The courses to be here provided for the satisfaction of those of the people whose sons must go at once into business on leaving the high school or the college should be such as are most certain to prove valuable as best promoting the interests of such youth by effectively increasing their capacity for successfully and usefully passing on through "the sequel of their lives." It is often practicable to "kill two birds with one stone," sometimes a dozen, by teaching such studies and introducing such methods of teaching applied science and languages as will at once furnish education and technical knowledge and training. In fact, one supreme advantage of much technical study is that it provides at once the gymnastic training of the academic school studies and valuable knowledge of a professional character. General Walker, the late president of the Massachusetts Institute of Technology, always claimed that the technical college, properly organized and administered, possessed decided advantages, for all youth, over the purely academic school, in that it gave at once gymnastic training in all essentials and useful and safe insurance against misfortune of the possessor of learning without such knowledge. He thought that the learned man, simply and as such, was never a wise man.

(4) The professional engineering school, as an accompaniment, in the educational organization of the academic college, as an element of the modern university, like the law school, the medical school, and the school of pedagogy and the school of theology, would, "in the complete and perfect" organization, be an institution in which, as in the law school, professional courses would be taught, supplemented in the school itself by such courses in applied science and in technical language and literature as could not be fairly expected to be provided by the academic schools of the university or the common academic college. The entrance requirements should be such as can be met either by the preparatory schools or the other departments of the university, without demanding too much of the matriculate, and can only be finally adjusted when experience has shown just what may be safely asked of those other schools and departments. The reports of the committees of the American Society for Promotion of Engineering Education show what is the situation in this respect at present in various parts of the United States. It may be safely asserted that it will be many years before it will be practicable to adopt uniform requirements for all, or even to comply with the ambitious demands of the academic schools regarding academic nonprofessional studies—preparatory or other.

(5) The extent to which the existing views of the people and current tradition in the schools and the prejudices of uninformed and unthinking academic teachers and of the monastic scholars of the community are to be deferred to is a question of greater importance than the professional commonly either believes or admits. Whatever this extent of deviation from what the practitioner often thinks the desirable organization and curricula of the professional school, it must be remembered that we must, probably, always be dependent, more or less, upon the fairness, good judgment, and kindly assistance of the academic teacher, that public opinion will always be largely molded by the nonprofessional, and that it is incumbent upon every member of the profession to so present the case as to secure, in as full amount as possible, fair and kindly discussion and unprejudiced consideration. \* \* \*

It is, in any event, the duty and the rightful privilege of the professional expert in technical education, in consultation with the practitioner, to construct the curriculum and to administer the technical school or college, of whatever form, and in its development he must, in the performance of a duty to the public

as well as to the profession, carefully follow that golden mean (in deciding between the claims of the scholar and those of the practitioner) which shall insure prompt construction of the system to be developed and give it best insurance against injury and embarrassment by the larger power and influence of the academic teacher.

(6) The control of the technical and of the professional school by nonprofessionals, whether officially through public officials or unofficially through public opinion, is one of the most dreaded dangers in the development of the forms of practically useful education regarding which Aristotle, Milton, and John Scott Russell have so eloquently written. The course to be taken in avoidance of such danger is obviously to see that public offices capable of being employed to injure the interests of the people in this direction are filled by men at once familiar with the subject, practically interested in the development of the best education of the people for the people's work, statesmanlike enough to see the bearings of the matter upon the best and highest interests of the nation, and strong and conscientious enough to do what they can to sustain and promote a truly scientific system of public education. Germany has produced such men; the United States should be able to find an even larger and better class, and to give them their opportunities.

Further, it is important that public opinion, and the opinion of the academic educators particularly, be formed by thoughtfully presented facts and arguments and especially by making known the marvelous gains effected by the German people through partial and imperfect development of a Miltonian educational system by their statesmen during these last generations. An enlightened public opinion, given practical expression by wise statesmen, will inevitably bring about the desired end.

(7) The extent and limitations of the curriculum of the distinctively professional school where students entering may be expected to have secured as extensive and liberal an academic education as their time and means, or the means of their parents, permit should obviously be such as would be obtained by eliminating from the existing curricula all those nonprofessional studies which can be secured in the academic college, as the modern languages, the pure sciences, and the higher mathematics, and substituting advanced professional work not previously attainable. Of this there will always be an ample amount available. When the limit is at last reached, the reduction of the professional course, until it is brought down to a length which will perhaps permit the graduate to enter upon his work and begin to earn a living soon after coming of legal age, will be an advantage of enormous value to him. Could he be graduated at 21, the country would gain greatly; could he even always take his place in the ranks of his profession at 23 or 24, it would be a gain; for, although many graduate from our technical schools at that age, they are seldom as fully and symmetrically educated, either academically or professionally, as is desirable.

(8) In these highest and most distinctively professional schools (and the question is one which applies to all professional schools—law and other, as well as those of engineering) it is asked, What shall be the extraprofessional curriculum, and what shall settle the boundaries of the school? Shall it make its requirements and its course as high as practicable, thus restricting numbers and, in a certain sense, creating an aristocracy, a professional "four hundred," or shall the requirements and the course, or that part which leads to the professional degree, be held down to the lowest acceptable plane, and thus the largest possible numbers of candidates for entrance into the profession be allowed to practice with the indorsement of institutions of learning?

This is a matter of such supreme importance, to the nation as well as to the profession and to the individual, that its decision must be most deliberately determined, and only time and experience can settle it. Possibly, the existing

method may continue in operation. To-day each engineering school fixes its own course and states its own requirements, and the usual fact is that the smaller schools hold lower, the larger schools higher standards, adjusting them to the location, to the conditions of the educational system of the place and time, in accordance with their own judgment of the wisdom of the course taken. This results in the provision of a variety of schools of engineering, as of other professions in which standards are high or low, courses more or less purely professional, and diplomas having correspondingly variable values—very much as among the coinages and currencies of different nations. The standing of each and its reputation is usually well recognized, however, and the outcome is the provision of technical education of considerable range in grade and quality for the most fortunate and for the least fortunate of aspirants alike. Each professional school adapting itself to the situation in which it finds itself, it is possible that a maximum amount of good is done with a minimum amount of injury to the profession, to the schools, and to the country.

It is important that the schools should do all that they possibly can to elevate the standing of the colleges and the professions; it is still more important that artificial impediments shall not stand between the poor but talented, the ill-educated but honest, earnest, and ambitious and naturally well-fitted youth, and their service of the nation in that vocation for which nature has particularly fitted them. The range lies between that low plane of professional training which verges on quackery and that high standard which restricts professional instruction to the classes having ample time and means, and able to secure the best academic education and the most liberal culture previous to entrance upon the study of professional matters and into the purely professional school of highest rank. Very probably the great universities and the few leading professional schools in sections of the country where general education is furthest advanced, and particularly in the largest cities, may find it to their interest, and to the interest of their patrons and the public as well, to steadily raise their standards until their technical schools are professional schools purely, with all preliminary work and much of their elective work, if they offer it, provided by the related academic schools and colleges, while the less fortunately situated in this respect may offer curricula intermediate between that of the highest university schools and the lowest that can, in any degree of fairness, be accepted by the guild as giving right of entrance into the work of the profession. Within this range many schools will adjust their curricula in such manner as to meet the requirements of the place and time, neither adopting highest culture and loftiest schedules of study with minimum numbers of students, nor that minimum range of work which is unjustifiable even by resultant increase to a maximum in the numbers admitted and graduated.

(9) The technical high school is usually necessarily a semiprofessional school. It must at once educate and technically train its pupils. It is necessarily a part of the general school system and must receive its pupils from the lower grade schools of its location. This means that, in this case, the entrance requirements must be such as are fixed by the necessity for arranging a smooth and unbroken line of studies from the primary on into the higher schools, and entrance into the technical high school will be given through substantially the same sort of general preparation as into the academic schools, except that the scientific and mathematical work will constitute the main elements of such preparation, rather than the classics or even modern languages and literatures. The semitechnical curriculum is constructed by leaving out of the curriculum of the corresponding grade of purely academic school all really unessential work and substituting for it technical studies and their accompanying laboratory work, drafting, and shopwork. The latter, indeed, may perfectly well, in this case, be given in time

taken from the ordinary playtime of the pupils, since it affords exercise as well as—to those likely to choose this schooling—pleasure and instruction combined.

(10) The trade schools and the manual-training schools are subject to the same remarks. They must usually be incorporated into the school system and must thus be made an integral part of that extended course of education which must begin with the youngest children in the community and steadily and effectively progress through intermediate to the highest grades reached in each line of study and work. The distinction between the trade school and the manual-training school must be carefully noted, however. The former teaches the precise methods and the exact limitations of the trade, giving sufficient practice in its manipulations to make the pupil expert in the use of the tools of the trade and familiar with its special formulæ and processes, turning out young men having, in addition to the technical knowledge given by this systematized apprenticeship, a good knowledge of the sciences, so far as specially applied in the trade taught them, and, besides, the elements of a good secondary education of the most practically useful sort. The manual-training school, on the other hand, is usually one in which a more youthful class of pupils is taught skill in the use of their hands and brains, and, incidentally, the use of the tools of the familiar vocations. The latter may grade upward into the former, as the ages of the pupils are greater, by imperceptible gradations. The trade school is properly an independent school in which a city teaches the vocations into which its citizens most largely enter, and for the products of which it has largest market and highest reputation. The manual-training school is a natural and proper adjunct to every common school system, in city and country alike.

(11) The classification of these various technical and professional schools is easy when a sufficiently broad view is taken of the field and of the economic relations of the schools and their work to the life and work of the nation. When the fact is recognized that every state and every nation owes to its people the organization of a general system of education—not abstract and ideal, not fitted to the purposes of the well-to-do citizens solely, not planned from the point of view of the older academician or fitted into the ancient monastic scheme—a system adapted to the immediate and practical needs of a great body of civilized people endeavoring to live and work and to enjoy the privileges of modern civilization on an average income of between \$600 and \$700 a year, for a family, in the settled portions of the country; when this is understood, the question finds easy solution—in words. The difficulties of securing the inauguration, in even our enlightened country, of such a system, in the face of long-standing prejudice, of existing and established curricula of the ancient and cloisteral type, of ignorance on the part not only of the average citizen and voter, but even on the part of the intelligent men of the country, very few of whom have given time to investigation, or thought to this most important of economical subjects, are beyond estimate. These difficulties, however, are certain to be in time overcome, for their removal is essential to the progress of our country in its great career.

The classification may, perhaps, take some such form as this:<sup>1</sup>

(a) A common school system of general education providing the elementary studies of a good English education, perfecting the pupil in the arts of reading, writing, and arithmetic, at least, and with so much of the most essential primary work in language, geography, etc., as space can be found for, without reducing the vitally important work to inefficiency. This system should be adapted to the needs of all classes.

---

<sup>1</sup> This scheme was substantially constructed as here presented by the writer when, as member of the New Jersey commission for devising a plan for encouragement of manufacturing industries in that State and as secretary of the commission, he prepared for the commission such a scheme.

(b) A system of special adaptation of primary instruction to the needs of children who must become skilled artisans, and who can not be kept in school by their parents longer than during the period of their growth to that size and age at which they can be made to assist in the support of the family. Such a system may, perhaps, prove to require special adaptation of text-books to the purpose, in which text-books the terms of the trades, and reading matter giving accounts of industrial processes, may be introduced.

(c) A system of trade schools in which general and special instruction may be given pupils preparing to enter the leading industries; in which schools the principles underlying the principal vocations of the locality are to be taught, and the essential actual manipulations of the trades are to be illustrated and taught by practical exercises until the pupil becomes expert.

Thus, the Germans have besprinkled all over their country schools of carpentry, blacksmithing, weaving, bleaching and dyeing, forestry, agriculture, etc.

These schools should be established in every city and town in the State.

(d) Polytechnic schools should be incorporated, formally and with system, into the great educational scheme of the State and of the country, in which higher work in the applied sciences, and, usually, some trade or professional instruction should be offered students whose circumstances are such that they may be given an education extending toward the years of maturity, and whose talents and inclinations lead them to select technical work as introductory to their later practice of the industrial arts.

(e) Technical schools and colleges, professional schools within the colleges and universities, in which the highest professional instruction in the applied sciences and in the scientific basis of the professions may be offered those who are permitted by rare good fortune to secure a good, a liberal education while preparing for entrance into the professional school and upon their chosen line of life work.

(f) Such a bureaucratic system of supervision and conduct—presumably by the State, acting through experts in all branches of educational work, and all imbued with the Miltonian idea—such as will insure symmetry and efficiency of the whole great structure of education of the people for the life and work of the people.

(g) In the United States the work of the several States should, it would seem, be correlated by a great central, a national, organization, a national university, presumably, in which, and to which, all lines should converge straight from the most elementary of the primary departments and schools, through the whole system of academic and technical secondary schools and State colleges and universities, and which should thus serve at once as a source of authority and of instructing talent of the loftiest character, providing men of genius, and giving grandest educational advantages to all lower grades; giving the level up to which the tide of culture may rise in attaining the highest possible altitude, and serving, further, as the ultimate goal of the great minds of the nation.

(h) National bureaus of education having enlarged powers, wider duties, and grander opportunities of engaging in the task of instituting and promoting systematic and general education, such as Milton would have approved, and serving as the great advisory and directing agents in the permanent task of maintaining and improving the symmetry and completeness of the whole national, State, and local systems of general and special education.

## IV. LOOKOUT MOUNTAIN EDUCATIONAL INSTITUTION.

By Hon. John Eaton, formerly U. S. Commissioner of Education.

Great interest in recent years has been awakened throughout the country in the education of the mountaineers of the South—the highlanders of the South. Before 1860 there were no State systems of public education in those regions to enforce the establishment of a public school in every district. The productiveness of industry among the mountains was not sufficient to warrant the sending of children at private expense to school for their education; the result was that generation after generation became more ignorant. During the civil war a multitude of these people left their homes and flocked to the headquarters of the armies; great numbers gathered about Chattanooga. Their ignorance and poverty specially stirred the sympathy of Christian people who came in contact with them. Mr. Christopher Rhinelander Robert, a merchant of New York City, visited the camps thereabouts, as many others did, to relieve the suffering. The condition of these whites led him to study carefully their wants and possibilities; he saw the significance of the education of their children. Born in Brookhaven, Long Island, New York, the 23d of March, 1802, he early entered upon a successful career as a merchant and so continued until he retired in 1862. In addition to his mercantile enterprises he was especially interested in a coal and iron company. He is best known as the founder of Robert College, Constantinople. He gave largely to Military College and Auburn Theological Seminary, and educated at his own expense a large number of young men, probably not less than 125. He gave to Robert College in his will \$125,000, besides real estate valued at \$45,000. He was at Chattanooga at the time the United States Government was erecting a large hospital on Lookout Mountain, said to have a mile of veranda, for the benefit of sick and wounded soldiers. He saw that this would not be wanted as soon as the war terminated; his active mind, deeply imbued with Christian principles in overlooking the future, put the facts together before him. The hospital when unused would be for sale. Chattanooga would be a natural center for the gathering of children of these people who so deeply appealed to his sympathies. The result was that when the time came he purchased the hospital building and founded the Lookout Mountain Educational Institution. He purchased a tract of land of more than 200 acres in extent lying along the brow of Lookout Mountain, about 5 miles from Chattanooga, elevated about 2,000 feet above the sea level, commanding a magnificent prospect, with excellent water and fine building stone near by. The purchase included the buildings thereon. Unfortunately he had much difficulty in perfecting the title. A charter from the legislature of Tennessee conferring university privileges was obtained and a name adopted intending to cover whatever departments the future of the institution might demand. The plan and the movement were unique. Information of the opportunities offered slowly extended through the mountain regions. The first session of the school opened May 15, 1866. The trustees were William A. Booth, president; S. B. Chittenden, secretary; C. R. Robert, treasurer; David Hoadley, Seth B. Hunt, William G. Lambert, Horace Maynard, William Bosson, and George W. Lane.

As remarkable and interesting as was this beginning, the whole plan was given up at the end of six years, to the great disappointment and sorrow of those who had shared its instruction and those who had become interested in its far-reaching purposes. Friends made special effort to secure for the institution public confidence and to add to the attendance, of which the following circular is an illustration:

## LOOKOUT MOUNTAIN.

The undersigned take this method of stating as the result of careful inquiry and personal observation that in our judgment the educational needs of the

Southern States urgently demand the liberal patronage and support of such an institution of learning as the one now in prosperous operation on Lookout Mountain. Its central location makes it easy to be reached by railroad from all parts of the South, while its attractive surroundings, its elevation of 1,400 feet above the Tennessee River, and its freedom from the temptations of a large town, are favorable to vigorous health, devotion to study, and the best development of character. We are glad to find it a school of Christian learning, officered throughout by men of undoubted piety and attachment to the Union, yet under no ecclesiastical control, and having no sectarian aim; a school where the two sexes, occupying separate halls, are yet under the same general discipline, and are brought together in classrooms, in religious and literary exercises, and in the dining hall under oversight of their teachers; a school where thorough preparation is made either for college or business or teaching or social position.

It gives us satisfaction to add that the principal of the Lookout Mountain Educational Institution, Rev. C. F. P. Bancroft; the superintendent, Rev. C. C. Carpenter; the preceptress, Miss Mary A. Wilson, and the assistant teachers, with whom most of us have the pleasure of a personal acquaintance, are worthy of the confidence of the people of the South, and are eminently qualified for their work by their thorough scholarship and experience in the schoolroom, by their admirable methods of giving instruction, promoting good order, kindling enthusiasm for study, and all the social, intellectual, and religious aims of such an institution.

September 1, 1868.

S. J. W. LUCKY,  
*Chancellor First Chancery District, Tennessee.*  
JOHN EATON, JR.,  
*Superintendent Public Instruction, State of Tennessee.*  
WILLIAM BOSSON,  
*President Tennessee Teachers' Association.*  
W. P. RATHBURN,  
*President First National Bank, Chattanooga, Tenn.*  
T. R. STANLEY,  
*Counselor at law, Chattanooga, Tenn.*  
WILLIAM T. WOFFORD,  
*Counselor at law, Cartersville, Ga.*  
EDWARD NORTH,  
*Professor of Greek in Hamilton College, N. Y.*  
THERON BALDWIN, D. D.,  
*Secretary Western College Society.*

Students came great distances; from Richmond, Va., from various localities in North and South Carolina, Tennessee, Georgia, Alabama, and Mississippi. Many came in great poverty and with insufficient clothing; some walking, others were brought by their parents with ox-teams.

The necessity of this work grew in the minds of every one associated with the school. Its great possibilities no one felt equal to describe. The youth coming to it, though poor, showed the finest natural capacity. At the end of the academic year, June, 1872, the gentleman in charge issued a general catalogue and a brief statement. Soon the buildings decayed and disappeared; many of the students went on to higher courses of study and to careers of great usefulness, but the school not only closed—it substantially disappeared from the memory of men. Few now (1898) engaged in the education of the mountaineers have any knowledge of it, but its influence can not be blotted out while mind remains and character endures.

The statement issued at its close shows that there had been in attendance an aggregate of 953 and an average of 80. The summary shows in detail, gentlemen, 328; ladies, 148; or a total of 476. From Tennessee 265, Georgia 94, Alabama 67, Mississippi 11, Florida 9, North Carolina 7, South Carolina 2, Louisiana 2, Kentucky 2, Pennsylvania 2, Massachusetts 2, Virginia 1; and 1 each from New Hampshire, Iowa, Minnesota, Indiana, New York, New Jersey, Ohio, Illinois, Kansas, Nebraska, Labrador, and Cuba. Of the officers, the principals were: Rev. Edward F. Williams, A. M., 1866-67; Rev. C. F. P. Bancroft, A. M., 1867-72, and Miss Mary A. Wilson, 1866-72. Superintendent, Rev. C. C. Carpenter, A. M., 1866-72.

Great care was taken that all teachers should be of the best qualifications and the highest character, and they became especially enthusiastic in their work.

They were aided by an efficient corps of assistants. Mr. Williams returned to pastoral duty, in which he has been eminently useful. Miss Wilson, a lady of marked excellence, occupied her position during the entire history of the institution, as did Rev. Mr. Carpenter. Mr. Carpenter, after finishing his education and entering upon the ministry, together with his wife, devoted his attention to the natives of Labrador, where his efforts made a deep and lasting impression. At Lookout Mountain both were recognized choice spirits, devoted to their work and skillful in discharging their responsibilities. They succeeded in a remarkable degree in giving to the young people who came under their care a genuine home school. Mr. Carpenter was specially charged with the business care of the institution, and his success left no doubt of the wisdom of his selection. His health always frail, since he retired from these labors he has been able only to a limited degree to undertake the burden of pastoral responsibility; in addition, however, to preaching, as his strength permitted, he has found much to do in the way of historical and biographical writing and newspaper editing, and has become specially and widely known among young people as "Mr. Martin," the editor of the conversation column in the Congregationalist. Mr. Bancroft, now honored with the degrees of doctor of philosophy and doctor of laws, had so become known for his scholarly attainments and success as a teacher and disciplinarian that in due time he was called to be the successor of the very eminent S. H. Taylor, LL. D., so long renowned as the principal of Phillips Academy, Andover, Mass. His wife, who shared with him so efficiently his responsibilities at Lookout Mountain, has adapted herself with a special skill, to the delight of the Andover students, to the conditions of her new situation. And Andover, instead of pausing in its career, has steadily gone on increasing in attendance and in the effectiveness of its scholarly Christian work.

A statement issued at the close of the institution acknowledges special indebtedness to Rev. Dr. Theron Baldwin, secretary of the Western College Society. The plan contemplated a school open to both sexes under the most improved modern instruction, directed by teachers of experience, culture, and Christian character, with accessories inviting to persons of refinement, yet at a cost not beyond the reach of the middle classes and of pupils dependent upon their own exertions. State patronage, with its political complications; a partisan bias, with its sectional prejudices; a sectarian control, with its incidental exclusiveness, were to be equally avoided. Dependence upon local patronage would give a local character and tone to the school, while the association of minds of both sexes from a wide range of society was regarded as the best condition of a truly liberal education. The influence of natural scenery in the formation of character, and surroundings favorable to physical development and vigor, were held prominently in view. The tendency to a superficial and merely ornamental education was to be firmly resisted. An education without the restraints and direction of personal religion is partial and dangerous; the chief aim of the institution was to lead every pupil to cherish the principles and act under the motives of the Gospel.

The site selected has become well known all over the country as included in the battlefield of Chattanooga. Its healthfulness, both summer and winter, are well and widely known. The general management of the school was carefully watched and directed by Mr. Robert himself, who visited it annually. Dr. Barnas Sears, that eminent educator and agent of the Peabody Fund for the aid of education in the South, saw and appreciated the important work done there in its relation to the public-school system of the South. Gen. O. O. Howard gave it his hearty approval. Aid came from benevolent and educational societies and interested individuals for the support of students in need. The statement continues: "How far the institution has realized the high and comprehensive aims of the founder

no one connected with it should undertake to say, nor could a casual observer intelligently estimate the amount or quality of the results. The officers would reverently express their gratitude to God for the favor he has shown the institution from the beginning. Many of the students are proving their education in the higher institutions, in the professions, and in practical life. Not a few look back to the Mountain as the place where their religious life began. A goodly number have begun their preparation for the ministry, and some are already in the field.

"It has been the constant aim of the founder as soon as the institution should be well organized and placed on a sound financial basis to transfer it to a board of trust who would conduct it after the original design. Several causes have combined to defeat this intention. Neither the men nor the money could be secured. Protracted and vexatious litigation have prevented the accumulation of endowments and the erection of contemplated permanent buildings. With the advance of years, declining health, and a natural wish to leave all his interests in a secure and simple shape, and a conscientious desire to use benevolent funds to the greatest advantage, Mr. Robert has been constrained to close the school at the expiration of the academic year, June, 1872, sell the property and transmit the proceeds to the trustees of Robert College."

The statement closes as follows:

"The officers take this method to return their thanks to the many friends in all parts of the country who have by their counsel, kind words, kind deeds, and fervent prayers assisted them in carrying forward the cause of Christian learning. The work has been arduous but delightful. In closing their own long and pleasant connection with the institution they would express to those with whom they have been associated in the relations of school life and labor on Lookout Mountain the hope that all may share in their happy recollections of L. M. E. I. They believe that its career, though short, is honorable, and its influence good, widespread, and lasting."

---

#### V. THE NEED OF ACTION FOR THE AMELIORATION OF THE CONDITION OF THE COLORED RACE.

THE SUBSTANCE OF A REPORT MADE TO THE TRUSTEES OF THE JOHN F. SLATER FUND BY J. L. M. CURRY, CHAIRMAN OF THE EDUCATIONAL COMMITTEE, APRIL 11, 1899.

*To the Trustees of the John F. Slater Fund:*

At our last meeting it was resolved to appoint Booker T. Washington, A. M., to visit some of the principal cities in the South and endeavor, by lectures and otherwise, "to improve the condition of the colored people." His report shows that the movement was well timed and that his race received with appreciation the effort made to enlighten and to suggest effective remedies for their amelioration. It is, however, most obvious that mere addresses, wise and instructive though they may be, will fall far short of the good intended, unless followed by well-devised and continuous local efforts to put the teachings in practice and make them an integral part of conscience and conduct. It needed not, except for clearer exposition of facts and enforcement of an imperative duty, that Mr. Washington should have added his intelligent and pathetic testimony to what was well understood by impartial observers to be the general condition of the negro. in a large part of the country where the race does most persistently congest. For a while, after Appomattox, churches and press and politicians were prolific in passionate appeals, in rose-colored views of the future, in the suggestion and use of means, more or less legitimate and defensible, to fit the negro for the

plane to which he had been suddenly lifted. For this elevation, neither race, intelligence, nor ethical standards and habits had prepared him. The enthusiasm, the aroused conscience, the favoring public sentiment, seem to have sunk into comparative apathy or diminished interest. In both sections of the Union, among descendants of Union and Confederate armies, have been hostile acts, which have taken the place of justice and orderly legal process. What produced this lessening of sympathy, this abatement of effort for improvement, this is not the proper medium for discussing. The fact is indisputable that the negro has not improved as was desired by all, expected by many, in his industrial, social, mental, and moral condition. Families are too often crowded into a hovel, and many of the race are ill born, ill fed, ill clad, ill cared for, ill environed, and these conditions are necessarily unfavorable to decency, to chastity, to self-respect, to wholesome living, to healthy improvement. The one-roomed home—if not a sacrilege to call it by that name—causes a promiscuous mixing of men and women, boys and girls, and the good obtained by them in schools and in church worship is canceled by the fearful surroundings of the places where they sleep. "Sound vitality and delicate sensibility are incompatible with filthy habits and abodes." In England there is a deep agitation on overcrowding as a sanitary and moral evil, causing immorality, vice, loathsomeness, debility, disease, death. Philanthropists and the Government are of the opinion that the state of the dwellings of the poor requires immediate and earnest attention. Through the slums, ignorance and injustice and crime are wasting much of the beauty, virtue, strength, and goodness, which go to make a nation great and prosperous. A whole generation has passed since emancipation, and 80 per cent or more of the nearly 8,000,000 never knew the evils of personal slavery. Much has been done for the negro, and yet a large proportion are as poor, as ignorant, as thriftless, as improvident, as unfit for responsibilities and privileges of citizenship and suffrage as were their ancestors at the close of the great war. With a preponderant majority there is a low level of intelligence and morality, with rudimentary notions of comfort, and under the influence of grossest superstition. No peasantry in Europe, no laboring class in any civilized country, occupies a lower position in home comforts, in skilled industrial capabilities, in potential influence upon public opinion, upon thought, upon all the constructive and beneficial agencies of civilization, than does the black population of the Southern States.

This report is not intended as a pessimistic picture painted in dark colors, nor to discourage and repress intelligent and comprehensive action for the betterment of the freedmen. God forbid. It is gladly conceded that churches, communities, individuals, have made marked progress, rendering absurd all skepticism or doubt as to the capability of the negro. Washington, Jones, Council, Atkins, Dunbar, Du Bois, Fortune, Turner, Gaines, Brooks, and many others are the exceptions, but they are the proof of the benefit and the necessity of large, proper, and hopeful work for the "lifting up of the race." As compared with the negro in Guinea, or Haiti, or Jamaica, or any other part of the world, his progress in the Southern States is undeniable. Emancipation has not been a failure, as may be seen in churches, schools, individual self-reliance, and accumulation of property. What has been done with limited, insufficient means is not a reason for arresting such work, but an unanswerable call for wiser plans and broad-minded educational statesmanship. The physician must understand thoroughly the condition of his patient before he can prescribe with reasonable anticipation of good results. The statesman, the philanthropist, the patriot must realize intelligently the status of the negro and what has been already attempted and done for him in order to know whether more should be done, and what. No good will be effected in this or any other reform by quackery, or by ignoring practical difficulties.

It may be safely affirmed that the history of free governments furnishes no page more unfruitful of practical benefit than that which records what has been attempted for the negro by the General Government since 1865. Reconstruction measures, rigidly leaving out of view their intent, conceding the best motives, have been a disastrous failure. Suffrage, given en bloc to masses destitute of the rudiments of political aptitude, of both knowledge and experience, has not protected the "wards of the nation" from chicanery, inequality, injustice, and fraud. Bryce has wisely said: "It is no kindness to thrust upon men functions they are unfit to perform. No English statesman would try any such experiment as was tried in America, when, after the war of secession, full rights of suffrage were conferred on the lately emancipated colored people of the South." No one can seriously contend that the experiment of freedom, citizenship, and suffrage has been so successful, that it has so thoroughly and well accomplished its purpose as to justify the Government or the people in abdicating obligations which they so joyously assumed. Surely prophecies have not been fulfilled, and the negroes have not as yet reaped any extraordinary benefits from citizenship. Privileges conferred have not simply been unprofitable to the race, but in their retroaction have been prolific of mischief to the white people, and pregnant with peril to the Government which sought to give a mighty impulse to free institutions. The failure makes imperative the need and duty of acting courageously and wisely, so as to avert peril and make positive to the negro what so far has been only negative in its attainments.

No language can make more forcible the duty and the possible blessings of emancipation. Slavery of person, labor, mind, is incapable of economic or ethical defense, but, with painful obviousness, the obligations resulting from abolition have been imperfectly understood and discharged. Along educational and religious lines much has been done by a few ecclesiastical organizations in establishing churches and schools; by individuals in the aid of such excellent institutions as Hampton, and Fisk, and Tuskegee, and by States and cities for general education. It would be gross injustice and inexcusable disloyalty to the Slater Trust not to claim great and permanent utility for its work. Steadily it has kept in view the specified end of its noble founder, and has accomplished much by substantial aid, by direction of thought, and the enlightening of public opinion as to the real needs of the negro, and the true scope, purpose, and methods of the education required. Such schools as Hampton, Spelman, Tuskegee, Claflin, Tougaloo, the State Normal at Montgomery, and scores of others are living witnesses of the inspiration and progress derived from Slater aid. No sane man will contend that education has accomplished what was proposed or what is needful. The field of need and endeavor furnished scope, stimulus, and reward, not merely for the teacher, but for the philanthropist, the Christian, the statesman. The results of whatever agencies have been tried have been painfully unsatisfactory. To stop now with what education, so partial, so lacking in adaptedness and right methods, has achieved, would be as if the colonies, after securing through the treaty of peace following a seven years' war the recognition from the mother country that each colony was a free, independent, and sovereign State, should not have consummated their victory by a constitutional federative Union, nor gone on in marvelous achievements in behalf of human rights under a government of law, order, and restrained liberty. The schools have not been unfruitful of incalculable advantages, are unanswerable arguments in favor of enlargement and improvement, but they make a reliance upon them as a sole means for the cure of existing maladies a stupid self-satisfaction with what demands larger, more continuous, and comprehensive measures. The dark stream flows on, and the man or woman is much to be pitied, the legislator deserves reproach, if not contempt, who folds arms in placid contentment with the situation as it is.

It can not need argument that a maximum of a race deficient in property, civilization, the use and enjoyment of the treasures of a cultivated mind, or in a pure religion, must be a most serious obstacle to all true and enlightened progress. Perhaps, it should not surprise us that there has been wanting a manly grasp of hard facts, a clear appreciation of essential needs and of the possibilities of a better future and of adequate remedies, when we recall how suddenly and with what demonstrations of high expectations the country plunged into emancipation, without any conception of the extent and magnitude and difficulties of a revolution, which has no parallel in the annals of this century. The London Standard, the organ of the present English ministry, said in January: "In the West Indies the mischief done by premature and hasty emancipation has never been wholly repaired." In other lands and other days, tedious periods of apprenticeship, of sagacious and helpful watchfulness, of control and training, of hopes deferred and triumphs hardly won, have been needed to fit for freedom and self-government, and to teach habits of industry, method, energy, and respect for the rights of others. The grim immensity of the gigantic achievement of emancipation has not yet been grasped, and there has been no definite nor coherent line of policy beyond putting the spelling book and the Bible into the hands of children. It is good ethics and good logic that he that wills the end must will the means, and if full and earliest citizenship were the purpose of emancipation, there has been a fearfully criminal omission to provide for such a result. There is a misapprehension or utter heedlessness of the perils which menace the black man, which menace both races and our free institutions. Mr. Lincoln, with that consummate forecast which characterized his utterances and actions, used this striking language: "In giving freedom to the slave we assure freedom to the free, honorable alike in what we give and what we preserve." What was joyously assumed can not be abdicated as a task or an obligation. Security against imminent danger, adequate provision for making a hazardous experiment work out its own slow rewards, have been relegated to the remote future. Other things, dazzling and fascinating, engross thoughts and energies. Men's minds have been intoxicated by schemes of expansion to the forgetfulness of a problem which deserves precedence in the American mind and conscience. Its magnitude, viewed in all its aspects, can not be overestimated. During the exigencies and convulsions of a mighty internecine conflict, the patriot Lincoln brooded over it with intense anxiety and sought, again and again, to induce the Congress to give it the attention it merited. It can not be safely left to local settlement, to haphazard attempts of individuals, to the impractical ideals of enthusiasts, to oft-misinterpreted providence. It is suicidal to ignore, to neglect, to postpone. It may be said that the South, where the congestion of the black population is such an evil, brought on herself the present troubles and should suffer the consequences. If that were true of the white people, what of the negroes?

A social and political and moral cancer at the South affects the whole body politic. An ignorant vote in a congressional or presidential election in South Carolina concerns vitally every citizen of the country. A great and wise scheme averting probable dangers, increasing productive resources of millions of people, relieving congestion, removing causes of irritation and discord, justifying the liberation of slaves and making the act a blessing to both races, to all the people, would be a work of unspeakable value and patriotism. No such great civic measure has been proposed. No statesman of any section has suggested an original train of thought, or connected his name with bill or law, filled with political wisdom, for meeting the severe difficulties which beset a problem that up to this time has baffled solution. Occasionally is heard a suggestion of two modes of solution: (a) Diffusion has been advocated, and it would remove many, if not all, of the evils, if the millions congested in a small area could be dispersed

over the whole country. Senator Windom, of Minnesota, advocated a plan for distributing by assisted emigration, so that the negroes might not remain massed in narrow areas. (b) Deportation has received a larger support, and South America, Africa, adjacent islands, have been proposed as desirable refuges. President Lincoln, Senators Butler, Gibson, and Morgan have advocated extra-union colonization. Neither scheme seems feasible or perhaps possible; certainly, has not secured popular favor, or the negro's assent, and so there is need for other plans. This unsettled question, acquiring more seriousness and danger with each year's delay, wider and deeper than any new or minor event, or incident, demands the cooperation of churches, statesmen and people, for it will, when rightly met and settled, aid the taxpayer, increase the rewards of labor, teach noblest lessons of humanity, relieve a race from the scourge of centuries, and our Government and Christianity from the reproach of not having met with fortitude and wisdom the most important and urgent matter within our purview as citizens and patriots. Before bringing into our citizenship and under our protectorate alien peoples, before the reversal of time-honored policy for the doubtful advantage of ruling by force, by military occupation, over distant populations, it would seem as if every consideration of justice and right and the weight of the undischarged obligations growing out of the compulsion of quick emancipation, should not allow any new and doubtful duty to interfere with the performance of what conscience, the Constitution, self-interest, unredeemed pledges, make an imperative claim of overwhelming importance. Liberty, citizenship, and what they involve were purchased at the price of blood and hecatombs of victims and uncountable sacrifices. The negroes are here, not of their own free will; their residence, their grievances and hardships, their inequality of intellectual energy and moral force, are not of their own seeking, and they are Americans, having become such through the avarice and horrors of the "middle passage" during the atrocious slave trade, against which Virginia and the Carolinas made frequent and impotent protest. Take up the white man's burden, is the poetic appeal which has made imperialism popular as a step toward civilizing the inhabitants of the two Indies. But another race of our own land has burdens, which, if not taken up and alleviated, will seriously compromise the prosperity, the life, of neighbors and fellow-citizens. This race is not like an extraterritorial dependency, which we can protect against itself and chronic revolution, until it is in a fit condition for self-government. This distinct class of citizenship is within our own borders, has been deliberately chosen as our own wards, and we can not, without gross criminality and most serious peril, leave it to its own self-support and development. Neither North nor South can wrap around herself robes of complacency in contemplation of the present deplorable situation and Pharisaically boast, "Thou canst not say I did it." Without crimination and recrimination, the whole people should thoughtfully trouble themselves to consider the real significance of present facts and tendencies, and most seriously inquire what humanity, civilization and good government require to solve the most difficult question that has presented itself during our national existence. The docile disposition of the Afro-American, his lack of individuality, initiative and foresight, his inability to plan and combine wisely for his own well-being, his facility of bad control, his irresponsibility for being the cause of conflict and peril, the drag weight he is and must remain upon his white neighbors, enormously increase the responsibility of those who govern. The power of the sentiment of race unity in forty years has unified Germany and Italy and reconstructed the map of Central Europe; but, here, race prejudice shows no signs of decay or disappearance. The cleavage growing out of racial differences, the points of irritation, the tendency to exasperated conflicts, have not sensibly lessened. The wide gulf of separation, not likely with lapse of time to be bridged over by coeducation, social intercourse, community of worship and

citizenship, is as fixed as it was in antebellum days. If we would enter aright upon the duties and privileges of a new century, we should base our claim for respect and gratitude, not on heavy armaments, nor cruel neglect of those of whom we are the only guardians, nor by novel experiments, but upon a nobler civilization, a beneficent illustration of the benefits of representative government, a dominant and self-sustained purpose to enable the freshly enfranchised to work out better industrial, social, political, and moral results. From our own American people we may expect what is noble and magnanimous, if we keep their vision lifted toward an ideal of justice and truth and righteousness.

In this connection, attention is invited to the accompanying maps, carefully prepared from the Eleventh Census (1890). Plate A illustrates, at a glance, the geographical distribution of the negroes in the Southern States, according to density of this population, and Plate B shows their relative number as compared with the white people. Plate B also shows the location of most of the principal colored schools, leaving out, except in a few instances, the public schools and the less-attended denominational schools. In each of the cities of Raleigh, Columbia, Charleston, Atlanta, Nashville, New Orleans, and Marshall are several schools. Besides the general public school systems, which include colored pupils, there are State Normal and Industrial schools for the negro race at Petersburg, Greensboro, Savannah, Montgomery, Huntsville, New Orleans, Prairieview, and one in Mississippi. The great institutes at Hampton and Tuskegee are loosely connected with the governments in Virginia and Alabama, through legislative appropriations and a minority of trustees on their respective boards. Some of the schools under control of religious organizations are designated on Plate B, but besides these are many others, not a few of considerable excellence.

These plates present, at a glance, in graphic and impressive form, the relative black and white population, the localization, the unnatural and dangerous concentration, of illiteracy and ignorant suffrage, and the predominance, within a limited area as compared with our whole territory, of the perils which demand, for their removal, the most active and sagacious statesmanship.

This paper is intended to reach chiefly those interested in public affairs—legislators, editors, etc.—so as to awaken attention to the necessity of looking more earnestly to the encouragement of such agencies as are adapted to uplift and benefit a numerous and important element in our citizenship. I venture, therefore, to suggest, with the assent of the board, a personal purpose to urge upon Southern legislators and those who mould public sentiment the necessity of looking to the encouragement and increased support of these agencies. Much would be secured if there was a studied desire, on the part of persons acquainted with principles and methods of instruction, to acquaint themselves with what would be best for the negro at the present time, having reference to those who are to become leaders and teachers, as well as to those who, by the necessities of the case, must, for a long period, remain in an humble condition. Without intrenching upon what is the work of churches, much can be accomplished in the way of indoctrinating great principles of virtue, morality, and integrity. A study of economic conditions is a field of promising usefulness, and the great industrial force might, by proper legislation, be protected against evil influences and trained for greater usefulness and happiness.

PLATE B.—Proportion of the colored to the aggregate population, 1850.

## APPENDIX.

ADDRESS OF PRESIDENT MCKINLEY AT THE TUSKEGEE NORMAL AND INDUSTRIAL INSTITUTE, DECEMBER 18, 1898.

*Teachers and pupils of Tuskegee:*

To meet you under such pleasant auspices and to have the opportunity of a personal observation of your work is indeed most gratifying. The Tuskegee Normal and Industrial Institute is ideal in its conception, and has already a large and growing reputation in this country and is not unknown abroad. I congratulate all who are associated in this undertaking for the good work which it is doing in the education of its students to lead lives of honor and usefulness, thus exalting the race for which it was established.

Nowhere, I think, could a more delightful location have been chosen for this unique educational experiment, which has attracted the attention and won the support even of conservative philanthropists in all sections of the country.

To speak of Tuskegee without paying special tribute to Booker T. Washington's genius and perseverance would be impossible. The inception of this noble enterprise was his, and he deserves high credit for it. His was the enthusiasm and enterprise which made its steady progress possible and established in the institution its present high standard of accomplishment. He has won a worthy reputation as one of the great leaders of his race, widely known and much respected at home and abroad as an accomplished educator, a great orator, and a true philanthropist.

What steady and gratifying advances have been made here during the past fifteen years a personal inspection of the material equipment strikingly proves. The fundamental plan of the original undertaking has been steadily followed; but new features have been added; gaps in the course of instruction have been filled in; the patronage and resources have been largely increased, until even the legislative department of the State of Alabama recognized the worth of the work and of the great opportunities here afforded. From one small frame house the institution has grown until it includes the fine group of dormitories, recitation rooms, lecture halls, and workshops which have so surprised and delighted us to-day. A thousand students, I am told, are here cared for by nearly a hundred teachers, altogether forming, with the preparatory department, a symmetrical scholastic community which has been well called a model for the industrial colored schools of the South. Certain it is that a pupil bent on fitting himself or herself for mechanical work can have the widest choice of useful and domestic occupations.

One thing I like about this institution is that its policy has been generous and progressive; it has not been so self-centered or interested in its own pursuits and ambitions as to ignore what is going on in the rest of the country, or make it difficult for outsiders to share the local advantages. I allude especially to the spirit in which the annual conferences have been held by leading colored citizens and educators, with the intention of improving the condition of their less fortunate brothers and sisters. Here, we can see, is an immense field and one which can not too soon or too carefully be utilized. The conferences have grown in popularity, and are well calculated not only to encourage colored men and colored women in their individual efforts, but to cultivate and promote an amicable relationship between the two races—a problem whose solution was never more needed than at the present time. Patience, moderation, self-control, knowledge, character, will surely win you victories and realize the best aspirations of your people. An evidence of the soundness of the purpose of this institution is that

those in charge of its management evidently do not believe in attempting the unattainable, and their instruction in self-reliance and practical industry is most valuable.

In the day and night schools many branches can be taught, at a small expense, which will give the man and the woman who have mastered them immediate employment and secure their success afterwards, provided they abide by the principles of industry, morality, and religion here inculcated. In common with the Hampton Institute in Virginia, the Tuskegee Institute has been and is to-day of inestimable value in sowing the seeds of good citizenship. Institutions of their standing and worthy patronage form a steadier and more powerful agency for the good of all concerned than any yet proposed or suggested. The practical is here associated with the academic, which encourages both learning and industry. Here you learn to master-yourselves, find the best adaptation of your faculties, with advantages for advanced learning to meet the high duties of life. No country, epoch, or race has a monopoly upon knowledge. Some have easier but not necessarily better opportunities for self-development. What a few can obtain free most have to pay for, perhaps by hard physical labor, mental struggle, and self-denial. But in this great country all can have the opportunity for bettering themselves, provided they exercise intelligence and perseverance, and their motives and conduct are worthy. Nowhere are such facilities for universal education found as in the United States. They are accessible to every boy and girl, white and black.

Integrity and industry are the best possessions which any man can have, and every man can have them. Nobody can give them to him or take them from him. He can not acquire them by inheritance; he can not buy them or beg them or borrow them. They belong to the individual and are his unquestioned property. He alone can part with them. They are a good thing to have and keep. They make happy homes; they achieve success in every walk of life; they have won the greatest triumphs for mankind. No man who has them ever gets into the police court or before the grand jury or in the workhouse or the chain gang. They give one moral and material power. They will bring you a comfortable living, make you respect yourself, and command the respect of your fellows. They are indispensable to success. They are invincible. The merchant requires the clerk whom he employs to have them. The railroad corporation inquires whether the man seeking employment possesses them. Every avenue of human endeavor welcomes them. They are the only keys to open with certainty the door of opportunity to struggling manhood. Employment waits on them; capital requires them. Citizenship is not good without them. If you do not already have them, get them.

To the pupils here assembled I extend my especial congratulations that the facilities for advancement afforded to them are so numerous and so inviting. Those who are here, for the time being have the reputation of the institution in charge, and should, therefore, be all the more careful to guard it worthily. Others who have gone before you have made great sacrifices to reach the present results. What you do will affect not only those who come after you here, but many men and women whom you may never meet. The results of your training and work here will eventually be felt, either directly or indirectly, in nearly every part of the country.

Most of you are young, and youth is the time best fitted for development both of the body and mind. Whatever you do, do with all your might, with will and purpose, not of the selfish kind, but looking to benefit your race and your country. In comparing the past with the present, you should be especially grateful that it has been your good fortune to come within the influence of such an institution as that of Tuskegee, and that you are under the guidance of such a strong leader.

I thank him most cordially for the pleasure of visiting this institution, and I bring to all here associated my good will and the best wishes of your countrymen, wishing you the realization of success in whatever undertakings may hereafter engage you.

---

#### VI. THADDEUS STEVENS'S DEFENSE OF THE PENNSYLVANIA FREE-SCHOOL SYSTEM.

[The following account of the part which Thaddeus Stevens took in the memorable struggle over the Pennsylvania free-school system in the early 30's is taken from a life of Stevens recently published<sup>1</sup>. It will serve to acquaint the reader of the present day with the circumstances under which the speech which follows was delivered, and the effect it produced.]

It was during this session (i. e., 1835) that Stevens rendered his great service to the public-school system, and against great odds achieved a victory which he regarded, even after he had won his wide fame, as the greatest achievement of his life. For many years the system had prevailed in Pennsylvania of furnishing public education, as of providing public subsistence, only to self-confessed paupers. In order to get his children educated at the public expense it was necessary for the father or guardian to make it appear that he was not able to furnish them the means of education, and in such a case instruction would be doled out as bread or meat would be doled out if he were unable to buy food. The system was substantially that illustrated by the Friends' Public School, established in 1697, a system for the education of "the rich at reasonable rates, the poor to be maintained and schooled for nothing." During the colonial times the church and local schools were generally conducted upon this principle.<sup>2</sup> The establishment of free institutions gave birth to notions of equality which made it impossible to continue a system under which a distinction was maintained in the public schools between the children who paid and those who were regarded as public charges. "The class distinctions," says Wickersham, "that had been broken up in general society could not be preserved in the school." Rather than permit poor children to be educated under conditions so fatal to their self-respect, their parents kept them at home.

The system was first cast aside in Philadelphia, which provided for free schools at the public expense. The agitation for the extension of the Philadelphia plan to the whole State finally bore fruit in the act of 1834, which, with many defects in detail, recognized the grand principle of free public schools for all, and was passed with only a single dissenting vote. But, like most noble things, this principle involved some cost. There were the taxes, and there is no more certain method of stirring up the public opinion of a virtuous, thrifty, and frugal people, such as then inhabited Pennsylvania, than by pricking their pocketbooks. They were willing to have reform, provided it did not come high or they were not compelled to pay for it. A violent reaction arose. Nearly half the districts in the State rejected the act or contemptuously ignored it. They were ready to do sweet charity and furnish schooling for the children of paupers, but they could not consent to a system which took by taxation the money of those who had no children and devoted it to the education of the children of the well-to-do. Thus it came to pass that the good Commonwealth, through all her rich valleys and across her noble mountains, was shaken, from the Delaware to the Ohio, and a legislature of stern Spartans was sent to Harrisburg to wipe out the law.

---

<sup>1</sup> *Thaddeus Stevens*. By Samuel W. McCall. Houghton, Mifflin & Co., 1899.

<sup>2</sup> Wickersham, *History of Education in Pennsylvania*, p. 294.

The Senate made short work of it. That body summarily voted to repeal the essential parts of the act by a bill which bore the inspiring title, "An act making provision for the education of the poor gratis." This bill passed the Senate by a vote of nearly two to one, and among its supporters were found 13 senators who had voted for free schools at the previous session.<sup>1</sup> It then went to the house.

Many members of the preceding legislature had lost their seats by their incautious vote for free education, and had given place to its pronounced opponents. The legislature was inundated by petitions for repeal. A committee favorable to the law reported that the number of signers was "deplorably large," and that 32,000 had petitioned for repeal, while only 2,500 remonstrated against it. The Democratic members passed a vote at a caucus, requesting the Democratic governor, who was a friend of the law, not to oppose the repeal, since a veto of the bill, which seemed sure to pass, would defeat him for reelection.<sup>2</sup> During a considerable portion of the time while this tempest was raging, Stevens was absent from Harrisburg. Upon his return, his colleague from Adams County, who was a warm friend of the law, informed him that the bill repealing the act had passed the senate with only 8 dissenting votes; that the test vote of reference in the house showed a majority of 30 in its favor, and that the friends of the law had consulted together and decided that it was useless to oppose the repeal. He also advised him that they were bound to vote for the repeal, as three-quarters of their constituents had petitioned for it.<sup>3</sup>

The situation was desperate and the cause of the law seemed lost. The senate bill to repeal came up in the house on April 10 and 11, 1835. Up to that hour the popular excitement, which is so often the precursor of an opposite ultimate popular opinion, had gone on unchecked and carried everything before it. One obstacle, however, stood in the path of repeal. There was one representative who would no more pander to a popular passion, of which he believed the people would repent as soon as their eyes were opened, than he would pander to a mob. The people might reject him, but so long as he was their representative he would follow his convictions of duty. He braved the storm when it was at its fiercest pitch and boldly moved to strike out all the senate bill after the enacting clause and to substitute for it a bill strengthening the law which it proposed to repeal. Upon that motion he made his speech, which, even from the imperfect reports, must be regarded as a powerful argument, and from the uniform accounts of those who heard it must rank with the great parliamentary speeches. Certainly it produced an effect second to no speech ever uttered in an American legislative assembly.

The hall was packed to suffocation. Nearly the entire senate and most of the principal State officers were present, as well as the members of the house. Stevens was in the prime of manhood. His form had outgrown the slenderness of youth, and it was not bent with that heavy weight of years which he dragged along when, a generation later, he moved, a portentous figure, across the stage of the National House of Representatives. He was erect and majestic. He may not, indeed, have had the appearance of "a descended god," as one of his fellow-members who has described the scene has portrayed him, but we can well believe the accounts of the wonderful beauty of those chiseled features which never lost their eagle look even to his dying day. It is fortunate that this early portrait of him survives to remind us that he was once young, and to enable us to trace out the immortal lineaments of his beauty; otherwise he would have wandered forever through history as the broken old man of more than three-score and ten, such as he was at the hour of his great fame and when the world first knew him.

<sup>1</sup> Wickersham, *History of Education in Pennsylvania*, p. 237.

<sup>2</sup> Bates, *Martial Deeds of Pennsylvania*, p. 933.

<sup>3</sup> *Ibid.*, p. 934.

Many references to the speech by those who heard it have been preserved, and they are uniformly of the most flattering character. I will refer to only two of them. The venerable Dr. George Smith, who had been a member of the legislature of 1834, wrote, nearly fifty years later, that "the house was electrified," and the "school system was saved from ignominious defeat." The Harrisburg correspondent of the American Daily Advertiser, of Philadelphia, attempted to preserve the occasion by a report, which is all the more forcible because given in the unsensational manner of that day. After crediting Stevens with preventing the repeal of the law, he declared that "the speech of this gentleman was the ablest I have ever heard." He then endeavored to furnish a synopsis of the speech, but he threw up the task in despair, and confessed that he was "unable to give even an outline of this most masterly production."

When every allowance is made from the reports of the affair which have been handed down, the effect in this instance proved the working of a prodigious cause. The house immediately voted, when Stevens sat down. The victory so confidently anticipated by the friends of repeal was suddenly turned into defeat and the motion of Stevens was carried by a nearly two-thirds vote. Most remarkable of all, the senate, which but a short time before had so decisively voted for repeal, returned to its chamber, thrilled and delighted with the great effort, converted as no senate had ever been converted before, and immediately concurred, with a few unimportant amendments, in the House substitute bill.

Governor Wolf was a loyal friend of free schools. Politically, he was opposed to Stevens. But he immediately sent for him after his great and unexpected triumph in the house, and, throwing his arms about his neck, warmly thanked him for the great service he had "rendered to our common humanity."<sup>1</sup> Some of the enthusiastic friends of the system he had saved had portions of the speech beautifully printed on silk and presented it to Stevens.

Speeches have sometimes changed the action of a legislative body when its mind had been apparently made up; but a large majority of the Pennsylvania house had been chosen with reference to the educational issue and for the purpose of repealing that portion of the law which made schools free. The speech of Stevens decisively turned them from that purpose. It is doubtful if his achievement can be matched in the history of legislative assemblies. Certainly it at once established his position among the very ablest men in Pennsylvania.

#### A PLEA FOR PUBLIC SCHOOLS BY THADDEUS STEVENS.

A speech against the repeal of the school law, delivered in the Pennsylvania legislature April, 1835.

MR. SPEAKER: I will briefly give you the reasons why I shall oppose the repeal of the school law.

This law was passed at the last session of the legislature with unexampled unanimity, but one member of this house voting against it. It has not yet come into operation, and none of its effects have been tested by experience in Pennsylvania. The passage of such a law is enjoined by the constitution; and has been recommended by every governor since its adoption. Much to his credit, it has been warmly urged by the present executive in his annual messages delivered at the opening of the legislature. To repeal it now, before its practical effects have been discovered, would argue that it contained some glaring and pernicious defect, and that the last legislature acted under some strong and fatal delusion, which blinded every man of them to the interests of the Commonwealth. I will attempt to show that the law is salutary, useful, and important, and that consequently the last legislature acted wisely in passing and the present would act unwisely in repealing it. That, instead of being oppressive to the people, it will lighten their burdens, while it elevates them in the scale of human intellect.

<sup>1</sup>Col. J. W. Forney in Washington Chronicle. See the Pennsylvania School Journal, Vol. XXXIX, p. 331.

It would seem to be humiliating to be under the necessity, in the nineteenth century, of entering into a formal argument, to prove the utility, and, to free governments, the absolute necessity of education. More than two thousand years ago the Deity who presided over intellectual endowments, ranked highest for dignity, chastity, and virtue among the goddesses worshipped by cultivated pagans. And I will not insult this house or our constituents by supposing any course of reasoning necessary to convince them of its high importance. Such necessity would be degrading to a Christian age, a free Republic.

If, then, education be of admitted importance to the people, under all forms of government, and of unquestioned necessity, when they govern themselves, it follows, of course, that its cultivation and diffusion is a matter of public concern, and a duty which every government owes to its people. In accordance with this principle, the ancient Republics, who were most renowned for their wisdom and success, considered every child born subject to their control, as the property of the State, so far as its education was concerned; and during the proper period of instruction they were withdrawn from the control of their parents and placed under the guardianship of the Commonwealth. There, all were instructed at the same school; all were placed on perfect equality, the rich and the poor man's sons; for all were deemed children of the same common parent of the Commonwealth. Indeed, where all have the means of knowledge placed within their reach, and meet at common schools on equal terms, the forms of government seem of less importance to the happiness of the people than is generally supposed; or rather, such a people are seldom in danger of having their rights invaded by their rulers. They would not long be invaded with impunity. Prussia, whose form of government is absolute monarchy, extends the blessing of free school into every corner of the kingdom—to the lowest and poorest of the people. With a population equal to our whole Union, she has not more than 20,000 children who do not enjoy its advantages. And the consequence is, that Prussia, although governed by an absolute monarch, enjoys more happiness, and the rights of the people are better respected than in any other government in Europe.

If an elective Republic is to endure for any great length of time, every elector must have sufficient information, not only to accumulate wealth and take care of his pecuniary concerns, but to direct wisely the legislature, the ambassadors, and the Executive of the nation—for some part of all these things, some agency in approving or disapproving of them, falls to every freeman. If, then, the permanency of our Government depends upon such knowledge, it is the duty of government to see that the means of information be diffused to every citizen. This is a sufficient answer to those who deem education a private and not a public duty—who argue that they are willing to educate their own children, but not their neighbors children.

But while but few are found ignorant and shameless enough to deny the advantages of general education, many are alarmed at its supposed burdensome operation. A little judicious reflection, or a single year's experience, would show that education, under the free-school system, will cost more than one-half less, and afford better and more permanent instruction than the present disgraceful plan pursued by Pennsylvania. Take a township 6 miles square and make the estimate; such townships, on an average, will contain about 200 children to be schooled. The present rate of tuition generally (in the country) is \$2 per quarter. If the children attend school two quarters each year, such township would pay \$800 per annum. Take the free-school system—lay the township off into districts 3 miles square; the farthest scholars would then have  $1\frac{1}{2}$  miles to go, which would not be too far. It would require four schools. These will be taught, I presume, as in other States, three months in the winter by male and three months in the summer by female teachers; good male teachers can be had at from \$16 to \$18 per month and board themselves; females at \$9 per month. Take the highest price, \$18, for three months would be \$54, and then for females at \$9 for three months, \$27, each school would cost \$81; or four to a township, \$324. The price now paid for the same is \$800; saving for each township of 6 miles square, \$476 per annum.

If the instruction of 200 scholars will save by the free-school law \$476, the 500,000 children in Pennsylvania will save \$1,190,000! Very few men are aware of the immense amount of money which the present expensive and partial mode of education costs the people. Pennsylvania has half a million of children, who either do, or ought to go to school six months in the year. If they do go, at \$2 per quarter, their schooling costs \$2,000,000 per annum! If they do not go when they are able, their parents deserve to be held in disgrace. Where they are unable, if the State does not furnish the means, she is criminally negligent. But by the free-school law, that same amount of education which would now cost \$2,000,000, could be supplied at less than one-third of this amount. The amendment which

is now proposed as a substitute for the school law of last session, is, in my opinion, of a most hateful and degrading character. It is a reenactment of the pauper law of 1809. It proposes that the assessors shall take a census, and make a record of the poor. This shall be revised, and a new record made by the county commissioners, so that the names of those who have the misfortune to be poor men's children shall be forever preserved, as a distinct class, in the archives of the county! The teacher, too, is to keep in his school a pauper book, and register the names and attendance of poor scholars; thus pointing out and recording their poverty in the midst of their companions. Sir, hereditary distinctions of rank are sufficiently odious; but that which is founded on poverty is infinitely more so. Such a law should be entitled "An act for branding and marking the poor, so that they may be known from the rich and proud." Many complain of this tax, not so much on account of its amount, as because it is for the benefit of others and not themselves. This is a mistake; it is for their own benefit, inasmuch as it perpetuates the Government and insures the due administration of the laws under which they live, and by which their lives and property are protected. Why do they not urge the same objection against all other taxes? The industrious, thrifty, rich farmer pays a heavy county tax to support criminal courts, build jails, and pay sheriffs and jail keepers, and yet probably he never has, and never will have, any direct personal use of either. He never gets the worth of his money by being tried for a crime before the court, by being allowed the privilege of the jail on conviction, or receiving an equivalent from the sheriff or his hangman officers! He cheerfully pays the tax which is necessary to support and punish convicts, but loudly complains of that which goes to prevent his fellow-being from becoming a criminal, and to obviate the necessity of those humiliating institutions.

This law is often objected to, because its benefits are shared by the children of the profligate spendthrift equally with those of the most industrious and economical habits. It ought to be remembered that the benefit is bestowed, not upon the erring parents, but the innocent children. Carry out this objection and you punish children for the crimes or misfortunes of their parents. You virtually establish cases and grades founded on no merit of the particular generation, but on the demerits of their ancestors; an aristocracy of the most odious and insolent kind—the aristocracy of wealth and pride.

It is said that its advantages will be unjustly and unequally enjoyed, because the industrious, money-making man keeps his whole family constantly employed, and has but little time for them to spend at school; while the idle man has but little employment for his family, and they will constantly attend school. I know, sir, that there are some men, whose whole souls are so completely absorbed in the accumulation of wealth, and whose avarice so increases with success, that they look upon their very children in no other light than as instruments of gain—that they, as well as the ox and the ass within their gates, are valuable only in proportion to their annual earnings. And, according to the present system, the children of such men are reduced almost to an intellectual level with their collaborators of the brute creation. This law will be of vast advantage to the offspring of such misers. If they are compelled to pay their taxes to support schools, their very meanness will induce them to send their children to them to get the worth of their money. Thus it will extract good out of the very penuriousness of the miser. Surely a system which will work such wonders, ought to be as greedily sought for, and more highly prized, than that coveted alchemy which was to produce gold and silver out of the blood and entrails of vipers, lizards, and other filthy vermin.

Why, sir, are the colleges and literary institutions of Pennsylvania now, and ever have been, in a languishing and sickly condition? Why, with a fertile soil and genial climate, has she, in proportion to her population, scarcely one-third as many collegiate students as cold, barren New England? The answer is obvious; she has no free schools. Until she shall have you may in vain endow college after college; they will never be filled, or filled only by students from other States. In New England free schools plant the seeds and the desire of knowledge in every mind, without regard to the wealth of the parent or the texture of the pupil's garments. When the seed, thus universally sown, happens to fall on fertile soil, it springs up and is fostered by a generous public until it produces its glorious fruit. Those who have but scanty means and are pursuing a collegiate education, find it necessary to spend a portion of the year in teaching common schools; thus imparting the knowledge which they acquire, they raise the dignity of the employment to a rank which it should always hold, honorable in proportion to the high qualifications necessary for its discharge. Thus devoting a portion of their time to acquiring the means of subsistence, industrious habits are forced upon them

and their minds and bodies become disciplined to a regularity and energy which is seldom the lot of the rich. It is no uncommon occurrence to see the poor man's son, thus encouraged by wise legislation, far outstrip and bear off the laurels from the less industrious heirs of wealth. Some of the ablest men of the present and past days never could have been educated except for that benevolent system. Not to mention any of the living, it is well known that that architect of an immortal name, who "plucked the lightnings from heaven and the sceptre from tyrants," was the child of free schools. Why shall Pennsylvania now repudiate a system which is calculated to elevate her to that rank in the intellectual, which, by the blessing of Providence, she holds in the natural world? To be the keystone of the arch, the "very first among her equals?" I am aware, sir, how difficult it is for the great mass of the people, who have never seen this system in operation, to understand its advantages. But is it not wise to let it go into full operation and learn its results from experience? Then, if it prove useless or burdensome, how easy to repeal it. I know how large a portion of the community can scarcely feel any sympathy with, or understand the necessity of the poor; or appreciate the exquisite feelings which they enjoy when they see their children receiving the boon of education, and rising in intellectual superiority above the clogs which hereditary poverty had cast upon them. It is not wonderful that he whose fat acres have descended to him, from father to son in unbroken succession, should never have sought for the surest means of alleviating it. Sir, when I reflect how apt hereditary wealth, hereditary influence, and perhaps as a consequence, hereditary pride are to close the avenues and steel the heart against the wants and the rights of the poor, I am induced to thank my Creator for having from early life bestowed upon me the blessings of poverty. Sir, it is a blessing, for if there be any human sensation more ethereal and divine than all others, it is that which feelingly sympathizes with misfortune.

But we are told that this law is unpopular; that the people desire its repeal. Has it not always been so with every new reform in the condition of man? Old habits and old prejudices are hard to be removed from the mind. Every new improvement which has been gradually leading man from the savage, through the civilized, up to a highly cultivated state, has required the most strenuous, and often perilous exertions of the wise and the good. But, sir, much of its unpopularity is chargeable upon the vile arts of unprincipled demagogues. Instead of attempting to remove the honest misapprehensions of the people, they cater to their prejudices, and take advantage of them to gain low, dirty, temporary, local triumphs. I do not charge this on any particular party. Unfortunately almost the only spot on which all parties meet in union is this ground of common infamy. I have seen the present chief magistrate of this Commonwealth violently assailed as the projector and father of this law. I am not the eulogist of that gentleman; he has been guilty of many deep political sins; but he deserves the undying gratitude of the people for the steady, untiring zeal which he has manifested in favor of common schools. I will not say that his exertions in that cause have covered all, but they have atoned for many of his errors. I trust that the people of this State will never be called on to choose between a supporter and an opposer of free schools. But if it should come to that; if that should be made the turning point on which we are to cast our suffrages; if the opponent of education were my most intimate personal and political friend, and the free-school candidate my most obnoxious enemy, I should deem it my duty as a patriot, at this moment of our intellectual crisis, to forget all other considerations, and I should place myself unhesitatingly and cordially in the ranks of Him whose banner streams in light. I would not foster nor flatter ignorance to gain political victories which, however they might profit individuals, must prove disastrous to our country. Let it not be supposed from these remarks that because I deem this a paramount object that I think less highly than heretofore of those great important cardinal principles which for years past have controlled my political action. They are, and ever shall be, deeply cherished in my inmost heart. But I must be allowed to exercise my own judgment as to the best means of effecting that and every other object which I think beneficial to the community. And, according to that judgment, the light of general information will as surely counteract the pernicious influence of secret, oath-bound, murderous institutions as the sun in heaven dispels the darkness and damp vapors of the night.

It is said that some gentlemen here owe their election to their hostility to general education—that it was placed distinctly on that ground, and that others lost their election by being in favor of it; and that they consented to supersede the regularly nominated candidates of their own party, who had voted for this law. May be so. I believe that two highly respectable members of the last legislature, from Union county, who voted for the school law, did fail of reelection on that

ground only. They were summoned before a county meeting, and requested to pledge themselves to vote for its repeal as the price of their reelection. But they were too high minded and honorable men to consent to such degradation. The people, incapable for the moment of appreciating their worth, dismissed them from their service. But I venture to predict that they have passed them by only for the moment. Those gentlemen have earned the approbation of all good and intelligent men more effectually by their retirement than they could ever have done by retaining popular favor at the expense of self-humiliation. They fell, it is true, in this great struggle between the powers of light and darkness; but they fell, as every Roman mother wished her sons to fall, facing the enemy with all their wounds in front.

True it is, also, that two other gentlemen, and I believe two only, lost their election on account of their vote on that question. I refer to the late members from Berks, who were candidates for reelection; and I regret that gentlemen whom I so highly respect and whom I take pleasure in ranking among my personal friends, had not possessed a little more nerve to enable them to withstand the assaults which were made upon them; or, if they must be overpowered, to wrap their mantles gracefully around them and yield with dignity. But this, I am aware, requires a high degree of fortitude, and those respected gentlemen, distracted and faltering between the dictates of conscience and the clamor of the populace, at length turned and fled. But duty had detained them so long that they fled too late, and the shaft which had already been winged by ignorance overtook and pierced them from behind. I am happy to say, sir, that a more fortunate fate awaited our friends from York. Possessing a keener insight into futurity and a sharper instinct of danger, they saw the peril at a greater distance and retreated in time to escape the fury of the storm, and can now safely boast that "discretion is the better part of valor," and that "they fought and ran away, and live to fight—on t' other side."

Sir, it is to be regretted that any gentleman should have consented to place his election on hostility to general education. If honest ambition were his object, he will ere long lament that he attempted to raise his monument of glory on so muddy a foundation. But, if it be so, that they were placed to obstruct the diffusion of knowledge, it is but justice to say, that they fitly and faithfully represent the spirit which sent them here, when they attempt to sacrifice this law on the altars which, at home, among their constituents, they have raised and consecrated to intellectual darkness; and on which they are pouring out oblations to send forth their fetid and noxious odors over the 10 miles square of their ambition! But will this legislature, will the wise guardians of the dearest interests of a great Commonwealth, consent to surrender the high advantages and brilliant prospects which this law promises, because it is desired by worthy gentlemen, who, in a moment of causeless panic and popular delusion, sailed into power on a Tartarean flood? A flood of ignorance, darker, and, to the intelligent mind, more dreadful than that accursed pool at which mortals and immortals tremble! Sir, it seems to me that the liberal and enlightened proceedings of the last legislature have aroused the demon of ignorance from his slumber; and, maddened at the threatened loss of his murky empire, his discordant howlings are heard in every part of our land!

Gentlemen will hardly contend for the doctrine of cherishing and obeying the prejudices and errors of their constituents. Instead of prophesying smooth things and flattering the people with the belief of their present perfection, and thus retarding the mind in its onward progress, it is the duty of faithful legislators to create and sustain such laws and institutions as shall teach us our wants, foster our cravings after knowledge, and urge us forward in the march of intellect. The barbarous and disgraceful cry which we hear abroad in some parts of our land, "that learning makes us worse—that education makes men rogues," should find no echo within these walls. Those who hold such doctrines anywhere would be the objects of bitter detestation if they were not rather the pitiable objects of commiseration, for even voluntary fools require our compassion as well as natural idiots.

Those who would repeal this law because it is obnoxious to a portion of the people would seem to find their justification on a desire of popularity. That is not an unworthy object when they seek that enduring fame which is constructed of imperishable materials. But have these gentlemen looked back and consulted the history of their race to learn on what foundation and on what materials that popularity is built which outlives its possessor, which is not buried in the same grave which covers his mortal remains? Sir, I believe that kind of fame may be acquired by deep learning, or even the love of it, by mild philanthropy or unconquerable courage. And it seems to me that, in the present state of feeling in Pennsylvania, those who will heartily and successfully support the cause of gen-

eral education can acquire at least some portion of the honor of all these qualities combined, while those who oppose it will be remembered without pleasure and soon pass away with the things that perish.

In giving this law to posterity you act the part of the philanthropist, by bestowing upon the poor as well as the rich the greatest earthly boon which they are capable of receiving; you act the part of the philosopher by pointing if you do not lead them up the hill of science; you act the part of the hero if it be true as you say that popular vengeance follows close upon your footsteps. Here, then, if you wish true popularity, is a theater in which you may acquire it. What renders the name of Socrates immortal but his love of the human family exhibited under all circumstances and in contempt of every danger? But courage, even with but little benevolence may confer lasting renown. It is this which makes us bow with involuntary respect at the name of Napoleon, of Cæsar, and of Richard of the Lion Heart. But what earthly glory is there equal in luster and duration to that conferred by education? What else could have bestowed such renown upon the philosophers, the poets, the statesmen, and orators of antiquity? What else could have conferred such undisputed applause upon Aristotle, Demosthenes, and Homer; on Virgil, Horace, and Cicero? And is learning less interesting and important now than it was in centuries past, when those statesmen and orators charmed and ruled empires with their eloquence?

Sir, let it not be thought that these great men acquired a higher fame than is within the reach of the present age. Pennsylvania's sons possess as high native talents as any other nation of ancient or modern time. Many of the poorest of her children possess as bright intellectual gems if they were as highly polished as did the scholars of Greece or Rome. But too long, too disgracefully long, has coward, trembling, procrastinating legislation permitted them to lie buried in "dark, unfathomable caves."

If you wish to acquire popularity, how often have you been admonished to build not your monuments of brass or marble but make them of ever-living mind. Although the period of yours or your children's renown can not be as long as that of the ancients, because you start from a later period, yet it may be no less brilliant. Equal attention to the same learning, equal ardor in pursuing the same arts and liberal studies, which has rescued their names from the rust of corroding time and handed them down to us untarnished from remote antiquity, would transmit the names of your children and your children's children in a green, undying fame down through the long vista of succeeding ages until time shall mingle with eternity.

Let all, therefore, who would sustain the character of the philosopher or philanthropist sustain this law. Those who would add thereto the glory of the hero, can acquire it here, for in the present state of feeling in Pennsylvania, I am willing to admit that but little less dangerous to the public man is the war club and battle-ax of savage ignorance, than to the Lion-hearted Richard was the keen scimiter of the Saracen. He who would oppose it, either through inability to comprehend the advantages of general education, or from unwillingness to bestow them on all his fellow-citizens, even to the lowest and the poorest, or from dread of popular vengeance, seems to me to want either the head of the philosopher, the heart of the philanthropist, or the nerve of the hero.

All these things would be easily admitted by almost every man, were it not for the supposed cost. I have endeavored to show that it is not expensive; but, admit that it were somewhat so, why do you cling so closely to your gold? The trophies which it can purchase, the idols which it sets up, will scarcely survive their purchaser. No name, no honor can long be perpetuated by mere matter. Of this Egypt furnishes melancholy proof. Look at her stupendous pyramids, which were raised at such immense expense of toil and treasure! As mere masses of matter they seem as durable as the everlasting hills, yet the deeds and the names they were intended to perpetuate are no longer known on earth. That ingenious people attempted to give immortality to matter, by embalming their great men and monarchs. Instead of doing deeds worthy to be recorded in history, their very names are unknown, and nothing is left to posterity but their disgusting mortal frames for idle curiosity to stare at. What rational being can view such soulless, material perpetuation, with pleasure? If you can enjoy it, go, sir, to the foot of Vesuvius: to Herculaneum and Pompeii, those eternal monuments of human weakness. There, if you set such value on material monuments of riches, may you see all the glory of art, the magnificence of wealth, the gold of Ophir, and the rubies of the East, preserved in indestructible lava, along with their haughty wearers—the cold, smooth, petrified, lifeless beauties of the "Cities of the Dead."

Who would not shudder at the idea of such prolonged material identity? Who would not rather do one living deed than to have his ashes forever enshrined in

ever-burnished gold? Sir, I trust that when we come to act on this question we shall all take lofty ground—look beyond the narrow space which now circumscribes our visions—beyond the passing, fleeting point of time on which we stand; and so cast our votes that the blessing of education shall be conferred on every son of Pennsylvania—shall be carried home to the poorest child of the poorest inhabitant of the meanest hut of your mountains, so that even he may be prepared to act well his part in this land of freemen, and lay on earth a broad and a solid foundation for that enduring knowledge which goes on increasing through increasing eternity.

#### VII.—EDUCATION IN BULGARIA.

A census taken in Bulgaria in 1893, revealed some remarkable facts. In that year the principality had a population of 3,310,713, among whom were 2,793,272 illiterates, children included, and 517,441 who could read and write (410,973 men and only 106,418 women), hence there were 5 illiterates to every 1 who could read and write, or 3 illiterate males to every 1 literate male, and 14 illiterate women to every 1 literate woman. Of every 100 inhabitants 15.63 had had some school instruction. This ratio is much higher in the cities, to wit: 47.43 males, 23.29 females, or an average of 35.90; while in the country districts the ratio varied between 10.30, and 2.37. If the children under school age, the blind, deaf, and imbecile are deducted as incapable of reading and writing (a total of 700,000 at least) the ratio of literates is raised to nearly 20 per cent. If, furthermore, we deduct the Mohammedans, who are almost all illiterate, the percentage of adult Bulgarians is increased considerably. A search among the marriage registers gives the percentage of men and women who could sign their names:

	Men.	Women.	Average.
	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>
Hebrews.....	76.96	59.69	68.32
Armenians.....	77.29	52.27	64.77
Protestants.....	60.00	60.00	60.00
Roman Catholics.....	35.39	39.90	33.15
Greek Catholics.....	42.39	13.24	27.82
Mohammedans.....	6.50	3.13	4.81
Averages.....	36.75	12.20	24.48

According to this the Hebrews are the ones who frequent schools most regularly, surpassing the Greek Catholics about two and one-half times, while the Protestants and Armenians remain but little behind them. But with reference to female education the Protestants take the first rank, followed by the Hebrews and Armenians. If the men are taken alone, the Greek Catholics stand higher than the Roman Catholics, but their women stand far below them in education. The Mohammedans exhibit only one-sixth as much education as the Greek Catholics, and only one-fifteenth of that of the Hebrews. These facts are corroborated officially by the publication of the results obtained by examining the army recruits.

According to these publications the following percentages of army recruits had an elementary education:

Year.	Christians.	Mohammedans.	Averages.
	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>
1888.....	26.58	5.41	31.65
1889.....	38.58	3.25	31.62
1890.....	35.92	4.44	30.75
1891.....	40.64	4.20	34.17
1892.....	59.49	4.27	51.17
1893.....	50.61	3.93	43.25

This table reveals the fact, that school education increases among the Christians, but not among the Mohammedans. The following table shows what place Bulgaria takes in the list of continental European States.

Of every 100 army recruits the following per cent could read and write.

Country.	Year.	Per cent.	Country.	Year.	Per cent.
Germany .....	1891	99.90	Italy.....		58.00
Sweden .....	1890	99.80	Bulgaria.....	1891	34.17
France .....	1891	92.60	Russia.....	1887	31.34
Belgium .....	1890	84.00	Servia.....	1881	20.70
Austria .....		66.00	Roumania.....	1892	10.60

Hence, Bulgaria is ahead of its neighbors on the Balkan peninsula—i. e., Servia and Roumania, though it gained its independence much later than the other two countries. Though the figures given for Servia are of 1881, that does not materially change the case, as is seen from the following table. Of every 100 inhabitants (including children under 6) there could read and write:

Country.	Year.	Males.	Females.	Average.
Belgium.....	1891	64.35	60.40	62.37
Servia.....	1891	17.73	3.55	10.73
Bulgaria.....	1893	24.31	6.57	15.63

Without children below school age:

Country.	Year.	Males.	Females.	Average.
Belgium.....	1891	72.68	68.22	70.45
Servia.....	1891	23.02	4.74	14.17
Bulgaria.....	1893	30.88	8.37	19.88

Comparing the results of the two censuses of 1888 and 1893, we find that of every 100 inhabitants in Bulgaria there could read and write:

Year.	Males.	Females.	Average.
1888.....	17.06	4.12	10.71
1893.....	24.31	6.57	15.63

Expressing it in other terms, we may say that the number of males in Bulgaria able to read and write has increased 42 per cent within five years; that of females, 60 per cent; that of the population, 46 per cent. If we consider that the population of Bulgaria increased by 156,338 in five years, or about 5 per cent, it is plainly seen the increase in education is even greater than the figures state, and it is reasonable to suppose, that the 15 per cent of literates found in the last census will increase to 50 per cent within the next fifteen or twenty years. (Zeitschrift für ausländisches Unterrichtswesen.)

VIII.—CONSOLIDATION OF SCHOOLS—THE KINGSVILLE PLAN.<sup>1</sup>

Those who have any acquaintance with district schools know that their advantages are meager as compared with those of the town or city school. There are thousands of these rural schools which furnish their pupils scant preparation for the duties of life. As a rule they are not graded; the studies taught are the most elementary; the classes are small, and the attendance is irregular. Many districts are so sparsely settled that it is impossible to raise by taxation sufficient funds to build good schoolhouses, or hire a sufficient number of teachers. And even if this be possible the attendance is such as to make the per capita cost of maintenance unduly large, so that even a common school education becomes very costly.

To overcome the many disadvantages of the subdistrict system, and for the purpose of offering an advanced graded school education to every boy and girl of the proper school age in Kingsville Township, Ashtabula County, Ohio, its citizens have adopted a plan of consolidation, or centralization, of the subdistrict schools of the township into a common central school, conveying the pupils from every part of the township to and from school by means of coaches.

The plan was not original with the citizens of Kingsville, Ohio; it was adopted by the citizens of Quincy, Mass., in 1874, and reported as successful. In Concord, Mass., it has been in operation since 1878. Up to the time the "Kingsville plan" went into effect a large proportion of Massachusetts towns had consolidated their schools. No similar plan, however, had been tried in the State of Ohio or in any States of the West. Generally speaking, the people were ignorant of this advance in methods of common-school management. The plan was favored by many educators, but up to the year 1892 no practical step had been taken to introduce a system of consolidation.

While the township is the unit of school organization and administration in Ohio, and is the school district proper, it is divided into subdistricts for the regulation of school attendance, and to serve as a unit of representation in the township board. Previous to 1892 a board of directors, consisting of 3 men elected by the voters of the school district, employed the teachers and carried on the schools. In the year 1892 all the old powers of the directors were transferred to the township board, which was now represented by one director from each subdistrict. It was this year that the question of building a new schoolhouse in district No. 4, in Kingsville Township came up for discussion before the school board of the township. The schoolhouse was a necessity, but the school attendance was small. The board hesitated about expending the money for a new building. It was at this juncture that Prof. F. E. Morrison, then the principal of the village high school, urged upon the school board the adoption of the plan suggested the year before, that the few scholars of district No. 4 be brought to the village high school at the expense of the taxpayers of the township. As the expense of conveying the children of that district to the high school was far less than the cost of hiring a teacher, to say nothing of erecting a new building, the board of education favored the idea. Upon investigation it was found, however, that there was no law on the statute books of the State which authorized the expenditure of money out of the public school fund to pay for conveying children to and from a centrally located school.

---

<sup>1</sup> By Edward Erf, in the *Arena*, July, 1899. A compilation of the available information upon this subject was given in the Bureau's Report of 1894-95, Vol. 2, pp. 1469-82; also in the Report of 1895-96, Vol. 2, pp. 1853-58. The Massachusetts School Report of 1897-98 contains (pp. 437-459) a valuable report on "The consolidation of schools and the conveyance of children," made by G. T. Fletcher, agent of the Massachusetts Board of Education. This latter is also issued in pamphlet form.

While discussing the question of conveyance the idea of school consolidation took deeper root. A bill was passed in the Ohio State legislature which enacted that any board of education in any township which, by the census of 1890, had a population of not less than 1,710 nor more than 1,715, may, at their discretion, appropriate funds derived from the school tax for the conveyance of pupils in subdistricts from their homes to the high school of said township, provided such appropriation for any subdistrict shall not exceed the amount necessary, in the judgment of the board of directors, for the maintenance of a teacher in such subdistrict for the same period of time. The law was based specifically upon the rate of population for Kingsville Township, and was passed for the benefit of that township only, so as to gain the support of legislators from other sections of the State who were attached to the old plan, but who did not object to a trial of the plan, which they regarded as chimerical.

The system was put in operation in Kingsville Township with but little opposition, which came wholly from teachers and their friends, who saw that by the consolidation of the schools the number of positions open to them was lessened. Each subdistrict was admitted upon a written petition signed by the taxpayers of the school district. At first only three subdistricts availed themselves of the privilege. A fourth followed later. At present there are only two subdistricts which still maintain separate schools; but these, it is confidently expected, will follow within a year.

When the taxpayers of the subdistrict have by petition signified their willingness to abandon the school of the subdistrict, and send their children to the central school, the board of education employs a teamster to convey the pupils of the subdistrict thither—one teamster employed for each subdistrict. These teamsters work under a special contract, and agree to construct covered wagons, approved by the board of education, to be used in the conveyance of the pupils. These wagons are provided with side and end curtains, which may be raised or removed on warm days, and tightly closed in cold or stormy weather. They have steps in the rear by means of which the pupils enter or leave the coach. The seats are arranged lengthwise, and are provided with cushions, and suitable blankets for the covering and comfort of the pupils. Each coach carries from 18 to 24 persons.

The contracts for conveying the pupils from each subdistrict are let out to the lowest responsible bidder; the board, however, reserves the right to give the contracts to those whom they deem fit to be intrusted with the care of the pupils. The moral character of the bidder, as well as the lowness of the bid, is considered. The teamster enters into a written agreement that he will get the pupils at their homes, convey them to the central school, at a time set forth in the contract, and be ready to return them within a specified time after the school is out. He also agrees that no profane, immoral, or indecent language shall be used by himself or others, during the transportation of the pupils to and from the school building. He further agrees that he will allow no tobacco or spirituous liquors to be used by any person in the conveyance. Every morning, during the school year, the teamster drives to the homes of the pupils on his route, makes his presence known by ringing a bell or blowing a horn, to which the pupil responds by promptly entering the wagon. If he does not appear within a few minutes the wagon drives on, and the pupil is marked tardy. Thus far there have been very few cases of tardiness. The price per day for each wagon varies in the different districts. During the present school year the price per wagon for conveying the pupils from the four outlying subdistricts is \$1.15 a day. Up to the present time, there have been more bidders than contracts to award. While the price is low, it offers fair and sure compensation to those who accept the contracts.

The experiment was watched with much interest by educators, and those inter-

ested in education, throughout Ohio. Some thought the plan impracticable, others championed it with ardor. The latter looked upon it as the most practicable and economical solution of the vexed "country school problem." This was specially true among educators of neighboring townships and counties. They saw realized in this plan their hope of giving to the country pupil all the advantages of education which the city boy or girl enjoys. And they urged the adoption of the plan in the localities in which they taught schools. Accordingly, two years later, a more general law was passed, which provided for the extension of the "Kingsville plan" to other townships. It has also been adopted in townships in New York, Pennsylvania, West Virginia, Kentucky, and other States of the West, since its trial in Kingsville, Ohio.

The residents of the subdistricts of Kingsville Township which have adopted this plan, would deem it retrogression to go back to the old subdistrict plan. It has given the school system of Kingsville an individuality which makes it unique and progressive. Pupils from every part of the township enjoy a graded school education, whether they live in the most remote corner of the township or at the very doors of the central school. The line between the country-bred and village-bred youth is blotted out. They study the same books, are competitors for the same honors, and engage in the same sports and pastimes. This mingling of the pupils from the subdistricts and the village has had a deepening and broadening influence upon the former, without any disadvantage to the latter. With the grading of the school and the larger number of pupils have come teachers of a more highly educated class. Higher branches of study are taught, the teachers are more conversant with the needs of their profession. The salaries are larger; the health of the pupils is preserved, because they are not compelled to walk to school in slush, snow, and rain, to sit with damp, and perhaps wet feet, in ill-ventilated buildings. Nor is there any lounging by the wayside. As the use of indecent and obscene language is prohibited in the wagons all opportunities for quarreling or for improper conduct on the way to and from school are removed. The attendance is larger, and in the subdistricts which have taken advantage of the plan it has increased from 59 to 150 per cent, in some cases; truancy is unknown. It has lengthened the school year for a number of the subdistricts; it has increased the demands for farms in those subdistricts which have adopted the plan, and real estate therein is reported more salable. The drivers act as daily mail carriers. All parts of the township have been brought into closer touch and sympathy.

The cost of maintenance is less than that of the schools under the subdistrict plan; the township has had no schoolhouses to build; it has paid less for repair and fuel. "Since the schools were consolidated, the incidental expenses have decreased from \$800 to \$1,100 per year to from \$400 to \$600 per year." In the first three years following its adoption, Kingsville Township has actually saved \$1,000.

State Commissioner of Public Schools O. T. Corson, in his forty-third annual report to the governor of Ohio, referring to the Kingsville experiment, states that "the expense of schooling the children has been reduced nearly one-half, the daily attendance has been very largely increased, and the quality of the work done has been greatly improved." Prof. J. R. Adams, superintendent of schools of Madison Township, Lake County, says that "under the new plan the cost of tuition per pupil, on the basis of total enrollment, has been reduced from \$16.00 to \$10.48; on the basis of average daily attendance, from \$26.66 to \$16.07. The total expense will be about the same in this district as under the old plan, but the cost per pupil will be much less." This is because the school attendance has increased in Madison Township from 217 to 300 pupils, since the plan went into operation.

In the townships where the "Kingsville plan" has been adopted it has met with general favor, and has received the warmest support of educators, who regard it

as a long step forward toward placing the country schools upon a higher plane of efficiency. Superintendent Adams, referred to above, writes: "A trial of this plan of consolidating our schools has satisfied me that it is a step in the direction toward whatever advantages a well-graded and well-classified school of three or four teachers has over a school of one teacher with five or eight grades. I am more thoroughly convinced than ever that centralization is the true solution of the country school problem." Prof. F. E. Morrison, to whom its adoption by the board of education in Kingsville Township was in a great measure due, speaks of it as "a system of education superior to any in the State of Ohio, and one which is to be the system of the future." And in the forty-fifth report to the governor of Ohio, State Commissioner O. T. Corson, referring to the "Kingsville plan," says: "I anticipate none the less an increasing tendency in all parts of the State, year by year, to make the law serviceable in reducing school expenses, and in extending the benign influence of well-graded instruction. Incidental to the operation of this law, township high schools will be established, township libraries will be built up, and possibly it is no idle hope that the same wagons that carry the children to and from school may also carry, under Government contract, the mails, and distribute them free to our farming communities."

Prof. L. E. York, superintendent of Kingsville School, in writing concerning the system, says: "The best physical laboratory in America is the well-regulated American farm. Here the boys and girls study nature first-handed. Here they observe the growth and life of plants and animals. Here they breathe pure air, become familiar with the beauties and wonders of the natural world. Here they make character. To have added to all these opportunities the advantages of a high school education, without any of the disadvantages that attend the spending of evenings, without chores or home duties, in the town, is an educational condition that is almost ideal."

The pupils like the system, as do the teachers employed. It has gained the favor of parents, and in general is regarded by those who have studied it and understand its workings as a most practical advance in methods of rural education.

---

#### IX.—THE NEW REQUIREMENTS FOR ADMISSION TO THE UNIVERSITY OF ILLINOIS.<sup>1</sup>

By Stephen A. Forbes, Ph. D., dean of the College of Science, University of Illinois.

The relations and responsibilities of the State universities of America, as compared with those of other institutions of higher learning, are in some respects new and peculiar. At no earlier time and nowhere else in the world has there been so extensive and so homogeneous a university system standing in relations so immediate and so vital to a general system of public schools. If this State university system had been historically a direct outgrowth of the public school, proposed and promoted mainly by public school men, and organized with principal reference to the public school relationship; if it had been originally intended simply as an extension of the work of the public high school into other and higher fields, then the connection between these different parts of the educational systems of the States would have been primary and organic, and problems of relationship, interdependence, and mutual influence, direct and reflex, would have been taken up and solved in some fashion in the very beginning; but, as we all know, this was not the fact. The controlling motive to the establishment of the State universities, especially the newer ones in the Central and Western States of the Union, was a desire to provide for the mass of our youth a kind of higher

---

<sup>1</sup> Read at the Illinois High School Conference, held at the university May 19, 1898.

education not distinctly prepared for or even foreshadowed in either the public high school or the private academy of that day, and not at all contemplated in the plans or the courses of the collegiate institutions then in existence here. The leading and controlling motive, without the efficient operation of which the founding of the State universities would at least have been long postponed, was a desire for an industrial education of collegiate grade founded essentially on the physical, natural, and mathematical sciences and leading to the practice and teaching of industrial arts and employments as a calling or a career.

The State university movement was not more notable, however, for the novelty of its ends than for the generous breadth of its intentions. While first making sure, very naturally, that there should be no possible failure or miscarriage of this primary purpose, a way was made in the beginning for expansion in due time of the work of these new institutions over the whole field of liberal learning and even of scholastic study, at that time already occupied more or less efficiently, partly by endowed colleges and partly by colleges which were not even endowed.

Now, these preexisting private and sectarian colleges, the private academies, and the public high schools had grown up and gone along together, influenced in some measure by the same educational ideals and controlled to a great extent by the same classes of men, and hence what adjustment there was of high-school work to collegiate study was an adjustment of it to the work of what we now call, for short, the old-fashioned college. The high-school graduate, if he went to college at all, went of course to a college of the old school; the high-school teacher and principal, if college men at all, came from such purely literary colleges, and the high school itself, if it prepared for college at all, prepared for such a college of literature, as we should call it now. The education of the whole people, including that of the teaching class, was thus narrow and one-sided, and the new State universities found themselves largely in the air, with no stable foundation for preparatory work beneath them. Here was a foundation story, the public school, slowly and carefully built up, the work of experienced builders, and here was a house and lean-to over it, but the lean-to was on the foundation, and the main building was on stilts.

Two things were evidently necessary to the symmetry of this rather ridiculous educational edifice, one to be done immediately by the university and the other immediately by the public school, but each really requiring the intelligent and earnest cooperative effort of both; first, the building up and building out of the collegiate literary lean-to until it should form a strong, equal, and harmonious part of the whole educational structure; and, second, the enlargement of the public school foundation to take the place of the temporary braces and piles on which the scientific, engineering, and agricultural departments of the university were propped up in mid-air.

Fortunately, the natural tendency of the times has been favorable to both these constructive educational movements, and notable progress has been made in both. It is now some years since the University of Illinois ceased to be essentially an industrial institution; and its college of literature and arts has pushed rapidly outward and upward, strengthening its walls to support the added weight, and sending upward also a graceful and imposing tower whose aspiring apex sometimes seems to swing suspended in the upper air. And the public school has appreciably strengthened its work and enriched its courses in the scientific lines, and is beginning to afford in chemistry, physics, and biology some hopeful approximation, in its preparation for the corresponding college courses, to that which it now rightly affords in literature and in Latin, for example. But this adjustment of high school and university is of course, as yet, incomplete, especially here in Illinois, where, for various reasons, some of them obvious and oth-

ers occult, the task of coordination has been unusually difficult. It is because the faculty of the University of Illinois has made, during the past year and a half, a strong, persistent, and, as we think, highly successful effort to improve this adjustment materially in very important matters that I have been charged with the duty of explaining our recent action with respect to the university entrance requirements.

As you will readily see from the way in which I have approached my subject, I have not supposed it sufficient that I should give you a bare mechanical explanation of the meaning and application of our new requirements, but have thought it better that I should try to show what we have had principally in mind as the general ends to be met and as the controlling conditions present to limit and direct our action, and that I should then show you how these ends have actually been approached, if not altogether accomplished, and where and how these limiting conditions have affected our course.

Since this is the university of the State, and of the whole of the State, we have undertaken to come into immediate, vital, and helpful relations of some sort to every high school in Illinois, whatever its kind or grade, and have further deemed it our duty not to lose sight even of those parts of the State in which there are no true high schools. For our purpose the county is the educational unit of maximum size, this unit being in advanced and prosperous counties much subdivided into units of smaller size, but in some cases remaining substantially without division. We are looking in each such county for the best public school, for the highest firm educational standing ground, and from that foundation corner we intend shall start, some day, something by which the competent and aspiring student may climb into the university of his State. Paved pathway, carpeted stair, naked ladder or knotted rope—something should stand or swing within the reach of every fairly fortunate boy or girl in the State who has done the best he can in his county, by the aid of which he may make his way upward as far as the most favored child from any part of Illinois. Paraphrasing a striking remark of Professor Huxley, I would say that before our educational system can be fully worthy of the name there must be in every Illinois cornfield and country town the foot of a ladder, the upper end of which shall reach to the top of the State University.

We have also endeavored to keep clearly in mind the fact that university and high school and the whole educational system generally are not ends in themselves or immediately subordinate in any way to each other, but that all are subordinate, as a whole and in every part, to the general end of the public welfare in the broadest and highest sense of that term, and that the educational welfare of no part of the public should be sacrificed to that of any other part. The interests of the pupil who can not go beyond the primary school, beyond the grammar school, beyond the high school, should be just as carefully studied, just as fully taken into account in every part of the organization, its exactions and requirements, as if he were to go through the full course of undergraduate and graduate study provided at the university itself.

Especially we have endeavored to give full weight to the fact that the public high school does not exist for the university, was not organized primarily to prepare its pupils for college, and could not long be maintained in the average Illinois community of the present time if it permitted anything to take precedence of its main present object, that of preparing its graduates to enter immediately and to a certain advantage upon the business of life. We have, I think, fully realized, and have endeavored to reflect in our exactions and adjustments, the highly composite character of the people of this State, the great differences in the educational ideals of communities in different parts of it, and the great and necessary diversity, in the smaller schools especially, with respect to courses of high-school study—diversities due to differences of local sentiment and control, to

variations in the preparation and ability of the corps of instruction in such smaller schools, and to variations in the stage of development of one school as compared with another of its grade or class.

While the university should, of course, exercise a strengthening and elevating influence on the high school, it must not force an over-rapid and unhealthy growth into unstable conditions: it must not force an artificial differentiation or specialization within the high school; it must not force anything on or into or out of the high school or the high-school community, but should take all good work which the high school offers at its real value as a preparation for college, enabling the student from any such a school to move on readily at the university from any point at which his high-school teachers leave him.

It must not stimulate and reward unequally equally valuable elements of high-school work; it must not use its influence, and especially it must not exercise its power, to distort or to deform high-school courses or to perpetuate such distortion or deformation by laying special stress upon or attaching special value to subjects which happen to be for the time being best or most conveniently taught. It must assist rather to rectify wavering lines of growth, to strengthen weak places, to check excess; it must have, in short, as said before, a constant eye to the ultimate educational welfare of the whole public which it exists only to serve.

Hence it must not adhere stupidly or obstinately to traditions established in former times or under different conditions from those present, but must move with the progress of civilization, flexibly adapting itself to present conditions and present needs, anticipating indeed for its students, so far as possible, the future conditions under which they must live and work as men and women. It must look forward, and not merely back.

It must not be content merely to imitate anything or anybody; but must study carefully its own conditions, and shape its organization and its work intelligently to its legitimate ends as determined by its own situation and responsibilities.

If one takes a bird's-eye view of the public school system of this State, as he would look over the landscape from a balloon, he finds that its upper surface, formed by its leading city and county schools, may be described as a greatly diversified inclined plane, with its highest levels to the northeast. Thence it slopes irregularly westward and especially southward, with here and there a broadly based mound or hill whose top rises nearly or quite to the highest plane, and here and there a slender peak towering ambitiously upward, with no breadth of base to speak of, and its apex mostly Latin. The reasons for this slope and for the irregularity of it are partly geographical, partly ethnological, partly industrial, partly historical, partly personal, etc.; but whatever the causes, there are few States in America in which the term high school must be made to do duty over so wide a range of meaning, and it is to this picturesque but perplexing surface that the State university must adjust itself.

Our principal means of adjustment are four: First, our University Preparatory School, which is intended primarily to make good the deficiency of the public high schools in some places and their entire lack in others; second, our recently revised system of accrediting schools; third, our just-established policy of giving university credit for such accepted work of the highest secondary schools as laps over upon any of our college courses; and fourth, the revised system of entrance requirements which it is my special object to discuss here to-day.

The Preparatory School serves at least to conceal, if it does not now wholly level up, the inequalities of our foundation which I have already referred to. It seems now the firm intention of the University authorities to make this no longer a mere substitute for a good high school, but a really excellent high school itself, to the end that the student compelled to resort to it for his college preparation shall find himself at no disadvantage here in anything as compared to the one who gets his preparation at home.

By giving credit on our entrance conditions for all good high-school work, whether it covers the full admission requirement or much less than that, we establish vital relations with the lower and imperfectly developed high schools, and enable the student from such a school to know in advance just what he must do in our own preparatory school to fit himself for matriculation. We also, beyond doubt, by crediting the work of such schools in some departments only must stir the emulation of instructors in departments of the school not so credited, and thus, by recognizing the best, help to bring the poorer work up to the higher level.

By crediting students from the best high schools with work done there not needed for entrance here but substantially equivalent to elementary courses which the University still finds itself obliged to teach, we enable such students to enter upon a college course where their preliminary work ceases, and to continue in it without duplication of studies or loss of time.

By establishing our new entrance requirements we have virtually offered to accept, with certain important limitations which I will presently specify, any and all good high-school work as a preparation for any and all college courses, thus laying increased emphasis on training, and removing it in great measure from specific kinds of knowledge. We have practically said, "Send us capable pupils, well trained, with minds well stored with something, and we will not inquire too closely what that something is." We have begun to say, "Prepare your pupils carefully, conscientiously, thoroughly for active life, as best you can in your communities and in your conditions, and that preparation, if the work is well done, we will accept for college also; and so far as it is not so accepted the real defect is not in the high-school offering but in the college course." We have introduced, in short, the elective system in our entrance conditions, not as fully perhaps as we may do later, but still somewhat extensively, as I now proceed to explain to you by the aid of the accompanying tables of our requirements, old and new.

To make my discussion intelligible I shall have to say that by the term high-school credit, which I shall need to use repeatedly, we mean a full credit for one term's work in one subject, on the supposition that the school year of thirty-six weeks is divided into three terms, and that the subject credited is taken in daily class exercises of forty minutes each. More explicitly, a high-school credit in any subject represents a total of forty hours' work of sixty minutes each in the class-room, or equivalent work in laboratories and the like, a laboratory period being commonly twice as long as a recitation period. A full year's work in one subject would thus cover one hundred and twenty sixty-minute class-room hours, and a full year of high-school work on four subjects for a single pupil would cover four hundred and eighty such sixty-minute hours.

I must also explain what I mean by restricted and free electives, respectively, as used in Table I. A restricted elective study is one chosen within certain specific limits. We expect, for example, that every candidate for admission shall offer three credits in physical or biological science and six in foreign language, these elections being thus restricted by a specification of the general subjects from which they must be made. The free electives, on the other hand, may be chosen anywhere from the entire list of high-school electives shown by Table III.

Zoology	1.5-3	French	3-9
Biology	3 -6	German	3-9

You will be surprised, perhaps, after what I have said about our proposed elective system of requirements, to see by my Table I that 19 or 20 of the 36 high-school credits necessary to entrance here must be made from subjects unconditionally required, leaving only 16 or 17 credits to be earned from subjects elective in any degree. These required subjects are, however, all, or nearly all, those which are always expected, and almost always taught, in every good high school. The credits required are 9 in English (including both literature and composition), 3 in history, and 7 or 8 in algebra and geometry.

The restricted electives, on the other hand, vary in amount in the different colleges and departments from 3 credits in agriculture, in Latin, and in Greek, to 12 in literature and arts at large. They are all scientific and linguistic—3 of the former in each college and department, and 0, 6, or 9 of the latter.

The actual range of the free electives and the maximum and minimum amounts which may be offered in each may be seen by Table III. These free electives, which were unknown under our old admission system, vary now in number for the different colleges—as you will see by Table I—from 14 for agricultural courses to 5 for literature and arts. The total number of electives of both classes is, however, fairly uniform; 16 for science and engineering and 17 for agriculture, and for all of literature and arts excepting Latin and Greek, which departments are distinguished from all others in the university by a much larger unconditional requirement and a correspondingly smaller elective list. Even in these departments, however, a considerable change has been made toward more liberal conditions, the Latin courses now requiring unconditionally 28 credits where they before required 34, and the courses in Greek requiring 25 credits in place of 36.

One leading original motive which led our faculty to consider anew the subject of entrance conditions was a desire to equalize and harmonize the requirements for entrance into the various colleges and departments of the university, and thus incidentally to equalize the value of the bachelor's degrees. The measure of success which we have had in this effort is shown by the column of "total credits" in Table I. Where formerly 22 credits would admit to the college of agriculture, 25 to that of science, 26 to that of engineering, and 36 or 37 to that of literature and arts—the latter number if university Greek was desired—36 credits are now required for each college and department, and no more than that for any, again excepting literature and arts with Greek, which still requires 37.

I think you will be pleased to see that this equalization has been accomplished by leveling up at all the lower points and not anywhere by leveling down, the standard of the university as a whole having been thus very materially raised. The requirement for the agricultural college, for example, has been increased not less than  $63\frac{1}{2}$  per cent, that for the college of science 44 per cent, and that for engineering  $38\frac{1}{2}$  per cent, while that for literature and arts remains unchanged. And this increase for the technical and scientific courses has not been made, as you will observe, by increasing the unconditioned requirements, which remain for these courses essentially as before, but by enlarging the elective list. The university standard has thus been raised without putting any considerable additional burden or strain on the public high school.

If you inquire how it came to pass that our standards were unequal before, I can only say that the entrance requirements have hitherto been fixed for the colleges separately, each asking from the high school whatever it could get which it regarded as definitely preparatory to its own college work; and organized and taught as the high school is, the literary departments could find much more such work in the high-school course than could those departments which rest immediately on a scientific rather than a linguistic preparation. In short, the floor sills of the technical and scientific departments of the university have sagged, as one may say, because the foundation under them was too low and slight; and they have now been hoisted up to the common level by using as additional props any good high-school timber that came to hand.

From the column of total credits in Table II we derive the fact that a three years' school can now, if it will, prepare for every department of the university, excepting only Greek. To enter for Greek also necessitates the presentation of 38 high-school credits instead of the 36 possible to a three years' school.

From the second line of Table II we see that to enter its students for any and all departments of the university unconditionally, a school must teach 8 terms of algebra and geometry, 9 of English (including composition), 3 of history, 3 of phys-

ical or biological science, 9 of Latin, and 6 of Greek—an amount impracticable, as already said, to a three years' school, but leaving for a four years' school 10 terms of work in subjects not required, and hence to be distributed at will.

I hope that no one will infer from the foregoing that this list of subjects and the number of credits in each is to be taken as indicative of the university ideal of a good high-school course for an Illinois community. Certainly few, if any, of us would say that the Illinois high-school boy should have as much Latin and Greek as history, science, and English combined, or that all his science work should amount to only half his Greek or one-third his Latin, or that he should do 15 terms' work in classics and none at all in German or French. The list just given is, in fact, made up not of matter deliberately chosen to make a course, but of the unconditioned requirements of all the various university colleges and departments combined; and those subjects preponderate, consequently, in preparation for which the least election is allowed. It may even be regarded, I think, as at least an open question whether any three years' school with a single course should attempt to prepare for all university work excepting Greek, since, as shown by the fourth line of Table II, this would require that it should teach 8 terms of mathematics, 9 of English, 3 of history, 3 of science, and 9 of Latin, leaving but 4 credits for studies elective in any sense—a number which must often prove too small to adapt the course to the more general ends of the school. If German be desired, for instance, only one year of it can be had, a single credit being then left for additional science or history. Such a three years' school may, however, it would seem, prepare fairly well for all except the classical work, since the 9 foreign-language credits may then be placed as desired, and 4 free electives will remain with which to raise the year of science work to 2, with a single credit still to spare.

If I were to summarize this matter according to my personal judgment in the premises, I should say that a three years' one-course school can not prepare for all the university courses, including Greek; that such a school can prepare for all excepting Greek, but commonly should not, since so to do would overload its courses on the language side and leave its science work extremely slight; but that it may very easily prepare for the three scientific colleges and can prepare at least fairly well for all university work except the classical. Or, putting the matter a little differently, a four years' school may meet all the university admission requirements and have 10 free elective credits left; but a three years' school should not attempt to prepare for Greek, and should make its choice, we will say, between a Latin-language course and a modern-language course, not attempting to cover both. The first of these, the Latin course, would prepare for all but Greek, but would be deficient on the scientific side at least; and the second, more liberal, or modern-language course, would prepare for all university work except the classical.

