis of Bute, the Marquis of Northampton, K. G.; the Marquis of Lorne, K. T.; the Earl of St. Germans, the Right Hon. and Right Rev. the Lord Bishop of London, the Right Hon. the Lord Mayor (ex officio), the Right Hon. Lord Ebury, the Right Rev. Bishop Barry, D. D.; Sir Charles Hugh Lowther, Bart.; Alderman Sir Andrew Lusk, Bart.; Sir Sydney Waterlow, Bart.; Sir Rutherford Alcock, K. C. B.; the Master of the Worshipful Company of Cloth Workers (ex officio).

*Trustees.*—His Grace the Duke of Westminster, K. G.; the Hon. W. F. D. Smith, M. P.; and William James Armitage, esq.

*Executive committee.*—The Right Hon. Lord Playfair, K. C. B. (chairman); W. J. Armitage, esq.; James A. Campbell, esq., LL. D., M. P.; J. Whitaker Hulke, esq., F. R. S.; William Mather, esq., M. P.; Arthur Miall, esq.; F. D. Mocatta, esq.; the Hon. W. F. D. Smith, M. P.; Dudley R. Smith, esq.; Sir Sydney H. Waterlow, Bart.; George A. Western, esq. (chairman of house committee); T. Marchant Williams, esq. (retired April 1, 1893); also the president, trustees, and treasurers (ex officio).

*Treasurers.*—The Right Hon. Lord Stallbridge; the Right Hon. A. J. Mundella, M. P.

*Honorable secretaries.*—W. J. Armitage, esq.; Arthur Miall, esq.

In addition, there is an extended list of councilors, together with the names of local committees organized in the interest of the college at Dundee, Edinburgh, and Glasgow. Indefinite quotations might be made from those in whose judgment the public would have the most confidence commending the work accomplished.

The venerable Archdeacon Farrar, D. D., remarked to those who had been listening to music furnished by the college:

“The exquisite anthems, hymns, and service to which you have been listening have been performed by musicians from the Royal Normal College for the Blind. \* \* \* What we should all desire for the blind, above every earthly blessing, is that they should not be a burden to themselves, or to their friends, or to the community in general, but that they should be trained to earn a blessed independence; to become profitable members of the church and commonwealth. \* \* \* I am happy that, owing to an improved state of things, we now rarely see the once common, but surely shocking sight, of a blind man led along by a dog with a string, and so pitifully exposed to the hundred accidents and chances of the street. But what we should all aim at is to foster every wise effort to uplift the blind above the disabilities of their condition. It should be our duty to alleviate their calamity. It should be our effort to bring courage and brightness into their lives; to provide them, as far as we can, with exceptional chances to compensate for their exceptional difficulties; to inspire into their gladdened hearts the sense that they, too, are dear children, beloved of their Heavenly Father, in the common family of man. \* \* \* The Royal Normal College for the Blind enables them to avail themselves to the full of those blessed compensations which lie in the inexhaustible resources of nature for all who have the faith and the energy to draw them forth. Those compensations are like the water locked up in the flinty crags of Sinai till, at God’s bidding, the rod of Moses bade them spring forth, so that in the wilderness did water break out and streams in the desert. But as the imprisoned runnels did not leap forth till the rod of Moses had smitten the stony rock, so neither are these compensations available for the common blessing until the mercy, skill, and perseverance of man has set them free. It is this which is being done in the Royal Normal College with conspicuous wisdom and success.

## CHAPTER X.

### MINOR MENTAL ABNORMALITIES IN CHILDREN AS OCCASIONED BY CERTAIN ERRONEOUS SCHOOL METHODS.<sup>1</sup>

By Dr. William O. Krohn, Psychologist, Illinois Eastern Hospital.

---

My discussion of this subject is based upon four distinct premises or propositions, each of which is a clearly proven and fully demonstrated truth—a fundamental principle—in some one of the various particular sciences. It is not my purpose to endeavor to substantiate any particular theory of education. We are not trying to bring forth evidence in favor of any “fad” or “ism.” It is an unwelcome fact, but a fact, nevertheless, that mental abnormalities do exist in school children. To what is this seeming mental disintegration due? We know that in a large measure these mental abnormalities are the direct result of erroneous school methods—the logical attainment of a pseudoeducation.

The present paper is not at all concerned with the physical ills of the child, many and serious as they are, due to improperly appointed schoolrooms. “Schoolroom diseases” do exist, and the fact that they do exist is a stigma that we should all hasten to eradicate. That a healthy, laughing, romping child entering our modern school may be doing so at the probable expense of health is a sad commentary upon our modern educational methods. Can you wonder that a parent sometimes hesitates to give his child to the modern school when he knows from observation that his dearly beloved child may come back to him at the end of a few years broken in health? Must the parent of to-day take along with the modern school, possessing as it does so much that is excellent, utilizing as it does so many of the best educational facts and forces—must he needs take also those factors that make against rather than for the child’s health? Can you criticise the parent for sometimes halting at the schoolroom door and repeating to himself the question, “What will it profit my child if he gain the whole world of knowledge and lose his health?”

But in these latter days reforms are being made in regard to seating, ventilation, lighting, and heating, as well as provisions for exercise, recesses, and recreations, all of which goes to show the steadily growing belief of parents, teachers, and school officers in the dictum that “a ton of knowledge gained at the expense of a single ounce of health is far too dearly paid for.” Our schoolhouses are being better builded, better equipped, and better appointed, so that as time advances the physical child—his health—will be more and more conserved.

But the mental abnormalities of school children, resulting from erroneous, misfit methods, have occupied the thought and evoked the sympathy of comparatively few, and for that reason I shall devote the entire time of this paper to the discussion of these mental abnormalities, their causes, and how they may be eradicated.

---

<sup>1</sup>A paper read at the Washington (1898) meeting of the National Educational Association, and published by the Commissioner of Education according to a request expressed in a resolution of the Association.

My first premise I take from the domain of the science of biology. It is the law of heredity, in which we all believe to a greater or less degree. I mean the law of heredity only in its more restricted but fully established sense—namely, the acquired characteristics of the parent are not transmitted to the child. A strong belief in heredity has become so general and so widespread that the direct results of descent are looked for with supreme confidence. The good parent is supposed to have a good child, and the brilliant parent a brilliant child. Yet this is too sweeping, for goodness and brilliancy are qualities purely functional, and not structural. They are the results of friction, struggle, social conditions, environment. The question of the underlying physical structure of the child is quite different. Bone, muscle, nerve in their distribution are governed largely by heredity. But there is a difference between natural inheritance of structure and artificial acquirements. The father may be deaf and the mother a deaf-mute, but the child of these parents will have normal hearing and speech. I have made personal observation of one family in which both parents were deaf—yet their five children are perfectly normal as to hearing and speech. A man may have his nose pushed to one side and the woman he marries may have suffered the same deformity, and yet the children born to them will have perfectly straight noses. Both father and mother may be “star” mathematicians—the result of acquisition and study—but the children born to them may be unable to go beyond the “rule of three.” Acquired characteristics are not transmitted. They are functional qualities rather than organic attributes. As Dr. Oppenheimer says in his recent book: “The doctrine of heredity, as commonly held, not only is falsely applied to human descents, but also renders the wisest and best efforts of training unnecessary and useless. For if at birth the child’s bodily and mental organization is complete, if the characteristics of parents are handed down to offspring, then there the matter ends. Every remarkable parent would have equally remarkable children, and every deficient person would curse his descendants with a like deficiency; work, training, striving after noble ideals would be useless and silly.” All individual efforts at self-improvement would be worthless, every individual impulse would be incapable of realization, every endeavor of parent or teacher would be at an end. Not a single educational fact, not a single educational force but would fail of fruition.

But education is not a matter of such utter hopelessness. Pedagogical efforts are not doomed to such complete barrenness of results. To such a hopeless philosophy this world would be a dull blank and man little more than a grinning skull. If one really observe the laws of growth and mental development as they become actualized in every child he will see that there is a more wholesome, roseate philosophy of education. Happily, then, the child does not grow according to some hard and fast rule that has been implanted in him before he was born. The old Calvinistic form of pedagogy, called heredity by Darwin, has given place to the counter dogma of liberally minded men, as Rousseau, who says: “Everything is good as it comes from the hands of the Creator; everything degenerates in the hands of man.” While both of these dogmas are too extreme—both the old Calvinistic and the more recent liberalistic—the sum of the whole matter is that entirely too much dependence has been placed upon heredity in its commonly accepted significance. Parents and teachers educate the minds, train the bodies, and develop the morals of the children under their care “not so much by what their ancestors were but what they themselves do and think.” In the meantime in any case of mental abnormality in the child, the teacher will shift the blame on the parent and the parent in turn on the teacher until finally, with their utter lack of cooperation, the psychopathically disposed child really becomes mentally disintegrated and quite degenerate.

In how far does the school help to develop mental and nervous abnormalities when they could and should be checked and obliterated? In how far does the

school give rise to new evils that affect the mental power of the child—evils that would be entirely unnecessary were the courses of study, the daily programme, and schoolroom methods more fitting and better adapted to the child? This vital question will be answered more fully after our other premises have been set forth. In the light of the true conception of the doctrine of heredity we are warranted, however, in saying that we have usually taken too much for granted in believing that the child of 6 years of age as he knocks at our schoolroom door is more developed than is really the case. We certainly take too much for granted with reference to the knowledge possessed by the children we are called upon to educate. There is in fact next to nothing of real educational value the knowledge of which it is safe to assume at the beginning of school life. The child does not inherit in any form the knowledge acquired by his parents, and we must proceed in his education by bringing into exercise all methods of appeal to the child's mind. We must be prepared to educate the whole child and not take for granted that a certain segment of the circle of his intellectual life has been measureably formed, fashioned, or developed by heredity. We must so place our array of educational forces that every form of the brain activity may be aroused and that appeal be made to every mental potency. If we take for granted that a certain parcel of knowledge is bestowed upon a child as an heirloom by his ancestors we are creating a possibility for mental abnormalities to appear in the particular child thus partially neglected.