I must not omit to notice that preparation for the colleges of engineering and science now requires three years of English instead of two, as before, and two years of modern language instead of one. By a slight modification of the entrance requirement for the college of agriculture, however, it is now possible for a student to matriculate in the university without any foreign-language work at all, his entrance in that case being conditioned only by a requirement that he shall take French or German in his college course if a candidate for a degree.

Table III has been prepared merely to show the wide range of subjects and of credits in each which will be accepted as free electives in preparation for any university course whatsoever. We have consciously excluded only bookkeeping from this list of subjects usually taught in public high schools, and have fixed in all cases the minimum credit accepted at the lowest amount which it seems to us would have an appreciable value as a preparation for college work.

One useful result of the establishment of this open elective list of studies available in preparation for any college course will be to give to each collegiate department an immediate interest in the kind of work done in every study in the high-school course. If astronomy and biology may be offered as part of the preparation for Greek, and if Greek and civics may be offered as part of the preparation for biology, then the faculty Grecian and the faculty biologist each must hope that even these parts may be thorough and sound. We have now, in fact, the vertical piles and pillars of our preparatory foundation firmly bound and locked together by a veritable network of cross and diagonal braces running from every point of support to every point supported. What is a pillar for one is a brace for another, and weakness in any part affects the stability of the whole; that is to say, by leaving the high school as free as possible to do its own work for its own primary ends we have really strengthened it greatly as a university foundation, and have at the same time enlarged and unified the university interest in the whole of it and in every part.

Doubtless to more than one it has occurred to inquire whether the system here described and discussed is to be accepted as a finality, and doubtless to some at least the answer must have occurred that this can not possibly be. In the first place, it must be admitted that the several exceptions to the general principle and modifications of the main idea give to the new scheme something the aspect of a compromise between somewhat divergent views and partially inharmonious interests, and such compromises are rarely altogether stable; and in the second place, the whole is confessedly a means of adjustment between a developing university and a system of public schools as yet clearly incomplete. What we hope and believe is that we have here a means to a close but flexible articulation of the university and public high school, such that both may henceforth grow and develop together as interdependent parts of a unitary whole, each shaping the other, and at the same time yielding itself to the other's shaping. Then the university requirements will be advanced only as the average high school can normally and permanently improve its courses and its work; and these can be so improved only as the educational ideals and the financial resources of the average Illinois community may be improved upon.

When every county has at least one good high school and every high school has its four years' course; when the nature side of the high-school work is as full and strong as the language side; when a language is not revered by any of our teachers merely because it is relatively old, nor discredited by any because it is relatively new; when every American child receives the full benefit of his birthright as an heir to the current use and accumulated treasure of the English tongue; when, in short, the public high school has been thoroughly liberalized and modernized and rationalized, and hence unified throughout the State, then the entrance requirements to the University of Illinois will doubtless be materially different from those now proposed; but in the meantime we have here a working scheme, I hope, which, by hitching the horse and the cart together—whichever of the two you may call the horse and whichever the cart—may insure at once the efficiency of the horse and the forward movement of the cart.

X.—THE BROOKLINE EDUCATION SOCIETY AND ITS WORK.<sup>1</sup>

The Brookline Education Society was organized May 8, 1895. Its general character, aims, and methods may be gathered to some extent from the provisions of its constitution, which is as follows:

## CONSTITUTION.

The Brookline Education Society is established to promote a broader knowledge of the science of education, a better understanding of methods now employed, and a closer sympathy and cooperation between the home and the school.

*Officers.*—The society shall elect by ballot, at the regular meeting in April, a president; a secretary, who shall also act as treasurer; and five other persons who, with the president and secretary, shall constitute an executive committee.

The president shall preside at the meetings of the society and of the executive committee.

The secretary shall keep a record of the proceedings of the society and of the executive committee; shall issue notices of all meetings; shall notify members of their election, and shall conduct the correspondence of the society. The secretary shall also be the custodian of the funds of the society, use them under the direction of the executive committee, and render an account of the same at the regular meeting in April.

The executive committee shall present for election to membership in the society such names as their judgment may determine, shall prepare programmes for all meetings, and shall have general charge and management of the business and affairs of the society.

*Members.*—Any persons of the age of 20 years, desiring to join the society, and sympathizing with its objects, may become members by signing the constitution, if nominated by the executive committee and elected at any meeting by a majority of the members present. Every member shall pay an annual fee of one dollar. The secretary shall send to all persons who are chosen members a notice of their election, with a copy of the constitution, calling attention to the provision for an annual fee.

*Meetings.*—Regular meetings of the society shall be held on the second Tuesday of October, December, February, and April. Special meetings may be called by the president whenever he shall deem it expedient. At all meetings of the society, after papers or addresses have been presented there shall be opportunity for free discussion of the same.

*Standing committees.*—The executive committee shall appoint the following standing committees: (1) Committee of not less than five persons on child study; (2) committee of not less than three on lectures; (3) committee of not less than five on art; (4) committee of not less than five on music; (5) committee of not less than six on science; (6) committee of not less than ten on physical training; (7) committee of not less than seven on school libraries; (8) committee of not less than five on history; (9) committee of three appointed by executive committee—from their own number—to act as finance committee, whose duties it shall be to obtain funds for the society and to act with reference thereto under direction of the executive committee.

*Vacancies.*—Any committee may fill vacancies in its number which occur after the annual meeting.

*Amendments.*—This constitution may be amended at any meeting of the society by a vote of two-thirds of the number present, if the proposed amendment has been stated in the notice of the meeting.

*Quorum.*—At all meetings of the society a quorum shall consist of 20 members.

Organization for 1897-98: President, Rev. William H. Lyon, D. D.; secretary and treasurer, Mrs. Alice N. George; additional members of the executive committee, Rev. Daniel Dulany Addison, Mr. Samuel T. Dutton (city school superintendent),<sup>2</sup> Mrs. Charles W. Kellogg, Mrs. Frederick S. Mead, and Mr. William H. Lincoln.

A statement of the meetings, lectures, committee work, etc., compiled mainly from the Third Yearbook of the society (1897-98), will serve to show the direction of its activities during the year, and in some measure the results attained.

## MEETINGS AND LECTURES.

*Meeting of October 19.*—Subject, "Local history." Addresses by Rev. Edward Everett Hale, D. D., Mr. Osborne Howes, Principal Daniel S. Sanford, of the high school, and Miss Annie B. Tomlinson.

<sup>1</sup> See also an account of the Public Education Association of Philadelphia, in the Rep. Comr. Education, 1894-95, vol. 2, pp. 1325-1326.

<sup>2</sup> The formation of the society is largely due to Superintendent Dutton's initiative.

*Meeting of December 14.*—Subject, "What should college do for our girls?" Such well-known experts in their lines of educational work as Dean Agnes Irwin, of Radcliffe College; Prof. Mary A. Jordan, of Smith College; Dr. Mary Webster, professor of philology at Wellesley College, and Prof. William T. Sedgwick, of the Institute of Technology, delivered addresses.

*Meeting of February 8.*—Subject, "Physical training in Brookline schools." The upper town hall was crowded with the members of the education society and parents and friends of the Brookline school children, the occasion being an open meeting under the direction of the committee on physical training of the society, with illustrations of games and gymnastics used in the public schools, all given by pupils of the various schools under the direction of their instructors. The exercises in general were examples of nearly every kind of exercise taught in the Brookline schools. The work of the higher grades was more finished than the simple games of the younger children. But the primary department romped with such vigor and with such vim that they captivated everyone present. The various drills and exercises by the girls of the high school attracted much attention, the marching calisthenics and æsthetic work being very pretty and very graceful. The programme was as follows:

1. Dumb-bells.....High-school girls, fourth class
2. Children's games .....Primary grades, Pierce School
  - a. Bean-bag race .....Second grade
  - b. Running jump.
  - c. Cat and rat.
  - d. Dodge ball.....Third grade
3. Swedish Day's order and game .....Fifth grade, Lincoln School
4. Vaulting, jumping, and balance beam.....Girls, high school
5. Fancy work with music.....Sixth grade, Lawrence School
6. Fancy step and wands.....Girls, high school
7. Land drill for swimming; push ball.....High-school boys, fourth class
8. Marching calisthenics and æsthetic work.....Upper-class girls, high school
9. Bean bags and games:
  - a. Three deep.
  - b. Fox and geese.
  - c. Teacher ball.
  - d. Jump the shot.
10. Swedish Day's order.....Ninth grade, Pierce School
11. Basket ball .....High-school girls

*Meeting of March 22.*—Subject: "The responsibility of the parent in the education of the child." Addresses by President Lyon, Rev. Reuen Thomas, and others.

*Annual business meeting, April 25, 1898.*—The membership rolls had upon them 572 names. The total expenditures for the year amounted to \$589.

#### FROM REPORT OF THE COMMITTEE ON CHILD STUDY.

Child study demands a uniform and intelligent treatment of the child, and the most feasible method of accomplishing this thus far has been in the holding of mothers' meetings, where mothers are aroused, not only to a sense of their own responsibility in this matter, but to a sense of the necessity for every mother studying the problem of motherhood. At such meetings, teacher and mother can together discuss subjects of vital importance to the child. In this, so general a report, we may not give any detailed account of these meetings.

The mothers have met in the afternoon at the various school buildings; the special need of the mothers in each district determining the line of work. In

the Cabot School meetings have been held, giving the mothers an opportunity to know something of the methods in the primary grade. Talks were also given on "Home reading" and "The parents' responsibility to the school."

The mothers, while not largely attending these conferences, have shown an increased interest in the school by more frequent visits to the schoolroom and by starting an art fund for decorating the walls of the building. Sufficient money has already been collected to provide the building with a goodly number of pictures and casts.

In its work among the mothers the committee has come to feel, more strongly than ever, the necessity of giving our girls more of the training which shall fit them for home makers.

One mothers' meeting was held at the high school, when this subject was brought most forcibly to the mind of every mother present by a practical talk on the "Place of domestic science in the girl's education," by Mrs. Alice Freeman Palmer.

The meetings, commenced last year in the Winthrop and Sewall schools, have been continued in the same line of work. In each of these districts a course of cooking lectures has been given, showing simply and practically what kinds of food are the most nutritious for the child and the mode and cost of preparation.

However good our schools may be, what sort of development can we expect from children fed upon tea and the product of the bake shops. At four and five years of age we find inveterate tea drinkers, tea forming a large part of the breakfast and an essential portion of the other meals of the day. He who discovers the relation of the tea-drinking habit to many evils existing among our people has opened up a field that can not lightly be passed by.

Other talks have been given upon "Play," "Sickness," "Care of sick," "Proper clothing," etc. It has been the aim of the committee in all its work among the mothers, whenever an evil was found to exist, not only to point out its danger, but to show a means of correcting it practical to the mother's condition in life.

The interest and appreciation of the mothers attending these conferences has been maintained to the last. Many a mother, absent from a meeting on account of work, tells us of a visit to a neighbor to find out what was said. These mothers are eager for knowledge and responsive to suggestions.

The teachers who have so cordially cooperated, as a result of these meetings, tell of another spirit in the school, an occasional visit from a parent, a more willing response from the home in whatever they may wish to undertake.

These bands of mothers, meeting together once a month—without sectarianism, without caste, without fees; united in the sacred bond of motherhood, in a desire to do the best for their children—is a leaven to any community.

#### FROM REPORT OF THE LECTURE COMMITTEE.

The committee determined to try the experiment of a course of lectures to be given for the most part by residents of the town, for whose services no charge would be made. The lectures were to be given in the hall of the William H. Lincoln School, on Boylston street, in a thickly settled part of the town, where it was hoped there might be a good attendance; and the tickets were fixed at a nominal rate, in the hope of still further increasing the attendance. The committee regards the result of the experiment on the whole as being satisfactory, although in some cases the attendance was not so large as was anticipated, the average being from one hundred and fifty to two hundred, while in one case it exceeded three hundred. The subjects of the lectures were as follows: "Commerce;" "The water supply of some foreign cities;" "Picturesque Scotland;"

“Alfred Tennyson;” “What the workingman really wants;” “Impressions from a trip abroad;” “Evolution of the dynamo;” “Some points of law in common life;” “The art of Egypt and Greece;” “The consular service;” “The modern newspaper;” “Francis Parkman.”

The financial results are shown by the following statement from Mr. Dutton:

Amount received from sale of tickets.....	\$131.65
Expended.....	\$56.25
Cash deposited in Brookline National Bank.....	75.40
	————— 131.65

A suggestion has been made in the committee that it may be well another year to enlarge the influence of the society and the interest in these lectures by having a number of courses in different parts of the town, on topics which will be educational in their nature, and thus reach a larger number of people than can be reached by limiting the work to any one locality.

FROM REPORT OF THE ART COMMITTEE.

It has been a matter of regret that for various reasons the committee could not arrange during the past winter for another exhibition of works of art. The loan exhibition of last year was so successful in its influence, particularly on the minds of the young people of the town, that it is evident similar exhibitions—even though not on so extensive a scale—will be of value in the future.

An important addition to the resources of the high school, in the direction of art education, was made through the efforts of Miss Weir last summer, who, during a visit to Europe, succeeded in gathering and classifying about 650 beautiful photographs of cathedrals, details of exquisite carvings, mosaics, Greek vases, mediæval ornaments, famous paintings, and frescoes. This collection is so arranged that different portions can be loaned to the schools of the town in the same way that books are loaned from a library.

We must never lose sight of the fact that the early impressions are the most lasting and the ones most easily influenced for good. We believe in art training for children, that they should be brought into contact with good pictures in order that their minds may be turned into the best channels.

The art committee of the Brookline Education Society have come to the conclusion that the legitimate field for their useful work in the future lies in the public schools. Some of these already bear abundant proof of the excellent and devoted work accomplished in this direction. The high school, the Longwood School, and the Edward Devotion School have been appropriately and generously supplied with pictures, and entirely outside of the school committee and the public appropriations. The school committee, while extending sympathetic encouragement toward any art work that may be undertaken, have wisely concluded that the decoration of the schools with works of art had best be undertaken by private enterprise.

In looking about for a school upon which to begin with some systematic art treatment, the committee have selected the Heath School. Although situated in the richest part of Brookline, this school is sadly lacking in many attractive features. With a moderate expenditure, say \$200, we find that valuable educational art features can be introduced. The committee have already formulated plans, and when these are completed they will begin the task of raising the money to carry them into effect.

## FROM REPORT OF THE MUSIC COMMITTEE.

The work actual or proposed for the year 1897-98 has been along several definite lines, as follows:

1. Weekly half hour of music in the schools.
2. Young people's concerts.
3. The organ recitals.
4. Band concerts on public common.
5. People's singing classes.

*Weekly half hour of music in the schools.*—Both through observation of the children and through testimony from the teachers, the members of the committee in special charge of this work have had proof of its value. Until recently the performers, who gave their services, were all ladies; but at the suggestion and with the aid of Mr. Cole of the committee, several gentlemen have been asked to sing to the pupils, with the wished-for result of arousing marked interest in the boys, who are apt to be more indifferent to musical effort and instruction than the girls. In this connection the purchase of two new pianos for the Devotion and Heath street schools is mentioned with pleasure, for the poor quality of the pianos in the schools is very noticeable.

*Young people's concerts.*—These concerts have not yielded so encouraging a result as had been hoped. At the first concert, given at 12.30 o'clock, the hall was filled, but at the other concerts, coming at 3.30 o'clock, the audiences were smaller, owing somewhat, undoubtedly, to the fact that a large proportion of the high-school pupils live at a distance from the schools, making it difficult for them to return in the afternoon. The concerts were devoted to—

- I. A review of the concerts of 1897:
  - a. Bach and Handel.
  - b. Hayden and Mozart.
  - c. Beethoven.
  - d. Schubert.
- II. Mendelssohn.
- III. Chopin.
- IV. Schumann.

They consisted of piano music and songs, with a short historical and biographical account of the composer and a few words explanatory of each musical number on the programme.

*The organ recitals.*—The committee essayed a new line of work in the free organ recitals, with such a gratifying result that a more extended series of this kind will undoubtedly be arranged for another winter. Two recitals were given, one at the Harvard Church and the other at the First Church. At both recitals practically all the seats were filled, there being not less than 1,700 people present on the two occasions. The audiences gave every evidence of appreciation and pleasure in the music. These recitals and the unmistakable popular interest in them have suggested to the committee the pleasure and advantage to the community if a good pipe organ were placed in Shailer Hall or in the town hall. In English town halls there is very generally an organ, the possession of which encourages the popular interest in music, the creation and perpetuation of local musical organizations, and the giving of concerts and other musical entertainments.

*Open air band concerts.*—The committee proposes to arrange for a series of band concerts in July and August similar to the very successful concerts of last summer. These concerts were made possible by the private subscription of a comparatively small number of citizens, and the committee wishes to urge upon the community the propriety and desirability of a more general support of them this year.

*People's singing classes.*—The committee has watched with interest the progress of the people's singing classes started in Boston recently, as this is a work that the committee took some steps toward inaugurating two years ago.

*Music in the schools.*—The committee wishes to call attention to the excellent work in music (singing) of the pupils of the primary and grammar schools, and also to the high-school orchestra, the study and work of which is done out of school hours, and not in connection with the school curriculum. The committee would be glad to see established in the high school an elective course in musical history and interpretation. There might be some question whether such a course should be supported from the public purse or through generous private endowment, but it is the opinion of the committee that it would be very desirable to have more attention given to music in the high school. At present the amount of time and money expended is small, and consequently meager results are produced.

## FROM REPORT OF SCIENCE COMMITTEE.

A school index to the bound volumes of the Scientific American Supplement from 1876 to date, embracing the titles of somewhat over 1,000 interesting and valuable articles upon applied science, including only such papers as are especially adapted to the use of pupils and teachers of our public schools, is now in the hands of the publishers; a classified index to the electrical literature of our public library, with a brief outline of a course of reading on the subject of applied electricity for those interested in such matters; a list of references, for eighth grade in physics, already in the hands of the teachers; a most effective lecture upon "The protection of our birds," given under the auspices of this committee, before the pupils of the high school, by Mrs. Hornbrook, of Newton; and a vigorous attempt, not yet abandoned, to produce a relief map of Brookline, constitutes the sum total of our labors.

## REPORT OF THE PHYSICAL TRAINING COMMITTEE.

The committee on physical training began the season with the intention of supplying some (as many as the funds to be collected would allow of) of the schools with apparatus to encourage the playing of the children at recess, and, if need be, of instructing them in the use of the apparatus. The object of this was to get a great number of children to take healthful exercise at the time apportioned for that purpose.

From the observations of this committee it would seem that the children lack direction as to how properly to use their recess. They are turned out of their rooms by the school regulations, but many of them, even when space is available, get none of the pleasurable, alertness-teaching, blood-circulating, health-giving exercises, which are the component parts of an interesting game of play.

The carrying out of this idea does not interfere with any of the school regulations, for the authorities make no attempt to govern the child at recess. In fact, after an explanation offered to a subcommittee of the school committee, their sanction was given to the plan and the hearty cooperation and advice of the director of physical training was also given us.

Your committee estimated that about \$100 was needed in order to fairly try their scheme, and to raise this fund personal solicitations were made, and an appeal and explanation were put in the Brookline Chronicle early in January last. Only about \$40 toward this fund of \$100 has been collected, and not all of this has been expended, as it has been only recently received.

The game of basket ball is at present very popular. It is a game which both sexes may play, but is especially appropriate for the girls. Several outfits for this game have been provided. The committee is not yet ready to report upon the benefits of this plan.

On February 8, under the auspices of the society, this committee gave an

exhibition of the regular work in physical training which obtains in our schools. With the help of many of the teachers and nearly 200 of the scholars a series of exercises, tableaux vivants, representing the class work done in the different grades of the schools in physical training were successfully shown.

The clumsy, though unconscious, interested play of the primary children—kindergartners—the more complicated movements of the grammar grades, the gymnastic games and apparatus work, and, finally, the graceful, rhythmic drill of the high-school girls each had a squad to present them. Such exhibitions of what actually goes on in our schools can not fail to be appreciated by the parents of the scholars. When, in addition, this is helped out by a syllabus on the programme explaining the part of each exercise in developing the muscular symmetry of the body, the lesson to eye and understanding is one never to be forgotten, and it would seem an invaluable method of instructing present-day parents in present-day practices.

The committee have attempted no other work, but hope next year to report fully on their plan for recess play, for which funds are still needed.

#### REPORT OF SCHOOL LIBRARIES COMMITTEE.

The committee on school libraries have come to the conclusion that the most effective work which they can do, and that will be of the most lasting value, is to devise some thoroughly practical plan for bringing the schools and the public library into closer relations, the one with the other.

With this object in view, we propose that our school children be taught in a thorough and systematic way how to use a public library—such instruction to be followed by examination. Our intention is to bring the children from year to year during their school life constantly and naturally into touch, not only with good books, but more especially with such books as are best suited to their age and mental development, with such books as will really appeal to them and interest them, thus causing them to form the habit first of using a library; and second, of seeking the best that it affords. We may hope in this way to cultivate the taste, and to bring our children gradually to realize and appreciate the resources of such an institution. To this end we recommend that the town be asked to make a special appropriation to the trustees of the public library, of which a portion shall be used for the salary of a school librarian, a portion for the expense of fitting up and maintaining a room in the library building for the issue of books to school children, and for the exhibition of such books as may be from time to time especially set apart for the inspection of pupils, and the balance for the purchase of such books as the school committee shall recommend to the trustees of the public library. The school librarian shall be employed by the trustees of the library, and shall be under the general direction of the librarian.

The duties of the school librarian shall be: First, to have general charge of the schoolroom in the library building; second, to issue books to pupils and to exhibit such books as shall be especially set apart for their inspection; third, to instruct pupils in the method of cataloguing, in the use of reference books, to otherwise assist and advise pupils, and generally to reveal to the pupils the resources of the library; fourth, to come in contact with the teachers, learn the needs of the school and, with the assistance of the teachers, under the supervision of the librarian and of the superintendent of schools, to draw up lists of books to be submitted to the school committee with the recommendation that they be added to the library. On the principle of the traveling library, books especially adapted to throw light on certain subjects may be sent from the schoolroom in the library building to classes engaged in the study of such subjects.

We therefore recommend that for the first year the town be requested to make a special appropriation to the trustees of the public library of \$2,000, \$700 to be

expended for the salary of the school librarian, \$300 for fitting up the schoolroom in the library building, and \$1,000 for books to be bought by the trustees of the public library, at the suggestion of the school committee.

FROM REPORT OF THE HISTORY COMMITTEE.

The work of the history committee has been continued along the lines indicated in the last report. In addition to the large wall map prepared under its direction, a small outline desk map has been issued for use in the schools in connection with the guide published a year ago.

The committee feels that the time has come to devote its attention to some of the larger aspects of history. In writing what it is most profitable for a person to learn, John Ruskin declares that a man ought to know three things: First, where he is; second, where he is going; and third, what he had better do under the circumstances.

During the time this committee has been in existence it has had for its object the solution of the first of these problems, and has tried to see Brookline as it is and to learn what it has been during a not very remote past. It would now seem to be the duty of the history committee to try to discover whither we are going. This seems an impossibility; and yet, if we believe that history repeats itself, can we not find the general direction of our course by looking backward over the great field of universal history? The transition from local to general history need not be sudden or violent. As in ancient days all roads led to Rome, so in modern times all roads lead from the home out into the remote corners of this busy world. The Seven Hills of Rome may be found right here in Brookline, and the earliest settlers of the town find their prototypes in the Patricians of the little city on the Palatine.

The schools have received many benefits from the town through the school committee and at the hands of generous private citizens. There is, however, much to be done to render the department of history in the schools more efficient than it is at present, and the committee on history will offer several specific suggestions by means of which the study of history may be placed on a firm basis. Laboratories there are for science—zoology, botany, physics, chemistry, and the domestic branch of the work; but you will look in vain if you try to discover a laboratory for historical research in Brookline. By and by, when patience shall have had its perfect work, perhaps the dreams of the instructors in history will be realized. But even under present conditions much may be done. There are in the town several clubs devoted to study. By the members of these clubs, papers are read, bibliographies are prepared, pictures and maps are collected. But why should not these clubs be given a wider field of usefulness? And, on the other hand, would not the clubs be glad to avail themselves of the resources which the schools could furnish? For instance, several of the schools now own stereopticons; one of these could be placed at the service of a club wishing to illustrate a subject graphically. The club would, perhaps, buy some lantern slides, which would in their turn be placed at the service of the schools. Is there not in this idea a chance for wide usefulness, and at the same time economy of effort and of substance? Again, the subjects of the papers read in the clubs are often the same as those which are being studied in the schools. Here is another opportunity for cooperation.

It has been the good fortune of pupils in the high school to listen to two papers written and read by members of the Thursday Club, one on "Greek life as shown in the poems of Homer;" the other on "Scottish life and character as seen in the literature of Scotland." The interest and enthusiasm which these lectures excited prove that they meet a want, that of merging the life of the school in the great community life of the world to which it belongs.

Maps, pictures, books, models, like those of the Parthenon and the Acropolis at

the art museum, are indispensable to the proper study of history, which must, of course, include the kindred subjects—art, literature, sociology, and political economy. Pictures illustrating different events in history are often to be found in the periodicals of the day. These would prove welcome gifts in many school-rooms. There is a series of historical plates illustrating different phases of life in ancient and mediæval times which the schools ought to own, because seeing goes a long way toward believing and realizing a past in which, at first, the child feels that he has no share.

Every school should have a good working historical library, and every school-room should possess a small library of its own to which reference could be made without loss of time. The map habit is one that should be cultivated very early in a child's education. Maps on a plane surface, globes, and relief maps are the necessary accompaniments of general reading.

It must be understood that all these aids and appliances are the common property of those who need them. Culture for its own sake is valueless; culture for service is the dearest possession of the enlightened man of to-day.

---

## XI.—OUR SCHOOL WORK.

[From an address delivered by Superintendent Edwin P. Seaver to the teachers of the primary and grammar schools of Boston, November 12, 1897.]

\* \* \* For one, I am not ready to admit there is not a science of education. Nor am I ready, with the writer of an article in a recent number of the Atlantic Monthly, to throw aside all the psychology hitherto known as being antiquated rubbish handed down to us from mediæval scholasticism and to wait in suspense until a whole new foundation for educational science shall have been built by the physiological psychologists. Undoubtedly we may expect valuable contributions to our pedagogical knowledge from the psychological laboratory, but the older introspective psychology has given us much that we are not yet ready to throw away. We may even admit that the mediæval scholastics had some good knowledge of the human mind, puerile and empty as were many of their speculations and disputations.

But the true basis of educational science is found in neither of these remote regions—neither in mediæval scholasticism nor yet in the psychological laboratory; it is found in the familiar psychic history of childhood and adolescence, more especially in that part of it which records and discusses the phenomena of the growing mind while undergoing the processes of instruction. This is no new science; but its true relation to general psychology has been very properly emphasized lately by bestowing on it a new name—child study. For the study of this psychology of childhood and adolescence, each of us has a laboratory well filled with specimens—many of them very live specimens—no two of which are exactly alike, while some are quite abnormal, but all interesting. Here we test our principles, extend our observations, and occasionally, perhaps, make a new discovery. In this way we learn all we really know of educational science. The principles of education imparted to us at a normal school or acquired by reading have for us no validity or significance until we have applied them to the practical exigencies of the schoolroom. For in education, as in other matters, the science and the art go hand in hand, and are indeed so intimately connected that neither is valuable without the other. The mere theorist, unacquainted with practice, and the mere practitioner, ignorant of theoretical principles, are alike incompetent to do good educational work.

Coming now to the particulars of our school work, let us consider, first, what

our established course of study requires of us in the use of school time. The general purpose of a course of study is twofold: First, to enumerate the matters to which attention may be given grade by grade in the schools; and secondly, to apportion the school time among these various matters. In a large system of schools an established course of study with a uniform apportionment of school time is an admitted necessity; and a faithful observance of its requirements is the best way of making satisfactory progress under it. The matters contained in the present course of study or the apportionment of time among them may not, in your opinion or in mine, be the best conceivable. Arithmetic, or drawing, or grammar, or manual training, or any other branch, may have more or less time than its relative importance, in our judgment, warrants. If so, we have interesting matter for discussion, and possible improvements to suggest. Discussion of proposed improvements is always helpful. But until the existing courses shall have been changed by the proper authority, you and I are bound to obey their requirements.

One good reason for insisting on a strict observance of the time apportionment in a course of study is the need of preventing favorite studies from robbing the others of their due share of time and attention. There have been times in the history of our schools when this kind of robbery went on more freely than it does now. For example, drawing, years ago, was the favorite study in many schools. \* \* \*

Perhaps there is hardly a branch of study in the whole course which does not at times betray predatory tendencies that need to be restrained. And the duty of applying the proper restraint falls on each individual teacher. It is not merely a matter of supervision, nor does it pertain only to a master's management of his school; it is and must be, under our free system of administration, an element in the daily work of every teacher.

Every teacher ought to work by a daily time-table. If carefully prepared by the teacher who is to use it and strictly followed, it is an effectual economizer of time. It prevents waste and compels prudence in the use of school hours. "There are more matters in the course of study than I can find time to attend to," I hear some teacher say. "Let me see your daily time-table," I ask. "Oh, I can not tie myself down to a time-table; I must be free to teach as the spirit moves; I have no time-table." "Well," I remark, "you are probably a spendthrift of your time, and your difficulty in finding time for all the things you are required to teach is like the difficulty experienced by another class of spendthrifts in meeting their obligations." Redeem all time from waste by using a daily time-table, and there will be time enough for all matters set down in the course of study. And the time-table will make your work more systematic, more concentrated and effective. All observers of teachers' work will agree that the teachers who do the most work, with the best results, and the most easily withal, are those who plan their daily work beforehand, make a careful appropriation of time, and then adhere steadily to their scheme. They have time enough for everything by attending to everything in its time. It is because the use of daily time-tables makes each teacher personally more effective that my appeal is made primarily to you as individuals. But the whole school is made more effective in the same way. It is therefore a matter of wise management for the principal of a school to see that all the teachers are using their school hours without waste and in accordance with the general appropriation of time made in the established course of study.

And here I will turn aside for a moment to say a few words on the nature and extent of the authority vested in the principal of a school or district. The need of a right understanding on this point has more than once been brought to my attention by unfortunate difficulties that seem to arise out of a misconception of the proper relations between the principal and the assistant teachers of a school.

Broadly speaking, the authority of a principal in his school is absolute. It is like that of a captain aboard ship, or that of a military leader in campaign. His orders must be obeyed promptly and fully; his plans are to be executed loyally and faithfully, no matter whether the assistants think them wise or unwise, agreeable or disagreeable, just or unjust. There is no other theory upon which a school can be managed successfully. "But must I submit," I have sometimes been asked, "when the orders I receive from my principal are clearly unwise or disagreeable, or even unjust? Is there no remedy for such wrongs?" Yes; there is a remedy for every wrong. If an assistant teacher feels aggrieved by the duties put upon her by the principal, there lies an appeal to superior authority. But before an appeal can be taken there must be obedience on the part of the appellant. First obey, and then appeal. The common mistake is to refuse obedience and then to appeal to higher authority for support. But the ears of higher authority are closed—ought to be closed—to one who is in the attitude of disobedience. Listening to disobedient appellants would soon bring on a state of anarchy. Moreover, a grievance can not be said to have arisen until the alleged unwise or unjust order has been obeyed; and even then the question whether the order was in fact unwise or unjust must be considered an open one, which the authority appealed to will not decide without hearing both parties. Disobedience, therefore, implies a premature decision of the very question at issue by one of the parties, and an appeal under such circumstances amounts to no more than a demand to be sustained in insubordination.

But a wise captain advises with his officers, and the ablest general would not dispense with councils of war. So will the wise and able principal of a school hold consultations with his assistant teachers. Teachers' meetings presided over by him have for their purpose the free discussion of all matters pertaining to the conduct of school business. No principal was ever so wise that he could gain no useful suggestions from meetings of this kind; no corps of teachers was ever so strong but that the mutual good understanding and sympathy arising from free interchange of experiences and opinions would make it stronger. Therefore should discussion in teachers' meetings proceed until all possible good has accrued therefrom. But at last the time comes when discussion must cease and action begin. Then orders must be given and obeyed. Then no longer can subordinates stand out on their differences of opinion with the chief. He has considered these, given his directions, and has the right to expect prompt and full obedience. A member of a certain executive board was once observed to be carrying on efficiently a course of action not in accord with his well-known opinions and votes in the board. On being asked why he did so, he replied, "I vote as I think, but I do as I am told." So I would advise all teachers to speak as they think on all proper occasions, but to do as they are told, and do so cheerfully and efficiently. This is the true principle on which to reconcile a free expression of opinion, which is wholesome, with due respect for authority, which is necessary. \* \* \*

Formerly our reading in school was confined to the school reading books. Now we make large use of "supplementary reading," partly for the purpose of gathering information and partly for the purpose of making pupils acquainted with literary compositions as wholes, and not through extracts. More important, however, than either of these excellent purposes is the expression of thought and sentiment by oral reading. Perhaps oral reading receives less attention now than formerly. If so, there is need of a reform. We should restore oral reading to all the prominence it ever had, believing that it makes more both for culture and for growth than any other single school exercise. The older the children the more marked is their improvement through oral reading rightly taught. \* \* \*

A word may be fitly spoken here about the reading matter used in the primary schools. There seems to be a tendency in many quarters to make an inordinate

use of the primer for the production of a high degree of mechanical facility in reading easy matter. When first-grade children have read through one primer the teacher gives them another primer, then another, and another, and another. One teacher I heard of who boasted of having read eight primers with her class.

Now, the language of primers is wholly artificial. It is selected and put together, not for the thought expressed, but to meet, in an assumed best order of succession, certain difficulties of spelling and pronunciation. Hence, "*The fat cat that sat on the mat, The rat that ran from the cat,*" and other equally thrilling stories. The whole training in the language of primers is a purely mechanical process, no doubt a necessary process for a while, but, nevertheless, unrelieved by a gleam of human interest, and to be got through with at the earliest time possible. Who of you can remember anything of the primer you read in school? Of my own primer I remember it had a yellow cover; it had "a picture representing sunrise, highly conventionalized, with the legend, "The sun is up;" and it had another picture of a cat with arching back standing on top of a stone wall just out of reach of a dog that was striving in vain to reach her; but what tragic story may have been printed under this lively picture I am utterly unable to recall. On the other hand, I easily remember the pages, both picture and text, of the book from which I first read some fables of Æsop. These are real literature. For more than two thousand years they have interested children, as well as their elders. Therefore do I say, Let the children pass as early as possible out of the empty primer language into real literature. I pity children who are required by the mistaken zeal of their teachers to read eight primers, or four, or any more than are absolutely necessary to overcome the preliminary difficulties of reading; and I beg you all to let your children reach reading matter of enduring interest at the earliest time possible.

Under the head of writing, in the modern use of the term, is included the whole use of that art in the expression of thought in composition. The mere mechanical ability to produce fair manuscript is hardly of enough importance in itself to rank as one of the main parts of elementary instruction. The great amount of drill given for the sole purpose of producing fine penmanship takes much time that could be spent otherwise to greater advantage. The act of writing, as a school exercise, should usually have for its object the expression of thought. Neatness and legibility, though important, are incidental, and are quite as likely to be secured when so regarded as when made the sole purpose of the writing exercise. It would be well, I think, if pupils in grammar grades were seldom allowed to take the pen unless to write what they wished to express, or record what they wished to remember. Copy books I would not use, save occasionally for teaching the best forms of letters. Practice enough could be had by writing for preservation, in a commonplace book, matter worth the time spent upon it, as poems or fine prose extracts. We have in our city one grammar school in which no copy books have been used for many years past; and yet I doubt if its graduates could be distinguished from those of other schools by the inferior appearance of their manuscripts. Less uniformity in the mass and more individuality their manuscripts may indeed show; but these graduates carry to the high school each a handwriting which is his own, and which, for that reason, is less likely to be broken up by the influences of high-school work. And so I leave the copy-book question for your further consideration in this form: Can time be saved for better uses, and yet without material loss to penmanship, either by discarding copy books altogether or by very much restricting their use?

In the primary schools it may be a question how far it is wise to go in the effort to use writing for the expression of the pupil's original thought. Children sometimes display charming originality when by a happy arrangement of circumstances the teacher leads them to describe what they have themselves observed,

or to relate what they have done. But the teacher's effort to control circumstances often fails, and children supply the lack of observation and thought by a remembrance of mere words and phrases. The performance of a little boy, in whom I had a personal interest at the time, illustrated this point to my mind in a striking way. He was a pupil in a modern primary school, where the first steps of reading and of writing were taught simultaneously; and the writing was taught, not only as a mechanical art, but also for the supposed expression of thought. It occurred to me that I would test his acquired power in this respect; and I proposed that he write a letter to his great-grandmother, of whom the boy was very fond. I first taught him how to write the words "Dear Grandmother" and "Your affectionate grandson," at the beginning and at the end of his letter, supposing these words too difficult for him at his stage of advancement. His own name he could write. I then told him to write his letter and show it to me before sending it. This is what the little boy wrote:

"DEAR GRANDMOTHER: Can you run to the hill? I can run. Run, boy; run!"

There may have been a touch of original thought in the youngster's application of his familiar primer language to the case of his venerable relative, but it was rather unexpected. \* \* \*

Let us turn now from school studies to school discipline. There are a few things that need to be said, and some questions which may repay your further investigation.

In the first place, I note with much pleasure one sure indication of improvement in our discipline. There is much less corporal punishment than there was a few years ago; and I hear that good order is even more prevalent. My statistics at the office show that reported cases of corporal punishment have diminished over one-half. In the primary schools they have diminished fully two-thirds; in the grammar schools nearly two-fifths. Now, if this movement could go on with some acceleration, it is possible that the schools of Boston might pass into the twentieth century practically free from corporal punishment. I doubt not that we are all agreed that such a consummation is devoutly to be wished. Is it not, then, worth working for?

I have called corporal punishment a means of school discipline; but I must at once qualify by assigning it the lowest rank among the means at the teacher's command. The aim of school discipline is not merely the outer one of good order in class room or yard, but much more the inner one of moral improvement in the scholars; it is right conduct from free choice, not from compulsion; it is the development of character toward good citizenship, through the formative influences of school life. Now, corporal punishment has about the same relation to the development of moral character in school children that the police force has to the moral elevation of a community. Both apply outward restraints to conduct; both secure obedience through fear of the consequences of disobedience; but neither seeks to touch the higher springs of action; neither is profitable for edification. The boy who gauges his conduct so as just to escape a whipping in school is likely enough to become the man whose moral sense will be satisfied by keeping himself out of jail. True moral culture seeks the development of character through systematic efforts to bring into habitual action the higher motives. It is at once the most essential and the most difficult part of the teacher's work. But in so far as this difficult work is done, do the occasions for the use of forcible means of discipline diminish and disappear. And it is because I feel sure that work of this kind in our schools is now supplanting corporal punishment that I hail the reported diminution of it as a welcome sign of improvement.

But I must not fail to point out some particulars in which still further improvement seems immediately possible. For this purpose let me ask your attention to some matters of record. Last summer I sent for the records of the corporal pun-

ishments that had been inflicted during the months of March and April, that I might learn the causes for which this form of punishment had been used. In two-thirds of these records the cause assigned was "disobedience" or "disorderly conduct." How flagrant these offenses might have been was not stated in most cases. But it would seem probable that in schools where boys are whipped for "tardiness," for "truancy," for "inattention," and for "neglect of work"—offenses which involve no branch of "good order"—the same punishment would likely enough be given for comparatively mild cases of "disobedience" and "disorderly conduct"—as, for example, disorder in the lines, or disturbance of the filing reported by the monitors.

It may be—indeed, I am strongly inclined to believe—that a closer observance of the spirit of our regulations, which require us to avoid corporal punishment "in all cases where good order can be preserved by milder measures," would result in a diminution of the corporal punishment scores for "disobedience" and "disorderly conduct." However this may be, our regulations can hardly be held to warrant the infliction of corporal punishment for the other causes already named—"tardiness," "truancy," "inattention," and "neglect of work;" nor for most of the rest mentioned in the reports—"leaving school without permission," "impudence," "use of bad language," "stealing," "ill-temper," "telling falsehoods," "bad behavior on the street," "destroying note sent to parents," and "untidiness." Is it for the correction of miscellaneous faults like these that the defenders of corporal punishment wish it retained in the schools? I think not. Let me quote, from the report of one very eminent defender of corporal punishment, language used by him thirty years ago, but still profitable to consider:

"There would be no good purpose accomplished," he says, "by concealing the fact that the prejudice which exists with regard to corporal punishment is due largely to its indiscriminate, unwise, and excessive use by some teachers. The constant infliction of it for trifling offenses, if not an abuse, is an unwise use of it, not only because it takes the place of those moral and ennobling influences that teach the pupil to govern himself, but because it destroys the principal power of this kind of punishment, which should be found, not in the infliction of bodily pain, but in the disgrace and shame associated with it."

"Nothing looks more suspicious," he says, further on in the same report, "than the constant occurrence of such reasons for corporal punishment as impertinence, inattention, disorder, restlessness, disturbance, playing, tardiness, not one of which, unless aggravated in its character, is worthy of it, but should be met by some other form of punishment. The kind, sympathetic teacher rarely reports impertinence as a cause for punishment, for it is generally the reflection in the pupil of anger, undeserved reproof, or bitter sarcasm on the part of the teacher. Children would be more than human to sit quietly under the taunts and jokes which we have known some teachers to indulge in. Inattention and restlessness too often originate in the teacher's lack of ability to make the studies interesting; disorder, disturbance, playing, in a want of that quiet power which makes itself constantly felt as a check upon the pupils, or, it may be, in a most foolish waste of power by attempting to enforce too strict discipline."

Earlier in the same report the writer had said:

"We feel that only in cases of gross impropriety, of willful, determined disobedience, and persistent defiance of the regulations or of the authority of the teacher, is corporal punishment justifiable."

This language, used by a defender of corporal punishment, has my hearty approval. My own position on the corporal punishment question ought to be well known, for this is not my first utterance upon the matter; but I have found myself extensively misrepresented. I am not in favor of taking away the right to use corporal punishment; but I am in favor of the teachers trying to reduce

the use of it to less than one-tenth of the present amount. Nine-tenths of it as now used I believe to be wholly unwise and unnecessary. \* \* \*

Children's offenses against morality, their lies, their thefts, their oaths are not usually best treated with harshness and severity. Children are often more ignorant than wicked. They are not adults. They need enlightenment more than punishment. The elements of right and wrong in their conduct need to be pointed out and explained to them with a tender earnestness that should touch their better feelings and win them over from the wrong to the right. One child so persuaded should rejoice the teacher's heart more than ninety and nine children restrained from wrong conduct by the mere dread of punishment.

---

XII.—ADDRESS BY HON. ABRAM S. HEWITT, LL. D.,

*At the Dedication of the New Site of Columbia University, New York City, May 2, 1896.*

\* \* \* This occasion has a significance which demands and justifies an explanation, familiar as it must necessarily be to the students of history and to the friends of education, but necessary in order to comprehend the genesis and the mission of the new university, destined to radiate its influence for good in all time to come from these buildings which we are here to dedicate to the service of God and man. Let it be remembered, however, that we are here not to dedicate buildings alone, but also to dedicate to the responsibilities and duties of advancing civilization the wealth, the energies, and the potentialities of the millions of men who will in the ages to come constitute the population gathered around this center of light and learning.

It is well that these ceremonies have been inaugurated by unfurling the national flag, which is the emblem of the sovereignty of the people. In every clime and under every form of government the flag represents the principle of loyalty to the constituted authority. Patriotism is not peculiar to any land nor to any people, but is the property of humanity wherever organized society exists. But with us the flag has a special significance. It represents not merely love of country, but something more. It is not only the ensign of the whole people, but it is the evidence of the liberty of the citizen, without which the Stars and Stripes would be for him but a badge of slavery. We are accustomed to speak of our Government as an "indestructible union of indestructible States," and in one sense this is a true definition, but in a larger spirit the Republic is rather to be regarded as an aggregation of units, every one of which is an independent citizen with equal rights and correlative duties.

But whence is the citizen to derive his knowledge of the nature of his rights, and how is he to rise to the full measure of the performance of his duties? Political knowledge is not a natural endowment. It is the growth of painful experience, and the outcome of training through ages of effort and sacrifice. The history of the world is the record of its acquisition. In its range are included the lessons of every age and every nation. Heroes and saints, statesmen and demagogues, tyrants and traitors, have alike made their contributions to its evolution. The silent masses of the people have suffered and died in order that humanity might at length achieve freedom. There is not a region on this great globe which has not made its mark upon the final record which we call civilization.

But among all the peoples of the world to none has the opportunity been so propitious for waging the conflict between right and wrong, for carrying on the struggle between ignorance and knowledge, as in this land of ours, which seems to have been reserved under the providence of God for settlement by men who

were dominated by a single idea, for which they were prepared to sacrifice home and comfort and wealth and all that men usually hold dear. The idea of personal liberty, which elsewhere was an abstraction, was made a reality in a new land, and the only land in which no aristocracy had ever existed and privilege was unknown. They were enthusiasts who came to a region where there were no prejudices to encounter, no abuses to overcome, no traditions to fetter the free spirit of man. While they claimed the right to worship God according to the dictates of conscience, they held this right always subordinated to the individual liberty of the citizen. In whatever else they may have differed among themselves or with their neighbors, civil liberty was never in question, and its rights were asserted whenever and wherever assailed by kings, governors, or parliaments. They regarded liberty as an end, and not as a means. "To secure it, to enjoy it, and to diffuse it was the main object of all their social arrangements and of all their political struggles. They held it to be the inalienable prerogative of man, which he had no right to barter away for himself, and still less for his children. It was a sacred deposit, and the love of it was the main instinct engraven in their hearts." These pioneers of freedom understood that without education liberty would perish from the land in which they had sought refuge. They were not numerous, but they were as prolific as they were earnest, self-reliant, and independent. It is estimated that the three millions who inhabited the British colonies which joined in the Revolution were descended from less than one hundred thousand immigrants, nearly all of whom could read and write, and some of whom were very learned men and statesmen of the highest order. They realized the value and necessity of education in order to preserve the liberty which they sought in a new world, and which they were prepared to defend at the peril of life and fortune. Hence they founded schools and colleges, even before they had acquired the primary comforts of civilization. Whatever else their children might lack, they were to be instructed in the knowledge of their political rights and their religious duties. Hence from the first religion and education were the inseparable guardians of liberty, equality, and property. These three primary elements of the social organization were never separated, and indeed never separable in the minds of the exceptional men who laid the foundations of the Republic upon the inalienable rights of man. They justly held that private property was the concrete expression of liberty, and that any interference with property was an attack upon individual liberty. They believed that all men had an equal right to acquire and hold property, but they recognized that this very equality of opportunity would necessarily involve inequalities of possession, due to capacity, thrift, and energy. Thus were developed communities of freemen, in which each man was master of himself, equal to every other man before the law, and recognizing no claim upon his property to which he had not assented as the price of the maintenance of order and the dispensation of justice.

While the love of liberty, and its dependence upon education were recognized in all of the thirteen colonies, Massachusetts founded Harvard College one hundred years, Connecticut founded Yale fifty years, and Virginia founded William and Mary sixty years before New York had made any provision for higher education. Her youth were thus forced (reluctantly, perhaps, but probably to their gain) to resort for education to these institutions, which were afterwards denounced by the enemies of freedom as "nests of sedition." It is provided in the will of the father of a patriot whose fame constitutes one of the chief glories of our college that his son should never "be sent to the colony of Connecticut for his education, lest he should imbibe in his youth that low craft and cunning which they disguise under the sanctified garb of religion."

And yet, to the cadet of a New York family, graduated at Yale, we owe the fundamental condition in the charter of King's College, granted in 1754, that no

tests shall "exclude any person of any religious denomination whatever from equal liberty and advantages of education." Moreover, in the long and bitter controversy which preceded the granting of the charter, the principle was laid down for the first time in the colonies that it was the duty of the State to provide for the education of all its children, free from the control of sectarian religious influence. The ideas thus propounded by William Livingston, the statesman and patriot, have all been incorporated into the legislation of the several States of the Union, and at length in the new constitution of the State of New York it is made a fundamental provision that no public money shall ever be appropriated to any educational institution under the control of any religious denomination.

The delay in the establishment of an institution for higher learning in New York was due, however, not so much to indifference or to opposition, as to the extraordinary variety in the nationality and religious belief of its inhabitants. Unlike New England, it was not homogeneous in creed or in race. It is said that eighteen different languages were spoken in the colony, and there were certainly thirteen different churches in the City of New York prior to the Revolution. When, however, at length the college came to be chartered, the leading denominations were all represented in the Board of Trustees, and, so far as instruction was concerned, unlike the colleges of New England, it was absolutely unsectarian. Nevertheless, King's College was the special care of the Church of England, and its site was the gift of Trinity Church upon condition that its president should always be a communicant of the Church of England. If, however, it were thus expected that its graduates would be less devoted to the principles of individual liberty and the right of self-government, its promoters made a grievous mistake, for in the controversies which were soon to ensue between the colonies and the mother country there were no more earnest advocates of the doctrine inherited from their Dutch, as well as from their English ancestry, that taxation should not be imposed without consent and without representation. \* \* \*

The first president of the college, Samuel Johnson, was a man of great piety and learning, the friend and companion of Berkeley, and the correspondent of his illustrious namesake, the lexicographer. In view of what our college is now doing and what it hopes to accomplish, it may be well to put on record here the aims which Dr. Johnson proposed to himself in the conduct of the institution which he had undertaken to organize: "A serious, virtuous, and industrious course of life being first provided for, it is further the design of this college to instruct and perfect the youth in the learned languages and in the arts of reasoning exactly, of writing correctly, and speaking eloquently; and in the arts of numbering and measuring, of surveying and navigation, of geography and history, of husbandry, commerce and government; and in the knowledge of all nature in the heavens above us and in the air, water, and earth around us, and the various kinds of meteors, stones, mines, and minerals, plants and animals, and of everything useful for the comfort, the convenience, and elegance of life in the chief manufactures relating to any of these things. And finally to lead them from the study of nature to the knowledge of themselves and of the God of Nature and their duty to Him, themselves and one another, and everything that can contribute to their true happiness both here and hereafter." I think it will be conceded that if our university shall be able to cover this ground and to accomplish the results expected to be produced by the college course, no just criticism or complaint will ever be made by the most ardent friend of education.

Certain it is that the scheme outlined in the original circular was carefully followed for more than one hundred years, during which the standard of scholarship was always of a high order, and the cultivation of morality and honor was maintained as the primary object of education.

If the leaders in the struggle for independence were college-bred men, the

foundation of the Government and the formation of the Constitution was pre-eminently their work. Of the 55 members of the Constitutional Convention of 1787, 9 were graduates of Princeton, 4 of Yale, 3 of Harvard, 2 of Columbia, 1 of Pennsylvania, 7 of William and Mary, and 6 of foreign colleges. The small number from Columbia was due to the fact that New York sent but three delegates to the convention, but its two sons, Alexander Hamilton and Gouverneur Morris, were with Madison, and afterwards with Jay, in the "Federalist," the very bulwarks of that instrument which is acknowledged to be the most wonderful and successful political achievement ever devised by the wit of man. \* \* \*

If the construction of the Constitution was thus a triumph of patriotism over what appeared to be insuperable difficulties, its ratification by the States was only achieved by memorable efforts of wisdom and statesmanship. The battle was really fought out in the State of New York, where Hamilton, Jay, Morris, and Livingston, who were the sons of our alma mater, overcame the opposition of Clinton, whose sturdy patriotism and great services to the cause of liberty made him a formidable foe. While the decision was still in doubt the impatient people of this city determined to celebrate the ratification of the Constitution, which was secured by the adherence of the State of New Hampshire before the New York convention could be induced to act. In the procession, which was the first of many memorable celebrations of a similar character, the professors and students of Columbia College took a conspicuous part. On the banner under which they marched were inscribed the words: "Science and liberty mutually support and adorn each other." The author of this legend (certainly not remarkable for classic grace) could by no possibility have anticipated the potentialities for New York which were involved in these simple words. Liberty was indeed secured by the Constitution just ratified, but science was in its cradle. The principle of gravitation had been discovered, and the composition of air and water had recently been disclosed, but the application of this knowledge had not yet been made in America. Not a single steam engine had been erected on the continent, and beyond the rude application of a few water powers, all forms of industry were still carried on by hand. But the country was a land of unbounded resources, and its inhabitants, animated by individual energy and protected by law, were well prepared to undertake the conquest of a continent, and to develop its possibilities of wealth. The free spirit of the nation was thus loosened at the very juncture when science entered upon the career of discovery and development which has crowded the nineteenth century with great achievements and produced a sum of wealth far exceeding all the results of the eighteen preceding centuries of the Christian era. No pen can describe, no imagination can conceive the material triumphs of which this generation has been the witness and the partaker.

The favorable geographical position of New York gave it the natural primacy in this development, and its sons were not slow to see and to take advantage of its opportunity. De Witt Clinton, the first graduate of Columbia College after the Revolution, created the Erie Canal, by which the wealth of the great West was opened up and poured into the lap of New York. Robert R. Livingston (another graduate), the great chancellor who administered to Washington the oath of office, recognizing the genius of Fulton, supplied the means which made steam navigation a success. John Stevens, an alumnus of Columbia College, gave us the railway and the screw propeller, which have revolutionized transportation by land and by sea and enabled us to feed the teeming millions of Europe. Thus were supplied the stimulus which has made the century now closing a very carnival of enterprise, and an uninterrupted triumph of science and industry.

But in order that the result of genius and energy may be made beneficial to

society, the protection afforded by government and by law must be assured. This work fell to the lot of James Kent, appointed in 1793 professor of law in Columbia College. His lectures to the students—afterwards expanded into his Commentaries on American Law—have had a deeper and more lasting influence in the formation of the national character than any secular book of the century. The rapid growth of wealth tends to undermine that respect for the rights of property which were embedded in the Constitution, and hence the timely exposition of the great chancellor, followed, as it was, by the exhaustive commentaries of Mr. Justice Story, became the inspiration of the conservative legislation which has characterized all the States of the Union, and produced that respect for law which is the most striking trait of our people, and which preserved the Federal Union in its time of peril.

Enough has been said to show not only that Columbia College has thus contributed its full share to the creation of the free Government, which is our chief glory, but that in the marvellous material development which has taken place under its influence and protection, the achievements of her sons have been of transcendent value. They have certainly made New York the largest and richest city on the Western Continent, with possibilities of progress which promise to make it the metropolis of the world. With this conclusion we might rest the case of Columbia College in the consciousness that her past is at least secure. But this occasion takes note of the past only as the pioneer of the present, and the promise of the future.

A nation is not great because it is rich, any more than a man is a hero because he is a millionaire. The question is not how much riches we have accumulated but what we are doing with them. Is this great store of wealth being used merely for the acquisition of more wealth, and for the satisfaction of material wants and pleasures, or does a fair share of it go to the gratification of the spiritual needs of humanity and for its elevation into a higher and purer atmosphere?

These questions can not be answered without a few words upon the nature and origin of the wealth which we find concentrated in the City of New York. Broadly it may be stated to be of two kinds—the one altogether material, in the form of commodities, houses, and other visible property in which the value is due to the expenditure of labor and skill upon raw material; the other element of wealth is invisible and conventional, but none the less possessing commercial value, because the world is willing to pay for genius, taste, beauty, and potential utility. The most important form of this invisible value resides in that increment in the selling price of land, which comes from the mere presence and aggregation of population. \* \* \* This increase in value, not due to any effort on the part of the owner, inures under our system of property solely to his benefit. It could not be otherwise without violating the principle of individual liberty on which our political system is based. The law imposes no obligation upon this form of property except the payment of taxes according to a general and uniform rate upon all property. And yet there is a feeling in the public mind that value created by the general effort has in morals attached to it certain obligations of trust, which do not inhere in other property produced by the labor and capital employed in the walks of industry and of commerce. \* \* \*

Columbia College is perhaps the most prominent example of the beneficent operation of the natural tendency by which the unearned increment sooner or later is devoted to the public welfare. Its original buildings were erected by the proceeds of two lotteries authorized by the State, and by modest contributions from the enlightened friends of education at home and abroad. Its site consisted of about 6 acres of land, the gift of Trinity Church, which held the King's farm in trust for the promotion of religion and learning. Its value in 1754 was esti-

mated by President Johnson at \$16,000. In 1814 the State of New York, desirous to rid itself of the burden of the botanic garden (which had been founded by Dr. Hosack, one of the most enlightened sons of Columbia) transferred to the latter the fee of about 16 acres of unproductive land in the vicinity of what is now Fiftieth street and Fifth avenue, estimated at the time to be worth about \$20,000. These parcels of land now constitute the source from which the permanent revenue of the institution is derived. They are estimated to be worth \$12,000,000, and yield at the present time an annual revenue of \$400,000. This property practically enables higher education to be supplied at about one-half the actual cost of its provision. Thus Columbia College is not merely a great educational agency in which New York takes special pride because it is the product and evidence of its growth, but it is also a standing monument to the wisdom of our political system, founded on individual liberty and the security of property.

While this process of incrementation was thus slowly but surely progressing, it must be conceded that Columbia College, in common with the other institutions of learning throughout the country, fell into a condition of comparative stagnation, in marked contrast with the activity in the material and industrial world. It continued, indeed, to perform its original work of educating Christian gentlemen—men who, as Herodotus says, "could ride and shoot and tell the truth," and whose influence in the community tended to promote conservative action and to mitigate the demoralizing influence of the mere pursuit of wealth. The trustees of the college, upon whose roll for a century appear the names of the foremost citizens of this State, were at no time insensible to the desirability of extending its educational advantages so as to bear some adequate proportion to the growth of the city in population and enterprise. In 1810, in accordance with an able report presented by Rufus King, in which the primary principle of all sound education was declared to be "the evolution of faculty and the formation of habit," changes were made in the curriculum and in the discipline of the institution, which, however, failed to enlarge the demand for its privileges. In 1854, when the old college site became available for revenue, a comprehensive university scheme was devised by a committee of the trustees, chief among whom was Dr. Henry James Anderson (of sweet and precious memory to the alumni of his time), which was justly regarded as the beginning of a new era in the educational history of the United States. Although this scheme was not at the time made operative, it resulted in securing for Columbia College the services of President Barnard, under whose enlightened administration the initial steps leading to the present university development were taken. There is nothing more touching in the long history of the college than the devotion by President Barnard of his modest fortune to the execution of the plans which he had never ceased to urge for university extension, and to which he had consecrated his life and given the results of his ripe experience and vast resources of learning.

But the efforts of the colleges everywhere, even if they had been endowed (as they were not) with ample means, would have failed in view of the fact that the demand for instruction in the liberal arts had actually fallen off in this country, in consequence of the diversion into industrial pursuits of the most promising and intelligent young men to whom the rewards of business were more attractive than the delights of learning. It is a remarkable fact that from the beginning of the century down to the conclusion of the late civil war, there was an actual decline in the number of students who graduated at the various colleges in proportion to the whole population. In other words, while the country was growing in wealth the conservative influence of sound learning was steadily diminishing, with the depressing results which are manifest to-day in every department of public life, in the halls of legislation, and in the sensational character of the public press.

The natural balance between the ethical and material elements of civilization

has thus been deranged, and in the City of New York this dislocation is far greater than in any other portion of the land, because there is a greater disparity of wealth on the one side and poverty on the other, due largely to the vast influx of foreigners, many of them illiterate, who have been landed chiefly in this port. While the general average of wealth has more than doubled in fifty years, indicating a vast improvement in the condition of the people at large, there has been a differentiation between the two extremes of the scale—the very poor and the very rich—without a precedent in the history of society, and accompanied by an accumulation of disturbing questions which, unless wisely dealt with, threaten an aggravation of discontent dangerous to social order. \* \* \*

The feeling is rapidly spreading that the time has come for a new and nobler civilization. A spiritual wave like that which produced the Crusades, erected the cathedrals and the universities in the Middle Ages, or the later movement which culminated in the Renaissance and in the Reformation, is plainly in sight and ready to usher in the advent of the next century, when the question will be, not as in the eighteenth century, "What are the rights of man," or in the nineteenth century, "How these rights are to be made available for the production of wealth," but rather What is the duty of society in regard to use of wealth which has thus been created.

Already we can see the effect of this coming movement. In the present generation there has been a sudden and wonderful outbreak among rich men to endow higher institutions of learning, which they instinctively recognize as the true saviors of society. Not only have large benefactions been made to the existing colleges by which Harvard and Yale and Princeton and Columbia have been converted into true universities, but new universities have been munificently endowed by Cornell, Johns Hopkins, Rockefeller, and Stanford, thus perfecting the chain of higher learning from the Atlantic to the Pacific Ocean. The smaller colleges and the technical schools have not been overlooked in this avalanche of munificence, but its characteristic feature is the recognition that something higher and nobler is needed in order to save the coming century from the materializing influence of the great increase of wealth in the nineteenth century. It is a confession that the mere knowledge of facts is not sufficient for the elevation of character, but that the ethical and spiritual side of man's nature needs the nutriment which can only be supplied by scholars and teachers who devote their lives to the pursuit of truth without regard to its material rewards.

These considerations, which are true of the country at large, apply with peculiar force to Columbia College, which in the nature of things must become the foremost university of the foremost city of the foremost State of the foremost country in the world. What opportunity, what possibility, what duty is implied in these simple words? How the souls of its faculty and its trustees must be inspired by the greatness of the undertaking! Confided to their hands is a vast fund, contributed not by individuals, but the product solely of the growth of New York. They must and do recognize, therefore, that its first duty is to the city by whose progress it has been thus enriched.

A city is not great because it contains many dwellings and covers much territory. Its greatness does not consist in mere numbers and in commerce. Its eminence is determined by the character of its civilization and by its provision for the material, intellectual, and spiritual wants of its citizens. Life, liberty, and property must be secured, order maintained, and the law enforced. The best system and appliances of education must be provided for its children; there must be adequate means of recreation from infancy to old age; the young must be trained to habits of obedience and diligence; outlets must be provided for their physical energies, and the spectacle of young men growing up without occupation must be removed from the conscience of the community, which is

violated when there is no opportunity to learn mechanical trades—the natural outlet for their physical and mental powers. The population must be properly housed, perfect sanitary conditions must prevail, the standard of living must be raised, and parks and pleasure grounds provided on a scale which will enable every dweller in the city to exclaim:

I care not, Fortune, what you me deny,  
You can not rob me of free Nature's grace.

Schools for commercial and technical education must be provided at night, so that artisans of talent and ambition may have the opportunity to develop natural capacity to its full extent; the evil influence of demoralizing resorts must be counteracted by the opening of museums of art, science, and industry, so that the population may become familiar with the highest types of beauty and the results of genius; free libraries and reading rooms must be provided on a scale demanded by the intellectual wants of an intelligent population; such provision should be made for the sick and poor that there will be no excuse for the presence in its avenues of tramps and beggars; its streets should be well paved and clean; transit should be speedy and cheap, and, above all, the churches should be conducted in a spirit so liberal as not merely to cultivate the religious instincts of men, but to exert a spiritual influence upon the rising generation through social organizations intended to amuse, instruct, and refine.

Such will be the great city of the future, and such a city New York will be if the Columbia University, whose new birth we celebrate to-day, shall be enabled to perform its mission as the teacher and exponent of the best results of civilization. It is evident, however, that New York is in a formative condition, and has not yet attained to the ideals of municipal excellence. It seemed to realize its imperial destiny when, in 1837, it introduced an adequate water supply. In 1854 it recognized its coming greatness by the creation of the Central Park; it was an inspiration of municipal genius when the museums of art and natural history were founded upon a basis which secured the cooperation of enlightened and munificent citizens in providing admirable collections in the buildings erected by the city. The same policy will now give to New York the great free library which has been rendered possible by the private beneficence of Astor, Lenox, and Tilden, whose endowments should be devoted solely to the increase of its collections and the expenses of administration. In fulfillment of the great ideals which have thus been slowly developed, the city is now preparing to expend vast sums on speedways, docks, new means of transit, new and better schools, small parks and playgrounds in the older and more crowded portions of the city, and in diversions of a healthful kind demanded for the comfort, recreation, and elevation of the masses of the people. It need not be feared that too much money will be invested in this direction if the works are wisely planned and honestly executed. The lessons of the civil war taught the people of this country that its resources are practically exhaustless when expenditures are made for the benefit of the whole community.

I have been moved to make this plea for individual liberty and private property because Columbia College by its origin, its history, and its traditions stands, and ought to stand for them as a sure defense; and from the unique manner in which its endowment has been provided should be a perpetual inspiration for the highest development of municipal spirit, as lofty as that which, in the days of Pericles, made Athens "the eye of Greece," and by a sublime exhibition of civic genius crowned its Acropolis with the peerless temple of the goddess of wisdom, before which the world still bows with admiring recognition. To educate the citizen, to place before him the highest ideals of duty, and to stimulate him to the stern performance of the obligations which rest upon him as a partaker in mind, body, and estate of the inestimable benefits of good government ought to be the chief

aim of the university, which from this day will be the most conspicuous and powerful institution in this great city. Here will be treasured the best memories of unselfish sacrifice and heroic achievement; here will be recorded all the failures as well as the triumphs of civic statesmanship; here social problems will be discussed and solved through its affiliated institutions, which will reach every household and every citizen. The children in the kindergartens, the boys and girls in the schools, the workmen in the shops, the clerks in the marts of commerce, the merchants and the manufacturers in their offices, the professional men in their studies, all will come under its influence. The efforts of the community will thus be coordinated for progress and for evolution into a higher and better environment. Every agency for instruction, for culture, and for refinement will be systematically employed in the development of a nobler civic life; and, above all, the wealth which has accumulated in this city by the joint association of its people, and to which every human being contributes by his industry, will come to be regarded as a sacred trust to be administered in the public interest for works of beneficence to all. The petty jealousies between the classes will steadily disappear, and it will be demonstrated that democracy and liberty are coexisting and inseparable factors in the largest and best development of civilization.

The trustees of the college have shown themselves to be fully conscious at all times of the obligation which rests upon them in the administration of the great trust confided to their keeping. From the humble beginning in 1754 with seven students and two instructors, with an income so modest for nearly a century as to limit the instruction of the college to such branches as were necessary to educate Christian gentlemen, the college, under the wise guidance of President Barnard and President Low, has been developed into a university, which, during the last year, gave instruction to 1,973 students, enlisted the services of 265 teachers, and expended a revenue of over \$750,000. It now undertakes to provide instruction in all departments of human learning required for the highest development of modern life. The old academic training is preserved for those who wish to lay the foundations of a scholarly education, fitting them for the study of the learned professions or for the pursuit of a literary career. Its schools of science qualify the engineers who are to become the captains of modern industry, or to pass their lives in the study of natural phenomena; its school of medicine, with its affiliated hospitals, in connection with which the names of Sloane, Vanderbilt, and Kissam will ever be held in grateful remembrance, provides the best instruction for alleviating the physical sufferings of the race, and the sanitary knowledge necessary to prevent the spread of disease; its school of law graduates the men who are to protect, enlarge, and defend the civil rights of a free people, and to develop jurists who will have the knowledge, courage, and honesty to maintain the law and administer justice without fear and without favor.

But, above all, and crowning all, is the school of political science, whose province it is to investigate the principles of justice, the elementary conditions and customs of the social organization, and the history and results of their influence in the development of civilization, and the progress of man from a state of barbarism to the infinite refinements and culture of modern life. Herein Columbia College has realized the ideals of Jefferson for the university to which he gave the ripe experience and the affectionate devotion of his old age. It has given effect to the hopes of Washington, who in his first message delivered to Congress in this city, in his correspondence, and in his last will, gave voice to the purpose which was near his heart, of founding an institution in which the principles of free government might be taught to specially selected students who would thus be qualified for public office in the same manner as the Academy at West Point educated officers for the military service of the country. Already in issues of

great moment the influence of Columbia University has done much to dispel error, to promote a better understanding between nations, and to avoid complications which might otherwise have resulted in actual hostilities.

Such is the university which the legislature of New York in 1784 foreshadowed when it declared that Columbia College was to be the mother under whose fostering care the educational system of the State would be made worthy of the great people who had pledged every dollar of its property for the education of every child within its domain.

But, as it is with the city which has given birth and wealth to this chief monument of its prosperity and glory, so the university stands only upon the threshold of a great career. Already it has outgrown the provision which a decade ago was supposed to be adequate for all possible requirements. By the general concurrence of its trustees, its faculty, and its alumni, and with the approval of the city and of the State, it is to be transferred to these historic heights, surrounded by a vision of beauty which satisfies the ideals of the poet, the patriot, and the scholar. Here, then, is to be forever the center of the intellectual life of the city—the citadel of last defense against the perils of ignorance, of superstition, and of false doctrine. Here, buttressed by the noblest cathedral of our age, by institutions of charity and learning, and especially by Barnard College, in which, if the rich people of New York do their duty, the women of the future will be admitted to equal educational privileges with their brothers, the university buildings will forever, under the flag of freedom, be an unassailable bulwark of sound learning and the gateway to universal knowledge.

If, then, the university has a duty to the city which it is striving to perform, have the citizens of New York no corresponding duty to discharge in providing it with the halls and buildings in which this beneficent work is henceforth to be carried on? If its vast endowment is to be sacredly applied, as it should be, to defray the cost of instruction and administration, ought not the rich citizens of New York, whose wealth has been derived from the same source and by virtue of the same law of increment which has given to Columbia College this endowment, be emulous to apply their surplus riches to the building of the structures and to the provision of the appliances for higher education on a scale adequate to meet the ever-increasing demands of modern civilization? Large gifts have already been made by the alumni, by the Fayerweather estate, and by public-spirited citizens for the purchase of the new site. Seth Low, its honored president, inspired by filial piety and by public spirit, has given the great sum of money required for the construction of the library, around which all the other departments of the university must necessarily be grouped. William C. Schermerhorn, chairman of its board of trustees, whose long life of usefulness in this city has only been equaled by his modesty, has set the example of appropriating a portion of one of the large fortunes which have been created by the growth of the city to the erection of a hall of physical science, whose developments day by day are awakening an astonished world to new possibilities of discovery tending to the prevention and cure of disease, the increase of the general welfare, and to the final triumph of mind over matter.

While these lines are being penned, another family, among whose members are distinguished graduates from Columbia, have provided the means for erecting the great building devoted to chemical science and art, which will for all time commemorate the source from which the prosperity of the descendants of Frederick Christian Havemeyer has been derived. For the naming of the remaining halls to be constructed, there will undoubtedly be a generous rivalry among the families whose names are connected with the early history of New York, and whose descendants have been enriched by its growth. In this country patents of nobility are wisely prohibited, but a title to immortality is surely

within the reach of those to whom the trustees may finally award the privilege and the glory of erecting any one of these buildings. One college hall, however, the trustees have wisely reserved for the alumni to build by contributions, large or small, as a memorial to the living and dead sons of Columbia, whose names shall be inscribed upon tablets to be placed in the great hall of the building. In the entire history of Columbia College the number of its graduates has not been large, but in point of character, ability, and achievement the roll of honor is illustrious. Hereafter, when the university shall number its sons by hundreds of thousands, every one of these early names will have an interest for future generations, especially when they suggest the ties of family and excite the pride of an honorable ancestry. In the coming competition which I foresee, it is to be hoped that the trustees will be very cautious in admitting to the company of the immortals, whose names these great halls shall bear, any one which may not hereafter revive the memory of an honorable and useful career in the acquisition of fortune. Thus Columbia will stand not only for what is pure in thought and action, but will be a perpetual incentive to virtue, public spirit, noble aspirations, and successful achievement. \* \* \*

Social reforms never come from below. They originate in the trained intellect of scholars and in the inspirations of genius in an atmosphere favorable to their reception. Slowly but surely great ideas descend and penetrate the mass of the people. The current belief of to-day was the scientific discovery of yesterday, while the evil of one age is very often due to reforms instituted in a previous age, and yet the underlying principles of truth and justice never change. The guardianship of these principles reside in the higher instructions of learning, and their application to the changing conditions of society depends upon teachers and scholars who devote their lives to the investigation of truth, regardless of the material results of their labor.

In this country the democracy, whose power will never grow less, will tolerate no violation of its ideals. But these ideals may be either true or false. They may lead to the ruin of society, as they did in the French Revolution, or they may raise it to new standards of justice and happiness. The outcome will depend on how far the public will is guided by the knowledge of sound principles. This knowledge can not be acquired in the common schools. Even if every child is instructed in the rudiments of education, the limitations of age and of the time which can be devoted to elementary learning do not admit of the intellectual and moral training necessary in dealing with great questions of public policy. It is true that in rare instances men like Benjamin Franklin, Roger Sherman, and George Washington, who were not college bred, appear upon the stage of public life and take their place among the leaders of thought and action. But they were men of great natural powers which had been developed by extraordinary opportunities and responsibilities in early life, serving thus to prove the rule that thorough training and large experience in public affairs are prerequisites to successful administration. \* \* \*

---

XIII.—SPEECH OF HON. J. L. M. CURRY BEFORE THE LEGISLATURE OF GEORGIA,  
NOVEMBER 29, 1897.

MR. SPEAKER: This generous and sympathetic welcome to a Lincoln boy is very encouraging. Our distinguished friend, who has demonstrated in our hearing this morning his great fitness for the position which he fills, spoke of his presence here before the legislature as being a "red-letter day." It is of course an honor which any one might appreciate to have the privilege of standing before those whom the honest and unpurchasable constituents of 137 counties have sent here to do the

great and solemn and, I might say, sublime work of making laws for the government of the people.

A few years ago, in my ministry of education, I visited the Girls' Normal School at Milledgeville, which is abundantly worthy of your confidence and support, and I went into the hall of the capitol, which now no longer exists, and I remembered (and it is among my earliest recollections) the fact of my own father leaving the dear old county of Lincoln and going down to Milledgeville—not once, but twice—as a legislator; and also an uncle of mine, who has held the position which you so honorably fill to-day as speaker of the house of representatives of Georgia—I mean Thomas W. Murray, for whom a county is named—and another uncle of mine, Peter Laman, who was for years a representative and a senator from the same county of Lincoln.

In addition to my nativity and bearing a diploma from the university, I feel that I have some right of speech before a Georgia legislature. As I stood in that old hall there came thrilling memories; and as I walked through those historic scenes where Georgia history had been made so luminous, I imagined I could see coming out from the walls into the aisles the images of those who had made Georgia so conspicuous, and I do not now hesitate to say that, in my humble judgment, there is no State in this Union—not even Massachusetts, Ohio, Pennsylvania, or Virginia—which has contributed to jurisprudence and to politics and to higher civilization more distinguished men than the State of Georgia. [Applause.] \* \* \*

Politics is a science of government that has too often been degraded into mere spoils of office, our citizens forgetful that public trust is not for individual aggrandizement but for the public good. I do not know that there has ever been a time when there was a greater need for wise and discriminating and courageous legislators or broad statesmanship. I have in the past known men who, taking their lives in their hands, would march with unblanched cheek in the presence of a strong battery or encounter the discharge of a whole field of artillery, and I have sometimes seen those same men in the legislature quake and shiver in a dastardly manner lest what they did would incur the ill will of Tom Jones or Jack Brown, of "Possum Trot," in his county. [Applause.]

The legislature is not here to ascertain what the people want, but what they ought to want, and I have sometimes thought that there was a failure to apprehend what were the just limits of legislation, distinguishing subjects for legislation from those that should be left to courts or to moral agencies of society, and also the art of framing appropriate and effective laws.

In these days of political corruption there is a new beatitude, "Blessed are the strong, for they shall prey on the weak." Government is perverted into partnership with monopolies, helping the few, the rich, to grow richer. The maxims and methods of government should be exalted and citizenship should be raised into a partnership with every virtue, giving predominance to justice, right, veraciousness, equality before the law. Ordinarily in looking over the calendar of a legislature you will find it is filled with bills numerous and experimental, and sometimes of local character and of doubtful justice. I came to-day to plead with you, my friends, for an object general and universal—one that applies to every neighborhood, to every family, and to every citizen in the State of Georgia, from Dade to Camden or from Rabun to Decatur—one of universal concern, which lies at the foundation of civilization and good government and of material as well as mental prosperity. The good book says that the "king himself is served by the field," and that is the text of the most excellent speech of our distinguished friend this morning, the Secretary of Agriculture, and it means that the people, the government represented by the king, are served by the field, and that wealth comes from the field, and that agriculture is the basis of our real wealth and prosperity.

There are some things of general and permanent concern which, it seems to me, should attract the attention of a legislator, and they are closely connected with the question of schools. One of the most important things is to provide for good roads. An agricultural journal estimates that farmers pay the enormous sum of \$600,000,000 for transportation of produce to nearest market. The heaviest tax a citizen pays in this country is the cost of transporting crops to market, and if that cost could be put down in dollars and cents instead of wear of machinery and live stock, loss of time and temper, and violation of the good rule which prohibits us from swearing, there is not a community in Georgia that would not rebel against the impoverishment. Wagon transportation over the average road costs from 15 to 20 cents per ton for each mile. When roads are impassable in winter, more than a million draft horses are kept in unproductive idleness. I have seen a woman and a dog hauling over a good road in Germany, more produce than could be hauled by a wagon and two mules over some roads in Virginia and Alabama.

Those who manage railway companies sometimes incur the ill will and prejudice of unthinking people. Those who manage the railroads of this country, amounting to a capital of twelve thousand millions, with 180,000 miles of railway—and generally, in my judgment, good men, many of them surely so—I take it that those who manage railroads are on an average about as good and nice people as the merchants and lawyers, and doctors, and, if some of my friends before me will excuse me, the preachers and legislators of the country. [Applause.]

Another, a great measure, is prison reform. I have before me a pamphlet which I picked up for railroad reading just as I left home, "The Fifth International Prison Congress Proceedings in Paris." It is a Government publication, and full of valuable information and instruction on this subject.

Nearly every man I met a few weeks ago was talking about the convicts. Well, I shall not take up your valuable time in saying what I think about them, but I will say that the prisons, generally, in this country might be called normal schools for criminals. The juvenile offenders are under the tuition of the criminal classes. We want better penal legislation, improved administration of the prisons. We want to strengthen the prevention of crime and introduce humanity into law, rehabilitate the offender, and put better elements into the present condition of prison life. [Cheers.]

We want better education, intellectual, moral, industrial, practical, and home training, and inducements to self-exertion instead of State-supported pauperism. What is saved in withholding proper education from children is lost in criminal jurisprudence, jails, police, almshouses. Perhaps you will laugh at me when I say that as prisons are normal schools for prisoners, it would be a good thing if we had a school for the training of wardens of the penitentiaries, so that they might understand their business and the science of penitentiaries. [Applause.]

We are told that agriculture is the great basis of civilization, and we know that the farms of this country aggregate over \$13,000,000,000 and are the most important economic interest of our people. It is natural that they should be interested in the improvement of agriculture. Agriculture is very unremunerative. Men can not grow cotton profitably at 4½ cents a pound. Some of the depression is the result of culpable negligence, of bad farming. The Commissioner of Agriculture, in his last report, says that 98 per cent of farms sold under mortgages were those in which the one-crop system was followed,

Your main duty now as legislators, as Georgia statesmen, is to enlarge the power and worth of Georgia citizenship. The chief wealth of civilization is man, his freedom in individual conduct and belief, his right to the possession and enjoyment of all his faculties, capacities, and activities in such full measure as is consistent with the enjoyment of like rights of other people. Does the sun shine less

bright, the flowers have less fragrance, does sleep come less sweetly to the children of the poor than to the children of the rich?

When I was a boy I heard Orestes A. Brownson define democracy as "the supremacy of man over his accidents." Democracy is a form of government and of political science which gives a man superiority over the accidents of birth, fortune, race, and blood. Every American is entitled to the full development of his powers. Some people say that does not do for the mudsills; it does for the aristocracy, and priesthood, and kings, etc., but not for the common people. Government no longer represents a clique or privileged class, but is the organized expression of the whole people. As a form of government democracy is not inherently nor necessarily good. There is a deal of ignorance and crime that masquerades under the name of democracy, which shows itself in popular prejudices, election frauds, bribery and falsehood, and blatant demagogism. Hereditary privileges have been abolished, but corporate power, confiscating taxes, legislation in the interest of the few, beyond even the dreams of avarice, unfortunately exist.

Our history does not show our democratic institutions to be infallible or inerrable. Newspapers and politicians talk flippantly of war, of the rights of insurgents, of colossal schemes of territorial acquisition, fighting navies, armies on a war footing, immense expenditures, while apparently indifferent to our own affairs, the enforcement of law and justice, and the suppression of crime. We had 11,000 murders in the United States last year, when there were only 163 in England and Wales. The reclamations of cities from misrule and bribery and the use of offices and contracts as rewards for deadbeats are of pressing need, for in our experiment of self-government there has been no such failure as in municipal government. Universal suffrage is not a panacea. Giving management to greed, ignorance, avoirdupois of number does not increase the wisdom or virtue of those possessed of these gifts. "The virtue of human wit is not greater than the virtue of human character." Representative government, a constitutional republic, is a condition of freedom under moral and intellectual control, requiring patriotism, intelligence, integrity. Absolutism is easy. Liberty is a high prize to be won, a reward for the best, and is difficult to be preserved.

A man capable of development has the right to be educated, and the State or the family which deprives the boy or girl of that inalienable right for the fullest development of his moral, intellectual, and spiritual nature is doing a grievous wrong to that child and committing treason against the State in which he lives. [Applause.] Democracy demands a larger and larger number to enjoy mental improvement. I know some people say it is not safe to educate the masses. I am not afraid of the educated masses. I would rather trust the masses than kings, priests, aristocracy, or established churches. [Cheers.] There is not an instance in the history of mankind where a church establishment has ever relaxed voluntarily its hold on the people. This separation of state and church comes from the uprising of the masses. Reforms have never come from the church or rulers, from above downward. Every social, political, religious revolution has come from the deep-settled convictions of the masses, determined to proclaim and assert their rights and their privileges, and that is the essence of democracy and is the essence of the New Testament. Despotic governments make men thin-blooded and low-browed; all back head and no forehead. No nation can realize its full possibilities unless it builds upon the education of the whole people. A wicked, stupid government, a penny-wise and pound-foolish legislator, can brutalize a race, and, reaching forward, can fetter generations unborn.

You can predestinate the condition of children by adverse and illiberal school legislation. The largest wastes are through ignorance, which paralyzes or misdirects the best forces. Knowledge saves. Wealth is not in iron ore, or water power, or marble, nor in the soil, but in the brain that organizes. We ought to

broaden our ideas on education, consider it in a more rational light, for it is character translated into action. "Common sense, sound judgment, wisdom acquired by observation and tempered by experience, with genius and power to help oneself to plan and execute, entitles a man to a diploma from the world at large, even if he never gets it at a university."

Men who are to increase the wealth of the country by any industrial pursuit will be successful in proportion to industry, intelligence, and integrity. Wages are regulated by mental capacity and not by muscular strength. The free public school is the highest evidence of statesmanship, the most economical measure that can be adopted. These public schools have come to stay. Those who oppose them may go, but the schools for the education of the children, if we would perpetuate institutions and if we value the Magna Charta of human liberties, the New Testament, are to continue and to be preserved.

What kind of schools do you want? I am an American, and I want American schools for American citizens. I do not want any of your hyphened citizenship—German-Americans, or Irish-Americans, or Swedish-Americans, but full-blooded, true-hearted, patriotic Americans. I went into a Boston school the other day, numbering 2,400 children. Every single one of them was of foreign parents, and 97 per cent of them, when they came into the school, could not speak the English language. I do not believe in giving public money to the schools that are managed by denominations or that are under sectarian influence and control. [Applause.] I believe in all kinds of schools, from the university up to the kindergarten. [Laughter.] I would support a university from public revenues. I would give moral support and influence to denominational schools. I would have institutions of technology. I would introduce manual training into every school established by the State, every one of them, but I would not give one cent of money to any schools or institutions for charitable purposes when those schools and institutions were not under State control, and when there was not an effective audit of every cent received by them. [Applause.]

The South has expended more than about \$350,000,000 for schools, and then foolishly impoverished herself by tributes to foreign peoples. I have seen on the streets of Asheville, N. C., wagons for sale that were made in Kansas City, and our friend tells us this morning that our cotton seed, instead of being used at home, is sent abroad to enrich other people. Instead of using our products and living at home, there is a constant sum being sent away. An enormous sum, a constant outflow of profit, is sent out from the State each year in the way of life and other insurances, with only a very small return.

With slave labor the South lost sight of the need of diversified employment, of multiplied utilities, of finding varied sources for wealth and prosperity. A crying need is industrial education, so as to give skilled labor, and take away our dependence on the one-crop system. In many countries are trade schools to fit for particular employments. What has been lately done in the multiplication of manual schools is something absolutely unknown in the previous history of the world. I can name over 100 towns and cities in the United States which have incorporated manual training along with their public-school system and elementary education. It ought to be done more and more. It is not to teach men to be blacksmiths and carpenters or shoemakers, but the principles that underlie trade and industries ought to be made a part of the instruction in our schools, so as to give something that has some bearing on everyday life—an education that will enable the children to do something that man wants done. Heretofore education has been for the literary, leisured, professional classes to an unfair extent compared to the breadwinners. This is applicable to girls as well as boys. For the girls we can have cooking, sewing, and domestic economy. Upon the education

of the American girl depends the future of the American home. Good house-keeping and good cooking are very important factors in a nation's prosperity.

I have before me a report made by a committee of Irishmen appointed to ascertain what was needed for the restoration of Ireland's prosperity. These gentlemen visited France, Germany, Switzerland, Denmark, Sweden, and other countries, and they went through the whole question of how far education was necessary for the prosperity and comfort and advancement of the nation. Their report showed that wherever they had gone in those countries they found that prosperity and education went hand in hand with industry, and that absence of education meant lapse of prosperity. And that is more and more the case with every country in the world; and it is as necessary to agriculture as to manufactures. It is even more necessary, if possible, for agriculture than for other industries. Taking the case of Switzerland, the report said: It would be impossible to enumerate the institutions in Switzerland devoted either directly or indirectly to technical instruction. The Canton of Zurich spends one-third of its budget on schools, and the other cantons more or less in the same ratio; for it is an axiom with these people, that in order to secure the permanent prosperity of the State it is indispensable to educate the masses, and thus enable the artisan to excel in his work. It was the same of Denmark, which did not ask for protection, but for education. Denmark was one of the countries which by intelligence had made agriculture prosperous with free trade, and to such an extent that last year it sent £9,000,000, or £4 per head of its population, including women and children, of products to England alone after supplying themselves. In Wurttemberg there was not a pauper to be found, and that was a country that was miserably poverty stricken half a century ago. I could go through all the nations visited and show that education went hand in hand with industry, and that without education industry did not flourish.

The lesson to be derived from all this activity in matters pertaining to education is clearly this, that our foreign rivals are determined to keep ahead in the matter of facilities for instruction, and not only in those institutions wherein the highest branches of scientific instruction are pursued. The committee were convinced that the nation that has the best schools is the best prepared for the industrial warfare which lies ahead, and no money appears to be grudged for the erection, equipment, and maintenance of educational institutions of all grades, and especially of the science laboratories, which are being multiplied in Germany. The great industries of to-day depend more and more upon the successful application of recent discoveries to ordinary manufacturing processes and less and less upon the presence of coal, iron, and raw materials.

Everything that occurs in Georgia, that I see in the newspapers in reference to her future, interests me beyond expression. I never forget my nativity, nor the same State with whose history I became familiar in my early life and from whose university I was graduated. I love every foot of Georgia soil. I love every breeze that blows from mountain to the seacoast, and I read with interest and joy everything that is for her prosperity and usefulness. The other day I saw what this legislature had done in reference to education. When you go home and think over the past and your honorable career here, it will be a consolation to you. It will be a happy reflection that whatever else you may fail to do you did march up boldly, almost unanimously, and declare that, let failures come, let disasters multiply, let discord arise in different portions of the State, for one thing there shall be no question as to our conduct, and that is that we will vote as one man to preserve and sustain the common-school system of Georgia. [Applause.]

I am brought into close and intimate relation with the superintendents of education of the different States. Every one of them, so far as I know, as the result

of our official intercourse, which was at first between strangers, has become my friend, and official acquaintance has ripened into sincere friendship. Among all those superintendents none purer, none more patriotic, none more devoted to his work, none more successful in the administration of his office, none safer or wiser in counsel, than my beloved friend, your admirable superintendent of schools, the Hon. G. R. Glenn. [Applause.]

Take care of the teachers. Pay them well. Train them for their work. The great need in the pulpit, in the Sunday schools, in public schools and universities everywhere is better teaching. Honor the profession, train for the work, dignifying it by your conduct and your appreciation of their services. Recognize teachers as among the chief factors of your civilization, and do what you can to make the schools equal to any in the whole country.

I spoke a while ago of the dignity of the office of the statesman and the legislator. It is the chief duty of the statesman to watch over the outward interest of the people, and of the educator to quicken their souls. The statesman must study and manage the passions and prejudices of the community; the teacher must study the essentials, the deepest principles, of human nature. The statesman works with coarse instruments; the teacher works on that delicate, ethereal essence, the immortal soul.

The golden age is in the future, and we must grasp it by diligent effort and by wise conduct. The children and patriots on whom we are to depend for future glory are committed to you. Arouse yourselves for the broadest statesmanship. Jefferson said: "If we educate the children aright, our descendants will be wiser than we, and many things impossible for us to do will be easy for them."

I am here to-day to plead for the children; not for the grown-up men, not for the banks nor railroads, nor even for agriculture; but I am here to plead for the children. They are all over your State. They are to be the guardians of your interests, the protectors of your lives and homes, and to them are to be committed all the destinies of the future.

As a native Georgian, as an American, loving our institutions, let me beg you, in the name of my country, in the name of humanity, in the name of these children, whatever else may be done, to see to it that the children of Georgia, your children, the children of your constituents, have the same rights and the same privileges and the same opportunities as the children of Massachusetts, or New York, or of any country of the world. [Great applause.]

---

#### XIV.—HUBERT ANSON NEWTON.

Dr. Hubert Anson Newton, the celebrated mathematician and astronomer, was born March 19, 1830, at Sherburne, N. Y., and died at New Haven, Conn., August 12, 1893. The following particulars of his life are condensed from a paper by Mr. J. Willard Gibbs, presented before the National Academy of Sciences in April, 1897. The special quality of Dr. Newton's abilities was early manifested and was evidently inherited. His father, William Newton, was in charge of the construction of the Buffalo section of the Erie Canal and other similar constructions in New York and Pennsylvania, and showed original power in the solution of problems involved in this work; his mother was also noted among her neighbors for her mathematical ability. The son—

fitted for college at the schools of Sherburne, and at the age of 16 entered Yale College in the class graduating in 1850. After graduation he pursued his mathematical studies at New Haven and at home, and became tutor at Yale in January, 1853, when, on account of the sickness and death of Professor Stanley, the whole charge of the mathematical department devolved on him from the first.

In 1855 he was appointed professor of mathematics at the early age of 25, \* \* \* almost the only instance in which the Yale corporation has conferred the dignity of a full professorship on so young a man.

The appointment was accompanied with leave of absence for a year in order that he might continue his studies in Europe. He was naturally attracted to Paris—

where Chasles was expounding at the Sorbonne the modern higher geometry, of which he was to so large an extent the creator. \* \* \* The effect of this year's study on Professor Newton is seen in several contributions to the *Mathematical Monthly* during its brief existence in the years 1858-1861. One of these was a problem which attracted at once the attention of Cayley, who sent a solution. Another was a discussion of the problem "to draw a circle tangent to three given circles," remarkable for his use of the principle of inversion. A third was a very elaborate memoir on the construction of curves by the straightedge and compasses and by the straightedge alone. These early essays in geometry show a mind thoroughly imbued with the spirit of modern geometry, skillful in the use of its methods, and eager to extend the bounds of our knowledge.

Nevertheless, although for many years the higher geometry was with him a favorite subject of instruction for his more advanced students, either his own preferences or, perhaps, rather the influence of his environment was destined to lead him into a very different field of research. \* \* \* When Professor Newton was entering upon his professorship the study of the higher geometry was less consonant with the spirit of the age in this country than the pursuit of astronomical knowledge, and the latter sphere of activity soon engrossed his best efforts. \* \* \*

It was doubtless not by chance that he turned his attention to the subject of shooting stars. The interest awakened in this country by the stupendous spectacle of 1833, which was not seen in Europe, had not died out, as is abundantly shown by inspection of the indexes of this journal. This was especially true at New Haven, where Mr. Edward C. Herrick was distinguished for his indefatigable industry, both in personal observation and in the search for records of former showers. A rich accumulation of material was thus awaiting development. In 1861 the Connecticut Academy of Arts and Sciences appointed a committee "to communicate with observers in various localities for combined and systematic observations upon the August and November meteors." In this committee Professor Newton was preeminently active. He entered zealously upon the work of collecting material for personal observation and correspondence and by organizing corps of observers of students and others, and at the same time set himself to utilize the material thus obtained by the most careful study. The value of the observations collected was greatly increased by a map of the heavens for plating meteor paths, which was prepared by Professor Newton and printed at the expense of the Connecticut academy for distribution among observers. \* \* \*

The results of these investigations appeared in an elaborate memoir "On shooting stars," which was read to the National Academy in 1864 and appeared two years later in the memoirs of the academy. \* \* \*

In an elaborate memoir in the *Comptes Rendus*, M. Faye says, with reference to our knowledge of shooting stars and their orbits: "We may find in the works of M. Newton, of the United States, the most advanced expression of the state of science on this subject, and even the germ. I think, of the very remarkable ideas brought forward in these last days by M. Schiaparelli and M. Le Verrier."

The first fruit of Professor Newton's statistical studies on comets appeared in 1878 in a paper "On the origin of comets." \* \* \*

The very interesting case of the comets of short periods and small inclinations, which was treated rather briefly in this paper, was discussed more fully by Professor Newton at the meeting of the British Association in the following year. Many years later Professor Newton returned to the same general subject in a very interesting memoir "On the capture of comets by planets, especially their capture by Jupiter," which was read before the National Academy in 1891 and appeared in the memoirs of the Academy two years later.

Meanwhile Professor Newton had attracted great attention by a series of papers embodying the results of important studies on the orbits of the meteors.

Most interesting and instructive to the general reader are his utterances on occasions when he has given a résumé of our knowledge on these subjects or some branch of them, as in the address "On the meteorites, the meteors, and the shooting stars," which he delivered in 1886 as retiring president of the American Association for the Advancement of Science, or in certain lectures in the public courses

of the Sheffield Scientific School of Yale University, entitled "The story of Biela's comet" (1874), "The relation of meteorites to comets" (1876), "The worship of meteorites" (1889), or in the articles on meteors in the *Encyclopædia Britannica* and Johnson's *Cyclopædia*. \* \* \*

The value of Professor Newton's work was recognized by learned societies and institutions both at home and abroad. He received the honorary degree of doctor of laws from the University of Michigan in 1868. He was president of the section of mathematics and astronomy in the American Association for the Advancement of Science in 1875, and president of the association in 1888. On the first occasion he delivered an address entitled "A plea for study of pure mathematics;" on the second, an address on meteorites. Of the American Mathematical Society he was vice-president at the time of his death. In 1888 the J. Lawrence Smith gold medal was awarded to him by the National Academy for his investigations on the orbits of meteoroids. We may quote a sentence or two from his reply to the address of presentation, so characteristic are they of the man who uttered them: "To discover some new truth in nature," he said, "even though it concerns the small things in the world, gives one of the purest pleasures in human experience. It gives joy to tell others of the treasure found."

Besides the various learned societies in our own country of which he was a member, including the American Academy of Arts and Sciences from 1862, the National Academy of Sciences from its foundation in 1863, the American Philosophical Society from 1867, he was elected in 1872 associate of the Royal Astronomical Society of London, in 1896 foreign fellow of the Royal Society of Edinburgh, and in 1892 foreign member of the Royal Society of London.

Of Professor Newton's relations to the university, Mr. Gibbs says:

If from all those who have come under his instruction we should seek to learn their personal recollections of Professor Newton, we should probably find that the most universal impression made on his students was his enthusiastic love of the subject which he was teaching.

A department of the university in which he took an especial interest was the observatory. This was placed under his direction at its organization, and although he subsequently resigned the nominal directorship, the institution remained virtually under his charge, and may be said to owe its existence in large measure to his untiring efforts and personal sacrifice in its behalf. \* \* \*

He was much interested in the collection of meteorites, and the fine collection of stones and irons in the Peabody Museum of Yale University owes much to his efforts in this direction.

Professor Newton was a member of the American Metrological Society from the first, and was conspicuously active in the agitation which resulted in the enactment of the law of 1866 legalizing the use of the metric system. He prepared the table of the metric equivalents of the customary units of weights and measures which was incorporated in the act and by which the relations of the fundamental units were defined. But he did not stop here. Appreciating the weakness of legislative enactment compared with popular sentiment, and feeling that the real battle was to be won in familiarizing the people with the metric system, he took pains to interest the makers of scales and rulers and other devices for measurement in adopting the units and graduations of the metric system, and to have the proper tables introduced into school arithmetics.

He was an active member of the Connecticut Academy of Arts and Sciences. He was associate editor of the *American Journal of Science* from 1864, having special charge of the department of astronomy. His notes on observations of meteors and on the progress of meteoric science, often very brief, sometimes more extended, but always well considered, were especially valuable.

In spite of his studious tastes and love of a quiet life, he did not shirk the duties of citizenship, serving a term as alderman in the city council, being elected, we may observe, in a ward of politics strongly opposed to his own.

---

#### XV.—MEMORIAL SERVICE AT THE OSWEGO NORMAL SCHOOL IN HONOR OF DR. E. A. SHELDON; BORN, OCTOBER, 1823; DIED, AUGUST, 1897.

The memorial service in honor of Dr. E. A. Sheldon, arranged by the faculty of the Oswego Normal School, of which he was the founder and inspirer, was held at the Normal Hall Friday, October 22, 1897. The exercises consisted of music and addresses by those who had known Dr. Sheldon most intimately in his varied

relations. The extracts from these addresses here given cover the chief points of his remarkable career, the inception and development of his educational work, and those personal characteristics which made him a sustaining power and endeared him to all friends and associates.

[From an address of Prof. I. B. Poucher.]

Our beloved principal, Dr. Sheldon, was born at Perry Center, N. Y., in a small, unpainted house containing one room. He attended the district school for ten years, but his energetic nature rebelled against the dreary round of this school life, and when the school day's work was completed he hastened to the more agreeable work of the farm.

This monotonous life was suddenly interrupted by the acquaintance of a college graduate and teacher, who inspired him with the desire to prepare for college. He borrowed some Latin books and commenced preparation with that energy, faithfulness, and industry which were ever after exemplified in his life. He entered Hamilton College, New York, at the age of 21, intending to fit himself for the profession of law. At the close of the junior year his health became impaired, and he severed his connection with the college; but he had left his impress upon the faculty of the institution. How well they had measured the young man's ability and character you who knew him may judge from their testimony, as follows: "Diligent and capable in business, distinguished by regular and studious habits, as well as by great excellence in character and scholarship, a young man of intelligence, ability, the firmest integrity, and a warm heart."

While in search of health, his active, energetic spirit sought varied employment. Working in a nursery in Oswego, N. Y., visiting the families of the poor in the vicinity, occupied his time. One who believed that heaven is a place of the greatest activity could not be idle on earth. These visits to the dwellings of the poor, his observations of the miseries surrounding them, and the ignorance of the children, led to the logical question, "How can these conditions be bettered?" The answer to this question led to the formation of an "Orphan and Free School Association," the first free school in the city of Oswego.

In the winter of 1848-49 about 120 children of the poor, many of whom had never before entered a schoolroom, assembled in the old tabernacle on the spot where the Vulcan Foundry now stands. Dr. Sheldon was their teacher at the lucrative salary of \$300 per annum, to be paid by citizens who felt liberally inclined. The school prospered, and soon a Sunday school was organized, in the belief that "to educate the mental man alone is but to educate the skeptic, to educate the spiritual man alone is but to educate the puny Christian, to educate the physical man alone is but to educate the savage; but to educate a man in whom all these powers are developed is to educate one who is worthy of Him after whose image he is formed."

These schools were the initiatory steps toward the organization of the free-school system of Oswego, which organization was secured in May, 1853, under the able supervision of Dr. Sheldon as secretary of the board of education and superintendent of schools. He was called to this position from the city of Syracuse, N. Y., where he had spent the preceding two years as superintendent of schools.

We can now form some estimate of the great amount of labor performed by Dr. Sheldon at this time. He invariably rose at 5 a. m. and wrote and studied until 7 a. m. After breakfast he immediately repaired to the office of the board of education, where he was occupied with the accounts of the board, meeting teachers and supplying their wants, visiting schools daily, and returning home only in time for the 6 o'clock dinner. In the evening it was his habit to study two hours.

The years of 1853 to 1859, so full of labor, were also filled with rich experiences. Evidences had accumulated which impressed him that neither the present methods of instruction nor the subjects pursued were best adapted to the development of the human soul.

One day on his round of visits to the schools he plucked from the wayside plants, shrubs, wild flowers, and seeds, and with his hands and arms full inquired of the children what they knew of these things. He found them absolutely ignorant of the things of profound interest round about them. In a meeting of teachers one asked him, "What is education?" His quick and reverent reply was, "To know God and obey him." But how are we to know God except by studying his works—animals, vegetables, minerals, and human souls? Two opposing views have been held as to the products of human understanding. The first claims that there is nothing in the intellect that has not been in the senses. Sense knowledge is the beginning of all knowledge and all our knowledge is measured by sense experience.

Since the senses furnish us with the elements of knowledge, we know what we have experienced, and that only can we know. Opposed to this is the conception that man possesses ideas that could in no wise have been derived from the circle of sense experience, however wide; such, for example, are ideas of God, of immortality, of universality, of first cause. Conceptions of this character are derived directly by rational intuition and are superior to sense experience. The latter was Dr. Sheldon's belief. But nevertheless he felt that children should begin by studying the material works of creation. He believed that this was the best means of developing the child's higher nature as well as of preparing him for the practical affairs of life.

While meditating upon these things he visited Toronto, in the Province of Ontario. Here, in the National Museum, he saw the appliances for instruction used in the Home and Colonial Training School in London, England. He came home laden with colored balls and cards, bright-colored pictures of animals, building blocks, silk worms and cocoons in boxes, cotton bolls, samples of grain, specimens of pottery and glass. "Here," said he, "are the subjects of thought and study." Where are the teachers to instruct? was the question raised on all sides, but unanswered. This turned his thoughts in a new direction. Miss M. E. M. Jones, of the Home and Colonial School of London, England, was engaged by the board of education of the city of Oswego as instructor, and the Oswego Training School was opened May 1, 1861.

Dr. Sheldon was not only principal of this school but student also, his name being enrolled with the first graduating class of 1862, numbering 39, many of whom were teachers in the city schools, who assembled daily from 4 to 6 p. m. for instruction. In the summer of 1862 Miss Jones returned to England to be gratefully remembered by all who came under her instruction. The city training school was continued under a corps of instructors, Dr. Sheldon still acting as principal. During the dark period of the rebellion, 1863 and 1864, the State of New York appropriated \$3,000 per annum for the support of a training school for teachers in the city of Oswego. Notwithstanding large sums of money were being expended for the suppression of the rebellion and the perpetuation of the Union "one, indivisible and forever," the State of New York was not unmindful of the intellectual and moral welfare of her children. These important educational movements followed in quick succession under the guidance of Dr. Sheldon, one of the strongest points of his character being the power of organization.

Let it not be thought that all was harmonious during these laborious years, 1860 to 1864. The Oswego system was named The New Education, and was severely attacked in the State teachers' convention of New York in 1862 and in the national convention of teachers in 1864. But in 1865 the Oswego principles and methods were formally approved by the national convention of teachers as being based upon sound psychological principles.

One would think that the labors of superintendent of schools of the city of Oswego and the principalship of the Oswego Training School would have furnished sufficient labor for Dr. Sheldon. Not so, for during this period he wrote and published many papers and addresses, a graduated course of object lessons covering 407 pages, and a manual of elementary instruction for teachers covering 471 pages. He subsequently published a set of reading charts, a complete set of reading books, and in addition to this taught in the Sabbath school and faithfully discharged all church duties.

These years of laborious duty were also years of honor. The degree of A. M. was conferred on Dr. Sheldon by Hamilton College, the degree of Ph. D. by the regents of the University of New York, also by Hamilton College. The board of education in the city of Troy in 1862 elected him superintendent of schools; in 1837 the University of Missouri invited him to take charge of its pedagogical department. These offers of positions were quickly declined, but were followed by another more honorable, more remunerative, and more congenial to his tastes, namely, the principalship of the Albany Normal School. Meanwhile the Oswego Training School had been adopted by the State of New York as a normal school, and assembled for the first time as a State institution (February, 1866) in the old United States Hotel, purchased by the city of Oswego in 1865 and presented to the State of New York to be used for the purposes of a normal school, with Dr. Sheldon as principal. I remember well Dr. Sheldon's announcement at one of the faculty meetings of this Albany offer. The thought that the Oswego Normal School in the first year of its existence was to lose its principal struck dumb every member of the faculty. The expression upon every countenance was one of amazement and distress. But the suspense was short. Here is Dr. Sheldon's answer, given soon after to the Albany officials: "I have endeavored to put myself in the position of willingness to pursue the line of duty, without any reference to

personal inclinations, seeking simply to know my Father's will, and then do it. \* \* \* I am told positively that if I should leave, all further effort for the Oswego Normal School will be abandoned, and it can not be sustained. I know much yet remains to be done and that there are many obstacles to be overcome in the accomplishment of what we wish to secure for this school. There are others who can do this as well as I, but this makes little difference so long as the feeling is such as it is. \* \* \* It would not be right for me to jeopardize the educational interests here, unless a greater good could be accomplished elsewhere. So far as Albany is concerned, there are many who can do the work there better than I can. \* \* \* I can assure you that this has not been a hasty conclusion. I have carefully and prayerfully weighed the whole matter, and after a severe conflict between inclination and a sense of duty I am led to decline your flattering offer."

So in Oswego he stayed. The Normal School continued to grow in numbers and reputation under its able principal, and it soon became evident that the old United States Hotel building on this lot would not accommodate those who came hither for instruction. So this new building which we occupy to-day, with its ample recitation rooms and well-equipped laboratories, was commenced in 1879 and completed in 1886. Its plan was essentially Dr. Sheldon's. Thus under his leadership the little school that was opened in 1861 with a faculty of one and nine pupils, with no funds, with no building that could be called its own, with one course of instruction, has grown into the present Oswego State Normal and Training School, with its botanical, chemical, physical, zoological, mechanical, and geological laboratories, with four courses of study, English, scientific, kindergarten primary and kindergarten training department, under the instruction of a faculty of 16 teachers, and an income of \$25,000 per annum. Many thousands of pupils have received instructions within its walls, and 1,978 honored graduates have gone forth from it. \* \* \* If you should ask me what thought most fully occupied the mind of Dr. Sheldon, what principle was the dayspring of all his actions, the foundation stone which was the basis of all the habits of this just and good man, I would answer in one short, comprehensive word, love—"the love that suffereth long and is kind; the love that envieth not; the love which vaunteth not itself, becometh not itself unseemly, is not easily provoked, thinketh no evil." He loved God; he loved his school; he loved his family; he loved little children; he loved his fellow-men; he loved his country.

When this building we now occupy was being constructed, one who had long observed the many interruptions to which he was subject, said to him, "Set apart one room where you can go and be alone by yourself, without interruption by scholars or teachers, and do your correspondence there. It will save you much time and annoyance." He did so. The room was named the private office. Notice was given to the students and faculty that they would be invited there when their company was desired. Instead of this being a relief to him, it became a great annoyance. It placed between him and his school a barrier against which his unselfish, generous nature rebelled. He desired to be approachable at all times by those whom he loved, and the private office soon became a thing of the past.

Dr. Sheldon was the most patient man I ever knew. The shortcomings of others did not irritate him or impress him; they only made him ask himself, "What can I do to eradicate the cause of these traits of character?" He always met his pupils with the greatest kindness and courtesy. These qualities in his character were not spasmodic in their action, but were continuous, because they came from the heart. His kindness was proverbial. It attracted others to him. The young delighted to be in his presence. His childlike simplicity in conversation pleased them. He was never "weary of well doing." \* \* \* Humility was ever exhibited in his daily walk and conversation. If others spoke of the importance of his educational work, if they referred to the fact that to him, more than any other, was due the great improvement in the methods of primary instruction in the United States, he would smile happily and probably felt conscious of the truth of the statement, yet pride was foreign to his nature.

Another commendable element ever observable in Dr. Sheldon was sincerity. He was transparent as a statue of glass. He was in every respect just what he appeared to be. His sentiments were never disguised. On all questions in which he was interested he held definite views and expressed them with fearlessness, and yet he was generous to a fault with those who differed from him. He was tenacious of his own opinions, which were formed after the most mature deliberation, yet he was most respectful and tolerant of the opinions of others. \* \* \*

Dr. Sheldon was merciful and generous to a fault. The needy never left his door empty handed. If a student met with misfortune his ear was always turned in sympathy and his purse was opened to relieve his wants. I have known him to borrow funds by hypothecating valuable securities to loan to those who

could give no security but a promise to pay. He was unselfish, disinterested, and ever true to his conscience, a noble specimen of both a man and a Christian, whose deeds and example should be the best inheritance of his children and his students. Conscience was the arbiter of all his acts. I do not believe he ever considered any great undertaking without profound study and humble prayer. If upon mature reflection, after consultation with his friends, an action seemed right, then he favored it, no matter what the result.

Miss Serita L. Stewart, a member of the Oswego school, dwelt upon Dr. Sheldon's influence as a teacher. Recalling her first interview with him when she entered the school, she said:

No student ever came away from that first interview without feeling that Dr. Sheldon was interested in his welfare and that he had one friend in the school. And a friend Dr. Sheldon certainly was to each of us, a friend who was never too busy to listen to our requests or attend to our needs. \* \* \* Many of our memories center about merry times at "Shady Shore." At the time of the ingathering of the fruits the whole school was made welcome to his home, and again in the spring for the planting of the trees on Arbor Day. His cordial greeting, "I am glad to see you here; I hope you will come often," gave its assurance of our welcome. Not the least of our enjoyment came from our surroundings there—the blue lake stretching off into the distance, and the great trees that gave the place its appropriate name, "Shady Shore." The trees were Dr. Sheldon's pride and delight. He had planted many of them and had watched them grow from slender saplings to stately and beautiful proportions. He told us that he always felt like taking off his hat in reverence to a grand old tree.

The influence Dr. Sheldon exerted over his students illustrates in a striking manner the silent force of character:

In the class room [says Miss Stewart] Dr. Sheldon was always the same courteous gentleman, ready to listen to the slowest, dullest student, and so drawing out the best that was in him. It could not but make an impression on everyone—the teacher known and honored throughout the country, with years of experience and thought behind him, listening attentively to the young man or woman expressing more or less crude ideas, and always finding something in the thought expressed that would be helpful to the class; so that when one day he said, "A teacher has need of the greatest patience—yes, infinite patience," we felt that he was the embodiment of that patience. And we knew that all our teaching would be better for having seen this patience in concrete form. \* \* \* Another trait of his character that was shown in the class room was his simplicity. He put himself on a level with his class as a learner with them. Yet he was most truly a teacher and thoroughly impressed on us a sense of the dignity of the profession of teaching. He taught us, too, that all our work should be based on general principles and gave us many such principles learned from his own experience and study. These teachings had an added weight coming from him, for we felt that he knew whereof he spoke.

One lesson that Dr. Sheldon strove to impress upon us was that of faith in the ultimate result of our work, if we were willing to be guided by a higher power than our own. More than once he has spoken of feeling on his shoulder a hand that turned him from the path he was pursuing and directed his feet into another road. Every time in obeying that guiding hand he had found himself in fields of greater usefulness. So he begged us to heed such guidance; not to be fretted or worried when our plans were spoiled and our lives seemingly thrown into confusion. Perhaps this very wrecking of our plans would be but an opportunity for better things.

He taught us, by precept and by example, to have courage in time of trouble and to go on with our work faithfully whatever difficulties came to us. Dr. Sheldon's own serenity and freedom from worry have often been spoken of. That this was not attained without effort we know, for he said more than once that his prayer had always been "Calm me, my God, and keep me calm." In speaking one day with a student he said that he had found it would not do to worry and that he had overcome the tendency to do so. His serenity, then, was the result of victory over himself, and this fact gives us encouragement to persevere in that direction. \* \* \*

Thoughtfulness for others was shown in every action of Dr. Sheldon's, a thoughtfulness that had its root in his sense of justice as well as in love. We knew that he would listen to all sides of a story before giving judgment and that we were safe to have full justice done us at his hands. He did not hesitate to blame him-

self if he thought he had the least occasion to do so. One day he said to his class that he felt that he was to blame for the poor work they had done in a recent examination, for he knew that he had not reviewed them enough. \* \* \*

In his last morning talk to the graduating class last June his theme was love. "Love is the chief requisite for the success of the teacher's work." As he spoke we felt that back of all he said was the man himself, giving depth of meaning to his words. We knew that for each one of us he had the love that "never faileth," that "suffereth long and is kind," and we loved him.

Superintendent Skinner followed with an address on Dr. Sheldon's influence on education in New York State. This influence was exerted through the principles which were embodied in the Oswego School and in his educational works. With reference to these principles, Superintendent Skinner said:

The central thought which moves us now is that he was the first great advocate in this country of the proposition that children should be taught according to certain fixed natural laws which always have and always will govern the development of children and determine their possibilities. Believing in the doctrines of Pestalozzi and Froebel, he was their most distinguished representative in this country and the first to point out the necessity of observing in the training of children certain unchangeable laws of nature which could not be violated without spoiling life. \* \* \* He believed that every child represented nature as much as a tree or flower, and should be studied and taught by natural methods. He believed that education is a growth—a natural development—not adding to but bringing out by proper method that children are not all to be measured by one standard or governed by one law, or their character and usefulness in life determined by the arbitrary rules of per centum calculations and estimates.

He said of his work many years ago: "In this plan of studies the object is not so much to impart information as to educate the senses and awaken a spirit of inquiry. To this end the pupils must be encouraged to do most of their talking and acting." In 1873 he said in an address to the students at the Genesee Normal School: "I may judge your work by a standard which you do not recognize. I can not determine the education of a child by its ability to answer questions in a given way. These answers may be learned from books. Rather let me ask a question to which they have not learned an answer from the text-book and let them give an answer in their own language from their own thought."

Was this the new education? Whether new or old, it worked a revolution in educational methods—in the proper treatment of the children. When the world became convinced that object teaching was related to the happiness of its children, when it was certain that it could not be laughed down nor stamped out, this school and Dr. Sheldon's efforts became centers of observation. They were the Mecca to all teachers who had been led to believe there was a simpler, better way to teach children. His work led educators to give attention, and when they began to think, conviction came. It was not a momentary flash—a passing thought or fancy—but a settled conviction. He was always in earnest, and because he was in earnest he convinced the thoughtful and won victories. He bravely defended the convictions of his own conscience on intellectual battlefields which he never left except as conqueror. Through his work and his influence in first attracting attention to this new principle in the education of children he helped to lay broad and deep the foundations of a system which will never again be questioned or attacked, but which to-day recognizes the power and scope and the possibilities of the kindergarten as a living, vital force in education, and places it within reach of millions of our children. It is no longer an experiment, but a settled fact, and the State now knows what it means to lead children early to think and do for themselves.

Beyond this, the influence which he exerted through all these years has led our educators into other avenues of thought, and the principles which he advocated have developed well-organized plans of investigation. As a result, whatever is practical or valuable in child study and nature study as we find them comes largely through his teaching.

If his influence was felt in the proper education of children from a child's standpoint, so it has been exerted for more than a generation over those who taught the children. In all his teachings he believed that in the development of the true teacher there must be not only broad scholarship and professional training, but behind and beyond all this must be the true spirit of the teacher. He taught his teachers to be independent and self-reliant—to work out questions for themselves and not depend upon text-books. In this way his teachers learned to teach independence and self-reliance to their pupils.

We claim to-day that we have in the common schools of the State better knowledge of real educational methods, a better knowledge of correct educational principles, more teaching with heart and soul in it and less form. If this claim is well founded, we owe much of the excellence of our schools, the spirit of our teachers, improved methods of instruction, to the influence of Dr. Sheldon, exerted upon the men and women whom he taught in this school and whom he led to higher ideals. \* \* \*

He breathed his sympathetic spirit into his books and the influence of his thought and personality went wherever his words were read, and who can tell the power of a written word, conceived in the hope of helping others? Through the printed page he multiplied his influence over teachers and pupils and perpetuated his power. His advanced thought, his clear statement, his mastery of the subject and his conscientious purpose made him as successful in touching the lives of his readers as in personal contact with those he taught. \* \* \*

In the educational associations of the State and country he was always welcome, and took a deep interest not only in promoting their objects but in the discussions which they furnished. Even if his associates differed with him they admired his rugged sincerity, his earnestness of purpose, and the courteous bravery of his gentle speech. He was everybody's friend; he had no enemies in the educational field, and was never provoked in debate beyond the bounds of kindly firmness. The influence which he exerted in these associations was always in the direction of higher standards. His last educational visit was at Milwaukee, where his face, like a loving benediction, smiled upon those who gathered in the National Educational Association, a most familiar figure, and my last look upon my friend was as he mingled happily with the vast concourse of educators which gathered there.

We speak of great centers of light and heat and their influences upon what they touch, upon nature, upon man, and field and flower. Dr. Sheldon was one of these great centers. The light of his life penetrated the atmosphere of many a life which touched his own, and this light will shine on for years and ages and be transmitted to bless generations which he will never see. \* \* \*

His last days were occupied with plans and hopes for further usefulness to the institution with which he had long been identified. If a personal allusion may be pardoned here, let me say that these hopes formed the subject of my last conference with Dr. Sheldon. He discussed plans for raising the standards of admission and establishing a higher course of study with all the zeal of a man who still had faith in the future, and his good heart was full of hope in anticipation of still grander achievements and greater usefulness in his profession. The fifty years which lay behind him were an inspiration rather than a memory. His face was always toward the rising sun.

The place of Dr. Sheldon in the educational world was the subject of an address by Supt. L. A. Jones, of Cleveland, Ohio. He recognized the difficulty of separating the professional from the personal side of his subject, since "Dr. Sheldon's success as an educator was the direct result of his greatness of soul and capability as a man and citizen." Of the philosophical spirit which formed the basis of his work Superintendent Jones said:

Dr. Sheldon cared little for popular crazes in education, but sought that which is permanent. His good sense saved him from the mistakes of erratic enthusiasts.

Froebel founded his theory to a certain extent on a study of infancy; Pestalozzi, upon childhood; Herbart, on youth; Rosenkranz, on the study of the mature man. Dr. Sheldon included in the psychology on which he founded this school the study of man throughout his development from infancy to manhood; and throughout life the best elements of all these systems have been embodied in the philosophy of education practiced in this institution.

A further marked element of strength in Dr. Sheldon's work is found in the fact that in the midst of his educational work he lived an upright life in harmony with the best phases of all the institutions which civilized man has originated for the uplifting of humanity. He believed in the substantial progress of the race and never doubted the high destiny of man. Rousseau, in his fierce fight for the rights of the individual, violated the conscience of his time and broke faith with all the institutions of civilization, in order that he might emphasize the tenets of individualism and the return to nature. Dr. Sheldon recognized what Rousseau never saw, that a return to nature is in fact to be a return to nature under law and order; and that the institutions of civilized life are the most natural things of which anyone can conceive when the nature of man is thoroughly understood. It was the great strength of Dr. Sheldon that he allied himself with all the forces of nature and spirit that make for righteousness and civilization. His great religious nature

came to his rescue at this point. He thoroughly believed that one with God is a working majority. So he planted himself squarely on the double foundation of faith in man and faith in God. He was never afraid that the study of psychology would lead him into untruth, on the one hand. On the other, he never hesitated in his reliance on God's power to lead him to a successful issue and His wisdom to guide to a worthy goal.

A feature of the occasion was the reading of letters and telegrams from all parts of the country and from men in all departments of educational work. In the course of the exercises a pupil of the normal school sang Dr. Sheldon's favorite hymn, "Calm me, my God, and keep me calm," and the ceremony was concluded by a tribute from his pastor, Rev. Mr. Wills, who summed up the lesson of Dr. Sheldon's life in these words:

More than all, he was a loving church member. His love was the very crown jewel of his life. He loved all mankind, following the commandment of God to love his Lord with his whole heart, soul, and mind, and his neighbor as himself. His worship, his religion, was a passion, not a proposition nor a theory. He was a loving member, and that is my message to you.

---

#### XVI.—REV. SAMUEL KNOX.

[By Bernard C. Steiner, Ph. D., Librarian of the Enoch Pratt Free Library, of Baltimore, author of the History of Education in Maryland and in Connecticut.]

Before the Revolution, Frederick County, the far west of provincial Maryland, had resolved to have its county school or academy, but the school's charter, obtained in 1763, was not used for many years. The pressure of frontier life; the presence in the county of so many Germans, alien in race and language to the English, who were dominant in the province; the death of that true friend to education the Manx clergyman, Rev. Thomas Bacon; the coming of the Revolution; the struggles during the period of the Confederation—all kept the project back. At last, in 1797, the plan was revived, a "large and commodious" building was erected on the schoolhouse lot, and on April 5 of that year the trustees advertised for teachers in the new school. They wished to employ "three masters—one of them to teach Latin and Greek, another English, including the mathematics, and a third to teach the German language." "In making choice of masters, the visitors will pay great attention to the credentials which the applicants may produce, respecting their literary talents, mode of teaching, and other necessary qualifications." A month was given to file applications, and, having made choice of masters, the visitors hoped to open the school on July 1.

These sanguine expectations were not quite carried out to the letter. Delays put off the opening until Monday, the 2d day of October, 1797, which is the true birthday of the school. In their announcement of the opening of the new "seminary," the visitors tell us they design "to comprehend a general course of polite and liberal education." They now plan to have four masters, when the school shall be complete, but as yet have engaged only one. This is "Rev. Samuel Knox, A. M., principal and professing tutor for the classical department." The teacher of English opened his department a month later and the teacher of mathematics came in due time, but, as far as I can discover, the academy had been in operation for a large number of years before a teacher of the German language was employed.

The school was not only for the residents of Fredericktown. In the opening announcement we are informed that "Mr. Knox proposes to accommodate a few young gentlemen in his own family." The "few young gentlemen" soon came, and Mr. Knox could boast that he had under him "a greater number of students from the different counties of Maryland, and some from the adjacent counties of

Virginia, than were at that time in the State College at Annapolis," though the latter was "endowed with an annuity of £1,700 and conducted by a faculty of considerable reputation as to literary acquirements." During the first year of the school's activity Mr. Knox held a "public examination of the youth in the Seminary in presence of the trustees and such friends to literature as may honor it with their attendance on the occasion." In addition to the examination, the principal promised those who should attend the pleasure of hearing "a variety of exercises in Elocution" from the students in the classical department.

Let us now turn aside from this flourishing young academy and see who the principal was and why his life is worthy of record. Samuel Knox, the eldest son of a farmer of the same name, was born in the parish and county of Armagh, in Ireland, in 1756. We know nothing of his early life, but I imagine it was a hard struggle with poverty, for he was 33 years of age when he matriculated at the University of Glasgow. He was of Presbyterian stock, doubtless, and had resolved to become a preacher. He was a faithful and diligent scholar, and in the first year of his university course won second prizes for translations from the Greek dramatist, Aristophanes, and "for the best specimens of composition on various subjects of reasoning and taste." In his second year he obtained first prizes for the subjects in which he won seconds in the previous year, and also second prizes for "ethic exercises in Latin," and translations in verse from the Latin poet Lucan. Of his third year's work we know nothing save that on April 10, 1792, Samuel Knox, "Hibernus," received the degree of A. M.

After leaving the university he studied for the ministry and was licensed to preach by the Belfast Presbytery. His restless disposition probably drew him toward the United States as a newer country. For this or some other reason he came to America, probably in the winter of 1794 and 1795. We first catch sight of him in the United States on April 29, 1795, when he produced his testimonials to the Presbytery of Baltimore. The congregation at Bladensburg was then in a distracted condition, and he was appointed to preach there until June. His ministry was evidently successful, for on October 7 he was tendered a call to that pulpit. A minority in the church opposed this step, but the Presbytery thought the call should be presented to Knox. He accepted the call, preached trial discourses acceptable to the Presbytery, and was ordained to the ministry and installed pastor of the church at Bladensburg on November 15, 1795. His ministry there was not a long one, for on April 19, 1797, he applied to the Presbytery for leave to resign his pastoral charge.<sup>1</sup> This was granted, and on May 3 he was dismissed from the church. He may have entered into negotiations with the trustees of the Frederick Academy before this.

Of Knox's activity at Bladensburg we have two evidences—one religious, the other educational. Joseph Priestley had recently come to America, and a discourse delivered by him in the Universalist Church in Philadelphia<sup>2</sup> was printed in 1796. This discourse was entitled "Unitarianism explained and defended," and it aroused Knox's polemic fire. He prepared and preached a carefully reasoned sermon, vindicating "the Scriptural doctrine of future punishment," and prefixed to it "Some prefatory strictures on the lately avowed religious principles of Joseph Priestley." The pamphlet was published at Georgetown, D. C. The "prefatory strictures" are decidedly controversial and thoroughly orthodox, but are not abusive. During his residence at Bladensburg Knox composed his great work, "An essay on the best system of liberal education adapted to the genius of the Government of the United States, comprehending also an uniform general

<sup>1</sup> The Federal Gazette of October 30, 1802, suggests that there was some difficulty between Knox and his congregation.

I desire to express my thanks to Rev. Dr. J. H. M. Knox for searching the records of the Presbytery, and to Prof. Lucian S. Tilton for numerous services.

plan for instituting and conducting public schools in this country on principles of the most extensive utility." (Baltimore, 1799, 173 pages.) He was aroused to the composition of this book by the offer of a premium of \$100 from the American Philosophical Society. This prize was offered in 1796 for the best work bearing the title under which Knox's appeared. On December 15, 1797, the society proceeded to adjudge the premium. Feeling perfectly satisfied with none of the essays, the society did not award the full premium, but gave premiums of \$50 to the best two essays presented to them. One of these was that written by Knox. In it he claimed that he presented "an entire, general, uniform, national plan, accommodated not only to future improvement in the sciences, but also preserving what hath already been so liberally done in behalf of public education by the United States of America." To the essay he prefixed a memorial he had sent to the legislature of Maryland, and had the book published at Baltimore in 1799. A list of subscribers in the back of the book shows that most of the members of the legislature of Maryland took copies, and that Georgetown, Winchester, Bladensburg, Baltimore, and Alexandria each furnished a number of persons who purchased the book, in addition to a large number of subscribers in Fredericktown. (There were a few subscribers in Hagerstown, Annapolis, Prince George County, etc.) Among the owners of copies of the book we find the name of George Washington. Knox kept some copies of it himself and presented them as prizes to his scholars.

My own copy bears this inscription: "Franciscus Mantz Fredericiensis Academia Alumnus Hoc Præmium, merito, Consecutus est. Die vigesimo quarto Decembris 1800. S. Knox." This work was the first pedagogic work written or printed in Maryland, and in its broad scope had few predecessors in America. It is divided into eleven sections, to which a conclusion is appended. These sections treat, respectively, of the definition of education; of the comparative merits of public and private education; of the importance of establishing a system of national education; of the proper extent of a plan of national education; of the establishment of the various schools necessary to complete a system of national education; of the advantage of introducing the same uniform system of school books into a plan of public education; of the establishment and conduct of the parish or primary schools; of the country academies; of exercises of amusement during the terms of relaxation from study; of the State colleges; and of the national university. His idea was, in brief, that of a national system of public education, with a primary school in every district or township, an academy in every county, a college in every State, and one university near the national capital.

Let us now examine how Knox worked out his great plan. "Education" he defines as "the training up of the human mind by the acquisition of sciences calculated to extend its knowledge and promote its improvement." The advantages of education are self-apparent; without it men "degenerate to a state of deplorable ignorance." The human mind is so formed by its Creator as to be adapted to "a progressive course of improvement." The faculties of the mind without exercise can not become "eminently conspicuous or serviceable." This enlargement, which promotes man's best interests, can only be obtained by education. Education "is not merely the acquisition of a few useful or ornamental arts and sciences." It also "enlarges the stock of man's ideas," causes him to acquire habits of attention and gives the mind "constant exercise in invention, reasoning, memory, and reflection." To sum up the matter, it is "the design of a liberal course of education to call forth all the latent powers of the human mind, to give exertion to natural genius, to direct the powers of taste and criticism, and to refine and polish, as well as exercise, strengthen, and direct, the whole economy of the mental system."

The central feature of any true system of education is the study of language, not only "as it is the great bond of human society, but more especially as the vehicle of instruction and mutual communication." Indeed, it is doubtful whether men would have attained their present stage of enlightenment had there been but one language. Among languages, those should be chosen for purposes of instruction "to which the vernacular is most indebted and in which also the most renowned philosophers, historians, poets, and men of letters have written." In other words, the Greek and Latin languages should be studied next after our own. For those who do not expect to attain to "the highest degree of literary erudition, the mother tongue may be sufficient." To reach the highest degree, it is essential to train the mind by contrasting two languages and by exercising its powers by "translating from one language to another." In the latter task "taste, memory, and reflection are all employed." This study of language should be pursued early in life. "During the childhood of life the faculties of the mind have not attained sufficient vigor or maturity for the acquisition of the higher departments of literature or a close investigation of the more abstruse sciences." These may follow later. Such is his idea of education, but, he adds, there must be both "proper seminaries of instruction" and cooperation from parents, or there will be no success.

He next turns to the comparison of public and private education. "Throughout history nations have supported public education in proportion to their improvement in the arts of civilization and refinement." History shows that public education has produced the best results. From the greater number of pupils under such a system the spirit of emulation is more excited and there is more opportunity for the cementing of friendships. Association with others of all classes of society will prevent a man from becoming conceited. There are more temptations to vice "in the private and retired shades of bad example and domestic indulgence, than in the social scene, bustling crowd, or public assembly." The fact that each teacher has a greater number of students need be no drawback to their advancement. By public education "the best means would be furnished for distinguishing literary genius and merit." This public education should be national. Here is where most nations have failed in the past. Most treatises on education have been theoretical in their character. The actual aid given by the public to education has been devoted to the founding of universities or colleges. "The poor and such as most wanted literary instruction have been left almost totally neglected." A few, indeed, "whom wealth and leisure enabled, might drink deep of the Pierian spring, while the diffusion of its salutary streams through every department of the Commonwealth has been either neglected or considered as of inferior importance."

It is difficult to have a uniform national system, as the United States has a "wide extent of territory, inhabited by citizens blending together almost all the various manners and customs of every country in Europe." The difficulty is only another proof of the importance of the task. No influence would "have a better effect toward harmonizing the whole" in the "combined cause of public virtue and literary improvement" than a "uniform system of national education." This national system ought to have two objects and only two. These are "the improvement of the mind and the attainment of those arts on which the welfare, prosperity, and happiness of society depend." The scope of the system of national education will, therefore, include "every science or branch of knowledge that is indispensably necessary to these important objects." Neither arts nor sciences should be neglected. "Those sciences that tend to enlarge the sphere of worldly interest and prosperity, and without which the various and complicated business of human life can not be transacted," are to be taught, as is also "that refined and sublime knowledge on which the improvement of genius, science, and taste, rather than worldly circumstances, depends." A false and utilitarian taste in

education must be guarded against. Education is not merely "the handmaid of industry;" and a great and prosperous nation such as the United States should encourage polite learning. "Seminaries of learning are the salutary springs of society, and their streams ought to flow not only to an extent, but also with a copiousness proportioned to the circumstances and situation of those to whom their course is directed." Therefore, "ornamental" branches of learning are entitled to patronage. The national educational system "should be adapted to youth in general, whether they be intended for civil or commercial life, or for the learned professions," that of theology alone excepted. Knox would include in his system of public education "a classical knowledge of the English, French, Latin, and Greek languages; Greek and Roman antiquities; ancient and modern geography; universal grammar; belles-lettres; rhetoric and composition; chronology and history; the principles of ethics, law, and government; the various branches of the mathematicks and the sciences founded on them; astronomy, natural and experimental; philosophy in all their various departments;" to which course also, at proper stages, ought to be added "the ornamental accomplishments—drawing, painting, fencing, and musick."

This broad-minded clergyman excluded theology from his national system, as Jefferson later excluded it from his university, and it is possible that Jefferson may have been influenced by Knox here as elsewhere. Knox proposed that each denomination provide its own institution for the instruction of its would-be ministers "in Hebrew, a critical knowledge of the Scriptures, ecclesiastical history, and theology." The exclusion of theology from the national system he justified by the separation of church and state and the existence of different denominations. The separation of theological seminaries from universities would be a benefit to the former, by providing professors and places of instruction possessing "such a solemnity of character as would impress 'the divinity students' with a just sense of their having set themselves apart to be the sacred instructors and pious example of society."

As we have now seen, Knox's ideas of the extent of the national educational system were that it should be "solid and extensive, and that neither should bounds be set 'to the advancement of human knowledge or science,' nor should 'the means of acquiring it' be contracted or circumscribed." All the schools in the system should be regarded as part of one scheme, "no part of which could be neglected without injuring materially the whole fabric." The elementary schools are those in which the education of the majority of the people must begin and end, so these schools, most of all, should receive "the fostering hand of public bounty." To administer the national system, Knox proposes the incorporation of a board of education "under the sanction of the united authority of the States." One or two members should represent each State, and might be chosen either by the national or by State authorities. These members should be chosen "on account of their distinguished literary merit," and should not receive large salaries, as the "honor of being chosen to such an office by an enlightened society" ought to engage the services of able men. This board should be styled the "presidents of literary instruction and members of the board of national education." Their duty "should not only be to preside over the general interests of literary instruction, to digest, direct, and arrange a uniform system in all its parts, and to correspond in such a manner as to support the general and united interests of education, but more especially in their individual capacity to preside with regard to it in those States in which they were resident." At the annual meeting of the board each member should report the state of all the primary or parish schools, the county academies, and State college of his State. He should also preside at the public examination in the last institution.

In each county a county rector should be appointed to assist the State presi-

dent. The rector, who should have a liberal salary and should devote his entire time to the duties of his office, should assist in procuring proper teachers, visit every school once a quarter, and report semiannually its condition and the number of scholars to the State president. Knox thinks it would also be desirable to have the county rectors act as principals of the academies.

To secure good teachers they should be given liberal salaries, provided with commodious and comfortable houses, and promoted from primary to academic schools, whenever deserving such promotion.

In these schools there should be one uniform system of school books, printed by the State printers, under the direction of the national board of education. The selection of these text-books should be one of the most important functions of the national board and they should examine any new ones recommended to them. The national university might well be excepted from this uniformity and the selection of its text-books left to its professors, but this should be the only exception.

The first schools to be established are the parish, or primary ones, to be placed "at a suitable distance from each other and endowed with a few acres of land and a proper house, sufficiently large to accommodate the teacher and the taught." Each school should have provision for 100 scholars and should have a teacher for every 30 or 35 scholars. Knox prefers that the girls be educated separately, under the instruction of the teacher's wife, but acknowledges that this may not be always possible. He thought it "almost indispensable that the head master of every school should be a married man." He should choose his own assistants, but should not fix their salaries. He gives minute directions for the arrangement of the schoolrooms and of the curriculum. "In the primary schools the course of instruction should be confined to a proper knowledge of the English language, writing, arithmetic, and practical mathematics, completed by some approved compend of history and geography." In addition to these, youth should early be impressed "with the principles of religion and morality," but this must be done with due regard to liberty of conscience. A brief prayer at the opening and close of each day's session and the use of a "well-digested, concise, moral catechism may be permitted." Knox's ideas of this last are peculiar and very interesting.

"In the first part of this catechism should be inculcated natural theology, or the proofs of the existence of the Deity from His works. It might, on this head, even extend so far as to show the insufficiency of the light of nature in communicating the knowledge of God, and consequently the necessity of a more express revelation. The second part might properly consist of the first principles of ethics; the nature and consequence of virtue and vice, and also a concise view of œconomicks and the relative duties. The third and last part should inculcate concisely the principles of jurisprudence, the nature of civil government, containing a short historical view of the rise and progress of its various species, and particularly that of the Federal Government of these States."

The interweaving of these subjects, treated in "the most concise and most simple and perspicuous style," into the "most early and general principles of education" is stoutly defended by Knox.

In addition to the prayer and catechism, he recommends that each morning a pupil act as "orator for the day" and read a short essay on some subject calculated "to impress on the tender mind a reverence for the Deity, a sense of His government of the world, and a regard for morals." For this purpose he suggests, not the Bible, but Sturm's "Reflections," then lately translated into English.

Three promising boys at the least, sons of poor parents, should be received free of tuition in each school and educated that they might become teachers.

The next stage in education was "county schools or academies." Their buildings should contain apartments for two masters and their families, two teaching

halls, two dining rooms, and two dormitories. The dormitories and dining halls should be used by the junior and senior students; the teaching halls by the classical and mathematical pupils. At the age of 12 children should be ready for the academies, having previously spent four years in the primary schools, though no one should be admitted without examination. No pupil should be received if over 14 years of age, which fact would spur parents to attend to the early education of youth. In the academy the students should study Latin, Greek, French, mathematics, ancient history, and Greek and Roman antiquities. In the three years' course of the academy the scholars should accomplish what would even now be esteemed a sufficient amount of work to entitle them to admission to a college. Such students as were to discontinue their education as soon as the academic course were completed might continue a year longer at the academy. The rector should give a weekly lecture "on natural, and afterwards on literary and civil, history; on ancient and modern manners, and the conduct of life," and he "should occasionally exhibit that connection which subsists between the several departments of knowledge and the dependence which the highest or most useful arts have on the elementary branches of science."

Public examinations should be held thrice yearly, and prizes should be conferred at these times. Elocutionary exercises should be given at the times of examination. It is interesting to note that no mention is made of educating girls above the primary grade. Of the free pupils in the primary schools, five at least should be admitted into the academy and still further instructed at the entire expense of the State.

In the academy attention should be paid to physical education. In the primary school it may be "most proper to leave youth to the choice of such diversions as were most agreeable to them." But in the academy "even their amusements should discover some marks of their improvement and progress in knowledge." Knox's chapter on physical education is full of common sense. He realizes the use of such vigorous recreations as tend "even to fatigue." The only definite suggestions he makes are that the youth be taught how to swim and instructed in military tactics and the manual of arms.

The third stage of education was to consist of a college in each State, pursuing a uniform plan of education. The existing colleges should be used as a part of the system as far as possible, but the plan must be uniform. Knox also thinks entrance requirements and "prices of boarding and tuition should be perfectly the same throughout the different colleges." Of course, "the claims of natural liberty" demand that the youth have the privilege of "attending any State college the parents might prefer." If, however, the State legislatures were sufficiently jealous of their literary character and sufficiently endowed their respective colleges, Knox thinks that "it would be seldom, except on account of health, that parents would incline to place their sons at the seminary of a different State." The entrance requirements should be as follows:

First. The applicants "should have previously gone through the course of education prescribed by the primary school and county academy, or if instructed by private tuition, that their progress should be equal to and on the same plan with such as were taught at those seminaries.

"Secondly. That none educated either publicly or privately should be admitted but such as on public examination should give satisfaction, both in their classical and mathematical proficiency.

"Thirdly. That all students in the State college should at least be intended for a triennial course, which, as nearly as possible, ought to be from the close of the fifteenth till the expiration of the eighteenth year of their age."

In the first year of the course the student's attention should chiefly be directed to the Greek, Latin, and French languages, and mathematics. In addition, either

the principal or the professor of classical learning or belles-lettres should lecture "on the history of literature, the manners and customs of the Greeks and Romans, and toward the end of the session on taste, criticism, and composition."

In the second collegiate year the students should continue the subjects mentioned above and "be introduced to a concise view of rhetoric, logic, and moral philosophy." These last he does not count worthy of much attention. The student's time is too precious to be spent in acquiring a knowledge of all the logical laws or forms of the syllogism. A thorough knowledge of Euclid's Elements is preferable to the best system of logic that ever was taught. He thinks scarcely more of the importance of moral philosophy, under which he includes "natural theology, economics, and jurisprudence." This would "afford much entertainment and instruction; but it does not appear that in a seminary of literary education any farther attention to it is necessary than what should inculcate a scientific view of it in all its parts. The study of the various most approved systems of moral philosophy may be more properly assigned to the shades of domestic reading and retirement."

In the second year of the course the students should continue the study of mathematics, especially geography by the use of globes, the laws of motion, the mechanical powers, and principles of astronomy. In the first part of this year the course in "classical reading and criticism" should be completed. Lectures should increase in number and importance as the course progressed. Essays should be written on all the different subjects of study and criticised by the principal and professors. Essays in competition for a prize should be prepared at the close of each session, and the essay obtaining the prize should be "spoken or read in public, before the literary characters of the State, the patrons of the college, and what other audience might be assembled." This would promote emulation.

In the third year, while other branches should be continued, the student should devote his chief attention to natural philosophy. This should be taught experimentally, with suitable apparatus. In connection with this course there should be an observatory and "proper apparatus for making astronomical observations." The emphasis on these things is noteworthy.

For all the students there should be on Saturdays a lecture from the principal in "the common or most spacious hall" on "morals and conduct, illustrating the effects which education ought to have on them." At this time also he should question some of the students as to the work done by them during the past week.

Vacations should not only be for four weeks in the year, as in the county academies, but should continue for the two summer months of July and August, with the addition of two weeks in January. These longer times of relaxation are to be allowed "in order that the students in the State colleges should have time to mix a little in society, see their friends, and know something of the world as well as books." This Presbyterian minister had a remarkable breadth of view in his educational outlook. When we look at the rules of Yale, Harvard, or other contemporary American colleges and see how they have restricted the amusements of the students, we are the more amazed at what Knox has to propose in this matter of amusements. "As the youth advance in years their amusements should proportionally become more manly and dignified," writes Knox, "so that while at this seminary I would have the recreative hours of their first session spent in learning to dance and in acquiring a polished address in conversation and manners." This should include "the proper attitudes, gestures, and actions in elocution." Not only did Knox favor dancing, but also he thought "that the profession of teaching dancing might be extended to a much more important degree of dignity as well as advantage at a seminary of public instruction than it commonly is in the domestic scenes of society." The hours of recreation in the second year should be spent in learning music, and in the third year in learning music and fencing. With such a broad curriculum and competent instructors, Knox "presumed that the student

would, at the expiration of this course, be properly qualified either for pursuing his literary course to the very highest stage of improvement at the National University or to commence his intercourse with the world as a scholar, a man of business, or a gentleman." At the end of three years there should be an "impartial and strict examination in the classics and various sciences," which, having been successfully passed by the candidate, the degree of bachelor of arts should be conferred upon him. No higher degree should be given by the State college.

The capstone of Knox's whole system is the "national university," to be called the "University of the United States." A careful examination of Jefferson's plan for his University of Virginia proves almost conclusively that he was familiar with this chapter and borrowed many features of Knox's plan. He may have owned a copy of Knox's essay. If so, the copy is not in the part of his library contained in the Library of Congress. The idea of a national university may have been suggested to Knox by Washington's desire for such an institution, but the way he worked out that idea was peculiar to himself, as far as I can learn.

Knox mentions that "A great, extensive, and enlightened Commonwealth" can find no better object on which to "exhibit, even to some degree of excess, its munificence than in founding, endowing, and supporting a suitable seat of national improvement in literature and erudition." Attention to this end is more necessary than to "objects of public prosperity in manufactures, commerce, and inland navigation," inasmuch as "the mental powers of man" are "superior to mere bodily endowments and the means of pampering these." But a national university, established without a system of subordinate institutions leading up to it, would have its advantages circumscribed, and the "effects of sending youth to such a seminary without due preparation" would be "vain." This defect has much injured the university system in Europe.

A national university, placed at the head "of a system of national education" such as Knox advocates, and "connected with every branch or seminary of the general system, would tend not only to finish or consummate the whole literary course, but also to confer upon it that national dignity and importance which such a combination of public patronage and interest would justly expect and merit. It would thus constitute the fountain head of science, that center to which all the literary genius of the Commonwealth would tend; and from which, when matured by its instructive influence, would diffuse the rays of knowledge and science to the remotest situations of the United States."

The first point discussed by Knox is the situation of the proposed university. The location should be "central and well chosen with regard to healthiness and convenience," at a few miles distance from a great city and "contiguous to the seat of government, in order that the youth, having an opportunity of occasionally seeing the grand council of the nation, should be animated by that patriotism which they in their turn might on a future day be called upon to exercise for their country." It should not be in a great city, for there "abound too many scenes of seduction, too many examples of profligacy, and too many opportunities of vicious corruption." The second subject discussed with reference to the university is its buildings, and here we can see Knox's influence on Jefferson's ideas most clearly. "The university buildings," Knox wrote, "in magnitude and style of architecture, ought to be suitable in every respect to the important purposes for which they were designed and also to the character and dignity of the nation." He enumerates as the principal buildings that will be needed under the general plan: "Proper apartments for the president and vice-president of the university, and contiguous to these a great room or hall for the faculty of professors to assemble in on the business of the university, in which also the students should be matriculated and the several degrees conferred after the proper examination by the faculty."

"There ought to be also a very large and spacious public hall, sufficiently capa-

cious to contain, on proper occasions, all the students of the university, the faculty of professors, and also any respectable assemblage of spectators or audience that might occasionally be introduced."

For each professor there should be provided "a commodious, well designed and fitted out class room, with desk and benches and such bookshelves and other apparatus as would be necessary "during hours of instruction." It will be noticed that Knox seems to have anticipated the seminary library.

"Convenient houses or apartments should also be provided for all the various professors in the arts and sciences, and it might be most eligible that each of their class rooms should be contiguous to or adjoining their private apartments." A steward's house, with kitchens, dining rooms, and lodging rooms, should provide accommodations for the students. Under the steward, who himself was to be "subject to the authority and government of the faculty," there should be a chamberlain, who, "by the aid of his servants," should "keep all the halls, class rooms, and lodging rooms clean, in good order, and supplied in the winter with fire, candles, or whatever else should be necessary."

"The buildings should also comprehend a house for a public library, a museum, and also proper apartments for those who taught the ornamental arts; especially a hall for painting, another for music, and a third for statuary." Knox is inclined to think that it might also be useful to introduce some of the most ingenious of the mechanical arts. He insists on the necessity of employing a university "printer of the very first abilities and reputation," and plans that he should "keep a bookshop, well supplied" with the needful books and stationery. This was the first suggestion in America of connecting a printing press with a university as part of its permanent equipment. He advises the disposition of these buildings according to the following plan: "The front, or elevation, of the university" should contain accommodations for the president and vice-president, the large hall for the faculty, and the great public or common hall. From this front should "extend rearward," "in the manner of wings," the "several professors' houses, with their respective class rooms." They should be at right angles with the main building, and together with it should form three sides of a quadrangle. The fourth side was to be occupied by the library, museum, etc. Within the quadrangle, and "at the breadth of 100 feet from each range of that square," a second "square," or quadrangle, should be constructed "for the accommodation of the steward and chamberlain, the necessary kitchens, dining rooms, and lodging rooms for the students." Jefferson reversed this arrangement. Within this second "square" should be yet a third, "for the accommodation of the teachers of the ornamental arts, with their respective halls, and also for the printing office and bookshop."

"On the most central part of the buildings," either as a part of the third square or at its center, "a magnificent steeple should be erected, with a proper bell. On the top should be a cupola or dome fit for an observatory and sufficiently large to admit of an astronomical apparatus in the first style of improvement." Knox quaintly adds that if the smoke from the surrounding buildings interferes with the central observatory, "the steeple might terminate with a spire" and an observatory might be erected "somewhere contiguous to the university." In the middle of each side of each square Knox would place "a public or common entrance, arched over so as not to intercept the range, and on each entrance an iron gate, to be shut precisely at a certain fixed hour at night." The outside square should have a front gate, "ornamented in a magnificent style, having on the upper part of the gate on each side in basso relievo the arms of the United States." "In the rear of the building" Knox plans for an athletic ground an "ample inclosure for walks and place of recreation for the students." Here also should be a botanical garden, containing a house for the gardener and a "summerhouse hall" for botanical lectures. Near by should be the "chemical laboratory and lecturing hall," which would be

“better secured against accidents” if detached, “than if connected with the university buildings.” Knox evidently did not trust the skill of chemical professors. The professors’ houses were placed by Jefferson on the inner range of buildings, by Knox on the outer one, so that they might be “most advantageously and comfortably situated,” with “respect to gardens and other conveniences,” and order could the better be preserved, as these houses would “form an inclosure round the youth lodged in the inner squares of the buildings.” No students should be lodged in the professors’ houses, that there be no jealousy among the students.

Knox next discusses the university faculty. It should be an “incorporated body,” with power “to make laws and regulations respecting the government of the university and for preserving peace and order in all its departments.” The professors are to be “amenable to the board of education,” and all their regulations subject to the sanction of this board. The professors should receive fixed salaries, that their support might not depend on the “precarious attendance” of many or few students upon their courses. It was obviously just that the principle of a payment to teachers of a sum proportioned to the number of their scholars should not be extended into an institution where it might be necessary to have a competent man lecturing on an unpopular subject. It could be justified, if anywhere, only where attendance on all courses was required.

“The respectable faculty” should be composed of the following officers: A president and a vice-president (Knox does not say whether these might also fill professorial chairs); “a professor of classical learning or belles-lettres and composition; a professor of Latin and Roman antiquities; a professor of Greek and Grecian antiquities; a professor of Hebrew and oriental languages; a professor of rhetoric, logic, and moral philosophy; a professor and assistant professor of natural philosophy; a professor of mathematics; a professor of astronomy; a professor of history and chronology; a professor of law and the principles of government; a professor of elocution and oratory;” the “various professors in the medical department, and also the professors of the various ornamental arts.” None of the faculty should be clergymen, or if they were, “they should suspend every clerical function during their being members of that body and devote themselves solely to their office.”

In addition to the professors, two chaplains should be appointed annually to officiate alternately on Sundays at services in the public hall. These chaplains should be chosen from the different Protestant denominations (Knox’s anti-Romanist proclivities appear here), and Knox suggests that it would be well to appoint young clergymen without any parochial charge, to whom residence at the university “on account of improvement” would be an attraction. “The whole faculty should, with the utmost solemnity, attend on divine service in a body.”

Knox now takes up the question of the students. The course of study should be one of three years, leading up to the degree of master of arts. A few free scholarships should be open to deserving and poor graduates of the State colleges. All university students must be graduates of State colleges, except foreigners, who must show “a proficiency on strict examination” equal to that of the college graduates.

In respect to the curriculum, Knox was disposed to allow large liberty of choice. At the beginning of the university career of each student, he or his parents or guardians should give the president some information of his “professional views in life and, agreeably to such information,” the course of his studies at the university should be directed. “The useful sciences should occupy the most serious hours of study and the ornamental be attended for the purpose of relaxation.” The only particular direction given by Knox with reference to the course of study is that on every Saturday, when the faculty and all the students are assembled in the public hall, and the list of students’ names is examined “with regard to con-

duct through the week, three of the students, who had been, in their turn, nominated orators for the day, should deliver alternately from the rostrum, an oration not exceeding twenty minutes in length each, on some literary or philosophical subject of their own choosing." Prizes should be conferred annually on the writers of the best orations. After listening to the orations the students "may be dismissed by the principal," Knox adds, "with an exhortation to good behavior and with prayer."

As to the law school, Knox is silent, and as to the medical school, his only remark is with reference to the requirements for admission. He doubtless felt that his knowledge of these branches of knowledge was not sufficient for him to be as dogmatic as he felt himself able to be in other subjects. Medical students, he advised, should be admitted without requiring a college diploma from them. Students whose views are directed "to the highest attainment in literary knowledge" may be required to have passed through a more "comprehensive and scientific course" than those whose views are directed to a "particular profession." In addition to this consideration, most of the medical students of that day were expected to spend part of their time, before attending lectures, in attending "some practicing physician." Though a diploma might be waived in the case of medical students, Knox was firmly of the opinion that they should not be received if "in any degree deficient in useful or polite literature." Theology should not be taught in the university, and consequently no theological degrees would be given.

This was the plan of a system of national education as developed by Samuel Knox a century ago. He claimed that "under proper patronage and the direction of a well-chosen literary board it would amply provide for the proper instruction of youth in every possible circumstance of life, and also for any particular business or profession." Many details were omitted, but the ground plan was complete. Four features of the system seemed to Knox of especial importance: "An incorporated board of presidents of education," to develop the details of the plan and to "watch over and add dignity to it by their virtue and talent;" the uniformity of the plan, which would produce "not only harmony of sentiments, unity of taste and manners, but also the patriotic principles of genuine Federalism among the scattered and variegated citizens of this extensive Republic;" the institution of a State printer "for supplying the seminaries with the proper authors in each science," and the education of selected youth "at the public expense." Knox calls attention also to the unusual emphasis given by him to mathematics and the sciences. This is indeed noteworthy.

He acknowledges that his plan is not final, and that, if adopted, it will doubtless be found to need certain improvements; but he feels sure that he has elaborated a system "generally suited to the citizens" and one comprehending "every description of situation and circumstance uncircumscribed by partial endowments, local prejudices, or personal attachments."

In referring to Knox's essay, Mr. Sollers sums up the important features of the plan as being: "Schools uniformly graded from the primary to the university, uniform text-books, adequate supervision, fair emoluments for teachers, promotion for merit, and provision for their professional training. To his contemporaries it must have appeared visionary indeed, but along these lines all improvement in public education has advanced from that time to the present date, and on these same lines there is little reason to doubt that future advances will be made."<sup>1</sup>

Outside of its probable influence on Jefferson and on the legislature of Maryland in diverting the public grant from the State colleges to the county academies, we can trace no direct effect of Knox's essay. It seems in some respects singular to

<sup>1</sup> Steiner's History of Education in Maryland, p. 47. Mr. Soller's account, pp. 43-49, was the first to call attention to Knox.

us at the end of the nineteenth century, but it was far in advance of the ideas of the end of the eighteenth century. He was an educational pioneer, crying his message and prophecy into the deaf ears of a careless generation.

The only publications of Knox during his principalship of the Frederick academy which I have found were an Address to the Legislature of Maryland, which he prefixed to his *Essay on Education; A Vindication of Mr. Jefferson's Religious Conduct and Principles*, and "A funeral oration commemorative of the illustrious virtues of the late great and good General Washington, the father of his country and the friend of man," delivered to a respectable congregation of the citizens of Fredericktown, February 22, 1800. This oration, for which Knox took the text, "All Judah and Jerusalem mourned for Josiah" (II Chronicles xxxv, 24), is in the most inflated and bombastic style, and speaks of the great leader in terms of most unbounded praise. Knox tells his hearers that "the effusive tribute of sorrow this day shed by the assembled millions of this extensive country, while it gratifies the spontaneous dictates of our own hearts, will transmit to latest posterity an illustrious testimony how far republican gratitude transcends the ostentatious blazonry of all the vain funeral pomp in which the useless hereditary despot is consigned to dust and oblivion." In Washington, Knox finds "all that was great and good, glorious, excellent, or praiseworthy" in either Epaminondas or Timoleon, the noblest of the ancients. Providence "felicitated this Western Hemisphere" with the "effulgence" of his endowments, "which shall enrapture the hearts and enlighten the minds of the truly virtuous and patriotic as long as the sun and moon endure." Washington was, however, praised by Knox, not only for his statesmanship and private virtues, but also for his interest in education and the favor he showed the project of a national university. This object, so dear to Knox's heart, was also one to which some of Washington's "last and most fervent recommendations were directed." He desired "the institution of such a dignified national seminary as was best suited to the genius of our Constitution and equally calculated to promote union and harmony of sentiment, as to diffuse the enlightening influence of science to the remotest corners of his country." The failure of Congress to take up Washington's recommendations in this matter meets with Knox's severest censure.

That a Presbyterian minister should publish a "vindication" of Jefferson's religion seems curious enough. The Westminster Catechism and Jefferson's free-thinking ideas were far enough apart. Yet Knox's zeal for the Republican party led him to publish a small pamphlet during the Presidential campaign of 1800, in the endeavor, as he later wrote Jefferson, "in a familiar and popular way to drive your enemies, as the enemies of republicanism, from what they then deemed their stronghold against you." Before having the pamphlet printed, Knox had it read and approved of by a prominent Republican, who did not know the authorship; and John Thompson Mason distributed 100 copies of it when a candidate for Presidential elector. It was afterwards republished, without Knox's sanction, by Pechin, in Baltimore, as an appendix to an edition of Jefferson's *Notes on Virginia*, published by him in 1800. Pechin calls it a "sublime and argumentative dissertation on Mr. Jefferson's religious principles." (Vide H. B. Tompkins's *Bibliotheca Jeffersoniana*, Nos. 104, 267.) The title-page of the tract is slightly different, reading, "A vindication of the religion of Mr. Jefferson and a statement of his services in the cause of religious liberty. By a friend to real religion. From envy, hatred, and malice and all uncharitableness, good Lord deliver us!—Lit. of Prot. Episc. Church. Baltimore: Printed for the editor of the American, by W. Pechin. Price, 18 cents." The half title is most truly descriptive of the work, which is the least satisfactory in its argument of any of Knox's writings. The tract was really written that we might find "Mr. Jefferson's services in the cause of religion vindicated." The main part of the argument is that Mr. Jeffer-

son, as the author of the Virginia act of 1776, establishing religious freedom, and of the Declaration of Independence, is "the man to whom the friends of religious society are more indebted than to any other in the United States."

Knox maintains that "we have no concern with the peculiar creed or profession of any public civil character. It is sufficient for us that he is the determined vindicator of that liberty which is not only the best guardian of true religion, but also provides and secures to us the happiness of worshipping God according to our consciences, 'without any to make us afraid,' to tyrannize over our opinions, to trample down that sacred prerogative conferred on us by God." Knox vehemently asserts that Jefferson's tenets as to religious liberty are those of our national Constitution: "Because in his Notes on Virginia he has shown in strong terms that men who embrace the greatest extremes of contradiction in their religious creeds—even those who believe in Trinity and those who do not—or those who believe in one God or those who believe in a plurality, may, notwithstanding, live together in civil and social harmony and happiness, these designing, ambitious sophists and partisans have attempted to give it the worst possible coloring. They forget that our excellent Constitution says, though in other words, the same thing." If it were not for Jefferson and such as he there might still be an established church in Maryland, and his struggles for religious freedom contrast themselves most strikingly with the recognition of the existence of the Protestant Episcopal Church by the Federalist legislature of Maryland in the vestry act of 1798.

Knox now calls to all classes of religious men in turn—Roman Catholics, Protestant Episcopalians, Methodists, Friends, Presbyterians, Baptists, Seceders, and Covenanters—and warns them against interference "with the religion of any man considered as a candidate for any office." The past history of each of these denominations shows to what disastrous consequences does such contemptuous disregard of the right of private judgment tend. Knox holds in the greatest abhorrence "all religious licentiousness—all infidelity in principle or in practice," but he is convinced that "all the clamor and calumny against Mr. Jefferson on account of religion is mere electioneering imposition." The zeal of the Federalists for religion is pretended to "suit some ambitious party purpose." Jefferson expresses himself "in the most respectful manner of God and his holy religion." This fact, Knox maintains, "could only be derived from his acquaintance with and belief in the word of God." Another proof urged by Knox as showing Jefferson's "regard for the word of God" is quite ridiculous. Jefferson has subscribed to "the most expensive and handsome edition of the word of God ever published in these States." Knox's peroration concerning this "hot-press Bible published in Philadelphia" is quite remarkable. He claims, quite seriously, that "many who probably never had a Bible in their families are crying out against Mr. Jefferson for denying the sacred volume, although we find him its public patron, introducing it in its most respectable appearance to his family, and thus giving the most dignified countenance and support to the most valuable edition of the Scriptures ever published in America."

Jefferson's eminent services to his country, his intimate friendship with Washington, his upright life, are all appealed to as arguments to make the Americans grateful to Jefferson. We listen to Knox's fervid words, and we are not convinced. He is out of his sphere, and we feel he has rather vindicated Jefferson's moral character than his religion. Less than two years before he had printed a sermon against the Unitarian, Priestley; now he has a pamphlet in favor of the equally unorthodox Jefferson.

The address to the legislature of Maryland is dated Fredericktown, November 30, 1793, and was doubtless largely instrumental in gaining for the academy that annuity of \$800 which it still enjoys and which has been of such essential service

to it. It probably was also the efficient cause of the subsequent course of the legislature. Previously, the State's support of education had been shown in the annual grant of £3,000 to the two colleges which composed the University of Maryland. In 1798 £500 was withdrawn from the grant to Washington College and distributed to several academies, among which was the Frederick County school. Seven years later the State withdrew the remainder of its grant to the colleges. This crippled them permanently and caused them to suspend operations for a time. Prof. Basil Sollers tells us that "the reversal of the policy of the State may be traced without doubt to the efforts of the Rev. Samuel Knox. \* \* \* The policy initiated by the legislature, to which Mr. Knox's memorial was addressed, was so directly in conformity with his recommendations that there can be little doubt that it was the immediate cause of action at this time, though influences were at work which would undoubtedly have brought about the same result at no remote period." Professor Sollers, to whom I am indebted for my first knowledge of Rev. Mr. Knox and for many subsequent kindnesses, calls this address "an able plea for secondary education."

Knox distinctly stated that he does not discuss the "advantages of public education to any community." To dwell on this subject "in the present enlightened age of the world," wrote Knox, "would appear like an eulogium on the benefits of the light of the sun to the solar system." He assumed that the advantages of public education were admitted and tried to answer the question, how that education could best be given. The argument thus begins: All, whether learned or unlearned, admit the "great importance of education." Should not, therefore, all the members of the same community "conspire in bringing into effect some well-digested plan for organizing and establishing that which seems to be the common object of their wishes?"

In Maryland, "though much has been done in behalf of public education," as was shown by the contributions to the State colleges, "yet all that might reasonably be done in so good a cause has not been effected." Hundreds of youths, all over the State, are as yet "deprived of the means of any instruction suitable to the offspring of free and independent citizens." This state of affairs can not be remedied by grants to the State colleges alone. "One or two pompous edifices and expensively endowed seminaries may give a partial and ostensible dignity to the literary character of our portion of the Union; but, in truth, without the means of establishing and providing proper subordinate nurseries of students prepared for entering and attending such dignified seminaries, they may tend to absorb or swallow up the greater proportion of public patronage, but can not, with any truth or propriety, be considered as the most effectual provision for diffusing the blessings of general knowledge or scientific improvement throughout the State."

"The present mode of promoting the interests of public education" in Maryland has not been sufficiently "dictated by the influence" of the consideration that "those means of education which are derived from the industry and exertions of the people" should be "disposed of in such a manner as would most effectually and generally promote the improvement and happiness of the people."

Other States, especially Pennsylvania and Virginia, have outstripped Maryland in encouraging education. Each other State has its college, and so Maryland youth must be looked to as the patrons of the Maryland colleges. But if there are no good secondary schools, how can they be fitted for the colleges? Thus even these latter will be benefited by the institution and endowment of academies.

There must be "public patronage of some general, well-digested system of education," such as Knox describes in his essay, that "the literary character of our State may assume \* \* \* dignity of understanding," "manliness of sentiment," "elegance of taste and criticism," and "scientific illumination." As Maryland's system is not complete, it should at least be increased by the public endowment of

academies. Despotisms have supported colleges alone, but it "would be highly preposterous, repugnant to its interests, as well as obnoxious to the genius of our Government and the spirit of the National Constitution," to support the colleges alone and not to patronize "subordinate seminaries."

The legislature should be careful, however, that "no publicly endowed seminary in this State shall ever be characterized as the nursling, or even distinguished by the appellation, of any particular body of religious professors." "The narrow restriction and contracted influence of peculiar religious opinions or ecclesiastical policies" have "too long and too generally obstructed" the "pursuits of science and literary knowledge," and Maryland should not fall into the error of supporting such an Old World system. If a "particular religious denomination" wishes to have "particular private seminaries \* \* \* most consonant with the spirit of that particular religious system they profess," let them establish them, but also let them support them.

Another important point is "the extent of the plan" on which the State-aided education should be conducted. Here Knox makes a vigorous plea for classical instruction. "A very superficial and contracted plan" seemed then to be gaining ground, and men were already crying out against the "college fetich" of "classical erudition." This, with "its solid and invaluable advantages," has been relinquished by many "for a smattering of French and the accomplishments preparatory for the countingroom. With many it begins to be an object of higher importance to have young master initiated into the science of a smart or graceful air, and all the little arcana of social pertness and confidence, than in the beauties of classical elegance, or the having formed a proper taste for literary and scientific accomplishments. In an enlightened and free State the Graces and Muses should ever go hand in hand."

Polite accomplishments were not the only rivals of classical education. Because some few have attained a high "sphere of excellence in some departments of scientific knowledge," though "untaught by any habits of literary discipline," there are many who favor a plan which "would immediately lead the scholar into the knowledge or study of the sciences without the usual attention either to the classics and ancient languages or even to that elementary preparation on the due attainment of which the thorough acquisition of any science must depend." This error may not seriously injure the more brilliant youth, but those of mediocre parts will suffer. A general system of education ought rather be designed for the great number in the latter class than for the few in the former. Only on a solid foundation can the "extremely diversified endowments to be found in the mental constitution of the youth" be properly developed and made ready to receive instruction in "the more distinguished walks of science." Knox believed that "every part of human knowledge, whether of the useful or ornamental kind, should be patronized with the fostering hand of liberality and care;" but at this time in Maryland "primary or township schools and county academies" most demand attention. Maryland must not "be among the last in the divine work of public instruction," and that this may not happen the "public mind" must "be fully impressed with this truth—that their interest, their character, their freedom, and their happiness depend on the state of the education of their youth." The ignorant are fair game for despots.

If the legislature is inclined to adopt his views, Knox suggests that it require a biennial report from school trustees or appoint a person to inspect the schools and report. If no general system for the whole State be adopted, it would be well to investigate into "the state of literary education in each district or county," to see where new institutions should be established.

Knox recommends that the legislative grant be used for teachers' salaries and

that the people of the township or county be required to provide a proper building. If the legislature provide the schoolhouses, a careless neighborhood might cause them to be useless by neglecting to provide teachers for them. The locality should provide the building; the legislature, making use of the merit system, should confer such a grant on teachers who merited it by "persevering usefulness in their profession" that, with the addition of a "moderate price for the annual tuition of each student," the instructors would have an "adequate salary." Here, as ever, Knox opposes free education as pauperizing, and salaries paid without regard to the number of scholars as corrupting the teachers. The master or rector of each county academy should be *ex officio* a trustee, and all trustees should be held to a strict responsibility in case of carelessness or neglect. Such seminaries as have been established should at once be patronized, and public notice should be given that whenever the inhabitants of a county should erect suitable buildings for a school or academy on a liberal foundation, the State would lend public aid.

These suggestions are given in case the legislature does not feel it advisable to provide for the establishment of public education in every county by an obligatory act. The last named is what Knox would prefer; but, knowing that there is little ground for being so sanguine, he will gladly accept any advance toward a system of public education.

Such was the memorial Knox submitted to the legislature of Maryland, and probably through the strength of his arguments that body was induced to enter upon a policy of dispersion of its gifts, which had a most important effect upon the educational history of the State.

Shortly after coming to Frederick, on September 27, 1797, Knox was appointed to preach as supply in the Presbyterian Church there. This double duty he performed until the latter part of 1802, though he was never installed at Frederick. At this latter time differences had arisen between Knox and the Frederick congregation, which were brought before the Presbytery, and caused him to cease to occupy the pulpit. I suspect that these differences may have been largely caused by political matters. Knox was an ardent Jeffersonian, while John P. Thomson, who owned the *Herald*, the local Federalist paper, was a prominent member of the congregation. Knox carried on a violent newspaper quarrel with Thomson, as we shall see.

The success of Knox's teaching was such that in 1799 there were 50 classical students in the academy, as well as 28 in higher English and mathematics, and 35 in the introductory department. The report made to the legislature (November 26, 1799) stated that "from the well-established character of the principal and tutors in said academy and the attention of the visitors and directors in the management of the same, your committee are led to conclude that Frederick Academy, aided by the fostering hand of the legislature, will be rivaled in usefulness by no academy in the State."

This bright prospect was clouded by Knox's inability to keep out of political quarrels. These seem to have begun at the General Assembly of the Presbyterian Church at Winchester, in May, 1800. Knox was a delegate, and when he found that Rev. Jedediah Morse and "a few other influential men" were trying to prejudice the Southern members against Jefferson, he worked against their plans successfully. This, he thought, was never forgiven by the Federalists.

As a result of this controversy a "hostile spirit" against Knox sprang up in the board of trustees of the academy. Hon. Richard Potts and "other highly Federal gentlemen," according to Knox's account, "removed their sons and placed them at Princeton, assigning as their motive that they had been improperly instructed by me." It seems curious to think of boys taken from a county academy and

placed at Princeton, and shows how much college education has advanced in the past century. Injurious rumors spread through Frederick, and, to counteract them, Knox wrote to the faculty at Princeton, asking them to examine the boys from Frederick and notify him how they acquitted themselves. The result of the examination was very flattering, and the Princeton report was that "no youths had ever entered that college who had done more credit to themselves or their instructor."

In spite of these testimonials, Knox's position was not a satisfactory one, and "the desire of being disconnected from such patrons of public education and parents who could so treat the instructors of their sons" caused Knox to give up his position of principal of the Frederick County School.

He had been engaged in bitter political controversy for a year before he left. Entering into local controversies over money voted for roads and such matters, he attacked the Federal newspaper of Frederick, saying it "was full of lies, and no gentleman should support it," and engaged in vehement quarrels with persons whose opinions differed from his own. (Vide Frederick papers of October 2, 16, 30, 1802; January 8, 1803.) He went to Benjamin Ogle's house when he was sick and disputed with him. Knox's rhetorical style is criticised by his opponents in a minute way. (Vide also National Intelligencer of October 1, 1803.) They claimed he was bidding for Jefferson's favor in hope of a place at the National University, and he in return attacked the trustees for not coming to inspect the school. (October 16, 1802, and January 8, 1803, the suggestion was made that Knox wished the legislature to turn out Federal trustees and put in Republican ones.)

Knox resigned the charge of the academy on September 22, 1803,<sup>1</sup> and shortly after that date removed to Baltimore. He seems to have felt that teaching was his proper vocation. It is true that the Presbytery appointed him supply at Soldiers' Delight on April 7, 1804, and that he continued to fill that pulpit for about five years; but, as he resided in Baltimore during that period, he could have done but little work there. After leaving Soldiers' Delight his name almost disappears from the minutes of Presbytery, and he seems to have attended its sessions but seldom.

When the Methodists removed their educational institution to Baltimore, after the burning of Cokesbury, they employed James Priestley, of Georgetown, as principal of the male department. After the destruction by fire of this second building, Priestley opened a private academy on St. Paul's street (then known as St. Paul's lane) and was quite successful. Procuring the support of several prominent citizens of the town, he petitioned the legislature for a college charter, and received it on January 7, 1804. This new college was intended to "stand on a thoroughly unsectarian basis, as to both scholars and professors," and its building was to be erected by aid of a lottery. This seems not to have been a successful financial enterprise at the time; but finally sufficient money was obtained to erect in 1811 a "plain but convenient" building on Mulberry street, where Calvert Hall now stands. The Baltimore College was absorbed by the University of Maryland in 1830, and formed its faculty of arts and sciences so long as that was continued. After some years Mr. Priestley resigned the position of principal on account of differences with the trustees about his salary, and went to Cumberland College, Tennessee. The school, and it was probably never more than a school, was then closed for some time. Meantime Knox had come to Baltimore and opened a private academy on Chatham (now Fayette street), at the corner of McClellan's alley. In 1808 he united his school with another one carried on by Sinclair, and the united school was adopted by the trustees as Baltimore College, Knox being made principal and Sinclair vice-principal. Among the first pupils was John P.

---

<sup>1</sup> His goods were advertised for sale on October 8, 1803.

Kennedy, who graduated with a diploma in 1812.<sup>1</sup> Knox continued in charge of the school until 1819 or 1820. After he left, Baltimore College was closed for a time, and reopened in 1821 under Dr. L. H. Gerardin.

Knox's Baltimore career was as full of turmoil as his Frederick one had been. Rev. William Du Bourg and his Sulpician Brothers had recently opened St. Mary's University, and this institution, under Roman Catholic auspices, early aroused Knox's wrath. In 1806 a laudatory article on this college appeared in the *Companion*, one of the Baltimore journals. This aroused Knox's ire, and he sent an answer to the paper at once. This they declined to print, whereupon he took it to another newspaper office, and in the *Evening Post* and the *Telegraph* a furious war was waged for several weeks. In his first letter Knox, who concealed his identity, after the fashion of the times, by calling himself "Quintilian, jr.," summed up his objections to St. Mary's University thus: Because its faculty of professors was "self-created or self-chosen;" because it had an "aristocratical tendency;" while every college should have its "funds in such a state as to admit to its advantages the youth of those in moderate as well as those in affluent circumstances" (Knox instances the British universities, where he, a farmer's son, had as classmates sons of peers), and because its president and its principal professors were exclusively of one religious denomination. "Pliny, jr.," took the side of St. Mary's and "Luther, jr.," as well as "Lex Talionis," became supporters of "Quintilian, jr.," if, indeed, they were not other pen names for Knox. "Lex Talionis" especially criticises the mathematical text-books published by St. Mary's and the catechism prepared by the Abbé Fleury, which was then taught. The dread of Romanism was a very real one, and the interest in the conflict was such that the newspaper articles were gathered up into a pamphlet of 58 pages and published under the title of "Strictures on the Establishment of Colleges, Particularly that of St. Mary's in the Precincts of Baltimore." Knox was not content with the honors of first "developing to the public" the "Jesuitical spirit" of St. Mary's University, but continued to work against it. It was doubtless largely through his influence, if not in his own words, that there was written the "Pastoral letter from the ministers or bishops and ruling elders of the Presbytery of Baltimore to all under their respective charges, on various duties, but especially on the religious education of their youth."

This pamphlet of 24 pages, which is almost entirely an attack upon Fleury's catechism, was published at Baltimore in September, 1811, and called forth rejoinders at once. Two of these I have seen, and there may have been others which have not come under my notice. The two known to me are entitled "St. Mary's Seminary and Catholics at Large Vindicated Against the Pastoral Letter of the Ministers, Bishops, etc., of the Presbytery of Baltimore" (44 pages, October, 1811), and "Sons of St. Dominick; a Dialogue Between a Protestant and a Catholic on the Occasion of the late Defense of the Pastoral Letter of the Presbytery of Baltimore" (94 pages, 1812). The pamphlet referred to in the second of these was probably by Knox himself and was entitled "A Defense of the Pastoral Letter \* \* \* in Reply to the Vindicators of St. Mary's College." (Baltimore, 1812, 68 pages.)

From this controversy we can easily imagine that Knox would obtain enemies and Baltimore College would suffer, and are not surprised to find him writing in 1818 that "the institution is unable to support itself against such discouragements in any proper consistency with its designation as a college." In addition to this difficulty, the "tide of party spirit ran high" against Knox in Baltimore, as in Frederick. "Not a Federal gentleman would put a son under my instruc-

<sup>1</sup> Kennedy (see *Life* by Tuckerman, p. 44) draws an unfavorable picture of Knox. He calls him "a large, coarse, austere man, with an offensive despotism in his character, which not only repelled all love, but begat universal fear and dislike among the boys. He was not much of a scholar either, I should say, and was far from successful as a teacher. He had no pleasantries, by the way, no explanations, no appeals to one's own perceptions of an author's merits."

tions." They preferred to send their boys to St. Mary's. There were a few patrons of prominence, among them the famous William Pinkney, and "many youths of considerable promise of usefulness" completed their education in Baltimore College, but the school was not thoroughly successful. Indeed, the city was not enthusiastic over higher education. The influential citizens had never been liberal in their patronage of public education, and some thought it "an obstacle to success in mercantile affairs" for a youth to have a college training. While the State had been under control of the Republicans, Knox had failed to secure State aid, which he had obtained while at Frederick, and after the Federalists regained power he was threatened by a new rival. The "sectarian spirit," which had already caused the Roman Catholics and Episcopalians in Baltimore to have their "favorite seminary," now induced the Methodists, the "most numerous denomination" in the city, to have Asbury College chartered in 1816, and to "manifest their usual zeal and exertion" in its behalf.

With the trustees Knox got along hardly better than with those at Frederick. They thought a building committee or architect or even a carpenter knew more than an instructor of long experience as to how a building should be constructed, and refused to take his advice therein. One of the trustees, a clergyman, had a serious difficulty with Knox because of discipline to which his son was subjected. The reverend gentleman's conduct toward Knox was "malignant and unwarrantable," "malevolent and unjust." The other trustees sided with Knox in this matter, but his position could not be pleasant.

Under these circumstances it is not surprising that Knox should look elsewhere for a situation, nor that he should turn to the university which Jefferson was just founding. When Knox and Jefferson first met is unknown to me. We have seen that Knox issued a tract in Jefferson's defense in 1800. In 1802, during the newspaper controversy in Frederick, Knox had been accused of favoring Jefferson in hopes of securing a professorship in the National University, should such be formed. On January 22, 1810, Knox wrote to Jefferson that he had for some time planned to publish a translation of Buchanan's dialogue, "De jure regni apud Scotos," and asks permission to dedicate the work to Jefferson. Knox wishes to use it as a text-book in civil government. In this letter he claims the authorship of the "Vindication," and apologizes for its issue by Pechin with the "Notes on Virginia," closing the letter with the remark that Knox is one of the multitude who "pray that the evening of your days may be a rich harvest of your pure and invaluable services to your country." (Jefferson Papers in State Department, series 2, vol. 48, No. 80.)

Jefferson answers this letter at length, granting the desired permission, though he has not read the dialogue. He tells Knox that "the boys of the rising generation are to be the men of the next and the sole guardians of the principles we deliver over to them;" that he had "acted through life on those principles of the sincere republicanism I feel in every fiber of my constitution, and when men who feel like myself bear witness in my favor my satisfaction is complete." Jefferson had previously known Knox, for he states that the "testimony of approbation" from Knox is "acceptable and flattering," the "more so as coming from one of whom a small acquaintance had inspired me with a great esteem." He speaks of the trying character of the times "which brought us within mutual observation," and states that he remembers the "Vindication," but neither knew who was the author nor that Pechin had republished it. "Had all this been known, I should have seen myself with pride by your side. Wherever you lead, we may all safely follow, assured that it is in the path of truth and liberty." (Jefferson Papers, series 1, vol. 13, No. 37.) This being the case, and Jefferson having probably read the "Essay on Education," we are not surprised to find that, on planning his new college, Knox was the first man thought of as its principal. Jefferson had in all

probability adopted some features in his plan from Knox's suggestions, and naturally thought of him as the proper person to carry on the enterprise.

So, on July 28, 1817, the visitors of Central College (which was to attain fame under the name of the University of Virginia) agreed "that application be made to Dr. Knox, of Baltimore, to accept the professorship of languages, belles-lettres, rhetoric, history, and geography, and that an independent salary of \$500, with a perquisite of \$25 from each pupil, together with chambers for his accommodation, be allowed him as a compensation for his services, he finding the necessary assistant ushers." Thus the whole institution was placed under his care, and Prof. H. B. Adams remarks, "Here was theoretical provision for an entire faculty."

For some reason news of this determination never reached Knox's ears, and later in the year 1817 the board receives intelligence that Dr. Knox has "retired from business," and resolves to apply elsewhere for a principal. As we have seen, Knox had not "retired from business," but was still in charge of Baltimore College. In 1818 a friend of Knox fell in with Carr, a nephew of Jefferson, who asked after Knox, and said that his uncle had recently expressed a wish that, if Knox were not otherwise engaged, a place might be found for him in the new university. This conversation was promptly carried to Knox, and led him to write Jefferson on November 30, 1818 (Jefferson Papers, series 2, vol. 48, p. 81). In this letter Knox gives interesting autobiographical information, and asks for a position in the university. He is now a widower, his four daughters are all married, and "more independent" in financial matters than he, so he can say he does "not so much seek emolument as usefulness to society." Though now principal of a college, he would not object to serve as a member of a university faculty, and suggests that he is especially well versed in the classics. It is true he is considerably advanced in life, but his health is good, as is his "capacity for industry and exertion," while his eyesight is such that he can read "the smallest Greek text without spectacles."

Jefferson answers the letter on December 11, 1818. He utters a number of generalities, such as: "Education has been too much neglected in the Southern States. In no form of government more than ours is it true that knowledge is power, and under all governments it is wealth, reputation, and happiness." But he says nothing of any appointment. I can not help thinking that some of Knox's enemies had gained Jefferson's ear, so different is the tone of the letter from that of the vote of the trustees a year and a half ago. Now, Jefferson writes that matters are uncertain; he is too old to carry out his plans, and has left them in the hands of others. (Jefferson Papers, series 2, vol. 48, No. 82.) We feel that there is no hope for Knox here, and probably he felt so also, for he seems to have made no further effort for a position at Charlottesville. After he left Baltimore College he seems to have lived in retirement for some years.

In the early part of 1823 Mr. Knox returned to Frederick and again took charge of the academy. He had recently married, as his second wife, Miss Zeruah McCleery, of Frederick. She was a Presbyterian, and her "connections" were a "leading part" of that "small society." The pastor of the Presbyterian Church, Rev. Patrick Davidson, was Mr. Knox's associate in the duties of teaching at the academy. The day after Knox arrived in town he opened his department in the school. Shortly afterwards (March 3, 1823) he wrote to his son-in-law, Mr. Archibald George, a Baltimore merchant, that "owing to its being so long mismanaged he found the number of students but small; there is, however, a prospect of this increasing in the spring." Mr. Knox taught the classics only, finding a number of promising youths among his pupils. Mr. Davidson gave instruction in English and mathematics. We are not surprised to learn that the latter was "not able to give sufficient attendance, owing to occasional sickness and his ministerial duties." Knox found his colleague quite congenial, but considered his "talents as a preacher buried in this place." When Knox came, he found Davidson "had

some jealousy lest I should be the means of undermining his interest in the congregation. But I considered it my duty to ease his mind upon that head." Poor Davidson, with a wife "in a very bad state of health," with "a large family," and without "the means of a decent support from the produce of the academy and the congregation combined," we do not wonder that Knox considered him "an object of Christian sympathy." For two years Knox enjoyed the fellowship of this "most pious man and zealous for the cause of Christ," and then was called on to preach his funeral sermon. This discourse, printed at Frederick in 1825, was one which showed how high an esteem Knox had for his colleague, whom he spoke of as one eminent for the steadiness with which he kept the faith. This was not, however, Knox's first printed discourse after his return to Frederick. In 1824 he preached a sermon in the Presbyterian Church on the occasion of taking up a collection in behalf of the Greeks. This discourse was published in Frederick, and the proceeds of the sale were to go to the Greeks. At that time this people were struggling to shake off the yoke of Turkish tyranny, and Knox pleaded their cause in a strenuous and earnest manner.

He said that though it may be that a wise and prudent policy for the Government will cause it to decline national aid or cooperation, yet as Christians and men we should sympathize with the Greeks. The fact that the New Testament is written in Greek and to Greeks, that we should feel sympathy with any nation struggling to become independent, and that the missionaries of the American Board report a growing interest in the Scriptures among the Greeks are among the arguments used by him to arouse the interest of his congregation.

In February, 1825, from one of his letters to Mr. George, with whom Knox kept up a regular correspondence, we learn that he was opposed to our present idea of free education. He had steadfastly favored State-supported education, but was not inconsistent in his opposition to "pauperism schools." His apprehension that an agitation for the establishment of such schools would "terminate in having the annuities withdrawn from this and the other academies in the State" was not the chief cause of his opposition, nor was it that he did not "perceive the ground that some do" for such schools in Frederick, "where common education may be had at the rate of \$1.50 or even \$1 per quarter." No; he stood out against the "considerable excitement" then prevalent "in Frederick" as to the establishment of free schools on the New England plan, because he thought "it rather of public interest that such a system should be adopted by the State as would render it obligatory on every parent to educate offspring and to consider it as much their duty to labor for the food and nurture of the mind as for that of their body. I believe a parent can be compelled by law, if he has any possible means, to provide sustenance for the life of his child, and I do not see why they should not also be rendered responsible to the State for their proper instruction according to their means." "One thing I am certain of, and that is, that any system calculated to place public education on a degraded foundation will terminate to its injury and discredit, and a spirit for having it conducted on pauperism plans must have this tendency."

Though opposed to free public schools, Knox cherished his plans for national education. It was a subject which had engaged his thoughts for thirty years, and now, in his old age, he still clung to this project, which his essay on education had unfolded. In March, 1826, he went to Washington to talk with members of Congress on the matter. Their views are of interest, especially since in recent years we have discussed Government aid to education through the Blair bill and since we have had a National Bureau of Education without cavil for thirty years. Knox writes to his son-in-law, Mr. George, as follows: "My object in going to Washington was to present a memorial to Congress on an improved plan of public education, which I have from long consideration been induced to believe as much

superior to any yet introduced. I was very attentively and politely received and treated by some of the members individually to whom I was introduced, but they all agreed that public education was a subject Congress could not take up; that it was unconstitutional and reserved as an inherent right in each particular State.

"I took the liberty of arguing the point with some of them in this way: I said that I regretted to have to observe that what tended to the growing opulence and high improvement of the nation in that respect, in as far as roads and canals could subserve the object, nothing seemed to be unconstitutional, but that roads and canals that were absolutely necessary to convey the treasures of wisdom and light and knowledge to the minds of the community at large did not seem to be equally important; that such inlets to knowledge were considered 'unconstitutional.'

"I had an interview with Mr. Everett, of Massachusetts, on the subject, and with Mr. Mercer, of Virginia, one of the committee on the National University, and by the latter was informed that they had determined to take no notice of the subject of a national university, though recommended by the President, and consequently could not promise to support any other plan of public education on the same national ground and views, and that this was left with the States respectively. Colonel Little and Mr. Barney, your delegates, behaved politely and promised to support my memorial were it presented, but this I declined, knowing well that if the subject of the national university was not to be even noticed, though recommended by the President, my memorial could not be sanctioned. I do not intend, however, to give it up. I shall send it on to Governor Clinton, of New York, especially as I am conscious, from long attention to the subject, that it would prove worthy of national patronage." No such paper can be found among the Clinton papers in the New York State Library, and it is possible that it never was sent.

Knox, however, endeavored, to procure aid to higher education from the State, if he could not from the nation, and in December, 1826, sent a memorial to the legislature, accompanying a pamphlet entitled "A brief essay on the best means of promoting the interests of public education." These were printed at Frederick in 1826, and are quite curious.

An analysis of the "brief essay" shows us that Mr. Knox had conceived many unique ideas as to educational methods. The pamphlet begins with a reference to the recent interest in education, especially in its "primary departments," and an expression of thanks to those who have aroused this interest. A law had been passed in the preceding year "to provide for the public education of youth in primary schools throughout the State." By its provisions a system based on that of Joseph Lancaster was established, to be introduced into such counties as should vote to adopt the bill. Though thirteen counties adopted it at once and only six rejected it, the transient enthusiasm for the law soon passed away, and the governor's message of 1828 stated that "the law for the establishment of primary schools, so well received by the people, is believed to be so defective that but a very partial attempt has been made to carry it into effect, and without revision and material amendment it will be useless."

In 1826, however, the failure was yet in the future, and Knox hoped to take advantage of the interest awakened in education through the discussion of the ideas of Lancaster and Bell. The ideas of the former, Knox thinks may have been derived from his essay on education, already discussed by us, as copies of that work were sent to London for sale. Now, however, Knox wishes to put into practice plans which shall deal with liberal education, as Lancaster did with elementary education. Not only the scholars but also the alumni of the institutions should be able to enjoy the lectures of the professors, according to Knox's scheme. This plan he offers first to Maryland, because there "all his dearest interests on earth exist," and he "can not but feel an earnest desire that this improvement should be adopted where he has so long labored, not without some creditable share

of success." He is already uncertain whether the new law is the best measure possible, and suggests that it would have been well to have committees on the Eastern and Western Shores examine existing schools and academies and see how far they were patronized, how many children of both sexes received education there, and what counties and vicinities are most destitute.

"At present," Knox finds, "a spirit of benevolence appears to direct a majority of the citizens of Maryland to the promotion of the interests of public instruction in the humbler walks of society." As we have seen, Knox was no favorer of giving free elementary education to those who could afford to pay for it, and he here declares that "it would appear that every free independent American should be taught to depend on no other individual than himself for the instruction of his offspring, and if systems of pauperism must prevail let these be extended only to the orphan and the unprovided offspring of the helpless widow." If the State support schools, however, for the "attainment of a common course of what is usually designated as English education, brought within the reach of the poorer class of the community, it is not the interest of the opulent only, but the interest also of those in the most discouraging circumstances, that a due attention and patronage be extended likewise to the more advanced seminaries."

If Maryland has no suitable institutions of higher learning, the "opulent" may send their sons elsewhere; but "to what state of degradation this would tend were the sons of genius, though poor, deprived of an advanced course of instruction in their own native State and within their reach." Provision is made for such youths in Great Britain, and "some of their greatest proficient in literature and science and some also of their greatest and most eloquent statesmen and civilians owed all their usefulness and dignified accomplishments to their being so trained and educated." "Public education in any free State can never be placed on any respectable foundation where no provision is made for fostering real traits of genius as they happen to arise in the humblest as well as in the highest ranks of society." Yet but little has been done in the United States in this direction, though a beginning had been made in Maryland by the establishment of eight free scholarships in each endowed academy.

With the existing condition of liberal education Knox is much dissatisfied, especially with the freedom of conferring degrees. He states that these "titular diplomas" which are given, instead of a "just but simple certificate" of the course pursued, can add nothing with the "judicious" to the "interest or credit of public education." "An honest regard to the literary character of the State," he adds, "must elicit the remark that the number of D. D.'s, LL. D.'s, A. M.'s, and A. B.'s at all our collegiate commencements, annually increasing and multiplying, can not fail to render us in the eyes of the learned of the Old World a nation of literary gasconaders. In their advanced seminaries, at some of which from 500 to 1,000 students are numbered at an annual session, not one-tenth of the number as at one of ours receive diplomatic distinction."

To improve the condition of things Knox has two plans—one for the establishment of a "State schoolmasters' college," or normal school, the other for the foundation of a "city institute." Four years before, on September 28, 1892, Knox had published a letter in Niles' Weekly Register, calling attention to the fact that he had conceived the plan for the latter institution and inviting correspondence with any State, county, district, or city which should wish to better its educational system. The "primary schools in each county on eligible and proper regulations, could well-qualified instructors be obtained, might be rendered highly useful and interesting." The greatest defect in the primary-school system in Maryland is "lack of emulation" of teachers, through their receiving "fixed salaries," with no hope of increase. A man should have "compensation proportioned" to his labor; for example, if 50 cents per pupil were given each quarter, teachers

would vie to have the largest schools. Some such system is in existence in Scotland, where the master has the use of a dwelling and garden, as well as a fixed salary and a "small pittance" for each pupil. But should the community consider primary schools "as alone necessary for the promotion of education, \* \* \* they will soon be enabled to discover their error and that nothing could so much tend to establish a monopoly for the affluent to talents and learning and, consequently, of office and place." Teachers must be trained in order to be successful. To obtain best results the State should have "one uniform system" to train up those "either actually employed or to be employed as instructors in the different schools and academies sanctioned and endowed by the State." The trustees and visitors of local schools are often incapable of examining teachers properly, and a State certificate from the schoolmasters' college should admit a teacher to any school. Knox has already written a pamphlet, as yet unidentified by me, on this subject and has distributed copies of it. One of these, given by him to Dr. Mitchel, a United States Senator from New York, Knox thought, may possibly have reached Governor Clinton and caused him to suggest such an institution in his last annual message.

Let us now see what Knox thought necessary for a school, which should place the "profession of public instructor on a more effectual and respectable foundation." There must be "proper apparatus" and a library of "the most approved authors," as well as professors of English, mathematics, the classics, and, probably, modern languages. The school, anticipating the University of Chicago, should be open all the year. During vacations and whenever they could attend, the school-teachers could come and would be greatly benefited, even in a short time at the college. In the intervals of the attendance of the teachers, a number of youths of suitable and promising talents "should be admitted and trained as teachers and bound as apprentices for a term of years." We have come to adopt Knox's position as to the importance of normal schools and agree with him that it is necessary to have an "institution for the express purpose of training up, examining, and approving all to be patronized and employed in the public schools of the State." Like Knox, in later years, we have seen too many instructors of youth springing up "like mushrooms from the very stercorearium of ignorance, and, through arrogance, pedantic vanity, and a little unwarrantable recommendation," seldom failing to succeed in obtaining positions, "even where examiners are legally appointed for that purpose."

The second of Knox's measures was the city institute, or high school, where 600 boys could be taught by a faculty of six—three professors and three assistant professors. If the pupils were charged \$3 per quarter, \$7,200 would be raised by tuition fees annually. This would be sufficient to pay the salaries of the faculty, and the expense to the public would be merely that for buildings and their maintenance. Knox regrets that he has been unable to put the plan in operation, as no description of it can be fully satisfactory. He gives, however, a diagram of the building. It is 144 by 48 feet, with a back building 48 feet square. The central room (48 feet square) is two stories high and into it open the 6 class rooms, each provided with 10 rows of desks, each row containing 10 desks. The central hall is to be used for lectures, etc.

Exercises and lessons which can be recited without leaving the desks are to be attended to in the class rooms, and in order to avoid the clatter of the boys bringing up their exercises to the instructors there should be placed above each desk an arrangement somewhat like that used in the cash system of department stores and the delivery of books in the Boston Public Library. Thus the exercise books would be brought to and returned by the teacher without confusion. "Tablets for the exhibition, telegraphically, of the different studies" are to be prepared by the instructors, and apparently these were somewhat of the nature of the modern syllabi. These tablets should be printed on the printing press, which was to be

placed in the basement of the building. This press was an essential part of the plan, and could be used for printing text-books, works of the instructors, the best essays of the students, etc. It was the idea of a university press seventy years ago.

There was much that was fantastic in these schemes. There was also much that is in curious accordance with the modern improvements in education. But Knox was only a forerunner who cried in the wilderness. He cried to deaf ears, and the legislature took no action upon his memorial.

His second term of service at the academy ended, like the first, in disagreement with the trustees. After his second resignation from the academy he published his side of the controversy in a "Letter addressed to the trustees of the Frederick Academy" (price 12½ cents, see *Frederick Herald*, August 25, 1827. I have not seen this tract). The cause of the controversy I have not been able to find. During the early part of his principalship, on May 1, 1824, the visitors (John McPherson, president; William Ross, Frederick A. Schley, and J. Henry McElfresh) published in the local newspaper a testimonial as to the examinations recently held in the academy, in which they said every part was flourishing and they were particularly gratified with Knox's teaching. (The school had a new principal, James J. McNeely, as early as August 25, 1827. The assistants were C. J. Haderman in mathematics, French, Italian, and German, and Samuel Markell in elementary branches.)

Occasional glimpses of Knox after his retirement appear in the newspapers. On September 29, 1827, he advertises that in his "present proscribed condition" he intends to open a private school and will give instruction at night, if 10 apply therefor. On January 5, 1828, he publishes a testimonial as to the excellency of Hubbard's Grammar, and on November 8 of that year he issues proposals to republish a work on "Jesuitical Influence," in four volumes, stating that the people are "Jesuitically applied to for education of their sons," but the real intention is to "make them ultimately vassals to the Pontiff of Rome."

Knox taught a private school for a short time, but he had become an old man, whom the boys cheated in performing their assigned tasks, and soon he retired from his life work. A little bookstore on Market Space, with the sign "Jesuitical and Non-Jesuitical Books," occupied his energies (*Recollection of Asbury Hunt*). He lived five years more in the western Maryland town, and then died, after a lingering illness, on August 31, 1832, and was buried in the Presbyterian graveyard. His wife, Zeruah, was thirty-three years his junior and survived him, dying in 1839.

The *National Intelligencer* of September 4, 1832, spoke of him as "a ripe scholar and worthy gentleman, and highly esteemed by his old pupils and a large number of relatives and friends." He was an educational pioneer, vehement and irascible in manner, firm and persistent in advancing his views. He conceived great plans which he was never to see realized; he was one of those obscure men whose combined effect upon the world's history has been so important. Impracticable as were some of the details of his schemes, he had the wisdom and largeness of outlook which enabled him to make great and far-reaching plans, whose influence was toward the advancement of education.

Tables illustrating the system of national education proposed by Samuel Knox.

CURRICULUM OF THE PRIMARY SCHOOL.

[Four years in length. Children supposed to be from 8 to 12 years of age.]

First year.	Second year.	Third year.	Fourth year.
<p>First rudiments. Large alphabets, letters at least 1 inch long, printed on sheets and mounted on pasteboard.</p> <p>Next spelling tables, and, thirdly, easy reading lessons, arranged as above, the type being gradually diminished in size.</p> <p>First monosyllables, then longer words. Begin reading as soon as possible.</p>	<p>Webster's institutes and vocabulary or pocket dictionary.</p>	<p>Readers; earlier ones without "verse pieces," but selections from the best historians, and from the Rambler, Guardian, and Spectator, arranged according to difficulty.</p> <p>Arithmetic, taught on same system as alphabet and with "blackened board" and slate.</p> <p>Writing; copying approved specimens of letters, bills, deeds, etc.</p> <p>Well-digested compendium of ancient history.</p> <p>English grammar; Ashe's introduction to Lowth's grammar, and Buchanan's English Syntax.</p>	<p>Poetical readers arranged: (1) pastoral, (2) elegiac, (3) didactic, (4) heroic or epic. Explanations by teacher.</p> <p>Composition of letters. Guthrie's General Geography, Morse's Geography of the United States. Use of maps and globes. Modern history.</p> <p>Daily reading of Sturm's Reflections or some similar religious work before whole school.</p>

Prayer at beginning and end of each day. Moral catechism, containing questions on (1) natural theology, (2) ethics and economics, (3) jurisprudence, civil government and United States Government.

No vacation, apparently.

CURRICULUM OF THE COUNTY ACADEMIES.

[Three years' course; pupils from 12 to 15 years of age.]

First year.	Second year.	Third year.
<p>Latin grammar (University Latin Grammar), Corderius's Dialogues; as soon as nouns and verbs are completed, follow (while still studying grammar) with Æsop's Fables and Erasmus's Dialogues. All of these to be read with literal translations, and followed by: Cornelius Nepos. Cæsar's Commentaries. Latin composition, Clark's or Mair's Geography.</p>	<p>Greek grammar (there should be one with rules in English instead of Latin). Sallust. Livy, "a considerable part." "A little" of Tacitus. (Those who are not to go to the university may substitute French for Greek in this year.) Rollin's Ancient History. Goldsmith's Abridgment of the History of the Grecian and Roman Republics.</p>	<p>Combine Greek and Latin writers (Latins close imitators of Greeks), as follows:                      Bucolics of Virgil                      Idyls of Theocritus.                      Odes of Horace.                      Odes of Anacreon and Pin-dar.                      Georgics of Virgil.                      Works of Hesiod.                      Æneid of Virgil.                      Iliad of Homer.                      One or two plays in each language.                      French begun for classical students.                      Rhetoric.</p>

Military drill and athletic exercises run through the entire course. In mathematics, use of globes, elementary astronomy, plain and spheric trigonometry, algebra and conic sections, Euclid's geometry. Half of each day given to these studies. More mathematics to be given to those not going to college. Occasional lectures from the rector on natural, literary, and civil history, ancient and modern manners, and the conduct of life. Four weeks vacation; one in January, one in May, two in August.

## CURRICULUM OF THE STATE COLLEGES.

[Three years' course. Pupils from 15 to 18 years of age.]

First year.	Second year.	Third year.
<p>Greek, Latin, and French read with a view to criticism rather than to the acquisition of the language, which has probably already been done. Critical essays.</p> <p>Mathematics, e. g., mensuration, surveying and navigation, gunnery, and fortification. Lectures on history of literature, manners, and customs of Greeks and Romans: taste, criticism, and composition. Dancing.</p>	<p>Completion of classical reading and criticism.</p> <p>Essays criticised by professors. Rhetoric (brief course). Logic: Locke's "Essays on the Understanding," Bacon's "Novum Organum." Moral philosophy: Natural theology, economics, and jurisprudence.</p> <p>Mathematics. Geography by use of globes, laws of motion, mechanical powers, principles of astronomy. Music.</p>	<p>Natural philosophy, with experiments. Astronomy, practical. Mathematics completed. Classics completed. Belles-lettres completed. Fencing.</p>

On Saturday, lecture by president on morals and conduct, and public examination of scholars.  
Vacation of two weeks in January and two months (July and August) in summer.

## XVII.—ANDREW J. RICKOFF.

On March 30, 1899, died at Berkeley, Cal., Andrew Jackson Rickoff, A. M., Ph. D., one of the most noted city school superintendents of the United States. He was born August 23, 1824, near Newhope, N. J., a small village lying between Trenton and New Brunswick. His parents removed to Cincinnati, Ohio, when he was only 6 years of age. Here he attended the public schools till his older brother became a teacher, after which he remained under his tuition, except for short intervals, until he entered the high school to fit himself for Woodward College. Having completed the studies of the high school, and fairly entered upon the collegiate course, he had to withdraw to enter upon the career of a teacher, which he followed from that time on. He was then less than seventeen years of age. With so limited a preparation for his duties, he had to work hard through many years of private study to round out his education, after he had begun his labors in the school-room. He thus became a self-taught man in the best sense of the word. But having a strong constitution he was able to do an amount of work which very few could have accomplished. For years, during this period of life, he was accustomed to allow himself but five hours a day for sleep, retiring to his bed at 10 o'clock and rising to recommence his studies at 3 the next morning. While thus supplementing his own education, he never permitted himself to go before his classes without so thorough a review of the subjects before them that he was able to conduct their lessons without reference to the text-books. Thus he acquired the reputation of an indefatigable laborer in whatsoever was set before him to do. By such untiring application he won from the Ohio State University at Athens the degree of A. M. Later, after his great success as an organizer and manager of schools, several colleges conferred upon him the honorary degree of Ph. D.

Such in brief was the career of Mr. Rickoff as a student. As a teacher his history may be presented in chronological order, as follows: He commenced teaching in 1840, and after being engaged for two or three years in the country schools near Cincinnati, he was invited to take charge of the schools in Portsmouth, Ohio, as superintendent. Here he remained five years, at the end of which time, August, 1849, he received an appointment as assistant in one of the public schools of Cincinnati, the same that he had attended for a while when a boy. Here he served

as assistant one year, at the expiration of which he received an invitation to return to his old position at Portsmouth. He declined, however, and accepted the principalship of the school in Cincinnati in which he was then teaching. This post he held a little more than two years—that is, until he was elected superintendent of all the schools of the city by the board of trustees and visitors, he being the first one to receive such an appointment from that board. The two superintendents who had preceded him had been elected by popular vote. Having filled this office five years, he resigned to establish a private school for the sake of the better income it afforded. For the succeeding nine years (1858-1867) his attention was mainly confined to this work, though he still remained upon the board of examiners of teachers for the city. In 1864 he was elected to represent the First Ward in the city board of education.

The following year, on the retirement of Hon. Rufus King, who had occupied the chair for fourteen years, Mr. Rickoff was elected president of the board. Before the year was ended he removed to a country residence, by which he became ineligible for another term, and thus his official connection with the Cincinnati schools came to a final and honorable close.

As a member of the board of education, as well as when acting in the capacity of superintendent, Mr. Rickoff always advocated the largest freedom for teachers in the instruction and discipline of their classes, and in the discussions of the board he maintained that teachers were the only proper examiners of those who sought to enter their profession. As the chairman of the committee on text-books and course of study, he gave much of his time to the unification of the system, some particulars of which had been left incomplete at the time of the reorganization of the schools, and when elected to the presidency of the board he was requested by unanimous vote to reappoint himself chairman of the same committee. This he did, though contrary to his own wishes, as well as to the rules of the board.

In the exercise of his duty as president, Mr. Rickoff took special care to appoint large-hearted and able men on the committee on salaries—men who would not hesitate in adopting a generous and liberal course toward the teachers, and whose influence in the board was powerful enough to carry through any measure of which their judgment might approve. The Hon. S. S. Fischer, afterwards Commissioner of Patents at Washington, and the Rev. Henry M. Storrs, the most eminent divine then occupying a pulpit in Cincinnati, were the leaders. In a short time the committee submitted a scheme proposing a very liberal increase in the pay of teachers. This was the beginning of a general advance of salaries in most of the cities and towns of Ohio and other Western States. The schedule then adopted has stood with hardly any change from that day to the present time.

In July, 1867, without Mr. Rickoff's knowledge or consent, and during his absence from the city, the board again elected him to the superintendency of the schools, the proposed salary being more than double that which he had previously received. Shortly after his return home he declined this flattering offer, and advertised the reopening of his own school for the following September. But in less than six weeks thereafter he was offered the superintendency of the schools of Cleveland, Ohio, at a salary of \$4,000, more than twice the salary then paid by any city having a population less than double that of Cleveland. This offer Rickoff accepted, and he filled the office for fifteen years.

Supt. Aaron Gove, of Denver, speaks of this period of Rickoff's life, saying:

I remember how overwhelming was my admiration for the painstaking and careful study which he had daily given to the manipulation of the great educational machine of that city. His work was scarcely accomplished when, in the unthankfulness of the American community, he received an intimation that his services were no longer needed; and when, in 1882, Mr. Rickoff left the Cleveland schools, he laid down the task of a life that has never been excelled in efficient execution in the history of the schools of our country.

Shortly after his resignation in Cleveland he received and accepted an offer of the superintendency of schools in Yonkers, N. Y., at a salary of \$4,300. Finding, after one year's service there, that the onerous labors attending the superintendency interfered too much with the literary work he had taken up and desired to pursue more exclusively, he tendered his resignation, which, at his earnest solicitation, was finally accepted, with the understanding that he should, by his counsel and advice, aid the board in carrying out the many changes in organization and reforms in methods of instruction which, on his recommendation, the authorities had already inaugurated.

In the winter of 1849-50 Mr. Rickoff became a member of the Ohio State Teachers' Association, and was elected to the presidency of that body in 1855, presiding at the sessions held in Cleveland the following summer, and in Columbus in the winter of 1856-57. He became a member of the National Teachers' Association in 1859, and was elected to its presidency the same year. He presided at the session of 1860, held in Washington, D. C. For a number of years he was president of the Ohio State board of examiners of teachers, which had been established by legislative enactment for the purpose of examining and issuing life certificates to those who, by their scholarly attainments and success as teachers and superintendents, had won the right to such honorable distinction.

As a member and as chairman of executive committees, Mr. Rickoff has had great influence in directing the proceedings and molding the character of the educational associations with which he has been connected. For many years he was a member and regular attendant upon the meetings of the Round Table Convention, as it was called, which was composed of a very limited number of city superintendents, among whom were J. L. Pickard, of Chicago; Dr. W. T. Harris, then superintendent of schools in St. Louis, and John Hancock, of Cincinnati, Ohio. It was the custom of these gentlemen to meet annually in one of those cities, or at some intermediate point, for the purpose of discussing the educational problems of the day more fully and freely than was possible in the larger assemblies of their profession. The Round Table, so called—it was without constitution or by-laws—derived its name from the fact that the meetings were held in the private parlors of the hotels at which the members were staying for the time. All reporters were excluded from their meetings. Many a vigorous educational germ was sowed by the Round Table, for to the thorough and exhaustive discussions of this association, ranging over almost every point of school organization, instruction, and discipline, the uniformity, high standing, and progressive character of the Western schools may, in a great measure, be justly attributed.

Mr. Rickoff was never satisfied with what had been attained in educational affairs. During an active service of more than forty years as teacher and school manager he was an unflinching student in all matters pertaining to his profession. His private library was one of the most complete educational libraries of the United States. As he put it himself, "he was a skeptic in education," believing that the practical results of the present systems of public and private schools are far from what they should be, and being always hopeful of the future, and always pointing to better ways and improved methods, he was recognized for many years as one of the foremost among the educational reformers of the country. On this point the following extract is quoted from the *History of Education in the State of Ohio*, published by authority of the general assembly, 1876:

No man in Ohio has studied more thoroughly the classification of schools, and done more during the last twenty years to bring about the degree of perfection, which has been attained in the present system of grading, than Mr. A. J. Rickoff, now superintendent of the Cleveland schools. Mr. Rickoff's attention was called to this important subject when, in 1854, he was superintendent of the public schools of Cincinnati. Soon after he entered upon the duties of his office he made a report on the expediency of organizing grammar schools as a part of the school

system intermediate between the district and high schools. \* \* \* In this able report he defines classification to be the arrangement of pupils, according to proficiency and capacity for study, into grades, classes, or divisions. That system of schools is most nearly perfect which enables us to secure the nicest classification. It is at once the most economical and the most efficient. The most economical, because it gives the greatest possible number of pupils to the teacher; and the most efficient, because it gives to each pupil the greatest possible share of the teacher's time and labor. In accordance with this plan, which differed in many points from any then existing, and on his recommendation the grade known as the "intermediate in the Cincinnati schools" was established. So perfect were the grading and classification of these schools at this time that hardly a single important change has since been found necessary.

Previous to this reorganization the principals of the schools had been required to employ all their time in the instruction of the first or highest grade. Thus they were effectually excluded from any supervision of the work of their assistants, and the result was that unity of purpose and action was found to be quite impossible. Hence, in the general changes of the Cincinnati school system, which Mr. Rickoff recommended, the principals were relieved of the charge of the A class and made the local superintendents of their respective schools. Since that time the plan has been adopted in almost all the large cities of the Union. In the discussion which led to its adoption in Boston, it was justly called the "Cincinnati plan" by Superintendent Philbrick, who warmly favored it.

When Mr. Rickoff became superintendent of schools in Cleveland, he gradually reduced the number of men principals till there were only three left, whom he raised to the rank of supervising principals, or assistant superintendents. For principals of buildings he chose women. But while the assistant superintendents had to perform many administrative duties, they could not well go into the minutiae of teaching and aiding the teachers in their work in the class room. This led to the appointment of departmental supervisors in Cleveland. Supervising principals were appointed for primary work, drawing, music, German, penmanship, etc. Mr. Rickoff said, in his report of 1871-72, regarding the choice of women principals, as follows:

I am gratified to report the continued and even increasing success of the experiment of putting women at the head of all the grammar and primary schools. \* \* \* It can not be denied that our schools are more efficiently governed and more thoroughly taught than when there was a man at the head of every house. The improvement in respect and attention paid by the older pupils to their teachers is remarkable. Classes of boys, corresponding to some that in times past drove one principal after another from his post, are to-day so quiet, orderly, and studious that it is often wondered that their predecessors should have ever given any trouble. This is true, not of one school alone, but of every school formerly distinguished for its insubordination. What physical force failed to control, subtler influences have completely mastered. It might be supposed, as, indeed, it has sometimes been asserted, that the more equable and thorough government of the schools to-day is owing to greater watchfulness on the part of the superintendent and his assistants to check the first signs of insubordination in the senior classes, and to the greater severity exercised in cases of discipline; but the fact is, that fewer scholars of the advanced grades are referred to the office, and that less rigor is necessary than formerly. The more tidy and tasteful schoolrooms occupied by the higher classes, the cleaner halls, the better-ordered school premises, the quieter neighborhoods display the exercise of that faculty which belongs especially to refined and educated women, to so direct the minor details of school government that the control of masses seems so easy that it requires little or no effort. Men, relying upon their strength to suppress disorder by the display of force, are not so watchful to prevent, nor has habit made them so keen to detect, the incipient steps of misrule; hence it is that they are more frequently compelled to resort to the rod, while with women, of the class of whom I have spoken, its necessity seldom or never suggests itself. \* \* \* There was one consideration, not without weight in the discussion, which preceded the adoption of this scheme of reorganization, the wisdom of which is demonstrated in the experience of other cities. The principals of schools not infrequently manipulate ward caucuses to secure the nomination of friends for boards of education, in order that they may them-

selves secure a tenure of office entirely independent of their merits as schoolmasters. In some cities the legislation of the school authorities is controlled by their employees, and those who have the appointing power are themselves the creatures of those who hold or who seek appointment.

Naturally this did away with the rod in school, but a new problem arose. Despite the refining influence of women there are unruly elements in every school, unsafe companions, which must be weeded out to secure perfect order and undisturbed peace. This problem Mr. Rickoff solved by establishing two unclassified schools, to which were referred morally unsound, insubordinate, and other unsafe boys. In this he followed the example of superintendents in Germany.

Speaking of the school organizations of the United States, Sir Charles Reed, chairman of the school board of London, England, who was at the head of the educational commission which came to this country in 1876, reported to the council at home "that no single city of the United States was superior to Cleveland."