My second premise I take from the domain of genetic psychology. It is also a firmly established, clearly demonstrated principle—an ultimate fundamental truth in the science that has given it its being. This principle is: Mental development in the child occurs by stages—by periods. Just as the entire body is not growing at any one time, so all the mental powers are not unfolding and growing at the same time. In bodily development growth settles for awhile on one set of muscles, one set of organs, and then another, and another, until the entire body is developed. Likewise, there is a nascent period for each mental faculty.

The first mental power to develop is sensation. At birth a child possesses but two senses—touch and temperature. They are the only windows of the soul open to receive the impressions that Mother Nature has to bestow upon him. A few hours after birth vision is added, then hearing, and after some days taste and smell, followed by the muscle sense and the others in turn.

The second epoch in the mind's process of unfolding is the memory stage. This is the period when the child is characterized by a prodigious power of remembering detail. A single hearing of rhyme or rule of song or catchy phrase is sufficient to insure its correct reproduction. We are all aware how much more difficult it is for us to commit rhymes or rules now than it was during our second or third year of school life.

The third epoch is the period of the growth of the imagination. Children love to live in a world of make-believe; they love to play circus, church, or school. How easy it is for the child to assume the rôle of Davy Crockett, Daniel Boone, Robinson Crusoe, or Buffalo Bill! During this period there is developed a mania which frequently occasions grave concern to parents. I refer to children's lies. Now, the lie of the child, it must be remembered, is by no means the same despicable moral offense as is the deceitful lie of the adult. It grows largely out of his desire to excite wonder. It is a bit of incipient research. He tries it, and if it works he tries it again; if not, he quits. But, in these roving of the imagination he is not attempting primarily to deceive.

The fourth period is characterized by the peculiar activity of the powers of judgment and comparison. This in turn by the period of curiosity. Curiosity must be properly developed. No child whose curiosity is throttled and starved will ever become a good reasoner. He must first ask questions and reasons of others in order to be able to ask questions and reasons of himself.

I have thus outlined the periods of mental development for the purpose of showing that a well organized course of study must be in harmony with these processes of development in order to be successful. More depends upon the order of studies assigned than upon the contents of the studies themselves. You have heard of the experiment made some years ago by four teachers in the city of Paris, in the Lycée (the school for boys), who asked permission of the minister of education that each of them might give to his 25 pupils the same studies prescribed in the required course, but in a different order, an order believed by them to accord with the natural development of a boy's mind rather than in the arbitrary order demanded by cast-iron law. These boys completed all of the required studies in this natural order in three and a half years, instead of seven years, the time assigned for the completion of the course as regularly given in the Lycée. Upon examination they were found to be equally proficient mentally, and above the average in physical development, as compared with those who had spent seven years in going over the same ground. As teachers we should have constant regard for the great principles of mental waste and mental economy. The course of study should fit the child; the child should not be jammed into an arbitrary curriculum, sustaining no relation to the natural order in which his powers of mind and body unfold.

In some of our schools seven or eight years are still devoted to the study of arithmetic; yet we know that all of arithmetic can be taught the child and better taught, in the years between  $7\frac{1}{2}$  and 10. This is admirably done, to my personal knowledge, in at least 150 schools, saving much time and energy, and making room for important studies which would otherwise be crowded out. Now we all know that the time to educate any mental capacity is the time at which that particular mental power is most rapidly growing. The time to educate memory is when memory is most rapidly developing; the time to educate the senses is when the senses are most alert—i. e., when they are rapidly unfolding. We would not have "diseased imaginations" in our school children if we would only properly cultivate imagination when it is most rapidly growing. A host of mental abnormalities in school children can be traced directly to the fact that the course of study is not formed to correspond to the child's various periods of mental development.

If at any period of mental development, the proper mental food, the proper school study is not given, then the mental faculty that would otherwise grow so rapidly and unfold so perfectly (had it been properly fed and exercised) will be stunted in its growth and in all probability atrophy, because of disuse. The child's whole mental development will thus be impaired and a whole line of mental abnormalities will present themselves at a time too late for their complete eradication. Especially serious are the mental abnormalities which result from improper and insufficient training of the senses. All of the "raw material" of thought comes through the senses. All of the raw material acted upon by memory, imagination, judgment, comparison, and reasoning is gained through sense experiences. It can be said without fear of successful contradiction that if the education of the senses be neglected all subsequent education will partake of a vagueness, haziness, and inefficiency which will never admit of complete cure. From any sense-error any other conceivable error may arise. And yet how many methods of instruction there are so inopportune and inefficient that they really dwarf the senses. Train the senses of the child and the rest of the mental development will almost take care of itself. The truly successful teacher is the sense teacher, for she is trying not merely to impart knowledge but also to develop mental force. In cultivating the powers of sense of the pupil we accomplish four things for him, each one of which is vitally important: (1) We make his knowledge more accurate and clearly defined; (2) we make his knowledge more comprehensive and complete; (3) we develop his mental power; (4) we make his acquisition of knowledge pleas-

ant and delightful because the natural order is followed—"first the blade, then the ear, then the full corn in the ear."

My third premise I take from the domain of abnormal psychology. It is this: The process of mental disintegration attacks the higher, more complicated, and more recently developed faculties first, and the simplest and those earliest developed are the last to be affected. This premise requires but brief discussion, for its application is at once seen. It teaches us that when mental disintegration once sets in, it is the finest mental faculties that first fall prey. These minor abnormalities are serious then from the beginning. They may not be observed and made certain of until terrible havoc has been wrought. Reason, both deductive and inductive, may have crumbled and fallen into decay, and imagination, memory and the powers of sense be as perfect as before. It is necessary to be constantly on the alert for even the minor mental abnormalities in children so that mental disintegration of the highest mental faculties may not proceed too far before remedial measures are sought and applied. If the closest observation is not maintained in reference to pupils in whom minor mental abnormalities are even merely suspected, the loss may become irreparable.

Inasmuch as fatigue is the most common source of danger in this connection, close watch should be made for fatigue signs. Some important discoveries have been made with reference to fatigue and its influence upon mental and physical development. Fatigue is a physical poison, and bodily fatigue always induces mental fatigue. The nature of the chemical poison generated by fatigue has been investigated by the Russian chemist Wedensky, as well as by Maggiori and Mosso, in Italy. Overstrain at school, by producing fatigue, may be the occasion of destruction and disintegration of bodily tissue, and also cause serious and permanent mental defect. The best period of the entire day, both with respect to mental quickness and mental vigor, is between the hours of 8 and 10.15 o'clock in the morning; the worst is between 11 and 12 o'clock. The period between 1 and 2.30 o'clock in the afternoon is the third best, while that between 3 and 4 o'clock is second best. The heaviest school work should be assigned to the hours when the child's mind acts most vigorously and with the greatest quickness, and the lightest work should be so arranged as to come at the period of greatest mental depletion.

The teacher and parent should be especially observant with reference to "abnormal nerve signs" as occasioned by fatigue, misfit methods, and inopportune studies. The more common abnormal nerve signs that presage danger are disturbances of balance, twitching of hands and face, eye movements, postures of the head and hands, irritability, inattention, excitability. If the child slouches and shows no exact symmetry of balance, if the voice is of poor tone, if he can not fix his eyes well, but looks about by moving the eyes and not the head; if there is a bagginess of the underlids of the eyes, if he be inattentive and devoid of interest in the usual school occupations, if his response in action be slow and uncertain, one may be assured that such a child is fatigued to the point of danger.

Again, since we know the order in which the mental faculties disintegrate, and we do, we may know how far the mental disintegration has proceeded. If reasoning only be affected, the child is not suffering as much from mental abnormality as if the memory, judgment, or imagination be diseased. His *mal* is not so deep seated as it would be in the latter case. This is a point of much value, for if we know just how far the processes of mental disintegration have proceeded, we know best what occupations and methods we are to employ in order to counteract the disease.

My fourth and last premise is taken from the province of physiological psychology. It is the principle of localization of brain function. By this we mean that not all parts of the brain surface respond to the same stimuli and give birth

to the same kind of sensations. Neither are all parts of the brain cortex concerned in sending forth motor impulses of the same group or class. We know, for example, that any excitation of the nervous elements in the back part of the head give rise to visual sensations. It makes little difference whether they come through the eye or not—a slight mechanical jar at the back of the head is sufficient to cause one to see “stars.” The brain center concerned in moving the finger is entirely distinct and separate from the one concerned in moving the arm. The outer gray rind or cortex of the brain is therefore a very complex organ, or rather, it is more like a very complicated keyboard, the responses coming in from those parts of the body that are in direct relation to certain specific forms of sensation. As Professor Hering, of Austria, says, “The different parts of the brain hemispheres are like a great tool box with a countless variety of tools. Each single element of the cerebrum is a particular tool. Consciousness may be likened to an artisan whose tools gradually become so numerous, so various, so specialized, that he has for every minutest detail of his work a tool that is especially adapted to perform just that precise kind of work very easily and accurately. If he loses one of his tools, he still possesses a thousand tools with which to do the same work, though under disadvantages both with reference to adaptability and the time involved. Should he happen to lose the use of these thousand also, he might retain hundreds with which to do the work still, but under greatly increased difficulty. He must needs have lost a very large number of his tools if certain actions become absolutely impossible, but the loss of a single tool is in every case just that much of a disadvantage.” This quotation translated from Hering states very clearly the exact physical basis of education. If the child is to have full use of all the nerve cells of his brain cortex, they must be developed—educated—by use, by activity. If they are not brought into action by occupation, sense experiences, mental employ, they atrophy.