Mr. Rickoff gave much study to school architecture, the warming and ventilating of schoolhouses, etc. Accordingly, he was authorized by the Cleveland board to make the floor plans of six of the largest school buildings, which were erected within the last six or seven years of his administration, the Central High School being among the number. All these plans included also plans for warming and ventilating. Of these, the French commissioners visiting Cleveland reported to their minister of public instruction that they greatly preferred them to the schoolhouse plans of Boston, New York, and other cities, and reiterated their judgment thus: "We do not hesitate to put Cleveland in the lead in respect to schoolhouses." For these plans Mr. Rickoff was awarded a medal and a diploma at the Centennial Exposition. The plans of these buildings have been extensively copied in different parts of the United States and in some other countries.

This sketch of the educational services of Mr. Rickoff, brief as it is, would be notably unjust if it failed to show his relation to the recent reforms in teaching that have for years deservedly excited attention. What he did in improving the organization of the schools, the schoolhouses, and his enduring influence in the association of teachers, all this is but a small part of the real work of Mr. Rickoff as a school superintendent. His greatest merit lies in his success in raising the personnel of the teaching force. He always held that the character and the work of the teacher is the vital element in school management and education. His lovable ways, in which he aided the teachers under his supervision to a higher level and to a better appreciation of the children under their care, will never be forgotten. Many teachers remember how manfully he stood up in their defense and how modestly he allowed others to reap public commendation for ideas and actions suggested by himself; how gentle he was in judging human failings, both in teachers and pupils, and how courageously he fought corrupt politicians who intended to use the schools as a fit place to reward political services. He rarely used the daily press, but when he did, it was with telling effect. The teachers always felt that in Mr. Rickoff they had a shield that would protect them against attacks from the board of education, from the parents, or supervising principals. The most astonishing conversions from irate parents to devoted friends of the schools took place in the old office on Superior street and, later, in the old office building on Prospect street. To see mothers or fathers enter Mr. Rickoff's office, fire and brimstone ready for use, and shortly after leave it, smiling shamefacedly, thanking him warmly for the interview, to see such scenes, as the writer often saw there, was a revelation of Mr. Rickoff's character. When his buggy appeared at a school and his tall, erect form entered the building, it was as though warm sunshine had pierced the clouds on a cold, wintry day. Teachers and pupils felt better for having had a glimpse of their beloved superintendent. He was very observant and saw many schoolroom details which might have escaped others, but never did he fall into the error of humiliating a teacher before her

school or before her colleagues. Before he finally decided that a teacher was not a fit person to keep in the schools he attempted, by transfers and by placing her into other environments, to save her. His judicious grouping of teachers enabled the principals often to carry along a weak teacher who, by private counsel and good example, succeeded in mending her ways.

In cases of contention between principals and teachers, or parents and teachers, he always succeeded in making both see that every question has at least two sides.

Numerous anecdotes might be quoted which bear witness to his success as a superintendent, but space does not permit. By means of teachers' meetings, and through the visits of departmental supervisors, he introduced new methods of teaching and new ideas and principles into the schools long before the educational press of the country began to advocate them. In a special report made to the Cincinnati board of education, more than thirty-five years ago, he set forth the theories and methods of what is now called the new education. He did this with a completeness, and advocated them with an ardor and directness, seldom met with, even to-day. He did not, however, present any theory or practice as having originated with himself. He uniformly supported his recommendations by many quotations from the writings of eminent educators in this and foreign countries, and especially reinforced reason and authority by references to the methods already prevailing in many of the best schools of Europe. His intimate acquaintance with prominent cultured Germans (such as Judge Stallo, of Cincinnati) enabled him to gain access to the methods of teaching in central Europe.

The report mentioned was very much in advance of the times when first made, but all the methods set forth in it have been practically realized to a greater or less degree in Cleveland, and hence it is that Mr. Francis W. Parker, who has done so much to promote improvement in the methods of instruction in the United States, said in a letter to Mr. Oliver Arey, then principal of the Cleveland Normal School:

It affords me great pleasure to inform you that the so-called and miscalled "Quincy methods" were obtained or first seen by myself in operation in the Cleveland schools. I was then a teacher in Dayton, Ohio, and, entirely dissatisfied with the work done there, I set about its reform. I visited Cincinnati and Cleveland, and in both cities, especially in the latter, I got the suggestions which started me off in better work. I saw in your city freedom in primary classes, grouping the little ones in small classes, script work on the blackboard, and life. I was fortunate enough to be one of the beginners of this work in New England; hence the talk of "Quincy methods." I claim nothing new whatever. I give my teachers freedom and let them work out their own salvation. I hold the Cleveland schools to be, if they have gone on in the same way, which they must have done under the best superintendent in the United States—Rickoff—the best in the country. You can learn nothing in Quincy.

In the year 1877 Mr. Rickoff and Dr. Harris, of St. Louis, Mo., were solicited by Messrs. D. Appleton & Co. to prepare a series of school readers. This being done, the series was issued two years afterwards. In this work Mr. Rickoff was greatly aided by his wife, Mrs. Rebecca Davis Rickoff. To her he confessed his obligation for much of his success in the direction of the work of the primary schools which came under his management. He said that to her he owed the development of that which is best in the practical application of school methods.

When Mr. Rickoff left Cleveland in 1882 he was speedily offered a position as superintendent of schools in Yonkers, N. Y. He accepted, and remained there for a number of years, chiefly engaged in preparing a text-book of arithmetic for Messrs. D. Appleton & Co. and other literary work.<sup>1</sup>

In 1888 he took charge of Felix Adler's school for workingmen, which was established in 1880, but his health gave way, not having been robust for some

<sup>1</sup> Many of the foregoing statements are gleaned from Educational Notes, issued by Messrs. D. Appleton & Co.

years. The accidental and most deplorable death of his young, hopeful son, William Monroe Rickoff, who was engaged as engineer on the Northern Pacific Railroad and was at Seattle at the time, and the death of his wife a few years after, were shocks from which he could not recover. He sought relief in the salubrious climate of California, and gradually withdrew from all efforts until, in March, 1899, at the age of 74, he paid the tribute to nature due her from all that is mortal.

He left two daughters—Mrs. Hinkley, at present a teacher in Cleveland, and Miss Bertha Rickoff, in Berkeley, Cal. His remains were brought to Cleveland, where they were interred in the family burial place in Lake View Cemetery.

At the funeral services held over the remains of Dr. Rickoff his lifelong friend and coworker, Dr. W. T. Harris, now United States Commissioner of Education, made the subjoined remarks, which are particularly interesting as coming from one who is perhaps best qualified to measure the value of the deceased leader's work in education:

Mr. Rickoff came into the work of superintendent at the beginning of the second period of city schools in this country. It was the period of the revival led by Horace Mann and his coworkers; the era of the introduction of skilled supervision and the organization of school systems.

Hitherto each school had worked by itself in isolation, and consequently had developed extremes of pedantry in methods of instruction and harshness, or even cruelty, in modes of discipline. The instruction was a mechanical affair. Memorizing of the text-book without mastering its meaning, obedience to school rules, not from good will and insight into their reasonableness, but solely from fear of flogging—this was the staple of the city school 1800 to 1850. Indeed, nothing better could have been expected, for the city school was then new, because cities were new and furnished new problems.

The new era in city schools began after the famous dispute of Horace Mann with the Boston schoolmasters. It was powerfully helped by John D. Philbrick, who superintended the Boston schools for twenty years. But the method of instruction did not change so rapidly, even in Boston. More progress was made in the West, and especially in Ohio.

Mr. Andrew J. Rickoff was the greatest pioneer in the movement toward bettering the methods of instruction. His career as teacher is, when understood, a new revelation of Christianity made especially to the school. It reached the school in the great epoch of which I have spoken, and in which Andrew J. Rickoff bore so conspicuous and noble a part; for he was permeated with love for the children, and he sought to introduce methods of development from within in place of harsh methods of compulsion from without.

Dr. Rickoff developed his theory of a new education partly in the work of conducting a private school and partly in the conduct of systems of city schools—in Cincinnati, Cleveland, and in Yonkers. Constant progress was made in the improvement of instruction by which pupils could be aroused to study through their own interest and to push their investigations into the meaning of what they learned with that spirit of inquiry which promised to make them students through life. It was during his stay in Cleveland that the superintendents of the larger cities of the West formed what was called a "Round Table." This was one of the most profitable of school conferences ever held. Mr. Rickoff held a high place at that Round Table by reason of his immense experience, his great practical skill in solving educational problems, and by the charm of his personality.

In his later career Mr. Rickoff was seconded and assisted by his enthusiastic wife, who devoted herself to the methods of instruction in the primary school.

In the family, as in the school, and as in the society of his friends, Mr. Rickoff was ever the kindest and gentlest of men, the tenderest father, the best of neighbors. I never knew that he had a single enemy. I think that he was beloved of all.

The significance of his life appears in stronger lines if we place it on the background of our national life. We are solving the problem of local self-government. We never could achieve that solution if we depended solely upon the police and a system of spies. We can solve it only by a system of development of public opinion and the participation of all the inhabitants in this public opinion.

Such a public opinion requires the newspaper for its creation and diffusion. Again the newspaper requires the universal diffusion of the knowledge of the printed pages. Not only must all read, but all must read day by day the events of the world and the opinions of their fellow-men on those events. All help make

the verdict of public opinion, and all are governed by that verdict when made. Even governments that are well-nigh despotic in their form of organization are forced in our day to watch public opinion as it is revealed in the newspaper and follow its behest rather than appeal to the decision of war.

Is not this a movement toward a realization of Christianity? Reason and not force is gaining its hold on the helm of the world. But public opinion of the nation can not penetrate an illiterate community. It learns too late that it has appealed to force against overwhelming odds.

In the newspaper civilization not only the statesman but the humblest citizen reads the decision of a great issue as it were on the sky in great blazing letters—as it were a Belshazzar's vision weighing it in the scales of public opinion and proclaiming it to the world before it comes to the test of war.

Mr. Rickoff has helped his community and his nation in making the school of the city into a great instrumentality that fits the citizen for a government of and by public opinion.

We, his friends, regret our loss of his personal presence, but we rejoice that he has fought a good fight and lived a life of faith in the new dispensation.

I love to quote the words of the prophet Daniel at the grave of a great teacher: "The teachers shall shine as the brightness of the firmament, and they that turn many to righteousness as the stars, forever and ever."

### XVIII.—SCHOOL SEATS.<sup>1</sup>

BY E. H. BRADFORD, M. D., AND J. S. STONE, M. D., BOSTON.

As it is often asserted that school chairs furnish one of the influential factors in the development of lateral curvature, a careful study of the proper form of school chair deserves and has received much attention. The results, however, are neither as satisfactory nor conclusive as is desirable, as the seats supplied in our schools are not always suitable.

The movement for reform in school furniture may be said to have begun with the publication, in 1841, by Barnard, of Hartford, of his classic work on school architecture. Preceding this publication there had been, however, considerable discussion of the subject. About ten years earlier, in Boston, Dr. John C. Warren and Dr. Alcott, and, in New York, Mr. William J. Adams, had begun to advocate the use of sloping desks of proper heights, the separation of the seats from the desks behind, and the use of individual seats with backs.

The use of seat backs began about fifty or sixty years ago.

Then followed the introduction of separate seats, and later, at about 1850, the separate desks and chairs were first used. Attention had also been directed to the horizontal "distance" between the back of the desk and the front of the seat.

Faulty attitude in sitting.

<sup>1</sup> Read by title at the annual meeting of the American Orthopedic Association, 1899. Reprinted from the Boston Medical and Surgical Journal, October 5, 1899.

Although a "minus" distance in which the desk overhangs the seat was advocated by some, yet Barnard and Alcott believed in a zero distance, which was, however, a step in advance as compared with the former "plus" distance of several inches.

Barnard was the first to make definite measurements of children of different ages, and to devise from this a scale for the height of the seat and desk. In 1863 Fahrner, of Zurich, published the first European scale. There have since been published in this country the Whitcomb and Bobrick scales, while in Europe the Frankfurt scale, published in 1885, and the scales of the Prague and Vienna commissions, published in 1892, are the most important. Much attention has been given to the various scales, according to which fixed furniture is constructed and by which adjustable furniture is fitted. Being based on different series of measurements of children of different nationalities and classes there have been considerable differences in the results. Moreover, different standards are taken as the basis from which seat height and desk height of adjustable furniture are computed, as, for

example, in one scale knee height and in another total height is taken as the basis.

While the scales have served a very useful purpose in bringing about more accurate fitting, according to averages, they can not, of course, compare for accuracy in special cases with individual measurements made, for instance, in the school measuring chair, devised by Dr. Hartwell, in which at one sitting all the required measurements are easily read off. In the use of individual measurements, particularly in weak children, and in children above or below the average of those of the same age, and in careful attention to the seating of such in-

Attitude commonly assumed by weak-backed children.

dividuals, much good may be done, although at present the universal adoption of complete individual measurements can scarcely be expected.

At the same time that so much was being done in the development of various scales there were introduced many different kinds of adjustable furniture, both desks and chairs.

The problems of desk construction are, according to Cohn, (1) to secure such a "difference" in height between the desk surface and seat that the elbow with the arm hanging naturally just reaches the desk, which brings the book at the proper distance from the eye; (2) to secure such a horizontal "distance" between the seat and the desk, that the body and head may not be inclined forward too far in order that the eyes may be near enough to the desk; (3) to have a proper slope to the desk surface. For purposes of reading the ideal slope is 45, because then the eyes can be directed downward without fatigue and without bending the head forward. Such a slope, however, is not practicable for writing, and therefore, as a compromise, a slope of from 1 in 6 to 1 in 10 has usually been adopted.

Modern construction in all adjustable desks meets the requirements of proper height. The problem is simple, because there is no need of automatic change.

The need for automatic change by the scholar in the horizontal distance between the desk and seat has been met in two ways—first, by movable desk tops, and second, by movable seats. Of the movable desk tops there were two types. In one the surface is divided transversely, so that one part may move upon the other, usually the posterior part folding over on top of the anterior, as in the desk devised by Parow in 1865.

There are also a great variety of mechanisms by which one half of the desk top slides upon the other. Some are comparatively simple, some are rather complicated, most of them, as of the folding type, are not used because of the break in the writing surface. Some obviate this difficulty by making practically the whole of the desk surface movable, leaving only a small portion at the forward edge fixed, thus approximating the type in which the whole desk top moves. So much weight has been attached to the importance of a movable desk top by Lorenz and Cohn, among others, that much attention has been paid to perfecting the mechanisms by which the desk top as a whole is moved.

Some of the folding and some of the sliding desks meet the third requirements of desk slope by making a change at the same time that they change the distance, so that for reading there is a positive distance with an increased slope, while for writing there is a negative distance and a decreased slope. The Simplex desk of Schenck deserves particular attention. In it the "distance," the "difference," and the slope are all altered automatically by a very simple mechanism.

Faulty attitude.

Faulty attitude from too low desk and stool.

By a simple mechanism also in the modern Chandler desk the slope and the distance may be changed together or independently as the scholar wishes. A certain amount of instruction and care is, however, necessary for the intelligent use of a desk of this sort, which is not necessary for those of the simplest construction.

Of course in the difference in height and the horizontal distance between the seat and the desk the chair must also be considered. Thus many adjustable seats have been made at the same time that the desks were improved. It is now universally recognized, in regard to the chair, that the height of the seat should equal the length of the leg from the sole of the foot to the under surface of the thigh when the feet are placed squarely upon the floor and the knee is bent to a right angle. It is generally agreed that the seat surface should slope slightly from front to back so as to counteract the tendency to slide forward, but not slope so much as materially to tilt the pelvis if the child sits sidewise in the seat. The

length and breadth of the seat should correspond roughly to the dimensions of the thighs. A seat of insufficient depth can cause no particular harm. A seat of too great breadth allows, while one of too great depth compels, bad postures. The last requirement is, as stated by Hartwell, that "the seat should be provided with a back that shall support the sitter's back whether he be quiescent or actively engaged, as in writing or drawing.

Adjustment for height is a comparatively simple matter. In some cases it is secured by adjustment of the foot rest, but now all modern seats have simple adjustments in the castings.

In order to obtain an adjustment for distance from the desk several types of seat have been made. As examples, Beyer devised one in which the seat slid on its supports. Wackenröder one in which the seat slid forward and back together with its supports, and Hippauf one in which the seat, by a parallelogram motion, could be moved forward and back upon its support like an inverted pendulum. In each of these the seat back was attached to the front of the desk just behind and

therefore was available only with a "plus distance." The same was true of the seat of Wandenesch, which secured a plus and minus distance by eccentric rotation on its support.

Various folding seats, such as the "Columbus" of Ramminger, secured the change of distance merely as an aid in getting in and out of the seat. Many modern seats have fixed adjustments for distance, but in most cases where an automatic adjustment is sought for it is obtained through a movable desk top. One seat in particular, devised in Copenhagen, deserves attention because the height of the seat, the distance from the desk, the depth of the seat, and the height of the back can all be changed automatically at the same time. The supports at the two sides of this seat are split from above and in front diagonally downward and backward, so that as the seat is raised up by notches it also moves

Faulty attitude from too low desk and stool.

nearer to the desk. The back also is drawn nearer to the desk as the seat is raised. The construction is, however, rather awkward. In some of the Bobrick chairs a similar mechanical principle is applied to the back, although the adjustments are not automatic. There have been a considerable number of seats constructed for home use which are adjustable in all their parts, so that they may be used alike by small and large children, but these are all rather too awkward for school use.

The great problem of chair construction has been the back. Meyer, in 1867, was among the first who carefully studied the question of seating and the mechanisms involved. In the sitting posture the weight is borne principally on the tuberosities of the ischium. When the center of gravity, which lies in front of the tenth dorsal vertebra, is exactly over a line connecting the tuberosities the body balances without muscular effort. If, however, the body inclines forward the center of gravity falls in front of the tuberosities and must be supported by

the under surface of the thighs resting upon the front of the seat. If the body inclines backward, there must be some point of support behind the tuberosities, and this is found in the coccyx. If, however, the body leans either forward or backward, then the weight must be supported by complicated muscular action unless some additional means of support is furnished. The chair back gives this in the backward position. In the forward position the body drops forward, according to Fehrner, by a series of jerks until the weight is caught by the elbows resting upon the desk. In the forward position there is a decided tendency to vicious attitudes, the tendency being to hang the body from the shoulders rather than let the arms hanging from the shoulders rest easily upon the desk. In the prevention of bad attitudes in the forward position the size of the chair seat, the "difference," the "distance," and the desk slope are of considerable importance, as well as the chair back.

In maintaining correct attitudes in the backward position the chair back is of the utmost importance. As recognized by the Vienna Commission, there are three

Faulty attitude at school.

Ill-fitting desk and stool.

types of seat backs. The first is the low pelvic support, the second the lumbar, the third the dorsal. These, of course, may be combined.

Meyer favored the pelvic support because by fixing the base of support for the whole spine it favored an upright position. He considered the last vertebra the most advantageous point of support. Though regarded by him as unnecessary there may be added a dorsal continuation of his back support, short and at the same time inclined very sharply backward. Cohn and Hermann agree essentially with Meyer. Meyer objected very strongly to any high straight back because it forced the child to slide forward on the seat.

Through the work of Lorenz and Schenck the reclining seat back is now generally used with an inclination averaging about 10 degrees. Both of these authors advocate writing in the reclining position, Lorenz at first advocating a desk slope rather more steep than experience has shown to be practicable. Lorenz and Meyer insist much more strongly than Schenck on the necessity of having a firm lumbar support. Many seats have been constructed with a lumbar support alone, having in view as the main object the maintenance of the normal lumbar curve. One

back deserving particular mention is that of Holscher, in which two supporting pads, a transverse lumbar and a perpendicular dorsal, are placed upon an upright rod, the whole inclined backward and adjustable for height.

In spite of all the work which has been done in regard to the chair backs they still remain the weakest point in even the best of the modern school furniture built in this country. It is evident that children with strong backs can get on with no support, especially if the sitting hours are properly regulated, but weak muscles are not uncommon among school children, and the best possible support should be furnished. Such support is given by a chair in which faulty positions would be less comfortable than correct ones. Children require a change of position as a relief, and it is desirable that such a change be furnished without tempting the child to attitudes in which the back is less favorably supported.

If children seated, but tired of sitting, are watched, it will be noticed that they either lean upon the desk or slide down upon the chair, to take as far as possible a reclining position, to relieve the downward pressure upon the pelvis and the strain upon the lumbar ligaments and fascia, or by twisting the trunk and sitting to one side or the other, relieving one set of muscles temporarily at the expense of a strain of the others. The photographs taken by Scudder in the public schools show admirably the faulty positions assumed as a result of fatigue and improper seating. Although these positions may be assumed without harm for a short time, yet if constantly taken, a habit is developed dangerous in growing children.

Ill-fitting desk and chair.

The danger from leaning upon the desk is minimized by a proper construction, properly adjusted height and slope of desk, which with a sufficiently narrow seat will diminish the tendency to a twisted position of the trunk, particularly if the height of the seat is properly regulated. Here also the general introduction of vertical script has been of marked benefit.

The tendency to slip down in the chair and to assume an inclined position is but imperfectly met by foot rests and by hollowing the seat so that the buttocks do not readily slip forward. The tired child will instinctively attempt to assume an inclined position as a relief. This should be made possible as far as practicable without depriving the child of the support that is desired in the lumbar region.

A series of back tracings in various sitting positions shows the great change occurring in the lumbar curves, and the need of firm lumbar support. Whether the child slides forward on the seat in a reclining position, or leans forward on the desk, or simply doubles up and holds the book in his lap, the normal lumbar concavity is replaced by a convexity. When the child slides forward and then leans back, the lower lumbar convexity is less marked, because in this position the pelvis becomes fixed when the coccyx touches the seat, but at the same time the head is carried forward by an increased upper dorsal convexity. Leaning forward on the desk diminishes the normal dorsal convexity, although the lumbar convexity is as marked as in other bad positions. It is essential for a suitable school chair that it should furnish support in the lumbar region; that it should

not press the shoulders forward, and that a change from a vertical to an inclined position be possible without a loss of lumbar support.

With a view to allowing a change from an upright to a reclining position, Miller has constructed a chair on entirely new lines. The chair of Hippauf, already mentioned, had the seat attached to the base by links, parallel and of equal length. Miller substituted iron castings for the wooden links, made the front one much longer than the rear one, and placed them at such an angle that they diverge several inches at the top. Thus this chair gives what no other chair has ever given—the ability to move forward into an upright and well-supported position for writing and the ability to slide away from the desk a few inches into a well-supported reclining position for reading.

The back of this chair, which is at slightly more than a right angle with the seat, carries two transverse supports, a lumbar and a dorsal. Each is adjustable for height. The former can be moved forward and back as well.

These adjustments in the back are a great gain over the ordinary chair back. Another marked improvement is seen in the modern spring-back typewriter's chair, having a back support adjustable for height, and at an adjustable angle with the seat. The latter mechanism is in some ways more satisfactory than the back of the Miller chair, which, however, has the advantage of a forward and back adjustment of the lumbar support.

By combining the seat and castings of the Miller chair with the spring back, and by replacing the two adjustable pads of the Miller chair and the single pad of the typewriter's chair with a combined dorsal and lumbar pad, swinging like a mirror with the long arm uppermost, the advantages of each are secured. In such a combination chair there are secured four automatic changes, by far the most important being that from the upright to the reclining position; second, that in the distance from the desk; third, that in the angle between the body and thighs; and, fourth, that in the back supports to conform to changes or individual variations in the curves of the spine.

There are other fixed adjustments, one of importance being that for seat height, and others being for height and angle and strength of spring of back supports. In ordinary use all of these adjustments might not prove necessary, although those least simple are the ones in actual use in the very popular typewriter's chair.

In the combination proposed there are secured automatic changes in distance from the desk and in the position of the body as a whole. There are also possible automatic changes in the back supports. At the same time the lumbar spine always receives firm and the dorsal spine sufficient support, no matter what the occupation of the scholar. The fact is recognized that improper attitudes result from fatigue, and that fatigue must always follow any attitude, no matter how satisfactory in itself, which is long maintained without change.

Diagram of modified Miller chair, allowing change of position without loss of back support.

XIX.—ADDRESSES BY RIGHT REV. JOHN LANCASTER SPALDING,  
BISHOP OF PEORIA.THE AMERICAN PATRIOT.<sup>1</sup>

Love of country, like all love, springs from a desire for life, for wider and richer life. Life is possible only through communion with what nourishes it, with what is not itself. We see ourselves in the image reflected from the world on which we look, as by a mirror. We are what we are by virtue of the thousand influences which have acted upon us—our minds have been fashioned and colored by sun and moon and stars; by the vestures with which earth clothes herself as the seasons change; by rivers, oceans, and mountains; by books we have read; by work we have done; by games we have played; by the good and the evil which have befallen us; by the men and women we have known, admired and loved, or feared and hated. All that we have seen, felt, suffered, and done has helped to make us what we are. For good and for ill we are bound to the universe, and apart from it we can neither know nor love nor enjoy. Stars whose light no human eye has beheld help to hold us where we are; grasses and trees that flourished before man ever trod the earth form the soil by which we are fed, the coal by which we are warmed and ministered to in a hundred ways. Nothing exists or lives in isolation, and as insight increases the perception that all things are in union and intercommunion with one another grows clearer. It is only in the lowest stage of thought that objects seem to stand out in separateness, apart from their relations. When we look a little deeper we see that certain relations at least enter as essential elements into all ideas of the objective world, and that all things are interdependent, are a system of forces moving and acting in unison. When we look still more profoundly we perceive within and beyond the world of relative things the independent being who is life and mind, the absolute and eternal, creative energy, God, in whom and by whom the universe exists, who is Himself self-determined and self-active.

Hence the radical impulse in the craving for richer and wider life is a godward impulse. What we really long for, whether consciously or not, is divine life, immortal life, and we need no other proof of this than the unsatisfactoriness of all, even the highest achievement. Nothing once attained corresponds to the dream which lured us to the pursuit, whether it be wealth or power or fame or pleasure. When we seek ourselves through all the mazes of matter, we may end weary and satiated, but not satisfied. God alone is the infinite other whom we need to fill and complete our lives. Hence religion is and has been the inexhaustible fountainhead of self-devotion—of the self-devotion of patriots and heroes, of saints and artists, of wives and mothers; for whoever loves truth or justice or beauty or goodness with a surpassing love, with a love which endures all things, braves all things, renounces all things, if only it may attain its end, can not but be inspired, strengthened, and upheld by an enthusiasm which must be called religious. By such men barbarous tribes have been led to higher planes, States have been founded, just laws decreed, tyrants overthrown, and the arts and sciences created. For this reason epochs of religious earnestness are epochs of advancing life; epochs of religious skepticism and indifference, epochs of decadence. There may still be, indeed, a gloss, a glitter, a polish, a material prosperity by which the frivolous and thoughtless are misled; but the power of heart and hope, whereby man lives and is strong, is falling. Will is enfeebled, character is undermined, and there is a general falling away in thought, in language, in manners, in conduct, even though it be so gradual as to be imperceptible to the careless eye.

<sup>1</sup> An address delivered at the Crève Cœur Club banquet, in Peoria, February 22, 1899.

## LOVE OF TRUTH AND JUSTICE.

There is a higher love than love of country—the love of truth, the love of justice, the love of righteousness; and he alone is a patriot who is willing to suffer obloquy and the loss of money and friends rather than betray the cause of truth, justice, and righteousness, for only by being faithful to this can he rightly serve his country. Moral causes govern the standing and the falling of States as of individuals, and conquering armies move forward in vain; in vain the fleeting fabric of trade is spread if a moral taint within slowly molder all. The national life is at fault if it be not in harmony with the eternal principles on which all right human life rests. The greatest and the noblest men, when they meet, rise into regions where all merely national distinctions are forgotten and transcended. In studying the works of a philosopher, a poet, or a man of science we give little heed to what country he was born and lived in, so eager are we to learn the truth and beauty he reveals—truth and beauty which are of no country, which are wide and all-embracing as the universe. In the presence of heroic virtue, also, the national limitations disappear, that the god-like man who belongs to all countries and ages may stand forth in his proper light. A man supremely endowed narrows his mind when he is less than universally human. What he says and does should make laws for all—those diviner laws which have their sanction in the common sense which makes the whole world akin. Patriotism as understood by the ancients is but a partial virtue. When it is most intense, it is most narrow and intolerant. In Jerusalem, in Athens, in Rome, the city was the fatherland. It was the thought of Zion and of “Siloa’s brook that flowed fast by the oracle of God,” of the Acropolis, with its marvelous setting in the midst of the Attic plain, of the world mother looking from her Seven Hills on the Tiber’s tawny wave that made the exiles waste away with repinings for home, and their passionate devotion to their country was rarely separable from a hatred of the foreign nature. Whoever was not a citizen was an enemy or a slave. The captive foe was treated with pitiless cruelty and the slave had no rights. We are separated from these ancient patriots less by the long lapse of time which has intervened than by the difference of spirit in which we look upon and love our country. For us the man is more than the citizen, humanity more sacred than nationality. To lead a man’s life, one must live for some one or something other than self. As we can see ourselves only in what is other, so we can find and love ourselves only in what is other than ourselves. To escape from the starved condition of the isolated, the individual is impelled to identify himself with larger unities—with the family, with the State, with mankind, with God. Now, for the ancients the State was the ultimate unity in which a man could find and feel himself; hence their aims and sympathies were partial and narrow. Their patriotism was more intense, but it was less rational, less moral, and therefore less enduring and less beneficent than ours. It was not possible for them to identify themselves with the race, to recognize that all men are made of one blood, and that whenever one suffers injustice wrong is done to all. But for us nationality has ceased to be the limit of individual sympathy, and the oppression of peoples, however remote, often affects us as though we ourselves had been injured, while noble words and heroic deeds, wherever and by whomever spoken or done, fill us with enthusiasm and gratitude. Many causes, of which the Christian religion is the deepest and most far-reaching, have led to the wider views and more generous appreciativeness of modern men. In looking to the one heavenly Father they are drawn together and held by ties, consecrated by faith, and approved by reason. Science, which deals with laws that are universal, that act alike upon the farthest star and the grain of sand at our feet, on the race as on individuals, promotes this catholicity of feeling and interest. Our machinery, too, in bringing the ends of the world together, facili-

tates the intercourse of the peoples of the earth and thereby weakens their immemorial prejudices and hatreds. The commercial interdependence of the nations has a like tendency; while the constantly increasing influence of woman makes for a larger sympathy and love. No great movement can now long remain within the boundaries of the nation in which it originates. The questions of education, of labor, of the rights of woman, rouse attention and discussion in every civilized country. A new discovery or invention is at once heralded from land to land. The telegraph and the printing press mediate a rapid and continuous interchange of thought throughout the world, and thus help to make us all, in a way never before possible, citizens of the world.

#### TENDENCY OF THE MODERN AGE.

At the present moment America, if simple truth may be uttered without incurring the suspicion of conceit, represents the general tendency and sentiment of the modern age more than any other country. Here the national feeling is larger and more hospitable than anywhere else; here men of all tongues and races more easily find themselves at home than anywhere else. No other country is so attractive, no other affords in such fullness opportunity for self-activity in every sphere of endeavor, no other insures such complete civil and religious liberty. Nowhere else is there so much freedom from abuses which, because they are inveterate, seem to be sacred; nowhere else is there so much good will, so much readiness to help, so much general intelligence, such sanguine faith in the ability of an enlightened and religious people, who govern themselves, to overcome all obstacles, and to find a remedy for whatever mishaps or evils may befall them. Here, too, more than elsewhere possibly, men feel that there is a higher love than the love of country, that the citizen can serve his country rightly only when he holds himself in vital communion with the eternal principles on which human life rests and by which it is nourished. The American's loyalty to his country is, first of all, loyalty to truth, to justice, to humanity. He feels that its institutions can be enduring only when they are founded on religion and morality. He is less inspired by the fortune of the Republic, its material advantages, and possibilities, than by its spiritual significance and destiny. He is, indeed, filled with a sense of gladness when he beholds it stretch from ocean to ocean, from the lakes to the gulf; when he sees the Northern pine salute the Southern palm as a fellow-citizen, when he looks on its prairies teeming with harvests sufficient to feed the world, on its mountains and plains filled with silver and gold, with iron and copper, with coal and oil. But he is less impressed by this geographical and material greatness and splendor than by the intellectual and moral conditions which America presents. Nature is fruitful in vain where man is contemptible. The palace makes ridiculous the occupant who is a beggar in mind and spirit. To no purpose is the country great if the men are small. Life is more than life's circumstance, man more than his environment. The American patriot then more than others seeks grounds for his love of country chiefly in the world of man's higher being. For him freedom, knowledge, truth, justice, good will, humanity are the essential needs, and it is a little thing that America offers facilities for satisfying the physical and material wants if here the soul is starved. Democracy itself is not an end, but a means. The end is a nobler, wiser, stronger, more beneficent kind of man and woman. How shall such men and women be formed except by opportunity—opportunity for all of worship, of education, of culture, of work that strengthens and purifies, while it creates material comfort and independence? If a nobler race is to spring forth in this New World, all the influences that are active and potent in the national life must conspire to form public opinion, by which in the end we are all ruled—a public opinion which shall be favorable to pure religion, to the best education, and to sound morality. The better

kind, however otherwise they may disagree, must unite and support one another in ceaseless efforts to create such a public opinion. They must not merely lead loyal, brave, chaste, and helpful lives, but they must so live that the atmosphere in which they move shall receive from them a magnetic quality—the power to stimulate all who breathe it to nobler thoughts and loves; to a deeper and more tender solicitude for the rights and needs of all men, of women and children, of the sick and forsaken, of the criminal and captive.

## GOOD PATRIOTS AND GOOD MEN.

Goethe, who never utters a foolish thing, says that in times of peace patriotism properly consists merely in this: That each one sweep before his own door, attend to his own business, learn his own lesson, that it may be well in his own household; and what he says, if but partial, is nevertheless essential truth. He himself, indeed, even in times of war and disaster for the Fatherland, seemed to act on this principle, and he has consequently been accused by some of his own countrymen of a lack of patriotism, though in fact he did more to make possible the political union of Germany than any other man, for he, more than any other, awakened the self-consciousness of the German people, and thus inspired them with a more intense longing for national unity. A good patriot is first of all a good man, true to himself and true in his relations to his fellow-men. If false to himself, he is false to all. If he love not rightly his father and mother, his wife and child, the neighbor who dwells beside him, how shall he rightly love his country? If he respect not the dignity of human nature in himself, but degrades it by drunkenness or lying or sensuality or dishonesty, how shall he feel a genuine and generous interest in the common weal and earnestly strive to do his part in correcting the evils and abuses which impair or threaten the national life and prosperity? It will indeed be easy for him to make his patriotism a theme for declamation, and easy, too, to throw suspicion on the loyalty of others, but if he is not a real man it is not possible that he should be a real lover of his country. Whoever deliberately wrongs an American wrongs America. The worst enemy of the country is not the drunkard, but the buyer of votes, whether at the polls or in council chambers or in legislative halls; not the petty thief, but the capitalist whose insatiate greed urges him on to crush all competitors; not the selfish man, who cares not at all for the general good, but the politician who makes his patriotism a cloak to cover him while he sneaks into public office, which he prostitutes to private gain; not he who refuses his assent to measures, however popular, unless he can give it honestly, but the demagogue who is ever ready to run and cry with the crowd; not the ranting anarchist, but the editor who for money impugns the known truth. \* \* \* The saloon is bad. The worst evil, however, resulting from it is not drunkenness, but political corruption; for if just laws were rightly administered the saloon would cease to be a source of degradation and ruin.

## AMERICANS LACK DISCIPLINE.

Our civilization is still incomplete. It is, as Emerson says, "A wild democracy; the riot of mediocrities and dishonesties and fudges." If numbers were enough, if wealth were enough, if machinery were enough to constitute a great people, for us the question would be settled; but the kind of man, not numbers, or wealth or machinery, is what we have to consider, and it is a favorable omen that we are not self-complacent, that our defects and faults are not hidden from us. We suffer from the absence of the discipline of respect, from a certain hardness and materialism, from a fondness for exaggeration and boastfulness. The fear of Demos and the demagogue prevents us from speaking the simple and salutary language of truth when far-reaching and vital issues are in question. We are so accustomed to bow to the will of majorities that we easily forget that votes count

for nothing when we have to consider what is true and wise and just. Here there is every likelihood that the minority is right and the majority wrong. The multitudes everywhere and in all ages are dominated by the present. They are unwilling to wait, unwilling to deny themselves now that they may become capable of higher things hereafter. The success of a day robs them of the glory of a lifetime. They are fickle, because, since they see only what is immediately before them, their opinions change as the road turns. They are selfish because they are shortsighted and but feebly influenced by large ideas and generous aims. Being a crowd, they are easily hypnotized and are quickly hurried from one extreme to another. They follow the cry of chance leaders, and being little able to think for themselves, they resent independence of thought in those things precisely in which such thought is most needed, for in the deepest and most critical questions concerning the national life and policy what is popular is rarely what is most wise. The voice of the most serious minds is not only not heeded, it is drowned in the clamor and vituperation of those who are themselves led by men who know little and who have at heart chiefly their own popularity and profit. We suffer ourselves to be hypnotized by glaring type and loud shouting. \* \* \* A false opinion is created and we are commanded to accept it without question as the will of the people, and our highest officials, when they yield to the outcry of the mob, are commended for their wisdom and patriotism. Our best minds do not guide us, our best men do not govern us. By faithful adherence to the principles with which our national life began we have grown to be a prosperous and mighty people. We have been taught to cherish these principles as being scarcely less sacred than our religion. Our climate is healthful, our soil fertile, our territory is as large as all Europe. Our industry, intelligence, and mechanical skill have in the brief space of a century made us the richest of the nations, while the growth of our population has been phenomenal. If success be an argument for continuing in a given line of policy and conduct, no people ever had so good a reason for following in the old way. Our success has been marvellous, but, after all, it is still only the success of an experiment. It has not yet been proved that a stable and enduring civilization can be built on a democracy such as ours. We occupy a continent stretching east and west, north and south for thousands of miles. It is not easy to reconcile the interests of regions lying so remote from one another. Our population is composed not only of heterogeneous elements from Europe, but also of a large and increasing and but partially assimilated body of Africans. \* \* \*

Here, at our hands, lies the task God sets us. It is the development of our inner life, the enriching of our minds, the purification of our hearts, the education of ourselves through liberty and labor, the reform of our politics, the rooting out of cant, lying, vulgarity, greed, and dishonesty, of drunkenness and lust, the correcting of our extravagant estimate of the value of what is merely matter, of life's accompaniments as distinguished from life itself, which is thought and love, strength and courage, patience and forbearance. We have to learn that what makes a millionaire spoils a man; that a people who think trade and commerce the one thing needful have no permanent place in history, because they have no influence on the spiritual, which is the real, life of man. The people that is the bearer of the largest thought, the deepest love, the holiest faith, lives and works forever in the race, while merchants and traders perish and are forgotten like the wares they deal in. See how quickly elated and how quickly cast down are they whose hope is in riches, for riches are akin to fear, to change, and death; while they who live for truth and righteousness move forward serene and unafraid, upheld by the unseen powers, for truth and righteousness are life. Beggars and outcasts, if but some divine thought or immortal hope upwelled within, have survived the fall of empires, the ruin of civilizations, and the utter vanishment of the people from whom they sprang. We have to learn how to be happy and noble,

for, as Ruskin says, till we have learned how to be happy and noble we have not much to tell, even to red Indians, and he goes on: "To watch the corn grow and the blossoms set; to draw hard breath over plowshare or spade; to read, to think, to love, to hope, to pray—these are the things that make men happy. \* \* \* The world's prosperity or adversity depends upon our knowing and teaching these few things; but upon iron or glass or electricity or steam, in no wise." The absolute, the highest is a person, and the civilization which issues in the noblest personalities is the best. By them we estimate the worth of our nature, by them the value of our political and religious institutions. But noble men and women do not spring forth in isolation. As an individual, man is insignificant; in fact he can not become human at all except in a social environment, in a medium in which he is made partaker of the life of the race, receiving the thoughts, hopes and beliefs, the aims, aspirations and ideals which are the food of the spirit of man, of that which places him in opposition to nature and lifts him above its fatal laws. It is the patriot's business to strengthen and purify the institutions by which the citizen is educated—the family, the church, the state. To whom the life of the home is not sacred nothing is sacred. The child that does not drink pure love and religion from this fountain-head can never be rightly educated. It is in vain that we build churches and schools if the home does not fill them with teachable hearts and minds. It is here that each one receives his better self—the self which makes him conscious that he is a center toward which infinities converge, where truth and justice and love are felt to be the real and permanent good. What burns in the hearts of the fathers will glow in the breasts of the children. Patriotism, like charity, begins at home. It is not a philosophy, it is a sentiment inspired above all by the mothers of a people, from whom also we receive religion and morality, which Washington calls the indispensable supports of political prosperity; and, therefore, he refuses to give the title of patriot to those who "labor to subvert these great pillars of human happiness, these firmest props of the duties of men and citizens."

The end of all worthy struggles is to establish morality as the basis of individual and national life, and morality can be firmly founded only on pure religion. To make righteousness prevail, to make justice reign, to spread beauty, gentleness, wisdom and peace, to widen opportunity, to increase good will, to move in the light of higher thoughts and larger hopes, to encourage science and art, to foster industry and thrift, education and culture, reverence and obedience, purity and love, honesty, sobriety, and the disinterested devotion to the common good, this is the patriot's aim, this his ideal. And if ever a minority, a remnant, work in this spirit, and strive with this purpose, the star of the Republic, which rose to herald the dawn of a new and better era, shall not throw its parting rays on the ruins of an empire, stained with blood. [Long-continued applause.]

## THE UNIVERSITY AND THE TEACHER.

Address by Bishop Spalding, of Peoria, at the convocation of the University of Chicago, October 2, 1899.

"The chief concern of every man is not, as it should be, the formation of his character. The most wish merely to find a recipe for comfort or a way to acquire riches and whatever else they aim at."—*Goethe*.

Whether the rule of the people shall approve itself as a wise, beneficent, strong, and enduring government will depend largely on its attitude toward religion and education, the fountain heads and safeguards of right human life. When power is placed in the hands of the multitude and opportunity is offered to all alike, whatever makes for utility, for comfort and ease, for physical health and well-being, will be held in high esteem, will be cultivated and promoted, for the need of all this is felt by all, and where there is freedom all will labor to provide it.

Consider for a moment this great metropolis, where but yesterday the wild fowls screamed among their fellows. Its growth and wealth are the marvel of a century of wonders. Not in London, or Paris, or other centers of the Old World shall we find more stately structures or more commercial and industrial activity. In the presence of this vast achievement of human energy the most thorough idealist can not but stand in awe, for such power, such energy, such efficacy of will, on whatever objects it may be exerted, is awful. Here, assuredly, it has been exerted almost wholly on what is material, on what is simply useful. Look on these lofty buildings, observe the eager throngs hurrying through these busy thoroughfares, and ask yourselves what it all means. Why have these edifices been erected? Why are these streets filled with people who hasten on as though pursued by death?

One thought, one purpose, dominates the whole. This city, with its population of two millions, has been created for commercial and industrial ends. It exists to provide the useful—to feed, clothe, house, warm, and carry men—and it does this work with such enterprise and skill, with such unremitting toil, that it is not possible to withhold admiration. All honest work is sacred, and they who labor with the hands not less than they whose mightier instrument is the brain are, if they are filled with the right spirit, God's workmen; and since it has not yet been found possible to teach the multitude to make efficacious use of their nobler endowments, manual labor is their salvation, and therefore the safeguard and basis of civilization.

But there are higher things than those which are merely useful, and consequently there are men whose function is of vastly more importance than that of the toilers who provide us with food and drink and clothing. These are indispensable; all must have them and the whole world takes care that they shall not lack; but genuine human life emerges, not when we eat and drink, for this we do as mere animals. We first become men and women when we think and love, when we hope and believe, when we listen to the voice of duty, however hard its command; when we rise through aspiration and imagination to those inconceivable heights where time and space are no more and the soul is alone with God. In this world, which is the proper human world and man's true home, it is not easy to dwell. It is within us, it is likeliest unto what we really are, but to become conscious of it and to feel the need of the blessings it holds, man must ascend from his primitive to his ideal nature, and the effort to do this with method and system is education, which is a conscious striving to fulfill in one's self the ideal of the perfect, and as a means to this end to transform both one's self and one's whole environment. The aim is to make one's self the best it is possible for a man to become and the world he lives in the most suitable to the development and play of the higher faculties.

Even the savage succeeds in getting what is simply useful—food and drink—and, when it is necessary, some sort of clothing; but there must be at least a beginning of civilization if man is to undertake the task of raising himself from his primitive to his ideal nature—endless task, not to be accomplished by any one individual or people. It is the work God imposes on the whole race for all time; and the highest individuals and races are those that contribute most to this divine consummation.

In this metropolis, created by the spirit of the wide-spreading and teeming Mississippi Valley to be a purveyor and provider of whatever ministers to man's material needs and comforts, to the wants of his primitive nature, it is altogether right and desirable that a center of intellectual light and moral influence should have been established where great teachers may dwell and work, men whose thoughts and aspirations and lives are suffused with a glow caught from higher worlds. A university, I think, is not so much a place where all that is known is taught as a place where noble and luminous minds create an atmosphere which it is impossible to breathe and not feel the quickening of new and larger hopes and aims—minds that are less concerned to impart information about anything whatever than to solicit, call forth, sustain, strengthen, and to bring into act the powers which lie latent in the human soul, striving themselves day by day to become wiser and more loving, that with each access of new life they may thrill, inspire, and impel others to generous and persevering self-activity. It is only in a university that such minds can be brought together, and they, be they few or be they many, are the life and essence of university teaching, for they create an intellectual and moral climate in which one can not live without imbibing the spirit of self-culture.

The important consideration for those who have the will to become all that is possible for them to be is not what they shall study, but where they shall find a genuine vital man who teaches anything, who, while he teaches, still continues to learn and upbuild his own being. The teacher, then, must first of all be a real man. Scholarship is secondary. The only wholesome influence which man can have on man is exerted by his personality. It is admitted that where observation is possible we may not rest content with explanation. Let the pupil be brought face to face with the thing itself, that he may exercise his powers on this and not on words about the thing. This is the method of all right teaching, which is never merely talk about science, or philosophy, or literature, but is, above all, exemplification, concrete presentation of the subject; and since the highest we know on earth becomes concrete only in man, the first thing to be asked for, when there is question of a school of whatever kind, is a genuine, noble, wise, and loving personality. This is the presupposition in all theories and problems of education. Like begets like, and to hope to illumine, exalt, and purify, when we ourselves are dark, low, and unclean, is to hope for a reversal of the laws of nature. He who would develop in the young a sense of religion and duty, of honor and freedom, must himself be all alive with these elemental powers.

There is doubtless a science and an art of education, and consequently there are principles and methods of which the teacher must make use if he is to do good work. Is it not plain that history or literature, or geography, or mathematics, may be rightly or wrongly taught? Is it not necessary that the methods of teaching be adapted to the subject as well as to the mental condition of the pupil? Now this is pedagogy—it is little more than good sense applied to the purposes of education. The object is to control individual experience by general experience. It is certainly most important that the teacher should live and act in the light which the history of education throws on his work.

Nevertheless, it is a fundamental error to suppose that the principles, rules, and methods of pedagogy are the chief requirements in education. Neither a fund of

accurate and pertinent information nor the most approved methods can supply the essential and indispensable pedagogical requisite—the awakened mind, the loving heart, the quick and comprehensive view, to which, as to the eye of a skillful general or physician, the exigencies of each moment and situation are revealed. The true teacher is at once a leader, an inspirer, and a healer. He is neither a slave of methods nor a victim of whims and hobbies. He knows that rules are but means, and he does not enforce them as though they were ends. He is not a machine, but a living soul, obedient to the light of a cultivated intelligence and to the impulses of a generous heart. His task is as difficult as it is important, as full of trials and hardships for himself as it is of blessings for those whom he influences. Let him, then, be free, let him be trusted, let him be cheered in his work.

To make him the slave of minute observances, the victim of a system of bureaucratic regulations, is to render it impossible that he should find joy and delight in his work, is to superinduce in him a servile disposition, is to degrade him to the level of a machine, is to make him unfit to mold and inspire free men. If he is to train his pupils to a wise self-confidence, without which nothing great is ever achieved, he must not be made to feel that he himself is unworthy of confidence.

Montaigne holds that the teacher needs a well-made rather than a well-filled head, which is his way of saying that learning is of less importance to the educator than an open and sincere mind, capable of judging with fairness and of reasoning with accuracy. Thus a father or a mother, simple and unlettered, but endowed with good sense and with love of truth and justice, has a more profound and lasting educational influence on the child than any which may be exerted by the doctors of the universities. Nothing has such power to draw forth human strength and goodness as love. The teacher's first business is to win the heart and through the heart the will of his pupils; and to this end a generous faith in them is the most effective means. By trusting them he shows them how to trust themselves; by believing in them he leads them to believe in themselves, thus awakening in them a desire to realize the high things of which they see they are held to be capable.

Nothing destroys the confidence of the young so quickly or so thoroughly as to know that their teachers are insincere or unjust. Better rule by brute force than by deceitful devices. If there be anything false in them, it can not be hidden from the quick glance of youthful eyes. "A man passes for that he is worth," says Emerson. "What he is engraves itself on his face, on his form, on his fortunes, in letters of light. His sin bedaubes him, mars all his good impression. Men know not why they do not trust him; but they do not trust him." The weak and the ignorant are the quickest to threaten and punish, and it is only where teachers lack moral and intellectual power that they resort to harsh measures. The bitterness they feel makes their own and their pupils' lives bitter. How pleasant it is to hear Montaigne tell that his father did not permit him to be awakened except by the sound of some musical instrument. So, possibly, does God awaken us from life.

Whatever others may hold, let the teacher be persuaded that the faults of the young are due to weakness and ignorance rather than to malice; and if he find a few who have inherited or acquired a vicious disposition, let him not imagine that they can be corrected and improved by anything but patience and loving kindness, assisted possibly by medicine and hygiene.

The master must first be master of himself. He must be sympathetic and lowly-minded; must often efface himself and suffer his presence to be felt only as a guidance and encouragement to the awakening minds of his pupils. And how shall this be made possible for him if his heart is not filled with the love of God and of human perfection? Behold the mother hen moving among her little brood, who, when she has found something of worth, lovingly calls their attention to it

and passes on, leaving them to decide whether they shall take or neglect it. If the teacher show his pupils how far he excels them in mental power and culture, he discourages them; for the more susceptible of education they are, the greater is their modesty and self-diffidence.

Let him be as one of his little ones—a learner and striver. Such have been and are the mightiest and noblest souls. Only a free spirit can educate the freedom, only a reverent and devout mind can inspire faith in God. The love of liberty springs from the love of truth—truth makes free. Indeed, it is only in the world of truth, speculative and practical, that man feels himself free, at home in a realm above that of physical law and determination. Healthful work is the mother of brave and joyful hearts; where learners are dispirited and heavy-hearted they are not doing the right work or they are not doing it in the right way. When young souls are bursting into bud and bloom their world should be as bright as the blue skies of spring, overhanging flowering orchards, where the birds sing and the bees hum, and the sparkling waters leap to see and hear. Throughout life they should be able to associate the memory of this fair time of spiritual growth with all that is pure, fragrant, and inspiring; for, should the experience of those early years make it impossible to believe in the surpassing worth of culture, they inevitably become the victims of arrested development and lead a stunted existence.

In a family in which the spirit of cheerfulness reigns there is peace and happiness; each one finds his task and performs it gladly. The school is a larger family. If the masters are harsh and morose, the pupils discouraged, the school is bad. The effectiveness of school methods depends upon the character of the teacher. If he lack intelligence and individuality they become mechanical devices, in which the pupils can take but a mechanical interest. Rules and laws are of little use in those who have not been brought up to desire and love the guidance of law. He who is grounded in faith in the principle of law will become a good man, a good Christian, a good citizen, and nothing else will make him so. Faith in the principle of law is faith in God. If we form true men, the rest will form and reform itself.

Schools where many things are taught, but where will, courage, seriousness, love of truth, great-mindedness, and respect and reverence for all that is high and holy are not cultivated, are institutions of perversion rather than of education. Let the teacher leave nothing undone to make brave, honest, chaste, unenvious men and women, even though they fail in scholarship. If conscience is not sovereign it is nothing. "Moral education," says Kant, "should begin not with reformation of conduct, but with renovation of thought and formation of character." Whatever may help to make a man is the teacher's business. In him indifference is imbecility; it is impotence. The gift of eloquence is of inestimable value to him, but he should not, like the orator, seek to captivate and carry away his hearers; but he should inspire, illumine, and prepare them for independence of thought, for freedom of view.

They are the best teachers who make study most attractive. This is the best genius does for its possessor; for what is it but an inner impulse which urges him joyfully to the pursuit of truth, goodness, and beauty? Nothing fatigues like dullness. From the weariness it begets there is no escape. The teacher's character is the best reproof. The mother does not occupy herself with projects for carrying her child; she is busy teaching it to walk alone. This is the aim and end of all right education. Suggestion is a large part of the teacher's business, hence there should be a magnetic something in him—the power to interest, to charm, to inspire, to impel, while he enlightens and guides. Courage is contagious. Brave thoughts, brave words, brave deeds—courage in his whole attitude toward life and death, toward God and man—this makes the teacher an educator,

constitutes him a former and creator of men; for the heroic mood leads to contact with divine things and has vital power. Refuse to entertain thy troubles and sorrows and they will leave thee. A great mind can console and heal as well as time. Our attitude toward circumstances determines what effect they shall have on us. A generous and active spirit turns to divine uses the things which weaken and corrupt the timid and indolent.

To do for the pupil what he should be inspired and impelled to do for himself does not help but hinders his progress. Teach him to teach himself by looking, listening, observing, and reacting on the impressions he receives. The imparting of information is but a small part of the teacher's business; his chief concern should be to develop faculty, to form character, and to point out the means whereby knowledge may be acquired, and, if need be, communicated.

In the presence of the infinite possible, nay, of the vast accomplishment of nature and of mankind, the work of the individual, though he be the greatest, is insignificant. Let not this discourage thee. Thou wast born to do but a man's work. Do thy best—it will make thee worthy. Each one's character is determined largely by heredity, environment, and the education he has received. None the less is it each one's duty to shape and build his own being into ever-growing harmony with what is eternally true and right. Only the gentle and loving know how to guide souls, for they are patient. They alone can stoop to all infirmities without losing their trust in God or their faith in man.

The teacher accomplishes more by making strong impressions than by constructing lucid arguments. If the heart is moved, if the conscience is awakened, the reasons for right doing become manifest. Hence the great moralists have been impelled to utter themselves in vigorous and sententious thoughts, in maxims which penetrate the mind and remain as an incentive or a reproach. "Do not withhold him from doing good who is able; if thou art able do good thyself also." "The wise shall possess glory; the promotion of fools is disgrace." "Get wisdom, and with all thy possession purchase prudence." "Take hold on instruction; leave it not. Keep it because it is thy life." "Choose knowledge rather than gold, for wisdom is better than all the most precious things, and whatever may be desired can not be compared with it." "The words of the wise are as goads and as nails deeply fastened in;" and unless for us they are as goads and as nails deeply fastened in they profit us in no way.

All things belong to thee, if thou but love them, and what thou possesseth will give thee pure delight, if thou hold and use it for the benefit of others. The life is the best which issues in the highest knowledge and the purest virtue—all else is frivolous. When our moral convictions are profound and living we easily communicate them to those about us; but if the essential goodness is lacking in ourselves, the words we utter, however fine, will not bear to others the seed of divine life. Make thyself free within, for turn outward whithersoever thou wilt, thou shalt find that confining walls proclaim thee prisoner.

Educableness is man's true characteristic, and the teacher who loves his calling and understands his business will give his chief thought and labor to education, whether it be his own, or that of a few, or of the whole race. Where is the learned? Where is he that pondereth the words of the law? Where is the teacher of little ones? In the right spirit, which is the important thing, whatever we do, there is either knowledge or a genuine yearning and striving for knowledge; but the teacher's knowledge, whether of method or psychology, or of whatever other pedagogical art or science, is of little worth to him as an educator unless he have the right spirit; for it is this that creates devotedness, gives insight, arouses interest, and stimulates self-activity.

As a wise man thinks little of his success and much of his failures, that he may learn to make them good, so when teachers shall have become educators less

attention will be paid to the bright pupils and vastly more to the weak and the slow. A school is more safely judged by those it fails to improve than by those it helps. What more worthy end can the teacher propose to himself than to accustom his pupils to find pleasure in the practice of virtue and to turn with disgust from what is base or wrong? If they be led to dwell habitually with high and true thoughts they will become part of their being, give warmth and glow to their feelings, and impel the will along the paths where their light falls.

We are transformed by what we meditate not less than by what we do. The word which God spoke in the beginning is the word which he forever utters: Let there be light; let knowledge grow, let wisdom increase, let love prevail. The light of the mind makes the world harmonious and beautiful. The noblest people is not the richest or the strongest, but the people whose soul is filled with the highest thoughts and the divinest aspirations.

Take from any country a hundred of its greatest men in religion, philosophy, poetry, science, and art, and the life of all falls to a lower plane. Let the teacher, then, strive day by day to lift his pupils to the world where these hundred best have made their home. The only serious instruction is that which cultivates reason and conscience. The words which the teacher utters, however true or wise, have less influence on his hearers than his character. The man, not the speech, is eloquent.

A hero, like a beautiful woman, persuades by simply appearing. It is the spirit that is divine, and words have irresistible force only when they spring from the hearts of Godlike men. They who create new and beautiful ideals, which give a new and holier sense of the worth and goodness of life, are our greatest benefactors. How blessed it is for a country to have good soldiers, good thinkers, good priests, good artists, good workers in every sphere! The supreme need is of good men, for only they upbuild the kingdom of earth and heaven. It is hard to love the multitude for what they are; the wise love in them the ideal of a higher life which they strive to realize here, believing and hoping that they thereby cooperate with the Eternal for ends which are absolute.

Sadden not the hearts of the young. Their worth as men and women will be in proportion to the joys of their childhood. Forbid as little as possible, but help thy pupils to do gladly wholesome and profitable work. Only they know how to teach who know how to rouse, to encourage, to incite. This is everything; for they who go bravely to work with joyful hearts will learn whatever is needful. The power to awaken ideas, so to use words that, like an enchanter's wand, they make what they symbolize rise into view, as though it stood before the eye, is a gift of genius, but it is also a talent which may be cultivated, and there is none which gives to the teacher's work more life and charm. It is important to make things plain, to throw about them the revealing light of the mind, but they who set the world aglow with the warmth and magnetism of an ardent and passionate soul are the true inspirers and teachers.

We little suspect what power of devotion and heroism there is in the simple people by whom we are daily surrounded, and who often appear to us altogether commonplace. Let but the proper occasion arise, and we shall behold their souls transfigured by the light of higher worlds and clothed with almost superhuman strength. Thus there is in the humblest man or woman a divine something before which the greatest may bow with reverence. Let, then, the teacher learn to recognize the good there is in every child's soul and let him strive religiously to unwind the bonds which hold him prisoner. "He who undertakes to form a man," says Rousseau, "must first have developed true manhood in himself." Again: "The pedant and the teacher say much the same things; but the former says them in and out of season; the teacher only when he is sure they will produce their proper effect." What we are capable of knowing depends on the power

and quality of our minds. Deep truth grows shallow in the shallow brain. Hence the genuine teacher gives little time to cramming his pupils with information for which they are not prepared, but he devotes himself to their whole being, which he exercises in every way, that they may gain strength and freedom, that they may become self-active, and address themselves gladly and perseveringly to the pursuit of truth and perfection.

The shadows, at least, of great thoughts fall on all, but for the most they are like the shadows cast by the wings of birds that pass for a moment above their heads. For a moment the soul feels the nearness of higher and holier things, and then suddenly finds itself again in the profane world of its everyday life. It dwells habitually on the hard and noisy earth, like the body, instead of rising to its true home in the serene realm where God reveals himself as everduring light and love. The sensual appetites exist for the preservation of the individual and the race. They are means, not ends, and to seek happiness in their indulgence is to smother the soul in filth and blood—it is apostasy from truth, from God. Our thoughts go forth to external things, or if we think of ourselves it is only in so far as we are affected by what is outside ourselves. Our desire is for such things; in them our hope is placed.

Shall we never learn to live with ourselves, that we may become alive in God? Thus alone is it possible for us to live truly, and to be no longer mere centers where a vain and transitory world mirrors itself. To live truly is to be good; and he who is good does good. In striving to improve thyself thou laborest for the good of others, and in helping others thine own life is made richer and purer. If we are to be teachers of men we must be soul-inspirers; we must work in the spirit of prophets, priests, and poets. Mechanical drill is the mill wherein the corn is ground; but once it is ground it will never take root and grow.

Religion brings into accord our intellectual, moral, and emotional natures; it appeals to the imagination as nothing else can. It is the inexhaustible fountain of hope, courage, and patience; it is the chief consoler in the midst of the troubles and sorrows of life; it is the eternal light which shines on the grave and lifts our thoughts to enduring worlds; it gives an immovable basis to the ideas of right and duty; it justifies faith in the superiority of mind to matter, and of pure and generous conduct to gross indulgence; it is the bond which holds men together in the family and the state; it is the source of the ardor and the enthusiasm which suffuses morality with fervor and gives it contagiousness; it is the consecration of our holiest yearnings and highest aspirations; it is the force which enables us to transcend the sway of the fatal laws of a mechanical universe, and to rise to the pure sphere where God, the Infinite Spirit, lives and loves and is free. How shall the teacher be a builder of character, a former of men, if he be not illumined, strengthened, and consecrated by divine faith? How shall he communicate the thrill of awe if he feel it not himself? How shall he teach reverence, which alone saves from shallowness and vulgarity, if his own spirit is profane? Culture, like religion, is propagated from soul to soul, not developed.

The ideal of culture is expansion and elevation of mind; that of religion, purity and lovingness of heart, to attain the wholeness and perfection of which human nature is susceptible. We must think and strive in the light of both these ideals. The open, flexible, and exalted mind must be nourished and steadied by the religious and moral sentiments which are the sustenance of our being. If the teacher himself has not made the everlasting affirmation, if his life is not enrooted in a noble faith and sustained by unalterable convictions, what vital thing can he say to his pupils? What that it is worth while to say? They whose religion is a code of rules and a system of practices, but who are not gentle, loving, and enlightened, are repellent forces. They have no power to educate. The greatest grow the longest time, and they whom nothing can arrest in their onward march to the

fountain head of truth and love are divine men and women. That which, like a mathematical demonstration, is wholly evident, leaves us indifferent; it is the infinite unknown that fills us with boundless yearning and draws us ever on and upward. Our aims and ideals are revealed by the objects and ends which we seriously strive to attain; by what, day by day, we labor for with heart and soul, unafraid and undiscouraged.

He must know how to govern; for what is education but the art of governing? But how shall he learn to govern unless he forget and deny himself that he may think solely of the good of his pupils? Is not this the secret of the mother's power, who, if she know how to love, is the world's first and highest teacher?

Passion of some kind lies at the root of human activity, physical, intellectual, and moral. Study springs from a desire to enjoy, and they who can not be made to feel that to know is itself joy, lack the inner impulse without which lasting mental effort is not possible. The inferiority of the multitude is due to their spiritual indolence. Their routine work performed, they sink at the end of each day into somnolence and lethargy; and this is true whether they read or talk or are silent, for in all cases they are passive. Their attention is not really aroused, and their minds are not really at work. In their social gatherings and amusements they are distracted, and in their intercourse with one another there is no spark of genuine intellectual and moral activity. Hence in the domestic circle the young receive no incitement to high and worthy effort, and they carry with them into the school the careless and indifferent habits which they have acquired from their parents. So long as this remains true so long will the multitude, in spite of schools and teachers, remain inferior.

"In my dealing with my child," says Emerson, "my Latin and my Greek, my accomplishments and my money, stead me nothing; but as much soul as I have avails." The highest wisdom is that which teaches us how to strengthen the will and to turn it resolutely to the love and practice of virtue, without which life is worthless. Hence it is unwise, not to say immoral, to commend virtue on the ground of policy, for virtue may not be policy, and to love it for anything else than its own rightness is to sin against its very idea; and so if we would seek truth profitably we must learn to feel that it alone can rightly nourish our intellectual and moral life.

If we wish to distinguish between education and culture we may say that education ends with our life at school, while culture, the self-imposed task of upbuilding our being on every side, then properly begins. Is it not plain, therefore, that the impulse the teacher gives is more important than the knowledge he imparts? In the home, in the sick room, on the battlefield, the great helper, consoler, strengthener, and light-bringer is a loving, cheerful, brave, and luminous spirit. Where he breathes and acts, suffering and death even lose their terrors; and the strength and wholeness which are born of such a spirit alone make the best work possible. Let the teacher, then, put far from him all worry, cowardice, pettiness, and spite, as well as whatever else may weaken hope, confidence, and love. "All things are hard. Man can not explain them by word." In the end as in the beginning, true wisdom lies in reverent faith and devout striving.

Without an ideal of some kind life has no significance. Above every doorway that leads to action is written "Why?" Over the lintel of the house of pain and sorrow we read "Wherefore?" Why should a man do and dare? Wherefore must he suffer and bear? For the right? But right supposes the eternally righteous one. For truth? But there is no truth if at the core of being there is only emptiness. God is the ideal or there is none. Turn resolutely then from whatever may weaken thy trust in God and in thyself, whether it be the love of money or the favor of the high-placed or sensual indulgence. Use as best thou canst what force is thine, nor doubt that aught which is needful to a worthy life shall

be lacking to thee. Keep thyself alive, eager for light and warmth, nor be troubled because thou drawest thy nourishment also from earth's soil, for whatever is an aid to strong, generous, human life is from God. If thy mind is open and sincere every real view will bring thee joy and strength, though it disturb thee by forcing thy old opinions into a new light.

What matter whether truth be profitable? It is to be sought, followed, and loved though it bring calamity and death. Accept the fact wherever and whatever it be, for not to accept it is to stultify thyself. The passions are good; they are the source of power and energy, but power misused is evil. Let not thy sympathy weaken the inner source of life and thus rob thee of vital force, for thy first duty is to be strong and self-contained, since so only canst thou be wisely loving and helpful. If thou hast good will, if, like God, thou lovest all that He has made, what else dost thou need but knowledge and strength, the power to make thy good will prevail?

The universal obstacle to progress is within. The light of heaven shines on all, but it shines in the midst of darkness as in interstellar space, because only here and there are there minds and hearts which offer a fit medium for its diffusion. The fatal fault is in ourselves, and the awful discouragement comes of the consciousness of what we and all men are. Let thy past be for thee as if it had not been. Forget the good and the evil thou hast done and begin to-day as though now for the first time thou heardest God's voice bidding thee win immortal life.

They are not wise or brave who are not able to draw greater profit from insult than from praise.

Then welcome each rebuff,  
That turns earth's smoothness rough,  
Each sting that bids not sit nor stand, but go.

If thy life seem to thee a useless burden, still bear it bravely, and thou shalt find at last that, like St. Christopher, thou hast carried a god across the troubled stream of time. Whosoever does what is right in a generous and brave spirit feels that he acts in harmony with eternal laws, and is, in his deep soul, conscious of the divine approval.

"Woe," says Bossuet, "to the sterile knowledge which does not fulfil itself in love." And again, "God is with us when we love." There is a love of the soul for souls—it is the only love which may be called love; it springs from the infinite soul, and makes us feel that there alone is our true and eternal home. Become conscious of thy soul, bend thy ear to its whisperings, and thou shalt hear the voice of God. In the depths, in the depths—here alone is life. And the noise of the world, the desire to be known, the thirst for pleasure and gold, and whatever things draw the soul to the surface, separate it from the source of its being and joy, whose waters are clear and deep, where silence reigns, where the calm, eternal face of God is mirrored.

An external authority may enlighten and guide us, but it can not give us the power of knowing and loving. "Let not Moses, nor any one of the prophets, speak to me," says À Kempis, "but speak Thou to me, O, Lord; Thou, from whom proceed the inspiration and the illumination of all the prophets." Think nobly of thy life, for thy habitual thought tends to become thyself. Renew day by day the will to live, to live in all that is true and good and fair; to live within the mind and heart, where glow the light and love which are eternal.

We blunder fatally in our schools in laying stress almost exclusively on what the pupils know. The young can know little, and nothing truly; but it is possible to inspire them with reverence for what is worthy and with faith in what is good, and this, which is almost the whole duty of the teacher, we neglect, while we apply ourselves to bring out in them a mental quickness which leaves

untouched the fountain whence human life springs and by which it is nourished. Man is infinitely more than a shrewd animal, and the teacher who fails to recognize this does little else than harm. The instrument of knowledge itself, of the knowledge at least which is wisdom, is not so much the intellect as the whole man, to whom we must address ourselves if we would make a man. Not the truth we hold, but the truth by which we are held, nourishes and shapes our lives. Keep open the way which leads from the seen to the unseen, for it is only by moving therein that thou shalt find strength and joy.

We live in the center of divine worlds, and how slight a thing will reveal the godlike virtue which lies asleep in the humblest heart! Not to the most wretched being alive is it lawful to speak a harsh or disheartening word. Though all else in his life be hideous and full of despair, yet shall the teacher bring to him the atmosphere of beauty, courage, and love. How much of our strength is derived from the opinions we have formed of the moral purity and goodness of the persons with whom we have lived, whom we have known and loved? Were it no longer possible to believe in their truth and worth, the foundations of our spiritual being would be shaken.

Suffer not, O teachers, that the all-believing, all-hoping souls of children find that the ideals they have worshiped are but idols. The good scatter blessings. In their company all divine things seem possible, even as cowards lose their fear when a hero leads them. If we could live habitually as live those who truly love, what joy and wealth should be ours! How easy it would be for us to become poets, heroes, saints. A thought one lives by, however simple; a desire which fills the heart, however humble, is enough to make life rich and fair. We make our proper world according as we believe, hope, desire, and love. A loving soul illumines and warms the house better than a blazing hearth and a lighted lamp.

It is not difficult to know what is good, but it is difficult to cherish this knowledge and to live with it until it becomes love and the substance of our being. "There is," says Ruskin, "no fault nor folly of my life which does not rise up against me, and take away my joy, and shorten my power of possession, of light, of understanding." Yet, though thy sins be as scarlet, believe that God's love can make thee white and pure. If with all thy heart thou seek the best things, failure is not possible. Strive then bravely to be true, gentle, chaste, loving, strong, and magnanimous, and thy life shall become sweet and noble. The light and peace of heaven shall enter thy soul, for thou shalt feel that God himself upholds and bears thee on. They who cherish right ideals are better than their characters, for they are ceaselessly rising out of themselves toward higher worlds.

How good is silence. It soothes and refreshes like sleep. It keeps us home with ourselves, wraps us like a blanket, cherishes the vital warmth, provides leisure, and shuts out the discords and contentions which are never wanting where words abound. Learn, O teachers, ye who are immolated to talk, how precious are the hours of solitude in which you may be alone with God and your own thoughts. There are no opportunities for those who have no life purpose. Let thy purpose be the making thyself a man, and whatever happens thee, the good and the evil will forward thee in thy work. There is no time but now, and in this now lies the promise and the secret of immortal life. There is no good but good will; it is the root of selfhood, the free and divine godward and manward impulse of the soul. Will to be and do right and thou art right. Make, then, the education of thy will the prayer and purpose of thy life. The foundation of thy being is moral. Knowledge must fulfill itself in deed or it is vain.

To conclude, a university is not so much a place where all the faculties are represented, where all knowledge is imparted, where original research is prosecuted, where men are prepared for the various professions which minister to human

needs, as a place where great minds and generous hearts and noble souls are gathered to bring their wisdom, their love, and their faith to bear upon the young to develop and raise their whole being toward the ideal of right life, of perfect manhood. The whole question of educational reform and progress is simply a question of employing good and removing incompetent teachers, and they who have experience best know how extremely difficult this is. In a university at least it should be possible, for a university is a home of great teachers or it is not a university at all. Costly structures, rich endowments, well-filled libraries, thoroughly equipped laboratories, many students, are but symbols of those delightful and luxuriant climates where "all save the spirit of man is divine," if great teachers are lacking. The chief value of a university lies in its power to attract and hold such men by giving them the fairest opportunity for the exercise of their high gifts.

The hero of a brilliant naval exploit, but just returned to his country, fills the whole land with the noise of acclaiming voices. It is a tribute of the popular heart to the worth of courage, skill, and daring. It is a privilege to be able to feel the thrill of genuine admiration in the presence of any high human quality, but the noblest hero is he whose achievements are wholly beneficent, who triumphs and scatters blessings without bringing sorrow or death to any child of man. Such a hero is a great teacher, who lives from generation to generation in minds made luminous, in hearts made pure, in wills confirmed in the love and practice of truth.

---

#### THE UNIVERSITY: A NURSERY OF THE HIGHER LIFE.

By the Rt. Rev. J. Lancaster Spalding, D. D.

"In my time and country learning cures the disease of the purse fairly well; that of souls not at all. To him who has not the science of virtue all other knowledge is harmful."—Montaigne.

An irresistible instinct impels man to preserve and diffuse life, and therefore it is his nature to think it good—not only good, but the standard by which all values are measured.

Life is good, and the highest life is the highest good. The morality of action is determined by its bearing on life. Religion and conduct spring from faith in its worth and sacredness, and urge to efforts to attain its maximum. That men may have life and have it more abundantly the Savior came and the church was established. For this the state also exists. To increase the power and quality of life, schools are founded, literature and science are studied, the arts are cherished.

Life, more life, ever-increasing life, is the aim and end of all we think and do. To inquire whether life is worth living is absurd, for life loves itself, and love originates all worth. Misconduct or misfortune may in individual instances enfeeble or even destroy the will to live, but the love of life, and therefore the belief in life's goodness, are indestructible.

Each new soul as it rises into consciousness is baptized with the waters of gladness; it feels that to be alive is joy, and its radical impulse is toward more and ever more life; and this is true also of the race, which blindly indeed, and along mysterious ways that often seem to turn and sink, has risen with ineffable yearning and struggle and hope toward larger and freer life, attaining through the lapse of centuries to truer knowledge, to worthier ideals, and to juster standards of conduct. Faith in the worth and sacredness of life is, at bottom, faith in God as essential life. Our courage, our strength, and gladness increase not when we look below but when we look above. From whatever depths we have ascended,

the height which calls us is infinite. The universe is not made of atoms. Atoms are but mental conceptions whereby we represent the world as a mechanism held together and controlled by causes. In reality it is not a mechanism; it is an organism, a system of means and ends. We therefore get at the secret and joy of life not by knowing, but by willing and loving, not through scientific abstractions, but through faith and conduct. The simplest soul wholly intent upon righteousness lives in a higher sphere than the philosopher who, neglecting his own perfection, gives himself up to research and speculation. The highest truth is practical; it is that which makes us wiser, braver, and holier. This is the truth which we should most cherish and diffuse in the home, in the state, in the church, and consequently in the university. They are all schools, and their worth is proportionate to their influence on life. The ideal is moral; not mental excellence, but human perfection.

Civilization is the unity of a people's moral will manifesting itself historically. The universities of the past, as those of our own day, have but partially fulfilled their mission because they have failed to foster a deeper and purer moral life. Nay, often they have been and still are the nurseries of vice. The radical failure is moral failure, and the education which does not promote conduct, which does not build character, bears within itself a mortal taint. Our life is controlled and directed vastly more by what we feel than by what we know, and the power to feel and will is as educable as the intellect. We can be taught to believe, hope, and love, to be brave, kindly, and helpful, more easily than we can be taught to think; and without moral earnestness in the pursuit of truth it is not possible to learn to think to good purpose. When philosophy is studied as an intellectual pastime and conduct is looked upon as a matter of policy, no genuine education can be given or received.

Religious faith and conduct are the basis of right human life, and the student who is not inspired by this principle may become a brilliant or a famous, but not a great or a noble man. Hence, whatever removes the dangers which threaten moral purpose, as wealth and luxury, is helpful to the life of the scholar. "What rendered the University of Paris powerful, nay, positively formidable," says Savigny, "was its poverty. It did not possess so much as a building of its own, but was commonly obliged to hold its meetings in the cloisters of friendly monastic orders. Its existence thus assumed a purely spiritual character and was rendered permanently independent of the temporal order." Its students were distinguished not less by their ardent application than by their poverty. It arose like our own university out of the faculty of theology, wrought in the spirit of a large philosophy, embracing the rational interpretation of the phenomena of mind and matter, was free from professional and technical aims, and was throughout the Middle Ages rightly regarded as the mother of universities. In every true university there must be a great moral purpose, and a great moral purpose to be inspiring and contagious, to have educational efficacy, must draw its nourishment from a deep and pure religious faith. Personal morality must be enrooted in the conviction that righteousness is life; if it be but a matter of convention and prudence, it is a dead and profitless thing.

It is doubtless the business of a university to educate the intellect, to make mental culture its direct scope; but knowledge should not be separate from wisdom, nor moral from intellectual excellence. The primary and essential aim is to form men, not scholars. The scholar, like the author or the artist, is an inferior being unless he is also a noble character—brave, loving, pure, upright. Organization, buildings, endowments, and privileges can not make a school. There must be an inspiring idea, a lofty aim, a living purpose, animating both teachers and pupils. All else is idle if this be lacking. In a university founded on religious faith and principle this truth applies with special force. Though

religious faith is the great fountain head of conduct, religion is not always a synonym of morality. On the contrary, it may associate itself with every human weakness and vice; but to have educational value it must be vital, must have the power to stimulate and nourish man's moral not less than his intellectual life. To be the highest it must be favorable to the highest life, and the highest life is found in seeking not the knowledge which is sterile, but that which fulfills itself in deeds.

They who realize how much of the spiritual activity of the present age is found outside of the church can not but see that the Catholic religion must more and more cease to be a power in the world unless Catholics themselves become morally and intellectually more alive. They must learn to understand that it is more important that they should do good than that they should do it in a particular way, more necessary that they should think than that they should think alike. In the presence of the vast movement of the modern world we Catholics seem to have grown timid, as though we feared lest human opinion should prevail against truth, man against God; and this lack of courage, which comes of little knowledge and less faith, makes us weak and despondent. Whatever is an aid to human progress is favorable to the Christian religion, to the worship of God in spirit and in truth. We must learn to walk without fear in the midst of a world of widening knowledge, to welcome every addition to the treasure house of the intellectual wealth of mankind as a preparation, however remote, for the Kingdom of God, for whose coming the Saviour has taught us to pray. There is nothing in Catholic faith which should impede advance in any department of learning. It is only when we come to draw inferences that the church sounds the note of caution; and this, if rightly understood, is helpful alike to the progress of science and to the soundness of religious doctrine.

All facts are sacred, since truth is sacred; and consequently there can be no reason why a Catholic university should impose restrictions upon inquiry and research. The intellectual interests of mankind, if not the highest, are at least immeasurably important, and to attempt to thwart them would be to place one's self in opposition to the mightiest force which the Eternal Father has confided to His children. It profits nothing to gain the world, if the soul is lost; but the world of which the Savior speaks is that of greed, lust, and ambition, not that of knowledge, science, and philosophy. Hence the Christian ideal excludes pride and sensuality, not intellectual power. It is reason that makes us capable of religion, and therefore to improve the mind, to dispel the darkness of ignorance, which is the cause of three-fourths of our sins and miseries, is to work with God for the good of men. The spiritual union to which all generous souls aspire can not be brought about by authoritative utterances, for we hold vitally only the truths which our own self-activity kneads into our intellectual and moral constitution; and spiritual unity is the result of truth held in common, whether through faith or knowledge, and held vitally, not mechanically. Reason and authority are not antagonistic; on the contrary, no authority is legitimate unless it is approved by reason. Are we not eager to claim great and enlightened minds when they are friendly to our faith? Do we not appreciate the Catholics, at least when they are dead, who, despite human frailty and error, have done memorable things? Do we not extol the church, for what in ages that are gone it accomplished in behalf of literature, art, and science? Do we not hold that modern civilization is largely due to the influence of the Catholic religion?

And what is all this but to proclaim our own shame, if we are retrograde, cowardly, and inactive; if we suffer ourselves to be thrown into antagonism to living and fruitful movements; if losing confidence in ourselves and in our cause we drift aimlessly and pour forth vain lamentations over a past which can not return; for history does not repeat itself. The environment is not the same,

and the human factors change ceaselessly. Hence antiquarian reactions lack vitality. They fail even when they seem to succeed. In America the past has but feeble hold on our young and eager life, and we are too absorbed in our work to think of the present. The future therefore lures us with irresistible power. To commend a religious faith to us for its achievements in other ages is to plead in vain; as to strive to bring back the conditions of former times is labor lost. Were it possible, our world would not have it. If we are to act along an inner line upon the life of America we must bring to the task a divine confidence that our Catholic faith is akin to whatever is true or good or fair; that as it allied itself with the philosophy, the literature, the art, and the forms of government of Greece and Rome, so it is prepared to welcome whatever progress mankind may make, whether it be material, or moral, or intellectual; nay, that it is prepared to cooperate, without misgivings or afterthought, in whatever promises to make for higher and holier life. Why turn regretful eyes to some buried century, which, if we knew it better, we should esteem less? The best things lie before, not behind us.

Out of nothingness the race, like the individual, has come forth and our way leads toward infinity—from God to God—this is the best we know. Knowledge grows, power increases, freedom is enlarged, good will spreads to wider circles. Has faith ceased to be a virtue, hope a source of courage, love the fountain of life, that we should linger amid ruins and funereal monuments, weeping for the things which are no more? He who wrought with divinest efficacy than all the apostles heeded not what was gone, but moved toward the future with a heart which knew neither doubt nor fear. Let the dead past lie in peace with its dead; we are the children of light and life. Increasing knowledge will doubtless lead to changes of which we scarcely dream; but in the meantime wisdom demands that each use what insight and power is given him to educate himself and to help others. We ask not whether one lives in an enlightened or a barbarous age; but whether he is a true and noble man; not whether he dwells in a great city or in a desert, but whether the world of his consciousness is wide, beautiful, and high. Wherever we are, however surrounded and attended, we can not live except in our minds and hearts. If all is well there, the rest need give us little concern. Let us learn to trust the Power by which we live, and to place less reliance on what is adventitious. They who are too much defended and protected, whether by the church or the state, or the school, or the home, never acquire the courage and skill to defend and protect themselves.

The university student reaps the special fruit which such education should bear only when he acquires the philosophic mind, whose attributes, Newman says, are freedom, equitableness, calmness, moderation, and wisdom. "If any man," says Bacon, "thinks philosophy and universality to be idle studies he doth not consider that all professions are from thence served and supplied. And this I take to be a great cause that hath hindered the profession of learning, because these fundamental knowledges have been studied but in passage." In the university the student finds men who really know what they are supposed to know, whose knowledge is derived from original sources and habitual self-activity, and who, while they teach, continue to drink at these fountain heads. They themselves keep growing, and therefore they have the power to stimulate growth in others. Not all, indeed, possibly not many, are such men; but if there be one or two they will become known and be followed; for the larger liberty granted in universities tends to bring the seekers after wisdom under the influence of the best masters; since students, more than others it may be, have a horror of bores, and will, if this be at all possible, flee the halls where they set up their melancholy chairs.

If university students live and die commonplace men or worse, they never were

in a true university or they never should have been in any. At the best the school can but stimulate and guide in the work of mental and moral discipline. The decisive thing for each one, if there be any special significance and value in his life, is not what he is taught, but what he teaches himself. The business of education is "to strengthen man with his own mind," and this each one must learn to do for himself. But the young are little able to abstract for themselves, and if they are to walk in the light of true ideals they must be proposed to them in concrete form in the home, in the school, in the church, and in the state. The feebler their reason, the greater their readiness to follow examples. Hence the all-importance of character in the parent, the teacher, the priest, and the ruler. Nothing is so delightful and bracing as the company of the wise and magnanimous. They create a climate in which the soul prospers, in which it is easy and natural to think great thoughts and form high resolves, in which youthful minds, as Plato says, seize on knowledge so readily that they seem to have come from a previous life and to be picking up again what they had known, not learning something new. Is it credible that influences which remain associated with dullness, monotony, fatigue, and fear should be perennial sources of joy and strength? Things will never improve so long as teachers take up their daily task, not in the spirit of sowers and reapers, who sing in the pleasant air, but in that of hirelings who must work or starve.

Where the young are rightly taught, books and teachers suggest glad thoughts. We tell them that their school days are the happiest and it is our fault that they find it impossible to believe us. The world composes its countenance to the expression assumed by the king, and since great men are rare and are not to be found in many places, therefore must there be a center, a university, where they may lead their lives and set up their chairs of high and contagious wisdom; where, separating themselves from the noise and tumult of current events, they may acquire an enlargement of view, a depth and elevation of thought, which will give them power to mold and fashion hearts and minds; where they may be surrounded by the privileged few, who crave knowledge as the eye light, not chiefly with a view to its use, but because it is essential to the perfection of man's nature, in whom this craving, slowly gathering force, deepens into a passion, and urges them ceaselessly onward, as saints are drawn by the ideal of holiness, as the purest souls are attracted to God, and who therefore stand forth from the multitude whose mental curiosity is soon satisfied and becomes a merely mechanical habit. The teacher is worth what the man is worth.

Great teachers make great schools. Socrates is the first university man. He is followed by Plato, who is succeeded by Aristotle, and they are still the masters of those who think, for they pursued and taught philosophy as a theory of knowledge and life, and there is and has been no great school in which this study is not carried on in their spirit. Alexander the Great, a pupil of Aristotle, in founding a city at the mouth of the Nile, established there, about three hundred years before the birth of Christ, the first university with a distinctive form and organization, and it soon attracted the most eminent scholars, and became a center of inspiration and light for nearly a thousand years for the studious youth of the civilized world, among whom were some of the most famous of the Christian doctors. When we think of Athens, Rome, Alexandria, Paris, Oxford, and Koenigsberg we think of the great, wise, and laborious men whose names are forever associated with them, men whose religious, moral, intellectual, and esthetic genius has illumined, ennobled, and strengthened the race to which they belong. These centers whence has radiated so much of the best we know and love, never lose their interest, because the lives of genuine and enlightened men can never cease to charm and help. What divine purposes does not a real center of the highest intellectual and moral life serve? If we are to have good primary

and secondary schools, good academies and colleges, we must first have genuine universities.

Progress spreads from the summits, as the sun gilds the mountain tops before its light floods the plain. It is in the university that the science and art of education, its history and methods, are studied to best advantage. It creates a demand for more thorough preparatory training. It keeps up a succession of scholars devoted to the pursuit of philosophy and literature. It is not its business to supply legal, medical, and clerical practitioners. The professions, in one way or another, take care of themselves. Its function is higher. It encourages those especially who pursue the study of the arts and sciences for the pure love of knowledge. Whether or not it fit a man to achieve what is called success, it will fit him to live wisely and well, like a gentleman and a scholar. In the university are taught the same things which are taught elsewhere, but there they are taught in a purer atmosphere, in a more liberal and disinterested spirit, in the midst of a body of men who represent the whole cycle of knowledge, who are themselves learners as well as teachers, whose enthusiastic and unselfish devotion to culture, religion, and morality keeps them young, hopeful, and vigorous, making their presence magnetic and their words vital.

Thus it forms spiritual leaders—those who give direction to the thoughts and deeds of the many—men whose minds have been trained and disciplined by studies which have no direct practical end, who take delight in intellectual exercise for its own sake, though their knowledge should have no other value than the enlargement of view it gives them; who deem their gain sufficient if they have learned to think and love great thoughts instead of little thoughts; who, having made themselves a home in their own breasts, feel that palaces and the society of the fairest are poor and paltry in comparison with the worlds they find there; who, clearly perceiving that the essential unity of religion, philosophy, and science is a postulate of reason, hold fast to this root principle and move forward, undisturbed by doubts, denials, and controversies which but waste strength. In the Middle Ages it was the universities of which Rome was the kindly and genial nurse that roused Europe to a sense of its need of greater freedom and wider knowledge. Had it not been for them little intellectual progress would have been made. In our own country, had we harkened to those who were never weary of asserting that the time had not yet come to found a Catholic university, we should still be standing on the river bank, like the rustic of whom Horace speaks, waiting for the waters to run by. The waters will flow on forever and forever, and they alone who have the courage and skill to swim or bridge the stream take possession of the promised land of a richer life. To expect that the lower schools should rise to greater efficiency and thoroughness when they lack the example and inspiration of a university is to show oneself ignorant of the most important educational lesson which history teaches.

Whatever may be thought of the moral and religious progress or regress of America, there can be no doubt that our institutions of higher learning have now for more than a quarter of a century been making rapid advances.

All that zeal, ability, and exhaustless financial resources can accomplish is being done in every part of the country to found, maintain, and improve universities; and the work is destined to proceed with increasing power and speed. It has the approval of public opinion, it is supported by the state, and it enlists the generous, almost lavish, cooperation of men of wealth. It is a protest in favor of the higher life, in the presence of the materialism and greed which threaten to overwhelm us. We feel that to be satisfied with what ministers chiefly to physical needs and comforts is to be superficial and vulgar. A noble nature yearns and strives ceaselessly for the things that feed the mind, the heart, and the conscience. We have come to understand that education in the true and large sense of the

word is our one means of improving men, and that it is a delusion to imagine that a reform which is not based on education can be either deep or lasting. The church which is not also a school exerts no vital influence. What is external is perishable. The source of life is within, and the stronger, the purer, the more conscious of itself it becomes the more is the soul filled with immortal hopes and loves.

This is the root idea of progress, of the progress which enters as an essential element into our conception of life, of the progress which is the soul's effort to realize itself. It begins, indeed, with the environment; for they who have no thought of improving their material surroundings rarely have a desire for intellectual and moral advancement. Material progress enables us first to provide for our physical existence, for health and comfort and length of days, but its proper human value consists in its power to minister to spiritual uses. Mere animals can do something for their physical well-being, but man alone is able to think and act in obedience to eternal laws of rightness. Where there is justice, morality, liberty, and good will there is civilization; and where these virtues are found in the greatest perfection there is the highest civilization. Knowledge is power as money is power; but it is power for good only when it belongs to rightly trained minds and worthy characters. The weak, the superficial, and the incompetent are easily overburdened with knowledge, as the foolish, the prodigal, and the sensual sink beneath a weight of gold; and they who hope to obtain good results by cramming the memory are as blind as parents who think it enough to make their children rich. A strong and flexible mind is better than much knowledge, a brave and loving soul than mountains of gold.

It is the radical fault of our education that instead of cherishing and developing that which constitutes man's proper worth, it is busy with imparting information about many things which are but feebly related to true human life. Human greatness depends almost wholly on moral energy. The mind does not illumine the depths in which the heart lives. Reason can not explain love; it can not explain religion which alone builds love's temple. For this cause mere intellectual culture is superficial, a refinement or a gloss, while religion is the power within which lies at the root of life and transforms the world. Philosophers, like anatomists, dissect what is dead, while souls, alive with faith, move forward to do and suffer. They ask not for arguments, for they are certain of themselves. But they are the mightiest in whom the power of religion is blended and interfused with the power of culture. They are great and luminous personalities, and personality is the highest fact we know. By personalities religion and culture are created, and by them they are preserved and propagated. In the great work the great person is always present as the great factor.

If ever and anywhere men of exceptional intellectual and moral strength were needed, they are needed by American Catholics, thrown as a minority, burdened with many disadvantages, into the midst of the eager, self-confident, and all prevailing democracy of the New World. Here the church lives and acts in virtue of its own power, neither having nor desiring the support of the state, content to lack the privileges which in other ages resulted from social conditions unlike our own. We could not have these privileges if we would, and could we have them they would hurt, not help us. It is enough that we have the rights which in a free country belong to all alike—freedom to teach, to publish, to organize, to worship. Liberty has, indeed, its inconveniences, its dangers even, but the atmosphere it creates is the native air of generous, fair, and noble souls; and where it is not, man's proper good and honor are not found.

God says St. Anselm loves nothing so much as the freedom of his church. In America it is free, free in the only way in which it is now possible for it to be free anywhere, free in the midst of the general liberty of a free people. To lament

that we are fallen on evil days would show lack of knowledge, lack of faith. Things have never been right in this world. God made it, not we. Let us take it as it is and do the best we can. Is it not much that here and now the people whom Christ loved are better fed, clothed, housed, and taught, more thought of and cared for, than they have ever been since time began? Shall we complain because here the priest is respected only when the man is worthy? Shall we murmur because here the word of God issuing from minds and hearts that are alive and faithful penetrates more surely and reaches farther than the splendor and pomp of ceremonial worship? Shall we regret the vanished power of prince-bishop and abbots, who were feudal lords? Is it an evil that if the rich and high placed are drawn to the church, they are not drawn by the hope of temporal gain?

Is it a grievance that here it is impossible that arbitrary and adulterous emperors and kings, in exchange for a protection of doubtful efficacy, should inflict upon us their oppressive laws and disgraceful lives?

Shall we lose courage because we are thrown back on the inner sources of life, whence alone spring joy and strength? We are a minority, and what lesson shall we thence derive but that we are thereby pledged to devote ourselves with all the more zeal to the cultivation of knowledge and virtue and to the practice of good works? The majority, Plato says, are wicked. If the multitude belong not to us, there is all the more reason why those who are ours should be pure, sober, honest, and wise. Not by boasting of the great things the church has done, but by becoming true men and doing something worthy ourselves shall we best commend and show forth the faith by which we live. Liberty is of a boon, the source of the highest good, but it is also a burden, heavy with the weight of responsibility, on which depends man's temporal and eternal welfare; for the free must upbuild their being and bind themselves to the service of God and of men, or the keen air they breathe will intoxicate and drive them to mad excess. "Remember not former things," says Isaiah, "and look not on things of old." Here are we, here is our world, here is our work. We are always in the center of a universe, and whatever we do, whatever happens to us, is great if we but know how to make use of it. If we would labor for the future we must labor in and for the present. Unless we are inspired by the spirit of the age and country in which we live, how shall men know or love us? If we are not at home in our own time and fatherland, in the midst of what God makes us alive to see and do, when and where shall we find a home?

If we occupy ourselves with what is dead our vital power shall grow less; if with what is weak and unhealthy, we shall become morbid and ineffectual. Let us be busy with life where it is strong, wholesome, and fair. If our religion bring us courage, joy, and peace, we shall not rail at the faults of men, but shall rather strive from a happy and loving heart to lead them toward the light. Least of all shall we contend and wrangle among ourselves. The words which a bitter and harsh zeal inspires are from the devil and drive men to him. Spiritual gifts can never be communicated mechanically. He who does not bear them in his own mind and heart can not make them live in the minds and hearts of others. To believe otherwise is superstition—a superstition which is the bane of true religion. Disputes of theologians, like all quarrels, interest mainly the participants—others they annoy or scandalize. They spring less from the love of truth than from the narrow and unsympathetic temper which is often found in the professional mind and which has wrought infinite evil in the world. Medicine, law, and theology, when followed simply with a view to practice are not liberal studies—they rather restrict the mental horizon and subdue the mind to what it works in, unless it first be rendered supple, open, and luminous by philosophy, which is liberal knowledge, a gentleman's knowledge, and a chief scope of university teaching.

Genuine devotion to philosophy, religion, or culture is rarely found in envious and contentious spirits. Disputes please the ignorant and the prejudiced; and they who are least concerned for man's highest good are readiest to wrangle about trifles. The air the true student breathes is pure and serene; the thoughts with which he lives have permanent value, and they are interfused with mild and kindly sentiments. His view is large, and he is tolerant of the little things which irritate the vulgar. He knows that truth does not reveal itself in the storm of controversy, which settles nothing. He cares not for place or popularity, and therefore has not the disposition which makes jealousies and rivalries possible. His clearer vision of the past gives him a greater and more real view of the present. In the dim and sober light of dead empires and civilizations fallen to decay he sees how vain are most of the things which we permit to disturb our peace. He knows that doubts and difficulties are best overcome by doing and suffering, not by arguing and fault-finding. And he understands how easily they who accustom themselves to a circle of narrow thoughts and loves come to think it profane to see God everywhere, and settle in their microcosm, believing it to be His universe. He will not disturb them, for so it is for them. He is aware, also, that the worst egotism is not individual, but corporate; that those who as individuals are kindly or even generous lose conscience and grow hard and unrelenting when there is a question of their party or their clique; and that thus what is called patriotism, or what is called religious zeal, has led men to commit the most atrocious crimes. His prayer is that of Isaias: "Only let peace and truth be in my days." "Let others wrangle," says St. Augustine, "I will wonder."

The true student, drawn by a disinterested curiosity and admiration, occupies himself with the great problems of philosophy as the highest means of intellectual culture. No other discipline gives such distinction to the mind or so reveals the soul to itself when it is taught and studied in a free and noble spirit. What is it but the art of thinking applied deliberately to the questions which most profoundly interest man, and which each one, if he is to rise above the level of vulgar opinion, must solve for himself as best he may? It is the most human of all efforts, the effort of man to know himself, to get insight into the mystery of being and life, of spirit and matter, of time and eternity, of God and the soul; and though one should hold that such effort can never attain its object, it must be admitted that it is a noble mental exercise and the source of pure and enduring delight. It is easy, as it is popular, to speak of metaphysics as empty and sterile studies; but it is easy, also, to be shallow and crude in one's views; and if there be any sphere where the opinions of the many have little weight it is that of pure thought. But those who decry philosophy, like those who decry religion, labor to no purpose, for so long as men continue to think philosophy will interest them, and so long as they continue to believe, hope, and love they will turn to God.

Philosophy, certainly, like religion, may be a pretense merely, but for those who enter the inner sanctuary it is wisdom and strength and joy. Nothing else emancipates so effectually from the tyranny of fact or guides so securely across the treacherous sea of theory. It educates the spiritual even more than the intellectual man, and this is the basis of individual character, which is itself a chief support of humanity. Faith gives direction to our aims and aspirations, hope strengthens and upholds the will, love expands our whole being by making the not-ourselves ours, while philosophy holds the lamp which illumines our pathway through the universal labyrinth. Its soft and equal light shines in the pure regions where the soul delights to essay its wings; where it breathes an ethereal air which gives it steadiness of purpose and enduring power; where it learns to feel how slight a thing is fame itself compared with the vision of the eternal, with the knowledge that wisdom is truth, that truth is love, that love is God. Philosophy leads us into the company of "great thoughts, grave thoughts,

thoughts lasting to the end," where we hear the words of the first world teacher exhorting us to take part in the great combat, which is the combat of life and greater than every other earthly conflict. If we are to be freed from ignorance and sin, our deliverance must be wrought from within. Not so much our circumstances as ourselves must be changed. As soft beds and every kind of delicacy fail to make comfortable those who are ill because the source within has become sluggish and its waters bitter, so nothing external can make us free and joyful if we are prisoners of our own base passions. Without philosophy, in a word, even the most learned men have but a kind of encyclopedic ignorance, for if it bind not the whole it is all chaos.

Whatever scope we may assign to university teaching, whether with Newman we call it liberal knowledge, or with Virchow, general scientific and moral culture, together with the mastery of one special department—whatever the scope, a true and living philosophy is its first and most essential means of discipline. Where this is lacking there is no university. It is this that lays aright the deep infinite foundations of religious faith; it is this that points out the absolute need of moral culture and conduct; it is this that shows how every talent may be developed and every susceptibility satisfied; it is this that assigns a place to every advance of science; it is this that teaches us to welcome men of exceptional gifts whatever their calling or their work; and unless we know how to welcome our greatest men, to give them opportunity and encouragement, to enable them to put their abilities to right uses we are barbarous or decadent. The earth is fit home for a race of much higher average moral and intellectual power than the human has ever attained; and if we are to gain wider life and reach higher plains; if, when degeneracy comes, as it comes to all, we are to leave an eternal memorial of ourselves, we must learn to love and follow the wisest, the best, and the mightiest. In the light and guidance of individual minds of exceptional insight and strength the slow crowd must grope its way to higher things or not rise at all. Whether or not universities shall be ultimately able to maintain their freedom under a democratic social system is a problem. As civilization becomes more complex, the means of oppression and tyranny increase, and if the multitude are permitted to degenerate their jealousy and hatred of superiority will become intensified.

Sparta and republican Rome became strong by sacrificing philosophy, art, and literature to the requirements of a merely practical and civic education. And this, it would seem, is the tendency also of the social democracy. It is a false and downward tendency. Individual man does not exist for institutions—they exist for him; and the practical side of life is valuable only so far as it ministers to the spiritual. As the possession of a world could not bless one who is ignoble in himself, neither could it give worth and distinction to a nation whose citizens are ignorant, base, and venal. This is the teaching of Christ, and it is this teaching which has made the alliance of Christianity with philosophy inevitable, even as the doctrine of the brotherhood of the race has led to that of the equal rights of all, and thus to the rule of the people. "But, however, *vox populi vox Dei* has prevailed as a maxim," says Locke; "yet I do not remember wherever God delivered His oracles by the multitude or Nature truths by the herd." When the world is rightly governed it is not governed by the many, but by the wisest and the best. The genius, the hero, and the saint can not, indeed, be explained by the schools in which they have been taught, but a true school is none the less our most effectual means of forming true men. Self-made men are poorly made. The higher and the holier the cause the higher and holier should the leaders be.

Here in America we Catholics have a twofold work to perform, and higher or holier task God never intrusted to human agents. We have to upbuild and firmly establish in this new world of universal opportunity, feverish energies,

and tumultuous passions, the church which has been handed down to us through the centuries, and which sprang from the mind and heart of Christ, uttering himself on the cross; and we have to do our part in purifying, uplifting, and civilizing the masses to which we belong, and who, if they are to be and to remain capable of self-rule, must be taught by science, morality, and religion to govern themselves. Knowledge alone will not suffice, and a merely philosophic morality has no significance or efficacy for the multitude. The moral dynamics of a people lie in its religion. Society rests on conscience, not on science. "Religious education," says Balzac, "is the great principle of the life of society, the only means of diminishing the total of evil and of augmenting the total of good in human life. Thought, the foundation of all good and of all evil, can not be disciplined, controlled, and directed except by religion, and the only possible religion is Christianity, which created the modern world and will preserve it."

The Catholic view of education is the result of genuine insight into man's true nature, which is sacred and godlike. To educate him merely with a view to his ease, comfort, enjoyment, and dominion over material things is to take him out of the divine element in which he belongs. Do we not all recognize that to quicken the wits and leave the conscience untouched is not education?

Is not the most vital question which Americans can ask themselves this—How to make our schools centers of moral influence? Can we not see ominous signs of degeneracy in the greed which everywhere is eating away the public conscience, in the universal craving for indulgence and luxury, in the dying out of the sense of honor and of the sacredness of the oath, in the loosening of the marriage tie, in the loss of obedience and reverence in children, in the worship of success, in the exaggerated confidence in the power of machinery, in the turning of the theater into a forecourt of the temple of Astarte, in the popularity of coarse mockers, for whom nothing is holy, who are little else than intellectual malefactors? Is there not need of making our schools centers of moral influence, all the more urgent because most of the churches seem to be drifting away from the eternally vital truth into mere sensationalism? How shall we make the school a center of moral influence? The answer is not difficult. Morality, like culture, like religion, is propagated, not evolved. The devout communicate the spirit of piety, as the luminous mind rouses those on whom its light falls. Character builds character. Which are the virtues that make man worthy and strong? Are they not truthfulness, sincerity, reverence, honesty, obedience, chastity, patience, mildness, industry, politeness, sobriety, reasonableness, perseverance? Who, then, can propagate these virtues? They in whom they are living powers; they and they alone.

National regeneration is not possible without moral regeneration; moral regeneration can be wrought only through a right education of the whole man and the whole people, and this can be given only by men and women who live in the mind, in the heart, in the conscience, whose souls are filled with light and suffused with love; who have made it impossible for themselves to take pleasure in any amusement or occupation whatever unless they can in some way make it contribute to their own improvement and so to the common good. The first thought in every true university is to mold and fashion men, and only in so far as they are a means to this end do refinement, polish, taste, and learning become an aim and ideal. Style and form and various knowledge are important, but they are vital only when they help to express the truth known and loved by ardent souls, inspired by genuine enthusiasm and a great purpose.

To have right principles is an excellent thing, but the worth of a school can be known only through results. Education, like medicine, is largely a matter of experiment. Our schemes and theories are vain unless they stand the test of application. Are schools religious if they do not make men religious? Are they

educational if they do not make men moral? Is universal instruction a good if it weakens faith in the eternal principles which underlie right human life?

That we might have one center where our educational principles should be put to the test under the most favorable conditions this university was founded; that we might make it plain to ourselves that the patience, the self-denial, the unworldly temper, the persevering industry, which alone can mold great scholars and intellectual leaders, are still to be found among us, at least in a few; and that these few should become for us, who are thrown into the cares, distractions, and businesses of the world, as beacon lights to the storm-tossed sailor, as well-springs to thirsty travelers through arid plains, as the voices of valiant captains to their soldiers amid the clash of arms and the roar of battle; that when men tell us that our religion deprives us of mental freedom and of the power to pursue science in a disinterested spirit, we might, instead of having recourse to speculative arguments which are ineffectual, or of going back to past ages, which is not to the point, simply say, Behold our great school and the clear, searching light that is there turned on whatever most interests the human mind; that we, too, we the children of centuries of oppression and poverty, might now stand forth in the front ranks of thinkers and lovers of their fellows, to help illumine this great turbulent democracy, and guide it along the uncertain ways to fairer, wider, purer life; and that we might thus show that there is in our Catholic faith a power of self-renovation, that its vital principle has not been exhausted by the struggles of ages, but that it is destined some day to become the inner and organizing force of society, and will then reveal itself to the whole world in all the depth of its truth and in all the wealth of its blessings—for all this and much more the Catholic University of America was founded.

It came into existence in the midst of doubts, misgivings, and oppositions of various kinds. Its earliest history is one of difficulties and trials. Never before had American Catholics undertaken a work whose significance and influence should be as far extending as the country itself. Diocese after diocese had been organized; churches and schools, asylums and hospitals had been built at a thousand points; a numerous body of devoted priests and religious men and women had been formed; and the most seemed to be willing to rest content with this expansion and growth in numbers. But to some at least it was manifest that if this vast and rapid development of the church in the midst of the greatest democracy that has ever existed was not to end in decay or confusion, it was imperative that we should establish here a common center of the highest spiritual life—intellectual, moral and religious—where men of exceptional gifts might receive an exceptional culture; for such men are urgently needed everywhere, as heads of our dioceses, seminaries, colleges, and parishes. In positions of authority weak and ignorant men do greater harm than men who are wanting in virtue. The worst ruin both in the church and in the state has been wrought by those whose intentions were good, but whom a narrow and unsympathetic temper, a weak and vacillating purpose and an unenlightened zeal blinded and misled.

In a society like ours where there is little reverence, little respect for anything save power, whether it be power of money or power of mind, it is not enough that the priesthood be blameless. The painfulness of the preaching will distract attention from the holiness of the life. If we are to draw and hold public interest we must be able to do more than appeal to the authority of the church and the Bible; we must know how to speak to the god in each man's bosom. Like every true teacher, the priest, though he is not expected to say all that he knows, must survey the whole field of knowledge and be at home in every department of learning; for only they who know the whole can take up a subject with a master's skill and follow it in all its bearings, certain at each moment of their position. "Ignorance," says Benedict XIV, the most learned of the popes, "ignorance

is the fountain head of all evils," and when it is found in a priesthood it is always associated with inner decay, with indolence, indifference, and self-indulgence.

No laborer leads a life of such intense and unremitting toil as a real student. A voice cries out to him ceaselessly that he must renounce. "Do without! Do without!" This is its one message; for it is only by turning away from the hundred things men seek that it is possible to strengthen and temper the mind so that it shall be able to give itself wholly to truth. He is not a degenerate; he is one in whom life's current is rising; for in him the love of knowledge and virtue overcomes the love of ease and pleasure.

To give examples of such a life, to train a chosen few in this high and severe discipline, who shall then scatter throughout the land, as bearers of light and contagious enthusiasm—for this the Catholic University was founded. Quality and power of life, not numbers, is the aim—"holding himself to be a fortunate and a great king, not because he ruled over many, but over the best." That she may show her faith in this high enterprise and become a sharer in the spiritual good which here diffuses itself, Notre Dame opens this college to-day.

She comes, bringing with her the strong heart, the tireless energy, the dauntless spirit of the West. She comes not unknown or unattended, but bearing with her a noble name honorably won by long and faithful services to the cause of education. She comes, proclaiming by the enduring monument which she has here built, that when there is question of uplifting a higher standard of religious, moral, and intellectual life in America it is possible to put away all lesser considerations, to forget differences of place and race, to rise into spheres where petty rancors and jealousies disappear as noxious vapors melt away when the sun, from the mountain tops, looks forth on God's glorious world. She comes to declare that here we shall have not only a Catholic university but a school of schools, a mother of universities, a center around which our teaching orders shall gather to drink wisdom and to learn to know and love one another in the serene air of delightful studies, to breathe which is to grow tolerant, fair, reasonable, and mild.

Not all at once may this come to pass. As an original writer has to create the taste by which he is appreciated, so a true university must diffuse the light whereby its high and holy uses are revealed. Already much has been accomplished. In our teaching brotherhoods and sisterhoods a new spirit has manifested itself, fresh eagerness to learn, a more self-sacrificing zeal, a more joyful confidence in the absolute rightness of the cause to which they have given their lives. The heads of our colleges have come together and agreed to meet annually for the purpose of interchanging views and of reaching conclusions for the advancement of our schools. They are no longer content to accept mechanically the traditional pedagogical theories and methods, but they will have the light of the mind play on them, and will adopt those which reason and experience most approve.

Here, too, under the shadow of the university, Trinity College is even now rising, a monumental witness to our faith in the right of woman to upbuild her being to its full stature, to learn whatever may be known, to do whatever right thing she may find herself able to do. Those who stand with averted faces, looking ever backward to Europe, do not impress us. What sacredness is there in Europe more than in America? Is not the history of Europe largely a history of wars, tyrannies, oppressions, massacres, and persecutions? Has not its lust for gold made it a scourge to all the inferior races of the earth? Have not its people long stood face to face, arms in hand, ready to butcher one another? Why should Europe be an object of awe or admiration for Catholics? Half its population has revolted from the church, and in the so-called Catholic nations which are largely governed by atheists, what vital manifestation of religious life and power can we behold?

In any case we are in America, not in Europe, and to stand in the midst of this vast, advancing world, with averted faces, looking backward, is to sink out of sight and be forever lost as a living force. What country ever had fortune like ours? Where else has there ever been such opportunity for all? Where else has the Catholic Church ever had a wider or a freer field? Does not our Lord say speaking to His apostles, "They who are not against you are for you?" Now the vast multitude of those outside the church here are not against us, and are therefore for us. If we fail, the fault is in ourselves, in our timidity, in our intolerance, in our lack of faith. What is there to make us afraid or despondent?

All the sciences prove and glorify God. All progress serves the cause of true religion. In immovable confidence in this principle, taking new courage from the happy omen of this day, let us bless the eternal Father that we are here to work for the church and for America, by doing what men can do to create a university which shall irradiate light and love, be a center of union and peace, and a nursery of the higher life.

---

## XX.—STATE UNIVERSITIES.

Address of James B. Angell, LL. D., president of the University of Michigan, at the dedication of Academic Hall and the new department buildings of the University of Missouri, June 4, 1895.

\* \* \* In response to your courteous invitation to me to address you, it has seemed to me that I might well ask you to consider what, in view of its organization, are the principal difficulties which the American State university has to encounter, what advantages it has to commend it, and what needs must be supplied to insure its success.

In our present study of State universities it will be convenient first to inquire what have been their chief embarrassments.

First. The business of disposing of the lands granted by the United States for their support has, in many cases, been badly managed, so that a large part of the endowment has been lost. In the early history of several of the States to which grants for universities were made the people did not appreciate either the possible importance or the future needs of a university, and therefore the proper disposition of the lands was not secured. It is not surprising that such was the fact. In some cases errors of judgment, in others, it is to be feared, the greed of speculators, who outwitted trustees and regents, caused lamentable sacrifices. The lesson should not be lost to the States whose lands are still within control.

If we may say so without seeming ungrateful, we may express our regret that the General Government, when making grants of lands for universities, had not given more of what it was then so easy to give. Doubtless when the first grants were made at the beginning of the century of two townships to each university, that was believed to be a very generous endowment. And so it was for the maintenance of universities according to the standards then prevailing. But the progress and elevation of the higher education have rendered necessary much larger revenues for the support of a university than the proceeds from the sales of the lands bestowed can furnish.

Second. A very common criticism on the organization of universities by the State is that political parties will interfere with them from partisan motives, and seek to use them in furtherance of party ends. Theoretically, that seems possible, but in fact, so far as I know, the good sense of our people has prevented this, as it has prevented such interference with the common schools. I think it may safely be predicted that any party which shall attempt to use either the universities or

the common schools for a partisan purpose will lose as it deserves to lose, popular approbation.

It is true, however, that there is a certain peril to the State university from the close relation which it holds to the public. If important differences arise within its governing board or its faculties concerning a line of policy, or concerning the fitness of president or professors for their positions, the discussion becomes more widespread and general and often more impassioned than it does when similar questions are before a close corporation which is practically responsible to nobody for its actions. Such political discussion of university questions is often conducted in large part by men who are fitted neither by reading nor by experience to speak as experts, and whose debates are therefore more heated than wise. No doubt it is possible to cite cases in which serious harm has been done by dragging universities and teachers into the public arena to be assailed by those who were quite incompetent to pass judgment on the question at issue, or were disposed to display their gladiatorial skill simply from the malignant ambition to pull prominent men down from honorable positions, and to cater to that base but too common desire to see them bespattered with abuse.

But, after all, while temporary harm and, in some cases, injustice to worthy persons has resulted from this exposed and open life of the State university, yet I believe that on the whole the university, like the general administration of the State, is the better and not the worse for being to some extent the subject of public discussion. It is thus made known to the whole State. The citizens learn that they have a responsibility and an interest in it. They can not be expected to bear taxation for its support unless its purpose and its management commend themselves to their favor. And therefore the more frankly and fully its life is laid bare to the people the better. The thing it has most to fear is misrepresentation. Under the fire of criticism and public discussion the State universities have, with some interruption, pretty steadily gained, and as a class are more vigorous to-day than they have ever been before.

Third. The State universities have had to contend with a more or less widespread impression that the conditions of their life are to some extent unfriendly to the development of a religious character in the students. Not a few men, speaking in the interests of denominational colleges, have displayed a pretty active zeal in disseminating this impression. The majority of those who desire a collegiate education for their children prefer to have them surrounded by influences which are helpful rather than hurtful to their religious life. The belief that such a life is discouraged rather than encouraged at any college would be an obstacle to its prosperity.

If a State university were open to this charge, it must be from one or both of two causes. It might be so because the regents took action which justified the charge, or because the faculties were made up of irreverent men, or from both these causes combined. It is said that there is nothing in the constitution of a State university to prevent filling the board of regents with irreligious or even vicious men. Sticking to the letter of the law, this is true. Sticking to the letter of the law, it is equally true that there is nothing to prevent us from filling the judicial bench with rascals. But, in fact, under the actual working of our laws, we do elect or appoint to the honorable and generally unrequited post of regents men who fairly represent the better sentiment of the State in regard to morals and religion, just as we do generally elect to the bench men fairly representing the higher stratum of character and talent of the bar.

The public sentiment of all our States is friendly to virtue and religion, and desires the cultivation of them in the young in a reasonable and catholic way, and it will not long sustain in power as a guardian of our schools of learning those who are actively opposed to this sentiment.

As to the faculties, it may be said without fear of contradiction that they are, as a rule, composed of men of exemplary life and of reverent spirit. Men of a different make do not generally incline to teaching as a permanent calling. If they do, they are rarely chosen to professorships in our higher institutions of learning. A large proportion of the teachers in the State universities with which I am familiar, as in all other American colleges and universities, are always actively engaged in work in church and Sunday school and in the religious meetings of students. I know of no kind of legitimate religious influence exercised on students by professors in any college which devout professors in our State universities may not and do not exercise, unless an exception be made in respect to religious services which students are in some colleges compelled to attend. And in my opinion the compulsory attendance on such services of students as old as those usually found in our State universities is of very questionable spiritual benefit.

It is, however, true that denominational colleges have one advantage over State universities in attracting religious students, particularly those who intend to study for the ministry. These colleges are generally furnished with scholarships endowed for the special benefit of such students. And, furthermore, those devout people who have a particular interest in the college controlled by their denominations are active in impressing candidates for the ministry of their communion with the belief that it is their duty to attend that college rather than the unsectarian university. These are, I think, the main reasons why the State universities do not furnish so large a relative number of graduates to the ministry as the denominational colleges, though they do compare favorably in this regard with some of the larger Eastern institutions, as, for instance, Yale and Harvard.

But with regard to the whole subject of the religious influences in and about the State university, I think it is time a frank and honest word was spoken to Christian men. All institutions of whatever kind are in the end controlled and managed by the persons who are interested in them and who take pains to shape their policy. If all men who have at heart the dissemination of wholesome religious influences in the State hold themselves aloof from the State universities and content themselves with criticising them, it may fairly be expected that the control of them will fall into the hands of men of different views. No one can reasonably doubt that the State universities are here to stay, for good or for ill. In accepting the United States grants of land for the maintenance of the university, each State has in reality bound itself to support such an institution. However, the States in addition have invested so much money in the plant, and so strong a sentiment in favor of the universities has been created, that they are certain to continue in some form.

Is it not, then, the part of common sense for all the good men of the State, however interested any of them may be in the support of other colleges, to exercise their legitimate influence as citizens in determining the policy of the university? In this prosperous State, whose future greatness is assured, it is certain that whatever your denominational colleges may do there will be work enough for the university to do—much of it work which the colleges are not likely to be able to do. See to it, citizens of the State, that the university is sustained by the sympathetic and active interest of all good men.

Fourth. The State universities have suffered from a certain instability of plan and purpose. This has resulted in part, as in the case of many independent agricultural colleges, from our inexperience in conducting such institutions. But it has also sometimes happened because one legislature has given the means to establish some department or some kind of work and the next legislature has failed to continue the needed appropriations. This uncertainty of plan is greatly to be deplored. It shakes the confidence of the students and of the public in the wisdom of the administration. It creates in the teachers a kind of solicitude

which is in a high degree detrimental to their work. We have now had experience enough so that we ought to be fairly agreed on what is the proper scope of the work of the university. We should be careful in filling out the broadest plan to undertake no department or work until there is a high probability that the time is ripe for it, and that it can have a permanent support if it proves successful. One legislature, of course, can not bind its successor to continue its appropriations. But the public mind may come to be as well settled, and in some States it is as well settled, concerning the necessity of continuing certain kinds of university work as it is concerning the necessity of continuing the maintenance of prisons and asylums. And certainly a legislature may not ruthlessly check the development of a department which has been begun in good faith by its predecessor and which is achieving good results. Still I fear that this danger can not be wholly escaped whenever a university is dependent on appropriations renewed annually or biennially by legislatures. But it is well enough to speak plainly on this subject and to remind legislatures that this instability of plan is a real and serious misfortune. The best plan to be devised for securing this stability of support is the enactment of a law providing for a tax of a fraction of a mill upon the property of the State. Experience shows that this tax law is not likely to be repealed, and of course the sum increases as the State grows wealthy, and so keeps pace in some degree with the increasing needs of a growing and prosperous university. Laws of this kind are now in force in Ohio, Michigan, Wisconsin, Minnesota, Nebraska, Colorado, and California.

We have thus considered, and with the utmost frankness, some of the chief difficulties which have thus far beset the path of the State universities.

Let us now consider some of the advantages which have accrued to State universities and to the public from their peculiar organization.

First. Most of these universities have saved to one, if not to two, generations the advantages of such an education as would otherwise not have been within their reach. The settlers of these Western States were poor, but generally intelligent and fairly educated. Not a few of them were graduates of colleges. They appreciated the value of advanced education. They desired it for their children; but they had not the means to send their children to the East or to found and maintain well-equipped colleges at home. The national endowment, however, supplemented in some cases by gifts of land by the States, sufficed for the founding of institutions and for the development of them within a few years to a strength which no college dependent on private benefactions could have reached for many years. But for the State universities, their children, and perhaps their children's children, would have looked in vain for the help of a college furnished for the excellent and varied work now done in this and other similar institutions. They have thus enabled the poor to gain an education, and in the days when these new States have greatly needed educated men. The few rich men could easily have sent their sons and daughters to Eastern colleges. It was of comparatively little consequence to their children whether the State provided a scheme for higher education. But it was of the first consequence to the children of the hardy settler who was rescuing a farm from the wilderness or the prairie. And it was of even greater consequence to the State that its population was not divided sharply into two classes—the men rich and educated and the men poor and ignorant. Wherever such a division exists you have all the elements of discord, strife, and civil war; but give the poor boy with brains and character education as good as the rich boy can have, and you need not fear an undue ascendancy of the rich. The chances are, as all history shows, that the poor boy, the son of the day laborer or of the washerwoman, will take the precedence of the rich boy, whether in church or in state. If the contrary is the fact in any case, the rich boy deserves to lead, and his leadership causes no heartburnings or conflict.

Second. The State university crowns and completes the public school system, and, by strengthening it, blesses the State. It is constantly exerting an inspiring and lifting power on the public schools. It does this by furnishing competent teachers for the high schools. It is a maxim of experienced educators that a teacher ought to have received a more advanced education than is given in the school which he teaches. Those high schools which have relied simply on their own graduates for teachers have made a grave mistake. Such teachers can not, as a rule, bring to the school the stimulus which a competent college graduate can impart. The State universities in most of the Western States have naturally come into a closer, more nearly organic relation with the schools than the denominational college can establish. In this State and elsewhere the university has established relations with the high schools most fruitful of good to the schools, as well as to the university. The schools have been incited and helped to larger and better work. A virtual unity in the State educational system has been secured. The power of this unity is felt by the youngest and humblest scholar in the most primary school in the State. Every child, even the poorest, knows that this generous State has opened and made clear and easy to him the way from the modest schoolhouse to and through the university.

Who can say in how many souls this knowledge is to-day kindling an ambition and molding a purpose which shall give you gifted leaders in every branch of human activity? For, thank God, this gift of genius is bestowed with no partial hand. It is as likely to be found in the hut of sods as in the marble palace. And when with your lower schools you have kindled in the heart of a child the unquenchable flame of a worthy ambition for larger and richer intellectual culture, are we to starve his soul on the meager fare of the common school? Will we say, "Thus far shalt thou go in this divine quest after knowledge, but no farther?" If you are thus to tantalize him, if you are thus to fire his holy passion and then furnish him no means of gratifying it, one might almost say that you had better never made him conscious of the illimitable powers within him. At any rate, you can do nothing nobler, nothing more justifiable on the grounds of regard for the public good, nothing which will prove more beneficial to your State, than to introduce him to the treasures, the stimulation, the inspiration of a university like this. To reap the fullest benefits from its common schools, the State should crown them with the university, and give a unity and completeness to the whole educational system. The public schools find their logical sequence in the university.

Really, the same arguments which justify the maintenance of the public high school justify the public support of the university. The line which divides them is constantly changing. The high school to-day teaches branches which the university taught yesterday. Hardly anyone now advocates limiting public education to the elementary branches. All recognize the fact that society must have a large number of men and women whose education has been carried far beyond those branches. When society has furnished such persons with this advanced education, society reaps the benefits quite as fully as they. The advantages of such education can not be confined to the possessors of it. The teacher and the physician bless others by their labors even more than they reward themselves. Those who have gone forth from these halls are returning to the State far more than what their education has cost the State by their active and intelligent lives, by becoming centers of intellectual light and stimulus in various parts of the State, by their influence in helping to shape a sound public opinion, by their sympathetic support of public schools, and by all the thousand ways in which a person of cultivation and character blesses the community of which he is a part.

Third. The State university, with its comparatively ample resources, has not only furnished a good college education at an earlier date than it would otherwise

have been secured in most of our Western States, but it has furnished a greater variety of instruction in the collegiate department, and has also afforded instruction in technical and professional studies. Most of the Western colleges, not sustained by the State, have been compelled by their narrow means to do their work with small and overtaxed faculties, and to restrict the range and variety of their work more than they could have desired. The larger endowments of the State universities have enabled most of them to make more generous provision for teaching than those colleges, to employ a larger corps of well-trained instructors, to furnish better laboratories and apparatus for teaching science by the most approved modern methods, to give instruction in engineering and in other applications of science to the arts, and in several cases to establish schools of law, medicine, pharmacy, and agriculture. They have thus brought within reach of all the citizens of the State, at a nominal cost to them, every kind of higher education, except theology, which is required for the best civilization of the age. They have stimulated the other colleges and every kind of institution of learning to a higher standard of attainment than they would otherwise have reached. In cooperation with our excellent public school system they have almost entirely saved the West from that wretched sham which long afflicted the East, the so-called female seminary, which gave girls the only chance they had for education, but which in so many cases gave only the thinnest veneer of an education.

In view of what has been accomplished by the State universities in their comparatively brief history, and of their promise of much larger usefulness in the future, have we any words but words of commendation for the wise and good men who, in laying the foundation of these new States, made generous and farsighted provision for the substantially free education of every boy and every girl, not only in the common school, but also in the university? The generations shall rise up and call them blessed. The States which find in every hamlet and on so many farms men and women with minds trained for the most intelligent discharge of every duty of life and for fulfilling with wisdom all the responsibilities of citizenship, will ever gratefully remember that through the provision of the fathers they have come to realize the platonic ideal of States, in which philosophers are kings. Not wells flowing with oil, nor mines teeming with silver and gold, nor plains covered with flocks and herds so enrich a State as noble men and women, equipped by training and culture to meet all the demands and high opportunities of our Christian civilization. That the State university is helping in a conspicuous degree to make her sons and daughters such men and such women must be its abiding glory, of which it can not be robbed.

Fourth. Even an institution which is rendering so great and useful a service as the State university can succeed in its beneficent work only in case the conditions of success are furnished. It has certain inevitable needs which must be supplied. Let us see what its principal needs are.

(1) Its affairs must be well administered by its board of curators, its chief executive officer, and its faculties. This may seem a commonplace remark. But an explanation of it will relieve it of its commonplace aspect. I mean to say that the proper administration of a university is a profession, a special business, which calls for experience and certain peculiar gifts in the administrators, and especially in the executive. The administration of the old typical colleges was comparatively simple. The curriculum of study was stereotyped. The faculty was small. The income needed was not large. The public, regarding it as something if not sacred yet mysterious to them and concerning them but little, never ventured to criticise any of its methods or its general policy. In fact, they gave very little thought to it. Almost any clergyman who could make a good appearance in the pulpit of his denomination and teach from text-books the elements of intellectual and moral

philosophy could fill the presidency acceptably. The trustees were seen at the college only during the crowded hours of the commencement season, and their business was usually performed in the most perfunctory way.

How different is the case with the State university, and, indeed, with many universities to-day. The courses of study are varied and manifold. They require large faculties and costly appliances. The annual expenditures are many times those of the college of other days. Not only must collegiate education be furnished by the university, but, in most cases, technical and professional training. Since it is under the control and dependent, in some degree, on the appropriations of the State, it is at once the pleasure and the duty of its officers to lay its affairs open to the public and to take all proper measures to keep the public acquainted with its operations. It must invite inspection and challenge criticism. It must be ready at all times to justify its policy before the people. Its curators, therefore, can not well be so neglectful of their duties as many college trustees permit themselves to be. They should keenly feel themselves responsible to the public for the manner in which they execute their trust. They should have meetings frequently enough to understand the affairs of the university and to decide upon the scope of its work and its general policy. They may safely leave, and practically they must leave, the details of the work inside the university to the faculties, reserving to themselves, of course, the right of ultimate control. Considering that they have generally been men who have engrossing business pursuits or heavy professional cares of their own, and that their labors as regents have been unrequited save by their consciousness of useful service, it must be admitted that they have for the most part been very faithful to their duties.

(2) It is in the highest degree desirable that the State university should, so far as possible, be understood and appreciated by the people of the State. To accomplish this is not easy. The proportion of the citizens of any State who can pursue their studies at any university or college is so small, the number of them who can ever even visit its buildings and grounds is so limited that it is very difficult to give to the great masses of the people an accurate idea of the precise nature of the work done at the university, much more of the method and spirit in which it is done. There is, therefore, a not unnatural tendency on the part of some to suppose that the university is a sort of aristocratic institution, intended to confer special privileges on a chosen few, and that it is conducted with extravagance. No pains should be spared by curators, teachers, and students to correct erroneous impressions on this point. By speech, by official reports, by the aid of the press, the indisputable facts should be made known that the overwhelming majority of the students in every one of these institutions are the children of parents who are poor or of very moderate means; that a very large proportion have saved by hard toil and by heroic self-denial the amount needed to maintain themselves in the most frugal manner during their university course, and that, so far from being an aristocratic institution, there is no more truly democratic institution in the world than the university; none in which wealth and birth pass for so little, and brains and character for so much.

So far as practicable, without neglect of their classes, the university teachers should improve such opportunities as offer to address the people of the State, especially upon educational, scientific, and literary themes, to manifest their interest in the public schools, and to show the people in every proper way that it is their interests which the university and all connected with it desire to subserve. I deem it of great consequence that the financial conduct of the institution should, with the utmost frankness, be made known to the State by publishing official reports. The more thoroughly people come to feel that the State university is their university, sustained in large part by their money, and for the benefit of

their children, and through these children for the benefit of the State, and that it is economically administered, the more strong and secure is the life of the university.

(3) The university needs, as a condition of success, that provision should be made for its growth and development. In this prosperous Western life, which increases wealth and population at so rapid a pace, the demands of the State university must constantly and rapidly increase. In these circumstances, for the university to stop growing is to begin to die. If it is not continually enlarging its facilities for instruction and improving its methods, so as to keep abreast of other first-rate universities in the qualities of its work, then it is relatively, if not absolutely, going behind, and bringing discredit on itself and on the State. If the State is not merely willing that it should grow, but, if still further it is not proud that it should grow, then the State had better kill it at once. Instant death is greatly to be preferred to death by starvation or torture. Men of high worth and noble spirit will not long work in an institution which is forbidden to grow and improve. If it is to have a wholesome growth, it must be conducted on some well-considered plan. It must be so supported and administered as to have a certain steadiness of life. Its abler teachers, whose ability and reputation give it a name, should be so compensated, and should be so sustained by the governing board and by the public, as to have comfort and a sense of security in their positions. It can not be too emphatically declared that it is not fine buildings nor great colleges that make a university, but gifted and learned men, endowed with the power and fired with the love of teaching and inspiring their pupils. If these can be retained on conditions which allow them to be reasonably free from solicitude, to enjoy intellectual independence, and to throw their whole energy and enthusiasm into their work students will flock to their rooms, sit delighted at their feet, and catch their spirit of scholarship and industry. And wherever you have great teachers and enthusiastic students you have a university, even though they dwell in log cabins, and teach and study upon the open prairie.

Nor should it be forgotten by any of us, especially should it not be forgotten by the students themselves, how largely the growth and prosperity of a university are dependent on the students. The regents and the faculties do not make a university. The regents, the teachers, and the students make a university. It is of the first consequence that the students appreciate the responsibility which rests on them in making a good name for the university and in promoting its prosperity. Nor are they generally delinquent in this regard. If occasionally they are tempted into youthful indiscretions, or if, with that affectation of cynicism which sometimes appears with the first sprouting of the beard, they indulge in overwise criticism of their elders, yet, as a rule, with a beautiful enthusiasm they sound abroad the praises of their favorite teachers, stand loyally by the colors of their institution in the face of all opponents, and gladly do what they may for its honor and glory. This comes, perhaps, generally from a wholesome and hearty impulse rather than from a consciousness of the power they really have to commend the university in all parts of the State, and so to build it up. The ardent affection of the graduates of a university is a richer treasure than the uncounted gold of a stranger. Who so well as these students that I see before me can perform that needed work of which I have before spoken, of making this university understood and appreciated by the thousands who can never see its real life. As the years go on, the students who have dwelt in these halls will be found in every city and town and hamlet and rural district in the State. If everywhere they shall have some good word for the dear mother, there will soon exist everywhere that public pride in the university which is the best guaranty that it shall have the means of healthy growth.

Fifth. Does not this study of the difficulties, the advantages, and the needs of the State university inspire us with hope for its future? The difficulties are not

insuperable, the advantages are positive and great, the needs can for the most part be readily supplied in these prosperous Western States. Each of these States has the territory and the resources of a European kingdom. There should be in each at least one vigorous university. Germany has one for each 2,000,000 inhabitants. Most of these States will at no distant day each have more inhabitants than that number. Some of them have more already. Can anyone who measures the strength the State universities have already attained cherish a doubt that the one great university in each one of these States, if there is to be one great university in each, will be the State university? Then the State in its legislation and the university in shaping its development should lay their plans in view of this fact.

Think of what a future this State may have before it. In area she is larger than England and Wales, and more than twice as large as Scotland. The population is about half larger than that of the Kingdom of Denmark. Lying in the very heart of the continent, favored with a matchless climate, watered by the two great rivers of the continent, teeming with agricultural, mining, and manufacturing resources, which can hardly be measured, with the amplest communications by river and by rail for the transportation of her abundant products to the markets of the world; with a population drawn from the choicest stocks of other States and of the Old World, a population abounding in energy, lofty in character, with a history lustrous with the achievements of men renowned in every honorable vocation, what elements of an imperial State, what assurance of a brilliant future are wanting to her? But with all these advantages, one thing she must make sure of, or they will prove powerless to retain for her that commanding position she has long held, and which you are hoping and predicting she will continue to hold. That one thing is a goodly number of men trained by the best education which the age can furnish them for leadership in all departments of human activity, for eminence in all branches of civic life. In the hot competition of these times those communities and States which produce the best intelligence and the loftiest character will press to the front. The whole nation is looking to the West, which is marching to the front with such tremendous strides, to wield the preponderating influence in guiding our national affairs and shaping our national destiny. But the West can not win this high honor, and does not deserve it, unless, while abounding in natural prosperity, she can rear generations of broad-minded, thoroughly-trained, high-souled men to speak and act for her in all posts of responsibility in the hour of the nation's need. In this great work may this State and her university do their full part.

---

## XXI. THE SCHOOL SYSTEM OF CUBA.

Communication of "A. G. R." to the New York Evening Post of March 13, 1899.

RESULT OF AN INSPECTION OF THE MATANZAS DISTRICT. CHARACTERISTICS OF THE SCHOOLS UNDER SPANISH RULE. BRIGHTNESS OF THE PUPILS. RECOMMENDATIONS.

MATANZAS, *March 4.*

Through the courtesy of Maj. Gen. James H. Wilson, commanding the district of Matanzas, I am enabled to give the following review of a report made to him regarding the educational system in the province of Matanzas and the facilities provided for the instruction of the children of the district. The report was submitted by Maj. Eli D. Hoyle, chief ordnance officer on General Wilson's staff. A better appointment for the work could hardly have been made. Major Hoyle combines a broadly developed faculty of close observation with the training of

West Point and long service in the regular army, during a part of which time he has filled the post of military instructor. His work of inspection and investigation of Cuban schools has been admirably done, and his report bears the unmistakable marks of both breadth and thoroughness. As the same general conditions obtain throughout the island, the features of this report may be taken as distinctive and applicable to the whole territory.

Ten days were devoted to the inspections. Major Hoyle was greatly assisted in his work by Señor Claudio Dumas, the principal of the High School in Matanzas City, and by Señor Pablo Llorach, a merchant of the same city. Señor Dumas is a gentleman of education and cultivation, who has traveled extensively in the United States and in Europe, making a specialty of the study of educational methods. His time, his strength, and his limited means have been unstintingly devoted to the education of the children of Cuba. Mr. Llorach is a Matanzas business man, who has had the advantage of an education in New York. The two investigated not only the schools of this city, but those of the country districts as well. From lack of space I am obliged to omit much that I should gladly include. Major Hoyle finds as follows:

*Organization.*—As organized under the Spanish laws, the public schools of Cuba are divided into two classes, the superior and the elementary. The elementary are divided into four classes, the first, second, third, and a very elementary group denominated "incomplete," and intended for small rural communities. The law of 1880 governing public instruction has been so modified by royal decrees and by regulations that the whole matter is complicated, difficult to understand, and much more difficult to execute. There is, in fact, no difference between the four classes of elementary schools. Much time and attention have been given to instruction in religion and sacred history, and no free thought in religious matters has been permitted.

*Attendance.*—Under the law, attendance was compulsory for children between the ages of six and nine, inclusive, but the law was never strictly enforced at any time. After the beginning of the insurrection it would have been impossible to enforce it on account of the poverty of the people, and the consequent lack of clothing, shoes, and even of food for the children. A Spanish regulation made obligatory the wearing of shoes at school, and this, as much as anything else, decreased attendance. The law was not enforced, and it is the fact that some children did attend who were destitute of foot covering, while others were provided with such crude substitutes as became possible for them. The deterring agent appears to have been less in the law than in the matter of personal pride. Shoe wearing became a matter of social caste, and pride and caste are an inherent trait of the race. Notwithstanding the law, school attendance in its operation is purely voluntary, even as to hours of appearance. Children seem to come and go pretty much as they please. The hours are generally from 9 a. m. until 3 p. m., with intermissions for recreation and for the customary midday breakfast. In some cases the schools begin at 7 a. m., and in some cases they close at 4 p. m. The laws recognize no distinction between white and black children, but unwritten social laws do have some measure of influence in that department.

A recent house-to-house census, made under the auspices of Professor Dumas, determined the number of school children in the city of Matanzas as 8,144. This included all between the ages of 7 and 18 years. Of these, 926, or less than 12 per cent, were on the rolls. Only 474, or less than 6 per cent, were in attendance. The largest number found in any one school was 56, and the smallest 7. Five hundred and forty-nine, including 21 colored, were found to attend private schools.

*School buildings.*—There are no public-school buildings. The structures commonly used for the purpose are private residences, occupied in part by the teacher

as a domicile. This often leads to an undue cramping of the space occupied for school purposes and can only result in inadequacy and limitation.

*Teachers.*—The high school (*escuela superior*) is an institution for boys only. It is provided with a principal and an assistant. The elementary schools have each one teacher, regardless of the number of pupils. The sexes are always separated, the boys' school (*escuela de niños*) being always in charge of a male teacher, and the girls' school (*escuela de niñas*), in its distinct building, always in charge of a female teacher. (How far this obtains throughout the rural district, I am unable to say, though I do not recall a single instance in which a mixed school was indicated.—A. G. R.)

School-teachers were appointed by the central authority at Habana, generally through favoritism, and with very little regard to qualification, though passing a nominal examination for fitness. This resulted in a frequent placing of Spanish teachers among children with whom they had little sympathy, and in magnifying the importance and the prominence of Spain in the instruction given. Teachers were paid a stated salary, and a fixed allowance was made them for house rent and stationery.

High praise is due to many of these teachers, who, amid hardships almost beyond belief, have kept the schools open during the years of the war, and have pursued their unselfish work with a devotion so rare as to deserve the admiration of the whole world. These teachers have received no pay whatever in many months. Their salaries are in arrears for periods varying from eighteen months to three years. They have pledged their personal credit for materials necessary for the schools, and in many cases it is not easy to see how they have obtained even their own daily bread.

*Furniture and text-books.*—The furniture of these schools is most meager and uncomfortable. It usually consists of long wooden benches, usually without backs, placed behind rude desks. The schools are generally provided with blackboards and maps of Spain and Cuba. A few had maps of the world and diagrams for explaining the metric system of weights and measures, simple geometric figures, etc. Text-books were those prescribed by the Spanish Government. They were deficient in number, of various editions, and many of them were old and worn by service.

*Punishment.*—As a rule no punishment was inflicted. This was because it was not often merited. The punishment which was given was of a mild type. The children are orderly, amenable to the discipline imposed upon them, and ambitious to learn.

*Instruction.*—In the elementary schools instruction is limited to reading, writing, and arithmetic for the majority, with geography, grammar, linear drawing, and the metric system for more advanced pupils. The children read fairly well, and their writing is unusually good. Irregular attendance was shown by some large children who knew very little, while some of the smaller ones were well advanced. The general system which is employed is antiquated. Instruction in arithmetic is especially poor. Mental arithmetic is but little practiced, and pupils generally follow purely mechanical methods. The fault lies in the instruction, for the children are remarkably apt and alert mentally. The girls are carefully instructed in needlework, Saturday being usually devoted to that branch. Some beautiful specimens of embroidery, drawn-thread work, and plain sewing were exhibited. Even the little ones are skillful with thimble and needle. Calisthenics is no part of the established school programme, but a few progressive teachers have taught a few simple movements with good results, and to the evident enjoyment of the boys.

*Medical inspection.*—Medical inspection for the prevention of the spread of contagious disease seems unknown. Cases of mumps and of itch were encountered

in schoolrooms. A teacher stated that during his thirty years of service in the schools no medical inspection had ever been made, and that no inspection of any kind had been made within the last ten years.

*Characteristics of children.*—The children of the public schools are decidedly quick and intelligent. They are docile, obedient, and ambitious, both to learn and to show their learning. They are greatly influenced by the capacity and the personality of their teachers, and a good teacher means a good school. On the whole, the material is promising, and these children give hope for the future of the island.

In the foregoing review of Major Hoyle's statements of the educational conditions I have sought as far as possible to confine myself to his expressions, and have, I believe, confined myself entirely to his views. My own more limited observation supports his experience in every particular. In the course of his comments Major Hoyle made one significant statement. "It is claimed," he said, "that the Spanish Government desired only a show of education, a system on paper; that useless restrictions were imposed; the attendance of children was discouraged; and that the schools and the teachers were continually subjected to neglect. What I saw lends color to this claim." Major Hoyle states his conviction that anything like violent changes in the school system of Cuba should be avoided in order to allow the people to adjust themselves by degrees to modern conditions. His idea is that change should come through a process of evolution which should be made as speedy as possible with due regard given to effectiveness. To that end he makes the following suggestions, which might well be immediately adopted, provided funds were obtainable for their prosecution:

(1) The location of the schools in city wards and in rural communities according to population, and in the best buildings obtainable until proper school buildings can be constructed.

(2) Abolition of small schools, below 25 pupils, where possible, and the making of the schools as large as will be permitted by the buildings selected.

(3) Mental, physical, and professional examination for teachers, with moral character as a *sine qua non*.

(4) The appointment of a superintendent of schools in each district, whose duty it shall be to direct and supervise the instruction and constantly to visit and inspect the schools in his department.

(5) The establishment of high schools for girls (there being none at the present time) for the encouragement of a much-needed higher education for women.

(6) The appointment of school boards, to consist of five members of the town councils, whose duty it shall be to examine teachers for fitness, and to appoint and assign them; to secure buildings for school purposes; to provide furniture, stationery, etc., and, in short, to manage all the business affairs of the schools. The question of attendance should be left to the discretion of the board, and should lead gradually to compulsory attendance.

It will be noticed that all these suggestions are purely elementary. Their most interesting feature lies in the fact that, in spite of their simplicity and their purely elementary character, no one of them has received the slightest recognition under the Spanish system.

## XXII.—MATERIAL PROGRESS IN MEXICO.

[Extracts from message of President Diaz, September 16, 1899.]

## MINING MATTERS.

The progress of mining may be appreciated by the number of new mining properties that have been acquired under the law on the subject. From July, 1892, up to the present date 10,099 titles, covering 86,426 "pertenencias" of one hectare, have been issued. The constant increase in the exportation of metals and ores of all kinds also affords the measure of the increase of the output. During the last fiscal year the exportation of mineral products, metallic and nonmetallic, was valued at \$95,273,000, showing an increase of \$3,835,000 over the exportation of the previous year. The increase in the exportation of gold, which exceeded by \$2,633,000 the exportation of the previous year, is to be noted; and the same observation applies on a lesser scale to copper, lead, and antimony. The exploitation of copper mines is progressing, concessions for the operation of deposits of that metal having been applied for for the first time in the State of Colima.

The discovery of gold placers at a place called Santa Clara, in Lower California, aroused great interest both in this country and abroad, and attracted to the placers a considerable number of people, both miners and merchants. This gathering of miners and the nature of the placers required the establishment at that point of a new mining agency, the sending thither of an inspecting engineer, and the taking of certain measures which, while facilitating the exploitation of the placers, might prevent the disorders which are so frequent in such cases. With the same object in view, steps were taken by the war, finance, and interior departments, respectively, but as it has turned out that there is little gold at the placers and that living is very dear there, the greater part of the people who went there have departed again, and operations have subsided to the scale prevailing in other placers in the territory.

## PUBLIC LANDS.

During the period that has elapsed since my last report 289,995 hectares of land have been converted into private property, either by grants of vacant lands, the sale of national lands to private individuals and colonists, free grants to poor farmers, compositions, and disclaimers as to the existence of vacant lands during the revision of title deeds. These transfers have been attended with the cancellation of \$164,565 in securities of the public debt. The constant conversion of national lands into private property and the confirmation of titles that are more or less ancient, subject to the liberal provisions of existing legislation, as well as the improvement in methods of cultivation and concessions of water rights for irrigation purposes, have all been attended with a noteworthy progress in agriculture, the increase in agricultural production being evinced by the corresponding increase in exportation. During the last fiscal year vegetable and animal products were exported to the value of \$49,500,000 in round numbers, showing an increase of \$6,000,000 as compared with the exportations in the previous fiscal year.

## ELECTRICAL MANUFACTURING PLANTS.

The manufacturing industries also give evidence of noteworthy progress, the following plants, which have been erected under concessions from the Federal Government for the utilization of water powers, being especially entitled to mention on account of their evident importance. The Industrial Company of

Vera Cruz erected a dam on the Rio Blanco in order to utilize a volume of water which, under a suitable elevation, produces 1,500 horsepower, consumed in the spinning and weaving factory of Santa Rosa, inaugurated in May of the present year. The Industrial Company of Orizaba constructed another dam on the Tlalpam River with a race of 1,700 meters in length, conveying the water to 4 turbines connected with dynamos, with a head sufficient to develop 2,250 horsepower. The electrical energy thus generated is transmitted along overhead wires to the cotton factory of the Rio Blanco. The San Ildefonso Company has completed all of its waterworks on the Monte Alto River, including an aggregate of 25 kilometers of races, with dams, sluices, and other engineering works of importance. Along the Tlalnepantla River 25 more kilometers of races are nearing completion. The ensemble of these works, with their respective electric plants, will produce an effective energy of 5,500 horsepower, which will be transmitted to this capital, for which purpose the line of posts for the transmitting cable has been completed, and work is in progress upon the receiving station. The above does not include the power that is already utilized in the San Ildefonso woolen factory. In the district of Atlixco, State of Puebla, another company has erected waterworks sufficient to produce 1,125 horsepower, to be utilized in a new spinning and weaving factory. Still another company has completed works on the Cuautitlan River of sufficient magnitude to produce 810 horsepower.

The concerns that have been mentioned have obtained concessions from the Federal Government under the new legislation governing water rights. Other similar undertakings of minor importance and without any special concession are being established at different points of the Republic. The development of the manufacturing industry is also proved by the increasing value of the exportation of manufactured products, amounting in the last fiscal year to more than \$2,600,000, showing an increase of more than \$700,000 over the preceding year. A considerable increase is also observed in the importation of machinery, copper wire, iron, steel, and coal. A corporation has recently been organized in Europe, composed of firms of high standing at Paris, Berlin, and Geneva, to undertake industrial enterprises in the Republic.

#### RAILROADS.

Since last April the railroad system has increased by 210 kilometers. The largest contributions to this increase are the Central's, 37 kilometers, on the branch from Yurecuara to Ario; the Xico and San Rafael Railroad's, 51 kilometers, and the International's, 21 kilometers, approximately, on its Guanacevi branch. The Mexico, Cuernavaca, and Pacific Railroad has been extended to the Mexcala River, and the road from Juile to San Juan Evangelista has been completed. The railroad system now aggregates 13,369 kilometers, including 193 kilometers of private branches connecting with the lines subject to federal jurisdiction, and 432 kilometers of tramways belonging to the States.

On April 29 last the general railway law was promulgated under the authorization granted to the Executive by the law of December 17, 1898.

#### ROADS AND BRIDGES.

The Texapan bridge in the State of Oaxaca has been completed, and thus the road from Chilchotla to San Antonio, a station on the Mexican Southern Railroad, has been completed. The contractor has also completed the Jayamita bridge spanning the Ameca River in Jalisco.

XXIII.—THE COMMITTEE ON THE NATIONAL UNIVERSITY PROJECT.<sup>1</sup>

On November 2 and 3 an important meeting of the National Educational Association's committee to make a thorough inquiry into the plan for a national university was held at Washington. This committee, it will be remembered, was authorized by the National Council of Education in July, 1898, and a report from it is hoped for in July, 1900. Twelve of the 15 members of the committee were present at the meeting recently held, namely: Presidents Harper, of Chicago University (chairman); Eliot, of Harvard; Schurman, of Cornell; Draper, of Illinois; Alderman, of North Carolina, and Wilson, of Washington and Lee; Librarian Canfield, of Columbia University; Dr. J. L. M. Curry, of Washington; Superintendents Maxwell, of New York; Soldan, of St. Louis, and Dougherty, of Peoria, and Professor Butler, of Columbia University. President Angell, of Michigan, and Professor Moses, of California, were unavoidably absent from the meeting, as was Professor James, of Chicago University, who is in Europe.

The committee devoted its first session to listening to the reports on topics previously assigned to some of its members for investigation. The first of these was the careful paper on the constitutionality of a national university by Professor James, which appears in full in this issue of the Review. Then followed short papers on the history of past efforts to establish a national university, by Mr. Canfield; on the bill now being urged upon the Congress by the so-called committee of one hundred, by Professor Butler; on the funds and bequests supposed to be available for a national university, by Professor Butler; on the action taken by the presidents of the land-grant colleges in asking the Government to extend to their students certain facilities at Washington, by President Harper; on existing educational institutions and agencies in Washington, by President Eliot; on the collections and establishments of the Government available for higher instruction and research, by President Eliot; and on the probable attitude of existing universities toward the proposal to establish a national university at Washington, by President Angell.

These reports placed before the committee in concise yet comprehensive form the information necessary to take up intelligently the main question before them. The committee had full and free discussion of the pending scheme and of some more acceptable and practicable method than it appeared to afford of utilizing the resources of the Government at Washington in aid of the higher education of the country. The committee finally agreed unanimously upon the following five propositions, much time and care having been devoted to the formulation of the fourth one:

1. It has been, and is, one of the recognized functions of the Federal Government to encourage and aid, but not to control, the educational instrumentalities of the country.

2. No one of the bills heretofore brought before Congress to provide for the incorporation of a national university at Washington commends itself to this committee as a practicable measure.

3. The Government is not called upon to maintain at the capital a university in the ordinary sense of that term.

4. That a subcommittee be requested to prepare for consideration by the full committee a detailed plan by which students who have taken a baccalaureate degree, or who have had an equivalent training, may have full and systematic advantage of the opportunities for advanced instruction and research which are now or may hereafter be afforded by the Government; such a plan to include the cooperation with the Smithsonian Institution of the universities willing to accept a share of the responsibility incident thereto.

It is understood that the financial administration of this plan should be such

<sup>1</sup>From the Educational Review, December, 1899.

that, whether or not Government aid be given, there shall be no discouragement of private gifts or bequests.

It is understood that the scope of this plan should be indicated by the governmental collections and establishments which are now available, or as they may hereafter be increased or developed by the Government for its own purposes.

5. The Government, through the State Department, might wisely maintain in Washington a school for consuls, analogous to West Point and Annapolis, and, like those schools, leading to a life career in the Government service.

The subcommittee appointed under the fourth proposition consists of President Harper, Dr. Curry, and Professor Butler. A full report is expected from this subcommittee in February, as the full committee adjourned to meet in Chicago at the time of the meeting of the Department of Superintendence.

The fifth proposition, relating to a school for consuls, was referred to a subcommittee consisting of Presidents Wilson and Schurman and Dr. Canfield, who will also report in February.

It will be noticed that the action of the committee looks toward the fullest possible development and utilization of the educational resources of the Government at Washington, but in a manner which will involve the cooperation and support of existing institutions and agencies rather than the erection of a statutory university organized along the familiar university lines, and duplicating, at unnecessary expense, work already in progress in different States throughout the country. That a workable and helpful plan will be developed by the committee along these lines we confidently believe. Such a plan, by avoiding the difficulties and dangers of the scheme for a statutory university, while accomplishing all that is good or useful in that scheme, ought to obtain widespread, if not unanimous, support.

---

#### XXIV.—THE CONSTITUTIONALITY OF A NATIONAL UNIVERSITY.<sup>1</sup>

The chairman of the committee to investigate the project for a national university has requested me to prepare a memorandum upon the constitutional aspects of the plan for a national university to be founded and supported by the Federal Government in the city of Washington.

It is fitting that the question of the constitutionality of such an enterprise should be taken up and discussed first of all, for if upon examination it is the opinion of this committee that such a scheme would be unconstitutional our work would be very simple and limited to the formulation of one of two propositions. We should either recommend to the national council that, inasmuch as the Federal Government has received no authority to establish and maintain a national university, the national council should not lend its support to an attempt to carry out the undertaking, or, in case we become further convinced that such an institution would be desirable, our recommendation would be to the effect that the national council should assist in securing such an amendment to the Constitution as would enable the Federal Government to carry through the enterprise.

Probably the best way to present the subject to this committee is to give a brief account of the history of this project so far as it has involved the discussion of constitutional questions. All parties in the United States agree that the Federal Government is one of limited and delegated powers; that it is in no sense a depository of residual authority, and that it can have no power to establish and maintain a national university unless this power is given to it in the Constitution of the United States. All parties agree that the burden of proof that the pro-

---

<sup>1</sup>A report by Edmund J. James, of the University of Chicago, submitted at Washington, November 2, 1899, to the committee to investigate the project for a national university, appointed by the council of education, National Educational Association.

posed measure is constitutional rests upon the party urging the Federal Government to adopt it.

We can not accept the view, therefore, that such action would be constitutional unless we become convinced that the authority to take it is vested in the Federal Government by the Constitution of the United States. It is plain that no such authority is vested in express terms, as there is no mention made in the body of the Constitution of the subject of a national university, nor indeed of education at all, either elementary, secondary, or higher.

If this power has been vested in the Federal Government by the Constitution, it must therefore be by virtue of some implication contained in the powers which are expressly granted, or because it constitutes an essential or necessary part of some authority which is specifically enumerated, or because it is necessarily bound up in the very idea of a government such as that organized under the Constitution. It must be, to use technical language, either an implied, a resulting, or an implicit power. Under which of these heads such an authority may be placed, if we shall find it to be actually conferred, will appear perhaps most plainly, as suggested above, from an examination of the history of the constitutional discussions relating to this subject.

There seems to have been a general notion abroad in the country during the period preceding the drafting and adoption of the Federal Constitution that the new Federal authority would establish and maintain a national university at its seat of government. The current literature of the time contains many hints and suggestions to this effect, and there seems to have been a generally felt need at that time of some such central and adequately endowed institution in order to supplement the existing educational facilities of the country.

In the constitutional convention itself the project appeared on several different occasions. In Charles Pinckney's draft of the Federal Constitution, submitted to the convention May 29, 1787, a clause was contained in the enumeration of the powers of the new government giving to the Congress the authority "to establish a national university."<sup>1</sup> In James Madison's proposition to confer additional powers upon the Congress, made August 18, 1787, a similar clause was contained.<sup>2</sup>

When the report of the committee on revision came up for discussion on September 14, Madison and Pinckney united in the motion to insert in the amended and revised draft, from which had been dropped their former recommendations, a clause conferring upon the Congress authority to establish a national university.<sup>3</sup> Wilson supported the motion. Gouverneur Morris opposed it on the ground that such a clause was unnecessary, since the power proposed was already included in the grant of exclusive jurisdiction over the seat of government. Four States then voted to insert the clause, six voted against such insertion, and one State was divided.

The proposition to add this authority to the list of enumerated powers in the Constitution was thus rejected, but there was nothing in the minutes of the convention going to show the grounds upon which this rejection was made. Whether it was because the members of the convention were opposed to conferring such an authority upon the Congress, or because they thought it had been conferred by some other clause, and therefore did not need specific enumeration, does not appear.

It is interesting to note, however, that so far as the records of the convention show there was no objection to the principle of the proposition. No one hinted that it was not desirable to vest such a power in the Federal Government or that such an institution was not necessary or expedient.

<sup>1</sup> Journal of the Federal Convention, kept by James Madison, edited by E. H. Scott, Chicago, p. 66.

<sup>2</sup> *Ibid.*, p. 550.

<sup>3</sup> *Ibid.*, p. 727.

The current discussion of the time contains many traces that the view of Gouverneur Morris expressed in the constitutional convention was correct, namely, that the Federal Government had received authority by other clauses than the one proposed to exercise such a function. There seems to have been a sort of general agreement that the new government had the power to establish such an institution if it desired, and there were many who urged the desirability of such an institution upon the attention of Congress and the country.

Washington himself, to whom this project was especially dear, and to whom it grew ever more precious as he approached his end, evidently took it for granted that the authority to establish such an institution had been conferred upon the Federal Government by the Constitution. In his second annual message, dated January 8, 1790, Washington declared that there was nothing which better deserved the patronage of Congress than the promotion of science and literature. He adds: "Whether this desirable object will best be promoted by affording aids to seminaries of learning or by any other expedients will be well worthy of a place in the deliberations of the Legislature."<sup>1</sup>

The Senate, in answer to this address, seemed to accept the view that the Federal Government had the function of promoting literature and science,<sup>2</sup> as did the House in its response to the same address.

By virtue<sup>3</sup> of the authority conferred upon Washington to set aside certain sites for the needed public buildings in the new District of Columbia, he assigned a site of nearly 20 acres for a national university. And in his message to Congress dated December 7, 1796, he urged in strong terms the establishment of a national university. The Senate, in its response, seems to agree that such a step would be wise.

At the same Congress the Federal commissioners appointed to lay out the city of Washington made a report to Congress, in which they urged very strongly the establishment of a national university in the city of Washington, in the District of Columbia, in accordance with Washington's proposal.

That portion of Washington's annual message referring to this subject and the report of the Federal commissioners upon the same topic were referred to a select committee, of which James Madison was the chairman. This committee made a report on December 21, 1796, to the following effect:

*Resolved*, That it is expedient at present that authority should be given as prayed for by said memorial to proper persons to receive and hold in trust pecuniary donations in aid of the appropriations already made toward the establishment of a university within the District of Columbia."<sup>4</sup>

It will be seen from this that the Federal commissioners, while in favor of establishing a national university endowed and supported by the National Government, did not feel that it was entirely wise to make such a recommendation, and proposed, therefore, simply that a charter of incorporation be granted to certain trustees to accept gifts or donations from private parties in furtherance of this purpose.

It will be noted, also, that this resolution speaks of appropriations already made toward such a university, referring doubtless to the lands set aside by the direction of the President for this purpose.

This recommendation of Madison's committee was debated at some length in the House. The friends of the motion urged that they were not asking the approval of the House for a motion looking toward the establishment and maintenance of a national university at Federal expense, but that they were simply

<sup>1</sup> Annals of Congress, First Congress, vol. i, p. 933.

<sup>2</sup> *Ibid.*, p. 936.

<sup>3</sup> *Ibid.*, p. 1052.

<sup>4</sup> American State Papers, Miscellaneous, vol. i, No. 91, p. 153.

asking for the incorporation of a board of trustees who might accept any money which should be given for this purpose. The opponents of the motion emphasized the fact that this would be a mere entering wedge for the establishment of an institution to be supported from the Federal Treasury. Madison himself declared that he would not vote for the report except with the understanding that the institution was not to become a burden on the nation.

It will be seen that this special proposition, therefore, was not for a national university in the sense in which we are using that term in our discussion, but merely for the establishment of an institution under the auspices of the Government, to be supported by private contributions.

Even so, the opposition to the proposition was so great that, after a debate of some two days, action was finally postponed by a majority of one, ostensibly to find out whether the State of Maryland might not grant this charter of incorporation instead of the Federal Government, and the motion was not again brought up.

There is no indication in the record of this debate that such a proposition was considered unconstitutional, at least by any great number of the members. The whole course of the debate went to show that such an institution, owing to the conditions of the time, difficulty of transportation, etc., would be largely a local and not a truly national enterprise, or went to show that education was something which the States ought to look after themselves, and in the support of which they should not be encouraged to expect aid from the National Government.

This action did not deter Washington from still insisting, wherever it was possible, upon the desirability of such an institution nor from his giving a considerable sum for its endowment.

In the following years the intense excitement over international relations, the struggle over the alien and sedition laws, etc., gave rise to keen discussions of constitutional authority, ending with the debates over the Virginia and Kentucky resolutions, in which the whole question of the powers of the National Government over against those of the States was canvassed as never before, and indeed but as few times since in the history of the country.

When Jefferson became President of the United States he urged, in his message of December 2, 1806, that the income from taxes should be rather applied to the great purpose of public education, roads, rivers, canals, etc., than to the reduction of duties on imports and other similar burdens. He adds: "I suppose an amendment to the Constitution necessary, because the objects now mentioned are not among those enumerated in the Constitution." From which it would appear that, in his opinion, the Federal Government did not have authority to establish a national university.

In his message of November 8, 1808, he says, speaking of the surplus funds in the United States treasury: "Shall the revenue be reduced or shall it not rather be appropriated to the improvements of roads and canals, rivers, education, and other foundations of prosperity of the Union under the powers which Congress may already possess, or such amendment to the Constitution as may be approved by the States." It will be remembered, however, that while Jefferson thought that Louisiana could not be purchased, and that money could not be appropriated for internal improvements under the Constitution, yet he not only negotiated the Louisiana purchase, and signed the bill to appropriate money in accordance therewith, but that he also, on March 29, 1806, approved the first Cumberland road bill, which involved the expenditure of money from the United States Treasury for the purpose of carrying out internal improvements within the States.

Madison, in his message of December 5, 1810, recommends "the establishment

of a seminary of learning instituted by the national legislature within the limits of their exclusive jurisdiction, the expense of which might be defrayed out of the vacant grounds which have accrued to the nation within its limits." In other words, he recommends a national university, to be supported, not by appropriations from the Federal Treasury nor by appropriations from the sale of public lands in general belonging to the Government, but by the sale of lands belonging to the Government situated within the District of Columbia.

The committee to whom this part of the President's message was intrusted in the House of Representatives declared in their report that, while Congress might incorporate a private seminary of learning for the benefit of the people of the District of Columbia, it had no authority to appropriate money from the Federal Treasury for its support. "The erection," they declared, "of a university upon the enlarged and magnificent plan which would become the nation is not within the powers confided to Congress." As to Madison's suggestion about the proceeds of vacant lands, they did not believe that such proceeds would amount to enough to make it worth while to start anything upon that basis, even if there were no constitutional impediments. They recommended that no action be taken in regard to the President's proposition relating to a national university.<sup>1</sup>

Madison, however, repeated his recommendation of 1810 in his message of December 5, 1815. A committee was appointed by the House to consider this recommendation, and reported a bill February 20, 1816, for establishing a national university based upon Federal appropriations. The attempt was made to call it up on April 12, but the House then refused to consider it, and on April 27 the bill was indefinitely postponed.

Madison, not deterred by the fate of his previous recommendations, urged this subject in his message of December 3, 1816, upon the attention of Congress in still stronger terms than in his previous message:

"The importance which I have attached to the establishment of a national university within the District of Columbia on the scale and for objects worthy of the American nation induces me to renew my recommendations of it to the favorable consideration of Congress."

The special committee to which this recommendation was referred made a lengthy report to the House December 11, 1816. It took the ground that "the means were ample, the end desirable, and the object fairly within the legislative powers of Congress," and consequently that a national university should be established, and in accordance with that recommendation it reported a bill to establish a university upon the basis of Federal appropriations.<sup>2</sup>

Mr. Atherton proposed, on the next day, December 12, 1816, an amendment to the Constitution conferring on Congress the authority to establish a national university; but the House refused to consider it by a vote of 54 to 56.

Mr. Wilde attempted to have the report of this committee considered by the House, but, failing repeatedly, asked finally for the discharge of the committee on March 3, 1817.

President Monroe, in his first message, December 2, 1817, recommended that Congress propose an amendment to the Constitution whereby it should be authorized to institute seminaries of learning. From which it would appear that, in his opinion, the Constitution conferred no such authority upon the Federal Government.

It was in the same message, however, that he expressed the same opinion in regard to the power of the Federal Government to appropriate money for the carrying out of internal improvements, holding that no such authority existed, and

<sup>1</sup> Annals of Congress, Eleventh Congress, third session, p. 79, February 18, 1818.

<sup>2</sup> Annals of Congress, Sixteenth Congress, second session, p. 258.

that, before such a policy could be adopted, it would be necessary to obtain an amendment to the Constitution authorizing such action.

But President Monroe experienced a change of view on this question, and his message to Congress on internal improvements, submitted May 4, 1822, in connection with his veto of the Cumberland road bill, marked an epoch in the constitutional history of the United States, as it gave us what has turned out to be an authoritative exposition of the meaning of one of the important clauses in the Constitution, and that in a sense different to that adhered to previously by Monroe himself, and by Madison and by Jefferson, and different to that underlying the general theory of the policy of the Government from its foundation; in harmony, on the other hand, with the views of Hamilton and Washington, and with the action of Jefferson himself, of Madison, and of the other Presidents—an exposition which was accepted by John Quincy Adams, by Andrew Jackson, and, generally speaking, accepted and acted upon by every succeeding President. This theory of constitutional interpretation is of especial importance to the subject in hand, since, if it be correct, there can be no doubt whatever of the constitutionality of Federal appropriations to a national university.

In his message<sup>1</sup> Monroe declares that his own opinion as to the power of the Federal Government over appropriations had undergone a profound change, and whereas he had formerly held that the Federal Government might not appropriate money for any other purposes than those specifically enumerated in the Constitution, he had now come to believe that the Federal Constitution in the first clause of section 8 of the first article conferred upon the Federal Government "an unlimited power to raise money, and that in its appropriation Congress has a discretionary power restricted only by the duty to appropriate it for the purposes of common defense, and of general, not local, national, nor State benefit"—in other words, that when the Constitution of the United States vests in Congress the power to lay and collect taxes to provide for the common defense and general welfare, it gives to that body power to raise any sum of money which it chooses, and to devote it to any purpose which in its judgment will promote the general welfare, subject to the limitation that it should be for the general, not the individual, for the national, not local, benefit.

In this message Monroe accepted the doctrine laid down by Alexander Hamilton in his celebrated report on manufactures made to Washington in 1791, "That there seems no room for doubt that whatever concerns the general interests of learning and agriculture, manufactures, and of commerce is within the sphere of the National Council so far as regards the application of money."

This is the only theory upon which all of the items in any of the general appropriation bills passed by the Federal Government from the time of Washington to that of McKinley can be justified.

It is the only theory on which the actions of Jefferson, as distinct from his pronouncements, can find a constitutional basis.

As said above, this doctrine was subsequently accepted, though under protest, by Andrew Jackson, having been fully adopted and acted upon by his predecessor, John Quincy Adams.

This theory of the power of Congress over appropriations has been accepted by the great commentators on the Constitution almost without exception.

Story raises the issue distinctly by asking the question: "May Congress appropriate money for any other purposes than those pointed out in the enumeration of powers?" His answer was yes, and based upon the following three considerations:

First, on the language contained in the first clause of the eighth section of the

<sup>1</sup> Compare *Annals of Congress*, Seventeenth Congress, first session, vol. ii, p. 1810.

first article, which can not receive any reasonable interpretation except in accordance with this view.

Second, on the nature of the power conferred, rendering it highly expedient that such a power should be given to the Federal Government, and indeed making it almost impossible for anyone to organize and administer an efficient central government without such authority.

Third, on account of the early, constant, and decided maintenance of it by the Government and its functionaries, as well as by many of our ablest statesmen from the very commencement of the Constitution.<sup>1</sup>

He then declares (par. 1374) that Congress may appropriate to any purpose which is for the common defense and general welfare.

This view was followed by Kent in his great commentaries.<sup>2</sup>

One of the most recent and one of the greatest commentators on the Constitution, Judge Hare, takes the same view.<sup>3</sup> He calls attention to a very interesting feature of this whole discussion, namely, that, owing to the principles of our constitutional law, it is almost impossible for the courts of the United States to decide this question, since it is primarily a question for the Legislature and not for the courts. He speaks of Monroe's recantation, contained in the message above referred to (p. 245), and says that it was, like that of Madison's of the earlier date, "a virtual adoption of the Hamiltonian theory, that the power of the Congress over the Treasury is in effect absolute as to the appropriation of money for any object which in their judgment will conduce to the defense of the country or promote its welfare. Such, in fact, has been the practice since the Government went into operation, and the right can scarcely be questioned in the face of a usage which will soon extend through an entire century."

It would thus seem to be as well established as any constitutional doctrine can be that the Federal Government of the United States may appropriate money to any amount for any object which in its judgment will conduce to the common defense and will promote the general welfare.

Surely under this head may be brought appropriations for a national university at the seat of government. The argument has sometimes also been advanced that the Federal Government might establish a national university under the authority given in the preamble, which declares that one of the purposes of ordaining the Constitution of the United States was the promotion of the general welfare. This argument deserves little attention, and would not be mentioned by your reporter if it were not that one finds it oftentimes urged in support of this and other measures in the current literature of the time. Such an argument certainly deserves little consideration. In the first place the preamble is a mere introduction to the Constitution and does not confer any authority whatever. It simply enumerates certain purposes for which the powers subsequently conferred by the Constitution were vested in the Federal Government. In the second place, such an argument leads to a *reductio ad absurdum*, since if the Federal Government receives from the preamble authority to promote the general welfare in any way which may seem to it good the whole idea of a limited or delegated government becomes baseless. The other provisions of the Constitution which vest authority, which enumerate powers, are idle and meaningless.

Two other arguments in favor of the constitutionality of a national university deserve, however, a brief mention.

It is claimed, namely, that the Federal Government has received power by the Constitution to establish and maintain a civil service, exactly as it has authority to

<sup>1</sup> Story: Commentaries on the Constitution of the United States, 2d edition, Boston, 1851, paragraph 977.

<sup>2</sup> Commentaries on American Law, by James Kent, Boston, 1884, 13th edition, vol. i, p. 268.

<sup>3</sup> American Constitutional Law, J. Clark Hare, 1899, 2 vols.

establish and maintain a military and naval service, and that it has the implied authority to establish a civil-service academy exactly as it has established a Military and a Naval Academy; and if it has authority to do all this, it alone, under the generally accepted principles of constitutional interpretation, is to be the judge of what is an adequate civil-service academy and what is necessary to the establishment and equipment of such an institution.

Now, a proper training of men for the civil service, at least for all the higher branches of the civil service, is a training in the sciences underlying the functions of such positions, and the best training in such sciences can be afforded in the modern world through the medium of a properly equipped and properly managed university.

This is recognized, for example, in Germany, where the universities are declared by law to be primarily academies for the preparation of men for the civil service of the country, and to a smaller degree in England, where attendance at the university is a prescribed condition for admission to certain examinations in the civil-service department.

There is certainly much cogency in this argument, and it is difficult to refute it by any other argument than would overthrow the legitimacy of the academies which the Government has already established.

The view above referred to, which was expressed in the constitutional convention by Gouverneur Morris, that the power to establish a national university at the seat of government is included in the grant of exclusive jurisdiction over the District of Columbia, would seem to be also a valid one.

If Congress, by the grant of power over the Territories, may establish in those districts systems of education from the primary school up to and through the university, in districts which are being prepared for later admission as States, surely it may exercise the same authority in the District of Columbia, over which its jurisdiction in every respect whatever has been made absolute, subject to the restrictions of the Constitution, especially since this District can not be regarded as in any sense on the road to admission as a State, and, if it is to have proper facilities for higher education at all, must obtain them from Congress.

And if the Federal Government may establish a university as the head of the school system in the District of Columbia, there is no constitutional limit upon the manner in which that institution shall be organized, upon the amount of money which it may spend in its administration, or upon the purpose which such an institution may be made to serve.

Although the preceding considerations seem to have covered the ground in a general way, there is perhaps one other aspect of the case which, owing to its immediate bearing upon the special problem before us, should not be overlooked. That is the argument that the actual policy of the Federal Government in regard to education can not be justified constitutionally upon any other ground than would also justify the establishment of a national university.

The Federal Government has considered education, almost from the first hour of its organization, as a subject with which it had to do, and whose promotion should be near its heart. The ordinance of 1787 bound the Congress to promote the interests of education in the territory northwest of the Ohio River. And when this ordinance was reenacted after the establishment of the Constitution the same duty was taken upon itself by the Congress. In pursuance of this policy it appropriated from the public lands within the possession of the Government large tracts for the endowment of elementary and higher education. It is true that this referred at first only to the territory northwest of the Ohio River, but it was evident at a very early day that the people of the United States would not be content with the encouragement of education merely in the newer portions of the United States. The older States claimed, and with much justice, that all the

States under the Constitution were entitled to the same treatment, and that if the newer States received assistance in the development of their education from national resources, the older States were entitled to the same advantage. This argument seemed to be especially good, since the public domain out of which this endowment was made had been acquired by the common sacrifices of the older as well as the newer States. Consequently, we find a steady tendency on the part of the National Government to make grants of land for the promotion of education within the States.

This has become such a well-organized policy on the part of the Government that every decade, and, one may say, almost every year since the opening of the century, has seen considerable additions to the educational funds of the States from this source.

The principle received, however, a very clear recognition in the celebrated land-grant act of 1862, by which to each State in the Union were granted 30,000 acres of land for each Senator and Representative in Congress for the endowment of colleges for instruction in agriculture and the mechanic arts.

But President Monroe, in the celebrated message previously referred to, expressed a truth which is coming to be recognized and acted upon more fully with every passing decade, that no distinction can be taken between the appropriation of money raised by the sale of public lands and of that which arises from taxes, duties, imposts, and excises. And so the Federal Government, not content with granting lands by the act of March 2, 1887, granted the sum of \$15,000 per year from the proceeds of the sale of public lands to each State and Territory for the establishment of agricultural experiment stations.

This policy was further followed in the act of August 30, 1890, for the further endowment of the land-grant colleges, by which the sum of \$15,000 per year—to be increased by an addition of \$1,000 more per year until the sum amounted to \$25,000 per year—for each State and Territory was voted by the Congress of the United States out of the proceeds of the sale of public lands. If the Congress of the United States may appropriate \$2,000,000 a year in cash from the Federal Treasury for the support of higher institutions in forty-five States in the Union, surely it may appropriate a similar or greater amount for the support of a single institution in the District of Columbia.

In view of the facts set forth in the above memorandum, it is the opinion of your reporter that there is a distinct grant in the Constitution of the United States to the Federal Government of the authority to establish and maintain a national university.

This opinion is based :

(1) Upon the grant of exclusive jurisdiction for all purposes whatsoever over the District of Columbia, contained in the seventeenth clause of the eighth section of the first article.

(2) On the right of the Federal Government to establish a civil academy for the education of its civil servants on such a scale and of such a character as in the judgment of the Congress may adequately serve the purpose.

(3) On the further ground that the constitutional history of the United States and the history of the Federal grants to education all go to show that our leading statesmen, including many of those who sat in the constitutional convention, have from the beginning to the present time maintained the view that such power was conferred upon the Federal Government.

(4) Upon the ground that the actual course of legislation by the Federal Government in the endowment of education can be justified only on the same principles as will justify, constitutionally speaking, the establishment and maintenance of a national university.

(5) On the further ground that the first clause of the eighth section of the first

article confers upon the Federal Government the distinct authority to appropriate money for any purpose which in their judgment provides for the common defense and promotes the general welfare; and that if, in the judgment of the Federal Congress, the establishment and maintenance of a national university would be in furtherance of the general welfare, then the authority to take such action is clearly and distinctly conferred by this clause.

---

## XXV.—RELIGIOUS INSTRUCTION AND ITS RELATION TO EDUCATION.<sup>1</sup>

The problems of what is called religious education are part of the problem of education as a whole.

True education, as distinguished from the innumerable false uses of the word, is a unitary process. It knows no mathematically accurate subdivisions. It admits of no chemical analysis into elements, each of which has a real existence apart from the whole. When stretched upon a dissecting table education is already dead. Its constituent parts are interesting and, in a way, significant; but when cut out of the whole, they have ceased to live. They are no longer vital or truly educational. For this reason I hold that while there is and may be a religious training, an intellectual training, a physical training, there is no such thing as religious education, or intellectual education, or physical education. One might as well imagine a triangular or a circular geometry. We do not at once feel the force of this statement, because of our loose, inaccurate, and inexact use of the word education.

In my view education is part of the life process. It is the adaptation of a person, a self-conscious being, to environment, and the development of capacity in a person to modify or control that environment. The adaptation of a person to his environment is the conservative force in human history. It is the basis of continuity, solidarity. The development in a person of capacity to modify or control his environment gives rise to progress, change, development. Education, therefore, makes for progress on the basis of the present acquisitions of the race. Its soundest ideals forbid, as a matter of course, both neglect of the historic past and the blind worshipping of that past as an idol. The importance of the past lies in its lessons for the future. When the past has no such lessons, we forget it as quickly as possible. The survival of a tendency, a belief, or an institution is evidence that it is at least worth studying and that it must be reckoned with. These tendencies, beliefs, and institutions are studied and reckoned with for the purpose of discovering their vital principles and of putting a value upon them. The working out of those vital principles is the future.

In this view, education is first and chiefly a matter of principles. Then, and secondarily, it is a matter of methods. The place, character, and function of religious training are to be settled, and only to be settled, by reference to fundamental educational principles.

The first of these principles, and one of the most far-reaching, is discovered in framing an answer to the question, What is the present environment of a human being. What do we mean by the use of the word environment, and what do we include in it, when we speak of it as that to which education tends to adapt a person? We mean, I think, by the word environment, two things: First, man's

---

<sup>1</sup>An address by Nicholas Murray Butler, professor of philosophy and education in Columbia University, delivered in St. Bartholomew's Church, New York, October 14, 1899, under the auspices of the Sunday School Commission of the diocese of New York. Reprinted from the *Educational Review*, December, 1899.

physical surroundings, and, second, that vast accretion of knowledge and its results in habit and in conduct which we call civilization. Natural forces play no small part in adapting human beings to both elements of environment, but the process of education is especially potent as regards adaption to the second element, civilization. Civilization—man's spiritual environment, all his surroundings which are not directly physical—this it is which has to be conquered, in its elements at least, before one can attain a true education. It is of the highest importance that we make sure that we see clearly all the elements of the knowledge which is at the basis of civilization, and that we give each element its proper place in our educational scheme.

We may approach the analysis of our civilization or spiritual environment from many different points of view, and perhaps more than one classification of the results of that analysis may be helpful. The classification which I suggest, and which I have stated elsewhere in detail,<sup>1</sup> is a fivefold one. It separates civilization into man's science, his literature, his art, his institutional life, and his religious beliefs. Into one or another of these divisions may be put each of the results of human aspiration and of human achievement. Education must include knowledge of each of the five elements named, as well as insight into them all and sympathy with them all. To omit any one of them is to cripple education, and to make its results at best but partial. A man may be highly instructed and trained in science alone, or in literature, or in art, or in human institutions—man's ethical and political relationships—or in religion, but such a man is not highly educated. He is not educated, strictly speaking, at all, for one or more of the aspects of civilization are shut out from his view, or are apprehended imperfectly only and without true insight.

If this analysis is correct, and I think it is, then religious training is a necessary factor in education, and must be given the time, the attention, and the serious, continued treatment which it deserves. That religious training is not at the present time given a place by the side of the study of science, literature, art, or of human institutions is well recognized. How has this come about? How are the integrity and the completeness of education to be restored?

The separation of religious training from education as a whole is the outgrowth of Protestantism and of democracy. A people united in professing a religion which is ethnic or racial, or a nation giving adhesion to a single creed or to one ecclesiastical organization, always unite religious training with the other elements of education and meet no embarrassment or difficulty in so doing. During the undisputed dominance of the Roman Catholic Church in Europe, education not only included religious training as a matter of course, but it was almost wholly confined to religious training. Theology was the main interest of the Middle Ages, and the theological interest caused religious training to permeate and subordinate whatever instruction was given in other subjects. Music was taught that the church services might be well rendered. Arithmetic and astronomy were most useful in fixing the church festivals and the calendar. With the advent of the Protestant reformation all this was changed. Religion was still strenuously insisted upon as a subject of study, but the other subjects of instruction became increasingly independent of it and were gradually accorded a larger share of time and attention for themselves alone.

Protestantism, however, would not by itself have brought about the secularization of the school as it exists to-day in France and in the United States. Democracy and the conviction that the support and control of education by the State is a duty in order that the State and its citizens may be safeguarded have necessarily forced the secularization of the school. Under the influence of the Protestant reformation and that of the modern scientific spirit men broke away

<sup>1</sup> Butler, Meaning of education, pp. 17-31.

from adherence to a single creed or to a single ecclesiastical organization and formed diverse sects, groups, parties, or churches, differing in many details from each other, the differences, I regret to add, being far more weightily emphasized than the more numerous and more important points of agreement. When the State-supported school came into existence this state of religious diversity found expression in dissatisfaction with the teaching, under State auspices, of any one form of religious belief. The first step toward the removal of this dissatisfaction was to reduce religious teaching to the lowest possible terms; and these were found in the reading of the Bible, the recitation of the Lord's Prayer, and the singing of a devotional hymn at the opening of the daily school exercise. But even this gave rise to complaint. Discussions arose as to whether a single version of the Bible must be used in these readings, or whether any version, chosen by the reader, might be read. A still more extreme view insisted that the Bible itself was a sectarian book, and that the non-Christian portion of the community, no matter how small numerically, were subjected to violation of their liberties and their rights, when any portion of the public funds were used to present Christian doctrine to school children, even in this merely incidental way. The view that the State-supported schools must refrain absolutely from exerting any religious influence, however small, is one which has found wide favor among the American people.

It has led to more or less sweeping provisions in State constitutions and in statutes against sectarian instruction of any kind at public expense. A judicial decision on this subject of great interest and of far-reaching importance is that rendered in 1890 by the supreme court of Wisconsin, in the case of the State *ex rel. Weiss and others v. the District Board of School District No. 6 of the city of Edgerton*.<sup>1</sup> In this case the essential question at bar was whether or not the reading of the Bible, in King James' version, in the public schools was sectarian instruction, and as such fell within the scope of the constitutional and statutory prohibitions of such instruction. In an elaborate and careful opinion the court held that reading from the Bible in the schools, although unaccompanied by any comment on the part of the teacher, is "instruction;" that since the Bible contains numerous doctrinal passages, upon some of which the peculiar creed of almost every religious sect is based, and since such passages may reasonably be understood to inculcate the doctrines predicated upon them, the reading of the Bible is also "sectarian instruction;" that, therefore, the use of the Bible as a text-book in the public schools and the stated reading thereof in such schools, without restriction, "has a tendency to inculcate sectarian ideas," and falls within the prohibition of the constitution and the statutes of Wisconsin.

In this decision there are some very interesting observations on the general question of religious training and the place of the Bible in education. The court says, for example: "The priceless truths of the Bible are best taught to our youth in the church, the Sabbath and parochial schools, the social religious meetings, and, above all, in the home circle. There those truths may be explained and enforced, the spiritual welfare of the child guarded and protected, and his spiritual nature directed and cultivated, in accordance with the dictates of the parental conscience." Judge Orton, in a supplementary opinion, adds: "[The schools] are called by those who wish to have not only religion, but their own religion, taught therein 'Godless schools.' They are Godless, and the educational department of the Government is Godless, in the same sense that the executive, legislative, and administrative departments are Godless. So long as our Constitution remains as it is, no one's religion can be taught in our common schools."

The supreme court of Wisconsin has in this decision given forcible, definite expression to the view held by the large majority of American citizens, and has

<sup>1</sup> Wisconsin Supreme Court Reports, 76: 177-221.

clothed that view with the authority of law. It is in this sense and for substantially the reasons adduced in the decision which I have quoted, that the American public school is secular and that it can give and does give attention to four of the five elements of civilization which I have named—science, literature, art, and institutional life—but none to the fifth element—religion.

In France, the great democratic nation of Europe, the case is quite similar. The famous law of March 28, 1882, excluded religious instruction from the public schools, and put moral and civic training in its stead. M. Ribière, in defending this provision before the senate, used almost the exact language later employed by the supreme court of Wisconsin. He held that the elementary school, maintained by the State, open to all, could not be used to teach the doctrines of any sect; that it must be neither religious nor antireligious, but wholly secular, neutral. M. Paul Bert, who presented the measure to the Chamber of Deputies, pointed out that the "religious neutrality" of the school was the logical outcome of the principle of the freedom of the individual conscience. "In our eyes," M. Bert continued, "this argument has so great force that, without the prohibition of religious instruction in the schools, compulsory education would appear to us to be not an advantage, but a danger." In order that opportunity should be given to parents to provide religious instruction for their children—this is explicitly stated in the law—the schools are closed one day each week, other than Sunday. In France Thursday, not Saturday as with us, is usually taken as the school holiday.

This, then, is the condition of affairs in the United States and in France as regards religious training in education. The influence first of Protestantism and then of Democracy has completely secularized the school. The school, therefore, gives an incomplete education. The religious aspect of civilization and the place and influence of religion in the life of the individual are excluded from its view. This is the first important fact to be reckoned with.

The second fact is that the whole work of education does not fall upon the school. It can not do so and ought not to do so. The family, the church, the library, the newspaper, society itself, are all educational institutions as truly as is the school. The school is the most highly organized of them all. Its aims and methods are the most definite. But it is quite untrue to suppose that nothing enters into education save through the medium of the school programme. Therefore, it does not follow that because the school has become secular, all religious influence and training have necessarily gone out of education. If the school is not distinctly religious, it is even more distinctly not antireligious. The real question, then, is what are the other educational factors, especially the family and the church, doing to see to it that school instruction is rounded out into education through their cooperation? It is the duty of the family and the church to take up their share of the educational burden, particularly the specifically religious training, with the same care, the same preparation, and the same zeal which the school gives to the instruction which falls to its lot.

Before coming to the implications of this position there are one or two suggestions which must receive passing notice. It is said, by a very few, it is true, that there is no such thing as religion other than mere superstition, and that religion is not universal in any event, and therefore that the fifth element of our civilization is but an empty name. It is urged, with Petronius, that fear first made the gods, and with Feuerbach that religion is man's most terrible ailment. These contentions seem to me to arise from simple ignorance, alike of history and of human nature. There is a response from the human heart and from the recorded thoughts and deeds of civilized men, based neither on credulity nor on fear, to the description of Hegel, that "religion is for our consciousness that region in which all the enigmas of the world are solved, all the contradictions of deeper

reaching thought have their meaning unveiled, and where the voice of the heart's pain is silenced—the region of eternal truth, of eternal rest, of eternal peace." If religion may be defined in Dr. Martineau's words, as "the belief and worship of supreme mind and will, directing the universe and holding moral relations with human life," then civilization is unintelligible without it. Much of the world's literature and art, and the loftiest achievements of men, are, with the religious element withdrawn, and without the motive of religion to explain them, as barren as the desert of Sahara. This proposition hardly needs argument. "The religiosity of man is a part of his psychical being. In the nature and laws of the human mind, in its intellect, sympathies, emotions, and passions, lie the well springs of all religions, modern or ancient, Christian or heathen. To these we must refer, by these we must explain, whatever errors, falsehood, bigotry, or cruelty have stained man's creeds or cults; to them we must credit whatever truth, beauty, piety, and love have glorified and hallowed his long search for the perfect and the eternal. \* \* \*

"The fact is that there has not been a single tribe, no matter how rude, known in history or visited by travelers, which has been shown to be destitute of religion under some form."<sup>1</sup>

But it is also urged that a satisfactory substitute for religious training is to be found in moral and civic instruction. This view is widely held in France, and has led to some rather absurd consequences. So scholarly a writer as Mr. Thomas Davidson has just now urged this view upon us Americans.<sup>2</sup> He is able to do so, however, only by completely identifying religion and philosophy, and, as I think, a bad philosophy at that, in his definition of religion. But, in fact, the field of moral and civic instruction is quite distinct from man's religious life; it belongs to the institutional aspect of civilization. The moral aspect of life has long since come to be closely related to the religious aspect, but nevertheless the two are quite different. A religion, indeed, may be quite immoral in its influences and tendencies. It may lead to cruelty and sensuality and yet be a religion. There have been not a few such. To confuse religion with ethics is to obscure both. Religion must be apprehended as something distinct and peculiar if it is to be apprehended at all. Matthew Arnold was absolutely wrong when he wrote, "Religion is ethics heightened, enkindled, lit up by feeling; the passage from morality to religion is made when to morality is applied emotion." It is still easier to make clear and enforce the distinction between morality and religion, if we substitute for the general term religion the highest type of all religions—Christianity. It is Christianity, of course, which we have in mind when speaking of religion.

My argument thus far has aimed to make it clear that religious training is an integral part of education, that in this country the State school does not and can not include religious training in its programme, that it must therefore be provided by other agencies and on as high a plane of efficiency as is reached by instruction in other subjects, and that moral and civic training is no possible substitute for religious teaching. The agencies at hand for religious teaching are the family and the church, and, in particular, the special school, the Sunday school, maintained by the church for the purposes of religious training.

The Sunday school is in this way brought into a position of great responsibility and importance; for it is, in fact, a necessary part of the whole educational machinery of our time. It must therefore be made fully conscious of the principles on which its work rests and of the methods best suited to the attainment of its ends.

The Sunday school must, first of all, understand fully the organization, aims,

<sup>1</sup> Brinton, *Religions of Primitive Peoples*, p. 30.

<sup>2</sup> "American Democracy as a Religion," *International Journal of Ethics*, October, 1899.

and methods of the public schools; for it is their ally. It must take into consideration the progress of the instruction there given in secular subjects, and must correlate its own religious instruction with this. It must study the facts of child life and development, and it must base its methods upon the actual needs and capacities of childhood. It must organize its work economically and scientifically, and it must demand of its teachers special and continuous preparation for their work. It must realize that it is first and above all an educational institution and not a proselytizing one, and that the inherent force of the truth which it teaches is far greater than any attempted bending of that truth to special ends. It must cease to be merely a part of the missionary work of the parish, and become a real factor in the educational work of the community. It must give more time to its work, and the traditional division of time on Sunday will have to be gradually readjusted in order to make a serious Sunday-school session possible. A Saturday session may also be planned for. It must recognize that ordinarily no single parish or congregation can make proper provision for the religious training of all the young people under its care. The very largest parishes and congregations may be able to maintain a fully equipped Sunday school for children from five to eighteen, but the smaller parishes and congregations in towns and cities must learn to combine for their common good. Each parish or congregation may readily and ought always to maintain a Sunday school of elementary grade, but several adjoining parishes or congregations must combine in order to organize and support a proper course of religious instruction for children of secondary school age and beyond, say from thirteen to eighteen years. In a whole city, unless it be New York or Chicago or Philadelphia, one, or at most two, training classes for Sunday-school teachers should be sufficient. Furthermore, Sunday-school teachers, like all other teachers, should be paid. They should be selected because of competence and special training; they should be led to look upon their work not as philanthropy, not even as missionary work, but as something which is larger than either, because it includes both, namely, education. The several Christian bodies, as long as they remain distinct, will naturally maintain their own separate Sunday-school systems; but within any given branch of the Christian church, be it Protestant Episcopal, Presbyterian, Methodist, or other, all of the principles just stated can be applied. Sunday schools so organized could be given the same systematic professional supervision that is provided for the secular schools. Each body of Christians in a given community could have its own Sunday-school board, and its own Sunday-school superintendent and staff of assistants. Between some Christian bodies actual cooperation in Sunday-school instruction ought to be possible. For the proper organization and conduct of this religious instruction there must be a parish or congregational appropriation, or, better far, an endowment fund, to bear the legitimate cost of religious teaching and its systematic professional supervision.

The Sunday-school course of study must be looked after. It is at present—I say it with all respect—too exclusively pious. Religion is much more important in civilization and in life than the Sunday school now teaches. It is more real. It touches other interests at more points. The course of study of the future must reveal these facts and illustrate them. It must be carefully graded and adjusted to the capacity of the child. It must reach out beyond the Bible and the catechism. It must make use of biography, of history, of geography, of literature, and of art, to give both breadth and depth and vitality to the truths it teaches and enforces. It must comprehend and reveal the fact that the spiritual life is not apart from the natural life and in antagonism to it, but that the spirit interpenetrates all life and that all life is of the spirit. The problem, then, is not religion and education, but religion *in* education.

This, it may be said, is a radical programme, a counsel of perfection. Perhaps

so. If so, it will provide something to work toward. It will at least bring religious teaching under the influence of those principles and methods which have of late years so vitalized all secular teaching. It will give to it modern instruments, text-books, and illustrative material.

Before dismissing these suggestions as impracticable, because in part unfamiliar, it is well to face the alternative. It is that religious knowledge—and with religious knowledge a good deal else which is worth saving—will go out of the life of the next generation. What appears important enough to the elder generation to be systematically organized, conscientiously studied, and paid for in a terrestrial circulating medium will deeply impress itself upon the younger. What is put off with a hurried and unsystematic hour on Sunday will not long seem very much worth while.

Already the effects of the present policy are being seen. To the average college student the first book of Milton's *Paradise Lost* is an enigma. The epithets, the allusions, even many of the proper names, are unfamiliar. This is due to ignorance of the Bible. It is necessary nowadays to know something about Christianity as well as to be a Christian. The study of history and of geography in connection with the spread and development of Christianity is fascinating. The study of biography in connection with the people of Israel, and Old Testament history generally, may be made to put plenty of life into much that is now dead facts to be memorized. For older pupils the study of church history, and of the part played by religious beliefs and religious differences in the history of European dynasties, politics, and literature will make it plain how moving a force religion is and has been in the development of civilization. Such pupils, too, are able to appreciate the Bible as literature if it is put before them from that point of view. It is too often treated as a treasury of texts only, and not as living literature which stands, as literature, by the side of the world's greatest achievements in poetry and in prose.

The heart is the ultimate aim of all religious appeals. But the heart is most easily reached by informing the intellect and by fashioning the will. Knowledge and conduct react on the feelings, and the feelings, the heart (so to speak), are educated and refined through them. This fact will never be lost sight of by any competent religious teacher, and his purpose will never be to amass in his pupils knowledge about religion alone, but to use such knowledge to direct, elevate, and refine the religious feelings and to guide and form conduct into character.

It is along such lines as these that the development of the Sunday school from a phase of parish mission work into an educational institution of coordinate rank with the secularized school must take place. There are numerous local problems to be solved, no doubt, and not a few practical difficulties to be overcome, but if the ideal be once firmly grasped and the purpose to reach it be formed, the result can not be doubtful.

---

#### XXVI.—COMMERCIAL EDUCATION.<sup>1</sup>

The phrase "commercial education" is likely to remind an American of the commercial course in a public high school or of the fictitious banks, offices, and shops of the private school called a commercial college. The so-called commercial course in an American high school is almost universally a course hopelessly inferior to the other courses, being made up by substituting bookkeeping, stenography, typewriting, and commercial arithmetic for some of the language, his-

<sup>1</sup> An address by Charles W. Eliot, president of Harvard University, at the National Export Exposition, Philadelphia, Pa., October 20, 1899.

tory, mathematics, or science of the classical or English scientific course. This course exists in our public schools because it has for committeemen and parents a practical sound. It seems as if the child who had learned a little about these technical subjects might be better able to earn its living early than the child who had only studied languages, history, mathematics, and science. For the purposes of mental training or of mental power getting this course is never to be recommended, and it is rare that the slight knowledge of these arts acquired by pupils in the public schools proves to be of much use to them in winning a livelihood. The so-called commercial schools supplement for many young people a defective elementary education, but they seldom train anybody for service above that of a clerk. It is not of any such training that I propose to speak.

I ask your attention for a few moments to the chief features of a commercial education capable of preparing men and women for much more than clerical service and much more than narrow retail trading. An indispensable element in the training I have in view is a sound secondary education—that is, an education in a first-rate school, public, endowed, or private, which occupies the whole school time of the pupil from 13 or 14 to 18 years of age. This secondary education should include the modern languages, an essential part of a good preparation for the higher walks of business life. It may or may not include Latin, or Latin and Greek. Thus the German nonclassical secondary education is a very substantial preparation for business life, although it includes no technical subjects whatever. It deals with modern languages, including the native tongue, the elementary mathematics, history, and science, both pure and applied. For international commercial life in English-speaking countries a good knowledge of three languages besides English is desirable, namely, French, German, and Spanish. A reading knowledge of the languages will ordinarily suffice for principals, but for traveling agents or agents resident abroad a speaking knowledge of at least two of these languages is desirable. This knowledge should be acquired at the secondary school.

Let us imagine a boy equipped at 18 with these broad fundamental acquisitions, and let us then ask ourselves what additional subjects should be treated in an upper commercial school. The following list of subjects is by no means complete, but may serve to give a fair idea of the diversity and difficulty of the subjects appropriate to superior commercial education: Economics, statistics, banking, currency, exchange, arbitrage, insurance, Government tariffs, transportation by land and water, commercial geography, climates, ethnology, commercial products by region and by nationality or race, consumption by region and by race, maritime legislation, blockade rights, neutrals' rights, commercial law, industrial combinations of capital, labor unions, and, if I may use a new but convenient word, financing new undertakings. Some of these subjects are already taught elaborately in universities, and the elements and general principles of all of them can be taught systematically to groups of pupils and enforced by examples and problems just as well as styles of architecture, rules of evidence in law, or the diagnostic value of blood examinations in medicine are now taught and enforced in special schools. That a given subject has practical applications and is to be really mastered only by much practice is no reason why it should not be taught systematically in its elements by teachers skilled in expounding principles and guiding practice.

It is obvious from the mere enumeration of these subjects that no young man could master any large proportion of the list in the two or three years which might wisely be allotted to such studies. A system of choice among these studies would therefore have to prevail in any well-conducted commercial school. The variety of business occupations in the modern world is immense, some of them being very broad and others very narrow; and for these various occupations widely differ-

ent bodies of information or knowledges are needed. We can classify these occupations and say that some of them are trade, others are manufacturing, and others are transportation; but there are many business occupations which are concerned with all these three groups, or with portions of them all. The youth who entered the upper commercial school knowing what business he is subsequently to pursue would have sure guidance in the selection of his studies. The youth who had no such knowledge would do well to acquaint himself with the general principles of the most fundamental subjects.

For what classes of persons would such a training, extending on the average through the twenty-first year, be appropriate and desirable? Let me first exclude two classes of young men. An elaborate training of this description is not necessary for men whose occupation through life is to be purely clerical. For that class the investment of time and money would be unreasonably large. Neither would it be the best course for the sons of men who are carrying on a well-established business and are able to introduce their sons into their already organized business and push them up rapidly through all its grades. For a specific business, selected beforehand and entered upon with sure prospect of rapid advancement, the best training is to work up through all the grades or departments of that particular business. But it is only exceptional youths who have such opportunities of acquainting themselves thoroughly with the details of a complicated business which later they are to direct. The thousands who every year come forward into business life have no access to a family business, but must take their chances of employment and advancement in whatever commercial occupation may become accessible to them. To what business careers, then, might young men carefully trained in an upper commercial school, parallel with a college or scientific school, look forward with confidence? For what careers higher than that of a clerk might they be trained? Remembering that such a school would not provide one uniform curriculum for all its pupils, but permit selection of studies among a great number of important subjects, we may confidently enumerate the occupations of the following classes of persons as appropriate to young men so trained. Consuls or government agents in foreign parts; actuaries, public accountants, and auditors; managers of departments in a large business; buyers abroad for home use and sellers of home products in foreign parts; State, city, and corporation officials in great variety; merchants engaged in international trade; junior officials in banks and insurance companies and in transportation companies by sea and by land. In all these cases the instruction received at the commercial school would have to be supplemented by practical experience in an actual industry, office, or trade; but this subsequent requirement would not be at all peculiar to this school. No school of engineering or of applied chemistry or physics nowadays undertakes to turn out students fit at graduation for responsible posts. They simply graduate young men well fitted to enter upon the novitates of these several professions; well fitted, that is, to begin to learn rapidly and well the practical details of an actual business in these several departments. That is precisely what might reasonably be expected of an upper commercial school, that its graduates should be fitted to learn rapidly and well the practical details of any mercantile pursuit in which they might engage.

It would not be the avowed object of such a school to train heads of great houses, or of great corporations, although it might easily happen that such persons might later be found among those who had received its training. The qualities which make captains of industry or of commerce are in large measure natural gifts. Such leaders must possess extraordinary energy, good judgment, insight in choosing subordinates, vivid imagination, and firm, upright character; and if I were asked what education would be best for a young man known to possess these gifts, and destined for commercial life, I should say, give him the

best attainable college education, and then let him travel. In attempting to estimate the value of an upper commercial school we should not, however, have such persons as these in mind, for they are highly exceptional. An upper commercial school should serve young men of fair parts by the hundred and the thousand. Nevertheless we shall do well to recognize the fact that international trade, and indeed domestic trade also, is becoming more and more complex, competition is growing keener, the percentage of profits smaller, the transactions larger, and the decisions of the principal necessarily quicker. The successful merchant has to know more to-day than he ever did before, and he has to be more alert and more inventive. Hence his preliminary training should be both more ample and more appropriate than it has been in the past.

I may illustrate the various classes of young men to whom an upper commercial school would be useful by stating briefly some of the uses of foreign languages in business. And first, to buyers. The conditions of many industries and trades have now become international. The raw materials of an industry or commerce may come from various parts of the globe in different qualities; and he is the best buyer who gets his material at the exact spot where it is best produced, or induces the cultivation in many places of that best plant or best animal which has heretofore been developed only in one place. The best cotton for a given fabric must be either bought in the one district where it is raised, or the cotton plants of this district must be spread throughout other cotton-growing countries. If China has a better tea plant than Ceylon, tea must be bought in China, or the better tea plant must be transferred to Ceylon. A chocolate industry established in Boston must seek its cocoa wherever cocoa best grows, and must be always inquiring in what other parts of the world cocoa can be well produced. This means that good buyers for great industries must often be polyglot men. As for the drummers or runners who solicit business, it is obvious that they need to speak the languages of the people with whom they would trade and among whom they must study on the spot the existing commercial conditions. The managers of great international industries need to be able to study foreign trade conditions in foreign newspapers and books, to understand the commercial intelligence in a foreign paper, besides knowing all the complications of local currencies, weights, and measures. If an American merchant wishes to introduce his goods into a foreign country, he is not well-advised to send out his price lists in English and in dollars and cents. Year by year, as ocean carriage becomes securer and quicker, and as business is done more and more all over the world by telegraph and telephone, the individual merchant's need of overcoming the obstruction to commerce caused by the variety of languages spoken and written in the business world becomes more and more pressing. We Americans are at great disadvantage in learning foreign languages. We can not pass like Dutch or Belgian boys in a few hours to a nation speaking French, or German, or English. We have to learn the modern languages by main force, as it were, without the advantage of immersing ourselves on occasion in the foreign speech.

Time does not permit me to dwell upon the specific preparation that might be obtained in an upper commercial school for a variety of interesting callings. I can only mention two callings for which very definite preparation might be made in such a school. The first is the calling of correspondent, traveling or stationary, for the commercial press. This function of the press in maintaining fresh correspondence with all parts of the commercial world is becoming more and more important as international trade spreads and fructifies; and it is obvious that this function, if it is to be well discharged, implies in the correspondent discrimination, insight, linguistic skill, and a thorough understanding of commercial conditions. The other calling I wish to mention is the service of government as consuls, or of intelligence departments conducted by trade organizations. We have

so long regarded consulships as mere political prizes that we have lost sight of their real function as commercial agencies. If this country is to enter seriously into competition for international trade the world over, the very first administrative reform needed in our Government is the conversion of consulships into commercial intelligence bureaus. It is obvious, however, that the men who are to discharge this function should have a first-rate training in several of the subjects which I have enumerated as appropriate to an upper commercial school. A government school for consuls would be just as legitimate as a government school for the Army or the Navy, and would be likely to lead to correspondingly good results. Such a school, however, would imply a life career for its graduates, just as West Point and Annapolis do.

An upper commercial school should possess the means of keeping its knowledge of commercial conditions absolutely fresh. No salted provisions or canned goods would be useful in its larder. Its teachers would have to live at a commercial center, and breathe every day a wholesome commercial atmosphere. Boards of trade would be better supervisors for such a school than any bureau of education. Men actively engaged in foreign commerce ought to oversee it.

I can hear the objection of the old-fashioned merchant to this whole project of a commercial school. He is saying, Business can not be learned in a school; it must be learned in a countingroom or a real shop. He is saying, The only way to bring up a boy for business is to set him to sweeping out the office and running errands. In answer I can only say that I believe commerce and industry in their higher ranges to be eminently intellectual pursuits; and that I know no other intellectual calling for which a professional school is not now provided. It used to be the fashion to study medicine by cleaning the doctor's horse and buggy, grinding his drugs, and driving around with him to make his calls; and to study law by copying deeds and briefs in a lawyer's office, and reading books taken from the lawyer's little library in the intervals of clerical labor; but the world has now learned that there is a better way of studying medicine or law—namely, by going to a professional school, where progressive systematic instruction rapidly developed is to be had. The intending physician or lawyer who does not go to a medical school or a law school condemns himself nowadays to hopeless inferiority, even if he ultimately gets into his chosen profession. To deny that young men may be systematically trained for industry and commerce is to assert that industry and commerce are merely imitative arts to be acquired only by seeing other people do the tricks and then practicing them. The gypsy in Asia Minor makes iron nails one at a time with a hammer on an anvil, just as his ancestors did before him for hundreds of years. I have seen him doing it; but I also observed that his small children were stark naked and that his larger ones had only one garment. In short, he was not making much of a living. Moreover, not one-thousandth part of the nails we use in this country could possibly be made in that way. In industry and commerce all things are become new: and new methods of preparing young men for these occupations must be invented with discriminating foresight, established with prudence, and maintained with liberality.

---

## XXVII. HOW TO TEACH CIVIC DUTY TO SCHOLARS.<sup>1</sup>

Before the next issue of the Review of Reviews is in the hands of its readers the municipal elections will be over, and we shall be in the thick of the school-board elections. Every year adds fresh evidence to the urgency of the need for quickening and educating public interest in the careful and continuous discharge

---

<sup>1</sup> From the Review of Reviews (London), October 15, 1897.

of civic duty, especially in the field of municipal administration. The efficiency, the purity, and the progressive character of the municipal institutions of the Old World constitute a precious heritage which it is our duty not only to maintain, but to hand down to our children with improvements not unworthy of this generation. It is in this particular department of human affairs that the Old World has the advantage of the New. In many things, notably, in its freedom from its crushing burden of imperialism, the New World beyond the sea has an immense advantage over Europe, but in the matter of municipal administration the New World has still to sit at our feet. This position of preeminence can only be maintained by constant vigilance, and by carefully instructing the young in the principles of local self-government.

Of late years much attention has been bestowed upon this subject. A league or society for promoting the education of our future citizens in civic duty has been formed, and much good has resulted from the increased attention that has been paid to the subject. It would be difficult to suggest any more admirable handbooks on the subject than those which have been written by Mr. Arnold Forster concerning the duties of a citizen. They constitute text-books which ought to be in the hands of the teachers in all our public elementary schools. But there is still much to be done in this respect; and I can hardly do better service to my readers on the eve of the municipal elections than by calling their attention to a scheme which has been tried with singularly good results in the city which of all others affords the most painful object lesson as to the consequences which follow the lack of good civic spirit on the part of all classes of citizens.

Where evil abounds there grace sometimes much more abounds, and the very extreme evils which have been suffered by the citizens of New York in the past have been as schoolmasters to bring them to realize the need for adopting the most effective and drastic measures for preventing any recurrence of a similar state of things in future. Whether the plan which has recommended itself to the Patriotic League in New York commends itself or not to our local authorities, the present month is of all others one in which the suggestion can best be brought before the public. I especially commend it to the attention of candidates for the school boards and the town council, and to all those who are practically engaged in the teaching of youth.

The New York project to which I wished to call attention was started last July at a vacation school. It was based upon the experience gained by a somewhat similar experiment tried the previous year at the West Farm school. This school had for some time been very unruly and extremely hard to manage. Last year it was suggested by Mr. Gill to the vice-principal that school discipline might be improved if he invoked the principle of self-government, and a large part of the duty of maintaining order were turned over to the scholars themselves. His plan was to treat the scholars as if they were a nation, and to throw upon them the duty of electing the house of congress, senate, and president. The plan worked extremely well. The president elected by the scholars, aided by his ministers and by congress, effected a magic change in the discipline of the school. From being turbulent and unmanageable, it became an orderly institution which gave the teacher hardly any trouble at all. The success of treating a school as if it were a microcosm of the nation, led Mr. Wilson L. Gill, founder of the Patriotic League, to hit upon the happy idea of developing the scheme, by substituting the organization of the city for the organization of the nation, as the conception before the scholars. American city organization is very different from that which prevails in our country, but there is no reason why, if the principle were accepted, the scheme could not be carried out in any English school with the alterations necessary to adjust it to the different circumstances. Without explaining the altera-

tions that would be necessary, I proceed to set out exactly what was done in the Norfolk-street vacation school, where the first experiment was tried in the city of New York.

Vacation schools in America are held in the public-school buildings, but they are not under the control and rules of the board of education, and it was therefore decided to make the experiment in a vacation school instead of waiting for the assent of the board. It was also argued that consent would be more readily accorded if the experiment succeeded in a vacation school, than if it had to be tried for the first time in a public school. When the Patriotic League took hold of the Norfolk-street vacation school, the first step was to declare all the scholars, irrespective of age, citizens of the mimic city of Norfolk-street school. There was no distinction of sex or of age. Every scholar was a voter with one vote. The first step in organization was to declare that each class was an election district, or as we should say, a ward. As the beginning of all things in America is the holding of a caucus, each class met in a primary and selected delegates for a city convention, composed of delegates elected by each class in the school. This convention nominated two candidates for each of the offices which in American cities are voted upon by the people, to wit, mayor, controller, and president of the board of aldermen. After the nominations were made in due form, polling booths were opened in each class room, the voting being by ballot. When the poll was closed the votes were counted and the successful candidates were duly installed in office. The mayor nominated the president of the board of health, the commissioner of street cleaning, a commissioner of police, and three judges. The board of health consisted of its president, a teacher, and a commissioner of police. The commissioner of police selected a chief, a captain, and a policeman for each class, while the judges named a clerk of the court. The experiment, which began on July 10, lasted until August 29, when the school was to close.

On closing day the mayor of Norfolk-street school, a boy of 14 years of age, wrote a letter to the mayor of New York, inviting him to pay a visit to the mayor of the school city. Two couriers were dispatched to the city hall, where they were ushered into the mayor's presence. Mayor Strong was very busy, but on reading the invitation he laughed, and in ten minutes he entered his carriage and drove off to Norfolk-street school. According to the narrative in the *New York Sun*, from which I am quoting, the visit of the mayor was a great success:

After shaking hands with the mayor he insisted upon meeting all the other city officials, and then inquired as to the process of law in the city. He was hugely delighted when he was told that a regular trial had been held the week before, that a police captain, accused of dereliction of duty, had been the prisoner, and that he had been convicted and dismissed from the service. Thereupon Mayor Strong asked that the court be brought before him. His amusement was great when he saw that one of the judges was a girl. But the crowning feature to Mr. Strong was when the police force was assembled for his benefit and he discovered that more than half of the policemen were girls. The offense of which the police captain was convicted was "conduct unbecoming a gentleman and an officer" while the school was off on a picnic. His was the only breach of the public peace serious enough during the existence of the city to make a trial necessary.

So successful did the mayor deem the experiment that he has given his support to the movement, the promoters of which hope will result in the establishment of similar mimic cities in all the public schools. The commissioner of the charities and the civil-service commissioners are united with the other officials of the city in drawing up rules. In the new scheme it is proposed to make a considerable improvement upon the simple organization of Norfolk Street School. The chiefs of each of all city departments in New York are at present preparing drafts explaining the actual work and purpose of their departments, the mimic counterpart of which is to be established in the school. By this means it is hoped each scholar will get a good idea of the actual work and purpose of the city

department of which he becomes an officer. The civil-service commissioners, for instance, are preparing a set of useful service questions for office-seekers under the new municipality. The head of the New York police school is preparing a scheme explanatory of the work of the policemen, while Colonel Waring is framing a simple constitution for the school street-cleaning department, modeled upon the lines of his own bureau, which has effected so marvelous an improvement in the outward appearance of New York. The board of health has sketched out a miniature health department on scientific and practical lines, and has added a sanitary code, somewhat like that under which New York City is controlled, adapted to children and their needs in the public schools. The Patriotic League is taking this very seriously, for they believe that the children, while apparently playing, will be learning practically the actual work of municipal government, and will communicate their interest to their parents when they go home.