Now, at birth the child possesses all the brain cells it will ever have. Brain cells do not proliferate after birth. If they are not exercised they entirely drop out of existence—they die. The problem before us is to educate the entire brain of the child—it is given him for that purpose. We can give him this complete education only when we approach him through every one of his avenues of sense and educate him into a wide range of motor activity. Life is growth. A brain cell that does not grow is dead. A brain cell can not grow save through exercise and use. All the brain cells can be made to grow only when the school and home environment of the child is such as to appeal in every possible way and with sufficient energy to arouse the child's many-sided activity. If a certain group of nerve cells is uneducated, is allowed to die, then the child becomes mentally and nervously abnormal in just so far. Brain disorderliness is due more to one-sidedness of methods of education than to any other possible cause.

Before closing I wish to make reference to certain specific cases: H. is a boy of fair complexion, ranks twenty-fourth in his class, and is continually losing his hold on school work. The signs of nervous exhaustion were overmobility; he was decidedly fidgety; fullness under each eye, indicating that he was a sufferer from headaches. These were the most noticeable, though other “nerve signs” were present. It would be a mistake to leave a weak boy like that to do nothing all day, merely waiting for him to grow stronger. Such children are especially in need of education and training, but “a detailed study of abnormal nerve signs in the child will give assistance of practical value to those in charge of nervous and delicate children. They will reveal certain points to be aimed at in physical training. A knowledge of the brain disorderliness indicated by the signs will give plain hints as to the form of mental disorderliness likely to be met with in the pupil.” (1) For instance, wandering eye movements lead to inaccuracy in copying work and in arithmetic; children with twitching finger move-

ments have spontaneous thoughts arising that lead to mental confusion and inaccurate answers to questions, also interfere seriously with memory. The child slow in all movements and slouching is apt to be dull in mental action until his posture, attitude, and response are improved upon. "Want of facial expression, grinning, frowning, protrusion of the tongue, ill-balanced hand postures, want of motor control, are all cardinal signs of brain disorderliness." The parent and teacher must patiently labor to remove such abnormal nerve signs and the brain disorderliness corresponding. Closely observing the circumstances under which each of the given signs most frequently subsides, one is enabled to carry on the best form of brain training. Nature study, in that it naturally calls all the child's mental powers into activity, is of much more value as a corrective and educative force than books alone. How the "The Barefoot Boy" of Whittier is to be envied in this regard.

Oh for boyhood's time of June,  
 Crowding years in one brief moon,  
 When all things I heard or saw,  
 Me, their master, waited for.  
 I was rich in flowers and trees,  
 Humming birds and honey bees;  
 For my sport the squirrel played,  
 Plied the snouted mole his spade;  
 For my taste the blackberry cone  
 Purpled over hedge and stone;  
 Laughed the brook for my delight  
 Through the day and through the night,  
 Whispering at the garden wall,  
 Talked with me from fall to fall;  
 Mine the sand-rimmed pickerel pond,  
 Mine the walnut slopes beyond,  
 Mine, on bending orchard trees,  
 Apples of Hesperides!  
 Still as my horizon grew,  
 Larger grew my riches too;  
 All the world I saw or knew  
 Seemed a complex Chinese toy,  
 Fashioned for a barefoot boy!

By nature study in the best sense, however, is not meant teaching science, but scientific teaching.

I can not refrain from calling attention to the very considerable danger arising from home study, especially in young children. In the so-called "study" at home the child becomes accustomed to certain irregularities of work that should never be cultivated. We should find out how much the child can do in a school day; let the child do such work at school, and let it feel that it leaves the school as the business man would his desk, with the business of the day done, and the satisfaction of well-deserved rest. Moreover, as Dr. Meyer has pointed out, "work at home creates that martyr-spirit with which the abnormally conscientious pupils pride themselves on having so much work to do, and on having to avoid company and society. These children are craving for admiring sympathy, and do this later in life, to the disadvantage of those who live up to more rational and sanitary rules."

Further, I must say that I have never seen a case of brain disorderliness that was not benefited by physical training. Evidence is available on this point from the comparison of a large number of pupils of schools with and without physical training. Physical training of the right sort, properly adapted to the child, tends to improve his brain condition, either preventing or removing disorderliness in motor and in mental action, and promotes healthy activity in both connections. This is absolutely true of children well-made in body, as well also of those in some slight degree below normal. A case in point: You may have in your school a

child whose mental processes are slow and limited, though fairly accurate. You ask him a question; his answer is slow in coming. You can best quicken the mental processes of such a child by quickening the interaction of his eye, ear, and hand by games of competition, such as baseball or tennis, where the action must be quick or failure result.

I have thus briefly considered some of the causes of nervous and mental abnormalities—how they could and should be checked. The school is not alone guilty, but only accessory. It is indeed distressing to the patriot and humanitarian to perceive how the mass of nervous evils, and at the same time mental and moral weaknesses and sins, increase in the people and how many are followed by these abnormalities from the cradle to the grave.

#### I. MILITARY DRILL IN THE SCHOOLS OF THE UNITED STATES.

[By Henry M. MacCracken, D. D., LL. D., chancellor New York University. From an address delivered at Tampa Bay convention, February 9, 1899.]

\* \* \* The total number of boys in the public high schools of America receiving military drill is 8,779; in the private high schools, 6,788.

I have selected four States that emphasize military instruction in either public or private high schools. The differences are striking.

##### CONTRAST MASSACHUSETTS AND NEW YORK.

In Massachusetts 12 per cent of public high schools have drill, enlisting 27 per cent of the boys, but only 5 per cent of private high schools have drill, enlisting 3½ per cent of the boys.

In New York only 1 per cent of public high schools have drill, enlisting 1½ per cent of the boys, but 29 per cent of private schools have drill, enlisting 26 per cent of the boys.

##### CONTRAST VIRGINIA AND SOUTH CAROLINA.

In Virginia no public high schools have drill in military tactics, but 18½ per cent of private high schools have drill, enlisting 16½ per cent of the boys.

In South Carolina 5 per cent of the public high schools have drill, enlisting 28½ per cent of the boys, and 8½ per cent of the private high schools have drill, enlisting 15½ per cent of the boys.

The following conclusions are easily manifest from a study of these figures:

First. It is not a question of sections of the country as to where military instruction is given and where it is omitted. It is, however, a question of States. The States that are highest as to giving military instruction in public high schools are Massachusetts and South Carolina.

Second. Even in a given State there may be superior attention given to military tactics in public high schools, and comparative neglect of the same in the private high schools and academies close by. This is seen, strikingly, in Massachusetts. The opposite, also, is equally manifest: That a State may excel—like Pennsylvania or Virginia—in the proportion of her academies and high schools that instruct in military matters, and yet her public high schools be far behind in the same subject.

I have said above that it is a question of States as to the condition of instruction in military tactics. I will now add to this, that it seems, also, to have been—in at least some of the States referred to—a question of one or two men that had convictions on the subject taking the lead in introducing and emphasizing this particular side of education.

The history of its introduction into the high schools of Massachusetts, in the National Commissioner's report of half a dozen years ago, has given abundant proof of this. November 3, 1863, a petition was presented to the school board of Boston, signed by Edward Everett and others, praying that instruction in military gymnastics and drill might be introduced into the public schools for boys. The school board favored the plan, "both as a means of physical training and ultimately of national defence." They decided to try the experiment in two high schools and two grammar schools, and employed an instructor for that purpose. The next year the experiment was reported a success by the committee of the board and, also, by the masters of the schools. Two hours a week were to be given to the military drill, not including voluntary drills out of school hours. It was to include all the grammar-school boys of sufficient size. The whole matter was put under a committee entitled "a committee on gymnastics and military drill." The experiment met one fate in the high schools and quite another in the grammar schools.

In the latter it endured only a single year. In the high schools, on the other hand, the report of 1892 states:

In the high schools military drill continues to this day under the same instructor, whose service has been continuous since its inception. Since 1865 no serious effort has been made to abolish it, and the Boston School Regiment is now one of the most popular features of the school system. It is sustained as a means of physical training, because (1) of its freedom from accident or injury to the boys; (2) the boys enjoy it; (3) it is a good mental and moral discipline—the boy learns to obey, and that is the first step toward learning to command; (4) it helps to form character, conducing to patriotism, chivalry, love and defense of country and home; (5) it is a powerful aid in maintaining a high order of discipline in the schools and an incentive to study, as the officers are the rewards of good conduct and scholarship; (6) with limited means for physical training more can be done in the time allotted to the drill—two hours a week—than by any other method yet discussed, for the same number of boys.

Passing down and out from the high schools to the grammar schools and statistics are almost utterly wanting.

In a pamphlet furnished me by Mr. J. J. Little, president of the New York City board of education, I find the latest and only trustworthy statistics on this subject. Three cities only in the United States make military instruction obligatory in the grammar schools: Newport, Ky., Colorado City, Colo., and Butte City, Mont., two of which are small cities in the Rocky Mountain region, and the third is practically a suburb of Cincinnati. Obligatory military instruction in grammar schools may be said hardly to exist. Four or five cities authorize voluntary instruction in military drill, namely, New York City; Geneva, N. Y.; Yonkers, N. Y.; Rochester, N. Y., and Winona, Minn.

New York City, in which I have my own residence, may fairly serve for an example of voluntary instruction. We offer boys the chance to take military drill if they and their parents choose, and if they are willing to foot the bills.