It is rather staggering to the slow-going conservative English mind to know that the whole machinery of government in a school city is to be turned upside down every month when new elections will take place, so that everyone may have a chance of holding an office. Out of a school of 1,000 children, 150, it is estimated, will be needed as officers. There are about twenty-five classes in a New York City school, each of which will become an election district electing one member to the municipal council. Courts will be established and judges chosen and jurors impaneled in the ordinary way. The most elaborate provisions have been drawn up to enforce sanitation and teach the children the laws of health:

There is to be a sanitary bureau and a bureau of records. The officials are: A president, a commissioner (a teacher, corresponding to the health officer of the port), the president of the police board, 1 secretary, a sanitary superintendent, 5 assistant sanitary superintendents, 10 food inspectors, 15 sanitary inspectors, 5 hygiene inspectors, and several medical inspectors, beside a squad of 10 sanitary policemen commanded by a sergeant.

"The food inspectors," says the sanitary code, "shall inspect all articles of food and drink brought into the city for consumption within its limits. They shall give information to citizens regarding proper food and drink; how prepared at small expense, etc., and shall assist citizens in properly preparing food for consumption (e. g., removal of the decayed parts of fruit, etc.)."

"The hygiene inspectors shall examine the citizens with reference to cleanliness of the face and hands, condition of hair, condition of clothes in respect to cleanliness, neatness, repair, etc.

"The sanitary inspectors shall inspect the condition of desks, schoolbooks, clothes, closets, toilets, etc., as to neatness and cleanliness. They shall prevent spitting on the floors, staircases, etc., and shall warn citizens against spitting on sidewalks or elsewhere, except into proper receptacles, and then only when absolutely necessary.

"The medical inspectors shall examine the citizens daily, immediately after they enter the city, and shall report to the assistant sanitary superintendent the names of any who do not feel well."

The sanitary police are to enforce the regulations, and reports are to be made. Verbal reports on the part of each assistant sanitary superintendent to the proper teachers each morning in regard to those citizens who do not feel well, and warnings and complaints are to be issued.

The school superintendent of New York has generally approved of the scheme, but he is at present somewhat dubious as to whether it might not interfere with the regular work of the schools, keeping the pupils longer than the regular hours, or distracting their thoughts from their studies. The Patriotic Leaguers, however, are confident that none of these evils will result:

The teachers are required to be in their class rooms about twenty minutes before school begins every day, they say, and a part of this time would be all that would be required for the running of the whole of the city government.

On one morning the primaries could be held, and the next the convention could sit, and the next morning the election be held. The counting of the votes, the canvassing, and the induction into office of the elected members could each be taken up in turn. On Mondays the commissioners could receive reports from

their subordinates, make their own reports on Tuesdays, and on Friday afternoons the council could sit. Except for enforcing the rules there would be no work or thought required of the pupils during any but the time now wasted in the mornings while waiting on the half hour on Friday when a part of the pupils are now allowed to go home early.

Such is the scheme as it was described to me in New York. It seemed quite the most original and promising project that I came across in my hurried visit to the New World. I, therefore, lose no time in describing it for the benefit of my readers at home, and in the colonies, where I hope that its intrinsic merits will commend itself to those who are practically interested in the teaching of children and the training of our future citizens for their duties to the city and the State.

## CHAPTER XII.

### THE STUDY OF ART AND LITERATURE IN SCHOOLS.

By W. T. HARRIS.

CONTENTS: I. Why Art and Literature Ought to be Studied in Elementary Schools.—II. Beauty in Art v. Beauty in Nature.—III. The Educational Value of the Tragic as Compared with the Comic in Literature and Art.—IV. The *Æsthetic* Element in Education.

---

#### I.

#### WHY ART AND LITERATURE OUGHT TO BE STUDIED IN ELEMENTARY SCHOOLS.<sup>1</sup>

All questions relating to the course of study in the schools must be taken first into the court that decides on educational values, and next into the court that settles the order of sequence. The former investigates the meaning of the proposed study in the light of civilization, and the latter the place of its introduction into the school programme. The first proceeding is to place the question in the light of all human learning, and the second is to place it in the light of educational psychology.

Our present question, therefore, must be examined with a view to see what art and literature mean in our civilization—what they have meant in the past, and what they must necessarily mean in the future that shall be. Then, having settled its degree of importance, we may turn to educational psychology and ask where, in the education of man, can this profitably be introduced, what stages of growth it presupposes as already attained, and what methods are best for the results we wish to accomplish.

By the term art I designate sculpture, painting, architecture, and music. By literature I mean chiefly poetry—epic, dramatic, and lyric. I include also such prose writings as critical miscellanies which furnish reflections on the same general themes that poetry treats. Above all I include the novel, the romance, or the story. While the epic poem has for its theme the conflict of nations, the novel treats of conflicts in civil society and in the family, and has been called the epic of the bourgeois.

In order to see what we have to do with in art and literature, let us look for a moment at its place among the fundamental activities of the soul. (Parenthetically I explain that I group together art and literature under one definition as the province of *æsthetics*: and hence I sometimes use the pronoun *it* or *its* to refer to them.)

The highest idea that man reaches is his thought of the divine as the first principle of the universe. There are three forms in which he attempts to express this idea. First, in religion: second, in art; third, in philosophy. This highest idea appears necessarily as the good, the beautiful, and the true. We call the effort

---

<sup>1</sup> Read before the Department of Superintendence of the National Educational Association at Indianapolis, February, 1897.

to celebrate the divine and realize it in good deeds religion; the effort to give visible forms or audible forms to it gives us the various branches of the fine arts and literature. The attempt to explain the world by the divine idea and to comprehend ultimate truth is philosophy. Thus we are to regard art and literature as having the same theme as religion and philosophy. The idea that sculpture and painting, music and poetry have no other use than amusement must give way to the view which regards them as among the most serious and worthy occupations of the human soul.

All that man does contributes to a revelation of human nature in its entirety, but art and literature lead all other branches of human learning in their capacity to manifest and illustrate the desires and aspirations, the thoughts and deeds of mankind. Hence the educative value of these things. In the presence of the conflict of moral ideals, the struggle of passion against what is rational, the attacks of sin and crime on the divine order of the world, all that is deepest in human character is manifested. Art and literature portray these serious collisions, and like the mountain upheavals that break and tilt up the strata of the crust of the earth and reveal to the geologist the sequence of the formations from the most primitive to the most recent, so these artistic situations reveal to all men the successive strata in the evolution of human emotions, ideas, and actions. Thereby the single individual comes to know the springs of action of his fellow-men.

I have already named the four provinces of art—architecture, sculpture, painting, and music; and the three general divisions of poetry—epic, lyric, and dramatic. There are, moreover, three great historical epochs of art and poetry, corresponding to the three great stages of advancement of the nations of the world into conscious freedom. For the art and literature of a people reflects its degree of enlightenment and is, in fact, next to religion, the chief means by which its civilization is preserved. We accordingly have as the lowest stage the art of nations that have reached only the freedom of the social world without reflecting it in the individual. The citizen is buried beneath a mass of customs and usages, laws, and prescriptions which he has had no hand in making and yet can not refuse to obey. This form of civilization is only a little above a condition of slavery for its citizens. Its art accordingly does not create forms of free movement, but represents by appropriate symbols the crushing out of individuality. Such is the art of the great nations of Egypt, Eastern Asia, East India, Persia, and Western Asia. It has been described by Hegel, whose *Æsthetik* is by far the most satisfactory philosophy of art, as symbolic art. Its works of art adumbrate or hint at what they do not adequately express.

The highest form of art is reached by the so-called classic nations—Greece and Rome. They arrived at the expression of freedom in the body—freedom in its pose and freedom in its action. This is properly called gracefulness. The limbs of the body are obedient to the will of the soul. When the limbs are in the way, when the soul does not know what to do with them, we have awkwardness as a result, and not gracefulness. The Greek artist would not paint a family group with their arms folded or their hands folded. Their hands and arms would be in action obedient to some purpose of the soul. But some Dutch painters would show us peasants embarrassed by their limbs, peasants who would evidently feel greatly relieved if their arms could in some way be detached from their bodies—perhaps unscrewed or unhinged in some way and hung up on the hatrack outside the room, with their overcoats and head covering. Greek art seizes for its theme some moment of life when all the limbs are required to express the purpose of the soul, as, for instance, in the Apollo Belvedere. If it takes for its theme a sitting figure—the Olympian Zeus—it poses the body in such a way that we see the full control of the will over the limbs. The sitting Zeus could rise instantly and hurl

his thunderbolt. The "classic repose" of which we hear is ever a graceful repose; graceful because the whole body is pervaded and controlled by the soul.

The third stage of art is Christian art; or, as Hegel calls it, romantic art, which at first is occupied in showing the superiority of the soul to the body, and for this purpose selects for its subjects examples of steadfastness under severe trial—martyrs, and especially the sufferings of Christ. It goes so far in this as to set itself in opposition to classic art, and sometimes indicates its contempt for gracefulness in order to accentuate its preference for inward freedom and spiritual elevation. It portrays freedom from the body, while Greek art shows freedom in the body. In the later development of Christian art we see the attempt to represent gracefulness without losing the expression of the pre-eminence of the inner life of the soul over its corporeal life.

In Fra Angelico's paintings we see Christian martyrs with tortured bodies, but meekness and peace in their faces—a peace that passeth understanding; for they are at one with the divine. There is no longer the expression of the desires of the body, but only the religious longing for spiritual perfection. Classic art showed us the soul in the body and with bodily desires and passions, but purified by subordination to social restraints. Christian art shows, in this first stage, the opposite of Greek art—not freedom in the body, but the renunciation of the body.

Then there is a second and later phase of romantic art, represented by such artists as Raphael, Murillo, Da Vinci, Michael Angelo, Correggio, Holbein, and Rubens.

Gracefulness has been more or less restored by these, but not the classic repose of the Greeks, for there remains even in the latest forms of Christian or romantic art the portrayal of a longing or aspiration of the soul for something beyond what it has achieved.

Here we can pause for a moment and consider the reason for giving the rank of highest phase of art to the Greek.

We have seen that religion realizes the divine in the good, while philosophy defines it in a highest principle and attempts to explain all things by it, but that art manifests the divine in material forms, or at least by images of material beings; so that we may say that art is the union of the spiritual and the material, while religion is the emancipation from what is material.

Now, classic or Greek and Roman art is the perfect realization of this union of the material and spiritual, hence the highest type of art as art. Christian art, representing as it does the struggle of the soul against its physical environment, is a form of art that looks toward religion. It is therefore a transition from art to a higher form of the realization of reason; namely, religion. But art is not a mere transitory phase of human culture; it belongs to all subsequent ages of human history after it has once come into being. Moreover, the classic form of art will more and more come to be admired in all the future Christian ages because it portrays freedom in the form of gracefulness. The earliest Christian ages could not admire Greek art without falling back into sensuality. It had not yet attained a persistent hold of the spiritual. But when the Christian idea had been evolved in history to a point where natural science could be pursued in a free and untrammelled manner, then came the age of inventions, labor saving and knowledge extending; inventions that enable us to conquer nature and emancipate ourselves from that drudgery which had been necessary for the sake of food, clothing, and shelter. We are now in this age of productive industry which is the sequel to inductive natural science. We see all about us the triumph of wealth. Wealth in the form of capital enables not only its possessors to obtain large shares of food, clothing, and shelter and means of access to knowledge, but it enables the unthrifty of the community, to the last man of them, to obtain a proportionately greater share in creature comforts and spiritual privileges. At the beginning of

this century the average total production per inhabitant in the United States was only 10 cents a day, and of course the share of this must have been very small for the poor. But in 1890 the average production had risen to nearly or quite 50 cents per day, and the share of all had proportionately increased.

In the presence of this development of power over nature we desire to see a reflection of our material freedom, and we accordingly gratify ourselves by reproducing Greek art with its graceful forms. The perennial image of free control of bodily forms pleases us, as it did the Greeks, but it does not excite in us a feeling of worship, as it did in the Greeks, for we worship a transcendent God, one who can not be fully revealed in graceful forms like Zeus and Apollo, but who needs religion and philosophy for his revelation, for the Christian civilization needs not merely piety of sense perception, which is art, but piety of the heart and piety of the intellect. We have varied our spiritual wants, and we have a place for art in our lives as a reflection of our freedom.

Literature and art in passing over from the classic type to the romantic become more fully pervaded with the expression of motives and delicate shades of feeling. They show us in a more complete manner the subjective or inner life of the individual. In modern art we can see all of the successive stages by which a blind desire in the mind of a character becomes at length an emotion, and then a well-reasoned thought, and later on a conviction, and finally an action.

The greatest works of art ought to become the most familiar ones to the people. Care should be taken, therefore, in the school to select these great works and to lead the pupil into an understanding of the motives of their composition and, next, to point out the artistic means and devices for the expression of the thought or idea portrayed, for I have said that a work of art is the union of thought and matter. The senses perceive the material object, but a higher faculty of the soul perceives the work of art and enjoys the spiritual suggestion in it.

By successive stages the teacher will carry forward his elementary pupils into an appreciation of the great works of art, and thereby cultivate their taste and make them wise with a knowledge of human nature.

The literary characters painted for us by Homer, Sophocles, Dante, Molière, Shakespeare, and Goethe are better known by the people than any historical characters, and they are thoroughly understood. People learn to do their thinking with them. They furnish keys to our everyday experience; for the great poets have given us characters that are types representing the chief classes of men and women in our civilization. Moreover, the situations in which these typical characters are placed involve the difficult problems of life and furnish their solution. The ambition of Macbeth, the jealousy of Othello, the indulgence of sudden gusts of wrath by Lear, furnish us vicarious experiences of life and widen our knowledge of self. The retribution that overtakes sin and error is seen by us with purifying effect. Aristotle has remarked that this purification through sympathy and terror is one of the chief uses of the drama.

The wrath of Achilles and the selfish pride of Agamemnon; the long-delayed return of Ulysses and the steadfastness of Penelope; the cycles of heroes and heroines of the Iliad and Odyssey have furnished literary categories for European thought for nigh three thousand years. They have grown into great ganglia of apperceptive ideas, and one has to become acquainted with Homer simply to understand the contents of his own literature.

Dante's Divine Comedy gives 500 biographies, foreshortened in the perspective so as to show the life of each sinner or saint as determined for weal or woe by his own deed.

Goethe's Faust depicts for us the life of the modern agnostic who tries to live up to his theory, but finds in the end that the world of human history presupposes the Christian theory of the Absolute. God must be a divine reason rather than a blind, persistent force.

What a large family of men and women, heroes and cowards, learned and simple, moral and immoral, Walter Scott has motivated in his poems and novels. It is a liberal education to be familiar with his works.

The school readers do not contain these works that I have here named, but they offer fragments of some of them. Moreover they prepare the way for an understanding of the greatest works by widening the pupil's vocabulary from the merely colloquial one that he brings with him to school, by enriching it with choice selections from Tennyson, Wordsworth, Longfellow, Whittier, Bryant, Carlyle, Emerson, Hawthorne, Swift, Webster, Gray, Campbell, Wolfe, Byron, Shelley, and more than a hundred others.

The pupils of our elementary schools become familiar with at least 200 felicitous literary works of art, containing expressions of thoughts and feelings that would otherwise remain dumb and unutterable in the pupil's mind. The school must, above all, see to it that the pupil makes incursions into great works of art in his home reading. He may be led to read the Merchant of Venice or the Midsummer Night's Dream, or some part of the Iliad or Odyssey or the Æneid, or especially Walter Scott's Ivanhoe or Rob Roy, and certainly The Lady of the Lake. Once a taste is formed for a work of the great author, a culture is begun that will go on through life.

The photographic art has made possible schoolroom instruction in the great works of architecture, sculpture, and painting. The greatest works should be selected rather than third and fourth rate ones. In the Metropolitan Museum of New York City there is a model of the Parthenon 12 feet long.

Mr. Prang, of Boston, has reproduced for us in colors, for schools, the Eastern façade on which is the pediment group of Phidias, restored by archæologists from the fragments that have been preserved. It shows the scene on Olympus after the birth of the goddess Athene from the brain of Zeus. On the left the god of the sun is urging his steeds up from the waves; in the east and on the right Selene, the moon, is driving her terror-stricken steeds into the western waves—for day is to ascend into the sky for Athens, and night depart. The patron goddess has been born. The Three Fates spin the thread of life for her; the gods and goddesses of the Attic land turn their heads joyously to the newly born Athene, as Iris hastens toward them with the glad tidings. For dignity and repose in action, these figures of the Parthenon surpass all art known to us. Taking the Parthenon for one specimen of architecture, add a large photograph of the Cologne Cathedral for Christian architecture, all of its lines aspiring toward the heavens and seeming to be supported from above rather than from the earth below.

For painting, let the school get good photographic reproductions of Raphael's "Transfiguration," "Sistine Madonna," and "St. Cecilia;" of Holbein's "Dresden Madonna;" of Coreggio's "Holy Night," and Da Vinci's "Last Supper." On stated occasions, say twice a month, explain to the pupils the motives that the artist has depicted in the composition of his picture, for the composition is the first thing to study in a work of art. The pupils will become skillful in interpreting pictures after the analysis of a few famous ones from the great masters.

For sculpture, besides the figures on the Parthenon, get photographs of the "Apollo Belvedere," the "Laocoön," Michael Angelo's "Moses," and the Medici marbles, and also of the antique busts of "Zeus Otricoli" and "Hera Ludovisi."

If these photographs of architecture, sculpture, and painting are made to adorn the walls of the schoolroom, they will produce a permanent effect on the pupil's mind in the way of refining his taste, even if no studies are made of the motives that the artist has brought into their composition. But, of course, the composition lessons should be provided for in the programme of every school.

As to music, our high school pupils learn to perform selections from Mendelssohn, Rossini, Schubert, Mozart, Beethoven, Wagner, and Schumann. There

ought to be studies made of the motives of a piece of Beethoven or Wagner, corresponding to those made on Raphael or Da Vinci.

It is by this study of the motives of the artist and his use of them in creating what is called the organic unity of his work of art that the pupil can be made to see that art is as serious as history, and even more truthful, as containing a logical consistency in the return of the deed upon the doer.

Art and literature preserve for us the precious moments, the elevated insight of seers who are, next to the religious seers, the greatest teachers of the human race.

## II.

### BEAUTY IN ART VS. BEAUTY IN NATURE.<sup>1</sup>

One of the good definitions of art describes it as a means of manifesting the divine in material form for the apprehension of the senses and the reason. This definition makes art one of the three highest products of the soul. The three highest activities of the soul deal with the beautiful, the good, and the true. Religion deals with the revelation of the divine as the good. Art deals with its manifestation as the beautiful, and the truth in science and philosophy deals with the definition of the divine for pure thought. The beautiful must contain two factors; first, a material factor, as stone and other building materials for architecture; stone, bronze, and other material for sculpture; canvas, pigments, etc., for painting; air vibrations produced by the agency of strings and columns of air in wind instruments, etc., for music; mental pictures of sensuous objects created in the mind through the words of the poet. Besides this natural side in art there is the other side, namely, the disposition of the material in such a way as to suggest spiritual activity—the feelings and passions of the mind, the motives of its actions, etc. It is this union of the spiritual with the material that makes art.

Inasmuch as the material has for its general characteristic inertness and receptivity of external impressions and complete absence of self-determination, what is material, as such, can not manifest mind, can not manifest intellect and will, because these are forms of self-activity. Material things become works of art when they are so disposed that they seem to manifest self-determination, or self-activity of a living soul within them. It is evident, therefore, that the highest work of art will take on human form because the human body expresses most readily in its countenance, in its attitudes and gestures, the feelings, thoughts, and volitions of the soul.

Regularity, symmetry, and harmony are degrees of the full realization of the art idea. Regularity obeys a hidden principle; symmetry presents identity under a deeper difference than regularity; harmony shows the subordination of regularity and symmetry to a more complete expression of the soul. A string of beads shows regularity, the mere dead repetition of the same form; but even this dead repetition is a manifestation of identity and a suggestion of a common origin of the individuals in one process. Right and left hands are symmetrical but not regular. You can not place the right-hand glove on the left hand. There is correspondence instead of repetition, and this represents the mind more adequately than mere regularity. The mind is an eternal vibration of subject and object. This is manifested in mere regularity; but subject is opposed to object, and this opposition is represented in symmetry. But the essential activity of the mind is much deeper than this. The mind as will modifies the object so as to make it conform to the subject. The mind as intellect thinks out the explanation of the

---

<sup>1</sup> Reprinted from the Indiana School Journal.

object and finds it a manifestation of divine reason. Harmony, or the sway of material objects by the indwelling soul, which uses it as an instrument and expression of itself, is the highest means of art.

With these principles in view, we are prepared to consider the question whether nature presents the beautiful in as high a form as art. It is obvious that inorganic nature by itself considered does not take on forms that represent freedom. Its forms are all derived from without, and do not express the desires, purposes, or volitions of mind. When inorganic nature is used as material and the artist gives it the human form as a statue or group or makes it expressive of human thought, it may become beautiful.

Some writers on art hold the doctrine that art is the mere representation of nature; but this can not be a true definition, because nature presents the ugly as well as the beautiful, and to represent the ugly of course does not convert it into the beautiful. A picture of the front of the Parthenon is beautiful because the Parthenon itself is beautiful. A picture of the Vale of Tempe, if taken from the right point of view, is beautiful. There are many landscapes that are beautiful, but very few landscapes that are beautiful from all points of view. Nature in its prose reality is very seldom beautiful. The artist must select his point of view and must remove from his picture certain objects which, though real, mar the presentation of the main features.

From our definition of art we can see that it is important that art shall express freedom. But there are many kinds of freedom. There is, for instance, freedom in the body, and there is freedom from the body. The Apollo Belvedere and nearly all the forms of the Greek youth in the pan-Athenaic procession on the frieze of the Parthenon are beautiful. They show the complete control of the soul over the limbs of the body. This beauty is gracefulness, and Greek art is everywhere graceful; it is freedom in the body, but Christian art shows freedom from the body; that is, it portrays martyrs under torture, but with peaceful countenances, showing that the soul reposes in the thought that it has conquered the flesh and attained to holiness. Christian art is the third form of art; Greek or classic art is the second form of art. There is a lower form called symbolic art, in which freedom is as yet an unrealized dream. There is the painting of a struggle, but the material body is too much for the soul, and the soul can not realize itself freely. The art of Asia—eastern, middle, and western—together with the art of Egypt, is symbolic art, and has this character of an ineffectual struggle against the environment. In its sculpture the limbs are not at the service of the will. In its architecture the pillars or columns that support the roof are clumsy and lack gracefulness. The human faces do not express conscious dignity and the repose of the soul. The temples either have an abstract unity which does not admit of ornamental details, or else the ornamental details do not reflect the unity, and the eye gets lost in incessant repetition of trivial particulars which do not adapt themselves to the building as a whole.

Those who look upon nature as the source of the beautiful think of the landscape with its interesting variety of objects, its mountains and vales and winding streams, forests and meadows, the sky and the ocean. There is a sense of freedom which comes to us as we leave the city and pass into the country. In the city we have a burden of care constantly on our minds, because we must be mindful of our human environment. We have complicated relations with our fellow-men, and there is an unremitting pressure of duty. When we come to the country and are alone with trees, mountains, meadow brooks, and other inanimate objects we have a sense of relief from duty and from the worry which a network of relations brings to us. This is not a sense of the beautiful; it is rather a charming sense of relief. The charming and the agreeable is sometimes the beautiful and sometimes not, and in the case of the enjoyment of the green fields and the

wild luxuriance of nature we do not have the sense of the beautiful so much as the sense of relief and freedom from care. There is, however, a symbolic correspondence of a landscape to the soul. Take, for example, Church's "Heart of the Andes." In the distant background the Andes Mountains rise to great height and are crowned with glaciers; not a rock projects through the vast snow fields. All the light of the sun is concentrated on these white summits. In the foreground of the picture we have a beautiful river, with a cataract and rapids in front. On either side are venerable woods, with the gay-colored flowers that one finds in the Tropics. There are birds, with plumage of crimson and bright tints; a road winds along the banks of the stream and disappears in the forest. We trace the stream back through the central part of the picture; collections of houses or pueblos are seen on its banks, and then it enters the mountains and we are sure that it is fed by the water melting from the vast ice fields above.

Away up on the right the eye ascends through great forests, and above the crest volcanic flames are reflected on the ruddy clouds. Such a composition, with variety in the foreground and sublime heights in the background, bathed in sunlight, is a ready symbol of the human nature, which has its petty details, consisting of daily occupations, amusements and disappointments, diversions and griefs, efforts and intervals of repose, for ourselves and for our neighbors; these are in the foreground of the picture of human life. In the background arise the moral elements of our character, the structure of reason itself, especially its moral laws, its intuition of the Divine, its religious faiths, and its philosophical insights; these are abstract, like the white snows on the glaciers. No green thing grows on them, but they furnish, all the same, the fertilizing streams which descend to the vales of our mortal life. The stream of life and the stream of goodness that come from the Divine make glad the terrestrial abode of man.

Correspondence between divine and material things is the basis of poetry and art, and we feel this correspondence in proportion to the degree in which we possess a cultivated imagination. Very few of us are conscious of the æsthetic feeling. When we analyze it we find that it is due to a direct perception of will and intellect animating material things, or it is a dim consciousness of the symbol of human nature as a whole. A beautiful landscape must have heights and depths. Cut off the top of the picture with its distant heights and the foreground with its details will soon weary us. We look from the variety which lies near us up to the eternal mountains, and the feeling of the beautiful arises in our minds. If we cut off the foreground and look only at the heights in the background, the picture becomes too severe and forbidding, and it is no longer beautiful. We look from the cold and deserted snow fields to the foreground, following the charming river to the fertile fields which lie near us, and both extremes become beautiful through the relation. But symbolic art is not the highest order of art. Classic art, with its supreme principle of gracefulness, is the highest order. Romantic art, with its representation of freedom from the body, forms rather the transition to religion and is not the most perfect form of art. Religion is higher than art. Morality and holiness are higher than beauty, but beauty is a good thing in itself, and a religion that condemns the beautiful has not arrived at the perfection of religion. We are told by those who find the beautiful solely or chiefly in nature that nature is a revelation of God: "God is creating the world all the time or it is creating itself under God's laws. Nature is a perfect revelation of God's love and law. Surely they are His laws which govern the universe. These laws never change." But nature does not make human institutions, nor does it make art or the constitutions or forms of states and the laws which secure justice and which make things into property and protect property by laws which secure man's freedom from natural wants. Nature does not make religion nor does religion become Christianity until it sees that will and intellect transcend time and space and can

interrupt the natural causality in which each human individual finds himself. Nature does not make literature nor sculpture. In fact, the human form is not worth sculpturing until it has been trained in accordance with ideas of freedom. Beauty does not come into the faces of human beings until they are civilized. The Greek sculptor had to take for his models the youth who gained victories at the Olympian games and not the bodies of savages or of the people of Asia or Africa. So the revelation of the Divine is not through immediate nature, which is a scene of violence. Fate rather than freedom is realized in nature by itself. The Divine, which is absolute reason, does not realize itself in rocks and soils, in mountains and plains, in oceans and lakes. These are base elements not divine in themselves, though used by the Divine in the creation of a world. And the world is not for itself, but a cradle for the development of individuality through plant and animal. The divine purpose does not reach its end until it produces man, who is an immortal individuality, free and responsible, in the image of his Creator.

The beautiful is distinguished from the useful in the fact that the latter is wholly for another, while the beautiful is for itself. We give in sculpture and architecture, painting and music, and poetry the semblance of being for itself or independence to material objects. But nature is not able to do this except in a small degree.

Hence the beauty of art transcends the beauty of nature as much as man with his institutions excels nature with its inorganic and organic realms in the function of realizing the Divine.

---

### III.

#### THE EDUCATIONAL VALUE OF THE TRAGIC AS COMPARED WITH THE COMIC IN LITERATURE AND ART.<sup>1</sup>

It passes for a commonplace observation to say that the proper study of mankind is man. From the version of the Delphic oracle, "know thyself," down to the sententious maxim in Pope's essay, the dictum has passed with the ready acceptance given to a proverb or axiom.

The poet Tennyson believed that if we once thoroughly knew "the flower in the crannied wall" we should know all that man is and all that God is. If this be so, surely to know all that man is will be to know all that nature is. Indeed, man as an immortal being stands on the highest round of the ladder of nature and connects nature with the divine spirit. He therefore contains in himself the explanation of the purpose of the chain of beings rising from the senseless clod through the plant and animal as far as the first stage of human history. But this purpose originates in the divine purpose. Hence human nature is a revelation of the will of the Highest, if we take it in the comprehensive sense suggested by Tennyson's poem.

Doubtless the knowledge of human nature once fully reached will explain the inorganic as well as the organic phases of nature; the external process of causality as well as the internal process of motives and deeds. Then mathematics will be read in the light of psychology; so will geology and botany.

At present, however, we lay more stress on the difference between human nature and material nature than upon their identity. Sometimes, too, we restrict the use of our term human nature to the aims and aspirations, the emotions and convictions of man, and exclude the common rational elements of his mind such as we find treated in logic and psychology. In this restricted sense we not only sep-

<sup>1</sup> Read before the department of superintendence of the National Educational Association, at Chattanooga, February, 1898.

arate the humanities from the nature studies, but we take a special province of the humanities, namely, literature and art, and consider only its content as revealing springs of action.

In the course of study we place on one side all the studies that belong to mathematics, physics, biology, and astronomy, and we add to these the studies of language and history. We then place on the other side the single branch of study known as literature. We speak of the numerous studies in the first group as relating to nature and mind in general, but we contrast all these with literature, and assert that the branch of study set by itself over against that group, namely, the gems of poetry and belles-lettres, is the one that does more to give us a knowledge of human nature than all the others combined.

Thus in old age a man is apt to say of his studies in the elementary school: "What I learned of arithmetic, geography, grammar, and history has been useful to me, but it has not proved to be so thoroughly practical as the selections from literature which I read in the school readers; for in them I learned to observe and express the feelings and emotions of the heart. I learned to trace these mere feelings in their growth into convictions and clear ideas. They became principles of policy, and finally inspired and guided the acts and deeds of my life. In conning our reading lesson we learned how a blind instinct becomes an emotion, then a well-reasoned thought; later on, a conviction, and then an action; and last of all, a habit. We noted all this in the lives of others and also in ourselves. We came to know human nature in this important respect."

No matter how well equipped we might be as mathematicians or scientific experts of any kind, if we lacked the power of seeing this genesis of actions out of feeling in our fellow-men and in ourselves, our lives would become a chaos of misdirected endeavor. We never could adjust ourselves to our human environment; we should take offense where none was intended and make collisions with our associates, for we should first misunderstand their motives, next seize on the wrong means of persuasion and conciliation; finally end in misanthropy. With regard to ourselves, we should be equally powerless to control our passions and desires, not knowing whither they tended nor where they were to be repressed.

The narrow life can be lived through without much knowledge of literature. Intuitive practice in reading the feelings of one's fellows and in noting their effect on their actions which follow fits the individual for his narrow sphere. But there is as much difference between the knowledge of human nature that rests entirely on individual observation of the people of one's environment and that founded on an acquaintance with the best literature as there is between an Indian doctor's acquaintance with plants and the lore of a skilled botanist.

Let us make this plain by inquiring into the essential characteristics of the literary mode of portraying human nature.

First, we will note that there are two currents or courses of feeling and action; that of the particular individual, and that of the social whole of the community in which he lives. There may be harmony or there may be discord between these; it depends upon the individual.

When at harmony with the social environment the individual does not reveal the limits of his individuality nor the all-conquering might of the institutions of society. It is only in the collisions between the individual and the social order in which he exists that the whole of human nature is revealed in both of its phases, as individual and as social whole.

Thus we have tragedy and comedy as the two educative forms in which human life is served up for us in literature; for the collision of the individual with the social idea takes one of two forms.

Comedy shows us the individual arrayed against some settled way of acting or thinking, some ideal of society, and the discomfiture of his plans through self-

contradiction, but without destruction to the individual himself. The social organism in which man lives is of such a character that it converts his negative deeds into self-refuting or self-annihilating deeds. This occasions amusement to his fellows when they see that he is not seriously injured by his irrational deed. The comic character has mistaken the limits of himself. He has not noticed how the institutions of the social whole reenforce him, and render effective his individual deeds, if they are rational ones. To be rational a man's deeds must not only tend to his own interest, but to the interest of the family, the civil community, the nation of which he is a part. His smaller self must reenforce his greater self or else his greater self will reduce his efforts to zero.

But this comic side needs further discrimination from the tragic.

Tragedy arises from a serious attack on the social whole and the recoil of the deed on the doer, so that he perishes through the return of his deed. This is not all. There must be the justification of the individual's deed by the adoption of a principle from a social order different from that of the social whole which crushes him. He must act in the name of a greater self, or else his action will not be dignified enough to be called a tragedy. The death of the bandit, Karl Moor, in Schiller's *Robbers* is a tragedy, because it is not mere personal gain, mere selfish interest that causes the collision, but a revolt caused by a tyrannous social whole, whose rulers have done real or imagined injustice. We do not respect the mere thief or the mere highwayman. But we respect the patriotic remnant who struggle against a usurping social whole, even though we may feel satisfaction in their defeat by a more reasonable world order. The Children of the Mist are described by Walter Scott in the *Legend of Montrose* and in the *Heart of Midlothian* as the remnant of a once powerful people among the western highlands of Scotland, never tamed by their many defeats at the hand of the encroaching Anglo-Saxons who had obtained the rich and fertile lowlands. They fiercely defended themselves to the last, like the famous chieftan Kocheeis of the Indian tribe (Apaches) in Arizona a few years ago. We respect the Children of the Mist, but we feel the necessity of their subjugation by a more rational civilization. But we do not respect the burglars that hide in the slums of our great cities. The tragic character makes a collision with his social order in the name of another social order, it may be of a less advanced world order or of a more advanced one. Antigone defies the law of the king and offends against the state. But she obeys an older world order which requires the burial of a dead relative by the living member of the family. This collision is made stronger by the art of Sophocles. He interests us in the noble unselfishness of Antigone, while he casts suspicion of selfish ambition on the character of Creon the king.

So, too, we are excited to pity and terror by the events which bring Oedipus into dreadful crimes through ignorance. He, too, attacks the existing world order by a newer one.

There is the tragedy of the life of Socrates, also, who holds up a new world order to the Athenians, the first teacher in the world of the right of private conscience as against the established church of his time. Before Socrates there was no individual moral right—everyone was expected to obey implicitly the social custom without questioning it. This tragedy, however, is called by Hegel the tragedy of Athens rather than of Socrates. He drank the hemlock, it is true, but it was a triumphant death; for his was the entire future of the world history. Since his time there has been unceasing growth of the right of individual conscience among nations.

The tragic, we repeat, must have this collision of the individual against the social whole in which he lives, but he must be backed by the principle of another social whole, either a perishing world principle or one of the future just beginning its career.

A mere attack against the state from motives purely selfish is criminal, but not tragic.

The commission of crime, and the capture, conviction, and punishment of the criminal make a story that interests us. But if we do not discover a moral principle in the mind of the criminal we are liable to injury in dwelling on the details of the story. The Police Gazette is justly excluded from the family, because it educates toward crime rather than away from it. The story of Jack Shepard, as told by Ainsworth, and the other stories of like character idealize the mere selfish revolt against the civil order. They are written from the standpoint of mere selfish individualism. The individualism that Socrates initiated was that of a moral individualism. Spend your life in the inquiry for what is right, and do not refuse the hemlock if it is your reward for preaching the right.

The death of Socrates was the tragedy of Athens; the death on Calvary was the world tragedy. But the world learned and learns its deepest lesson from that tragedy; not merely the right of individual conscience is taught by that, but the worship of sorrow; the sacrifice of the self as mere selfishness for the emancipation of other selves; the principle of divine charity; the missionary spirit.

Tragedy reveals the depths of human nature, while crime does not, because it shows us the struggle between two social ideals, an older and newer, an earlier and a later. These are revealed in their fullness in the struggle.

As tragedy demands that the tragic character must be the bearer of a diverse principle of social order, so, too, does comedy require something more than mere capricious difference from prevailing custom, and something more than mere self-seeking at the expense of the social whole.

Spanish Cervantes has depicted for us the attempts of Don Quixote at resuscitating knight-errantry. Knight-errantry had been a few centuries before a very serious affair for all Europe. Chivalry was an essential epoch in the history of Europe, and there is no epoch in the evolution of modern civilization more important than it, for it was the desertion of the classic ideal for the Christian ideal; it was the celebration of this abandonment of the old ideal and the adoption of the new. The ideas of love, honor, and fidelity were consciously set up as the expression of the new freedom that dawned on the mind of Europe as a result of the world view of Christianity. Each soul has an infinite destiny beyond the grave. All that is secular is secondary to this religious principle. There were three crusades made as a result of this new consciousness: First, the conquest of the land containing the holy sepulcher. This was the outward crusade against Islam. Secondly, the inner crusade, the refutation of the Arabian interpretation of the Aristotelian philosophy by the great thinkers, marshaled by such scholars as Alexander of Hales, Albertus Magnus, and Thomas of Aquino. This was the scholastic crusade. After these outer and inner crusades came a little later the discovery of America, the third crusade, against the darkness of outlying heathenism. Queen Isabella contributed her jewels to fit out the fleet of Columbus in the name of the holy church.

Knight-errantry was a passing phase of one of the most serious of spiritual movements. And when we laugh at Don Quixote's adventures we do not laugh at him as a madman or lunatic, but at the ineptness of the Old World form seriously set up in the midst of a comparatively modern world. Its mediations seem absurd when deprived of the principle of chivalry and its social order on which they had been established.

Just so in Walter Scott's story of Woodstock, and especially in that of Old Mortality the excesses of Protestant individualism, both of Independents and Presbyterians, are found in comic situations because brought against a more advanced or matured theologic view. They furnish comic and not tragic situations, because they do not involve the characters portrayed in destruction for their views, but only in futile acts and endeavors; endless self-contradictions.

Aristophanes ridicules not the older world views, striving for reestablishment in his time, so much as the products of the new movements put forward by the sophists and the freethinkers of that time. He took Socrates as his type and model of a sophist. He ridiculed anything and everything that was offered as a substitute for the old customs, the Greek morality that had come down from the good old times. Nothing could stand up against the inextinguishable laughter kindled in the *Clouds*, the *Wasps*, the *Frogs*, and his other comedies. The bad went down altogether, and the good went down temporarily in the person of Socrates. But Aristophanes did not save Athens from "the newness," after all. Alexander the Great, the pupil of Aristotle, the pupil of Plato, the pupil of Socrates, had to save Athens from the good old times incarnated in Spartan conservatism. The great, grand pupil of Socrates, in the person of Alexander, marshaled Grecian youth to war on Persia, and his conquests extended to India and Bactria, and Greek kingdoms took the place of Persian satrapies. We see how serious were the elements entering the most comic of all comedies, those of Aristophanes. He had serious intentions, but he did not show the deeds of the individual returning upon him to destroy him. His dramas showed only the futility of plan and purpose undermined by inherent self-contradiction.

We have in later comic writers, say, Swift and Sterne, the production of comic situations by means of importing one nation's customs into another nation. Seen through the eyes of one land or native country the daily habits of another land or country seem absurd. The French word *outré* expresses it. Swift is an Englishman who goes to Ireland and acquires a habit of looking critically on the ordinary manners and customs about him. He does not ridicule the Irish, however, but his own countrymen, the English, and writes the voyages to Lilliput and Brobdingnag, everywhere showing up the inconsistencies and absurdities in the social and political life of England in the first part of the eighteenth century.

Sterne shows French and Belgian life through English spectacles.

Our own Mark Twain shows us border-land life through the eyes of the urban life of the Atlantic slope, and in turn he makes his most comic situations by showing us the border-land traveler, with his local prejudices and ignorance of the history of culture, making his journey through the museums and art galleries of Europe.

But in all these examples we have one serious national order against another, the French against the English, or the American against the European, or the earnest pioneer life against the life of culture.

A definition of comic and tragic situations may be made as follows, using the distinctions of content and form, content standing first for the temporary or transient, the local or individual interest, the less substantial side. When it is placed under the form of the permanent, the ethical or universal or the substantial interest, it is seen at once as ridiculous. The form is a world too large for the shrunken importance of the content to fill. The special interest is given the dignity of the general interest, the local and provincial puts on the airs of the world culture, and we can not help but laugh at it. We have within us the psychologic reaction of making up our minds for a serious and universal interest and then suddenly encountering the local and insignificant. We collapse with laughter, for laughter is the physical counterpart to the inner collapse of our ideas descending from the great to the small.

On the other hand, the content may be a serious matter, a collision of world ideas; the person bearing the new or old ideal, and with all seriousness setting it up against the established usage, proposes a content for which the existing form has no place. It would shiver that form to admit it. The established form must destroy it and its bearer. We may act against the new content and kill the messenger that brings it, but we do it in pity and terror, for it is a tragedy. The new substance is too ample for the old form. The new idea and its bearer can

not yet be tolerated. His time is yet to come. It must be a tragedy under the present circumstances.

We take courage, however, in this thought, that new forms are on their way which will permit without danger to the social whole a greater freedom in the adoption and promulgation of new or old ideas. There will come a larger tolerance and fewer tragedies.

In concluding our survey of the tragic and comic we may ask ourselves whether they belong to the sublime or the beautiful, one or both.

We are disposed to call the tragic the sublime and to see in the comic its opposite, which is said to be the ridiculous. So the opposite of the beautiful is the ugly. Certainly the comic or ridiculous contains the elements of ugliness, but in contrast with what? Certainly not with the sublime. It is the irrational overcome by the rational. But the beautiful is defined as the spectacle of the rational overcoming the irrational. It is a presentation not to the reason or the intellect primarily, but to the senses; to the senses primarily, and only secondarily to the intellect or reason. Nevertheless, both activities, the sense and the reason, must participate in the perception of the beautiful. To the reason alone the beautiful becomes simply the true. "The beautiful is the splendor of the truth," said Plato; it is the glory of the truth seen by the senses. Just so the truth presented to us through the will is the ethical, or rather the good. As the reason must be present and cooperate with the senses in the perception of the beautiful, so the reason must be present and cooperate with the will in the good.

The beautiful certainly includes the works of art in which the tragic and the comic, one or both, are presented. The sublime, therefore, may be considered as falling under the concept beautiful if it is to be applied to tragedy. But it is better to make the sublime a separate idea coordinate with the beautiful, and not containing or contained.

The sublime is properly applied to that whose content and form are not commensurate or in harmony with each other. The Old Testament descriptions of God's power often make nature so inadequate that it is seen to be no adequate revelation of God's omnipotence. The result is an idea of sublimity, but not of beauty. The vast things of the earth, its mountains and seas, the sky and the rocky foundations of the earth, these, together with the sun, moon, and stars, are such inadequate manifestations of Jehovah that we conceive sublimity rather than beauty. The beautiful is an adequate manifestation, something in harmony with that which is manifested in it. The sublime reveals the spiritual as not revealable—that which is to manifest the spiritual is made very distinctly to manifest its incapacity to manifest—hence we have an æsthetic contradiction, art refuting itself.

We now see or may see the educative function of the tragic and comic; for all art must treat as its best subjects the tragic or the comic phases of human nature. In each of these it makes us conscious of the eternal elements of human nature, the divine-human in some contrast with the finite and transitory.

In no way can the individual learn to know the practical problems of human nature so effectually as through art and literature. He learns to see how the deeds return upon the doer to bless him or to curse him. The individual learns to know his greater self, the social whole.

The world view of a people gets its utterance in the national poets, and hence the great works of art, such as have been furnished by Homer, Æschylus, Sophocles, and Aristophanes for the Greeks, by Virgil and Dante for Italy, by Molière and Cervantes for France and Spain, by Shakespeare for England, and Goethe for Germany, contain a vicarious experience. The types of character presented give the people their apperceptive material under which to classify the people they meet with in their lives and the deeds which they see performed.

We learn best the lesson of the deed which we see others perform. Without making the experience ourselves, we profit by seeing others make it. The experience of the poet thus becomes our own vicariously. Human nature recoils against direct advice, and does not like to have personal applications made. But as Aristotle said, the spectacle of the drama purifies the beholder. The lesson is more impressive and wholesome because it is accepted by us in our freedom and not imposed upon us by external authority.

---

#### IV.

##### THE ÆSTHETIC ELEMENT IN EDUCATION.<sup>1</sup>

In the course of study as we find it in the schools there are five distinct lines of intellectual development which have deep significance, both as regards the unfolding of the mind itself and the adjustment of the career of the pupil toward the social institutions in which he is to live.

These five lines of intellect which the pupil cultivates in school aid him in perfecting his powers as an individual, and also in solving the problem of life. They have both a psychological side and a sociological side.

Two of these five intellectual disciplines are mathematics and grammar, these relating especially to the world of nature and to the world of mind as revealed in language. While mathematics give us the forms in which inorganic matter may exist and be moved, and makes known to us the structure of time and space and all externality, grammar and its kindred studies, pure logic and ethics, give us the form of self-activity and the structure of all that possesses internality.

Here are the two polar directions of intellectual education, relating the pupil to matter and to mind. Psychologically, these branches give him the first use of the two deep-lying categories of the intellect, quantity and energy; the category of quantity deals with results in time and space; the category of energy deals with causal originations. If one does not see, at first, how grammar and logic deal with energy and its laws of self-activity, let him reflect on the fact that logic deals with the ideas of universal, particular, and singular, and grammar shows the devices in speech for their expression; and then next, let him consider that energy or self-activity has just these aspects, being general, if we consider it before it has acted on itself, and particular in the process of activity. It is, moreover, singular, or one activity uniting general and particular. He will find this thought the key to logic and grammar.

Out of these two primordial studies, mathematics and philology, arise three other studies, making up the five.

First, there is the study of organic nature, the first transitions from mathematical nature toward mind, or the pole of energy; not only the plant and the animal belong to organic nature, for they are manifestations of life, or energy, which is active in organizing matter and movement into bodily expression, but, besides these, we have chemical processes, and geological changes, cycles or circular movements of astronomical bodies, sun, moon, and planets, and the meteorological process, all of these belonging to the crude first stages of the manifestation of energy on matter. For, in short, we have a world that is in the process of making. It is ascending out of the mathematical condition, so to speak, to the organic condition, wherein energy, or mind, is manifesting itself in a more direct and adequate form; for the plant and animal show us perpetual readjustment of the internal to the external.

---

<sup>1</sup> Read before the National Council of Education at Milwaukee, July, 1897.

The internal readjusts itself to the external, but with a purpose, namely, to make the external environment of nature conform to its ideals and become its instrument. It is, therefore, at first an act of adjusting itself to the external, but finally a readjustment of the external to the internal, all brought about by the power of mind or energy. Thus all studies of nature, not only botany and zoology, or biology in general, but also physics, both molecular and molar (movements of molecules and masses)—in short, chemistry, and the sciences of heat, light, and electricity, also geology, meteorology, astronomy—all relate to the beginnings of the organic process and are a sort of foundation to it.

Hence the two branches that bring the school pupil face to face with nature are mathematics and biology, or the science of organism. In the elementary school geography covers this line of intellectual training, while arithmetic covers the purely inorganic side of nature.

There are two other lines, namely, the study of history and the study of art and literature, both of these subsidiary to the study of energy or self-activity as found in grammar, logic, and ethics.

History shows the spectacle of the will power of individual man consolidating into social units of will power—organizing institutions, the state, the church, and civil society, with its division of labor and its union of labor through commerce. In history the little individual sees his bigger self. In the Middle Ages the philosophers used to speak of the microcosm, or the individual man, and the macrocosm, or the organic whole of individuals. History, in this way of looking at it, enables the microcosm to see the macrocosm.

Even in the most elementary beginnings in the district school or the kindergarten there are scraps of history and biography that initiate the pupil into this great and important field of knowledge and enable him to see in dim, shadowy outlines what the great world (the macrocosm) is doing, and he is astonished to find that there are not only individual deeds for particular uses, but also deeds done by society as a whole—national deeds, and even cosmic deeds. It takes a long time to grow into the use of this category of the mind whereby we can see clearly social action and understand its results critically. The growth of this insight is the development of a moral sense in the pupil. It is something higher than moral habits, which he has already acquired in the family or ought to have acquired before coming to school. The stage of moral habit was learned through obedience to authority. It listened to the commands, "do this, and refrain from doing that." But though moral habit is a great thing in the conduct of life, it is not so great as moral insight, which sees the necessity of morals for the very existence of the social whole. Without ethical action the individual can not be reenforced by the action of his fellow men; he can not have institutions back of him—the family, civil society, the state, the church.

The fifth study, literature and art, is called "æsthetics," or, as in our council programme to-day, "the æsthetic element in education." I am sure that we can understand it better if we approach it, as we have done in this paper, by considering the hierarchy of studies—mathematics, grammar, biology, and history—on the way to it. For we have already become familiar with the trend of the whole. We have the general spectacle of a world of matter acted upon and organized by a world of mind or energy. From the mathematical or inorganic field we ascend to plants and animals organized by the principle of life. Then we come to the world of man, in which individuals unite to form social wholes, and see the ethical idea which forms the structure of institutions. For man as individual can not form a member of an institution unless he is moral. Morality is, in fact, a name for the kind of action which will not injure others nor obstruct their freedom—the name for deeds that will reenforce the deeds of others.

The manifestation of mind or self-activity on matter appears first in plants and

animals. For all living being has self-activity. But there is a higher form of manifestation, and that is found in history. It is, as we have seen, the smaller individual selves of men forming above them bigger selves or social selves, such as States and nations.

Art and literature, which is the æsthetic activity of men, has also for its function the manifestation of energy—or mind or self-activity. And, indeed, it is specially a manifestation, for it essays to create the appearance of it where there is no realization of it. History shows us not only an appearance of divine reason, but also a realization of it. Art shows us an appearance of it in fields of mere inorganic being—the mathematical province. It takes matter and shapes it into living forms, and makes it take on poses and movements that express freedom and moral action.

In short, it turns the world of externality pure and simple into a world of internality made perceptible to the senses of seeing and hearing. It shapes bronze and wood and marble into temples and statues. It brings out by light and shade and color and perspective on surfaces the paintings and drawings that represent rational and moral beings. It produces sound, arranged in a tonic system, and can by this means express feelings in a more direct manner than by the plastic arts. Finally, it makes the words of language its art material and reaches poetic expression, the highest of the arts, because of greater compass than all the others and more adequate in its manifestation of reason.

The school has always had literature in all its grades, but not so generally the other arts, except music.

It is the practical part of this discussion to show that architecture, sculpture, and painting should add their healthful lesson to the curriculum of the school.

Let us briefly consider in the remainder of this essay the nature of the several arts and their respective capacities to educate man by the spectacle of reason.

Plato said that "the beautiful is the splendor of the true." This is a definition good for all time. For art renders visible or audible the world of internality and truth—the world of mind or reason is indeed the object of the several arts or æsthetic modes of expression.

The several fine arts are, in an ascending scale, architecture, sculpture, painting, music, and poetry. Dancing, landscape gardening, engraving, elocution, dramatic art, and rhetoric are accessory to one or more of the five great departments of art, rather than separate departments.

Art appeals to the feelings. It arouses emotions and aspiration, but not appetites. Its effects are, therefore, to purify the feelings. It directs them toward ideals. It is not so much an education of conscious thought as of instinctive judgments in matters of taste. But as it has to do with ideals, it inspires religious and ethical emotions, and through these indirectly develops thought.

*Architecture.*—The silent lessons of architecture, the impressiveness of its masses, its harmonious proportions, its suggestion of great natural powers overcome by spiritual might—these effects are obvious. Art has an end of its own, and to be art of a very high character it must show that the beautiful object exists for itself, and does not exist for the sake of other objects—not even for morals or religion. But of course the highest art will be found in harmony with both morals and religion.

There are, as shown by Hegel, three stages to each of these arts, namely, the symbolic stage, wherein a spiritual might struggles without pronounced success against the natural powers which hinder it; higher than this, classic art, wherein the spiritual might has completely subdued matter and force into means of expression for its ideals; third, there is romantic art, Christian art, which expresses the ideal with more or less antagonism toward what is material and natural.

Thus the architecture of India and Egypt belongs to symbolic art. The human

is struggling against the natural, but is not able to subdue it and achieve freedom. The highest achievement of Egyptian architecture appears in the pillars or columns of its temple crowned with the lotus, for in the lotus capitals there is an approximation toward gracefulness.

Greek architecture is much superior in its expression of freedom. Its Doric, Ionic, and Corinthian columns fully achieve gracefulness. In a solid wall for the support of roof the manifestation of the forces which are struggling against the power of gravity are not so adequate as when the support is a pillar or column. The column being isolated, the effects of gravity are exhibited in the yielding of its capital, its expansion as in the Doric capital, or the graceful yielding curves as appearing in the Ionic volute, or the graceful bending of the acanthus leaves in the Corinthian capital. Gravity is manifested on the one hand, but the Greek capital shows how easy and gracefully the supporting column resists the downward force.

The Roman arch is converted into a dome by carrying out its principle on all sides, instead of laterally alone. The arch is a ready suggestion, symbolically, of the Roman national principle. Each stone in the arch is relatively a keystone to all the rest. All depends on each and each on all. Each Roman citizen felt and acted as if he were the keystone to his nation. The dome suggests the sky over all, and hence toleration. Under the dome of the Roman Pantheon the gods of all nations were set up and worshipped. The dome is an appropriate symbol for the State or nation. Each patriotic citizen consecrates his life for the life of the social whole, and each is in turn supported and protected by the rest like a keystone.

Romantic architecture comes to its highest completeness in such Gothic structures as the cathedrals of France and the abbeys of England, but especially in the Cologne cathedral and that of Amiens and the Sainte Chapelle of Paris. It celebrates the Divine not as something originating in matter and lifted up away from matter by its self-activity, but it expresses rather the complete nugatoriness of matter except as supported by spirit. For instead of expressing the effects of weight or gravity in its slender columns, it expresses rather the support of what is below by what is above. The columns seem visibly to pull instead of to push or thrust. It is the heavens that support the earth. It seems as if the cathedral floor is fastened to the columns, and these pull up and sustain the floor by fastening it to the roof. All the lines point upward and seem to worship what is above. The Christian religion is expressed in the Gothic cathedral, which has been called a petrified prayer. The Roman dome expresses the universal sway of civil law—a sky of justice, which extends over all. The Greek temple shows freedom in matter. It crowns a hill, like a blossom which has ascended from the surface of the earth to manifest a deep inner self-activity of matter itself.

*Sculpture.*—The statuary of Egypt and the Orient does not express freedom, it abounds in stiff and ungraceful lines, but the statuary of the Greeks is the supreme achievement of that beauty-loving people. In the highest period of its perfection it represents so much dignity of character, so much rationality and clear consciousness of purpose in its figures of the gods, that the Divine itself seems to be present in material form. Christianity has not been able to express its distinctive ideals in sculpture. It finds painting a far more adequate means. Painting can express sentiment by means of color; it can show subjective feelings and subtle reactions occasioned by the situation in which the theme of the work of art is placed. Modern sculpture is defective through the fact that an attempt is made to express sentiment, rather than action. The highest sculpture exhibits the serenity of the soul even in the presence of danger.

*Painting.*—The proper subjects of painting are to be found especially in the Christian religion and in the situations of modern life that appeal intensely to our ethical emotions. Greek painting, except what has been preserved for us in the

frescoes of buried cities, is known to us only through descriptions. From the evidences before us it is safe to say that painting did not find with the ancients its appropriate themes. The subjects of Christian painting are divine love and tenderness as seen in the Madonnas; the soul, supported by its faith in the Divine, manifesting its constancy even when enduring the bodily tortures of martyrdom; the Divine, gracious and forgiving even the crucifixion scene; the Transfiguration reflecting the light of the soul when seeing pure truth; the Last Supper exhibiting the emotions of the good when betrayed by the bad; the Last Judgment showing the return of the deed upon the doer; not so much action as reaction, not so much the deed as the emotion aroused in the depths of the soul by the presence of injustice and hate.

*Music.*—Music has the form of time, while architecture, sculpture, and painting have the form of space; hence it can express all the steps in the genesis of the situation which it portrays, and is not confined to a single moment, like the special arts. The group of statuary, the Laokoon, for instance, must seize the highest moment of the action and present it. In this highest moment we can see what has happened before and what is likely to happen in the time that follows. (Goethe has discussed this admirably in his essay on the Laokoon.) It will not do for the sculptor to attempt to present us in his work of art the entire completion or working out of the theme; he must seize it in the middle, where the spectators can easily read the past series of actions and motives and forebode what is to succeed. Painting is not so closely confined to a point of time as sculpture. Painting can idealize space through perspective, light and shade, color, clearness and obscurity. While actual size, actual length of line, is necessary in architecture, in painting it can be represented by perspective. Not only the largest temple of the world, but even Mont Blanc could be painted on a piece of ivory which could be covered with one's thumb. Painting, moreover, by reason of the fact that it can present to us sentiment through the aid of color, finds the limitation of its theme to a single moment of time less important. But music can take up the whole series of actions and reactions which are presupposed by a serious situation of the soul and can carry these all through to the final denouement. The material side of music is found in the structure and peculiarities of the several musical instruments—vibration by means of strings, columns of air in wind instruments, and, above all, by the vocal chords of the human being. A tone is a repetition of the same wavelength. One tone can produce with another one which has an agreement with it partial or complete chords and concords; with another tone not agreeing with it it produces a discord. There is a natural order of tones, partly discordant and partly concordant, which forms the scale. It includes what is called an octave. An aria starts from the fundamental tone of a scale, or from its third or fifth, and by departing from the fundamental tone or from those kindred with it expresses its alienations and collisions. Finally, it returns to the fundamental tone or one of its close kindred, and the problem is solved. There is also counterpoint, which, like the persons in a drama, expresses a concordant or opposing aria to the chief one. With these resources music excels all the plastic arts in its ability to express problems and collisions of human life and their solution. Emotional disturbances and the restoration of harmony naturally take on this form of expression. But there is the music of sensuous pleasure, and opposed to it the music of moral action. The Italian boat song or the Scotch reel may express the former, and a sonata or symphony of Beethoven will express moral action. Architecture has been called frozen music. Neither architecture nor music deals directly with the shapes of rational creatures or with the image of the human form divine, they are confined to proportions and symmetries.

*Poetry.*—Poetry is the form of art that unites in itself all the others.

It is closely allied to music—the time art—and through the imagination it can

reproduce each and all of the space arts. It can do more than this; it can, through its appeal directly to imagination, transcend the time limitations of music, and the space limitations of architecture, sculpture, and painting. There is the poetry of the nation, or epic poetry, the poetry of society, or the drama, and the poetry of the individual, or lyric poetry. Comedy shows us a collision which has arisen between the individual and some social ideal in which the discomfiture of the individual is not so deep as to destroy him. The social organism in which man lives is such as to convert his negative deeds into self-refuting or self-annihilating deeds. This occasions laughter when the individual is not seriously injured by his irrational deed. Tragedy, on the other hand, shows us a serious attack upon the social whole and the recoil of the deed upon the doer, so that he perishes through the reaction of his deed. Tragedy, however, requires as a necessary condition that the individual who perishes shall have a rational side to his deed. A mere villain is not sufficient for a tragic character; there must be some justification for him.

The greatest poets are Homer, Dante, Shakespeare, and Goethe, and these artists are in the truest sense educators of mankind. The types of character exhibited in their literary works of art, Achilles, Agamemnon, Ulysses, Macbeth, Hamlet, Wilhelm Meister, and Faust, have helped and will always help all mankind to self-knowledge by showing them how feelings become convictions and how convictions become deeds, and how deeds react upon the doer through the great organisms of human society. The world-wisdom of a people is largely derived from its national poets, not as a moral philosophy, but as vicarious experience. Aristotle said that the drama purifies the spectator by showing him how his feelings and convictions will result when carried out. Without making the experience himself, he profits by participating in the world of experience depicted for him by the poet. It is more or less in human nature to recoil against direct advice, especially moral advice. We do not like to have its application made personal; but in the work of art we see the moral energies of society acting upon ideal personages, and the lesson to the spectator is more impressive and more wholesome, because it is accepted by him in his freedom and not imposed upon him by external authority.

## CHAPTER XIII.

### THE WESTERN LITERARY INSTITUTE AND COLLEGE OF PROFESSIONAL TEACHERS.<sup>1</sup>

#### A CHAPTER OF WESTERN EDUCATIONAL HISTORY.

By B. A. Hinsdale, Ph. D., LL. D., professor of the science and the art of teaching in the University of Michigan, and Mary L. Hinsdale, A.M., graduate student in that institution.

One of the most interesting chapters in Western educational history, and, indeed, in the educational history of the country, has never been written and is known only in scraps and fragments. This missing chapter the writers here attempt to supply. Its subject is the Western Literary Institute and College of Professional Teachers, commonly called by the second of these names. The origin of this college is involved in some obscurity that it would be difficult or, perhaps, impossible to clear up at this late day; but the main facts are clear and plain.

An educational society called the Academic Institute was founded in Cincinnati in 1829. It was in all respects a pioneer society, and not much is now known about it. If the constitution and roll of members, with reports of the proceedings, are now in existence, the writers do not know where they may be found. The institute was undoubtedly a local association, and it is a significant fact, illustrating the character of educational progress, that it was organized the same year that Cincinnati, having first procured from the general assembly of the State the requisite authority, including power to levy special taxes, organized her system of common schools. The main interest attaching to the institute springs out of the fact that under its auspices was formed the association whose history we are to trace.

The publishing committee that sent out the first volume of *Transactions of the College of Professional Teachers* furnished in its preface some interesting items of knowledge. It gave this very brief account of the origin of the college:

The idea of the College of Teachers, in its present form, was first cast in the Academic Institute, an institution of similar character, but more limited operations, established in 1829. The project was the work of teachers, as may be easily imagined, but the sympathies of noble-minded and patriotic citizens, more

<sup>1</sup> The principal sources of information for the institute and college are: *The Academic Pioneer*, Cincinnati, 1831, Vol. I, No. 1; the six volumes of *Transactions of the Western Literary Institute and College of Professional Teachers*, 1835-1841; *The Western Academician and Journal of Education and Science*, edited by John W. Pickett, Cincinnati, 1837-38; E. D. Mansfield, *Memoirs of the Life and Services of Daniel Drake, M.D.*, etc., Cincinnati, 1855, and *Personal Memories, Social, Political, and Literary*, with sketches of many noted people, 1803-1843, Cincinnati, 1879; William G. W. Lewis, *Biography of Samuel Lewis*, first superintendent of common schools for the State of Ohio, Cincinnati, 1857; W. H. Venable, *Beginnings of Literary Culture in the Ohio Valley*, historical and biographical sketches, Cincinnati, 1891; and W. T. Coggeshall, *Ohio System of Common Schools*, in *Barnard's American Journal of Education*, Vol. VI. Mansfield says the College of Teachers was formed about 1833. Venable assigns it to 1831 in one place (p. 317), and to 1834 in another (p. 421). This confusion of dates as well as the contradictory forms of the name is probably due to the fact that the college was an evolution, presenting different forms and names at different times.

ambitious of usefulness than fame, have been the animating cause of its permanence and success. The first general convention of the teachers of the Western country was called in June, 1831, under the auspices of the Academic Institute. The proceedings and addresses were published in No. 1, of *The Academic Pioneer*.

Resorting to the number of the journal just named for further information, we are met, first, by the statement that, "agreeably to public intimation, the members of the Western Academic Institute and Board of Education met in the First Presbyterian Church in Cincinnati, June 25, 1831, at 11 a. m." The document contains a variety of information. First comes an address preliminary to the constitution, and then follows the constitution itself. Article I, reads as follows:

This association shall be denominated the Western Academic Institute and Board of Education, whose object shall be to promote harmony, cooperation, and the diffusion of knowledge among its members, and to discuss such subjects as may be considered conducive to the advantage of education generally.

There were to be two kinds of members, ordinary and honorary members; the first approved professional teachers, the second such literary and scientific gentlemen as might be chosen for the purpose. The officers were to be a president and a vice-president, recording and corresponding secretaries, a treasurer, a librarian, and seven counselors, who were to have charge of the periodicals, books, and library of the association, and were to make the programmes of the annual meetings. The society was to meet the first Saturday of every month, and the anniversary is appointed to be held in Cincinnati on the last Saturday of June, on which occasion an anniversary address was to be delivered. The significance of the second half of the name of the society is explained in the following article:

The society shall choose annually a board of education, consisting of honorary members, whose prerogative it shall be, individually or in committees, to visit and inspect the schools and academies of the members of the society quarterly, or oftener if they think possible, provided such visits do not contravene the duties of the city visitors of the district schools.

The principal address at the meeting of 1831 was delivered by Rev. Dr. Bishop, president of Miami University.<sup>1</sup> However it may have been seventy years ago, this address is now interesting reading. Dr. Bishop begins with setting forth various arguments for education, as those drawn from its political, religious, and industrial uses. He insists particularly upon the value of education to the people of the United States, dwelling mainly upon common schools, and alleging that improvements in these schools have not kept pace with improvements in other departments of life. He speaks of the disorganization growing out of the fact that each teacher is compelled, in defiance of all common sense and sound principle, to teach almost everything at one and the same time, and declares that a common school, to be efficient and to correspond with the other improvements of the age, ought to be divided into distinct departments, as follows:

In one department ought to be taught, and taught only, the alphabet, including the pronunciation of the vowels and diphthongs, in words of from one to four syllables.

In a second department ought to be taught arithmetic, from notation to the single rule of three.

In a third I would put reading and spelling and English and penmanship.

In a fourth I would put geography, with sacred history and the history of the United States; and

In a fifth department I would put all the higher branches of arithmetic, with the elements of general history, and of mental philosophy.

The advantages of having some such distinct departments would be these:

1. The elements of every distinct article would thus be presented to the young

<sup>1</sup> An interesting but brief sketch of Dr. Bishop, who had been a professor in Transylvania University, Lexington, Ky., for some twenty years before entering upon his work at Miami, may be found in the Decennial Anniversary volume of Miami University. The Republican Publishing Co., Hamilton, [1899].

mind distinctly and clearly, and hence, in the most of cases, everything would be fully understood from the very beginning.

2. A habit of forming clear and distinct conceptions would thus be early acquired. The common mode of teaching children is extremely unfavorable to this important branch of mental discipline.

3. A competent teacher would, under an arrangement of this kind, give a great deal more instruction on any one subject within a given time than in the ordinary mode and with a great deal less animal exhaustion.

Dr. Bishop pauses to glance at the influence that an improved mode of instruction in the primary schools would exert on the higher schools and colleges. More pupils would be fitted for the higher schools, more persons would receive an improved education, students who went to college would go better prepared, and the course of study in the higher schools could be extended and improved. He dwells at length upon the need of competent teachers. The subject of education he declares to be one great whole; no matter what else is done it will be of little value unless republican simplicity is preserved; much time must be devoted to instruction, both by teacher and pupil, in order to secure a good education, and proper social intercourse between pupil and teacher must be fostered. Of the charlatany that prevailed, he speaks in this decided fashion:

The strolling men of wisdom and of experience who propose teaching grammar and geography and astronomy and chemistry and natural philosophy and Latin and Greek and almost everything, in some ten or twenty or thirty lessons—and thirty lessons generally exhaust all their knowledge and acquirements on any one subject—these strolling teachers follow an occupation about as honorable to themselves and about as profitable to the community as the occupation of strolling beggars and strolling showmen is. There is, in fact, only one class of men who follow an occupation less honorable—that is, the class of strolling blacklegs.

The third address, delivered by Mr. Alexander Kinmont, was explanatory of the objects and designs of the Western Academic Institute. It contained what we should now consider an excessive number of Latin quotations, but Mr. Kinmont was fond of the classics, and such was the fashion of the times.

The committee of publication respectfully solicit information from all parts of the great Valley of the Mississippi concerning the condition of schools, the various improvements or changes that may have been lately introduced, and the state of public feeling on this very interesting and important subject.

The pamphlet closes with the prospectus of *The Academic Pioneer*, to be conducted by the editorial committee of the institute. The purposes of this publication are declared to be to furnish information in the various departments of education, to give efficiency to the means of instruction, to call to its aid the improvement making by the ceaseless action of the human intellect, and to bring home to the minds and bosoms of parents and instructors the importance and magnitude of the duty of proper attention to the moral, physical, and mental character of the young. The purposes are still further explained, and school committees and parents are appealed to to take a deep interest in the enterprise. As soon as a sufficient subscription should be received to justify the continuation of *The Academic Pioneer*, it would be published on or about the first of every month. It was to be 16 pages in size, and the price was fixed at \$1.50 a year.<sup>1</sup>

<sup>1</sup> The library of the Historical and Philosophical Society of Ohio, in Cincinnati, contains a single copy of a document that bears the following title page: "*Academic Pioneer*, Vol. I, Cincinnati, 1831, No. 1. Proceedings of the first anniversary meeting of the Western Academic Institute and Board of Education. Held in Cincinnati, June 25, 1831. *Quid majus reipublice, majus meliusve afferre possumus, quam si juventem docemus, et bene erudimus.*—Cicero. Cincinnati: Williamson & Wood, printers, 177 Main street. 1831."

Venable, in his "Partial list of literary periodicals published in the Ohio Valley from the year 1803 to 1860," gives this title: "*The Academic Pioneer and Guardian of Education*, Cincinnati. Monthly. 1833. 40 8-vo. pages. Price, \$2. Organ of the Western Academic Institute and predecessor of *The Academician*, Albert Pickett, editor."—*Beginnings of Literary Culture in the Ohio Valley*, p. 135.

Mr. Venable calls the meeting of 1831 "a general meeting of teachers" and "a convention."<sup>1</sup> The publishing committee of 1835 also calls it "a general convention of the teachers of the western country." We have no list of the members and are not able in all cases to locate those whose names are given, but it is clear that a large majority of those in attendance were from Cincinnati. Rev. Elijah Slack, A. M., D. D., president-elect, was from Cincinnati, while one of the vice-presidents was from Harrodsburg, Ky., and one from Risingsun, Ind. The long list of officers embraces the names of many of the men who were afterwards best known and most active in the College of Teachers.

It is apparent that the year 1831 was an important one in the history of the organization. Unfortunately, we have but meager accounts of what was done the two following years. The preface of the Transactions of 1834 contains a few bits of information. The second general convention was held in October, 1832, and the College of Teachers was then embodied in a constitution of its own and officered. Apparently the change of name from Western Academical Institute and Board of Education to Western Literary Institute and College of Professional Teachers was made at this time. The committee states that the proceedings came but partially before the public, and the addresses, although replete with spirit and sense, and worthy of being more generally known, were not published. "It was our poverty," said they, "and not our will that consented to this failure." Mr. Venable, drawing upon other sources of information, gives this fuller account of the convention:

The object of the second meeting in 1832, as announced in the newspapers throughout the West, was to promote the interest of education and to secure the cooperation of parents and the friends of science in aid of scholastic institutions, whether they are of a public or private character. The Cincinnati Mirror described the association as a congress of talent, several displays of which were a treat of the highest gust.<sup>2</sup>

The publishing committee of 1834 tells us further that the third general convention, held in October, 1833, was marked by an increase of power and interest; addresses of various descriptions were listened to by crowded audiences of intelligent citizens, but no more than a brief view of the proceedings appeared; yet even this, they say, when circulated through the Western country attracted general attention and proved how warmly the cause was espoused. It found disinterested friends in every quarter. In November of the same year a similar convention was held in Lexington, Ky.

It is quite clear that in the partial organization of 1831 the ambition of these zealous friends of education had outrun their ability. It would appear that the prospectus of *The Academic Pioneer* must have failed to accomplish its purpose, or at least that that journal could not have lasted beyond a few numbers, for if it had continued until 1834 it would have furnished the college the organ of publication that it needed, and might even have rendered unnecessary the series of volumes known as the Transactions. It took the College three years to fill out the form of 1831.

We have now reached the time when the promoters of the College were better able to realize their ideas. Beginning with the fourth annual meeting, in 1834, we have six annual volumes of Transactions, which give us a full view of what the College was doing. These volumes contain the minutes of the business sessions, most of the formal addresses and reports, the constitution and the annual list of members, and editorial notes, together with addresses and notices to teachers and to the public. This series of volumes, which is now rare as well as valuable, is quite indispensable to any thorough investigation of Western educational history. Its rareness—which means that it is little known—is a reason for drawing

<sup>1</sup> *Beginnings of Literary Culture in the Ohio Valley*, p. 421.

<sup>2</sup> *Ibid.*, p. 422.

upon its treasures more fully than would otherwise be necessary. In some respects the minutes of the sessions are even more interesting than the formal addresses. The two together show us very fully what was passing in the minds of the most active educators and friends of education in the Mississippi Valley in the years 1834-1840. We shall go through the volumes in order. They also show, in a measure, what was taking place in the general body of society.

The College of Professional Teachers in 1834 had now become fully organized.<sup>1</sup> Its name might suggest, perhaps, that it was a school, or some similar organization, for the preparation of teachers. It was nothing of the sort, but only an association of teachers and others interested in education. Its character will become very clear when we have taken account of its constitution. The preamble was in these words:

Whereas the convention of teachers assembled in Cincinnati, deeply impressed with the importance of organizing their profession in the Valley of the Mississippi by a permanent association, in order to promote the sacred interests of education so far as may be confided to their care, by collecting the distant members, advancing their mutual improvement, and elevating the profession to its just intellectual and moral influence on the community, do hereby resolve ourselves into a permanent body, etc.

Article 1 ordains the name, the Western Literary Institute and College of Professional Teachers, and defines its sphere of work:

Its object shall be to promote by every laudable means the diffusion of knowledge with regard to education, and especially by aiming at the elevation of the character of teachers which shall have adopted instruction as their regular profession.

It will suffice merely to summarize the other features of this constitution.

The association was to be composed of such teachers of good literary and moral character as might sign the constitution and pay to the treasurer the initiation fee of \$1 and an annual assessment of the same amount; and of such societies for the promotion of education as should annually send delegates to its meetings. Any gentleman eligible to membership might become a life member on the payment of \$10, and become exempt from further assessment. Honorary members might be elected on the recommendation of the board of directors.

The officers were a president, one vice-president and five directors for each State represented, a corresponding secretary, a recording secretary, and a treasurer, all of whom were to form the board of directors, to be elected at the annual meeting. The president and vice-presidents, the two secretaries, and the treasurer were to perform the duties that the titles of their offices suggest. The board of directors was to have the general management and supervision of the society, appoint competent persons to deliver the annual address and lectures, and recommend to the society suitable persons to serve on standing committees. The board had power to appoint from their number a local executive committee to carry into effect duties that might be assigned to it by the constitution. It was also directed to procure the annual address and lectures for publication, and empowered to examine the reports of standing committees and other communications, and to publish such of these documents as, in its opinion, would throw light on the subject of education. Each section of the directory, through its vice-president within its own State, had power to admit associates of that body, and were charged with the interests of education, but were made responsible to the general institute for their proceedings, to which they were to make an annual report.

The stated meetings of the society were appointed to be held annually in the city of Cincinnati, beginning on the first Monday in October. Special meetings might be convened by order of the directors. By-laws in accordance with this constitu-

<sup>1</sup> Transactions of the Fourth Annual Meeting of the Western Literary Institute and College of Professional Teachers. Held in Cincinnati, October, 1834. Cincinnati: Published by Thomas Drake. 1835.

tion might be made at any time, but no alteration or amendment of the constitution itself could be made unless recommended by the board of directors and agreed to by a majority of the members present at an annual meeting.

Some time before 1834 Albert Picket, sr., had become president of the college, and he continued such at least as long as the Transactions appeared.<sup>1</sup> He opened the annual conventions with an address. In the address of 1834 he defined some of the prominent objects which led to the formation of the college. These were as follows:

(1.) The necessity of advancing the profession by introducing a higher standard and requiring a more complete preparation among its members by rendering apparent to the community the great value of thoroughly educated teachers.

(2.) The desirableness of giving teachers an opportunity of becoming acquainted with each other and freely communicating their views of new modes of instruction as they are introduced.

(3.) The advantages of a liberal discussion on various systems and the accumulation of facts from numerous independent, practical teachers, and the consequent improvement of the objects, the course, and the means of instruction, and the qualifications and characters of teachers.

We shall now look into the secretary's minutes of the session of 1834 to see what we can discover.

For one thing, the local executive committee reported what it had done since the last annual meeting. In particular, it had addressed a circular to the boards of directors of the States represented and others interested urging the establishment of State institutions for the preparation of teachers. In Ohio this circular had had the effect of securing the chartering of an institution for collegiate purposes under the style of the Teachers' Institute, which was expected to go into operation as soon as it could be effected with a prospect of success. It had also brought before a convention held at Lexington, Ky., the previous November a plan of a general association of all who felt an interest in the promotion of education in the West. This subject it now urged upon the present convention. The proposed association should include as members literary persons who were friendly to the cause of education, embracing the College of Teachers as a component part, with a view of securing a sphere of operations and influence coextensive with the Mississippi Valley. The educational condition of the West was deplorable, with some signs of improvement, and educational information scanty and hard to be obtained. The committee suggested that the State legislatures be induced, if possible, to offer suitable rewards for the best essays on the best systems of education for the West. It mentioned, also, but without a recommendation, the subject of an educational periodical to be founded by the college.

There were 125 members in attendance.

The enlargement of the influence of the institute and college occupied much time and attention. The Circleville (Ohio) Association of Teachers sent in a communication suggesting that the college so amend its constitution as to admit auxiliary societies. Out of the discussion grew the constitutional provision relating to that subject that has been quoted above. The board of directors, through the executive committee, in obedience to instructions, also sent out an address to

<sup>1</sup> The authors have failed to find even the slightest biographical sketch of Albert Picket. He first comes into view in New York City in 1818, as editor, in connection with his son, J. W. Picket, of *The Academician*, the first educational journal published in the United States, and of which only one volume appeared. Mr. Picket was at that time the head of the Manhattan School. He and his son removed to Cincinnati not long before the college was organized, and there carried on a flourishing school for girls. He is said to have been the originator of the college. Mr. Mansfield describes him as "a venerable gray-haired man, who had been for nearly fifty years a practical teacher. He was a thorough scholar, a man of clear head, and filled with zeal for his profession. He presided over the college with great dignity, and I never knew a man of more pure disinterested zeal in the cause of education."—*Personal Memories*, etc., page 269. Mr. Picket is the author of numerous text-books, a list of which may be found in *Barnard's American Journal of Education*, volume XV, page 549.

teachers urging the formation of local societies where a sufficient number of teachers could be induced to attend, having in view the raising of the moral and professional character of teachers, the collecting and diffusing of useful information among other societies and adjoining neighborhoods, and increasing the power which springs from associated effort. It was also recommended that the college be notified of the existence of such societies, and that they send delegates to the annual meeting. A resolution was also adopted declaring it the duty of every member of the college to endeavor to establish county societies of education where they did not already exist, and to make a written report at the next meeting.

The discussions of the college were carried on in three ways: Formal addresses by individual speakers, formal reports by committees appointed the previous year, and the floor debates. At this meeting several of the standing committees submitted reports.

One of these reports, made by J. L. Van Doren, Lexington, Ky., related to the course and order of studies to be followed in female primary schools. With the exception of the text-books named, this report was fully approved; to recommend books was held to be contrary to the genius of the institution. This conviction appeared in another instance. Mr. E. D. Mansfield, an influential member of the body, laid before it the proof sheets of two works, one entitled *The Political Grammar*, of which he was the author, and one *The District School*, by J. Orville Taylor, of New York, requesting the opinion of the college on their merits; but the convention, having first referred the subject to a committee to report, unanimously voted that it was inexpedient at any time for the convention to constitute itself a tribunal of review.<sup>1</sup> The course of study that was approved has not been preserved.

A committee previously appointed to prepare a manual of instruction for the Mississippi Valley, which should contain the best plans for erecting schoolhouses and organizing schools, the best modes of government, methods of teaching, and branches of study, reported that it had found it inexpedient to prepare such a work, and asked to be discharged. This was accordingly done, but the convention, not satisfied with the outcome, immediately ordered the appointment of a larger committee to prepare such a work.

A committee was appointed to draft an address to the citizens of the Western States in relation to the inefficient modes of instruction that were so prevalent. Furthermore, the questions, "Are there any defects in the common schools?" and, if any, "What are they?" and "How may they be remedied?" were referred to the same committee, to report at the next annual meeting.

Still other action was had. A resolution was adopted soliciting written communications from teachers or others upon improvements in education to be read at the next meeting. There was also adopted, after discussion, a resolution that reminds us of the ambulatory schools of France, the moving schools of Scandinavia, and the traveling schools of New England, viz, that "we recommend the establishment of circuit schools in portions of the Western country where the population is sparse."

The list of officers elected for the succeeding year throws still more light upon the personnel of the college, its geographical distribution and educational status:

Albert Picket, sr., esq., senior principal of Cincinnati Female Institute, president.  
Thomas H. Quinan, esq., principal of Cincinnati Adelphi Seminary, corresponding secretary.

David L. Talbott, esq., junior principal of Cincinnati Academy, recording secretary.

Isaac Van Eaton, esq., treasurer.

<sup>1</sup> Mansfield's work was published in 1834. It was one of the early books on what we now call civics, and under a new title continued long in use as a school manual. Taylor's *District School* was also published in the East, and for a time widely read.

## FOR KENTUCKY.

Rev. P. S. Fall, president of the Female Eclectic Institute, Frankfort, vice-president.

Directors: J. L. Van Doren, president of Young Ladies' College, Lexington; S. V. Marshall, professor of languages in Transylvania University, Lexington; O. L. Leonard, esq., Frankfort; Rev. R. T. Davidson, Lexington; L. Munsell, M. D., Danville.

## FOR OHIO.

Rev. Elijah Slack, A. M., D. D., Cincinnati, vice-president.

Directors: Rev. W. H. McGuffey, professor of philology and mental science, Miami University, Oxford; M. G. Williams, esq., principal of Dayton manual Labor School; Rev. T. J. Biggs, professor of church history, Lane Seminary; A. Kinnont, principal of a Mathematical and Classical Academy; John L. Talbott, esq., senior principal of Cincinnati Academy.

## FOR INDIANA.

Rev. M. A. H. Niles, professor of languages, South Hanover, vice-president.

Directors: John H. Harney, esq.; W. M. McKee Dunn, esq.; Mr. Morrison, Salem; Rev. J. U. Parson, president of Teachers' Seminary, Madison.

## FOR ILLINOIS.

Rev. Edward Beecher, president of Illinois College, Jacksonville, vice-president.

Directors: T. M. Post, esq., professor of languages, Illinois College; Rev. J. M. Sturtevant, professor of mathematics, Illinois College.

Still adhering to the committee plan of investigation and discussion, the convention adopted a large programme for the ensuing year. A transcript of this programme will show what subjects were agitating the minds of Western educators in 1834 and also throw some light upon the personnel of the College of Teachers.

(1) To what extent may manual labor be beneficially employed as a means of reducing the expenses of a collegiate education? And should the engaging in such labor extend to all the students, or should it be left optional?

Committee: M. P. Jewett, of Marietta; M. G. Williams, of Dayton; J. M. Sturtevant, of Jacksonville.

(2) On physical education.

Committee: J. Cobb, M. D., John Eberle, M. D., Cincinnati.

(3) Ought anatomy and physiology to constitute a part of education?

Committee: A. Kinmont, A. M., Prof. Joseph Ray, Cincinnati.

(4) What is the best method of teaching English composition?

Committee: D. L. Talbott, Prof. Joseph Ray, Cincinnati.

(5) Elocution, embracing the best method of teaching extemporaneous speaking.

Committee: A. Harvie, Prof. C. Bradford, Cincinnati.

(6) How far is it practicable to introduce the physical sciences into common schools?

Committee: Thomas D. Mitchel, M. D., J. L. Talbott, Cincinnati.

(7) What is the best mode of establishing and forming common schools in the West?

Committee: Samuel Lewis, A. Picket, sr., Elijah Slack, Cincinnati.

(8) What is the best method of employing the principle of emulation (as defined by a resolution heretofore adopted by the college) as a means of instruction in our institutions of learning?

Committee: A. Kinmont, Daniel Drake, M. D., J. L. Talbott, Cincinnati.

(9) To inquire into the expediency of and report on the subject of an improved book of definitions.

Committee: W. Nixon, W. Hopwood, Cincinnati.

Part II contains seventeen discourses and reports on education, as follows:

(1) Opening address. Albert Picket, President.

(2) Discipline. Discourse on the philosophy of family, school, and college discipline. Daniel Drake, M. D., Cincinnati.

(3) The classics. Lecture upon the study of the Greek and Latin languages as a part in the course of a liberal education. Prof. T. M. Post, Jacksonville, Ill.

(4) American education. Oration on the subject that neither the classics nor

the mathematics should form a part of a scheme of general education in our country. Thomas Smith Grimké, Charleston, S. C.

(5) The mathematics. Discourse on the utility of the mathematics. E. D. Mansfield, esq., Cincinnati.

(6) The classical report on the question, "Ought the classics to continue a part of education?" Alexander Kinmont, A. M., Cincinnati.

(7) Physical science. Lecture on the applications of principles to practice in the various departments of physical science. Rev. Elijah Slack, A. M., M. D., Cincinnati.

(8) Government. Lecture on the government of public literary institutions. H. A. M. Niles.

(9) Music. Address on the history and moral influence of music. William Nixon.

(10) Language. Lecture on the best method of teaching languages. William Hopwood, M. D.

(11) Annual report of the local executive committee of the College of Teachers made to the convention of 1834.

(12) Emulation. Report on the question, "Has emulation as a motive in education a favorable or an unfavorable influence?" Thomas H. Quinan.

(13) Emulation. Prof. Thomas J. Mathew's report of the minority.

(14) Emulation. Mr. J. Buchanan's report on the question, "Ought the principle of emulation to be appealed to as a motive in education?"

(15) Calisthenics. J. Livingstone Van Doren's report on the physical education of females.

(16) Common schools. Letter to the president of the college from the trustees and visitors of common schools, Cincinnati. Peyton S. Symmes, President.

(17) Closing address of the executive committee.

Biographical notice of Thomas Smith Grimké. Edward D. Mansfield.

As a rule these addresses were long, much longer than would now be listened to with patience, and several of them are accompanied by explanatory notes. Particular attention will be drawn to a few of them.

The discourse on discipline is one of the long addresses, occupying in its delivery a portion of two sessions. Its author, as well as its character, gives it interest. Daniel Drake was one of the most distinguished citizens of Cincinnati, an eminent physician and man of science, a voluminous writer, and one of the active members of the college.<sup>1</sup> He may be taken, therefore, as an excellent exponent of the best contemporary opinion on the subject that he discussed. When these facts are taken into the account his address becomes as good a base line as one could wish from which to measure the later movement of ideas. Only an outline need be presented.

I. God's universe is a universe of laws; to each law of nature and to each law of society a penalty is attached; the economy of the world is that rewards and punishments are the appointed means of securing obedience. To sustain this last proposition the argument from revealed religion is unfolded. Two and a half pages of texts of Scripture, embracing all the leading texts that were once so freely quoted in discussing this subject, are given.

II. Punishments—what shall they be? The constitution of childhood affords the foundation for physical correction; the Bible bears this out. The punishment

<sup>1</sup> Dr. Daniel Drake, the genius of the college, was born in New Jersey in 1785, and while still a boy was carried west to Kentucky by his father. His opportunities for early education were extremely limited. He was drawn to the study of medicine, which he prosecuted in 1805, at the University of Pennsylvania, and upon the practice of which he entered soon after. It is impossible here to give any adequate account of his extremely varied and active life. He was physician, man of science, author, educator, orator, man of society, and man of affairs, all in one. He was the founder of the Ohio Medical College and one of the active members, as preceding pages show, of the College of Teachers. He died in 1852. Mr. Venable says of him: "So many good works did he undertake, so much did he accomplish, so effectually did he stimulate exertion in others, both friends and enemies, that I think he may be called with propriety the Franklin of Cincinnati. Much of what he did for this Western metropolis reminds us of the philosopher who aided in founding the early institutions of Philadelphia." (*Beginnings of Literary Culture in the Ohio Valley*, Chap. X; see also *Memoirs of Daniel Drake, M. D.*, etc., Cincinnati, 1855, Edward D. Mansfield.)

of the body, even with the rod, is expressly enjoined by heaven as a parental duty. Corporal punishments are of two kinds—active and negative; the rod exemplifies the first, withholding satisfaction from the appetites, the second. The familiar argument that corporal punishment leads to self-abasement is refuted from experience, and the explanation added that physical punishment must be attended by an explanation of the causes why it is administered.

III. Physical rewards: These appeal (1) to taste, which encourages love of luxury; (2) smell, which is unattended by danger; (3) hearing, not dangerous, but less potent than smell because habitual with mothers and nurses; (4) feeling, that is, physical exercise, no danger; (5) sight, the noblest of all. These physical rewards are then combined in a description of a school ramble.

IV. Rewards and punishments of the mind: (1) The mother's smile and frown, very effective; (2) appeal to love of ornament, not dangerous; (3) appeal to love of play, commended; (4) appeal to love of property, making lessons of economy possible; (5) appeal to curiosity and wonder; (6) love of knowledge, an extension of curiosity and wonder, and seldom needing to be moderated in a child; (7) appeal to proper pride, or self-esteem, but there is danger of misdirecting pride; (8) appeal to proper ambition, and (9) appeal to love of relative distinction. Popular objections to the employment of these motives are then stated and considered, as that they tend to stimulate some minds to excess; that they generate unkind feelings among classmates, and that they substitute the applause of man for the approbation of God. These objections are not sustained. The resort to emulation is approved in these words: "The principle of emulation, then, is subordinate to the principle of duty to God, and not at variance with it, except when impossibly directed or excessively exercised. Under this view I regard the workings of emulation as not necessarily immoral, and in reference to its influence in schools the inquiry should be, how to obtain its valuable exciting influences without its disadvantages." (10) The innate sentiment of benevolence may be appealed to as a means of discipline; but (11) the highest principle of action is veneration for God. Such veneration is not carefully cherished in the United States, and particularly in the Mississippi Valley; the reasons lie in free institutions, etc.

At the close comes a summary of points essential to the success of any system of rewards and punishments. (1) Children, like grown persons, act from motives; when they transgress they have an object in view; they should therefore be carefully and patiently instructed in their duties. (2) There is great variety of bodily and mental temperament, which makes it necessary to study the character of each child, and to discover the appropriate means of rewarding and punishing him. (3) Children have periods of undefinable indisposition, and consequent irritability; those who govern them should look into this matter, and consider the facts in meting out punishments. (4) The excitation of fear is a legitimate means of correction, but children should not be frightened by goblins or be threatened with supernatural appearances. (5) Both rewards and punishments should be proportionate to offenses. (6) It is sometimes said that rewards and punishments do not change or purify our motives; the truth is, if we habitually make our actions right our motives will gradually improve.

Some of the topics covered by this address were also considered by the authors of the three reports on emulation, and the whole subject was also thoroughly and warmly discussed on the floor, some of the most prominent members of the college taking part in the discussion. Various resolutions declaratory of the sense of the college on emulation were offered, and finally the following, proposed by Mr. Kinmont, was unanimously adopted. It may well be doubted whether if one of our educational societies or associations wished to express itself on this subject it would do better than to adopt this resolution.

*Resolved*, That emulation, so far as it implies a desire of excelling others for the purposes of self-gratification is inimical to the principles of pure morality,

and ought not to be fostered in schools; but that so far as it involves a wish to excel in knowledge and virtue on their own account, to gain the esteem of the wise and good, and to improve to the utmost those faculties which are bestowed on each individual by his Creator, is praiseworthy and meritorious; but that this convention feel themselves inadequate to devise any universal system of rules, by which the original element, endowment, or affection of human nature might be so directed as to secure the good and avoid the evil: but that they believe it will be found less difficult to fix it in practice than to define it in theory and that therefore it should be left in its own natural undefined comprehensiveness, to be used according to the good sense and discretion of the teacher.

The interest of the meeting culminated in Mr. Grimké's oration on American Education. This distinguished Carolinian had won a wide reputation as a lawyer, scholar, writer, orator, and philanthropist; he was an ardent advocate of education and a well-known opponent of classical studies; very naturally, therefore, the local committee of the college, when it learned that he was to visit Miami University, at Oxford, Ohio, for the purpose of delivering a literary address, took steps to secure an address from him at Cincinnati on one of his favorite themes.<sup>1</sup> Beginning with Lord Brougham's famous saying, "The schoolmaster is abroad," Mr. Grimké plunged at once into the heart of his subject. His main thought was that the schoolmaster who is abroad in our land must be the Christian, the American schoolmaster; he must give a truly Christian and American education to make the people what they should be, peculiarly a Christian and American people. He uttered the settled conviction that the great body of the materials employed in education in our country are altogether unsuited to furnish what he regarded as the only legitimate object of a system of instruction for the people.

First: Of things as they are.

(1) They are not decidedly religious; if the Bible be used as a school reading book or a few verses be committed to memory, still it is not made the subject of daily instruction. (2) The existing plan is in no proper sense of the word American. The whole amount of attention paid to subjects purely American is measured by Morse's or Worcester's Geography, a 12mo history of the United States, and Pitkin's History of the Union, Rawle on the Constitution, The Federalist, or Story on the Constitution. Further than this, American biography, eloquence, history, political philosophy, and constitutional law are unknown. (3) The existing plan is so un-Christian and so un-American that it would suit equally well any other form of government, any other state of society, any other religion, and any other national literature. (4) The existing scheme does not fill the mind with useful and entertaining knowledge. (a) The mathematics: as to valuable knowledge, except the first and simplest parts of arithmetic, the whole body of the pure mathematics is absolutely useless to ninety-nine out of every one hundred who study it. (b) The classics: the classics have the advantage of the mathematics; but not more than one person in fifty who studies them keeps up his acquaintance with them. How seldom are either the classics or mathematics the subject of conversation. What is there in the classics that is really instructive and interesting? The history is too scrappy; the eloquence, in con-

<sup>1</sup> Thomas Smith Grimké was born in Charleston, S. C., in 1783. He was of distinguished family, Sarah Moore Grimké and Angelina Grimké (Mrs. Theodore D. Weld), who were prominent in the early antislavery movement, being his sisters. He graduated at Yale College in 1807, studied law, and won distinction both at the bar and in politics. But it was as philanthropist and reformer that he was best known. He held radical views on the subject of education, as the above account of him clearly shows. He published a volume of addresses on Science, Education, and Literature, New Haven, 1831. He was a man of the highest personal character. His Cincinnati oration was his last one. He left that city for Columbus after its delivery, but died of cholera before he reached it, October 11, 1834. Mr. Mansfield contributed a biographical sketch of him to the Transactions of 1834. See also Venable, Beginnings of Literary Culture in the Ohio Valley; Mansfield, Personal Memories; and Writings of Hugh Swinton Legaré, Charleston, 1845, Vol. II.

tent and spirit is alien to Anglo-Saxon institutions; the poetry finds themes in treachery and license; the heroes of Homer and Virgil are inferior to those of Walter Scott; the morality is of no more value to those who read the New Testament than Ptolemy is to modern astronomers. (5) The present system has no direct and obvious tendency to create and preserve the habit of intellectual improvement and the love of reading. (6) It does not furnish that discipline of mind which the country needs: First, mathematical reasoning has nothing to do with the materia's and modes of moral reasoning; secondly, the classics furnish moral materials that are alien to our age, social state, and government. (7) The study of the English language is sacrificed to the study of Greek and Latin. (8) English composition is very imperfectly taught, extemporaneous speaking neglected, the art of conversation not taught at all. (9) English grammar is taught only by rule, without regard to practice.

Second: Corrections of objectionable features.

(1) Christianity should be made an element of all general education; the Bible should become a text-book from the infant school to the university, not only because it is the fountain of duty and usefulness, but because it contains, (a) history the most authentic and valuable; (b) biography the most instructive and interesting; (c) philosophy the most profound, theological, and moral; (d) wisdom the most enlarged and practical; (e) eloquence and poetry the most sublime, pathetic, and beautiful. Other theological writings that may be recommended, are Dymond's Essays, Dwight's Sermons, and sermons from English and American divines. (2) The scheme should be decidedly American, embracing American history, biography, and geography. (3) It should be made suitable to our religion, government, and state of society, which may be attained by carrying out the two previous recommendations. (4) It should provide, in every stage of instruction, an abundant supply of useful and entertaining knowledge. The following substitutes for the classics and mathematics are proposed: Natural philosophy, natural history, geography, including travels, American history, American geography, English history and geography (not going back of Henry VIII and including Scotland and Ireland), modern European history, especially the history of France, eloquence. Christian, civil, literary, constitutional history, *e. g.*, Stewart's View of Society in Europe, Adam Smith, Ricardo, Pitkin's Civil and Political History of the United States, and poetry. To New Englanders, whether at home or abroad, the travels of Dr. Dwight are declared to be more full of the instructive and entertaining than the Livy, Cæsar, and Tacitus they study at home; while Mrs. Hemans has written a greater number of charming little pieces than are to be found in Horace and Anacreon. (5) It should look to the creation of love for reading; the substitution of English biography, history, poetry, and fiction for the classics will accomplish this end. (6) Discipline of mind; the studies proposed furnish moral materials and modes of moral reasoning. (7) English grammar or technical English grammar should be deferred till the close of the course. (8) Some practice should be secured in composition, extemporaneous speaking, and conversation; the classroom method should be conversational. (9) Pupils should be required to speak correct English. The conclusion is reached that Christian and American subjects should have assigned them nine-tenths of the time that is now consumed by the classics and mathematics.

Mr. Grinké, with all the rest, was a spelling reformer. His oration is printed in the "Transactions" in accordance with his ideas, which are briefly stated in a prefatory memorandum.

But Mr. Grinké's views were not the only ones that were presented on his leading topics. Before he had delivered his oration, Professor Post had warmly advocated the teaching of the classics, and afterwards Mr. Kinmont presented the report which he had previously prepared in relation to the same subject. Mr.

Kinmont<sup>1</sup> took occasion, when presenting his report, to offer some extemporaneous remarks in immediate reply to Mr. Grimké. He said Mr. G. had not analyzed the terms of the phrase "Christian and American education," and that without such an analysis they were well fitted to delude. He declared that if there was anything valuable, intrinsically so, in the Grecian and Roman intellect, it is virtually and substantially Christian; and that an American education must be an education suited to Anglo-Saxons planted in America, and such an education calls for everything fair, good, and useful, no matter from what country, or from what age it comes. A proper American education could not be narrow or exclusive. Mr. Grimké had said that the best way to study history is to go backward rather than to come forward. The history of every people is to a far greater extent independent than dependent on that of preceding nations. Mr. Kinmont showed real grasp of the principle of historical continuity when he said the Anglo-Saxon race did not originate in America, nor did it come hither to seek the seeds of liberty and religion and good government, but to plant them.

A committee of four was appointed to report at the next annual meeting on the course of study that Mr. Grimké proposed, and a resolution was adopted calling upon his friends to organize an institution in accordance with his ideas for the purpose of subjecting them to an experimental test.

Mr. Grimké's views met with opposition from another quarter. Mr. E. D. Mansfield, the journalist and publicist of after years, made an ardent and interesting defense of mathematical studies, though not as an offset to Mr. Grimké's views. He maintained that mathematics is the most powerful discipline of the mind; that in the business of life it is the most useful attainment; that in this western country there are peculiar reasons for its study; and that, therefore, there could be no better means of intellectual education. This address furnished the familiar lesson on the mathematics found in one of the well-known school readers of a generation ago, containing the passage:

Yes; he who would shun mathematics must fly the bounds of "flaming space," and in the realms of chaos, that

dark,  
Illimitable ocean,

where Milton's Satan wandered from the wrath of heaven, he may possibly find some spot visited by no figure of geometry, and no harmony of proportion. But nature, this beautiful creation of God, has no resting place for him. All its construction is mathematical, all its uses reasonable, all its ends harmonious. It has no elements mixed without regulated law; no broken chord to make a false note in the music of the spheres.<sup>2</sup>

<sup>1</sup>Alexander Kinmont was born and educated in Scotland. He made his home in Cincinnati in 1827, where he conducted a select academy for boys. He was an excellent classical scholar and teacher, and a stout advocate of classical education. Venable says of him, "He was adored by his pupils. He believed in great freedom in school, allowing the boys to study aloud. It was his theory that a student ought to be able to get a lesson in the midst of the confusion of a steamboat wharf. If two of his boys got into a quarrel, he ordered them to leave the room and settle their dispute by a fair fight." The same author thinks he was "perhaps the most forcible and aggressive man in the college." He died in 1833. (Beginnings of Literary Culture in the Ohio Valley, p. 423.)

<sup>2</sup>Edward Deering Mansfield was born at New Haven, Conn., in 1801, and came west with his father, who was surveyor-general of the Northwest Territory, in 1803. He graduated from Princeton in 1822, and finally made his home in Cincinnati in 1832. He was by profession a lawyer, but he made his reputation as a publicist and professional writer. He was an editor and the author of numerous books and pamphlets. He was one of the most prominent citizens of Cincinnati, and one of the active men in the College of Teachers, contributing abundantly to its discussions. His Political Grammar, afterwards Political Manual, was one of the first books for schools on the subject of government. His American Education, its Principles and Elements, is still in the market. Mention may also be made of his Personal Memories, Social, Political, and Literary, Cincinnati, 1879, and Memoirs of the Life and Services of Daniel Drake, M. D., etc., Cincinnati, 1855. Mr. Mansfield claimed to have originated the name "people's colleges," given to the public schools.

Besides the addresses and reports published in the Transactions, Rev. W. H. McGuffey,<sup>1</sup> then of Miami University, made an address that was not prepared for publication, and so did not appear, on "The influence of the regular study of the Bible on intellectual and moral improvement." Following this address the subject of Bible teaching in the schools was discussed, the discussion closing with the unanimous resolution: "That the Bible be recommended as a regular textbook in every institution of education in the West."

The convention was marked by one feature that now would be thought novel enough. The president of the trustees and visitors of common schools of Cincinnati submitted to the college a list of eighteen questions asking, in the name of the board, the opinion of the college, or its committees, upon such questions as they had been led to investigate. They were questions that were occupying the minds of the board, which had come into being only five years before, and were causing its members much perplexity of mind. A similar appeal by the present Cincinnati Board of Education, or any similar one, to the National Council of Education, would today be thought a strange proceeding. The mere fact that it was made suggests the character of the times; in respect to popular education school boards and others interested in the subject saw men as trees walking, and they were seeking to purge their sight. In particular the board invited the judgment of members of the college upon the model schoolhouse that had been built on Race street. The letter was referred to a special committee, from which we shall hear at the next meeting.

The fifth annual convention of the college, so the introduction to the Transactions for the year asserts, was one of unusual interest.<sup>2</sup> The names of 147 members are found in the printed list, and officers were elected for eight States, viz: Kentucky, Ohio, Indiana, Illinois, Missouri, Tennessee, Mississippi, and Louisiana. At the second session the local executive committee submitted its annual report, which contains many items of interest. The history of the publication of the volume of Transactions for the previous year suggests the financial difficulties under which the college labored. Copies of the volume had been sent to the twenty-four literary colleges of the West, besides seminaries. A circular had been sent to these colleges and seminaries, with a view to secure their cooperation in the college. The rapid growth of the Mississippi Valley in population, 150,000 or 200,000 a year, calls attention to its educational conditions, and imposes heavy burdens upon teachers and friends of education. The influence of the college has been extending, like leaven, since its organization in 1831. Important educational associations have been formed in Kentucky and Ohio in the course of the year, which have held interesting meetings. The influence of the general convention and of local conventions has caused schools, academies, and colleges to arise within two or three years in the forests, and multiply in a manner unprecedented.

The committee urged that associations for the advancement of education be formed in New England, in the Middle States, in the South, and in the Great Valley; and, furthermore, when all these have met and deliberated and published

<sup>1</sup> William H. McGuffey was born in Pennsylvania in 1800; lived in childhood in Trumbull County, Ohio; was educated at Washington College, Pennsylvania; in 1826 became professor of ancient languages at Miami University; in 1829 was licensed a minister in the Presbyterian Church; in 1832 became professor of philosophy in Miami University; in 1836 became president of Cincinnati College; in 1839 president of Ohio University; in 1843 was a professor in Woodward College, and in 1845 went to the University of Virginia as professor of moral philosophy. He died in Virginia in 1873. He was one of the most valuable members of the College of Teachers, but is best known as the compiler of the series of Eclectic School Readers, which, as Mr. Venable says, have favorably influenced millions of children in morals and intellect by their happy literary selections. (Beginnings of Literary Culture in the Ohio Valley, pp. 178-79.)

<sup>2</sup> Transactions of the fifth annual meeting of the Western Literary Institute and College of Professional Teachers, held in Cincinnati, October, 1855. Cincinnati. Published by the executive committee, 1856.

to the world their labors, "let a national institute of teachers be formed by delegations from these four great branches; let sectional jealousies—too contemptible in so hallowed a cause—be laid aside; let untrammelled and mature deliberations ripen into sage decision, and in a period not very remote a revolution will be effected in almost every department of instruction at which the most experienced teachers will be astonished. The march of science will be rapid, and a sound and substantial moral education will be born and bless society.

Some of the more significant resolutions that were adopted may well be quoted: That J. L. Van Doren be a committee to report on the propriety of employing a general superintendent for the city district schools; that a committee of three be appointed to adopt a petition to each legislative body in the Western and Southwestern States early in the coming winter, praying them to pass legislative enactments in behalf of universal education in their respective territories, and report the same to this college before its final adjournment; that this committee be instructed to petition for the universal establishment and support of common schools and seminaries for the education of teachers; that this college request the council of Cincinnati, or any other body, to furnish the College of Professional Teachers with a central and convenient room for the accommodation of a library of education, to be established by the college for the promotion of the cause of education in the West; that a committee of five be appointed to devise and report forthwith as to the method of reaching and animating the community on the subject of education; that, in the opinion of the college, it would greatly advance the interests of education in the West for teachers and the governors of schools and the friends of education generally to hold periodical conventions at the seats of government in the different States during the session of the legislature. Steps were taken to establish at once the educational library. Members of the college, booksellers, publishers, and the friends of education generally were respectfully entreated to contribute to its promotion. Still it does not appear that a library was actually established.

The committee on the expediency of petitioning the legislatures in the interest of universal education reported a plan embracing these features: The appointment of a committee of three in each State to serve as an organ of operations; the preparation of a form of petition to the legislature to be used by these State committees; the preparation of an address of fifteen or twenty pages in length, to be printed in pamphlet, containing outlines of the best and most improved systems of public education, with suggestions of possible improvements. The committee also submitted a form of petition. Such committees were accordingly appointed for the eight States that were represented. The committee to devise a plan for reaching and animating the community on the subject of education was accorded a full year in which to make its report. Vice-presidents and of directors were elected for the eight States above mentioned. When finally presented and adopted the list of subjects to be investigated in the course of the year and reported upon embraced twenty-four different subjects.

The accounts of the State convention of teachers held in Lexington, Ky., the previous November, and of the educational convention held in Columbus, Ohio, in the January following, contained in the appendix, give us valuable information of what the friends of education were doing and proposing in those States. The Kentucky teachers were careful to limit the phrase "universal education," found in one of the resolutions sent out from Cincinnati, by the phrase "of the white population." The reporter of the Columbus meeting states that the population of Ohio, nearly 1,500,000 in number, contains but few enlightened and efficient teachers. "A willingness pervades all ranks to aid and support a system of thorough and scientific instruction; but a great apathy prevails in action for

want of knowledge as to how and by what means such a system can be brought into existence."