President J. J. Little writes me as to the extent of military instruction in the grammar schools: "We do have it in a few of our public schools; but it is, if I may use the expression, only tolerated—not recognized or encouraged."

The history of its introduction in New York City has been furnished me by Commissioner J. A. Goulden, chairman of a special committee of five to carry into effect certain action of the New York City board of education, adopted four years ago, December 5, 1894. This action was as follows:

*Resolved*, That the board of education of New York City cordially indorses the proposition looking to the formation of companies of cadets in the public schools under its jurisdiction, without expense to the city, the pupils, or the teachers, and without interference to the prescribed studies and management of the respective schools.

Commissioner Goulden called a meeting of all the principals of male grammar schools, of members of the board of education, and others, who established an advisory council for military instruction in the public schools, of which Colonel Goulden was made president. The boys were formed into companies, battalions, and regiments, and named the American Guard. At the Memorial Day parade of that year 16 regiments, numbering 10,000 cadets of the American Guard, making a full corps of three divisions, under the command of Gen. J. J. Little, took part.

All this, let it be noted, was done under the rule that forbade expense to the city, the pupils, or teachers, and without interfering with the prescribed studies and management. Since expense was necessarily incident to the work, it was not possible to continue the drill in a systematic way, except where the parents or citizens were persuaded to undertake the burden.

In 90 per cent of the grammar schools in the city the drill inaugurated in 1894 was ephemeral for the very evident reason named by President Little. The whole burden of the effort was placed upon parents and teachers, the parents to contribute uniforms and equipment and the teachers to contribute their time and trouble.

To sum up as to the extent of military drill in the grammar or common schools of the country, I conclude that out of an army of 7,000,000 boys enrolled in the grammar schools not one in a thousand has any opportunity of instruction in military tactics, and so far as I have been able to learn not a half dozen communities in America have imposed this work upon the grammar or common school, to be paid for at public expense.

The usefulness and value of attempting this work in the grammar school will claim attention in a moment.

The first question touching the desirability of military instruction concerns the public and private high school. I have not attempted to ask an opinion on this from every State of the Union. I have asked from the States that have given the subject the greatest attention, Massachusetts being preeminent for the extent of the work in the public high school, and New York in the private high school. Outside of these States, I have sought a few opinions from cities where special attention has been paid to this matter. I will begin by giving you the opinions collected by me which touch the public high school only.

As I have shown above, Massachusetts is the only State that has 10 per cent of her schools enlisted in this cause. Let us hear what the Massachusetts high school people say of results.

For the purpose of this address I wrote a letter to each principal of a public high school in the States of Massachusetts, New York, and Pennsylvania that gave instruction in military drill to more than fifty young men. I did the same with each private high school or academy. I asked a judgment as to three points: 1. The usefulness of military drill to the student's physical culture. 2. To his intellectual and moral well-being. 3. To making him valuable as a citizen soldier.

Out of 22 high schools in Massachusetts, I have received replies from 16. Seven of these are from Boston, the other 9 are from smaller cities in Massachusetts. I shall give first the answers from Boston, selecting only the heart of each reply.

Principal Moses Merrill, of the Public Latin School, Boston, writes:

It is better than no physical exercise at all; therefore my opposition is not strenuous. The school is large, nearly 700 boys, and the drill accommodates itself to our circumstances better than any other form of exercise yet proposed or provided for.

Head Master Robert E. Babson, of the English High School, Boston, writes:

The drill is one of our most effective means of discipline, which I should be exceedingly sorry to lose. The military training our boys receive enables them to learn their duties as soldiers, when they come to enter the volunteer militia, much more easily.

Principal George C. Mann, of the West Roxbury High School, writes:

As a means of physical culture, it is very narrow. The childish, show features of the whole system are the ones that most appeal to the boys. I accept it, but do not value it particularly.

Head Master John C. Ryder, of the Brighton High School, Boston, writes:

Military drill, when properly conducted in high schools, is of much value in physical development. Military drill quickens a boy's attention; it teaches prompt and implicit obedience to commands. Next to the graduate of the Government military schools, the public schools turn out the most valuable educated soldier material to be found in the country.

Head Master J. O. Norris, of the Charlestown High School, writes:

The setting-up exercises are excellent gymnastic movements. I prize the drill highly for the training it gives boys in promptness, in ready obedience, in the subordination of self. It seems to me to be a powerful factor in contributing to good training of the mind and character.

Head Master Charles J. Lincoln, of the Dorchester High School, writes:

We find it an excellent break in the midst of the confinement of school. As over against the gymnasium, it is found much more interesting. The drill serves a most excellent moral purpose. Many a young man, who tremblingly at first has stood before his company as captain and given his commands, I have seen transformed into a leader of men before his education in school is completed. It becomes a powerful engine of discipline in the school.

Principal John F. Eliot, of the East Boston High School, writes:

I favor it as at present conducted. The effect is good for the physical culture; it sharpens the boy, in a way, intellectually, and, in a sense, improves his discipline and moral well-being.

Outside of Boston, 9 high school principals are heard from.

Principal Alton E. Briggs, of the Chelsea High School, writes:

I am not an enthusiast upon military drill in public schools. If properly presented, however, I realize that it may have its beneficial effects.

Principal Charles H. Howe, of the Wakefield High School, writes:

There are some advantages to military drill in the school, but not sufficient to balance the disadvantages.

Principal Charles C. Ramsay, of the B. M. C. Durfee High School, Fall River, writes:

There is considerable intellectual discipline and no little moral training through military drill in school. Military drill increases the usefulness and value of the pupil to the State and nation as a future citizen soldier.

Principal L. H. Owne, of the Woburn High School, writes:

I am a believer in the drill. It does very much toward putting our boys into proper form. Although we have the drill but once a week, we have the setting-

up exercises every day. I believe that a country with a small standing army should require military drill in the public schools.

Principal Forrest Brown, of the Amesbury High School, writes:

Military drill was introduced into our high school eight years ago. From that time it has been an important factor in the life of the school. The town furnishes an instructor, who drills the company once a week. The results are extremely gratifying. Our overcrowded high school curriculum may well be pruned for a place for military drill.

Principal A. W. Bachelor, of the Gloucester High School, writes:

We have no doubts regarding the usefulness of the exercise. The social features of the organization are helpful. Twenty-seven of our boys went to the war of 1898. Without exception, they stand high as good soldiers. Our entire original equipment, maintenance, and extraordinary expenses have been met by voluntary contributions of the citizens. The drill occupies about two hours per week, forty weeks per year. It is compulsory for all except those physically disabled; is ranked as a study, just as algebra or Latin. We have never employed the services of a special instructor.

Principal A. E. Tuttle, of the Milford High School, writes:

I have had military drill in high school as a regular part of the work for about twelve years, and I should dislike very much to have it stricken out of the course of study.

Principal Charles S. Morse, of the New Bedford High School, writes:

I consider military drill beneficial in all the three lines outlined.

Principal Edward Parker, of the Brockton High School, writes:

I regard the military drill in a high school as beneficial.

Coming on to the State of New York, the number of public schools giving military instruction does not reach a half dozen. From three of these I have received reports.

Principal Thomas O. Baker, of the Yonkers High School, writes:

Military drill gives boys a good carriage, good form, and a dignified bearing. It teaches habits of obedience, makes boys attentive, and increases their self-respect. Anything that strengthens body and mind tends to make more useful citizens. Schools giving the drill should have a large drill hall either in or adjacent to the building.

Principal Alexander Falconer, of Waterford, N. Y., writes:

Our military organization is known as the "Waterford High School Cadets." The organization is a volunteer one. The money to sustain it is raised by subscription. The cadets are uniformed the same as the regular army. The equipment is Springfield rifles cut down, weighing about 9 pounds. Our drills are weekly from October to June, and in charge of a National Guard officer. I take the company to camp for about ten days each year. The legislatures of the several States would do a wise thing to make it compulsory for every able-bodied boy to spend a portion of his school days in military drill.

Principal A. A. Lavery, of Ballston Spa High School, writes:

It is one of the best means of physical culture; not too severe for the weak, not too light for the strong. As a means of curbing selfishness, establishing an esprit du corps, and keeping the boys from the rough play of the streets and the rougher companions it is one of the best. The individual knowledge of a gun (inbred from the cradle) has made America from Bunker Hill to San Juan.

In like manner in the State of New Jersey are only two schools giving military instruction. I have a report from each of these.

Principal W. H. Brace, of the Trenton High School, writes:

It gives to a youth soldierly bearing, which includes erectness of figure, expansion of chest, and correctness of movement. The intellect is benefited by the cultivation of the faculty of attention, and by the development of the power of

application. A true military training intensifies patriotism and imparts dignity, manliness, and a well-bred carriage and address.

Principal I. W. Travell, of the Plainfield High School, writes:

We have now for five years had a cadet corps organized among the students of our high school. For commandant of the company we have availed ourselves of the free services of a man of military training living in the town. Its main contribution to the intellectual welfare of the boys lies in the attraction it exerts to keep some boys in school; the moral effect depends almost entirely on the character of the commandant and the leading student officers.

In the State of Pennsylvania there are no public high schools of importance giving military instruction.

In the State of Ohio are two, from one of which, the high school of New Lexington, I have a report through Supt. James C. Fowler. His statement has elements that are unique. He writes:

It gives the students physical culture in matter of carriage. It gives the pupils fine intellectual drill. He is valuable to the State as a citizen soldier, because he is more of a developed man, physically and morally. We give our boys (public school cadets is what we call them) wire swords to drill with the first two years, and then light guns after that. (We have not got guns yet, but hope to be able to have them before long.) The swords are made out of heavy wire. They can not by accident or any other way hurt themselves or anyone else. We hold them in organization for one complete year, and then reorganize at the beginning of the school year. Take them into camp one day each year on some pretty day in May or June, let each one furnish provisions enough for himself, also each carry a tin cup on a string over his shoulder. Get a team to haul anything they may want to take to camp (baseball bats or anything else). Get brass band to go with them out of city (out to suburbs) from armory (schoolhouse). March out about 2 miles to some good grounds near good water and go into camp, placing out pickets in regular form, and carrying on the day's work same as in regular camp. Let those who are off duty play ball and have a good time. This is a gala day with our guards. Also, bring them out on all big days, Decoration Day, etc.

In the District of Columbia all of the four high schools offer military drill.

Director F. R. Lane, representing the high schools which are attended by white scholars, writes me thus:

First. Experience shows that military drill produces men of better courage and far greater vigor.

Second. Much good is done by training cadets in obedience; first as privates in the ranks, then as officers, they are taught self-control, tact, and responsible use of authority.

His report adds:

At the Eastern school there is a faded flag of "blood and gold," torn from a roof by an army that entered Manila and sent back by a soldier boy as a memento to his old school. Two former cadet captains from the Central school went up the hill in the desperate assault upon San Juan.

Principal W. S. Montgomery, of the Washington High School, colored, writes:

Participation in the military drill here is entirely voluntary, but its utility is magnified constantly that a large number of boys may join.

His report adds:

The military organization includes a battalion of three companies, and the manual for instruction is the same as prescribed for the infantry arm of the Regular Army. The instruction and exercises do not interfere with the regular book work, but rather prepare for healthful and successful mental effort. The plan of selecting officers is an incentive to scholarship, 75 per cent of the rating for the battalion promotions being based on the record made in school work. Company and battalion work including foot movements, the manual of arms, dress parade, and loading and firing have consumed the greater part of the limited time allotted to this branch. It is to be remembered that a part of but two days in each week is given for training the boys.

Before I sum up this evidence from the public high schools, I will present the reports of certain private high schools. Of the ten private high schools in New York, I have answers from a few.

Dr. White, head master of the Berkeley School, New York City, who has been personally engaged in the work of military drill for nearly thirty years, says:

The drill in the high school ought to answer every purpose. The objection that the teaching of the military drill to the boys inculcates a love of war is finical, and it would have rather the opposite tendency, because all the curiosity as to the matter of handling arms is eliminated by the miniature rifle. As to rendering the boy valuable to the State as a citizen soldier, its advantage is not as great as might appear at first flush, because, as everyone knows, the volunteers are very speedily put into shape for actual warfare; but it does render the student more quickly eligible for promotion through the various offices in a regiment, because he starts with the elementary knowledge pretty thoroughly acquired.

Principal Henry P. Warren, of the Albany Academy, Albany, N. Y., writes:

The setting-up drill, which is an essential part of the military drill, is invaluable as a physical exercise. I do not regard it as of very much importance intellectually, but its value in moral training is considerable. Three years of implicit obedience followed by three years of responsibility first as private, then as officer, are very valuable.

The report of the military academies may naturally be expected to favor military drill. Some may even say the reason of their teachers favoring military drill is their membership in a military academy. Perhaps the converse is just as true, that their membership in a military academy is on account of their belief in the military drill.

Dr. Henry C. Holbrook, Principal of Holbrook's Military Academy, Sing Sing, N. Y., writes:

We have had a military school here for about thirty years, and we have no hesitation in saying that the military training has a great deal to do with the physique of the boys. It begets a manly carriage, develops the chest, and shows a boy how to handle himself. The intellectual and moral well-being are helped on. Boys get habits of order and system. Another advantage, particularly in a school like ours, which is composed almost entirely of rich men's sons, is that the uniform prevents all display in dress, and is a great leveler of distinctions.

Principal C. F. Brusie, of the Mount Pleasant Military Academy, Sing Sing, N. Y., writes:

The military drill contributes very materially to the proper development of boys. The general health of our boys is much improved. There is danger that the inculcating of mere military discipline may come in the military school, to take the place of the development of moral character, of moral purity and uprightness. As directly contributing to the military strength of our country I should not consider this military training of the first importance.

Superintendent S. C. Jones, of the New York Military Academy, Cornwall, N. Y., writes:

The habits of promptness, unquestioning obedience, and truthfulness are fundamental requirements of a military organization, and undoubtedly have a decided effect upon the mind and morals of a cadet.

Already in this address I have given the history of military drill in certain grammar schools of my own city—New York. I have spoken also of my failure to obtain any account of grammar school work in other cities. In discussing the value of grammar school work I must therefore confine myself to these two heads—first, the reports on the value of the work from the public schools of New York, which are actually conducting it; second, opinions of the desirability of grammar school drill as gathered from the principals of the high schools, who are giving such instruction. These two classes of witnesses seem to me to be more competent than any others to give a judgment on grammar school work.

Of the four or five grammar schools in New York giving military instruction, I have reports from the following:

Acting Supervisor M. E. R. Alger, of the New York School for Truants, writes:

To the physical education of the student I pronounce it excellent.

To his intellectual and moral well-being I find it is of great benefit, inasmuch as it stimulates the patriot fervor and teaches self-control, and imbues him with military ardor.

The third question teaches him obedience and proper recognition of authority.

In my opinion it would be of greater benefit and of far more value to the pupil than so much manual training now in vogue. I introduced it here in the Truant School last May, and it has been a very great success.

Principal Thomas Moore, of Grammar School No. 93, writes:

Military drill in the schools is a great aid to the proper development of the boy—morally, mentally, and physically. It tends also to inspire patriotism, and to make him valuable to the State and nation as a citizen soldier.

Principal D. E. Gaddis, of Grammar School No. 54 writes:

I have given the subject of military drill in our schools much thought and years of trial, and the conclusions at which I arrive are based, not on theory, but on experience. Military instruction produces a liking for school. The dry old routine of study, study, all day long is brightened by a little play. The habit of attention is well developed in company drills, and produces fruit in the class room, as the boy listens from habit. Manners are improved. On being spoken to by his teacher, the pupil stands on both feet, and with head up gives a distinct answer. Greater care is given to personal appearance. Shoes are polished, collars are worn, and clothing brushed. The awkward, clownish boy, who lops about in his seat, whose feet appear to be in his own way, who is ashamed to speak to a lady or gentleman, is by means of this drill transformed into a frank, manly fellow. Much good is done our teachers. The lack of power to govern is the chief source of trouble. If these young teachers were put through a thorough course of drill, if they were taught to obey promptly themselves, they would be much better qualified to enforce discipline in the class room.

Principal E. H. Boyer, of Grammar School No. 87, writes:

Military drill of the boys who desired it was begun in Grammar School 87 in 1894, the consent of each parent having first been obtained. Uniforms, costing less than the average school suits, were bought by the parents, and about one-third of the membership of the school was enrolled in what was called the First Battalion American Guard.

Drills, including as the most essential feature the setting-up exercises, began in March, 1894. They have been continued until the present year. Arms were bought from the proceeds of a voluntary entertainment provided by the friends of the school. The chief motive which controlled the introduction of military exercises was the desire to educate the wills of boys in such a way as to secure from them prompt, exact, and cheerful obedience. After the simple military evolutions and the manual of arms were thoroughly learned and the element of novelty was eliminated the drills became educational, in this special direction, in a very high degree. The time devoted to the drill after school hours was better spent in that way than it would otherwise have been by the majority of the boys.

The second class of witnesses in regard to military instruction in grammar schools consists of the principals of high schools who are engaged in military instruction. I have asked the opinion of a score or more and will present them in a very brief shape.

Director Lane, of the Washington High School, says:

Military drill was a failure in the grammar schools for lack of money and trained supervision.

Principal Montgomery, of the Colored High School, of Washington, says:

The various setting-up exercises might be readily introduced into schools below the high. The quick attention to orders, the rapid execution of commands, the spirit of obedience and regard for authority, all may well be inculcated there.

Principal Fowler, of New Lexington, Ohio, says:

Grammar school boys should have the drill the same as the high school.

Principal Baker, of the Yonkers (N. Y.) High School, says:

I should not advocate military drill below the high school period. This age is best suited for the purpose.

Principal Falconer, of Waterford, N. Y., says:

I favor beginning the work the last year in the grammar school. The advanced grammar grades will reach more boys.

Principal Jones, of the Cornwall Military Academy, says:

I have not been favorably impressed by the little I have seen of the attempt to introduce military drill into the public grammar schools. Some good must come from the system, but it does not seem to be sufficient to justify the necessary labor and expense.

Principal Warren, of the Albany Academy, says:

The serious objections to military drills in grammar schools are: First, the expense. Boys soon tire of a Quaker gun. The drill guns would cost, by the thousand, perhaps \$5 apiece. The expense for the guns alone would be not less than \$5,000 for Albany. Uniform dress would be impossible. Even uniform caps would be impossible, except in the upper two classes.

Second, there would be a scarcity of the upper-class grammar school boys to act as officers.

Third, I raise the question whether it is wise to turn the thoughts of children during the impressionable years of their lives to war. It is the last and most terrible argument used by man. To make soldiers out of our boys is to encourage the drift to militarism.

President Fetterolf, of Girard College, Philadelphia, says:

I am convinced as to the desirability, but as to the possibility I am not prepared to express any views.

Principal Brace, of the Trenton (N. J.) High School, says:

Military drill in the grammar schools would certainly be an auxiliary of wonderful potency in the preparation of young people for the higher courses of education.

Principal Travell, of the Plainfield (N. J.) High School, says:

I do not believe it is wise to organize military companies among the grammar school boys, but should advise gymnastics instead.

The school principals of Boston speak on the grammar school question as follows:

Principal Mann, of the West Roxbury High School, says:

I believe the boys are quite young enough in the high schools, and that it is undesirable to begin military drill earlier, or to keep it up longer than three years.