Part II is rendered the more valuable by the abstracts of speeches made in the course of discussion on many of the addresses and reports. Omitting the names of the authors of such speeches, the following is the programme:

- (1) Opening address. The president, Albert Picket, sr.
- (2) Lecture on domestic education. Rev. T. J. Biggs.
- (3) Report on the education of immigrants. Rev. C. E. Stowe, Lane Seminary, Cincinnati.
- (4) Discourse on the importance of a more practical education. Rev. J. W. Scott, A. M., Miami University.
- (5) Report on anatomy and physiology as a branch of study in schools. Alexander Kinmont, A. M., Cincinnati.
- (6) Lecture on the relative duties of teachers and parents. Rev. W. H. McGuffey, A. M., Miami University.
- (7) Report on the best method of establishing and forming common schools in the West. Samuel Lewis, esq., Cincinnati.
- (8) Report on the system of education proposed by the late T. S. Grimké, Nathaniel Holley, sr., A. M.
- (9) Report of the committee on a manual of instruction.
- (10) Report of a committee on the expediency of an improved book of definitions. William Hopwood, A. M.
- (11) Report on the best method of teaching English. D. L. Talbott.
- (12) Report on the Carstairian system of penmanship. D. W. Woolley.
- (13) Abstract of the report of the committee on the questions submitted by the trustees of common schools, Cincinnati.
- (14) Remarks in reply to Mr. McGuffey on the establishment of auxiliary societies.

Appendix.—Proceedings of the educational convention held in Lexington, Ky., November, 1835; Proceedings of the educational convention held in Columbus, Ohio, January, 1836.

Four or five of these addresses and papers will be selected for comment. First, however, it should be remarked that this volume as a whole shows that the convention is drawing nearer to the overshadowing question of the times, namely, that of popular common-school education. The addresses are less academical and more practical and earnest than the year before. The college seems pervaded by the conviction that a vast work needs to be done, and done speedily, or that the most serious evils may be expected to follow in every sphere of life.

Mention will first be made of Prof. C. E. Stowe's Address on the Education of Emigrants, made at the request of the Emigrant's Friends Society of Cincinnati. He begins with some statistics showing the number and the nationality of the foreign population of the city where the college sat and of the immediate vicinity, their religion, means of instruction, etc. He reports that the Germans comprise a vast majority of such population, 10,000 in number, 2,000 or 3,000 Protestants, 8,000 or 7,000 Catholics. There are 1,200 or 1,500 children of school age, of whom only 400 are in the schools. He describes the organization and work of the society in whose name he speaks, and gives an interesting account of the efforts in behalf of the foreign population made by the students of Lane Theological Seminary. He says the children of the Germans are commonly apt at learning, and much more attentive than American children. He concludes that there are some 900 emigrant children destitute of means of education, and that the number is constantly increasing. He then makes a stirring argument in favor of vigorous efforts to reach this population. Their intellectual and moral training is essential to the common safety, to the generation of a true national spirit. The only effective agency that can be employed to transform these people into good American citizens is the school. A few sentences will show the drift of his appeal.

The children of immigrants must be taught English and prepared for the common English schools; and the safety of the Republic requires that destitute children should be sought out and made to attend the public schools. The public schools

should be our best schools and possess a character sufficiently elevated to secure the patronage of the influential and wealthy, that all the children of our Republic may be educated together. \* \* \* Private schools for special purposes would not be discontinued, but their encouragement and patronage increased; and the descendants of different nations need not forget, but still know and love, the language and literature of their fatherland. So many languages as a man learns, so many times is he a man, said the sagacious Charles V of Germany; a child can learn two languages as quick and as easily as one, etc. \* \* \* Education should be universal. \* \* \* The limiting of elementary education to suit the peculiar circumstances of a particular country can serve only to confirm prejudices, to confine and narrow the mind, and prevent its onward progress. Chinese are carefully educated; but they have stood aloof from all improvement that was not of native growth, and now are very much as they were two thousand years ago. Modern European education has, on the other hand, been universal rather than national. \* \* \* The Bible without dogmatic comment, just as it is in its own simplicity and majesty, should be the text-book of religion and morals in our institutions of education, from the primary school to the university and professional seminary. \* \* \* Cincinnati possesses peculiar advantages for the commencement of such a work as this, and the designs of Providence are shown in the fact that the work has been in reality begun.

Professor Stowe's views were heartily seconded by several speakers who followed him.

Samuel Lewis's report on the best method of establishing and of forming common schools in the West looked to providing the means for such work as Professor Stowe described. He discussed the system that empowered school officers to appoint teachers in the schools and to pay for the tuition of the poor, leaving all those who were able to do so to pay for the tuition of their children as taxed in a rate bill. This plan, which was much in vogue early in the century, and sometimes produced what were called "charity" or "pauper" schools, Mr. Lewis condemned. He then considered the plan which was followed to some extent in Ohio, of levying taxes amounting to a small sum per pupil to carry on a public school as long as the money lasted, and pointed out the obvious objections, as that the school year was too short and the school overcrowded with pupils. He showed, also, the total inadequacy of the school revenues that came, or could be expected to come from the school lands voted to the Western States by Congress. In Cincinnati, he remarks, children aged from 4 years to 16 years are eligible to the public schools; such children are 7,000 in number; the school tax collected is \$10,146, or \$1.45 per scholar. Though this tax be annually increased, the increase will fall short of the growth of population. A competent teacher must have at least \$400 a year, and can not do justice to more than 35 scholars; at which rate the school fund would maintain the schools for all the scholars less than six weeks in the year. He strengthens his argument to show that \$1.45 is wholly inadequate to the purpose by citing the cost of tuition in private schools. He contends that the people were not hostile to common schools, but were ready to pay for them, and that they wished to have better schools. Public opinion was ahead of the schools. He laid down the following as indispensable requisites to establishing common schools in the West on the best plan: (1) The funds raised for the support of common schools must be adequate; (2) the very best teachers must be employed, and (3) the important duties of school visitors and examiners must be properly performed. This report and the speeches that followed abound in statistics and other facts in relation to the deplorable condition of the common schools, especially in the State of Ohio, which make them valuable contributions to the materials of history.

The committee of four appointed the previous year to consider and report on Mr. Grimké's proposed course of study left that duty to one of their number, Mr. Nathaniel Holley. The report was, therefore, simply an expression of individual opinion. Mr. Holley approved in the strongest terms of some features of Mr. Grimké's plan, as the demand for a thorough knowledge of our own country, its dis-

covery and settlement, its geography, customs, manners, and government, its first settlers and eminent men, its theologians, statesmen, and scholars; full acquaintance with the best English writers, and an accurate and extensive knowledge of the English language, together with its ready use in composition and conversation, and especially the strong emphasis placed on morality, piety, and a religious life, founded on the practice of Christian virtue and a close adherence to the doctrines of the Sacred Scripture. Mr. Holley then criticised Mr. Grimké's arguments against the study of the classics and mathematics, and presented arguments of his own in favor of those studies. Such was the state of society generally, he said, and such the state of families and schools, that children and young persons, with the exception of here and there one, did not and would not pay that attention to study that was requisite in order to acquire even a tolerable education. Teachers were so overwhelmed with scholars that they could not pay proper attention to them, and the result was that idle habits had formed in schools. When adequate provision for universal education shall have been made, there will be time for the classics and mathematics, as well as for Mr. Grimké's American education.

The manual of instruction comprised little more than a code of rules relating to school management and discipline, and a general course of study which was recommended as the lowest that should ultimately be adopted in primary schools. This course of study embraced reading, writing, and arithmetic, geography, grammar, composition, and the history and Constitution of the United States, geometry, surveying, natural history, including a general knowledge of the human organization, natural philosophy, moral philosophy, and the Bible.

Only an abstract of the report of the committee submitted in answer to the questions by the trustees of the common schools of Cincinnati is published. This abstract shows the report to have been a careful, painstaking document, taking up and answering one by one the questions that had been propounded. Both questions and answers are of the most practical character, revealing the state of the common educational mind at that period. The committee does not believe that the rod, which is the ordinance and appointment of Divine wisdom, should be laid aside; reading, writing, arithmetic, geography, the history of the United States and its Constitution, English grammar, composition, bookkeeping, with instruction in plain sewing for the females whose parents may desire it, are the appropriate and essential studies of the public schools; but on the question of the best school books the committee declines to commit itself. Furthermore, the committee holds that the sexes ought to be separated whenever small circumstances will admit; that it would be advantageous to establish infant schools for the instruction of children under 6 years of age, and that a high school should be established as soon as circumstances might warrant, containing a department especially adapted to qualifying young men and women for teaching. In answer to a question relative to the monitorial system, the committee answers in a guarded manner approving that system. The committee recommends the board to establish immediately a public library for the common schools, however small the beginning may be, and warmly recommends monthly meetings in which the teachers and the school trustees shall participate. These are a few of the topics considered in this report.

The attendants upon the convention of 1836 were not only much more numerous than upon any previous convention, but they represented a much wider territory.<sup>1</sup> The names of 222 members stand in the printed list, and vice-presidents and directors were elected for fifteen States, namely: Kentucky, Ohio, Indiana,

<sup>1</sup> Transactions of the Sixth Annual Meeting of the Western Literary Institute and College of Professional Teachers, held in Cincinnati, October, 1836. Edited by D. L. Talbott, Cincinnati; published by the executive committee.

Illinois, Missouri, Michigan, Pennsylvania, Virginia, Tennessee, Arkansas, Mississippi, Louisiana, Alabama, Georgia, and South Carolina. It is impossible to say with certainty that the officers elected for these States were all present, or, indeed, that any of them were present in some cases; but it is evident that the efforts which the college had been making to increase its constituency were bearing fruit. Some distinguished men were present for the first time. The editor of the Transactions, in his introduction, says that the college lays claim to no monopoly of wisdom or experience; it pretends to no more than this, that it institutes a "grand annual mart where the dealers and traffickers in intellectual goods may assemble for the interchange of their wares, and to receive and give encouragement." He further pronounces the education of human beings, even the meanest and most ignorant, a most worthy and noble employment; but this is yet only a sentiment, very easily written and very easily spoken; "it will require several centuries even in the United States of America—even in the West—to make it appreciated and honored."

The executive committee, in its annual report, not only gave an account of the efforts made to extend the influence of the college and to create interest in education, but it raised the question of the most eligible and desirable and practicable method of printing and publishing any educational documents that it may be deemed desirable to lay before the public. The committee says also that it had availed itself of the opportunity afforded by Professor Stowe's mission to the continent of Europe to open correspondence with several eminent literary gentlemen, such as Professor Pillans, of Scotland; M. Victor Cousin, of France, and Dr. Bowring, of England. From Bowring a response had been received calculated to confirm the committee in their previous persuasion that their cause was the cause of human nature.

At the first session a portion of time was spent in hearing verbal reports from delegates as to the state of education within their respective limits, and at the second session the communication from Dr. Bowring was read. The financial affairs of the college still gave trouble.

For some time the proposition to publish a periodical under the auspices of the college had been under advisement. A report from the executive committee dealing with this subject was adopted, and the proposition to undertake such a periodical approved, with the proviso that it should not in any way interfere with the annual publication of the Transactions in a separate volume. The report favored a periodical devoted largely, but not exclusively, to education. "Education in the abstract is, with many persons, a dry and uninteresting subject; and as the circulation of the work directed to that subject would be limited, although it might receive a patronage sufficient to carry it on, we would fail to circulate it among and to hold up prominently before the great body of the people this important subject, unless it were made somewhat miscellaneous in its character. For this reason, then, and in order to interest the community on this subject, we shall endeavor to extend its circulation over the widest field." The plan embraced the following features: (1) A periodical under such name and title as might be adopted; (2) an editor appointed from among the members of the institution whose appointment shall be permanent; (3) an editorial committee of conference, to consist of five members of the college, resident in Cincinnati, of whom the editor *ex officio* shall form one; (4) the editor to select annually his associates in the editorial committee, with the consent of the executive committee. The report was no sooner adopted than John W. Picket, son of President Albert Picket, was unanimously chosen editor, and the volume contains a "notice" from his pen defining more carefully what was proposed.

The following resolutions were adopted: "That it be made the duty of every member of the Western Literary Institute to promote the calling of educational

conventions in the several districts for the formation of associations of teachers, and of the friends of education." "That it is expedient and proper that anatomy and physiology should to a certain extent be made a branch of a general elementary education in our high schools, colleges, and universities. That to afford time in such of the latter as have a fixed term and course of study some of the branches of literature and science now taught should if necessary be abridged." "That this college believes the formation of library associations and the establishment of a library in every township in the Western States will greatly promote the cause of learning and the moral habits of the young." "That the executive committee be directed to offer a premium of \$100, or a gold medal of that value, as the author may prefer, to the writer of the best essay illustrative of the maxim that knowledge is wealth, competition being open to all friends of education in any part of the United States." "That it be recommended to the directory in each State to call the attention of their legislatures the present winter to the propriety of appropriating a portion of their share of the surplus revenue [that is, the surplus revenue deposited with the States by the General Government] to literary institutions, especially to the carrying out of common schools and female academies, so as to educate in morals and science the whole population in the South and West." A resolution was also adopted thanking Mrs. Louisa H. Sigourney for contributing to the interest of the convention her essay on female patriotism, which had been listened to with great satisfaction.

The subjects for reports for the ensuing year were 31 in number. Some of these subjects were very comprehensive, as this one: On the causes which conspired in the revival of literature, A. Campbell and R. Richardson; or this one: On a philosophical classification of all science, President Philip Lindsley and P. S. Fall. Practical topics, however, predominated. For example, a very strong committee, consisting of Alexander Campbell, Virginia; Samuel Lewis, Cincinnati; E. N. Elliott, Bloomington, Ind.; J. H. Harvey, South Hanover, Ind.; C. E. Stowe, Cincinnati; E. D. Mansfield, Cincinnati, and G. Weller, Nashville, was raised to consider this very pressing question: On the practicability and importance of creating departments in our State governments, having the subject of public instruction under their immediate supervision.

The contents of Part II show nearly the full range of the addresses and reports; a few were not published, as the lecture by Mr. John D. Craig on the prevalent inefficient and superficial modes of instruction, and the lecture of Thomas Sim, jr., on the claims of phrenology to the attention of teachers. This is the table:

- (1) Opening address. Albert Picket, sr.
- (2) Address on the proposition that a system of universal education is not only desirable but practicable. Rev. J. L. Wilson, D. D.
- (3) Lecture on the philosophy of the human mind. Rt. Rev. Bishop Purcell.
- (4) Abstract of a lecture on the difficulties in the management of colleges and the means by which they can be successfully met. Rev. R. H. Bishop.
- (5) Lecture on the importance of uniting the moral with the intellectual culture of the mind. Rev. Alexander Campbell.
- (6) Lecture on the qualifications of teachers. E. D. Mansfield, A. M.
- (7) Lecture on the necessity and importance of education. President S. H. Montgomery.
- (8) Lecture on popular education. John P. Harrison, M. D.
- (9) Essay on female patriotism. Mrs. L. H. Sigourney.
- (10) Annual report of the executive committee.
- (11) Report on the causes of the fluctuation of schools; the evils and their remedies. Rev. Samuel Lewis.
- (12) Report on the question, What is the best method of prosecuting the study of the Bible in common schools? Rev. P. B. Aydelott, M. D.
- (13) Report on the question, Ought agriculture to be made a branch of common-school education? Rev. E. Slack, A. M., M. D.
- (14) Report on the question, Ought manual labor to be introduced as a means of reducing the expenses of a collegiate education, and should the engaging in such labor extend to all the students, or should it be optional? M. G. Williams.

- (15) Report on the question, To what extent can the reading of fictitious compositions be rendered beneficial to students? A. Kinmont, A. M.

 Appendix. Minutes of the executive committee, etc.

It will be seen that an unusual number of ministers of religion appear on the programme. The addresses, lectures, and reports are not accompanied by reports of the general discussions. Space can not be taken to comment upon these papers, one by one, but attention may be drawn to a few of them.

Rt. Rev. Bishop Purcell, after reviewing the leading systems of philosophy that had appeared in the world, insisted upon the inadequacy of philosophy as a guide to life. She must end by acknowledging, with the sage of antiquity, when arrived at a certain prescribed limit, that she knows nothing beyond it—in a word, that she is the handmaid of religion. Mr. Slack assigned agriculture a high rank as an art, and recommended that State legislatures found polytechnic schools, which should make provision for ample training in agriculture. Mr. Williams reported somewhat adversely to manual labor as a pecuniary resource for college students, maintaining that a student's earnings can not defray a very great part of his expenses without interfering with his studies. He favored uniting manual labor with study in the colleges for the promotion of health and mental vigor. Mr. Kinmont's report ran strongly against the general reading of fiction, particularly novels, but he was gracious enough to make a few exceptions. Mr. Slack's counter report went still further. He seemed at one moment to make an exception from his sweeping condemnation of Sir Walter Scott, but, correcting himself, said: "It is believed by some that he has done infinite mischief to the cause of education and morals by perpetuating the existence of novels and romances, which before his attempts were verging to destruction." The report on universal education recommended, naively enough, conversation, extempore speeches, occasional remarks, addresses, lectures, and articles in the public papers, as means of creating interest in the subject; it urged also the organization of extensive systems of committees in the different States.

Much the longest discourse of the convention, and perhaps the ablest one, was delivered by Rev. Alexander Campbell, on the importance of uniting the moral with the intellectual culture of the mind. He held that—

The excellence of education consisted in teaching and training man to think, to feel, and to act in perfect harmony with his own constitution, and with the constitution of nature and society around him; not merely to think, not merely to feel, not merely to act, but to think, to feel, and to act rationally, morally, and religiously, all in harmony with the whole universe, and with his relations to each and every part thereof.

Mr. Campbell seems at this time to have accepted the new science of phrenology as furnishing a solid basis for a purely inductive system of mental philosophy and of literary and moral education. The accomplished teacher's creed, as written out by him, is strongly marked by phrenological phraseology. This creed contains but seven articles, as follows:

- (1) The human soul incarnate operates only through organs, and through organs only can be operated upon.
- (2) An organ is a natural instrument, such as the brain, the eyes, the ear, the

tongue, the hand. The human soul thinks and feels by the brain, sees by the eyes, etc.

(3) A faculty, contradistinguished from its organs, is the power of the organs. The eye is an organ, but seeing is its faculty.

(4) Organs and faculties are simple and compound. The eye and the ear are simple organs; the brain and the hand are compound organs.

(5) Operations are to be distinguished from the organs and the faculties. Organ is the instrument, faculty the power of that instrument, and operation the act of the faculty or of the organ.

(6) The strength of an organ is its size and firmness. It is a law of the animal economy that exercise directed by reason enlarges and confirms every organ. Education, if rational, will therefore seek to improve the mind by improving the organ.

(7) The exercise of any one organ only improves itself. We can not improve the eye by improving the ear, or the faculty of tasting by the faculty of smelling. No person would seek to improve the memory by improving the imagination; neither will a wise man seek to improve the moral powers by exercising only the intellect.

Mr. Campbell held no high opinion of the moral value of education as commonly conducted in Europe and America, but assigned the greatest value to moral instruction and exercise, and threw all possible stress upon religion. Mr. Campbell was a thoroughgoing disciple of John Locke, if not of George Combe, and his sensationalism was perhaps never made more prominent than in this address.

President Picket, in his opening address at the convention of 1837, says that every year since its organization has seen the College of Teachers grow in numerical and intellectual strength.<sup>1</sup> However, the names of but 163 members are found in the printed list, and vice-presidents and directors are elected for only 14 States. A remark in the introduction to the Transactions for the year shows that the editorial committee had at length encountered a cause of embarrassment which has troubled many succeeding committees—the question of what to print in the annual volume. “The committee, if they had consulted only their own tastes,” the plaint runs, “might have omitted or further curtailed several articles; but it was discovered that every article had certain warm admirers, of good hearts, at least, if not very cultivated understandings; and it was deemed most advisable to gratify as great a number of readers as possible.” The subject came up in the convention, and resolutions were adopted conferring upon the committee more stringent editorial powers.

At this convention Rev. J. D. Pierce, author of the Michigan system of public instruction—if it is proper to confer that designation upon any man—appeared and, as though striking at some of the views advanced the year before, moved a resolution, which was promptly laid on the table, asserting that moral education in distinction from intellectual culture is an idea unfounded in fact and of dangerous tendency. To Mr. Pierce was also assigned this subject for the ensuing year: “On the effects of a multiplication of universities in the Western States on the higher branches of literature and science.” Possibly it was a topic of his own suggestion; at least he was then laying out his strength on the organization of the University of Michigan. Perhaps Mr. Pierce was an unconscious Herbartian.

Mr. Kinnmont offered a resolution to the effect that the system of public instruction should be so extended as to embrace the entire educational wants of the community, which led to an animated discussion, and to the adoption, no doubt, of certain resolutions offered by Mr. McGuffey, asserting that while the freest and fullest scope should be given to individual and associated efforts, a system of public instruction sufficient to meet the wants of the entire population should provide for teaching the usual branches of an English and scientific education;

<sup>1</sup> Transactions of the Seventh Annual Meeting of the Western Literary Institute and College of Professional Teachers. Held in Cincinnati, 1837. Cincinnati: Published by James R. Allbach, 1833, p. 255.

and that public schools of the different grades ought to be provided for that purpose to an extent sufficient to supply the existing and recurring deficiencies, under such regulations as the legislatures of the respective States should deem best adapted to effect the object. Following Professor Stowe's lecture, a resolution was offered similar in its terms.

Following Mr. Mansfield's report on the introduction of the study of law into literary institutions, the college resolved that the elements of government as developed in the American Constitution ought to be a permanent study in American schools, academies, and colleges. It was resolved also that the capacity for vocal music is common to mankind, and that it may be employed to great advantage in schools, and should be made a part of the daily course of instruction in common schools, as well as in higher seminaries. There was also a resolution favoring institutions for mutual instruction, such as lyceums and mechanics institutes, as a means of supplying the wants of education not yet met by the general system of schools and colleges. The list of reports for the next annual meeting included 18 subjects. To Dr. Drake, Mr. Mansfield, and Professor Stowe this pregnant theme was entrusted: "What are the effects on the progress and character of the learned professions in the West of the defective preparatory education of so large a proportion of those who are dedicated to these professions?"

Following is the list of addresses and reports, with their authors:

- (1) Opening address. Albert Picket, sr.
- (2) The moral influence of rewards in a system of education founded upon the doctrines of the Word of God. S. W. Lynd.
- (3) The expediency of adapting common school education to the entire wants of the community. Samuel Lewis.
- (4) Address in behalf of the Mechanics' Institute. John P. Foote.
- (5) Report on domestic education. B. P. Aydelott.
- (6) The effects of education upon the physical development of man. William Wood.
- (7) The moral dignity of the office of the professional teacher. Samuel Eells.
- (8) Report on the expediency of introducing selections from the Bible, instead of the Bible itself, into our schools. J. B. Purcell.
- (9) Report on the same subject. B. P. Aydelott.
- (10) Report on the importance and practicability of creating departments in our State governments having the subject of public instruction under their immediate supervision. Alexander Campbell.
- (11) Report on constitutional law. Edward D. Mansfield.
- (12) Report on the best means of early mental culture. O. L. Leonard.
- (13) Report on the importance of civil engineering as a branch of collegiate education. O. M. Mitchell.
- (14) Report on linear drawing. F. Eckstein.
- (15) Report on vocal music as a branch of common-school education. T. B. Mason and C. Beecher.
- (16) Report on the mutual relation of trustees and faculties in literary institutions. B. P. Aydelott.
- (17) Report on the question whether infant schools ought to be conducted rather with a reference to moral than intellectual culture. Joshua L. Wilson.
- (18) The importance of moral education keeping pace with the progress of the mechanic arts. Benjamin Huntoon.
- (19) The inducements to accept teaching as a life profession. Mrs. Julia L. Dumont.
- (20) Report on the course of instruction in the common schools of Prussia and Württemberg. C. E. Stowe.
- (21) Outlines of true education, and of the national system. Walter Scott.
- (22) Poem. Mrs. Caroline Lee Hentz.

Mr. Lewis, the newly appointed superintendent of the common schools of Ohio, contended, in his report, that public schools should be so expanded and improved as to include all that was then taught in the best English schools. He favored, therefore, not only district schools, but township schools of a higher grade. It will be seen that emulation, moral instruction, and the Bible still receive a large amount of attention. Bishop Purcell stated the Catholic position

in respect to religious teaching in the public schools, opposing the substitution of selections from the Bible instead of the book itself.

I therefore most respectfully submit—I therefore most earnestly urge on the attention of this college what seems to me, after the most anxious reflection upon the subject, to be the only wise and liberal and patriotic course to be adopted, viz: That Protestant Bibles be not placed in the hands of the Catholic youth in our schools; that our common-school teachers be strictly forbidden to give any sectarian bias to the minds of their pupils; and, to obviate all inconveniences, that one day or two days in every week be selected, and that the students of different creeds be assembled together to be instructed in the Bible and in their religious and moral duties generally by their own pastors. Thus, and only thus, as I think, can we provide for the effectual removal of the obstacles which now impede the diffusion of useful redeeming knowledge throughout the whole length and breadth of the land.

Rev. Dr. Aydelott, the Protestant member of the committee, also opposed the introduction of selections from the Bible instead of the Bible, but, in contending for the whole Bible, did not carry his views so far as to oppose the use of the New Testament, the gospels, the psalter, or even a single gospel. It was unanimously voted, "That the convention earnestly recommend the use of the Bible in all schools, to be read as a religious exercise, without denominational or sectarian comment, and that it is the deliberate conviction of this college that the Bible may be so introduced in perfect consistency with religious teaching and without offense to the peculiar tenets of any Christian sect."

Reporting on the importance and practicability of creating educational departments in the State governments, Mr. Campbell, as usual, built up his argument from the bottom. He showed himself familiar with European systems of education and pressed these systems into the service of his report. He urged the maintenance of district schools by the State, and also of normal schools for the purpose of teaching teachers the art of teaching. State education had become a matter for State supervision. Finally, he asked whether the needed State supervision could be secured through legislative enactments in the absence of constitutional provision, and answered that, while there might be nothing in the constitutions to forbid legislatures taking such action, the safe way was for every State to make it a prominent item in its constitution.

Mrs. Julia L. Dumont held that while the ban of degradation, laid for centuries upon elementary teaching, had been removed, and the schoolmaster might boast his vocation as among the better callings of men, it still remained to establish an appreciation of the high order of talent required by the work and the large preparation demanded.

The freshest topic was Professor Stowe's report on the course of study in the common schools of Prussia and Württemberg. At the time Mr. Stowe was professor of biblical literature in Lane Theological Seminary, and in May, 1836, he had been sent abroad to purchase books for the library of that institution. As he was on the point of leaving home, the legislature of Ohio gave him a commission to investigate and report on the conditions of common schools in Europe, particularly in Germany. He was well prepared for such a commission, as he was proficient in the German language and literature, and a professional educator. His report to the legislature, which was one of the influential educational documents of the time, was not published until 1839; in the meantime, after his return, as well as afterwards, he often lectured and wrote on the subject, thus doing as much, perhaps, as any man of the time to popularize knowledge of German schools and education. The present report is a straightforward exposition of the subject. In his closing paragraph he repels the idea that the German system of schools, so superior to anything that existed in the United States, was impracticable or visionary, emanating from the closet of the recluse; it was rather the course of instruction actually pursued by thousands of schoolmasters in the best district

schools that had ever been organized. The system could be carried out in the United States, as it had been in Europe; it could be done in Ohio, as it had been done in Prussia.

In March, 1837, the first number of the proposed periodical appeared, *The Western Academician and Journal of Education and Science*, and was in regular course of publication at the time when the convention was in session. It was an octavo pamphlet, generally counting 56 pages. Its threefold name suggests its character; it contained academical, educational, and scientific articles. Nearly all the contributors were members of the college, and some of the articles were extracts from their earlier addresses and reports made to the conventions. Still there were many original articles. Book reviews were something of a feature. The college, after careful investigation, adopted unanimously the resolution that the periodical be made the organ of the college, and that its literary character was such as to entitle it to the full patronage of the college and the friends of education in every section of the country. The full proceedings of the convention of 1837 are contained in the first volume. Referring in one of the numbers to the continued growth of the College of Professional Teachers in talent and numbers, and the extension of its vast and benign influence in the cause of education throughout the West and South, the editor relates the history of the creation of the office of State superintendent of common schools by the legislature of Ohio. It was due to the powerful appeals of a committee representing the college that was sent to Columbus for this purpose that the office was created, and Samuel Lewis appointed the first superintendent. This action was had, it may be remarked, some months before Horace Mann was appointed secretary of the Massachusetts board of education. The editor reports further that similar efforts, made through the instrumentality of the State directors in several of the other States at the last sitting of their respective legislatures, had led to valuable legislation.<sup>1</sup>

The preface to the *Transactions of 1838* contains various items of educational interest, domestic and foreign.<sup>2</sup> One of these is that in Ohio alone upward of 1,000 common-school houses have been erected during the previous year. The preface attributes the great educational revival to the influence of the Bible. "Never," it says, "had the Bible been so widely circulated and generally read as it was just previously to the present revival of the cause of education."

The veteran president was absent from the convention, owing to indisposition, and his annual address was read by another. The names of 194 members were reported, and directors were elected for 13 States and Territories. Iowa Territory now comes into the circle. Both the minutes and addresses and reports convey the impression that the college is undergoing some internal change. The discussions are animated, but fewer resolutions than before are adopted. There is more than a suggestion that the men who had organized the college, and so far sustained it, were beginning to give way to new men, which was, of course, perfectly natural, especially when we consider the widening sphere of its operations. In particular, Mr. Kinmont, who had been one of the ablest and most active men in the body, died but a few weeks before the convention sat. President Picket in his address referred to his death in a feeling manner.

The executive committee reported that *The Western Academician* had not been published since the termination of the first volume, in April preceding; the publisher had declined to go on with it and the committee had been unable, owing to the unpropitiousness of the times, to effect a continuance of the work by any

<sup>1</sup> *The Western Academician and Journal of Education and Science*. Edited by John W. Picket, A. M., Cincinnati. Published by James R. Allbach, 1837-38, p. 704.

other publisher, "which is the more to be regretted as the work had already acquired well-deserved celebrity, a very respectable patronage, and bid fair to realize the fondest anticipations of its warmest advocates, affording a means whereby the proceedings of the college could be extensively circulated and a knowledge of its operations widely diffused." A committee was duly appointed to consider its resuscitation, but the committee did not go further than to express regret at its suspension, and to authorize and recommend the executive committee to reestablish it provided it could be done without involving the college in any pecuniary charge. Such an arrangement was never made, and The Western Academician was never resuscitated. It was, plainly enough, in advance of the wants, however it may have been with the needs, of the Western country.

Mr. Pierce did not appear to discuss the effects of the multiplication of colleges and universities in the Western States on the higher branches of literature and science, but the subject was called up and discussed at different times with no little animation. It soon became apparent that there was a strong opposition to the multiplication of such institutions in the West, but the grounds of it are not very clear. A resolution declaring that such multiplication was calculated to exert a favorable influence on the higher branches of literature and science was laid on the table.

The subject of female education engaged much of the time of the convention. A resolution by President McGuffey, asserting that the interests of such education demanded the endowment of female seminaries for the education of female teachers, and also for those who were not directly designed for that office, was not brought to a vote.

Mr. Lewis offered resolutions declaring that the great want of qualified teachers of common schools was such as called loudly for action that would supply the present and increasing demand, and that the subject of establishing national or State institutions for teachers was one which required the careful deliberation of every friend of popular education, as well as of every legislator who sought to preserve and delegate our popular institutions. This subject came to the front at various times during the convention; several resolutions were offered, all of which were finally referred to Professor Stowe, to be reduced to a consistent scheme. The next day the Professor brought forward a somewhat elaborate scheme, when, after further discussion, the convention disposed of the subject for the time by referring it to a large committee for investigation and report. Professor Stowe's programme, it may be remarked, involved, in addition to the ideas that were then being worked into the Massachusetts normal schools, the teaching of the German, French, and Spanish languages, with the elements of Latin. It was resolved that Sunday schools, when properly conducted, are a most valuable auxiliary to the common schools; also that the habit of relying upon printed questions in text-books is highly detrimental to the intelligent development of the pupils and to the improvement of the teacher in the art of teaching.

The list of reports for the next annual meeting embraced 23 topics. A comparison of these annual lists is interesting, showing, as it does, a tendency to leave behind the large general questions that had given full scope for the lengthy addresses of earlier years and to take up more specific and practical questions. Still, such a scheme as this, "On the duties at present peculiarly incumbent upon American citizens," would seem to give any reasonable amount of latitude for vague general disquisition.

The annual list of topics was as follows:

- (1) Opening address. Albert Picket, sr., president of the college.
- (2) Introductory discourse. The Bible as a means of intellectual improvement. C. E. Stowe.
- (3) On the formation of society, its leading developments, etc. Hon. J. McLean.
- (4) On moral culture. Rev. M. M. Carll.

- (5) On the importance of introducing a uniform system of common-school education. E. Vance, esq.
- (6) On the advantages of a department of English language and literature in colleges. B. P. Aydelott, D. D.
- (7) On the study of the modern languages. J. F. Meline, esq.
- (8) On college government. Rev. Dr. A. Wylie.
- (9) On the uses of history. E. D. Mansfield, esq.
- (10) On female education. A. H. L. Phelps.
- (11) On conversation as a study to be introduced into schools. Mrs. C. L. Hentz.
- (12) On education and the best means of acquiring it. Mr. T. S. Reeve.
- (13) On the introduction of gymnastic exercises into the American system of education. Mr. J. C. F. Salomon.
- (14) On physical education. William Wood, M. D.
- (15) On professional education. Prof. C. E. Stowe.
- (16) On education. Mr. William Slocomb.
- (17) Valedictory. Rev. A. Wylie.

Appendix: Report on the duty of teachers. The schoolmaster. E. P. Langdon.

The appearance of Hon. John McLean, an associate justice of the Supreme Court of the United States, on this programme naturally attracts attention. The trend of his discourse is shown in the statement of his subject. One of the most readable passages is a quotation from a foreign periodical:

As for literature, the Americans have none—no native literature, we mean. It is all imported. They had a Franklin, indeed, and may afford to live half a century on his fame. There is or was a Mr. Dwight who wrote some poems; and his baptismal name was Timothy. There is also a small account of Virginia by Mr. Jefferson, and an epic by Joel Barlow, and some pieces of pleasantry by Mr. Irving. But why should the Americans write books, when a six weeks' passage brings them in their own tongues our sense, science, and genius, in bales and hogsheads. Prairies, steamboats, and grist mills are their natural objects for centuries to come.

The learned judge cites this passage, published twenty years before, merely to remark the change of the foreign press in its tone toward this country. It is almost needless to remark that he strongly favored teaching the elementary principles of our Government in the schools. Nothing less than the preservation of our public institutions was involved in the inculcation of these principles.

The observant reader has not failed to notice that the names of few women appear in the annual programmes of the College of Professional Teachers. The programme for 1836 includes an essay on Female Patriotism, by Mrs. Huntley Sigourney; the one for 1837 an essay on The Inducements to Accept Teaching as a Life Profession, by Mrs. Julia L. Dumont; and Mrs. Caroline Lee Hentz contributed a poem to the exercises of this session. In 1838 Mrs. Almira H. L. Phelps contributed an essay on Female Education; in 1839 Miss Anne W. Maylin, an essay on the Pains and Pleasures of Teaching. It seems that none of these ladies appeared to read their papers in person.

The most thoughtful of these contributions is that of Mrs. Phelps. Her essay is a brief paper containing nothing that would now be considered novel, but it is nevertheless a well-considered and well-written argument for the better education of women. She treats her subject under three divisions:

First, in regard to the well-being of woman herself; second, in its effects on the character of the other sex; and third, the improvements which have been made in female education.

She confutes the assertion that education renders females less contented with the lot assigned them by God and by the customs of society, that it tends to draw them from their appropriate domestic duties, and thus renders them less happy and less useful. Remarking upon the advances recently made in female education she writes:

Thirty years since the writer recollects hearing her elder sister, then a young, enthusiastic girl, inveighing against the injustice which withheld from females

the advantages of education bestowed upon the other sex; she said what in my childish folly I thought to be very absurd, that there should be colleges for females as well as for males, and that the time was at hand when such institutions would exist. Fifteen years afterwards this visionary girl, as her friends then called her, had founded the Troy Female Seminary, which in its thorough and liberal course of study, its various instructors and recitation rooms for different branches, its separate departments for pupils, where they can uninterruptedly pursue their studies, may very properly be termed a female college.

She incisively characterized the old boarding-school education for girls, and happily presented the alternative that presented itself to the learned man desiring a companion, when his choice lay, on the one hand, between the superficial boarding-school girl whose whole education, in many cases, was summed up in her piece of embroidery, and who was in reality fitted neither for ornament nor use, and, on the other, the domestic drudge who, having been at her father's house a patient and useful laborer, might be expected to relieve her husband of domestic cares, and leave his mind free to roam in his more elevated sphere. She closes with saying that it is to the younger States that society must look for liberal endowments of female institutions. "New England, priding herself upon her steady habits, gives little encouragement that she will change her policy, which gives all of aid to male institutions, leaving female education wholly to the uncertainties of chance."

It is interesting to note in this connection the general temper of the college with regard to female education. Throughout all its sessions may be traced addresses, reports, and resolutions on such subjects as courses of study for females, the physical education of females, the branches of study appropriate to the two sexes, etc. There are evidences of a very active and practical interest in the matter. However, the prevailing tone of the discussions is that the mental diet of the woman can not with safety be made very strong. In the session of 1899 the discussion seems to have become quite heated. William Johnston, esq., submitting the report of a committee to which all the papers before the convention on this subject had been referred, said that the committee was unable to see any good reason for making distinctions between the education of males and females, for whatever faculties of mind belonged to man belonged to woman also. On the other hand, Bishop Purcell introduced the following:

*Resolved*, That in the opinion of this college the education of females, in order to be such as would at once attract the esteem and love of the other sex; and to elevate their own characters, should be based on the union of polite accomplishments with a thorough knowledge of housewifery.

The only report from the committee on professional education in the West, appointed the year before, was made by Professor Stowe on his own profession. It is a much more academical performance than one could wish to have it, saying nothing except by implication about the concrete subject assigned to him. The Professor begins with laying down what he conceives to be a complete preparatory education for the clerical profession, and then proceeds to point out the more prominent evils which universally and necessarily result to the profession from a general deficiency in this preparatory course. Rev. Dr. Wylie's valedictory contains some satirical remarks on college faculties and boards of control, which suggest that he was not altogether pleased with the state of things at the Indiana University, over which he presided.

There was a report by Dr. Lyman Beecher, not published, on the familiar subject of emulation, and counter reports by Mr. Picket and others that do not appear in the Transactions.<sup>1</sup>

<sup>1</sup> Dr. Beecher, although he participated in the discussions at other times, was hardly as prominent in the conventions as we should have anticipated. It is noteworthy that the names of four of his sons appear in the lists of members—Edward, Charles, Henry Ward, and George.

The attention given to physical education by the college is a question of interest, in view of the amount of attention given to it to-day. In 1828 Mr. J. C. F. Saloman, who had trained in gymnastics more than 10,000 young Prussians, made a report on the introduction of gymnastic exercises into the American system of education. Dr. William Wood made an address at the same session on physical education. Throughout the sessions of the college the necessity of an intelligent care of the body is recognized in the addresses on mental and moral training. However, there are no traces of action to inaugurate any system of physical education. Such exercises as dancing and horseback riding were regarded with considerable disfavor by the graver members of the college, and the equipment necessary to the gymnastic courses of the present day seems not to have been available.

In its report for 1839 the executive committee held an encouraging tone, not merely respecting the cause of education, but also the cause of the college.<sup>1</sup> The back volumes of the Transactions, as well as the surplus copies of *The Academician*, had nearly all been sold. The committee strongly urged the revival of that journal as soon as practicable. The business embarrassments of the times were a material cause of its suspension. The organ had been strongly commended, there was no want of laborers or materials, and the need was great. Nothing but a Western periodical could fully meet the exigencies of the West. Finally the committee suggested that the following subject be set for investigation and report at the next annual meeting: "The state of colleges and common schools in the West." Unfortunately the annual list of members was omitted from the volume, but the number of State directories elected was 18. North Carolina, Florida, Alabama, and Wisconsin Territory now appear.

The division of opinion as to public and private schools higher than elementary schools was equally as marked as at the last meeting. Professor Telford, to whom the subject had been referred, reported the following resolutions:

(1) *Resolved*, That in the opinion of this college the establishment by law of literary institutions, with corporate capacities, empowered to confer degrees, and sustained by public endowment, is unfavorable to the progress of education.

(2) *Resolved*, That in the opinion of this college the business of education, especially in its higher departments, will be most successfully conducted when it is left to free competition and voluntary enterprise.

(3) *Resolved*, That any multiplication of universities or colleges in the Western States, by charter or statute, is unnecessary and would be seriously pernicious in its effects upon the higher branches of literature and science.

There were numerous "animated" discussions, but the convention could come to no agreement, and the subject was indefinitely postponed. At the close of a lecture by Dr. Mussey on the influence of tight dressing upon health and life the whole subject of female education was again discussed and then referred to a committee of four. This committee reported that the thorough and substantial education of females is of equal importance with that of males, and that in all branches of literature and scientific knowledge it should be equally extensive; but after further discussion the whole subject went over to the following year. A communication was sent in by ladies in attendance and read returning "the thanks of the fair to the members of the college for the interest they had manifested in that great cause."

Rev. J. Blanchard, of Illinois, offered some resolutions relating to the education of the colored race, which, rather suspiciously, were not printed. They were referred to the committee on bills and overtures, which reported that the resolutions did not come properly within the objects of the college. A committee of

<sup>1</sup> Transactions of the Ninth and Tenth Annual meetings of the Western Literary Institute and College of Professional Teachers, held in Cincinnati, October, 1839, and October, 1840. Cincinnati: Kendall & Barnard, printers, 1841.

five was appointed to consider what measures should be adopted to awaken a more general interest in the great objects which the college was designed to accomplish, and to secure the advantages of this institution to the several States of the West. Mr. Maylin attempted to commit the convention to a philosophical creed, offering the resolution that "the association of sensations and ideas is the principle upon which all the intellectual and moral acquirements are formed and matured." He offered a defense of the doctrine in his address on the same subject, but no action was had.

After Mr. Perkins's paper on the subject, and a further discussion, resolutions were offered declaring (1) that the idle and vagrant boys found in the streets of our Western cities inflict deep injuries upon our schools, both public and private; (2) that a report be made to this college next year as to the best means of curing the evils resulting from the vagrancy of boys in our cities; (3) that this college respectfully invites citizens to consider the subject of the above report, and to inquire what may be done to remedy the evil there set forth by schools of moral reform, houses of refuge, and other means. Resolutions were adopted in regard to the teaching of science, declaring (1) that natural science is peculiarly fitted to form a prominent feature in every correct system of education; (2) that an expression of opinion be solicited from the trustees and visitors of the common schools of Cincinnati as to the expediency of introducing the more useful departments of natural science into one or more of the schools under their care, and (3) that a committee of three be appointed to draft the outlines of a plan on which an academy could be organized in each county in the State for the purpose of affording instruction in the higher departments of English literature and science.

Numerous other resolutions were adopted—one or more in favor of the collection of educational statistics and other educational information; one in favor of giving school children sufficient exercise; one in favor of permanent school boards; one asserting the propriety of making the profession of teaching a distinct profession and the desirability of adopting some well-regulated plan to secure that end. The subjects for reports in 1890 are 24 in number. The subject "On the peculiarities of German universities," assigned to Rev. William Nast, is suggestive of growing interest in German education.

The list of addresses and reports found in the volume is as follows:

- (1) Introductory remarks. Dr. J. L. Wilson.
- (2) Opening address. A. Pickett, sr.
- (3) Address on discipline. J. P. Foote.
- (4) Annual report of the executive committee.
- (5) Address on the duties of American citizens. Dr. D. P. Aydelott.
- (6) Essay on the pains and pleasures of teaching. Annie W. Maylin.
- (7) Report on the question, How far can an appeal to the sense of honor and the moral sentiments in school be made a substitute for corporal punishment? James Shannon.
- (8) Report on the state of education in Georgia. J. Dillingham.
- (9) Report on the principle of association of sensations and ideas in forming and maturing intellectual and moral acquisitions. Thomas Maylin.
- (10) Report on female education. William Johnston.
- (11) Report on extending the usefulness of the college. By a committee.
- (12) Report on teaching arithmetic. D. Hand, jr.
- (13) Report of a committee on examining the pupils from the Ohio Institution for the Education of the Blind.
- (14) Report on the state of education in Mississippi. C. G. Forshey.
- (15) Report on the blackboard. J. Ray.
- (16) Report on primary education. George R. Hand.
- (17) Annual address of the executive committee.

At the session of 1839 the executive committee of the college confined their annual report almost entirely to a plea for the formation of auxiliary educational societies, which should cooperate with the College of Teachers. They used the following language: "The formation of actual auxiliary societies in every part of

our land is, therefore, our great object at this time; and to bring this about we offer the following plan, etc." Then followed a mode of procedure by which a group of persons might form themselves into a society for "the promotion of the home interests of education," adopt a constitution, and, after notifying the corresponding secretary of the college that it had become auxiliary to that body, be privileged to send representatives to its conventions.

The first response to this plan for the extension of the influence of the college was the formation of the Cincinnati Society for the Promotion of Useful Knowledge. The initial step in the founding of this society was taken at a public meeting held March 27, 1840, at the hall of Cincinnati College. The object of the meeting was stated to be "to establish a society for the purpose of aiding in the improvement and extension of practical education, and of laying the foundation of the great Western Academy of the Sciences and General Literature." A constitution and by-laws were adopted for the new society. Herein it was ordained that the society be divided into fourteen sections for the investigation of such subjects as practical teaching and the various branches of learning that enter into a liberal education and into the professions. It was ordered that the society institute each year a course of lectures to be delivered weekly or oftener between the beginning of November and the close of March. There were to be two meetings of the society each year. At the one next preceding the convention of the College of Teachers, delegates to that body were to be appointed and the matter prepared to be submitted to it.

All these proceedings were reported to the College of Teachers at its session held in October, 1840. The minutes of this session include the following resolutions:

(1) *Resolved*, That this College would rejoice to see formed in the West a general academy of science, art, and literature, with branches or corresponding societies, and corresponding members in the various parts of the country.

(2) *Resolved*, That the meeting of such an academy in connection with this College would be a benefit to both institutions.

(3) *Resolved*, That the executive committee of this college be desired to send, to such points as they may deem best, an outline of the constitution and organization of the Cincinnati Society for the Promotion of Useful Knowledge, with a view to the formation of similar societies elsewhere.

(4) *Resolved*, That we recommend to the Cincinnati Society for the Promotion of Useful Knowledge such a cooperation with the executive committees of this College as may secure the formation of similar societies elsewhere and the presence of representatives at the next meeting of the College, for the formation of such an academy as is contemplated.

Mr. Venable says that "this Great Western Academy of the Sciences and Literature" was planned mainly by Prof. O. M. Mitchell, General Mitchell of the civil war. "The organization had too many aims to hit anything in particular. The most important section that survived was the astronomical, which, under the fostering care of Mitchell, came to fruition in the Cincinnati Observatory." He adds:

The energy of the College of Teachers was transmitted to different institutions—the Mechanics' Institute, various libraries, schools of medicine and law, the Historical Society, and the Academy of Fine Arts. The impulse which it gave to popular education spread throughout the State of Ohio and throughout the nation, and the schools of to-day inherit a legacy of vital force from that vigorous pioneer institution.<sup>1</sup>

The mild suggestion of internal changes in the college that were first met with in 1838 became more pronounced in the two following years. More and more the active work passed out of the hands of the men who founded the institution and gave it its early success. Some of the best known of them, for some reason,

<sup>1</sup> Beginnings of Literary Culture in the Ohio Valley, pp. 426-427.

ceased to attend. But there were signs of a decline of power as well as of change in the working force. The college was never able to resuscitate its organ, *The Western Academician and Journal of Education and Science*, while the proceedings of 1839 were not published until they were more than a year old, and then in connection with those of 1840. This delay, whether it was foreseen or not, pointed to the final disappearance of the *Transactions* the next year. The addresses and reports as a whole show less ability than in earlier volumes, while certain action taken by the convention suggests that there was more or less unrest and dissatisfaction within the body itself. The report of the executive committee, made in October, 1840, is extremely brief, and lacks the hopeful spirit of earlier reports. The reason for the failure to publish the *Transactions* of the previous year at the proper time was the failure of the publisher to secure advance subscribers for 300 copies. The venerable president for the first time failed to make an opening address. The convention was, however, well attended; the names of 216 members appear in the lists, and directories for 18 States and Territories. The opening address was delivered by J. H. Perkins, on the importance of forming societies auxiliary to the college.

Professor Forshey, of Mississippi, offered resolutions declaring that the incorporation of military discipline into civic institutions of learning, so far as might be necessary for the vigorous and voluntary exercise of students and the insuring of promptitude and punctuality and implicit obedience to the same, without interfering with the usual course of study, is highly desirable, and that the substitution of military for civil discipline in the schools, academies, and colleges of the United States would furnish an ample substitute for the United States militia; but the convention did not share his opinions. A committee of six was appointed to consider and report definite objects for the action of the College. On motion of Professor Stowe this committee was instructed to report respecting the manner in which female teachers might best cooperate in promoting the objects of the College. The committee considered the subject carefully and reported a plan of work in some respects new, but it is impossible to make out from the minutes what this plan was. It may be inferred that the confusion in which the secretary left the subject was indicative of the prevalent state of mind in respect to it.

The subject of female education came up again, and the resolution that "whatever education a parent gives to his son he ought to give to his daughter, except that part which may be given with a special view to a profession," was offered, but it did not carry. Professor Forshey offered resolutions affirming that, in this country, institutions need no endowment save for buildings, libraries, and apparatus; that all endowments by which scholars are supported after leaving college, and no constantly active duties are required of them, are unwise and should be discouraged; and that the current religious instruction at colleges, male and female, was vague and insufficient, and that means should be adopted to give greater definiteness, force, and effect to the religious education of the pupils, at least out of the common schools; but no action appears to have been taken on them.

Following a report by President Biggs, it was resolved that the College would rejoice to see formed in the West a general academy of science, art, and literature, with branches of corresponding societies and corresponding members in the various parts of the country; that the meeting of such an academy in connection with the College of Teachers would be a benefit to both institutions; that the executive committee be desired to send an outline of the constitution and organization of the Cincinnati Society for the Promotion of Useful Knowledge to such points as they might deem best, with a view to the formation of similar societies elsewhere; and that the Cincinnati Society for the Promotion of Useful Knowledge be recommended to cooperate with the executive committee in such way as

might secure a formation of similar societies elsewhere, and the presence of representatives at the next meeting for the formation of such an academy as was contemplated. Other resolutions were adopted—one calling for the full cooperation of parents and teachers; one creating a committee to report a course of study for the district schools; one that natural science should occupy a prominent place in the college course of instruction; one that conscience should be educated under the influence of those principles developed in the word of God; one that the evidences of the Christian religion should receive a full degree of attention in a college course, and still others. The subjects for report the next year were 51 in number.

The list of formal addresses and reports was as follows :

- (1) Report of the executive committee.
- (2) Address on the classification of all human knowledge. R. Park.
- (3) Report on a course of study for females. J. M. Matthews.
- (4) Report on the cooperation of parents with the teacher. S. N. Manning.
- (5) Report on natural science. F. Merrick.
- (6) Report on ancient languages and literature. T. J. Biggs.
- (7) Report on English universities. J. H. Perkins.
- (8) Report on the education of the conscience. James Challen.
- (9) Address on the immortality of mental influence. Dr. Morrill.
- (10) Report on the means that boards of examiners may employ to elevate the literary character and qualifications of the teachers of the public schools. Joseph Ray.
- (11) Report on voluntary obedience. Thomas Maylin.
- (12) Report on the definite objects for the action of the College. A committee.
- (13) Report on the evidences of Christianity as a branch of education. T. A. Miles.
- (14) Report on the moral and intellectual faculties and their development. M. M. Carl.
- (15) Report on a course of instruction for common schools. George R. Hand.
- (16) Formation, constitution, etc., of the Cincinnati Society for the Promotion of Useful Knowledge, with the names of the members.
- (17) Present condition of the Ohio Mechanics' Institute, with the names of the members.
- (18) Address on female education. William Johnston, esq.
- (19) Report on the influence exerted upon our schools (in cities particularly) by idle, vagrant boys found in their neighborhood.

This was the last volume of the Transactions, and the college did not long survive. Probably the files of the Cincinnati newspapers would furnish some information concerning its last years, but it would hardly reward the labor that it would cost to find it. Mr. Venable informs us that the meetings of 1843 and 1844 were held in Louisville. No doubt a new lease of life was sought in the change of scene, but it was not found. The college died peacefully, perhaps in 1845.

We have now completed this chronological account of the Western Literary Institute and College of Professional Teachers. Perhaps some will think its length quite disproportionate to the importance of the subject. Others, possibly, may hold that the time and space devoted to it have been altogether wasted. Such questions as these are likely to arise: "Why describe these old books that nobody reads or cares anything about?" "Why reproduce these dead resolutions, programmes, and extracts from forgotten speeches?" While we can not think intelligent students of our educational history will take either of these views of the matter, but will rather see in the story an important stage in our educational development, we still think it wise briefly to set forth the main facts that constitute the answer, especially as the attempt will give an opportunity to describe some features of the college more fully.

By the fourth decade of the century the great educational revival, or, more narrowly, the common-school revival, was well under way. Never had anything like it been seen in the history of the world. Men of all kinds and classes in all progressive countries were awakening to the necessity of popular education. We

need not carefully inquire concerning the causes of this great awakening; in fact they can not be made altogether plain. We see the educational bearings and effects of industrial and commercial ideas, of political and social sentiment, of the wide diffusion of knowledge and the growth of the scientific spirit, of the philanthropic impulse, of the resolution on the part of men more fully to realize their manhood, and on the part of nations to achieve a more complete development; but, when all is said, we feel that something has escaped us in the analysis, and so fall back into the arms of the Time Spirit. We see the awakening as a fact, and that the time for it had come. In our own country the States that had public-school systems were seized with a desire to improve them; the States that had none, with a desire to create them. Some of our best-known educational agencies date from this time; educational departments in State governments, normal schools, teachers' institutes, the superintendency, the developed graded school, articulated State school systems, and district-school libraries, while educational literature received a great impulse. It was in the midst of this storm and stress that the College of Professional Teachers was founded.

The meaning of the last sentence is that in the West the educational awakening was felt with peculiar power. There were many reasons why it was so. Population was increasing, not by the slow increments that marked the English colonies in the seventeenth century, but by leaps and bounds. The population of the Old Northwest was 272,000 in 1810, 842,000 in 1820, 1,470,000 in 1830, 2,924,000 in 1840. Within these limits of time Ohio rose from the thirteenth place in the Union to the third place. This population was of a very miscellaneous character. Men of New England, the old Middle States, and the South jostled one another, and they all jostled foreigners of many nationalities. It was the first period of emigration on a great scale to our shores. Under the new conditions the bonds of society were more or less loosened, and on the wide frontier, where the white man met the red man, he tended to fall to his level of life. Morals, religion, social customs, parted with some portion of their energy, while the longing for education was sometimes lost with the opportunity to obtain it. Institutions of all kinds had to be built up, and built quickly. From the Lakes to the Gulf of Mexico society was in a formative state. Education can hardly be said to have taken on any organized form. Ohio, for example, only took the first step toward forming a common-school system in 1821, and ten years later this system was still very rudimentary; Indiana had not even the semblance of a system until years afterwards; while Cincinnati, as we have seen on a previous page, had only established her common-school system in 1829. Multitudes of men thought the coming of the foreigner boded danger, if not disaster, to the Republic, while those who had been reared under the influence of Puritanism dreaded in particular the influx of Catholics. At the East there was no little anxiety lest the vast westward extension of the Union should prove fatal to its perpetuity.

These facts will but faintly suggest to those who have not looked into the matter the state of mind of philanthropic and patriotic men in regard to the destiny of the West. Their anxiety may seem to us uncalled for, but we can not deny that it was real. Casting about them for relief and hope, these men fixed their eyes mainly upon education and religion, the school and the church. Said Professor Stowe in his address on the education of foreigners: "Let us now be reminded that unless we educate our immigrants they will be our ruin. It is no longer a mere question of benevolence, of duty, or of enlightened self-interest, but the intellectual and religious training of our foreign population has become essential to our own safety; we are prompted to it by the instinct of self-preservation."

It was his profound conviction of the danger and the need that induced Dr. Lyman Beecher, in 1832, to resign his Boston pulpit and accept the presidency and professorship of theology in Lane Seminary, Cincinnati. This conviction glows

in his correspondence in relation to his taking this step.<sup>1</sup> Moreover, during the early years that he held this position, besides his work in the West, he strove to arouse the people of the East, and particularly of New England, to an active cooperation in the work. He beat the Bibles of the leading Calvinistic churches, appealing for aid for his own institution. Nor was this all. In 1834 he made the churches of Eastern cities ring with his "Plea for the West," a powerful discourse in which he covered the whole ground.<sup>2</sup> Two short extracts will show the quality of this plea:

But what will become of the West if her prosperity rushes up to such a majesty of power, while those great institutions linger which are necessary to form the mind, and the conscience, and the heart of that vast world? It must not be permitted. And yet what is done must be done quickly; for population will not wait, and commerce will not cast anchor, and manufactures will not shut off the steam, nor shut down the gate, and agriculture, pushed by millions of freemen on their fertile soil, will not withhold her corrupting abundance.

We must educate! We must educate! or we must perish by our own prosperity. If we do not, short from the cradle to the grave will be our race. If in our haste to be rich and mighty we outrun our literary and religious institutions, they will never overtake us; or only come up after the battle of liberty is fought and lost, as spoils to grace the victory, and as resources of inexorable despotism for the perpetuity of our bondage. And let no man in the East quiet himself, and dream of liberty, whatever may become of the West. Our alliance of blood, and political institutions, and common interests is such that we can not stand aloof in the hour of her calamity, should it ever come. Her destiny is our destiny; and the day that her gallant ship goes down our little boat sinks in the vortex.

This and similar appeals led to the creation of organizations and agencies at the East for the promotion of Western educational and religious interests that still continue.<sup>3</sup>

Such were the general conditions under which the College of Professional Teachers was founded and carried on. It was not the creature or product of Western schools and education, but their creator. These facts serve to explain still others that are well worth stating.

The membership of the college, in respect to numbers, range of territory represented, and character, was, for the time, remarkable. The footings of the annual lists of members may be reproduced:

1834 .....	125	1838 .....	194
1835 .....	147	1839 .....	
1836 .....	222	1840 .....	216
1837 .....	162		

In all, the names of 317 men appear in the rolls, coming from about 20 States and Territories. The college more than realized the ideal of a Mississippi Valley association, for it drew within its circle several States on the Atlantic seaboard, and all of those on the Gulf of Mexico. However, the name College of Professional Teachers was misleading. The strength of the institution lay in the fact that it was composed, not merely of teachers, but of other persons who were actively engaged in promoting the cause of education. An association of teachers alone never could have exerted the influence that this association exerted. Mr. Mansfield, who was an active member, and a very competent judge, after calling the college "an institution of great utility and wide influence," thus describes its field and work:

Its object was both professional and popular—to unite and improve teachers, and, at the same time, to commend the cause of education to the public mind.

<sup>1</sup> Autobiography, Correspondence, etc. of Lyman Beecher, LL. D. Edited by Charles Beecher. In two volumes. New York, 1865. Vol. II.

<sup>2</sup> A Plea for the West. By Lyman Beecher. Cincinnati: Truman & Smith, 1835; pp. 30, 31.

<sup>3</sup> The above remarks suggest an interesting theme that has never been adequately treated, or, one may almost say, treated at all—the educational work of Eastern churches and societies in the West.

The former object might have been obtained by the meeting of practical teachers only, as is now done, but to popularize education required that gentlemen of science and general reputation, who had weight with the community, should also be connected with it. At that time public education was just beginning, and almost all in the Ohio educational system \* \* \* was created and developed after that period. To do this was the object in view, and accordingly a large array of distinguished persons took part in these proceedings. I doubt whether in any one association to promote the cause of education, there was ever in an equal space of time concentrated in this country a larger measure of talent, information, and zeal.<sup>1</sup>

And again, after mentioning its death, he says:

Since that time associations of practical teachers have taken its place, and are beyond doubt useful and instructive to teachers. Yet there is wanting some popular means of connecting teachers with the general public, and I am convinced that the College of Teachers, composed of both practical and literary men, was the best reunion of that sort yet devised and for which no substitute has been found. The human spirit, like a plant, needs a genial soil, and draws nutriment not only from the earth, but from the atmosphere.<sup>2</sup>

There can be no doubt of the correctness of Mr. Mansfield's opinion that there is wanting some popular means of connecting teachers with the great public, and that to secure this end teachers and practical men must in some way be brought together. In education certainly, if not in religion and other social interests, the separation of the professional and the lay elements has gone too far. Our educational meetings of all kinds are almost exclusively made up of teachers.

Mr. Venable, the historian of early literary culture in the Ohio Valley, speaks in language similar to that employed by Mr. Mansfield: "The College of Professional Teachers was a popular body, grounded on democratic principles, and its mission was to create a public opinion in favor of the free-school system." "The professional teachers called to their support the shining lights of the pulpit, the bar, and the press. Such distinguished representative men as Beecher, Campbell, Purcell, J. M. Peck, Drake, and Grinké joined in the discussions with all their force and fervor. The best scholars of the West brought their best learning to the convention." He quotes Mr. Gallagher: "Perhaps the most important literary institution in the West, and certainly one of the most interesting in the world, is the College of Professional Teachers."<sup>3</sup>

The interest and enthusiasm that attended the annual meetings were certainly extraordinary. Mr. Venable very properly finds evidence, both of the interest and of the influence of these meetings, in the fact that delegates came to them from points as remote as Florida and Wisconsin, Pennsylvania and Louisiana. "People crowded to its daily sessions, which were held in the largest churches, and listened to essays and addresses with breathless attention and semireligious enthusiasm." Mr. Mansfield, after calling the college "a means of great intellectual development," the best that Cincinnati ever had, gives his personal recollections as follows:

In its meetings I have heard such discussions as I have neither heard nor read of elsewhere. I have heard Alexander Kinnmont keep an audience intensely excited till past midnight. I have heard Dr. Drake in his most eloquent and animated strains; Dr. Beecher in his strength and fervor; Dr. McGuffey in his acute and logical argument; and Professor Stowe in his plain, yet learned, criticism. In listening to such men discuss some of the most important points in education, connected in the first place with the metaphysics of the human mind, and then with great social interests to flow from them, I have received a pleasure and a benefit in vain sought among the ordinary pursuits of human life. The memory of these discussions lingers in my mind, and calls up the delightful company of friends, and the intellectual brilliance which surrounds them.<sup>4</sup>

This sketch would be incomplete without some account of the city that furnished the college its meeting place.

Cincinnati was by no means the oldest town in the Mississippi Valley, but it was the leading town. It soon came to be known as the "Queen City of the West." In 1830 the population was 24,831, while Pittsburg had but 12,542 and Louisville but 10,341. St. Louis had not yet taken a separate place in the census tables and Chicago did not exist. Founded in 1788, the place, when once it cast off its frontier reputation, was marked by its enterprise, public spirit, and cosmopolitan character. It drew its population from all parts of the Union, as well as from foreign countries. Mrs. Harriet Beecher Stowe, writing in 1834, speaks of the eclectic character of society. Cincinnati printed a newspaper in 1793 and a book in 1796; opened a subscription library in 1802 and started a literary journal in 1820. Schools appeared in 1790 and 1792; a school association called Cincinnati University was founded in 1806, but did not flourish, and the Lancaster Academy opened its doors in 1815. Four years later this academy was chartered as Cincinnati College, with literary, medical, and law faculties. In 1825 it was compelled to suspend, but reopened its doors ten years later; its chartered privileges still continue, but everything except the law school long ago disappeared. The Ohio Medical College was established in 1820 and the Ohio Mechanics' Institute in 1828. About the time that this history opens the city was well supplied with private schools, some of them conducted by very able teachers. There were Albert and J. W. Pickett, with their successful girls' school; Alexander Kinmont, with his select academy for boys; Mrs. Caroline Lee Hentz and her husband, with their female seminary, and Miss Catherine E. Beecher, who, assisted by her sister Harriet, carried on a school for girls. In 1833 there were 24 private schools in the city, with 33 teachers and 1,230 pupils. The public schools, which had been organized only four years before, had 21 teachers and 2,000 pupils. Cincinnati was foremost in the public-school movement in the West, and it was due to the efforts of a small number of her citizens, more than to any other cause, that the foundations of the Ohio public-school system were laid. Mr. Venable tells us that the years 1832-1837 may be regarded as an era of intellectual activity in Cincinnati and its literary dependencies. In the early part of the century, Lexington, Ky., prided herself on being the "Athens of the West," Transylvania University<sup>1</sup> constituting her principal title to that honor, while Cincinnati, boasting her industrial and commercial superiority, contented herself with the name of "Tyre;" but it was not long until Cincinnati assumed both characters. When we have mentioned the central geographical and commercial position of the city, considered in respect to the transportation facilities of 1830-1840, our characterization is complete.

It was, therefore, natural enough that Cincinnati men should have been the creators of the Western Literary Institute and College of Professional Teachers, and that Cincinnati should have been its home. It was the only city in

<sup>1</sup> Transylvania University, formed by the union of Transylvania Seminary, 1785, and Kentucky Academy, 1774, was chartered to go into operation January 1, 1799. It was the first institution of collegiate rank in the Ohio Valley. Here the degree of B. A. was conferred on three students on October 10, 1806, and the degree of M. D. was conferred on one student in 1820, both the first instances of the kind west of the Allegheny Mountains. "Had the earlier policy pursued been adhered to," says a distinguished Kentuckian, "Transylvania would to-day be one of the leading universities, not only of this country, but of the whole world. It was doomed, however, to be sacrificed upon the inconsiderate altar of denominational antagonisms. Different and opposing religious sects struggled for its control, and in the conflict the university was consumed by the fervor of the contest." (Thomas Speed, secretary of the Filson Club, preface to Transylvania University, its Origin, Rise and Fall. Robert Peter and Johanna Peter, Louisville.) Dr. Peter says the medical department of Transylvania became the second college of medicine in the United States, both in the number of its students and the distinguished reputation of its professors (p. 100). The institution was merged in Kentucky University.

the Mississippi Valley that furnished the conditions essential to such an enterprise.<sup>1</sup>

Three or four facts concerning the membership of the college are very noticeable. One is the total absence of women from the membership. The constitution excluded them by implication, and probably custom would have done so if the constitution had been silent. Women contributed a few papers, on an average about one a year. Another fact is the remarkable number and influence of clergymen in the college. This was due in part to the popular character of the institution, and in part to the fact that the ministerial and teaching functions had not then been separated to the extent that they are to-day. A majority of these ministers of religion were active teachers. Still another fact is the prominence of private school-teachers, which is explained by the place that private schools then held in society as compared with the present time. Finally, public school-teachers are hardly to be identified in the reports. This is one of the most significant facts in the story, suggesting the feeble state of public schools in the West 60 years ago.

It is never possible carefully to measure influence; and least of all the influence of associations educational in their character that hold occasional meetings and put forth occasional publications which, directly or indirectly, bring them into contact with thousands of minds. But in this case we are not likely to err on the wrong side. The college was, if not the first educational association in the West, the first to attract attention and to exert an influence, and so was something of a novelty. It caused laws to be put into statute books and controlled the appointment of State officials. Mention may again be made of the Ohio superintendency.<sup>2</sup> Were it possible to study the biographies of those who comprised the College of Professional Teachers, it would be found that they were in general the leaders of educational thought and effort in their several States and communities.

The conditions under which the college existed throw light upon the questions that engaged the annual conventions, the ardor with which they were discussed, and the character of the discussions. Such papers as some of those contained in the volumes of Transactions would not to-day command the smallest audience for a day's session in the city of Cincinnati. The subjects are not inviting, and the style is not attractive. Other papers are of high excellence, ranking with the best in our early educational annals. If we fail at first to see why these papers produced the effect they did—if we fail to enter into the enthusiasm of Mr. Mansfield—we must recall the mental and moral condition of the auditors. The people who were so deeply stirred were listening, as they thought, to a new gospel, upon which their salvation depended. Once more, if we think some of these old ques-

<sup>1</sup> One is surprised not to find in the Transactions, either in minutes or list of members, the name of Nathan Gilford, known, says Mr. Venable, not only as the apostle of the public-school system in Ohio, but also as publisher, editor, legislator, business man, and general writer. Mr. Coggeshall says of him: "Solomon Thrifty should be revered in Ohio as Poor Richard is in New England. His almanac, edited by Mr. Gilford, and published for seven years in Cincinnati, contributed, in large degree, by facts, arguments, and appeals, to the awakening and support of a public sentiment to which the legislature of 1821 responded when it passed an act for the support and better regulation of public schools," etc. Mr. Gilford was also foremost in founding the public-school system of Cincinnati. (Barnard's American Journal of Education, Vol. VI, p. 83; Vol. VIII, pp. 287-294.)

<sup>2</sup> Mr. W. T. Coggeshall speaks of the college as contributing "largely to the advancement of an educational sentiment which, as early as 1833, demanded teachers' associations, begun to urge the need of a State school department, and in 1835 obtained a resolution from the general assembly appropriating \$500 to be paid, by order of the governor, to Calvin E. Stowe, \* \* \* who was about to visit Europe, for the purpose of securing careful examination into and a judicious report upon the elementary school systems of Prussia and other European Governments." Mr. Coggeshall points out in detail the close connection between the college of teachers and the work of organizing the educational forces of Ohio. (Barnard's American Journal of Education, Vol. VI, pp. 81-103.)

tions too obvious for discussion, we must remember that they were then new, and that in the then existing state of opinion nothing could safely be taken for granted. Much the same must be said of some of the ablest addresses. They may appear to us unduly labored, and as abounding in platitudes or pedantry; but they did not originally create any such impression. No one can place a proper valuation upon those old volumes unless he appreciates that they belong to an early stage of a great movement, which was more strongly marked by moral earnestness than by intelligent insight. In respect to common schools the situation was novel. Men were not importing from the East and setting up in the West, as in the case of churches and courts of law, completed institutions; they were seeking to create ideals as well as schools. Everything was in an experimental stage. It was quite in the nature of things for the trustees of the Cincinnati common schools to seek counsel of the College of Teachers. Nobody saw the way clearly, but all were seeking to find it.

The death of this excellent association, which had apparently long passed the dangers of infancy, has never been satisfactorily explained. Mr. Venable ventures no theory. Mr. Mansfield remarks that "the duty of organization and publication, in fact, that of practically sustaining the association, fell mainly on the working teachers of Cincinnati, and for this reason, probably, it ultimately died away and lost its popular character." The history hardly sustains this view. Mr. Mansfield's further remark that the college had "accomplished its object in exciting popular interest in education, and impelling many persons to its support who had the ability and influence to form the present system of public schools in Ohio," is probably nearer the mark. Even if the establishment of the Ohio school system was not as common an object as he represents, the college had no doubt done its peculiar work, while the work that next needed to be done was of another kind and called for different machinery. The time was at hand when, owing to the multiplication of those interested in the subject and improvements in the means of communication, State associations were to be formed and maintained. It was no longer necessary to collect men from a dozen or twenty States in order to hold a successful educational meeting. The present Ohio Teachers' Association was formed in 1847, two years after the college ceased to exist, and there had been a still earlier one similar in character. The whole West north of the Ohio River was soon covered over with educational associations, State, county, and sectional, which no doubt afforded better facilities for doing the work in hand than a distant central organization. In fact, the promotion of such organizations was one of the things that the college existed to accomplish. Reference to local associations and conventions are frequent in its records. In a sense, therefore, the college had done its work too well. For the time, the smaller associations that took its place answered men's purposes, and when they again sought the basis of a larger organization they found it in the country and not in the Mississippi Valley.

The American Institute of Instruction, organized at the same time as the Academic Institute, the forerunner of the college, has lived until the present time, and is now a vital organization; but a slight examination of the history of the two societies shows the conditions surrounding them to have been very different. For one thing, the American Institute, notwithstanding its national name, has been from the first practically a New England association, serving directly a territory not much larger than the State of Ohio; while the College of Professional Teachers, having a name that at once suggested a local habitation, embraced twenty States.

## CHAPTER XIV.

### THE UNITED STATES NAVAL ACADEMY AT ANNAPOLIS— ITS ORGANIZATION AND METHODS OF TRAINING.

By EDWARD S. HOLDEN, Sc. D., LL.D.

CONTENTS.—I. Sketch of the history of the United States Naval Academy.—II. Officers, professors, and instructors attached to the United States Naval Academy in 1897-98.—III. Regulations for the admission of candidates.—IV. The course of instruction.—V. The marking system.—VI. Practical instruction.—VII. The Naval War College and Torpedo School at Newport, R. I.

An examination of the methods of instruction at the United States Naval Academy at Annapolis and of the United States Military Academy at West Point is of importance in a twofold point of view. These Government schools profess to educate, and do educate, hundreds of young men to a considerable degree of intellectual proficiency. The records of the graduates of these schools in civil life abundantly prove this point. They also train their students to a certain special efficiency and competence, which depends in a very large measure on the moral influences exerted at the two academies. The latest proof of the efficient training provided by the United States Naval Academy is afforded by the splendid operations of the fleet commanded by Admiral Sampson in the blockade of Santiago de Cuba in 1898, and in the naval battle fought there under his orders by graduates of the Academy, which resulted in the total destruction of the Spanish vessels opposed to him. Efficiency of this sort is a kind of virtue, and it is only to be obtained by training the whole man—his character as well as his intellect. It is not to be had by intellectual influences alone.

The United States Military Academy at West Point was founded in 1802, nearly a century ago. The United States Naval Academy at Annapolis was founded in 1845. The experiences of these years of peace and the stress of several wars have won for the graduated cadets of these institutions—for the officers of the Army and Navy—the respect and confidence of the American people. If there has been trouble at an Indian agency through unfair and greedy management of the Indians, an Army officer is ordered there to establish peace and fair dealing. It is a practically universal opinion, borne out by statistics, that his administration will be, on the whole, just, intelligent, and strictly honest; that he will conduct himself like a good public servant and a worthy citizen. Corresponding complications with the authorities of small foreign States in Central America, in the West Indies, and among the islands of the Pacific have time and again been adjusted by officers of our Navy without excessive friction and in a satisfactory manner. It is admitted on all hands that the officers of the two services are honest and competent. The officers are the graduated cadets. What, then, is the system of training that produces results which are, on the whole and making every allowance for exceptions, so satisfactory? It is the object of the present chapter to set forth the principles on which the two public Government schools are organized and administered. Especial attention will here be paid to the organization and management of the United States Naval Academy. The

Report of the Commissioner of Education for the year 1891-92, vol. 2, pp. 767-774, contains a reprint of part of an article by the present writer on the United States Military Academy, to which those who are interested are referred. Certain matters are there considered at greater length than in the present chapter.<sup>1</sup>

An inquiry of the sort may have some pertinence at this time, when so much thought is bestowed on the question of the kind of training best fitted for the common (public) schools of the country. The general opinion of the country is very favorable to the public school and its merits and services are fully recognized. At the same time there are many thoughtful men who doubt whether the public schools of the whole land do all that they might to elevate and to confirm moral character, considering the extraordinarily liberal endowments bestowed upon them. Here, then, are two Government schools which do produce, on the whole and in the main, excellent results of the desired kind. May not the administration and organization of these special schools have some lessons of value to the administrators and teachers of the common schools of the whole country?

### I. SKETCH OF THE HISTORY OF THE UNITED STATES NAVAL ACADEMY.<sup>2</sup>

As early as 1794 an act of Congress prescribed that eight midshipmen should be attached to each vessel of the Navy. They were appointed from civil life by the President, and most of them knew nothing of the theory or practice of navigation. They learned their profession by practicing it from the outset, and they learned it, therefore, under great disadvantages in some respects. On the other hand, they were considered as sailors from the beginning and were taught in the hard school of experience. The Navy has never had better officers than some of these very midshipmen.

About 1802 the midshipmen were instructed on board ship by the chaplain. In 1813 special schoolmasters were appointed for every large ship and each was charged with the instruction of 20 midshipmen. In 1814 the Hon. William Jones, Secretary of the Navy in the Cabinet of President Madison, recommended as follows: "I would suggest the expediency of providing by law for the establishment of a Naval Academy, with suitable professors, for the instruction of the officers of the Navy." The United States Military Academy, proposed as early as 1776, had been founded in 1802 and was in full operation, although it did not take on its present form and methods until 1817.

About 1830 there were three "naval schools," so called, at Boston, New York, and Norfolk, respectively, where midshipmen were under instruction by chaplains and by schoolmasters. In 1835 provision was made for professors of mathematics. Their duty was to teach the midshipmen at sea or at shore stations. The salary attached to the position was respectable and men of ability were appointed. In 1848 the professors were made staff officers of the Navy, and the rank is still continued in the service, although most of the corps are not employed in teaching, but at the United States Naval Observatory, etc. In 1840 Prof. William Chauvenet, a recent graduate of Yale College, was appointed a professor of mathematics. After a short experience at sea, he was ordered to the Naval Asylum at Philadelphia to prepare midshipmen returning from sea service for

<sup>1</sup> It is perhaps worth noting that the writer is a graduate of the United States Military Academy, and that he has held commissions in the Corps of Engineers of the Army and the corps of professors of mathematics in the Navy, and has likewise served as a member of the board of visitors to both the military and the naval school.

<sup>2</sup> Condensed from (a) Historical Sketch of the U. S. N. A., by Prof. J. Russell Soley, 1876, 348 pp., 8 vo. and (b) Annual Register, U. S. N. A., 1898-99, pp. 5-8. The United States Naval Academy, by Park Benjamin, New York, 1900, 486 pp., 8vo., was not printed when this chapter was written, but should be referred to by anyone who wishes to obtain a comprehensive view of the training of naval officers.

their examination for the grade of passed midshipmen. Chauvenet had charge of the departments of mathematics and navigation; Lieutenant Ward, U. S. N., of the instruction in gunnery; and Prof. H. H. Lockwood, a graduate of West Point, was associated with them. Chauvenet was a man of first-rate ability as a scholar and as an administrator, and, although he had no real authority, his influence soon made itself felt at the school. The midshipmen in attendance saw the great advantages to be derived from good instruction previous to their examinations for promotion, and it was not long before Chauvenet's proposal to found a Naval Academy for the training of midshipmen was received with favor. The proposal was no new thing. It had been made as early as 1814, as already stated, and had been renewed and enforced by several able Secretaries of the Navy and by many of the best officers. The success of Chauvenet and his colleagues at the school in Philadelphia crystallized opinion and proved the practicability of the project.

In 1845 Hon. George Bancroft became Secretary of the Navy and the plan for a permanent naval academy was proposed to him by various officers and civilians. In particular the success of the recent experiment at Philadelphia was laid before him. On June 13, 1845, Bancroft addressed a letter to the board of examiners of the Naval Asylum at Philadelphia, in which he asked their assistance in maturing a more efficient system of instruction for young naval officers. He suggests Fort Severn (Annapolis) as a suitable site for the school, and remarks that the present term of instruction is too short. "Might it not be well to have permanent instruction and to send all midshipmen on shore to the school?" He asks also for a plan of studies for the proposed school.<sup>1</sup> The United States Naval Academy dates from this time. The board of examiners replied to it from the United States Naval Asylum on June 25, after consultation among themselves, and after hearing the opinions of Chauvenet and of his colleagues on the question of academic organization.

The full and interesting history of the establishment of the Naval Academy may be read in Professor Soley's book, above cited by title. The following paragraphs are taken (with a few changes) from the register of the United States Naval Academy.

The U. S. Naval Academy was formally opened October 10, 1845, under the name of the Naval School, with Commander Franklin Buchanan, U. S. N., as superintendent. It was placed at Annapolis, Md., on the land occupied by Fort Severn, which was given up by the War Department for the purpose. The course was fixed at five years, of which only the first year and the last were to be spent at the school, the intervening three years being passed at sea. This arrangement was not strictly adhered to, the exigencies of the service making it necessary, in many cases, to shorten the period of study. In January, 1846, four months after the opening of the school, the students consisted of 36 midshipmen of the date of 1840, who were preparing for the examination for promotion; 13 of the date of 1841, who were to remain until drafted for service at sea; and 7 acting midshipmen, appointed after September of the previous year. The midshipmen of the date of 1840 were the first to be graduated, finishing their limited course in July, 1846, and they were followed in order by the subsequent dates until the reorganization of the school in 1850.

In September, 1849, the following board was appointed to revise the plan and the regulations of the Naval School:

Commander William B. Shubrick, U. S. Navy.  
 Commander Franklin Buchanan, U. S. Navy.  
 Commander Samuel F. Du Pont, U. S. Navy.  
 Commander George P. Upshur, U. S. Navy.  
 Surg. W. S. W. Ruschenberger, U. S. Navy.  
 Prof. William Chauvenet, U. S. Navy (a graduate of Yale).  
 Capt. Henry Brewerton, U. S. Army, Superintendent U. S. Military Academy, West Point.

<sup>1</sup> A copy of the letter is given in Soley's History of the Naval Academy, p. 43.

The plan reported by the board was approved, and went into operation July 1, 1850. The new organization provided for a course of seven years, the first two and the last two at the school, and the three intermediate years at sea. The school was placed under the supervision of the Bureau of Ordnance and Hydrography of the Navy Department, and its name was changed to the United States Naval Academy. The corps of professors was enlarged, the course was extended, and the system of separate departments with executive heads was fully adopted. It was provided that a Board of Visitors should make an annual inspection of the Academy and report upon its condition to the Secretary of the Navy. A suitable vessel was attached to the Academy as a practice ship, and the annual practice cruises were begun.

After the system had been in operation a year new changes were proposed, and the recommendations of the academic board on the subject were referred to the board of examiners for the year 1851, composed of the following-named officers:

Commodore David Connor, U. S. Navy.  
 Capt. Samuel L. Breese, U. S. Navy.  
 Commander C. K. Stribling, U. S. Navy.  
 Commander A. Bigelow, U. S. Navy.  
 Commander Franklin Buchanan, U. S. Navy.  
 Lieut. Thomas T. Craven, U. S. Navy.

The change recommended by the board of examiners, and adopted by the Department, consisted mainly in leaving out the requirement of three years of sea service in the middle of the course, thus making the four years of study consecutive.<sup>1</sup> The practice cruise supplied the place of the omitted sea service, and gave better opportunities for training. The change went into operation in November, 1851, together with other improvements recommended by the board. This system has been continued, with some slight modifications, to the present time. The first class to receive the benefit of it was that which entered in 1851. Six members of this class completed the course in three years and were graduated in June, 1854; the rest of the class followed in 1855.

In May, 1861, on the outbreak of the war, the Academy was moved to Newport, R. I. The three upper classes were detached and ordered to sea, and the remaining acting midshipmen were quartered in the Atlantic House and on board the frigates *Constitution* and *Santee*. In the summer of 1865 the Academy was brought back to Annapolis, where it has since remained.

When the Bureau of Navigation of the Navy Department was established, July 5, 1862, the Academy was placed under its supervision; March 1, 1867, it was placed under the direct care and supervision of the Navy Department, the administrative routine and financial management being still conducted through the Bureau. On the 11th of March, 1869, this official connection with the Bureau ceased, but was renewed by the general order of the Navy Department issued June 25, 1889. These changes in organization are the signs of certain changes of opinion in the minds of the higher officers of the Navy. The judgment of the Navy in general has always been, it is believed, that the affairs of the Academy would be best administered by one of the bureaus of the Navy Department.

The term of the academic course was changed by law, March 3, 1873, from four to six years. The change took effect with the class that entered in the following summer.

In 1866 a class of acting third assistant engineers was ordered to the Academy for instruction. The course embraced the subjects of steam engineering, mechanism, chemistry, mechanics, and practical exercises with the steam engine and in the machine shop. This class was graduated in June, 1868, together with two cadet engineers who had entered the Academy in 1867. After an interval of four years, in October, 1871, a new class of cadet engineers was admitted. This class followed a two years' course, somewhat more extended than that of the class of 1868, and was graduated in 1873. In 1872 and 1873 new classes were admitted, the first of which left the Academy in 1874 and the second in 1875. By an act of Congress approved February 24, 1874, the course of instruction for cadet engineers was made four years instead of two; the new provision was first applied to the class entering the Academy in the year 1874. This class was graduated in June, 1878.

By an act of Congress approved August 5, 1882, it was provided that from that date "there shall be no appointments of cadet-midshipmen or cadet-engineers at the Naval Academy, but in lieu thereof naval cadets shall be appointed from each Congressional district and at large, as now provided by law for cadet midship-

<sup>1</sup> The academic board had always favored this arrangement, but had been overruled by the opinion of certain distinguished officers.—E. S. H.

men, and all the undergraduates at the Naval Academy shall hereafter be designated and called 'naval cadets;' and from those who successfully complete the six years' course, appointments shall hereafter be made as it is necessary to fill vacancies in the lower grades of the Line and Engineer Corps of the Navy and of the Marine Corps: *And provided further*, That no greater number of appointments into these grades shall be made each year than shall equal the number of vacancies which has occurred in the same grades during the preceding year; such appointments to be made from the graduates of the year at the conclusion of their six years' course, in the order of merit, as determined by the academic board of the Naval Academy; the assignment to the various corps to be made by the Secretary of the Navy upon the recommendation of the academic board. But nothing herein contained shall reduce the number of appointments from such graduates below ten in each year, nor deprive of such appointment any graduate who may complete the six years' course during the year eighteen hundred and eighty-two. And if there be a surplus of graduates, those who do not receive such appointment shall be given a certificate of graduation, an honorable discharge, and one year's sea pay, as now provided by law for cadet-midshipmen."

"That any cadet whose position in his class entitles him to be retained in the service may, upon his own application, be honorably discharged at the end of the four years' course at the Naval Academy, with a proper certificate of graduation."

In 1886 a special course of instruction in physiology and hygiene was established, in accordance with an act of Congress approved May 20 of that year.

The act of Congress approved March 2, 1889, provides that "the Academic Board of the Naval Academy shall on or before the thirtieth day of September in each year separate the first class of naval cadets then commencing their fourth year into two divisions, as they may have shown special aptitude for the duties of the respective corps, in the proportion which the aggregate number of vacancies occurring in the preceding fiscal year ending on the thirtieth day of June in the lowest grades of commissioned officers of the Line of the Navy and Marine Corps of the Navy shall bear to the number of vacancies to be supplied from the Academy occurring during the same period in the lowest grades of commissioned officers of the Engineer Corps of the Navy; and the cadets so assigned to the Line and Marine Corps Division of the first class shall thereafter pursue a course of study arranged to fit them for service in the Line of the Navy, and the cadets so assigned to the Engineer Corps Division of the first class shall thereafter pursue a separate course of study arranged to fit them for service in the Engineer Corps of the Navy, and the cadets shall thereafter, and until final graduation, at the end of their six years' course, take rank by merit with those in the same division, according to the merit marks; and from the final graduates of the Line and Marine Corps Division, at the end of their six years' course, appointments shall be made hereafter as it shall be necessary to fill vacancies in the lowest grades of commissioned officers of the Line of the Navy and Marine Corps; and the vacancies in the lowest grades of the commissioned officers of the Engineer Corps of the Navy shall be filled in like manner by appointments from the final graduates of the Engineer Division at the end of their six years' course: *Provided*, That no greater number of appointments into the said lower grades of commissioned officers shall be made each year than shall equal the number of vacancies which shall have occurred in the same grades during the fiscal year then current; such appointments to be made from the final graduates of the year, in the order of merit as determined by the Academic Board of the Naval Academy, the assignment to be made by the Secretary of the Navy upon the recommendation of the Academic Board at the conclusion of the fiscal year then current; but nothing contained herein or in the naval appropriation act of August fifth, eighteen hundred and eighty-two, shall reduce the number of appointments of final graduates at the end of their six years' course below twelve in each year to the Line of the Navy, and not less than two shall be appointed annually to the Engineer Corps of the Navy, nor less than one annually to the Marine Corps; and if the number of vacancies in the lowest grades aforesaid occurring in any year shall be greater than the number of final graduates of that year the surplus vacancies shall be filled from the final graduates of following years as they shall become available."

"That after the fourth day of March, eighteen hundred and eighty-nine, the minimum age of admission of cadets to the Academy shall be fifteen years and the maximum age twenty years."

It appears from the foregoing that the policy of the Naval Academy has not been, on the whole, as stable as that of the Military Academy at West Point.

The main reasons for the difference are: First, that the Naval Academy has had no single organizer of ability, authority, and of long service like Colonel Thayer; second, that its Academic Board is not composed of permanent officials, but of officers who serve for comparatively short terms.

In October, 1897, a post-graduate course in Naval Architecture, for the education of officers for the Construction Corps of the Navy, was established; and a class was formed from the naval cadets that had finished the four years' course in that year. On May 1, 1899, this course was discontinued and some of the students who were pursuing the course at Annapolis have been sent abroad to Paris and to Glasgow to continue their studies. While this may be a satisfactory course for the present, it is not likely that a permanent policy of this kind will be followed. Post-graduate professional courses are so necessary for the education of experts in shipbuilding, ordnance, etc., that it seems likely some permanent plan will be found by which they can be given in America.

During the first fifty years of the existence of the Naval Academy (1845-1895) there have been received into it as students 4,320 young men, exclusive of the various classes of midshipmen sent to the Academy from the general service, in its earlier years, for periods of instruction. Of the 4,320 who have been admitted there remained in the service on July 1, 1895—

On the active list .....	873
On the retired list .....	111
Naval cadets .....	243
<b>Total</b> .....	<b>1,227</b>

“The total number of graduates, including the midshipmen of the date of 1840 and including the class of 1899, is 2,420. \* \* \* The proportion of those who have been graduated to those who entered is a little short of 44 per cent. This ratio is, at the present time, considerably augmented, and sometimes exceeds 50 per cent of the entire number of graduates, including those of the early dates, about 51 per cent are still (1900) in active service in the Navy, 6 per cent are on the retired list, 24 per cent are dead, and 19 per cent have left the Navy and are in active civil pursuits. The total cost of the Naval Academy to the country (sum of all appropriations, including the year 1898) has been in round numbers, \$8,000,000. That is about 25 per cent more than the amount paid for a single battle ship, such as the *Indiana* or the *Iowa*. Its average yearly cost is about \$197,000. The yearly expense of keeping the cruiser *New York* in commission is about \$400,000. From this it will be observed that the average yearly cost of maintenance of the Naval Academy has been about one-half of that required for a single large cruiser.” (Park Benjamin: The United States Naval Academy, 1900, page 344.)

## II. OFFICERS, PROFESSORS, AND INSTRUCTORS ATTACHED TO THE UNITED STATES NAVAL ACADEMY IN 1897-98.

- 1 rear-admiral, Superintendent.
- 1 lieutenant-commander, assistant to superintendent, in charge of buildings and grounds.
- 1 lieutenant-commander, assistant to Superintendent, secretary of Academic Board.

### DEPARTMENT OF DISCIPLINE (5 OFFICERS).

- 1 commander, Commandant of Cadets.
- 4 lieutenants, assistants to Commandant.

## DEPARTMENT OF SEAMANSHIP (3 OFFICERS).

1 lieutenant, head of department.  
2 lieutenants, assistants.

## DEPARTMENT OF ORDNANCE (3 OFFICERS).

1 lieutenant-commander, head of department.  
2 lieutenants, assistants.  
1 swordmaster; 2 assistant swordmasters (3 civilians).

## DEPARTMENT OF NAVIGATION (3 OFFICERS).

1 lieutenant-commander, head of department.  
2 lieutenants, assistants.

## DEPARTMENT OF STEAM ENGINEERING AND DRAWING (7 OFFICERS, 1 CIVILIAN).

1 chief engineer, head of department.  
1 chief engineer, assistant.  
4 passed assistant engineers, assistants.  
1 assistant professor, assistant.

## DEPARTMENT OF MECHANICS (2 OFFICERS, 1 CIVILIAN).

1 commander, head of department.  
1 lieutenant, assistant.  
1 professor, assistant.

## DEPARTMENT OF PHYSICS (2 CIVILIANS, 3 OFFICERS).

1 professor, head of department.  
2 lieutenants, assistants.  
1 ensign, assistant.  
1 professor, assistant.

## DEPARTMENT OF MATHEMATICS (1 PROFESSOR U. S. N., 4 OFFICERS).

1 professor U. S. N., head of department.  
3 lieutenants, assistants.  
1 ensign, assistant.

## DEPARTMENT OF ENGLISH (4 OFFICERS, 2 CIVILIANS).

1 lieutenant-commander, head of department.  
3 lieutenants, assistants.  
2 professors, assistants.

## DEPARTMENT OF LANGUAGES (1 OFFICER, 4 CIVILIANS).

1 lieutenant, head of department.  
3 professors, assistants.  
1 assistant professor, assistant.

## IN CHARGE OF POST-GRADUATE COURSE OF NAVAL CONSTRUCTION (1 OFFICER).

1 naval constructor.

## IN CHARGE OF SPECIAL INSTRUCTION IN PHYSIOLOGY AND HYGIENE (1 OFFICER).

1 passed assistant surgeon.

## INSTRUCTOR IN PHYSICAL TRAINING (1 CIVILIAN).

1 instructor.

## OFFICERS NOT ATTACHED TO THE ACADEMIC STAFF.

1 librarian (professor U. S. N.).

Other officers serving at Annapolis are not noted here, as they have no direct relation to instruction or to academic affairs.

Total number of officers giving instruction (including officers in charge of administration of academic affairs and of the library), 53.

Total number of (undergraduate) naval cadets under instruction, 280.

One instructor to every 5.3 undergraduates.

Attention is called to the large number of instructors relative to the number of students. The thoroughness of the training at the United States Naval Academy and at West Point depends mainly on this relation. A large number of able officers are available. The attention paid to each student is constant. The work of the students is necessarily thorough. It should be remarked, in passing, that it is an admirable training for an officer who has spent several years at sea to serve at Annapolis as instructor, among other men of intelligence, and in an academic atmosphere. The instructors who are placed in these positions are greatly stimulated. It is, therefore, of great use to the Navy at large, as well as to the Naval Academy, to have as many young officers as can well be spared detailed for duty at Annapolis.

The departments of instruction at the United States Naval Academy fall naturally into two groups.

First. The departments of mechanics, mathematics, physics, English (including history and international law), languages (French and Spanish), drawing.

Second. The departments of discipline, seamanship, ordnance, navigation, steam engineering.

In the first group the fundamental principles and the processes are practically unchanging, and it is of the greatest importance that the instruction in these subjects should be uniform from year to year and from class to class. In the opinion of many persons (of whom the writer is one) this can best be effected by providing permanent heads to the departments of this group, precisely as at the United States Military Academy at West Point. The first selections should be made from officers of the service who have shown especial aptitudes. The duties of heads of departments should be to supervise the instruction of the whole class and to see that the teaching of the assistant instructors conforms to a well-considered plan, formulated by the head of the department, and approved by the Academic Board. By such a supervision it is insured that a consistent scale of marking in each subject is maintained throughout the class. If this very desirable change is made, it should be arranged that the positions of heads of departments are in fact, as well as in name, permanent.

The second group of subjects is professional in character. The fundamental principles are those of mechanics, mathematics, physics, etc., but the practice (as of ordnance, steam engineering) varies from time to time as processes are perfected. It is of importance that the heads of these departments should present the very latest developments of naval science and practice, and such heads should be detailed (as now) from the most accomplished officers of the service. Their terms of service should be long—never less than three years—it would seem. Under such a plan the Academic Board would always include at least six permanent members, and this would insure a steady and consistent policy in all intellectual matters. Fresh blood and ideas would be brought into the Board by periodical appointments of the heads of the professional departments. A close touch between the Academy and the service at large would still exist as at present.

### III. EXTRACTS FROM THE REGULATIONS GOVERNING THE ADMISSION OF CANDIDATES INTO THE NAVAL ACADEMY AS CADETS.

#### NOMINATION.

I. The students at the Naval Academy shall be styled Naval Cadets.

II. There shall be allowed at said Academy one naval cadet for every Member or Delegate of the House of Representatives, one for the District of Columbia, and ten at large: *Provided, however,* That there shall not be at any time more in said academy appointed at large than ten.

III. The course of naval cadets is six years—four years at the Naval Academy and two years at sea, at the expiration of which time the cadet returns to the academy for final graduation, and the district then becomes vacant.

V. "The Secretary of the Navy shall, as soon after the fifth of March in each year as possible, notify, in writing, each Member and Delegate of the House of Representatives of any vacancy that may exist in his district. The nomination of a candidate to fill said vacancy shall be made upon the recommendation of the Member or Delegate, if such recommendation is made by the first day of July of that year; but if it is not made by that time the Secretary of the Navy shall fill the vacancy by appointment of an actual resident of the district in which the vacancy exists, who shall have been for at least two years immediately preceding the date of his appointment an actual and bona fide resident of the district in which the vacancy exists and of the legal qualification under the law as now provided. The candidate allowed for the District of Columbia and all the candidates at large shall be selected by the President. (Rev. Stat., § 1514.)

VI. "Candidates allowed for Congressional districts, for Territories, and for the District of Columbia must be actual residents of the districts or Territories, respectively, from which they are nominated. And all candidates must, at the time of their examination for admission, be between the ages of fifteen and twenty years, and physically sound, well formed, and of robust constitution." (Rev. Stat., § 1517.)

VII. Candidates who may be nominated in time to enable them to reach the Academy by the 15th of May will receive permission to present themselves on that date to the Superintendent for examination for admission. Those who may not be nominated in time to present themselves at the May examination will be examined on the 1st of September following.

No leave of absence will be granted to cadets of the fourth class.

#### EXAMINATION.

VIII. "All candidates for admission into the Academy shall be examined according to such regulations and at such stated times as the Secretary of the Navy may prescribe. Candidates rejected at such examination shall not have the privilege of another examination for admission to the same class unless recommended by the board of examiners." (Rev. Stat., § 1515.)

IX. "When any candidate who has been nominated upon the recommendation of a Member or Delegate of the House of Representatives is found, upon examination, to be physically or mentally disqualified for admission, the Member or Delegate shall be notified to recommend another candidate, who shall be examined according to the provisions of the preceding section." (Rev. Stat., § 1516.)

X. Candidates will be examined physically by a board composed of three medical officers of the Navy at the Naval Academy.

Any disease, deformity, or result of injury that would impair efficiency will be sufficient to cause the rejection of a candidate.

XI. Candidates will be examined mentally by the academic board in reading, writing, spelling, arithmetic, geography, English grammar, United States history, world's history, algebra through quadratic equations, and plane geometry. Deficiency in any one of these subjects may be sufficient to insure the rejection of the candidate.

#### GENERAL CHARACTER OF THE MENTAL EXAMINATION.

*Reading and writing.*—Candidates must be able to read understandingly, and with proper accent and emphasis, and to write legibly, neatly, and rapidly.

*Spelling.*—They must be able to write, from dictation, paragraphs from standard pieces of English literature, both prose and poetry. The spelling throughout the examination will be considered in marking the papers.

*Punctuation and capitals.*—They must be familiar with the rules for punctuation and for the use of capitals.

*Grammar.*—Candidates must exhibit thorough familiarity with English grammar.

*Geography.*—Candidates will be required to pass a satisfactory examination in descriptive geography, particularly of our own country.

*United States history.*—The examination in this branch will include questions concerning the early settlements in this country; the forms of government in the colonies; the causes, leading events, and results of wars; and prominent events in the history of our Government since its foundation.

*World's history.*—Candidates must be familiar with the general history of the world, including the rise and the fall of empires and of dynasties; changes in territory as the result of wars or from other causes; the most important treaties of peace; the relations between church and state in different countries; in brief, such information as may be found in the ordinary general histories.

*Arithmetic.*—The candidates must possess such a complete knowledge of arithmetic as will enable them to proceed at once to the higher branches of mathematics without further study of arithmetic.

*Algebra.*—The examination in algebra will include questions and problems upon the fundamental rules, factoring, greatest common divisor, least common multiple, algebraic fractions, equations of the first degree with one or more unknown quantities, simplification of expressions involving surds, and the solution and theory of quadratic equations.

*Geometry.*—In geometry candidates will be required to give accurate definitions of terms used in plane geometry; to demonstrate any proposition of plane geometry as given in the ordinary text-books, and to solve simple geometrical problems, either by a construction or by an application of algebra.

#### ADMISSION.

XII. Candidates that pass the physical and mental examinations will receive appointments as naval cadets, and become students of the Academy. Each cadet will be required to sign articles by which he binds himself to serve in the United States Navy eight years (including his time of probation at the Naval Academy), unless sooner discharged.

The pay of a naval cadet is \$500 a year, commencing at the date of his admission.

It will be noticed that the entrance examination is a very elementary one. The cadets are appointed from every Congressional district in the United States, and the requirements have been kept low in order to insure that no injustice should be done to cadets appointed from districts where the educational facilities are not high. In order to do this justice to a few individual cadets, the country at large has been made to suffer. If the subjects of solid geometry and of plane trigonometry were added to the requirements, it would work no real hardship to the candidates, and it would be a great benefit to the Academy.

The subjects might be rapidly reviewed by the cadets during their fourth-class course. The consequent saving of time would materially lighten the work of the cadet during his academic course, which is very desirable. The time saved in this way should not, it appears to the writer, be devoted to theoretical work, but to practical and professional exercises.

The best opinion seems to be that the age at entrance should be from 15 to 18 years, not from 15 to 20, as at present.

The following extracts from the report of the Superintendent of the United States Naval Academy for 1897 present interesting statistics, and comments upon them which are especially valuable in this connection:

“The table following exhibits the number of cadets on probation at the Naval Academy on October 1, 1896, and again on June 5, 1897, after the annual examination, with the ensuing casualties:

Class.	October 1, 1896.	June 5, 1897.	Loss.
First, line division .....	38	37	<i>Per cent.</i> 24
First, engineer division .....	13	11	15
Second .....	48	40	17
Third .....	60	54	10
Fourth .....	95	70	26
	254	212	16½

Number of cadets at the Academy October 1, 1897 .....	259
Graduated June 4, 1897.....	47
Resigned.....	41
Dropped.....	1
Transferred to lower class by reason of physical disability.....	6
Transferred to higher class, having qualified.....	2
Entered May, 1897.....	37
Entered September, 1897.....	59

In May 59 candidates reported for examination, of which number 33 passed, 1 of whom was rejected for physical disqualification.

In September 104 candidates reported for examination, of which number 61 passed, 2 of whom were rejected for physical disqualification.

The record shows that 60 per cent of the candidates successfully passed the mental examinations, a larger percentage than has been the case for many years, which, in itself, is an encouragement. A much larger percentage of candidates would undoubtedly be successful if the oft-repeated recommendation were adopted to grant the permits to candidates a year in advance, and making it an absolute rule that there shall be but one examination each year for admission, which should be in May.

Several advantages would thereby accrue to the service as well as to the candidates; a longer time for preparation, a saving of money to the candidates by an avoidance of a special course of preparation, a more substantial preparation than can be given by the cramming system now in vogue, which leads to momentary success, but eventual impoverishment of mental faculties; and, lastly, the Academy would have the entire class as a homogeneous body for practical training through the summer months, whereas under the present system but one-third of the members of the fourth class have this valuable training. It is my opinion that no more important reform can be made than this to enhance the efficiency of the Naval Academy.

The routine of practical exercises followed by the fourth class from the middle of May until the opening of the academic year on October 1 is shown below:

- 8.30 to 10.00 a. m. Setting up drill in the armory.  
 10.20 to 12.00 m. Swimming drill in the natatorium until the cadets are proficient. For all who are proficient in swimming this period is given to marline-spike seamanship and other practical work in the rigging and sail lofts.  
 4.00 to 6.00 p. m. Drill in the cutters with oars and under sail.  
 8.00 to 9.00 p. m. Gymnasium drill.

No more efficient system can be devised for preparing the sound body to enter upon the academic work which is to develop the sound mind. Moreover, those who have this training attain a familiarity with the water and with handling boats, which advantage will abide with them through their professional lives.

From this experience are debarred all those candidates held back for a later examination, or those who do not receive their permits to appear until after July 1, all of whom should not be allowed to report until the following May.

In this connection it may be remarked that many naval cadets served during the Spanish-American war of 1898 on board of war vessels. An experienced sea officer reports that he did not see a single naval cadet attached to the North Atlantic Squadron who could handle a boat properly in a strong tideway or in a heavy sea. Their boat work indicated a lack of practice. It is noteworthy that the sports of the cadets at the Academy are less nautical than one would suppose they should be. Baseball and football excite at least as much interest as rowing and sailing.

What we may call the college spirit is said to be developed at the expense, perhaps, of the professional naval spirit. If this is so, it is a matter deserving attention.

The examinations in all departments of the Academy are now conducted in writing only, it is believed. It seems to be quite clear that an important part of every examination should be oral. The justice and impartiality of the instructors is beyond question and need no written vouchers. Written examinations serve very well for tests of certain qualities, but one can not learn to reef topsails on a sheet of foolscap. Oral examinations test other points besides mere intellectual

proficiency, and it is these very points which are especially valuable to a service like the Navy.

Every moment of the cadet's life should impress upon him his special relation to professional life. In general, it is believed that this is effectively done. It is possible that even more attention should be paid to seamanship, using the term in its widest sense.

Seamanship can not be taught alone by precept, and it is impossible to create a lively interest without possessing suitable instruments.

The Naval Academy should have two vessels of moderate size and so handy that practice under way can be had throughout the year. These vessels should be \* \* \* sailing vessels, with no steam appliances on board.

The quick judgment, the readiness of resource, and the unfailing nerve required of our naval officers in the management of modern men-of-war can only be developed through the teaching of seamanship, and that on board sailing vessels. The argument that seamanship is no longer necessary in these days of steam and of mastless ships is a grievous mistake; but the art must be taught in youth. It should still be the foundation stone of this institution. (Extract from the report of the Superintendent United States Naval Academy, 1895.)

There is, perhaps, too much time devoted to infantry drills compared to the time devoted to drills in seamanship, gunnery, etc.

#### IV. SUMMARY OF THE COURSE OF INSTRUCTION.

##### ASSIGNMENT OF TIME.

A term is four months. The numbers in the table show the number of recitations per week. F stands for Friday, from 7.30 to 9.30 p. m.