Head Master Ryder, of the Brighton High School, says:

I do not think it at all desirable to introduce military drill into the grammar schools. The boys are not old enough to do the physical work required of them. They would be obliged to use toy guns.

Principal Norris, of the Charlestown High School, says:

My opinion would not be favorable to military drill in grammar schools for these reasons:

First, the boys are generally too young.

Second, it would be to put the subject into the curriculum for so long a time that it would become irksome. In one or two years they learn all that it is wise to teach them.

Head Master Lincoln, of the Dorchester High School, says:

Certainly only the very highest classes should attempt it, and only the larger boys. I am not much of a believer in wooden or sham guns, which would be necessary for most grammar boys.

As an interlude, at this point let me introduce an opinion received by me a few hours before leaving home from a committee of the Grand Army, Col. H. H. Adams as chairman, and Herman P. Smith, of New York, who advise that hours be given in grammar schools, to be named, not "military drill," but "patriotic exercises," including, besides the setting-up drill, patriotic songs and recitations; then in the last year but one of the grammar grade there should be, besides the setting-up drill with company formations, also the drill with arms after school hours in a public armory, but that this drill outside of school be entirely voluntary, and that no uniforms be required.

Massachusetts principals outside of Boston declare themselves thus:

Principal Briggs, of Chelsea, says:

I should not advocate its introduction into the grammar schools.

Principal Ramsay, of the Fall River High School, says:

It would seem to me that the boys were too young to do much of the drill, and especially to be charged with the responsibility of military officers. It is better for them to wait until the high school period or until they are old enough to join some existing local military organization.

Principal Owne, of the Woburn High School, says:

I would require drill in the last two years of the grammar school.

Principal Brown, of the Amesbury High School, says:

This is a matter of local conditions. In towns where there are nine years before the high school there is some training desirable for the pupils of the ninth grade.

Principal Bachelor, of the Gloucester High School, says:

The higher grades of the grammar school might adopt profitably the military exercise.

Principal Tuttle, of the Milford High School, says:

I should hardly favor the introduction of the drill into the grammar grades, except, possibly, the setting-up exercises.

Principal Howe, of the Wakefield High School, says:

I should consider military drill entirely out of place in the grammar schools.

I offer, as an induction from the data that has been given us, two propositions:

First, instruction in military tactics in public and private high schools, so far as tried, has been eminently useful to the boys and to their teachers and the nation, and therefore this convention should organize a propaganda to secure the extension of instruction in the high schools until, instead of less than 5 per cent of the public high schools giving such instruction, there should not be 5 per cent neglecting this instruction. Also in the private high schools, so that instead of less than 15 per cent in any of the five divisions of our country that give such instruction, there should be less than 15 per cent not giving it.

My second proposition is that in communities where no high schools exist and where boys are continued in the grammar or common schools until they are 15 or 16 years of age this convention should encourage such schools to give military drill such as is elsewhere given in high schools.

Further, that grammar schools should be encouraged to introduce the various "setting-up" exercises as a valuable and easily arranged gymnastic. Beyond this, as a rule, the grammar school should not attempt any military tactics.

II. UNIFORM FINANCIAL REPORTS FOR PUBLIC SCHOOLS.<sup>1</sup>

*To the Department of Superintendence of the National Educational Association:*

The committee appointed at the Chattanooga (1898) meeting of this body to report upon a uniform style of financial school report for the use of cities or school districts, and also upon some form suitable for the use of State school systems, beg leave to report as follows:

The committee have not found it practicable to have a meeting of its members before coming to Columbus. Discussion of the matters committed to them has been carried on by correspondence, both between members of the committee and with others.

The printing of this report, so that it might be in the hands of the members of the department at this meeting, was authorized at the time this committee was appointed, but in view of the fact that the members have not been able to meet for final discussion of the matters intrusted to them until the assembling of the department here, it seemed best to have printed only the proposed form or schedule.

It is not probable that any form for school financial reports could be presented which would be entirely satisfactory to everyone. Your committee are of the opinion, however, that most persons would agree on nearly all important items, and that an agreement should be made throughout, even though, to some, the classification of a few minor items may seem arbitrary or incorrect.

While local conditions enter into necessities for expense in any public school system, yet one of the most useful means of estimating proper expenditures, and the necessity for particular expenditures, should be afforded by a study of the financial school reports of other similar cities or districts. As these reports are at present made they are of little use in this respect. Items given in one report are omitted from another. Items of income or outgo are differently grouped in different reports, and the statement is made in such a way that it is impossible to separate the items for the purpose of reclassification. In getting the cost of education per child, different items are put into the total cost of education, which forms the dividend, while sometimes the divisor is the number enrolled, sometimes the average number in daily membership, sometimes the average number in daily attendance.

One of the chief studies of a wise administrator of schools is to make the cost of education per child as low as consistent with the best service. Attention to this and to a comparative study of reports for a period of years, now that most of our school systems have become established on a somewhat similar plan, should give an idea of the average or normal cost of education per child. Having this, the manager of schools may know how expense in his system differs from this normal standard, and, if not normal, why it is above or below. This knowledge can not be arrived at, however, until the same items are included when computing cost of education, and the same divisor is used in obtaining the average. By careful comparative study railroad men know the average cost of hauling freight per ton per mile, and the cost per mile of transporting a passenger. Those administering schools should be as well informed upon the cost of education.

The two things one studying a report of school finances most desires to know are, first, the rate of direct local taxation for schools borne by the community reporting; and second, the average cost per child per year for the usual educational expenses. There are many items which, when given, are explanatory of these two and serve to correct the inferences which might be drawn from a bald statement of them.

<sup>1</sup> A report submitted to the department of superintendence of the National Educational Association, at Columbus, Ohio, February 23, 1899. Reprinted from the Educational Review

There are also many items, not directly related, which aid to give a correct estimate of the conditions surrounding the school organization reporting.

In arranging the proposed form, an attempt has been made to group items so that the two prime factors which such a report may show may be easily determined; and to give, in addition, information of interest and use in such comparative study of income, outgo, and conditions as those charged with the management of school systems find it profitable to make.

The heading of the blank form was, at the suggestion of members of the committee, made to cover cities, school districts, or school corporations. In some cases the city and the school district have the same boundaries; in other cases the school district covers territory not included within the limits of the city; in some cases the title varies, and the school district is called a school corporation. The proposed heading will permit the form to be used not only for cities but for any school district, or for any form of organization the purpose of which is to carry on public schools.

Taking up the items of the form, Nos. 1, 2, and 3 serve to show the rate of local school tax, and to determine how this rate in one system of schools compares with that in another. The proportion of the true value at which property is assessed for purposes of taxation varies so in different States and different cities that all of these items are necessary that a comparison may be made. A tax of 7 mills on the dollar, where property is, as in some cases, valued for taxation at only one-tenth of its actual value, is really much lower than a tax of 4 mills in a city where property is valued for taxation at two-fifths its actual value. The tax of 7 mills on the one-tenth valuation might be increased, on the same valuation, to a tax of 16 mills before it would be as great in reality as the 4-mill tax on the two-fifths valuation. A tax of 6 mills on the dollar, where property is assessed at one-fourth its actual value, is in reality only one-half as great as a tax of 3 mills where property is assessed, as in Massachusetts and in some other States, at its full actual value. With the figures given in 1, 2, and 3, valuation and tax rate may be reduced to a common basis and fairly compared.

Under the head of receipts, the ordinary and extraordinary sources of income are separated. The ordinary sources, items 4, 5, 6, 7, and 8, serve to explain each other, and also to explain No. 3. In some States little or nothing is received from State distribution or funds; on the other hand, in at least one Commonwealth, this State school fund is so generously endowed that with prudent care it should, in the future, carry a large part of the expense for public education. Where this source of income is large, the necessity for local taxation is correspondingly reduced. In cases where the county figures to a considerable extent as the unit of taxation, the necessity for tax in the local school district is likewise lessened. In many cases the amount received into the school fund from fines, licenses, and penalties is inconsiderable. On the other hand, this source of revenue is sometimes large—in some cases even providing the greater part of the funds needed for the maintenance of the schools. Where such a condition as this exists, the necessity for taxation, of whatever sort, is materially reduced. Cities or districts sometimes have unusual or temporary sources of income: gifts or bequests, interest on permanently invested funds, tuition of non-resident pupils, etc. These items, indicated in No. 8, serve to put all the facts before the reader of the report.

Receipts from money borrowed and from the sale of bonds are not normal or regular sources of income. The receipts from sale of bonds are generally to be applied to some particular purpose, usually the purchase of sites and the erection of buildings. Income from loans is a temporary makeshift. Nevertheless, these two items must be reported to give a correct understanding of the situation.

Expenditures seem to fall into three classes: The usual current expenditures necessary for the maintenance of the schools; expenditures for sites, buildings,

permanent improvements, and equipment; other expenditures which, for various reasons, are not put in either of the two preceding classes.

For the purpose of this report the first of these classes is by far the most important, for it would probably be conceded that from this item of current expenses should be determined the cost of education per child, the most important item to be shown. Most of the difficulties in preparing such a form as is here proposed are met in the attempt to agree upon the items which should be included and those which should be excluded from item No. 13. Item No. 12 is simple, including only expense for regular and special teachers, and for those engaged in supervising or directing the work of instruction. An agreement is easily reached upon most of the elements making up the total in No. 13. Here without doubt belong all expenditures for salaries of executive officers of the board, salaries of janitors, fuel, lights, water where this is purchased, material and labor for ordinary repairs to buildings and premises, the care of grounds, text-books where these are owned by the school board, school stationery, school supplies, both those for janitors and those used in the work of instruction, cartage and freight, advertising, election expenses, school census, legal expenses, postage, telegraph and telephones, etc. Your committee would also include sums paid for rooms or ground rented for the use of the schools. It may seem inconsistent to include rent here while excluding interest paid and interest estimated on value of buildings and grounds used for school purposes. Rent, however, is seldom a large item, and it seems best to class it as current expense.

Actual usage as to items included in "cost of education" varies widely in different cities. Perhaps in one case only part of what is included in No. 12, simply the expense for teachers, is included. In another city the cost of instruction and supervision, all of No. 12, is included, and this is reported as "cost of education." Sometimes to these items is added cost of janitors, fuel, and school supplies, while all other items are omitted.

It has been urged that to the items grouped under No. 13 should be added the sums paid for interest and also a sum for interest, estimated at the current rate upon the value of all grounds and buildings owned by the school district and used for school purposes. The item of interest paid upon bonds or upon temporary loans has been arbitrarily excluded from No. 13. This has been done because interest is not directly an expense for educational ends; because in many cities no debt exists and no interest is paid. If the item is included, it will in some cities weigh unduly in the showing of the cost per child. Whether school buildings and grounds shall be purchased by direct appropriations of funds from the school treasury, or by funds derived from the sale of bonds, is a matter regulated by each community for itself, under State laws, and one plan or the other is followed as the particular community considers advantageous. The matter is largely out of the management or control of those directly charged with administering the schools. Your committee have, therefore, recommended this exclusion.

The question might be raised as to including in No. 13 the interest upon estimated value of buildings and sites and permanent equipment. While it is true that the community is permanently deprived of the use for other purposes of the sums invested, its inclusion would be a wide departure from any prevailing usage. Estimates of the value upon which interest should be computed would vary largely, as one person after another in different years was called upon to make the estimate, and the item would become a variable factor, causing apparent cost of education to show strange increase or decrease. Your committee have, therefore, considered it wiser to exclude both interest paid and interest estimated from "cost of education."

Items 14 to 19, inclusive, show permanent investments in plant. The items are

separated because it is desirable to know amounts expended for each purpose. Some little perplexity may arise in classifying expenditures under Nos. 16 and 17. Probably window poles and shades and carpets should go under 16, while door mats should go with brooms under 13. The repairing or replacing of shades should probably go under 13 also. Maps, charts, globes, etc., with all original fitting up of laboratories and workrooms, as well as additions of permanent pieces of apparatus, belong under 17, while the repair of apparatus and the replacement of the daily consumption and small breakage of laboratory material and utensils should be counted under 13, as should rebinding and repairs of library and reference books. Bookcases, etc., an improved heating plant, a new system of ventilation put into a building, fall naturally under 19.

Items 20, 21, and 22, not placed with either of the foregoing classes of expenditure, are desirable for information, and are therefore included.

Although this form for report does not resemble a bookkeeper's balance sheet or exhibit, yet item 24 is desired as a matter of information, as is also item 27. Items 25 and 26 are necessary to give a correct understanding of the significance of item 24. Items 28 and 31 are also desired as items of information, important as giving a full knowledge of the situation which exists in the reporting district. Nos. 29 and 30 modify considerably the significance of 28.

Items 32, 33, and 34 give an opportunity to estimate the cost of ordinary schools, free from complications with the unusual schools indicated in these items. They also give information as to what extraordinary educational responsibilities are assumed by the community.

Item 35 is inserted simply as information often desired, but frequently omitted from school reports.

Item 36 sheds light on the item following, and both of them are things well to be known when considering items 38, 39, and 40. These facts are not all strictly related to finances, but help in a view of the whole situation. They should often be borne in mind as correctives when considering items 3 and 44.

Items 41, 42, and 43 bear the same relation to 40 that 32, 33, and 34 do to the sum of 12 and 13. They permit the cost of education for the common schools to be separated and computed apart from that of the schools for special classes or purposes indicated in 41, 42, and 43.

There will no doubt be criticism of the selection of No. 40 as the divisor in obtaining No. 44. Both No. 38 and No. 39 were considered.

No. 38 varies so in different cities in proportion to the school population, and the average number of days each pupil enrolled is in attendance during the year varies so, that this does not seem to provide a divisor that is in any degree stable or reliable. Neither does the enrollment, in any great degree, determine the number of teachers or the school accommodations necessary.

For many reasons No. 39 seems the most suitable divisor. If computed in a uniform manner, the figures showing number in average daily membership would most nearly show the requirements for school rooms, furniture, supplies, and teachers. But it is not true that these figures are obtained by the same processes or based upon the same facts in different school systems. Usage varies so in computing membership in different schools, pupils in some cases being counted as members of the schools when in other cities the same state of facts would cause the child to be considered as no longer a member of the schools, that fair comparison is not apparently practicable by the use of this divisor.

Your committee are of the opinion that a divisor as little subject to misunderstanding as possible, and one based upon facts which are obtained in the same way everywhere, is of the first importance. The members believe this is provided by item 40, and we have therefore made that item the divisor to be used, in connection with items 12 and 13, to obtain what shall be known as the "cost of education."

Your committee further recommend that the accompanying form for reports of cities or school districts be used as a basis for uniform financial reports by State superintendents of public instruction:

*Report of the school receipts and expenditures of city (or school district or school corporation) of \_\_\_\_\_ for the year ending \_\_\_\_\_ 18—.*

1. Estimated actual value of all property in the city (or school district or corporation)...
2. Assessed valuation of all property in city (or school district or corporation).....
3. Rate of school tax levied on each dollar of assessed valuation of city (or district or corporation) .....

## RECEIPTS.

4. Received from State apportionment or taxes.....
5. Received from county apportionment or taxes.....
6. Received from city (or school district or corporation) taxes .....
7. Received from fines, licenses, penalties, etc .....
8. Received from all other sources, except loans and bond sales (specify different sources).....
9. Received from loans.....
10. Received from bond sales .....
11. Total receipts, all sources .....

## EXPENDITURES.

12. Paid for salaries of teachers and supervisors.....
13. Paid for other current expenses, excluding interest:
  - Salaries of officers .....
  - Janitors .....
  - Fuel and lights.....
  - Text-books, including drawing and copy books .....
  - Stationery.....
  - Other school supplies .....
  - Ordinary repairs to buildings, etc.....
  - All other items of current expense (specify items) .....
14. Paid for sites.....
15. Paid for additions and new buildings.....
16. Paid for permanent furnishings and furniture .....
17. Paid for permanent equipment for manual training, science laboratories, etc.....
18. Paid for reference and library books .....
19. Paid for all other permanent improvements, such as grading, paving, etc. (specify different expenditures) .....
20. Paid for interest .....
21. Paid on principal of loans .....
22. Paid on principal of bonded debt .....
23. Total paid out, all purposes .....
24. Cash on hand at beginning of year .....
25. Cash on hand at beginning of year in fund for sites and buildings (included in 24).....
26. Cash on hand at beginning of year in sinking fund (included in 24) .....
27. Warrants outstanding at beginning of year .....
28. Cash on hand at end of year .....
29. Cash on hand at end of year in fund for sites and buildings (included in 28) .....
30. Cash on hand at end of year in sinking fund (included in 28).....
31. Warrants outstanding at end of year.....
32. Paid current expenses, evening schools (included in 12 and 13).....
33. Paid current expenses, teachers' training schools (included in 12 and 13).....
34. Paid current expenses, schools for defectives or other special schools (included in 12 and 13, specify different schools) .....
35. Bonded school debt of city (or school district or corporation) at end of year.....
36. Population of city (or school district or corporation).....
37. Persons of school age, \_\_\_\_\_ to \_\_\_\_\_ years, in city (or school district or corporation) .....
38. Number pupils enrolled, all schools.....
39. Average number in daily membership, all schools.....
40. Average number in daily attendance, all schools.....
41. Average number in daily attendance, night schools (included in 40).....
42. Average number in daily attendance, teachers' training schools (included in 40).....
43. Average number in daily attendance, schools for defectives or other special schools (included in 40, specify different schools).....
44. Annual cost of education per pupil (sum of Nos. 12 and 13 divided by No. 40).....

Your committee find it impracticable, without more time than has been at the disposal of its members, to present a suitable form of report showing the important facts as to finances of State schools and educational institutions other than public schools.

Respectfully submitted.

### III. THE ORGANIZATION AND CONDUCT OF PROFESSIONAL SCHOOLS.<sup>1</sup>

By Robert H. Thurston, Director of Sibley College, Cornell University.

\* \* \* The correct theories and methods of organization and conduct of professional schools of whatever sort are in essence the same. The courses of instruction in engineering, in trade, in manual training schools are similar in general character in their characteristic features; they are properly organized on similar principles and by similar methods and must have their relations to the academic schools, whether high or low, primary, secondary or collegiate, determined by the same principles. These principles, on the other hand, are by no means identical with and may not even resemble, those dictating the construction of the courses, the details of curricula, or the entrance requirements of the academic school.

The ideal system of planning the professional school would seem to be the following:

(1) Ascertain what are the needs and demands of the profession to insure the highest efficiency of its practitioners, the best result of its operation as an element of the industrial system of the nation.

(2) Determine just what portion of the professional training is practically and appropriately to be demanded of the professional school. Take this scheme, properly scheduled, as is the reasonable and proper requirement of the student entering the profession as a novice, with his strictly preparatory education completed, prepared to commence the acquirement of the art of that profession by practice and experience.

This scheme presumably should include a knowledge of the pure sciences underlying the art to be pursued, for such studies can not reasonably be expected to be acquired in later professional life. It must include so much of the applied science of the chosen vocation as can be safely and successfully incorporated into the curriculum of the school, for it is this which constitutes the claim to rating as professional. It should include such necessary and such desirable elements of the college curriculum as are not fairly to be expected to be possessed by a novice and which are needed to permit the acquirement of professional knowledge.

<sup>1</sup> Reprinted from "On the organization of engineering courses, and on entrance requirements for professional schools."

The complete scheme of studies for the technical school of this higher professional class, obviously, thus comprehends these three main divisions: (1) As the ultimate and final preparation for professional work, certain distinctive and professional branches which are recognized as appropriate and needed for professional success; (2) certain branches of pure and applied science which are essential as preparatory to or as needed accompaniments of the distinctively professional studies; (3) certain accessories the possession of which is found, by professional experience, to be prerequisite to main or incidental lines of work and progress toward the idea of the profession.

(3.) The plan of the curriculum of the professional course being thus by exact methods prescribed and limited, it must next be ascertained to what extent the educational institutions to be drawn upon can supply the needed preparation for entrance upon the proposed course. A statement of such work in preparation as may be reasonably expected constitutes the proper system of entrance requirements and the only appropriate demand for the professional school.

If it is found impossible to secure elementary preparation for entrance into the course as planned, it will be found necessary, as has constantly occurred in our own schools, to incorporate some nonprofessional work into the professional scheme; but this means simply that the professional school is compelled to do work outside its province. Should it prove, as has usually been the fact in this country, that so much nonprofessional work must be performed in the professional school as to compel excess of load, the surplus is necessarily left out and the student is compelled to defer professional study of importance until actually entering upon professional practice. Such a mongrel course is now illustrated more or less by practically all engineering schools, and it may be a generation before they can be raised to a professional level.

Meantime all are endeavoring to gradually raise the professional scheme of instruction and even to provide opportunity for the advanced student to secure accessory and closely related and important instruction in law, economics, the finance of engineering, and economics of manufactures, at the same time, circumstances permitting, proposing to restrict the specified preparation for the professional school to essentials, leaving to the candidate for admission the decision of the question just how far he can afford to give time, money, and strength to the pursuit of earlier academic studies.

The fact is that with every technical school, and especially with the professional school in the department of engineering, the entrance requirements should be made just as few, just as fit, and just as precise in adaptation to the courses to be taken up as is by any means possible. The nature of the professional course to be offered, and the sequence of primary studies with its special courses, determine the proper requirements for entrance. To increase entrance requirements by introducing those which do not furnish suitable introduction to work to be taken up is to deprive deserving men—usually the most deserving classes of young men—of the right of gaining a scientific knowledge of the fundamental principles of their chosen profession, or art, or vocation. To raise requirements for sentimental reasons, simply to make entrance into such courses as difficult as into others, is, in the opinion of every person familiar with the equities and the facts of the case, a crime against the people, and especially against the "industrial classes," the special care of whom is made, by the fundamental law and by the charter of the land-grant college, its primary duty. "Procrusteanizing" is bad in all departments; but procrusteanizing in any university seeking to adapt itself to the needs of a people, including the "industrial classes" as well as the cultured, is an educational blunder, a political mistake, and a crime against those classes of society which it is the great purpose of such a college and of its founders no less, to give most effective aid. A famous engineer, at the head of a deservedly famous engineering college, discussing this subject from the point of view of the

practitioner, as well as of the educator and professional expert—all of which capacities he illustrates in a rare and admirable degree—writes:

I fear that our preparatory schools are under influences, if not inimical indeed, certainly unfavorable and unsympathetic toward the preparation that should be given to students entering scientific professional courses. The schools now furnish much matter upon which so-called "counts" are based, which could be easily supplanted by other matter quite as useful in developing the thinking power of young people as any subject they now exact; whilst on the side of professional training we must demand subjects that should not be taught in the college, and yet the schools do not provide for them. I believe the majority of young men entering the college of engineering have to obtain special preparation outside the schools. In many, even large, cities, plane and spherical trigonometry, solid geometry, and perhaps advanced algebra, are rarely taught. A student now in college was refused instruction in solid geometry and plane trigonometry because the school could not afford to hire a teacher for him alone. If this is the usual fact, higher education is only within the reach of the wealthy classes, and intellectual scientific progress is dammed at the outlet of the public schools.

It is indeed strange that, in a country so essentially industrial as is ours, all the efforts of the public schools towards higher education seem to be confined to the promotion of old academic courses and literary professions. Yet the study of the classics is exceedingly backward with us; and, in spite of all the drawbacks from this state of affairs and the often narrow-minded discrimination observable against their students, the schools of engineering in this country are generally the best of professional schools, and some of them have no superiors, even as to intellectual accomplishment, on either side of the Atlantic.

As elsewhere remarked by the writer:

It is as essential that the engineer familiar with this branch of construction should plan and direct the courses of instruction in engineering as that the student should be instructed by an engineer. Experience shows that it is a decided advantage that every subject taught in engineering schools should, as far as practicable, be taught by engineers, or by specialists practically familiar with engineering and its applications of their subjects. We even find great advantage in securing instruction in applied mechanics from members of the profession having a talent and special predilection for that subject. The absurdity of establishing engineering schools with nonprofessionals at their heads has slowly come to be recognized to be as great as that of the custom, formerly general, of putting a clergyman, as such, simply, at the head of every college; the folly of seeking to construct an engineering course to be taught by nonprofessionals is not less patent. The organization of any professional school with any other than a professional expert at its head has come to be recognized as eminently absurd and dangerous. Eminent professionals at the head and talented men, practically experienced, on the staff, are the primary elements of success in an engineering as in any other professional school; and a no less important element of success, perhaps, is the placing of specialists in charge of special lines of engineering work. This is now always a feature distinguishing the larger and the better classes of technical schools and colleges. A baby should not only be "nursed by one who loves it," but by one who knows what it wants and how to supply it.

In detail, we may perhaps summarize the points of discussion as below, following the order already given:

(1.) In the technical high school the form and extent of its technical and other courses must, in the now usual case, be settled by the conditions characterizing the location, and by the character of the adjacent population. As a rule its pupils must come from the same class of schools as those which furnish the candidates for admission to the academic schools for youth of similar age. This means that the technical courses, which are commonly largely mathematical, must be started at that point at which it is found practicable to secure satisfactory preparation in the schools. The science work must be similarly adjusted, and this commonly means that it must begin in the technical high school itself; for it rarely happens that any real scientific work can be offered in the next lower grade of academic or manual training school, and, even where attempted, it is too generally the fact that it is so ineffectively performed that the pupil must begin in the high school to unlearn what he has been taught, rather than com-

mence any real work of this sort. All that can be said of the general case is that all that can be had from the lower grade of school should be secured, and thus here, as in all grades and schools, the greatest possible economy of time and labor secured, and the earliest possible beginning made in technical work.

In addition to the technical and semitechnical scientific work of the course, the essential elements of the academic education of the average citizen should be provided, and, in addition, an effort should be made to give some instruction in at least one modern language. This, for the purpose of the average engineer, is best made the German language and its technical literature, while the architect usually prefers the French.

The manual training or the trade instruction should be condensed into as continuous periods as practicable, and it will be found to have the double advantage of giving at once some useful and practical knowledge and that added physical vigor which assures the power of making the most and the best of the mental powers. One has only to visit the United States military and naval academies to witness, in perfection, this peculiarly desirable gain.

In each city and town the technical high school should be adjusted, in extent and character of its courses, to the particular vocations which are most characteristic of the place; and, in fact, in many, perhaps in most, cases should be made, if not a regularly organized trade school, as largely accessory to the requirements of the principal vocations of the place as practicable. In large cities, where several such schools can be perfectly well organized and are really needed, a system of trade schools may be substituted for the technical high school, in each of which schools some important trade may be systematically taught, with all the special scientific and related courses appropriate to such technical courses and schools. Germany admirably illustrates this idea and there every city sustains carefully planned trade and technical high schools directly adapted to the needs of its people.

(2) The distinctive and essential entrance requirements of such schools, as already remarked, must be as high as circumstances permit. Their precise form can only be stated when the conditions of the educational system of the place are known. The essential requirements are those which lead directly into the work of the school; the nonessential—professionally speaking—are those academic studies for which time and place can be found in addition. No definite limit exists to their extent, and only the greatest discretion will secure the highest efficiency of the technical school courses as a whole.<sup>1</sup>

(3) In the technical colleges these requirements and the courses adopted, in any consistent system, should have the established character and altitude of academic college work in so far as they are not distinctively professional. The technical high schools and the trade school, for example, would presumably demand mathematics sufficient to permit the taking up of higher algebra and geometry; the technical college would demand sufficient to allow of entrance upon the higher mathematical branches, as analytical and descriptive geometries and the calculus; the objective being early entrance upon the study of the subject which constitutes the spinal column of the whole technical curriculum—applied mechanics.

Laboratory work in the sciences of chemistry and physics and extensive courses of instruction in drafting and in machine design, with as much trade instruction as can be provided, will constitute the characteristic studies; while the modern languages—French and German, at least—will come in as nontechnical but essential elements of the curricula. In many cases law, economics, and mercantile practice can be brought in to supplement the purely professional work of the engineer, the architect, or the textile designer, and the practitioner of industrial

<sup>1</sup> See the paper by the writer, "Technical Education in the United States," published in the Transactions of the Am. Soc. Mechanical Engineers, 1893, as read at the World's Engineering Congress of 1893 at the Columbian Exposition, Chicago, Ill., in that year, especially pp. 4, 5, *et seq.*

art of whatever sort. The primary and most important point is the securing from the preparatory schools of as large a preparation in mathematics and the sciences, and in modern languages and literature, in addition to the lower recognized standard academic studies, as can by any possibility be obtained.