Departments.	Fourth class.		Third class.		Second class.		First class, line division.		First class, engineer division.	
	First term.	Second term.	First term.	Second term.	First term.	Second term.	First term.	Second term.	First term.	Second term.
Seamanship .....					1	1	3	4		3½
Ordnance .....							3	5		
Navigation .....							4	4		
Steam engineering .....					3	3			10	10½
Mechanics .....					5	4½	3		3	
Physics .....				4 F.	4	4	3		3	
Mathematics .....	6	5	5	5						
English .....	5	5	4	4	1	1		2		½
Languages .....	5	5½	3	3	1 F.	1 F.				
Drawing .....			4	2						

##### *Special instruction.*

Physiology and hygiene .....								½ F.		½ F.
------------------------------	--	--	--	--	--	--	--	------	--	------

This table can be reduced so as to show the number of recitations per week per one term, and it will then exhibit the relative amount of time devoted to each subject by naval cadets of the line division and of the engineer division, respectively, as follows:

Study.	Relative amount of time.		Study.	Relative amount of time.	
	Line division.	Engineer division.		Line division.	Engineer division.
Seamanship .....	9	5½	English .....	20	18½
Ordnance .....	8		Languages .....	17½	17½
Navigation .....	10	2	Drawing .....	8½	8½
Steam engineering .....	6	26½	Physiology .....	½	½
Mechanics .....	12½	12½			
Physics .....	15	15	Total .....	127	129
Mathematics .....	21	21			

## DETAILS OF THE COURSE OF INSTRUCTION.

[Reference books are marked (\*).]

FIRST YEAR—FOURTH CLASS.

FIRST TERM.

Department.	Number of recitations a week.	Number of months.	Subjects.	Text-books.
Mathematics ----	4	4	Algebra: Fundamental operations; reduction and conversion of fractional and surd quantities; reduction and solution of equations of the first and second degrees; inequalities; involution and evolution; arithmetical, geometrical, and harmonical progression.	Hall and Knight's Elementary Algebra. Hall and Knight's Higher Algebra. Todhunter's Algebra.*
		2	Geometry: Geometry of the straight line, of the circle, and of the plane; theory of proportion; properties of similar figures.	Chauvenet's Geometry.
English -----	2	4	English: The structure and historical development of the English language; syntax; analysis of sentences; punctuation and capitals; exercises in the composition of letters.	Whitney's Essentials of English Grammar. Hart's Punctuation. Buehler's Practical Exercises in English.* Webster's Dictionary.*
		3	History: Outlines of history, especially the history of Greece and Rome, and of the states of western Europe; historical geography; important points in naval history, by notes.	Swinton's Outlines of the World's History. Labberton's Historical Atlas.*
Languages -----	5	4	French: By "The Natural Method;" pronunciation drill on the sounds of vowels and the articulations of consonants with their combinations; verb drill on the auxiliaries, the conjugations and the irregulars; lecture, questionnaire, grammare, and dictée on practical subjects.	Méthode Néel—Le Premier Livret avec Tableaux Muraux. Marion's Le Verbe en Quatre Tableaux Synoptiques. Bercy's Le Français Pratique. Bellow's French-English and English-French Dictionary.*

SECOND TERM.

Mathematics ----	3	4	Algebra: Course for first term continued. Development of algebraic functions by means of indeterminate coefficients and the binomial theorem; permutations and combinations; theory of probability; summation of series; continued fractions; logarithms and the use of tables; exponential equations; theory of equations, including the solution of numerical equations; determinants.	Hall and Knight's Higher Algebra. Gauss's Logarithms.
		2	Geometry: Course for first term continued. Spherical geometry; the cone and the cylinder; mensuration of rectilinear figures, and of the sphere, cone, and cylinder; application of algebra to determinate geometry.	Chauvenet's Geometry.
English -----	2	4	English: Words, sentences, and paragraphs; exercises in the composition of letters and telegrams. Themes.	A. S. Hill's Foundations of Rhetoric. Buehler's Practical Exercises in English.* Webster's Dictionary.*
		3	History: Progress of colonial development in America, and the history of the United States; important points in the naval history of the United States by notes or lectures.	Eliot's History of the United States. Mitchell's Atlas.*

## Details of the course of instruction—Continued.

## FIRST YEAR—FOURTH CLASS—Continued.

## SECOND TERM—continued.

Department.	Number of recitations a week.	Number of months.	Subjects.	Text-books.
Languages.....	5	4	French: By "The Natural Method." Course of the first term continued.  Spanish: By "The Natural Method." Given as an advance course, with same subjects as in French.	Bercy's Le Français Pratique. Bercy's Lectures Faciles avec Notes Grammaticales et Explicatives. Marion's Le Verbe. Worman's First Book in Spanish. Cortina's Verbos Españoles. Pocket Dictionary, English-Spanish, Tauchnitz edition.*

## SECOND YEAR—THIRD CLASS.

## FIRST TERM.

Mathematics .....	1	4	Descriptive geometry: Orthographic projections, representation of points, lines, and planes; problems relating to the right line and the plane; representations of surfaces of the second order; projections of the sphere.	Church's Descriptive Geometry. Rittenhouse's Exercises in Descriptive Geometry Drawing.
	4	4	Trigonometry: Measures of arcs and angles; trigonometric functions; analytical investigations of trigonometric formulas, with their application to all the cases of plane and spherical triangles; construction and use of trigonometric tables; inverse trigonometric functions; De Moivre's theorem; solution of trigonometric equations; practical applications of trigonometry to the solution of plane and spherical triangles, the astronomical triangle, and the measurements of heights and distances.	Chauvenet's Trigonometry. Bowser's Trigonometry. Gauss's Logarithms.
English .....	2	4	English: Rhetoric and composition; choice and use of words; kinds of composition; narration and description; argumentative composition; exercises in the composition of official dispatches, letters, and telegrams. Themes.	A. S. Hill's Principles of Rhetoric. Buehler's Practical Exercises in English.* Webster's Dictionary.*
Languages.....	2	4	Law: The Constitution of the United States.	Andrew's Manual of the Constitution. Modern French Comedy. College series.
	3	4	French: By "The Natural Method." Reading comedies and reciting the parts from memory; writing anecdotes from dictation; sea terms and phrases; personnel; organization; distinguishing flags; honorary distinctions; uniforms; ceremonies and salutes of the French and English navies. Spanish: By "The Natural Method." Continued and given as an advanced course.	Picard et Freemantle. Langage Marin: Connaissances utiles aux officiers des Marines de France et d'Angleterre. Modern Spanish Comedy. Sea Terms and Phrases. (Departmental pamphlet.) Knapp's Spanish Grammar.*

## Details of the course of instruction—Continued.

## SECOND YEAR—THIRD CLASS—Continued.

## FIRST TERM—continued.

Department.	Number of recitations a week.	Number of months.	Subjects.	Text-books.
Drawing .....	4	4	Mechanical drawing; Sketching from models; the use of instruments; construction of scales; notation and symbols used in mechanical drawings; construction of rectilinear and curved figures to scale; drawing section lines; round writing. Drawing exercises in descriptive geometry, including the projections of lines and the representation of planes and geometrical solids, and the projections and sections of surfaces and solids.	Faunce's Mechanical Drawing. Rittenhouse's Exercises in Descriptive Geometry Drawing.

## SECOND TERM.

Physics .....	4	4	Physics: An elementary course intended to present the leading principles and the correlation of the branches of physical science, to which more time is devoted during the second and first class years. Constant practice with the fundamental and derived units of the C. G. S. system. Practical work in the physical laboratory; experiments illustrating the daily recitations and exact measurements of length, mass, volume, and specific gravity. Lectures. Chemistry: Recitations in general and organic chemistry. Practical work in the chemical laboratory; experiments illustrating the daily recitations and the determination of simple salts, acids, and bases. Lectures.	Daniell's Principles of Physics. Practical Physics by Stewart and Gee.  Remsen's General Chemistry. Lecture Notes.
Mathematics .....	5	4	Stereographic Projections and Solutions of the "Astronomical Triangle." Analytical geometry: Equations of the straight line and of the conic sections; transformation of coordinates; properties of the conic sections; equations to tangents and normals; determination of loci; discussion of the general equation of the second degree.	Hendrickson and Dresel's Stereographic Projections. C. Smith's Conic Sections.
English .....	2	4	English: Classification of words; definition of words by usage and by derivation; synonyms; laws of change in the meaning of words; faults in diction and their remedies; selection and arrangement; elementary principles of reasoning; principles of composition; exercises in the composition of official dispatches, letters, and telegrams. Themes.	Abbott and Seeley's English Lessons for English People. Abbott's How to Write Clearly. Buehler's Practical Exercises in English.* Webster's Dictionary.*
Languages.....	2	4	French: Course of the first term continued. Spanish: Course of the first term continued.	Same as for the first term.
Drawing.....	2½	4	Mechanical drawing; Sketching from models; representation of objects by projections; drawing the projections of models to scale; oblique projections; drawing screws, bolts, nuts, and gearing; round writing.	Faunce's Mechanical Drawing.

*Details of the course of instruction—Continued.*

## THIRD YEAR—SECOND CLASS.

## FIRST TERM.

Department.	Number of recitations a week.	Number of months.	Subjects.	Text-books.
Seamanship .....	1	4	Seamanship: Use of the compass, lead, and log; signals; blocks and tackles; running rigging; description and use of sails and their fittings; purchasing weights; boats and their management; ground tackle; handling anchors; handling sails; port drills and evolutions; management under sail; duties of naval cadets; rules of the road.	Luce's Seamanship. Department circulars.
Steam engineering.	3	4	Principles of mechanism: Conversion of circular into reciprocating motion; link work; conversion of reciprocating into circular motion; the teeth of wheels; the use of wheels in trains; aggregate motion; truth of surface and the power of measurement; miscellaneous contrivances.	Goodeve's Elements of Mechanism. Gow's Notes and Problems in Elementary Mechanism.
Mechanics .....	5	4	Differential calculus: Functions; rates; differentials of functions; indeterminate forms; series; maxima and minima; geometrical applications; functions of two or more variables. Integral calculus: The methods of integration; definite integrals; quadrature of surfaces; cubature of volumes; rectification of curves; centers of gravity; moments of inertia; planimeters; rules for approximate determination of the areas and volumes.	Rice and Johnson's Differential Calculus.  Johnson's Integral Calculus.
Physics .....	4	4	Physics: Recitations on simple harmonic motion; wave motions, sound, light, and heat. Practical work in the physical laboratory; experiments illustrating the daily recitations, and some exact measurements, such as the determination of the candlepower of gas and electric lights, index of refraction of glass prisms and lenses and of liquids, focal length of lenses; length of light waves. Photography. Chemistry: Short course in chemical analysis.	Daniell's Principles of Physics. Ganot's Physics. Stewart's Treatise on Heat. Practical Physics, by Stewart and Gee. Kohlrausch's Physical Measurements. Lecture Notes.  Stoddard's Outline of Qualitative Analysis for Beginners.
English .....	1	4	History: The history of the United States Navy.	Maclay's History of the United States Navy.
Languages .....	1	4	French: Conversation upon articles and paragraphs selected from newspapers. Spanish: Same .....	Le Courrier des États-Unis. Langage Marin—continued. Las Novedades.
Drawing .....	2	4	Mechanical Drawing: Drawing gearing; sketching machinery and making working drawings; round writing; tracings and blue prints of drawings. Topographical and isometrical drawing exercises.	Tomkin's Machine Construction. Fauce's Mechanical Drawing.

*Details of the course of instruction—Continued.*

## THIRD YEAR—SECOND CLASS—Continued.

## SECOND TERM.

Department.	Number of recitations a week.	Number of months.	Subjects.	Text-books.
Seamanship .....	1	4	Course of the first term continued ....	Same as for the first term.
Navigation .....	2	4	The Celestial Sphere: Spherical and rectangular coordinates; use of instruments, especially those for determining terrestrial latitudes and longitudes; refraction; dip; parallax; the earth, sun, planets, and solar system in general; different units of time and calendars; laws of universal gravitation, precession, nutation, and aberration; the moon; eclipses and occultations; tides; comets and meteoric bodies; fixed stars; nebulae; motion of the solar system; solutions of the astronomical triangle; use of the Nautical Almanac. Dead reckoning and "day's work."	White's Astronomy. Bowditch's Navigator. American Ephemeris and Nautical Almanac.
Steam engineering.	3	4	Marine Engines: Early history and progress of marine engineering; work and efficiency; nature and properties of heat; application of heat to water; combustion of coal and economy of fuel; arrangement and efficiency of boilers; fittings and mountings of boilers; corrosion and preservation of boilers; efficiency of the steam; methods of increasing the expansive efficiency of steam; compound engines; condensation of steam; regulating and expansion valves and gear; slide valves and fittings; starting and reversing gears; cylinders and their fittings; condensers and fittings; rotatory motion; details of compound and triple-expansion engines; propulsion, screw propellers; the indicator and indicator diagrams; auxiliary machinery and fittings.	Sennett's Marine Steam Engine. Marine Engines: Problems, Notes, and Sketches. 1895.
Mechanics .....	4	4	Mechanics: Kinematics: statics: kinetics; the motion of projectiles; friction and other resistances; the application of mechanical principles to simple machines and to instruments.	Johnson's Mechanics.
Physics .....	4	4	Physics: Recitations in light and heat concluded. Electricity and magnetism commenced. Practical work in the physical laboratory; calibration of thermometers; determination of the hygrometric state of the atmosphere; measurements of the coefficients of expansion and the specific heat and latent heat of various substances; other experiments illustrating the course of study and leading to the skillful use of instruments of precision. Photography. General experiments illustrating the phenomena of static and voltaic electricity; setting up and comparing galvanic cells and secondary batteries; measuring their resistance and electro-motive force; calibration of galvanometers; determination of dip and horizontal intensity.	Same as for first term. Thompson's Electricity and Magnetism. Ayrton's Practical Electricity. Day's Exercises in Electrical Measurements. Lecture notes.
English .....	1	4	History: The history of the United States Navy.	Maclay's History of the United States Navy.
Languages .....	1	4	Course of the first term continued ....	Same as first term.

## Details of the course of instruction—Continued.

## FOURTH YEAR—FIRST CLASS—LINE DIVISION.

## FIRST TERM.

Department.	Number of recitations a week.	Number of months.	Subjects.	Text-books.
Seamanship .....	3	4	Seamanship: Stowage and organization; boats and their management; ground tackle; handling anchors; handling sails; management under sail and under steam; turning and maneuvering; wharfing, docking, towing, anchoring, mooring, etc.; emergencies; port drills and evolutions; duties of officers and crew; routine; rules of the road; laws of storms and management in cyclones; use of sounding machine. Naval Tactics: Organization of the fleet; school of the ship, section, and squadron; evolutions of the fleet; signaling by Army and Navy code; Navy and International codes of flag signals.	Luce's Seamanship. Department Circulars. Navy Regulations.  Navy and International Signal Books. Fleet Drill Book (Navy Department).
Ordnance .....	3	4	Drill Regulations for Infantry and Artillery; Schools of the squad, company, battalion, and brigade, in close and extended orders; street-riot drill; ceremonies; arm and away boats. Gunnery Drill: Distribution of the crew to the guns and other stations; duties of officers and men; drill of guns of the main and secondary batteries. Clear Ship for Action .....	Drill Regulations for Infantry, Artillery, and Arm and Away Boats, United States Navy, 1898.  Gunnery Drill Book for the New Armaments.  General Instructions; Clearing Ship for Action, 1896.
Navigation .....	4	4	Guns and Gun Mounts: Metals used in their construction; description and manufacture of service guns and their mounts for main and secondary batteries; nomenclature, care, and preservation of the ordnance outfit. The Theory and Practice of Navigation, including instruction in the duties of the navigator, the construction and use of navigating instruments, the use of tables, and the solution of problems; determination of meridian distances. Hydrographic Surveying: The instruments used; selection and measurements of bases; determination of azimuth of base; triangulation; determination of heights; leveling; plotting a survey; hydrographical-surveying; tidal observations; current observations; sailing directions; the form of the earth, with special reference to the construction of charts; projections; running surveys.	Text-book of Ordnance and Gunnery. Descriptions of Modern Ordnance and Modern Gun Mounts.  Chauvenet's Spherical and Practical Astronomy.* Coffin's Navigation. Bowditch's Navigator. American Ephemeris and Nautical Almanac. Pheips's Practical Marine Surveying. Projection Tables. Craig's Azimuth.*
Mechanics .....	3	4	Method of Least Squares: The theory of least squares and probable errors; fundamental principles of the theory; practical methods and formulas; independent observations; conditioned observations. Hydromechanics .....	Johnson's Method of Least Squares.  Bowser's Hydromechanics. Cotterill and Slade's Lesson in Applied Mechanics. Cotterill's Applied Mechanics.
			Applied Mechanics: Strength of materials; elasticity; stress and strain; theory of structures; strength and deflection of beams; beams of uniform resistance.	

*Details of the course of instruction—Continued.*

## FOURTH YEAR—FIRST CLASS—LINE DIVISION—Continued.

## FIRST TERM—continued.

Department.	Number of recitations a week.	Number of months.	Subjects.	Text-books.
Physics .....	3	4	Physics: Recitations in electricity and magnetism; practical work in physical laboratory; determination of the constants of galvanometers; testing ammeters and voltmeters; running dynamos and electric motors and measuring their efficiency; experiments on the electric transmission of energy; testing cables and electric-light wires; experiments upon induction; practice in photography and microphotography.	Same as for the second-class year. Thompson's Dynamo Electric Machinery. Lecture Notes.

## SECOND TERM.

Seamanship .....	4	4	Naval Construction: Definitions: history and practice of shipbuilding in iron and steel; systems of construction, subdivision, and armoring; systems of pumping, draining, ventilating, steering, and hoisting; fittings in general; distribution of armor, guns, and boats; special constructions; launching; types of ships; structural strength and strains; buoyancy and stability in the intact and the damaged conditions; theory and observation of waves; rolling and pitching; principles of stowage; resistance, propulsion, and steering of ships; qualities of ships; construction and use of diagrams of qualities; the use of qualities; steam steering gear; steam capstan; plans of ships and reproduction in mold loft; finding the displacement of ships and center of buoyancy, etc.	Special Notes and Drawings. Navy Department Pamphlets. White's Manual of Naval Architecture.
Ordnance .....	5	4	Ballistics: The laws of combustion of gunpowder; velocities and pressures in guns; rifling, effect on pressure; the motion of projectiles in a non-resisting medium and in air; computation and use of ballistic and range tables; accuracy and probability of fire; derivation of rules for correcting the errors which occur in gunnery practice; the penetration and effect of projectiles. Guns: Computation of their elastic strength and shrinkage. Ammunition: Its description, preparation, supply, stowage, and use. Armor: Description of; use of armor and other protection of matériel and personnel. Torpedoes: Their description and use.	Interior and Exterior Ballistics. Accuracy and Probability of Fire. Ordnance Notes.  The Elastic Strength of Guns. Text-book of Ordnance and Gunnery.

*Details of the course of instruction—Continued.*

## FOURTH YEAR—FIRST CLASS—LINE DIVISION—Continued.)

## SECOND TERM—continued.

Department.	Number of recitations a week.	Number of months.	Subjects.	Text-books.
Navigation .....	4	4	Theory of the Deviation of the Compass, including the nature and causes of the several parts of deviation, the determination of the vertical and horizontal forces of the earth and ship, the causes and amount of the heeling error, the changes that take place upon a change of geographical position, the graphic representations of the amount and direction of the forces that act on the needle, and the mechanical correction of the deviation and heeling errors. Practical Navigation. Practical Surveying.	Admiralty Manual for the Deviations of the Compass. Diehl's Practical Problems and the Compensation of the Compass in the United States Navy.*
English .....	2	4	International Law: The objects, sources, and sanctions of international law; the laws of war, embargo, reprisal, and retorsion; blockade, contraband of war; right of search; ship's papers and nationality; prizes; privateering; piracy; the rights and duties of neutrals; jurisdiction over vessels at sea and in territorial waters; fugitives and deserters; licenses to trade; recaptures. Military Law: <sup>1</sup> Courts of inquiry; general and summary courts-martial.	Snow's International Law. United States Navy Regulations. Lauchheimer's Forms of Procedure.
Special instructions.	1	4	General description of the human body and its functions; the arrest of hemorrhage; resuscitation from drowning; alcoholic drinks, tobacco, and other narcotics. (Lectures and practical instruction Fridays, 7.30 to 9.30 p. m., additional.)	Blaisdell's Practical Physiology.

<sup>1</sup>The cadets of the Engineer Division also take the course in military law.

## FOURTH YEAR—FIRST CLASS—ENGINEER DIVISION.

## FIRST TERM.

Steam engineering.	10	4	Marine Engines: Horsepower, nominal and indicated, and the efficiency of the engine; resistance of ships and indicated horsepower necessary for speed; space occupied by, and general description of, modern marine machinery; engines, simple and compound; expansion of steam, mean pressure, etc., piston speed, stroke of piston, revolutions, size of cylinder, cylinder fittings, etc.; the piston, piston rod, connecting rod; shafting, cranks, and crank shafts, etc.; foundations, bedplates, columns, guides, and framing; the condenser, pumps; valves and valve gear; valve diagrams, etc.; propellers; sea cocks and valves; fitting in of machinery, starting and reversing of engines; materials used by the marine engineer.	Seaton's Marine Engineering.
--------------------	----	---	---	------------------------------

*Details of the course of instruction.—Continued.*

## FOURTH YEAR—FIRST CLASS—ENGINEER DIVISION—Continued.

## FIRST TERM—continued.

Department.	Number of recitations a week.	Number of months.	Subjects.	Text-book.
Steam engineering.	10	4	Metals: Their properties and treatment.  Boilers: Fuel, etc., evaporation; proportions; water-tube boilers; boiler details; mountings and fittings; wear and tear; repairs; performance; corrosion; determining the heating value of fuels; forced and natural draft and resistances; measurement of heat produced and wasted; analysis of waste gases; strength of boiler material; design; construction; board of trade rules; management; liquid fuel.  Designing Machinery: Materials used in machine construction; straining actions to which machines are subjected; resistance of structures to different kinds of straining action; fastenings, riveted joints, bolts, nuts, keys, and cotters; pipes and cylinders; journals, pivots, axles, and shafting; crank-shaft design; practical designing of various parts of machines.	Metals, by A. K. Huntington and W. G. McMillan.  Seaton's Marine Engineering.  Stromeyer's Marine Boiler Management and Construction.
Mechanics .....	3	4	Same as for the line division.....	Unwin's Elements of Machine Design—Parts I and II.
Physics .....	3	4	.....do.....	Same as for the line division. Do.

## SECOND TERM.

Seamanship .....	4	4	Naval Construction: Definitions: history and practice of shipbuilding in iron and steel; systems of construction, subdivision, and armoring; systems of pumping, draining, ventilating, steering, and hoisting; fittings in general; distribution of armor, guns, and boats; special constructions; launching; types of ships; structural strength and strains; buoyancy and stability in the intact and the damaged conditions; theory and observation of waves; rolling and pitching; principles of stowage; resistance, propulsion, and steering of ships; qualities of ships; construction and use of diagrams of qualities; the use of qualities; steam steering gear; steam capstan; plans of ships and reproduction in mold loft; finding the displacement of ships and center of buoyancy, etc.	Special Notes and Drawings. Navy Department Pamphlets. White's Manual of Naval Architecture.
------------------	---	---	---	--

*Details of the course of instruction—Continued.*

## FOURTH YEAR—FIRST CLASS—ENGINEER DIVISION—Continued.

## SECOND TERM—continued.

Lineham's Mechanical Engineering, Part I.</p> <p>Same as for the first term, with notes. Do.</p>

## V. THE MARKING SYSTEM AT THE UNITED STATES NAVAL ACADEMY.

Each naval cadet is called upon for recitation as often as possible and a mark is given by the instructor of his section in proportion to the cadet's knowledge and manner of exposition. At the end of each week the marks are publicly posted, so that each student knows how his work has been rated and how his standing compares with that of other students of his class. At the end of each year merit rolls are made out for each class separately, showing the proficiency of each cadet in each branch of study. A numerical coefficient is assigned to each study, likewise, in the order of its value in a naval training. The mark of the cadet in each study on a scale of 4.0 (= perfect), 2.5 (= tolerable), 0 (= total failure) is multiplied by the coefficient for that study and the product is his aggregate of credit for that particular study. For example, in the fourth class the coefficient for mathematics, for English, and for languages is 5. The maximum possible mark for recitation is 4.0 (= perfect). The maximum credit to the fourth-class cadet is, therefore, 20 for mathematics, 20 for English, 20 for languages. If his "conduct" is perfect his mark will have been 4.0, the corresponding coefficient is 3, and his aggregate merit 12. If his "efficiency" is perfect his mark (4.0) will be multiplied by the corresponding coefficient (1), and his

aggregate merit 4. If such a cadet has been perfect in all his work he can attain a maximum merit of 76 therefore; (20 + 20 + 20 + 12 + 4).

Maximum for a fourth class cadet .....	76
Maximum for a third class cadet .....	152
Maximum for a second class cadet .....	228
Maximum for a first class cadet .....	304

Maximum at the end of four years..... 760

A final merit roll is made up at the end of the four years of academic work on this principle, and the standing of graduating class is determined by a simple numerical rule. To stimulate ambition the names of cadets who attain 85 per cent of the maximum in any year are printed with a star affixed to their names on the merit rolls of the Annual Registers, and the diplomas of cadets whose final marks on the graduating merit roll are not less than 85 per cent of the maximum read, "Passed with distinction;" those whose final marks are between 74 per cent and 85 per cent of the maximum read, "Passed with credit," and those whose final marks are between 62½ per cent and 74 per cent of the maximum read, "Passed."

The table of adapted numerical coefficients, or of relative weights, of the various studies is instructive, but it is too long to be here given in full. Seamanship in the second class year has a weight (a coefficient) of 3, while in the first class year it has a weight of 15. More is expected of the first class man. Ordnance and gunnery has a weight of 15; physics (in the second class) a weight of 10, and so on.

Conduct has a weight of 3 for the fourth class, 5 for the third class, 7 for the second class, 8 for the first class. Efficiency has a weight of 1 for the fourth, 3 for the third, 7 for the second, 8 for the first class. Here, again, more is expected from the upper class men.

The following table shows the maximum credit that can be attained in each department of study by cadets fitting for line officers and for engineers, respectively:

Department and subjects.	Maxima for four years, line division.	Maxima for four years, engineer division.	Department and subjects.	Maxima for four years, line division.	Maxima for four years, engineer division.

Whatever may be said of the marking system in our colleges and schools there is no doubt whatever that it is an integral part of the methods of the schools at Annapolis and at West Point, nor is there any doubt that it should be retained. The graduates of these schools would be practically unanimous in this judgment. *As there practiced* it has the advantage of giving each cadet a full knowledge of his own performance at short intervals. If he is ambitious to stand well in his class (and his future promotion in the Navy depends on his graduating standing) he can tell each week how he compares with his friendly rivals. If he is near the foot of the class, and in danger of being dropped, he can measure each week what he has done, and estimate what still remains to be done to become proficient.

In after life the verdicts of our fellows on our attainments and conduct are often postponed for many years, and we live meanwhile in a false security. By this system, as here applied, Nemesis comes once a week. Best of all, frequent opportunity is given to reverse her judgments. There is no better way of training men to endure the long trials of actual experience in after life than to give them verdicts on their competence and conduct at short intervals in the very beginning of their career.

If we are teaching mathematics to a class of young Newtons, or the humanities to a class of youthful Porsons, the ideal method of instruction is to open the royal gates of knowledge to these eager minds; to exhibit the vast fields beyond; to invite them to the intense pleasures that come of acquisition and discovery. Such ideal pupils need no stimulus. They will themselves press forward, and at the most will require only a little guidance or, it may be, restraint. If there be any sluggards among them, the example of the brilliant ones will serve to excite and stimulate. Science will be studied for its own sake; learning will be free; there need be no compulsion; wisdom will be its own reward.

While the foregoing might conceivably be true for brilliant pupils of mature age, it is certainly not true for young students, no matter how brilliant. For them tasks must be set and performances tested. For a company of young men, just out of boyhood, chosen as the cadets of the two Government schools are chosen—that is, so as to make it certain that many of them are ill-equipped, idle, and not clever—it is imperative to urge them in every possible way toward the desired end.

And it can not be said too plainly nor too often that the desired end in these Government schools is not, primarily, to make scientific experts and scholars. Out of any great company of well-taught men some will become scholars and experts. Experience has proved it. But the primary object of the Government schools is to turn out year by year a class of worthy public servants for our Navy and Army. We wish to insure that every year they shall go forth well-instructed, faithful, obedient, patient, competent. For a long series of years each one of them will hold a subordinate position and be charged with comparatively humble duties. Wherever he is placed he must be at the level of his responsibilities. Each year he must be better fitted to undertake graver matters. Few of the graduates will ever, in the ordinary course of things, be called upon for any serious and grave responsibility. We wish to insure that if they are so called upon they will be fitted for it and competent to undertake it. Once in a long period some few officers may be suddenly plunged into problems like that of Essex Porter off Cape St. Roque, Farragut at Mobile, Dewey at Manila. The training that is needed is the training required to fit the graduate for all his duties—not alone for great emergencies, but also for daily routine duties without brilliancy and very likely without any especial recognition.

A ship is a complicated machine manned by seamen of limited intelligence. The duties of a ship-of-war may take her into all oceans and into any port. The ship itself—the machine—must be kept in perfect order. Every part of her armament and equipment must be at every instant in perfect readiness for work. Each

man of the crew must be trained to the highest pitch of individual perfection in his especial duties; and, moreover, the ship's company as a whole must be welded into one mass and imbued with one spirit. To accomplish these requirements the sea officer must faithfully perform his round of allotted duties without the slightest falling off in his military spirit or in his assiduity. Steadiness is needed here more than brilliancy, character even more than accomplishment.

The methods practiced at the Academy are the very methods needed on board a man-of-war. The sailor-man is to be instructed in his practical duties precisely as the cadet was trained in his. No breach of discipline or lack of efficiency can be allowed to pass unnoticed. The marks that are given at the Academy are an essential part of the cadet's daily and hourly training in efficiency. They are necessary in these first years of an officer's training to form his standard of professional excellence. When the standard is finally formed his sense of professional honor and duty, stimulated as it is by association with his fellows, is usually sufficient to maintain his performance at the desired level.

One fundamental point must be insisted upon. It is essential that each cadet at the Academy should acknowledge the justice of the marks with which he is credited. In general this justice is acknowledged. In particular cases, there have been complaints on the part of naval cadets that the marks of a class were not on the same scale throughout the class. Such complaints arise in this way: The class is divided, let us say, into four sections, each section under an officer. There may be four officers then, A, B, C, and D. Theoretically, a perfect recitation should be marked 4.0 by each officer, a good recitation 3.0, and so on. Practically, it may happen, and perhaps sometimes does happen, that a performance that would be graded as 3.0 by instructor A is graded as 2.9 by B, 2.8 by C, and 2.7 by D. The cadets in the sections presided over by A, B, and C have a certain advantage over those in the section taught by D.

At the United States Military Academy, at West Point, a uniform grading throughout the class is secured in the following way: The head of the department of study is a permanent officer, serving for life in that capacity. His assistants are, as at Annapolis, line officers, detailed for a short term (about four years). Each one of them is charged with the instruction of a section. The professor teaches no section, but occupies the whole of his time in visiting the different sections, spending now an hour, now a half an hour in the various rooms. One of his duties is to know, by such visits, the performance of each student of the class, and another duty is to enforce a uniform scale of marking throughout. This he can readily do by assigning marks to each recitation that he hears and by subsequently comparing the instructor's markings with his own. If this detail of management were added to the system employed at the Naval Academy there would never be ground for any doubts of the essential justice of the method. I have never heard it questioned by graduates of West Point, and only very rarely by graduates of Annapolis. With daily supervision of the head of department all objections to the system, as there practiced, vanish.

## VI. PRACTICAL INSTRUCTION OF CADETS.

### SEAMANSHIP.

Knotting and splicing; compass and lead line; ship nomenclature; cutting and fitting hemp and wire rigging; rowing, and the management of boats under oars and under sail; sailmaking; making up, bending, unbending, and handling sails; rigging ship; stripping ship; shifting spars; getting under way and anchoring; evolutions with vessels under sail and under steam; signaling, Army and Navy code; management of steam launches; steam fleet tactics with steam launches.

## ORDNANCE.

Infantry, schools of the squad, company, and battalion, in close and extended orders; artillery, schools of the battery and battalion; exercise and target practice with small arms and guns of main and secondary batteries; exercise with cane, smallsword, and broadsword; handling and firing torpedoes, etc.; determinations of velocities; experimental determination of range tables, etc.; the preparation, inspection, care, and preservation of ordnance material.

Six medals are awarded annually for marksmanship: Gold, silver, and bronze medals to the cadets of the first class, as prizes for excellence in rapid-fire gun practice; and gold, silver, and bronze medals to the cadets of the second class, as prizes for excellence in practice with the service rifle and revolver.

## NAVIGATION.

*Navigation.*—Observations, with sextant and artificial horizon, for time, longitude, chronometer correction, latitude, and azimuth.

*Surveying.*—Surveying and constructing a chart of a portion of the Severn River.

*Compass deviations.*—Swinging an iron ship, and observing the deviations, etc., on different courses; from these observations finding the approximate and the exact coefficients, and the horizontal and the vertical forces acting on the standard and steering compasses; also finding the heeling coefficients for the same compasses without heeling the ship; also correcting the deviations of a compass, using a navy compensating binnacle.

## STEAM ENGINEERING.

*Shop work.*—The pattern shop: Selection and treatment of different woods for different purposes. Elementary work of the carpenter shop, through mortising, joining, etc., to finished pattern work.

The foundry: Iron and brass casting; the making of bronzes, alloys, etc.

The blacksmith shop: Forging, welding, etc.; tempering, casehardening, etc.; bending and quenching tests of metals.

The boiler shop: Riveting, soft and hard patching, calking, annealing, tube expanding, etc.; testing.

The machine shop: Vise bench work; machine tool work; including the setting of work; turning; planing; boring; slotting, etc.; pipe fitting; building, erection and aligning of engines and engine fitting; preparation of working drawings and working from the same.

*Ship work.*—Management of main and auxiliary engines; getting up steam at leisure and in emergencies; fire-room and engine-room routine, firing, water tending, and oiling; routine under way when desirable to obtain maximum speed; same for maximum steaming radius; management of engines while maneuvering at sea; determining the condition and locating defects in machinery while in motion; causes and prevention of explosion of boilers, steam pipes, gasses in uptakes, and in coal bunkers; lying under banked fires; coming to anchor; overhauling machinery; cleaning boilers and condensers; preservation of machinery of a vessel when out of commission; conducting progressive and full-power trials and the collecting of data.

Ordinary casualties: Hot crown sheets, burst feed pipes, leaky boiler tubes and seams, burnt grate bars, hot pins and journals, fire in bunkers, flooded compartments.

Damages received in battle: Preparations for action; temporary repairs and alternative devices and expedients to be adopted in event of receiving injury from shot or torpedoes; quick methods of disabling machinery about to fall into the hands of the enemy.

*Miscellaneous.*—Standardizing steam gauges and indicators; preparing specifications for purchase of machinery and stores; testing, inspection, and preservation of stores; preparation of various cements, paints, and varnishes in ordinary use; selection of coals; making estimates of the amount of coal on hand, prevention of deterioration, etc.; making of watch, quarter, and stations bills, etc.

## PHYSICAL TRAINING.

Class drills in calisthenics, free movements and with apparatus.

Special exercises to promote symmetrical development when necessary. Athletic exercises, including boxing and swimming. Dancing.

Summary of practical instruction.

Kind of instruction.	During each academic year.				Total number of instructions during 4 academic years.
	First class.	Second class.	Third class.	Fourth class.

*a* Study periods.      *b* Line Division.      *c* Engineer Division.      *d* Cadets who are proficient in swimming receive practical instruction in knotting, splicing, rigging, and other practical work of the sort.

The instructions in seamanship and gunnery on board of the practice steamers are also made instructions in running and managing the engines and boilers of those vessels. The instructions in naval tactics are also made instructions in running and managing the engines and boilers of the steam launches when practicable.

PRACTICE CRUISES.

During the summer months the cadets of the fourth (entering) class are kept at Annapolis under instruction in practical matters. The cadets of the second class are then allowed a leave of absence of about two months.<sup>1</sup> The first and third classes are sent to sea on naval vessels, and are there trained in every duty of the seaman, and of the warrant, and of the commissioned officer. The lower classmen are seamen, and perform every detail of a seaman's duty, not only once, but hundreds of times, until they acquire a perfect familiarity with these duties. The upper classmen navigate the ship and stand the watches, etc.

<sup>1</sup> This leave and short leaves at Christmas time are the only ones granted during the four years' training.

The cadet-engineers are sent on a special vessel to visit important shipyards and engineering establishments in the United States. During the Spanish-American war of 1898 the annual cruise was suspended, and 123 of the cadets were ordered to ships actively engaged in warlike operations. The naval cadets of the graduating class of 1899 had, on the average, eight months of service in practice ships (two cruises and one summer as fourth-class men), besides two or three months' service on ships during the war immediately after their graduation at Annapolis. The graduated cadet of 1899 therefore began his practical life with a total of about eleven months' sea service to his credit.

The cadets are selected one from each Congressional district in the United States; and ten are appointed "at large" by the President of the United States. The requirements for admission are fixed by order of the Secretary of the Navy, and can be changed at any time. The requirements for graduation are practically fixed by the necessities of the naval service. The best opinion seems to indicate that a course of four years of study (certainly not more than five years) is, on the whole, the proper term. As time goes on and the service becomes more complicated by the introduction of new ships and more elaborate fighting machines the requirements of the graduated cadet will become higher. When the course of study becomes too full it must be relieved by raising the standard of admission. This can be done at any moment by the Secretary of the Navy, and will no doubt be done whenever the pressure of work is felt to be excessive. The system is thus elastic, and can be made to fit the circumstances at any time.

Under the present system the cadet remains for four years at Annapolis engaged in study. He is then sent to sea for two years, and returns for his final examination. It is only after such final examination that the cadet becomes a commissioned officer. This system is condemned on all hands, and it appears to be justly condemned. During the two years at sea the status of the cadet is most unfavorable to his professional advancement. He is not an officer, with an officer's feeling of responsibility and professional pride, and his real, intimate, and vital connection with the Navy only begins when he obtains his commission and knows at last that he is a life member of an honorable profession. The cadets who graduate with the highest standing are of course reasonably sure of their careers, and this system does not operate so unfavorably in their cases as in those of cadets who are doubtful whether any amount of diligence on their part during their fifth and sixth years will secure their advancement to the officer's grade. There can be no doubt, it would seem, that the present system should be changed so as to give commissions to the cadets at the end of four years (or possibly at the end of five years) spent at the Academy.

In the British navy young officers are kept at sea, with only short intervals of shore duty, for the first ten or twelve years of their career. They thus acquire "the habit of the sea" early and never lose it. In the German navy young officers are constantly engaged in torpedo-boat maneuvers. In our own service it is probably true that responsibility comes too late in life, and that there is more shore duty for young officers than is desirable. These conditions will doubtless be much changed by the new responsibilities undertaken by the country; and they are only mentioned here because they seem to be, in some degree, related to the matter of the practical training at the Academy, which, in the judgment of many excellent officers, tends to prize academic attainment above its true value.

So long as the ships of the Navy were propelled by sail power alone the officers of the service were the line officers (who commanded, sailed, navigated, and fought), paymasters or pursers (who were pay officers and commissaries), and officers of the Marine Corps (which was a corps of marine infantry), and surgeons. The line officers were naval officers par excellence; the staff officers were

their auxiliaries. With the introduction of steam power into naval vessels (about 1840) the duties of the line officer became far more complicated. He was thenceforth required to understand the management of engines, which were operated at first, under his direction, by mechanics. It was soon found that a new staff corps was necessary, viz, the corps of naval engineers. It was not until 1866, however, that engineers were instructed at the Naval Academy, and it was not until 1882 that the present system of instruction was adopted.

Since 1882 all cadets receive the same training during the first three years. At the beginning of the fourth year the first class is divided into two divisions—the line division and the engineer division. Each division pursues its course of special studies. (See the preceding tables.) When cadets receive their assignments in the Navy some of them become line officers, some engineer officers, some officers of marines—i. e., marine infantry. A few graduates have been appointed naval constructors. A very few have entered the pay corps.

By the precedents of the old Navy the command of ships, guns, boats, and men rested with the line officers. The staff officers were simply their auxiliaries. A midshipman commanded the boat, for example, in which a chief engineer, thirty years his senior, was going ashore. The vessels of the modern navy have no sail power at all, and the duties of the marine engineers have become more complicated and important. The relations of line and staff officers have led to some friction in the service afloat, which has been reflected to some degree in the Academy.

The questions involved are delicate and complicated. They are spoken of in the report of the Board of Visitors for 1897 and a remedy proposed as follows:

A curriculum of four years is certainly sufficient to fit the young men for all subordinate work on board even a modern man-of-war. Each and every graduate after a four years' course, alike for all, and under exactly similar conditions, would then enter the service and could be assigned to alternating duty, either on deck, the engine room, in command of the police of the ship, or in charge of the purchasing and commissary of the vessel. In short, the graduate becomes a naval officer, entering the wardroom as an ensign, trained to habits of command, and associating at a proper age, under like circumstances, with his brother officers of higher rank. The present staff of the Navy asks for lineal rank; in this way each alumnus has it. The line wishes homogeneity on board the ships; it thus obtains it. The country demands the strictest discipline and submission to one-man power, and it gains it; differences occasioned by present rival claims of different corps cease to exist; the staff disappears, and the all-round man comes to the front.

Post-graduate courses, either at the Naval Academy, the War College, or the Torpedo Station, will train the special minds of those men who, after experience at sea, desire to perfect themselves on scientific lines, and may be used to educate a small corps of experts, which should be entirely divorced from the hardships as well as from the rank and promotion of the seafaring navy. This corps of experts should include the present so-called constructors, engineers, and civil engineers, as well as the officers who wish to devote their lives to the construction of armor and to ordnance.

The strife between staff and line up to the present time has not been altogether an evil, as it has produced a rivalry and developed men capable of interchangeable duties. Instances are not rare to-day of graduates who have fitted themselves for all positions and lines of research, but they have not accomplished this at the Naval Academy, but after leaving it, and from experience and digested study; but the tendency to magnify the knowledge of material has led thought away from the true scope of naval training, while the personnel, by wrangling over individual preferment, has lost sight of the true dignity and development of the sailor.

The questions here treated are in the way of solution by legislation, and need not be further referred to except as to the post-graduate courses.

In this regard a brief reference to experience and practice in the Army may not be without value. The cadets of the United States Military Academy are all educated together at West Point, and there is absolutely no feeling except brotherhood between them at the Academy, although it is well known that the first five

of the class will receive promotion into the Corps of Engineers (a staff corps), the next group into the artillery, the next group into the cavalry, and the members lowest in class rank into the infantry (practically the infantry and cavalry graduates from one group). A system of post-graduate schools is maintained for young Army officers. All engineer officers serve at the engineer school of application (and the torpedo school) at Willets Point. This school is also open to line officers, and many such have taken advantage of its instruction, to the great benefit of the service, as, for example, during the Spanish-American war. All artillery officers are sent (so far as practicable) to the artillery school at Fortress Monroe. All infantry and cavalry officers (so far as practicable) attend the infantry and cavalry school at Fort Leavenworth. The courses followed at these schools extend over a period of at least two years. Officers usually serve for some time with their regiments before going to these professional schools.

Appointments in the Ordnance Corps (a staff corps) are usually made from artillery officers of merit. Appointments in other staff corps (the Adjutant-General's, the Inspector-General's, the Judge-Advocate-General's Department, the Pay Department, the Quartermaster's Department, the Commissary Department) are made usually by selection among line officers of merit. The same system is advocated for the Navy (not for the first time) in the report of the Board of Visitors above cited, and the recommendation appears to the writer to be worthy of consideration. It would be easy to adduce many arguments in its favor.

If the Revenue-Marine Service, the Life-Saving Service, and the Inspection of the Merchant Marine (now under the Treasury Department) were transferred to the Navy Department, the positions in these services could gradually be filled by cadets from the Naval Academy, to the great advantage of the country.

There is a slight tendency at both Government schools to overestimate the importance of purely scientific studies, somewhat to the detriment of the strictly professional branches. It is of course true that most professional branches—as ordnance, for example—rest on scientific bases; and, again, that a student who faithfully performs an allotted task in the integral calculus is, in some degree, training himself for the faithful performance of military and naval duties. The greater the scientific accomplishment of an officer, other things being equal, the greater his efficiency. But the point to be noted is that efficiency is the *first* matter to be considered, while academic excellence is, in these special schools, only a means to an end. The stress should constantly be laid on the professional branches. The ideal to be kept in view is to train the cadets to be honest, worthy, faithful, competent public officers in time of peace and efficient soldiers and sailors in time of war. Primarily these schools are war schools. They are special schools for training our soldiers and sailors in technical matters—not scientific schools in which soldiers and sailors are trained. In the first half of the century West Point was the leading scientific and engineering school of the country. It is so no longer, and can never regain this rank, nor is it desirable that it should do so. But during the whole of the century it has been a magnificent training school for soldiers, and since 1817 it has had no superior in the world in this particular regard.

It is therefore necessary to bear in mind that the United States Naval Academy is also primarily a technical school of a highly special character, whose chief business is to teach the art of naval warfare.

Its students must be trained to be efficient, honest, and devoted public servants in war and peace, and prepared for the very various duties which fall to the naval officer, who may be, by turns, a seaman, a navigator, a soldier, a diplomatic agent, an inspector of technical works, a director of large expenditure.

The training required is very special, at the same time that it is required to cover many fields. The chief and most important result of the Academy training

is the formation of a high sense of official duty and of professional honor. This is accomplished by methods peculiar to the school which depend to a great degree on the large number of instructors relative to the number of students. Each cadet is daily and hourly brought face to face with his duties, and every shortcoming is noted and must be made good.

All requirements are reasonable and obviously necessary. Every requirement is insisted upon and there is no escape from it. There are, for example, several thousand opportunities for a cadet to be "late at roll call" during his academic course. No single tardiness is allowed to pass unnoticed. At the end of four years promptness has become a habit. In the same way neatness in dress, cheerful obedience to orders, respect for superiors, alert attention, efficiency in the performance of any and every official duty, large or small, has also become a fixed habit. During four years of such training, habits crystallize into the bases of official character. The primary object of the school is to form the official character of the officer. The secondary object is to give him all the intellectual and scientific training possible.

The two Government schools can not afford to lose sight of the relative importance of these two objects.

Specialized, technical, and scientific training should be given in post-graduate courses to officers who have shown special talent. The Naval Academy has its task in training all officers alike for the performance of their common duties.

#### VII. THE NAVAL WAR COLLEGE AND TORPEDO SCHOOL AT NEWPORT, R. I.

In a certain sense the Naval War College at Newport is a post-graduate school for officers of the Navy, although the name of "post-graduate school" is disclaimed. It is, however, a professional school for graduates. Its objects are stated in the following editorial from the New York Sun, to which the writer has been referred by the president of the college as, on the whole and in general, a satisfactory account:

There was formerly some misconception with regard to the aim of this establishment. It was supposed to offer to the graduates of the Naval School at Annapolis merely post-graduate instruction in subjects with which they were already to a certain extent acquainted, as, for example, the higher chemistry and astronomy. This is a mistake. The Naval War College has no such end in view. Neither is its teaching designed to give a naval officer expertness in handling a single ship, or in keeping company with other ships, or in firing guns. It is, on the contrary, only the great strategic and tactical problems of maritime warfare which are considered at Newport; such problems as confronted Admiral Dewey at Cavite and Admiral Sampson at Santiago. In other words, the establishment gives the prospective commander the same kind of instruction with reference to great operations of war at sea as its prototype, the Kriegsakademie of Berlin, which for so many years was under Von Moltke's supervision, offers to the student of war on land.

To exemplify the kind of service which a college of this kind may render, let us recall the state of things which existed in April, 1898, at the time when we began war with Spain. Our opponent then had two fleets in being, namely, one in the waters of the Iberian Peninsula, which might be used either for the defense of Cuba and Porto Rico, or for aggressive operations against our Atlantic and Gulf ports; secondly, one at Manila, which might be employed either for the protection of the Philippines or for an attack upon our seaboard cities bordering the Pacific Ocean. It is obvious, then, that our naval strategists were confronted by two complex and momentous problems, of a kind similar to that solved by Nelson, when, having followed, as he imagined, the Franco-Spanish fleet to the West Indies, he returned betimes and reduced it to impotence at Trafalgar. To keep our own seacoasts safe and at the same time to annihilate the enemy's means of shielding his own transmarine possessions was an intricate and difficult task, which called for talents of precisely the same kind as are involved in the conception and execution of a comprehensive campaign on land. Or rather, when we bear in mind that Spain and the Philippines are separated by half the

diameter of the earth, we can see that it was two wholly independent campaigns, each of the highest importance, which the staff officials of our Navy Department and the officers in command of vessels had to devise and carry out.

Now, the business of the Naval War College at Newport is primarily to familiarize officers, who may at any time be summoned to assume maritime command, with naval strategy, or, in other words, with the paramount aims of naval warfare. There, too, are studied vital questions of naval tactics—the rôle of which begins when strategy has performed its part—such as were memorably illustrated at Cavite and at Santiago. Touching this subject, invaluable lessons may be drawn from the campaigns of the great English admirals of the eighteenth century and the early part of the nineteenth century.

To facilitate the historical and analytic study of the strategic and tactical elements of maritime warfare is the main design of the War College at Newport. \* \* \*

The president of the college has kindly put at the disposition of the writer the following memorandum, which is printed in full:

#### EXPLANATION OF THE COURSE.—1899.

The methods employed in the regular courses of late years at the college have presupposed in the officers in attendance maturity of years and professional experience and knowledge. With this as a basis, the system has been the one so successfully employed in Germany, and of late in the United States, of individual work, research and thought, with collective discussion. As means to further this research, the library and lectures are presented. Although this system can not be followed out entirely in a course of the nature proposed for this summer, still it will be kept steadily in view, and in the war games—or better, war situations—this method is alone employed.

The want of continuity in attendance pertaining to the situation, then, will lead to the postponement for the present of the general problem of 1899, which involved a study of the Lakes and of the whole Atlantic and Gulf coasts, and the question of the protection of Porto Rico; also a postponement of individual description and criticism of the various important naval campaigns and fleet actions of the past, and the examination and study in detail of the large foreign navies of the world. It is expected, however, to give a general review of the sea power of England, Germany, France, and perhaps other powers in separate papers, if time permits.

The course proposed will be arranged to make each day, so far as possible, complete of itself.

The only continued series of lectures now proposed will be those of Captain Mahan on naval strategy. These are six in number and were to be delivered by Captain Mahan in person during the first week in June, but his appointment as a representative of the Navy and of the nation at the international conference at The Hague prevents this personal delivery, and the lectures will be read by members of the college staff.

It is hoped that one or more lectures, treating of naval tactics in a broad and comprehensive manner, will be delivered by Captain Taylor, of the *Indiana*.

Captain McCalla will deliver, late in July, one or two lectures upon the "Naval lessons of the war," which it is hoped will evoke a full discussion from those interested.

Several important subjects will be taken up for discussion by officers in attendance, and it is hoped that the officers of this squadron, which represents one of the two great fleets of the late war, will give us the benefit of their experience and observation so magnificently acquired in war service.

The first of these will be upon the general subject of scouting by ships. To hinge a discussion upon this question, there will be read a short paper on scouting by Lieutenant-Commander Murdock.

The second discussion will be upon "Modern naval blockades and investments." This discussion will be introduced by the reading of a paper upon this subject by Lieutenant-Commander Glatzel, of the German Navy, translated and read by Lieutenant Traut of the college staff.

The third discussion will be upon the relative sphere of mobile and fixed coast defenses. The discussion will be based upon a paper by Capt. C. F. Goodrich of the Navy, upon the "Military elements of coast defense," to be read, in his absence, by one of the college staff.

Printed copies of the International Law Situations for 1899 have been distributed. Written solutions are invited from officers interested in the subject on or before

the 25th of July. At a period after that date there will be a discussion and general formulation of the solutions. At some period before the 25th of July there will be a lecture upon the international law bearing upon the subjects by the President of the War College.

There are other lectures that were intended to be delivered this summer by Professor Alger, Lieutenant Rodgers, Lieutenant Bernadou, Mr. John C. Ropes, Medical Inspector Siegfried, Professor Hollis of Harvard University, Major Wallach of the Marine Corps, and a series upon international law, that may be given later if time permits.

I do not more than mention the war games in this statement. They will be explained in full by Lieutenant-Commander Murdock, who is in charge of that department of the college. Of their value too much can not be said.

They have been improved from year to year, and a comparison with these games and those used by other services—the Jane or English game, for instance—will show the greater utility and practicability of the War College games.

A course of reading, which has been recommended to officers at regular sessions, will be found posted in the library. The college building is open every day from 8 a. m. to 10 p. m. and, with its library, charts, and plant in general, is at the service of the officers of the fleet.

Whatever may be the proper designation of the War College, it is in fact a professional school for the training of sea officers in the principles underlying the art of naval war. The Torpedo School (also at Newport) affords to naval officers facilities for instruction of precisely the same kind as that given to army officers at Willets Point.

If it is desirable to enlarge the instruction so as to include all subjects in which line officers at sea should be trained, the nucleus already exists in the War College. A special school for engineers could readily be formed, by a mere order from the Secretary of the Navy, at any one of the great manufacturing cities of the country. Other courses in ordnance, naval architecture, etc., can be formed at any time by such an order and with little expense. The Government already possesses all the technical apparatus (gun foundry, shipyards, docks, etc.), and the instructors could be detailed from officers now in active service. As a matter of fact, instruction of the sort is even now given to young officers who are detailed on ordnance, shipbuilding, torpedo, and other duty. If it is desirable to systematize such instruction, it appears that this can readily be done at slight expense and by a mere order of the Navy Department. The extra expense of the engineer, artillery, and infantry and cavalry schools of the Army is a trifle. The results obtained by these professional schools in the Army are most satisfactory. Probably all army officers would agree with the writer in the opinion that such graduate schools ought not to be situated at West Point, and on similar grounds it is likely that naval officers would decide that Annapolis is not the best site for graduate schools of the Navy.

The past history of the Navy of the United States has been glorious. During the war of the Revolution it rose into being. The war of 1812 opened the eyes of the world to the genius of Americans as constructors of ships and to their capabilities as sea officers. The credit gained in the war of 1812 had been foreshadowed by the operations of Bainbridge, Decatur, and others in the Mediterranean (1801). The naval operations of the civil war (1861-1865) are among the most splendid in history. It was at this time that the training of the United States Naval Academy began to be felt. Farragut was not a graduate of the Academy (he had been a midshipman with the elder Porter on the *Essex*), but his junior officers were graduated midshipmen. The first of them left the school in 1846 and had had twenty years' service at the close of the civil war. The Spanish-American War of 1898 was fought entirely by graduates of the Academy, with a new navy that had been constructed under their advice. It is interesting to remember that Admiral Dewey had served on the *Hartford* under Farragut, and that the traditions of Porter and Farragut were carried on at Manila, while Admiral Sampson had been Superintendent of the Naval Academy, and himself represents

the highest product of the new school. There is no doubt in the future history of our country and of the Navy that the graduates of the Naval Academy will maintain the splendid traditions of the past. The main argument of this paper is that the traditions of the old navy must constantly be kept in view, along with the new ideals forced upon us by new conditions.

STOCKERIDGE, MASS., *August, 1899.*

#### 1861. REFFELT'S ARITHMETICS.

Herman Reffelt prepared a four-book series, namely: Volume 1, 12mo, 103 pages; volume 2, 12mo, 151 pages; volume 3, 12mo, 189 pages; volume 4, 12mo, 134 pages.

The first book treats of numeration and the four fundamental rules; the second, of the four fundamental rules, of denominate numbers, and fractions; the third, of proportions, percentage, average and alligation, and mensuration, and the fourth, of short methods, equations, logarithms, and progressions.

These are books of problems, arranged and classified. The first book was published in 1861, the second in 1871, and the third and fourth in 1873, by E. Steiger, New York.

#### 1861. CALDWELL'S PRACTICAL ARITHMETIC.

The author of this work is M. P. Caldwell, professor of mathematics. On the title page the author says the "science is presented in its simplicity and its purity, and an original and generalized method of calculation is taught."

This is a brief arithmetic of 173 pages. The definitions, rules, and illustrations are very concise. What the author has to say he says pointedly and stops. It might have been more voluminous without detriment.

The first edition was published in 1861, and a stereotyped edition in 1867, by J. W. Burke & Co., Macon, Ga.

#### 1862. RODGERS' ELEMENTS OF MENSURATION.

This book can be used by the pupil after completing any good common-school arithmetic. It requires neither algebra nor geometry as a preparation. The author has given such definitions and explanations as are absolutely necessary for the learner to comprehend each principle and to apply it understandingly.

Under mensuration of surfaces are included parallelograms, triangles, trapezoids, trapeziums, and regular and irregular polygons of more than four sides, circles, arcs, sectors, segments, etc. Mensuration of solids: Cylinders, cones, wedges, prisms, polyhedrons, and spheres.

Each geometrical figure is illustrated by a diagram or picture, and the entire subject, so far as it is treated, is leveled to the comprehension of the nonmathematical mind. It is such a manual as every school boy and girl should be drilled in before leaving school. The author, M. H. Rodgers, was teacher of mathematics in the girls' high school, Philadelphia. The book is a 12mo, 144 pages, and is published by E. H. Butler & Co., Philadelphia. 1862.

1862. E. ORAM.

Oram's Table-Book; or Stepping-Stones to Intellectual and Practical Arithmetic. By E. Oram. New York: D. & J. Sadlier & Co., 31 Barclay St. Montreal: Corner Notre Dame and St. Francis Xavier Streets.

18mo, boards, 88 pp. Copyrighted 1837. Preface dated 1832. A. M.

1863. GEORGE PAYN QUACKENBOS.

The subject of this sketch was born in New York, September 4, 1826, and died July 24, 1881.

He graduated from Columbia College in 1843, and spent a year teaching in North Carolina. Returning to New York City, he began the study of law, but gave it up to open a private school in the city in 1847, and continued teaching till 1868. He was a frequent contributor to various journals, and from 1848 to 1850 edited the *Literary American*. But he was better known as an author of text-books, including grammars, histories, rhetorics, natural philosophy, and a series of arithmetics. The degree of LL.D. was conferred upon him by the Wesleyan University in 1863.

The arithmetics he wrote were prepared upon the basis of the works of George R. Perkins, LL. D., and published by Messrs. D. Appleton & Co., New York. They are the following: *Primary Arithmetic*, 1863, 18mo; *Elementary Arithmetic*, 1863, 16mo; *Practical Arithmetic*, 1866, 16mo; *Mental Arithmetic*, 1868, 16mo; *Higher Arithmetic*, 1874, 12mo.

The *Primary Arithmetic* is a beautifully illustrated little volume of 108 pages. It assumes that the beginner knows nothing of arithmetic, and he is gradually familiarized with the four rules and the simpler and more useful tables by the use of such exercises as he can easily understand.

The *Elementary Arithmetic* is a step above the primary; and is intended for more mature minds. While reviewing the subjects in the primary in a more extended manner other topics are introduced, such as fractions, United States money, reduction, and compound numbers.

The book prepares the pupil for the *Practical Arithmetic*. It contains 144 pages. The exercises are well arranged and "hard enough" to cause the pupil to work cheerfully.

The *Practical Arithmetic* is the strongest book of the series. "The aim has been to make it comprehensive, clear, free from verbiage in its definitions and explanations, inductive in its development of the subject and well adapted to the schoolroom." In the preparation of the book the author has kept constantly in view the wants of the pupil in after life. A great variety of problems is inserted under each topic to give practice and precision in the application of principles.

Whenever practicable, business terms and transactions closely connected with the counting-room are inserted to familiarize the pupil with the working processes of ordinary affairs.

The volume is a handsome 12mo of 360 pages.

The *Mental Arithmetic* is a book of 168 pages. It is on the same general plan as the previous volumes of the series. It encourages instead of discouraging the pupil. The object of the work is to impart readiness to the pupil in all mental operations. While it is not what would be called a strong text-book, it is a good one for the class room.

The *Higher Arithmetic* is a neat volume of 420 pages, designed as a complete treatise on practical and commercial arithmetic. The matter is fairly well selected but too indefinite.

A careful examination of these books leaves an impression that "arithmetic making" was not the author's sphere, and that if he builded upon the basis of Perkins's, somehow he missed the foundation.

1863. EDWARD BROOKS.

The educator and author, Edward Brooks, was born at Stonypoint, Rockland County, N. Y. At the age of 15 he removed with his father to Sullivan County, N. Y. Here he learned the blacksmith's trade, but he spent his leisure time in study. About this time he also acquired the habit of classifying all important facts or thoughts. He mastered all the common branches and several of the higher ones. In arranging and classifying his knowledge he became quite proficient in composition. It is stated that his career as a teacher commenced in

teaching a singing school in a barn. After this he taught a common school for six months and then attended the normal institute at Liberty, N. Y., for one session. Next he entered the University of Northern Pennsylvania, but did not graduate. In 1852-53 he taught in this institution, and in 1854 he taught mathematics in the academy, Monticello, N. Y. The next year he was elected professor of mathematics in the Millersville State Normal School, Pennsylvania, and in 1866, when President James P. Wickersham was elected superintendent of the public schools of Pennsylvania, Professor Brooks was chosen his successor as principal of the Millersville school, which position he filled for twenty years.

Professor Brooks is the author of a series of mathematical text-books, including arithmetic, algebra, geometry, and trigonometry; Philosophy of the Science of Arithmetic, Normal Methods of Teaching, Mental Science and Culture, and Elocution and Reading.

In personal appearance Professor Brooks is rather undersize, about 5 feet 6 or 7 inches in height; spare built, lithe, active, and graceful in all his movements; a fine head and face well poised on his shoulders, smooth, regular, and pleasant features, dark-gray eyes that look straight through character; soft, glossy, dark hair, now tinged with gray. His voice, either as a lecturer or in private conversation, is one of the most pleasant that I ever listened to. As a public speaker he is, perhaps, the best connected with the National Teachers' Association of America.

#### THE ARITHMETICS.

The first series included the following: 1. Normal Primary Arithmetic; 2. Normal Mental Arithmetic; 3. Methods of Teaching Mental Arithmetic, and Key to Normal Mental Arithmetic; 4. Normal Elementary Written Arithmetic; 5. Normal Written Arithmetic; 6. Methods of Teaching Written Arithmetic, and Key to Normal Written Arithmetic.

Later a new series of these books was published under the following titles: Normal Primary Arithmetic; Normal Elementary Arithmetic; New Normal Mental Arithmetic; New Normal Written Arithmetic. The Union Series: Normal Union Arithmetic, Part I; Normal Union Arithmetic, complete. Also, the complete is bound up in two books, as follows: Part II and Part III. Normal Higher Arithmetic.

#### THE NORMAL WRITTEN ARITHMETIC.

This is a volume of 337 pages. It was published in 1863. In the preface the author calls attention to this method of treatment, the arrangement of topics, the reasoning, solutions, and rules.

The new book of 1877 is simply an enlarged edition of that of 1863. It contains 421 pages. These are two of the best common-school arithmetics yet published. They are so well known that I will not attempt a written description of them.

#### THE NORMAL UNION ARITHMETIC.

To satisfy that class of persons who think that it takes too much time for the pupil to study two separate books, one on mental and the other on written arithmetic, this book was prepared. The combination is as complete and harmonious as the two subjects will admit. The author retains the essential features of the two books in this one, which is the reason for the name—Union Arithmetic. It makes a book of 421 pages, and as meritorious a book as it is possible to make out of such diverse elements. Excellent judgment is shown in the selection of the matter.

#### HIGHER ARITHMETIC.

This is a scholarly work. The Higher Arithmetic is a handsomely bound volume of 542 pages. It was published in 1877.

1863. N. W. STARR.

The Arithmetical Assistant, in Three Parts: containing an extended series of Practical Examples under the various rules of the Arithmetic: designed as a companion for all arithmetics in use, and being in conflict with none. By a Teacher

of thirty years' experience. Part I. Embracing examples from Roman notation to compound numbers, including simple operations in Federal Money; and closing with bills in various forms, adapted to ordinary business transactions. New York: Mason Brothers, 5 & 7 Mercer Street. Boston: Mason & Hamlin. 1863.

Boards, 351 pp.—A. M.

1863. JOSEPH TROLL.

The Intuitive Arithmetical Guide on the Synthetic, Analytical Method, for Children from Six to Ten Years. A series of Progressive Questions and Lessons on Arithmetic, with a Valuable Appendix of Remarks on the Mode of Instruction, for Teachers. A True Representation of own Observation, by J. Troll. Lebanon, Ills. Published by the Author. 1863.

16mo, 156 + 25 pp.—A. M.

1863. J. RHOADS.

The Primary Arithmetic, for Young Learners. By J Rhoads, M. D., Principal of The Palmer Street Grammar School, Philadelphia. New and Revised Edition. Philadelphia: Sower & Barnes, Publishers, No. 37 North Third Street. 1863.

18mo, 72 pp.—A. M.

1863. M. H. RODGERS.

A Note Book of Arithmetical Rules and Definitions used in the Girls' High and Normal School of Philadelphia. By M. H. Rodgers, Teacher of Higher Mathematics. Philadelphia. 1863.

Small 18mo, boards, 44 pp.—A. M.

1863. OUR OWN SCHOOL ARITHMETIC.

This work was prepared by S. Lander, A. M., and published at Greensboro, N. C., 1863.

It is an elementary treatise, carrying the learner through interest. It is well printed on coarse linen paper. The book is a 12mo of 281 pages.

1864. THE SOUTHERN CONFEDERACY ARITHMETIC.

This arithmetic was prepared by Rev. Charles E. Leverett, A. M., Columbia, S. C., and published at Augusta, Ga., 1864.

This is a pale volume of 218 pages, the last 12 pages being devoted to single-entry bookkeeping. The subjects are all briefly but clearly presented.

1864. L. JOHNSON'S COMMON SCHOOL ARITHMETIC.

Raleigh, N. C. Published by Branson & Farrar. 1864.

A pamphlet of 152 pages. Designed for beginners, and embracing the first principles of the science. It was printed for the benefit of the Southern Confederacy by the Biblical Recorder print, for L. Johnson, professor of mathematics in Trinity College. It is printed on rough white paper—ink is very black. It contains only the simple rules, and is chiefly a question book. The book is divided into five parts: 1. Mental arithmetic; 2. Practical arithmetic; 3. Fractions; 4. Confederate currency; 5. Compound numbers.

1865. FELTER'S ARITHMETICS.

There are eight books in the Natural Series of Arithmetics: First Lessons, 98 pages (1865 and 1868); Primary Arithmetic, 182 pages (1863); Intermediate, 303 pages (1862 and 1866); New Practical, 367 pages (1872); New Primary, 154 pages (1880); New Intermediate, 283 pages (1875); Advanced Arithmetic, 268 pages (1877); Complete Arithmetic, 469 pages (1877).

These arithmetics were first published by Charles Scribner's Sons, but subsequently they were purchased by Messrs. Ivison, Blakeman & Co., who continue to publish them.

First Lessons is not a primary arithmetic, but a storehouse from which the teacher may draw material for the instruction of his pupils. The book is filled with suggestive illustrations. It is a good manual to put into the hands of little children, that they may look at the pictures, if the teacher knows how to ask the right sort of questions afterwards.

*The Primary Arithmetics.*—While the old Primary is a good beginning book, the New Primary is much better. In both books mental exercises are followed by written work, in which larger numbers are used than in the mental problems. The authors hold that the teacher should carefully criticise the pupil's work with reference to the following points: 1. Accuracy; 2. Correct form of figures; 3. Neatness of general appearance; 4. Time required to complete the exercise.

*The Intermediate Arithmetics.*—There is so little difference between these books, except in appearance, that it is difficult to decide which is the better. Both are excellent drill books.

*New Practical.*—This book was prepared by Selim H. Peabody, A. M. The book is divided logically into three parts: 1. Elementary Review; 2. Commercial Arithmetic; 3. Mensuration and Mechanics. This is a logical, consistent, and teachable text-book, and is one of the best if not the best book of the entire series.

*Advanced Arithmetic.*—This is the third book, and it continues the subject where the New Intermediate leaves it.

There is little difference between the Advanced and the second part of the Complete Arithmetic. In some respects the Advanced is fuller in problems, yet on many pages the examples are the same. The chapter on mensuration in the Advanced is very complete.

The New Intermediate and the Advanced slightly modified constitute the Complete Arithmetic.

The New Practical and the Complete, using the Advanced for the second part of the Complete, are superior text-books.

#### 1865. ORTON & FULLER.

New Mathematics, or Lightning Calculator. The Shortest and most Rapid Method of Computing Numbers, within The Comprehension of all having The slightest Knowledge of Figures. Cincinnati: Moore, Wiltach & Baldwin, Printers, No. 25 West Fourth Street. 1865.

16mo, 79 pp.—A. M.

#### 1865. ADOLPH MÜLLER.

Praktisches Rechenbuch für die Mittelklassen der Volksschulen in den Vereinigten Staaten von Amerika. Von Adolph Müller. St. Louis, Mo.: Verlag der Conrad Witter'schen Schulbuchhandlung. 1865.

18mo, 155 pp.—A. M.

#### 1865. MEHREREN LEHRERN.

Mehreren Lehrern in New York und St. Louis. Praktisches Rechenbuch für die Unterklassen der Volksschulen in den Vereinigten Staaten von Amerika. Von mehreren Lehrern in New York und St. Louis. First Book. St. Louis, Mo.: Verlag der Conrad Witter'schen Schulbuchhandlung. 1865.

16mo, 122 pp.—A. M.

#### 1866. PAUL ALLEN TOWNE.

Prof. Paul Allen Towne was born at Hardwick, Mass., in 1833, and at present he resides in the city of New York. He spent many years in the South engaged in teaching. In addition to his mathematical writings, he is a contributor to educational periodicals and scientific journals.

#### SERIES OF MATHEMATICS.

Professor Towne's series of mathematics comprises Towne's Primary Arithmetic, Towne's Intermediate Arithmetic, Towne's Mental Arithmetic, Towne's Practical Arithmetic, Towne's Algebra, Key to the Algebra.

The Primary Arithmetic is a book of 144 pages. It was published in 1867. It contains no numbers above 1,000. All formal definitions are excluded, and yet technical terms are so introduced as to make familiar both the words and their exact meaning.

The Intermediate Arithmetic, a volume of 216 pages, was published in 1867. A special feature

of this book is the "Model Recitations" found on almost every page. These recitations, properly made, force the pupil into a thorough examination of every step in his progress. No rule is given until by numerous synthetic and analytic recitations it must have been suggested to the mind of the pupil.

The Mental Arithmetic is a book of 176 pages. It is intended to be studied in conjunction with the Intermediate and large Practical Arithmetics.

The Practical Arithmetic contains 330 pages. Its title page reads—

ARITHMETIC: | Adapted to the | Course of Instruction Usually Pursued | in the | Academies and Common Schools | of the | United States. | By P. A. Towne, | Formerly General Principal of the Barton Academy, Mobile, Alabama. | Louisville, Ky.; | John P. Morton & Co. | 1866.

In this arithmetic decimal fractions are introduced as the offspring of decimal notation and not of vulgar fractions, for the sake of scientific accuracy, as well as for the early insertion of problems involving questions of United States money.

The general characteristic features of this series of mathematics are—1. Clear and exhaustive definitions; 2. Early introduction of decimal fractions; 3. Improved operations in solving problems; 4. Models for recitations; 5. Clear and brief analyses; 6. The beautiful typography of the whole series.

#### 1866. REGENTS' ARITHMETIC.

This is a compilation of the arithmetical questions submitted by the regents for admission to the University of the State of New York from 1866 to 1882. The assistant secretary, Daniel J. Pratt, A. M., Ph. D., submitted the list to C. W. Bardeen for publication in 1866, 1880, 1887.

Part I contains 1,293 problems.

The following little books published by C. W. Bardeen, Syracuse, are handy and helpful:

1. Suggestions for Teaching Fractions, W. W. Davis, 1880, 43 pages.
2. Metric Tables and Problems, Oscar Granger, 1888, 23 pages.
3. Thirty problems in percentage, W. W. Bradford, 1877, 33 pages.
4. Latitude and Time, J. Anthony Bassett, 1883, 42 pages.
5. Dime Question Book, Albert P. Southwick, 1883, 36 pages.

#### 1866. JOHN H. FRENCH, LL. D.

John H. French was born at Batavia, N. Y., July 7, 1824. His early educational advantages were very limited. He worked on a farm during the summers, and attended school a few months each winter. At the age of 17 he began teaching. When 21 he revised Adams's Arithmetic, and two years later he wrote Adams's series of mathematics. In 1849 he was chosen principal of the Clyde High School, New York, where he remained for three years. Next he accepted the principalship of the Newtown Academy in Connecticut; but returned to his native State in 1855, when he engaged in publishing county maps. The four years following he was engaged in the preparation of a map and gazetteer of the State of New York. During this period he worked on the revision of Robinson's series of mathematics. In 1866-1869 he prepared a series of arithmetics published by Harper Bros. In 1865 he was superintendent of schools of Syracuse, N. Y., and immediately after called to take charge of the training department in the Albany State Normal School. In 1870 he was appointed secretary of the State Board of Education of Vermont, which position he filled for five years. From 1878 to 1881 he was principal of the Indiana Normal School in Pennsylvania. He resigned on account of ill health, and was soon afterwards appointed institute conductor for the State of New York, which position he held at the time of his death at Rochester, N. Y., December 23, 1888.

This series consists of four books: First Lessons in Numbers, 120 pages, 1866; Elementary Arithmetic, 220 pages, 1867; Mental Arithmetic, 180 pages, 1870; Common School Arithmetic, 348 pages, 1869.

The plan of these books was fully matured in the author's mind before he set about writing them. They assume that there is a natural order in the unfolding of the mental faculties, and that the subjects are adapted to this order. Clear ideas and practical knowledge in the application of numbers to the business affairs of life distinguish this series of arithmetics from most other works.

In the First Lessons the author claims that the natural order of teaching children numbers is: 1. Visible objects; 2. Concrete numbers; 3. Abstract numbers. This book is handsomely illustrated.

The Elementary Arithmetic is one of the very best manuals that has been written on this subject. The definitions are pointed, accurate, and comprehensive. Principles are deduced from exercises inductively presented and are fixed firmly in the mind by the solution of copious examples.

The methods of proof are made to depend upon the pupil's ability to reason correctly.

*The Mental Arithmetic.*—This "mental arithmetic" teaches two things: 1. That the pupil should acquire accuracy and rapidity in combining and separating numbers; 2. That he should learn to reason correctly. This book is a teachable one.

*The Common School Arithmetic.*—The last book of this series is one of the most systematic text-books that has been produced in this country. Instead of writing arithmetics, and arithmetics only, Professor French has made a profound study of child mind, and he brought his psychology down from lofty heights and put much of it in his arithmetics. This is evident to anyone who will catch his ideas from the presentation of the subjects he discusses and the many valuable suggestions that he has given to help teachers to understand the subject and how to teach it and how children should learn it.

These are good books, prepared by an educator of clear and keen insight into the workings of child mind.

Harper & Bros. publish these books in excellent style.

#### 1866. GEORGE A. WALTON.

George Augustus Walton, A. M., was born at South Reading, Mass., February 22, 1822. He received his schooling at the common schools and academies in his native place, and afterwards graduated at the State normal school at Bridgewater, Mass. From the time of his graduation in 1843 he taught continuously until 1868.

Since 1861 Mr. Walton has been employed as instructor and conductor of teachers' institutes in Massachusetts, New York, and Virginia. He was appointed agent of the Massachusetts State board of education in 1869, which office he still holds. He is the author of: *Primary Arithmetic*, 1866, 1869, 12mo, 96 pages; *Intellectual Arithmetic*, 1866, 1869, 12mo, 176 pages; *Illustrative Practical Arithmetic*, 1869, 12mo, 336 pages; *Written Arithmetic*, 1864, 12mo, 348 pages; *Walton and Cogswell's Arithmetical Problems and Key*, 1872, 12mo, 144 pages; *Dictation Exercises*, 1866, 12mo, 108 pages.

These books are now published by Messrs. J. H. Butler, Philadelphia, and William Ware & Co., Boston.

The general plan of the books is, by practice, to make the pupil rapid and exact in handling numbers. Drill work and plenty of it are the means the author believes in to secure accuracy. Interest is first created in the subject, and then inductively and progressively the child moves forward in the work which is so attractive to him.

The *Primary Arithmetic* treats the subject from an objective standpoint. Addition and subtraction are taught together; also multiplication and division.

*Walton's Intellectual Arithmetic.*—This is a joint production by George A. Walton, A. M., and Electa N. L. Walton. The intellectual part of the book closes with page 149, while a short treatise on written arithmetic fills 16 additional pages. To develop and train the mind is the design of the authors rather than to make expert mental arithmeticians. It is what is called "an easy mental arithmetic." Two editions were issued, the first in 1833 and the second in 1869.

*Illustrative Practical Arithmetic.*—This is indeed a most excellent common-school arithmetic. The subjects are presented in their natural order. Familiar illustrations are employed to excite correct ideas in regard to numbers. Special cases lead gradually to generalizations. Unity of purpose runs through each set of problems. The pupil is taught how to do one thing well before learning several ways of doing it. Electa N. L. Walton assisted in the preparation of this book.

*Walton's Written Arithmetic.*—The *Written Arithmetic* was published in 1864, and it is designed to prepare the pupil for the actual duties of life. The table of contents includes the following subdivisions: 1. Simple numbers; 2. Federal money; 3. Properties of numbers; 4. Fractions; 5. Compound denominate numbers; 6. Decimal fractions; 7. Percentage; 8. Miscellaneous; 9. Appendix. Each subject is ably treated, and definitions, explanations, and solutions, are such as the learner can readily understand.

*Written Arithmetic.*—The chief merit of this book is the great variety of exercises that it presents. These drills, or exercises, are given to perfect the pupil in the practical applications

of the science. Decimals and integers are treated, usually, together. Curious and puzzling problems are omitted. Principles are referred to a few general rules, and the pupil is afforded a good opportunity to test his own judgment in solving problems.

*The Book of Problems.*—This book is what its title indicates—containing over 12,000 problems for drill in the various subjects of arithmetic. It is in the line of “drill exercises” that Mr. Walton excels. He knows *how* “to ring the changes on problems.”

## 1866. ORTON'S LIGHTNING CALCULATOR.

Hoy D. Orton puts in italicized letters on the title page, “*Energy is the price of success,*” and this is indicative of the work throughout, which consists of “short cuts” in the fundamental rules—cancellation, interest, square and cube roots, mensuration, weights and measures, and astronomical calculations. Common sense and practice make perfect according to this author, who achieved such wonderful notoriety in handling numbers.

The volume is a 12mo, 194 pages, and was published by T. K. Collins, Philadelphia, in 1866.

## 1866. W. MILLER.

Praktische Buchrechnung, veranschaulicht durch Kreise mit ihren Sectoren, für die Oberklassen der deutschen Schulen in den Vereinigten Staaten von Amerika. Von W. Miller, Lehrer in New York. St. Louis, Mo.: Verlag der Conrad Witter'schen Schulbuchhandlung. 1866.

18mo., 72 pp.—A. M.

## 1866. S. S. WOOD.

A Concise and Methodical Statement of the Definitions, Principles, and Rules of Practical Arithmetic. By S. S. Wood, Graduate State Normal School. New York: Baker & Godwin, Printers, Printing-House Square. 1866.

18mo, 68 pp.—A. M.

## 1866. WILLIAM R. G. HUMPHREY.

The Western Abbreviated or Practical One Rule Arithmetic, where the Rule is Illustrated and its Principles made Plain. Compiled by Wm. R. G. Humphrey, Springfield, Illinois: Ben. A. Richards, Printer. 1866.

24mo, 30 pp.—A. M.

## 1866. JOS. DEGHUÉE.

Aufgaben und Anleitung zum Schriftlichen Rechnen. Für deutsche Schulen in den Vereinigten Staaten. Von Jos. Deghuée. Erster Theil, 84 pp.; Zweiter Theil, 102 pp.; Antworten, 42 pp. New York: E. Steiger. 1866.

German and English. Double-column pages, first German, second English. 8vo.—A. M.

## 1866. BENJAMIN NAYLOR.

The Radical Mental Calculator, and Student's Guide to a Knowledge of the Powers of Numbers. By Benjamin Naylor, Author of the “Speedy Calculator,” and of “Naylor's System of Teaching Geography.” Philadelphia: Published by the Author. 1866.

12 mo, 84 pp.—A. M.

## 1867. BASIS OF ARITHMETIC.

This book is a collection of tables and exercises for beginners. The author, Richard S. Jameson, says: “The Basis of Arithmetic is what its name purports—a primer for beginners—not a treatise for the instruction or guidance of teachers. \* \* \* The nature of numbers, the values of measures, and the use of arithmetical signs can not well be learned by the young from books. They must be explained by the living teacher.”

The volume is a thin 12mo, 48 pages, and it is published by J. W. Schermerhorn & Co., New York.

1867. T. A. BRYCE.

The American Commercial Arithmetic, for the use of Commercial Colleges, Private Students, Schools and Counting Houses, embracing an Extensive Course both in Theory and Practice together with the Laws of the United States relating to Interest, Damages on Bills, and the Collecting of Debts. By T. A. Bryce, M. A., LL. D., Author of Treatises on Algebra and Geometry. Used in the Erie Business College. Erie, Penn.<sup>1</sup>: Published by T. Cook & Co., Business College. 1867.

8vo, 341 pp.—A. M.

1867. A. D. Y. HENRIQUES.

Modern Mercantile Calculator, a Companion for the Accountant and Book-keeper practically and illustratively arranged for the use of Bankers, Brokers, Commission Agents, Factors, Book-keepers, Accountants, and Teachers. Elucidating the Shortest and Most Correct Methods of Working out all Problems of Investments, Equations, Discounts, Interest, Domestic and Foreign Exchanges, &c., and embracing every variety of Calculation used in the Counting-House which have never before been published. By A. D. Y. Henriques. New York: J. M. Bradstreet & Son, Printers and Publishers. 1867.

8vo, 369 pp.—A. M.

1867. E. S. WINSLOW.

The Merchants' Calculator and Accountants' Desk Companion; or, Mathematics and Mathematical Data applicable to the Business Transactions of Business Men. By E. S. Winslow, Author of Winslow's Comprehensive Mathematics, the Universal Modern Cambist and Foreign and Domestic Commercial Calculator, The Machinists' and Mechanics' Practical Calculator and Guide, Etc. Boston: Published by The Author. 1872.

16mo, 171 + 32 pp. Copyright, 1867.—A. M.

1867. D. H. CRUTTENDEN.

The Young Pupils' Arithmetic Objectively or Synthetically Arranged. By D. H. Cruttenden, A. M., author of "The Rhetorical Grammar," "The Philosophy of Language," etc. Fourth Edition. New York: Published by J. M. Bradstreet & Son, 18 Beekman Street. 1869.

16mo, 96 pp.—A. M.

The Objective or Synthetic Arithmetic in which the Science is learned from the Art. By D. H. Cruttenden, A. M. First Course. New York: Published by J. M. Bradstreet & Son. 1868.

12mo, 396 pp.—A. M.

1867. WILHELM GRANERT.

Turner-Schulbücher. VI. Leitfaden der Weltgeschichte. Herausgegeben durch den Vorort des Nordamerikanischen Turnerbundes unter Begutachtung einer Commission Schulmänner. Verfasst von Wilhelm Granert, A. M.

New York. 1867. pp. 181. A. M.

1867. J. A. HAWORTH.

Haworth's Key to Lightning Calculations. All kinds of Business Calculations taught in the Shortest and Most Simple Manner. A Guide to the School Boy, the Graduate, the Farmer, the Banker, and any one having the slightest knowledge of numbers. By J. A. Haworth. Cincinnati: H. O. Homan & Co., Printers, No. 118 West Fourth Street. 1867.

18mo, 144 pp.—A. M.

<sup>1</sup>I have a copy of an edition published at Cleveland, Ohio, by Musgrove & Wright, in 1867, containing 368 pages.—A. M.

## 1867. NELSON'S ARITHMETIC.

Richard Nelson's Arithmetic was published in 1867 by R. W. Carroll & Co., Cincinnati.

It is a practical treatise of 290 pp., devoted, according to the author, to the general purposes of life. These purposes, judging from an examination of the work itself, lie in the direction largely of commercial arithmetic.

## 1868. GROESBECK COMMERCIAL ARITHMETIC.

A business arithmetic is composed usually of three distinct features: 1. Short cuts in addition, multiplication, fractions, and interest; 2. Various forms of business paper, some legal information, labor-saving tables, etc.; 3. Business correspondence. In the respects mentioned, this arithmetic, prepared by John Groesbeck, is an ideal book. There is not much arithmetic in it, but what there is is handy; the legal hints are sound, and the other information such as any person needs.

I have the eighth edition of 1869, a 12mo, 348 pp.; it was entered for copyright in 1868, and is published by Eldredge & Bro., Philadelphia.

## 1868. WHITMAN PECK.

A Practical Business Arithmetic, for Common Schools and Academies. Including a great variety of Promiscuous Examples. By Whitman Peck, A. M., Author of the Promiscuous Exercises in Andrew's Latin Lessons (Revised Edition.) New York: J. W. Schermerhorn & Co., Publishers, 14 Bond Street. 1868.

12mo, 293 pp.—A. M.

## 1868. D. H. CRUTTENDEN.

Second Course. The Subjective or Analytic Arithmetic, in which the Science is applied to the Art. By D. H. Cruttenden, A. M. No. III. Fourth Edition. New York: Published by J. M. Bradstreet & Son. 1870. Copyright 1868.

12mo, 390 pp.—A. M.

## 1868. JEAN MACÉ.

Grand-Papa's Arithmetic: A Story of Two Little Apple Merchants. By Jean Macé. New York: P. S. Wynkoop & Son. 1868.

Small 12mo, 142 pp. Not copyrighted.—A. M.

## 1869. CHARLES S. VENABLE, LL. D.

The subject of this sketch was born in Prince Edward County, Va., in 1827. After receiving a common-school education he studied in the University of Virginia, and afterwards in the universities of Berlin and Bonn. He was for a time professor of mathematics in Hampden-Sidney College, Virginia, and later professor of mathematics and astronomy in the University of South Carolina. For a while he held the chair of physics and chemistry in the University of Georgia. In September, 1865, he was elected professor of mathematics in the University of Virginia, which position he still holds. For five years he was chairman of the faculty of the university. The degree of LL. D. was conferred upon him by the University of South Carolina.

Since his connection with the University of Virginia the University Publishing Company, New York, has published the following mathematical works by Professor Venable: 1. First Lessons in Numbers, 16mo, 128 pages; 2. Intermediate Arithmetic, 16mo, 256 pages; 3. Practical Arithmetic, 12mo, 348 pages; 4. Mental Arithmetic, 16mo, 160 pages; 5. New Elementary Arithmetic, 12mo; 6. New Practical Arithmetic; 7. Key to Arithmetics; 8. Easy Algebra, 12mo; 9. High School Algebra, 12mo; 10. Keys to Algebras; 11. Elements of Geometry, crown 8vo; 12. Notes on Analytical Solid Geometry, crown 8vo.

## THE ARITHMETICS.

First Lessons begins with the unit and gradually the four fundamental operations in numbers are unfolded. At every step the mind is aided through the eye by pictorial illustrations. The author combines in a happy manner oral and slate work.

## THE INTERMEDIATE ARITHMETIC.

This forms the connecting link between the First Lessons and the Practical. Mental and written work are combined throughout the text, which is sufficiently full to give the pupil a good, practical knowledge of arithmetic through interest. The subjects are well adapted to the capacities of the intermediate classes of pupils in graded schools. It is a book that can be well finished by average classes.

## THE PRACTICAL ARITHMETIC.

This is a good, strong book, and is regarded as being sufficiently comprehensive as to render a higher treatise unnecessary. The problems are varied in kind and numerous in quantity, and partake largely of practical affairs. It is a modern book in arrangement of matter and in the treatment of topics.

## MENTAL ARITHMETIC.

This little volume appears to have been thrown into the series as an afterthought as a drill book for those teachers who had lingering doubts about doing away entirely with mental arithmetic.

## NEW ELEMENTARY ARITHMETIC.

This is the first volume of a two-book series. The child is supposed to be started orally in the text, and in time he begins the work himself. In the preparation of this book the author's primary and intermediate arithmetics are combined and revised in such a manner as to embrace about four years of work in graded schools.

This volume will be followed by the New Practical, thus completing the series.

## 1869. C. P. BUCKINGHAM.

A new Arithmetic on the Unit System: in which the Fundamental Principles of Arithmetic are familiarly explained and illustrated. By C. P. Buckingham, formerly Assistant Professor of Natural Philosophy in the U. S. Military Academy, and Professor of Mathematics and Natural Philosophy in Kenyon College, Ohio. Philadelphia: Claxton, Remsen & Haffelfinger. 1869.

12mo, 447 pp.

An edition was issued with an inserted title page, dated 1872, and copyrighted in 1871, with title changed to the following: "The Principles of Arithmetic, Explained and Illustrated;" using the same book or original edition of 1869.

Catharinus Putnam Buckingham was born in Springfield (now part of Zanesville), Ohio, March 14, 1808; died —. He was graduated at the United States Military Academy in 1829 and served as second lieutenant in the Third Artillery on topographical duty till August 19, 1830, and as assistant professor of natural and experimental philosophy at West Point till August 28, 1831. He resigned from the Army September 30, 1831, and from 1833 till 1836 was professor of mathematics and natural philosophy in Kenyon College, Ohio. May 3, 1861, he was appointed assistant adjutant-general of Ohio; May 8, commissary-general; July 1, adjutant-general, serving until April 2, 1862. He became brigadier-general of volunteers July 16, 1862, and served on special duty in the War Department, at Washington, till February 11, 1863, when he resigned. General Buckingham was author of an excellent treatise on the differential and integral calculus. The first edition was published in 1875, and a second, revised, in 1880.—A. M.

## 1869. W. H. KORFMACHER.

Rechenbuch für Elementarschulen. Nach der Methode von A. Richter und J. Grönings, Seminarlehrern. Für deutsche Schulen in den Vereinigten Staaten Nord-Amerika's bearbeitet von W. H. Korfmacher, Lehrer in St. Louis. Erster Theil. Für die Unterklasse. Vierte Auflage. St. Louis, Mo. Verlag von F. Galer's Buchhandlung, 1869.

16mo, 81 pp.

Zweiter Theil. Für die Mittelklasse. Fünfte Auflage, 1869.

16mo, 186 pp.

Dritter Theil. Für die Oberklasse. Zweite Auflage, 1870. 16mo, 332 pp.—A. M.

1869. H. DALMON.

Metrical Pocket-Book; or, Manual of Weights, Measures and Coins. For the Use of Merchants, Clerks, Travelers, Statisticians, Jewelers, Physicians, Chemists, Engineers, Mechanics, Students and Teachers; containing the Principles of the Metric System; Scales and Tables for the reduction of all the Metric, English and United States Standards; Tables of the more important Foreign Weights, Measures and Coins, with their English and Metric Equivalents, Etc., Etc. By H. Dalmon. Philadelphia: J. B. Lippincott & Co. 1870.

Small 18mo, 54 pp.—A. M.

1869. JACOB J. PERES.

The Child's Arithmetical Example Book and Teacher's Key combined, by Jacob J. Peres, late President of Memphis Board of School Visitors. Chicago: Geo. Sherwood & Co., n. d.

18mo, 43 pp. Copyright, 1869.—A. M.

1869. JOHN E. WADE.

The Mathematical Velocipede; or, Instantaneous Method of Computing Numbers. By John E. Wade.

18mo, 144 pp., n. d., n. p., copyright, 1869.—A. M.

1870. WHITE'S ARITHMETIC.

In 1870 Messrs. Van Antwerp, Bragg & Co. published Dr. Emerson E. White's two-book series of arithmetics, and in 1883 the same firm issued a revised edition. In the preparation of this series the author deviated from the plan usually pursued by others of patching up a two-book series by selecting from three or more books of a series such matter as would constitute a shorter course.

The plan of the author was to arrange an "elementary arithmetic" that would give enough of the subject for pupils through the third, fourth, and fifth grades of city, town, and village schools. Children taking such a course upon leaving school at the end of the fifth year would have acquired a fair working knowledge of arithmetic as far as the computation of simple interest. This groundwork—the Elementary Arithmetic—is designed to accomplish by suitably uniting oral and written exercises in integral and fractional numbers. The inductive method of instruction is followed in the presentation of all subjects. It is emphatically a "drill book for pupils."

It is neatly bound, well printed, and forms a volume of 268 pages.

## THE COMPLETE ARITHMETIC.

This is an enlarged growth of the elementary.

The plan of treating each subject is divided into four steps: 1, problems, oral and written; 2, definitions; 3, principles; 4, rule.

There are 360 pages in the book, and it is an attractive volume in appearance as well as in subject-matter.

The title, Complete Arithmetic, is somewhat misleading, since the book is complete in name only.

In both these arithmetics the author combines oral and written work about equally, and for the obvious reason that by such a union the mental arithmetic is not needed.

## ORAL LESSONS IN NUMBER.

In this manual, which is designed to guide the teacher during the first, second, and third years of the child's school work in arithmetic, the author sets forth his method of teaching oral arithmetic to children. The directions and model lessons are plain, simple, and easily followed, and are worked out with great care. It is what might be properly called a minute elaboration of the subject with specific directions to teachers.

Emerson Elbridge White was born in Mantua, Portage County, Ohio, January 10, 1829. He was educated at Ewinsburg Academy and the University of Cleveland, taught in the former

institution, and was afterwards an instructor of mathematics in Cleveland University, and principal of the Central High School in that city. He became superintendent of the public schools of Portsmouth, Ohio, in 1856, State commissioner of common schools in 1863, was president of Purdue University 1876-1883, and since that time has been superintendent of schools in Cincinnati.—A. M.

1870. JOHN E. WADE.

The Merchants and Mechanics' Commercial Arithmetic; or, Instantaneous Method of Computing Numbers. By John E. Wade. New York: Russell Brothers, Publishers, 17, 19, 21, 23 Ross Street. 1878.

18mo, 144 pp. The same book as the one above, with a different title-page.—A. M.

1870. G. L. DEMAREST.

Atlantic Primary Arithmetic. Simple Numbers. By G. L. Demarest. Boston: Ginn Brothers and Company, 13 Beacon Street. 1870.

16mo, 252 pp.—A. M.

1870. REV. URIAS JESSE KNISELY.

Arithmetical Questions for the Recreation of the Teacher and the Discipline of the Pupil. By Rev. U. Jesse Knisely. Philadelphia: Cowperthwait & Co. 1870.

12mo, 69 pp.—A. M.

Rev. Urias Jesse Knisely was born in New Philadelphia, Ohio, March 14, 1838; died May 19, 1881. He was in a great measure self-educated. The degree of M. A. was conferred on him by Marietta College, and that of Ph. D. by Wittenberg College, in which latter institution he had formerly been a classical and theological student. He also attended Jefferson College, Pennsylvania, but was not a graduate of any college. He was chosen president and professor of mathematics of Luther College, an institution of ephemeral existence. Rev. Dr. Knisely was a Lutheran minister of marked ability and great eloquence, and for the fourteen years previous to his death he was pastor of the church of that denomination at Newcomerstown, Ohio. He was a fine mathematician, and excelled especially in the solution of algebraical and geometrical problems. His last work was the revision of Ray's Higher Arithmetic and the key, in connection with Professor Greenwood, which he completed but a short time before his death.—A. M.

1870. JOHN B. JONES.

Elementary Arithmetic, in Cherokee and English, Designed for Beginners. By John B. Jones. Prepared by the Authority of the Cherokee National Council. Cherokee National Press: Tahlequah, Cherokee Nation. 1870.

Boards, 61 double pages; first page, Cherokee; second, English.—A. M.

1871. HANNA'S ARITHMETIC.

Hanna's Complete Ready Reckoner and Log, Table, and Form Book is one of those handy pocket manuals which are designed to save time to the business man, the architect, mechanic, farmer, lumber inspector, etc. It contains 20 tables, and is heartily indorsed by lumber dealers. It is a small 12mo, 203 pages, published by J. B. Lippincott & Co., Philadelphia, 1871.

1871. SHELTON PALMER SANFORD, A. M.

Shelton Palmer Sanford was born in Greensboro, Ga., January 25, 1816. He received his early education in Greensboro. He entered the freshman class of the State university in 1835. It was here that he fully developed his natural fondness for mathematics and laid the foundation of the mathematical knowledge which places him in the forefront of the instructors of the day.

He graduated in 1838. Three months before he graduated Mr. Sanford was elected tutor of mathematics in Mercer University, and he entered on his duties the week following his graduation, at the age of 22. It is rare that a man receives such a tribute to his excellence so early in life.

In 1840 he was elected professor of mathematics in Mercer University, Macon, Ga., which position he still holds.

Professor Sanford is the author of a series of arithmetics which have a national reputation for superior excellence, and which have a very extended circulation not only throughout the South, but in many portions of the North.

The only living representative of the first board of instruction appointed at the organization of the university in 1838; Professor Sanford is now in the fiftieth year of his service as professor of mathematics, wide awake, and abreast of the times. Still vigorous, elastic, and energetic in mind and body, his daily instructions are full of vivacity, arresting and holding the attention of the student and making abstruse mathematical principles clear and simple.

His arithmetics constitute a series of four books: Primary Analytic Arithmetic, Intermediate Arithmetic, Common School Analytical Arithmetic, Higher Analytical Arithmetic. They are published by Messrs. J. B. Lippincott & Co., Philadelphia.

The Primary combines simple exercises in oral and written work. It is an easy drill book, and is designed to give small children clear and distinct notions of the elementary combinations and separations of numbers. The numerous illustrations throughout the text appeal directly to the eye of the learner, and thus help him to set principles more firmly in his mind. The four fundamental rules and an introduction to fractions are included in the 130 pages composing the book.

The Intermediate Arithmetic is a grade higher than the Primary, and it is also preliminary to the Common School Arithmetic. The following subheads indicate the character of this work: 1. Of numbers; 2. Fundamental rules; 3. Fractions; 4. Federal money; 5. Compound quantities; 6. Percentage; 7. Miscellaneous questions, by analysis exclusively. This is a good elementary arithmetic, in which oral and written exercises are combined. It and the Primary were published in 1871.

The Common School Arithmetic is a 12mo of 355 pages. This volume, as well as the former ones, is analytic in its nature. The author gives the problems and the learner is expected to find out solutions. The plan of the book is to make the pupil an intelligent thinker rather than a mere mechanical recorder of figures. The book was entered for copyright in 1872.

The Higher Arithmetic is a well-arranged treatise of 419 pages. The definitions are clear; the principles are well illustrated, and the exercises are original. To reduce the science to its last analysis without the aid of formal rules is what the author proposes to do in this book. The chapter of miscellaneous problems is very interesting.

#### 1871. HAGAR'S MATHEMATICAL SERIES.

This series is published by Cowperthwait & Co., Philadelphia. It contains: 1. Hagar's Primary Lessons in Numbers, 1871; 2. Hagar's Elementary Arithmetic, 1871; 3. Hagar's Common School Arithmetic, 1871; 4. Hagar's Elementary Algebra, 1873.

For teachers: Dictation Problems and Reviews in Arithmetic, 1874; Key to Hagar's Common School Arithmetic, 1874; Key to Hagar's Elementary Algebra, 1874.

This is a series of arithmetics consisting of three books: Primary Lessons in Numbers, Elementary Arithmetic, and Common School Arithmetic. Mental and written exercises are combined in each book of the series, and their connection is such that the Primary Lessons and the Elementary Arithmetic form an abridged course and the Primary and the Common School form a complete course.

*Primary Lessons.*—The aim of this book is to teach one thing at a time by the presentation of ideas of number objectively and in their natural order. The exercises are simple, progressive, and illustrative. They require little, if any, explanation.

*Elementary Arithmetic.*—In this work the principles and rules are established by induction. Processes are stated concisely, yet clearly. This work meets the wants of intermediate classes in graded schools. There is a strong, vigorous tone running through the book.

*The Common School Arithmetic.*—This is a teachable book. Its title indicates its scope and character. It is also a strict arithmetic, arranged upon the plan that questions must be definitely answered, principles and rules exactly recited, and all forms of solutions logically and concisely expressed. The exercises are designed to cultivate the habits of self-reliance and independence in the pupils.

Dictation problems may be used to supplement the author's course or to furnish additional problems with any other text-book. The examination questions are very suggestive, and they constitute a valuable chapter of 14 pages.

Daniel Barnard Hagar was born at Newton Lower Falls, Mass., April 22, 1820. He received his early education in the schools of his native town. After some years of service in a paper manufactory at home and in a dry-goods store in Boston he was prepared for college under private instruction. He received his collegiate education at Union College, Schenectady, N. Y., graduating in 1843. After graduation he was for nearly five years principal of the academy at Canajoharie, N. Y., and was also superintendent of schools in that city. In 1848 he became principal of the large academy at Norwich, N. Y., and in 1849 principal of the Eliot High School at Jamaica Plain, now a part of Boston, which position he held for sixteen years. In 1865 he accepted the position of principal of the State Normal School at Salem, Mass., and he continues to hold it to the present time.

For about ten years he served as an editor of the Massachusetts Teacher. He has delivered many lectures before educational associations. He prepared a history of the Massachusetts Teachers' Association from its organization, in 1845, to 1880.

Believing in the great value of united action among teachers, he has done what he could to promote the interests of teachers' associations. While never in any way seeking for official positions in such associations, he has served as president of the Montgomery County (N. Y.) Teachers' Association, of the Norfolk County (Mass.) Association, of the Massachusetts State Teachers' Association, of the American Institute of Instruction, of the American Normal School Association, of the National Teachers' Association, and of the National Council of Education.

The call for the meeting which was held in Philadelphia in 1857 for the organization of the National Teachers' Association and the original constitution of that body were written by him.

#### 1871. B. S. POTTER AND R. B. WELCH.

Common Sense Applied to Numbers; or, Lightning Addition Reduced to a System. Being a Classification of the Nine Digits into Syllables and Words, by means of which a Column or Columns of Figures may be read as rapidly as a line of Letters in our Written Language; also, Short Methods for Multiplication, Interest, Etc., Etc. A Work of Vast Importance to Accountants, Teachers, and Business Men Generally. By B. S. Potter, A. M., and R. B. Welch. Price one dollar. Bloomington, Ill.: Published for The Authors. 1871.

13mo, 60 pp.—A. M.

#### 1871. B. S. POTTER, R. B. WELCH, & J. E. ANDERSON.

Common Sense Applied to Numbers, or the Word System in reading columns of Figures Explained and Exemplified. By B. S. Potter, A. M., and R. B. Welch. Second Revised Edition. By R. B. Welch, and J. E. Anderson, B. Ph. Quincy, Ill., 1874.

48 pp. Copyright 1871.—A. M.

#### 1871. LELAND BURTON.

Burton's Lightning Arithmetic especially adapted to Class Teaching. Designed as a Self Instructor or Pocket Companion. The Shortest, most Rapid, and Simplest Method ever known; adapted to every Kind of Business; suitable for the Beginner, yet will give the Finishing Touch to a Graduate. Progress is a Law of God. Leland Burton, Professor of Mathematics. Address all orders for this Book to Bowman & Matthews, 510 Pine Street, St. Louis. Or W. A. Reed, Fayetteville, Arkansas. Single copies by mail, \$1.00. 1871.

Small 18mo., 109 pages.—A. M.

#### 1871. LORENZO FAIRBANKS.

A Practical Business Arithmetic; designed as a Text-Book for Commercial Colleges, Academies, and High Schools, and for the Use of Business Men, Accountants, Clerks, and Private Students. By Lorenzo Fairbanks, A. M., author of a Treatise on Bookkeeping by Double and Single Entry. University Publishing Company, New York. 1886.

12mo, 440 pages. Copyright 1871.—A. M.

1872. WILLIAM S. HUTCHINGS.

The Lightning Calculator: A New, Readable and Valuable Book, containing Three New Processes of Addition, Four New Forms of Multiplication, Rapid Processes of Squaring and Cubing, Subtraction and Division, his Improved Form of Interest, and Valuable Information in Book-Keeping; together with a History of his Remarkable Life, his Wonderful Discoveries in Numbers, his Amusing and Instructive Parlor Feats, Etc., with his Autograph. Just issued by Professor Hutchings. New York: Press of Wynkoop & Hallenbeck, 118 Fulton Street. 1872.

18mo, 12 pages. My copy does not contain "his Autograph." This pamphlet does not seem to be the complete work described above, and may be only an advertising circular, as it is not copyrighted.—A. M.

1872. W. POWELL WARE.

Prof. Ware's \$10,000 Prize Rule for the Equation of Payments. Two-thirds of the time and labor saved—requiring only one division in debit and credit accounts. To which is appended Rankin's Perpetual Almanac. Philadelphia: Claxton, Remsen & Haffelfinger, 624, 626 & 628 Market Street. 1877.

Small 18mo, 47 pp. Copyright 1872.—A. M.

1872. T. W. NIXON.

Nixon's New Method of Teaching Children Multiplication Tables and Remembering Historical Dates. Our Success depends on Practice. T. W. Nixon, Sole Author. Baltimore: Printed by F. A. Hanzschue, No. 166 W. Baltimore Street. 1872.

16mo, 24 p.—A. M.

1872. JOHN SCHMITT.

John Schmitt's New Rules of Multiplication, containing several Entire New Rules of Multiplication, with Sufficient Examples to make the work a ready Reckoner, from  $1 \times 1$  to  $90 \times 90$ . Kansas City, Mo. For sale by Christ. Schmitt, 710 Main Street. 1872.

Small 18mo, 67 pp.—A. M.

1873. J. A. HENDERSON'S ARITHMETIC.

Henderson's Intellectual and Practical Calculator is a 12mo book of 167 pages. It was published in San Francisco in 1873. The author's theory is this: "It is better to know everything about something than something about everything."

The work is one of those in which the learner is taught how to maneuver with numbers with speed and accuracy. It is similar in character to Orton's Lightning Calculator, but less in its scope.

1873. CHRISTIAN ROPP, JR.

Ropp's Rapid Reckoner and Commercial Calculator; a New, Practical, and Scientific System of Calculation, unequaled for Simplicity, Brevity, and Accuracy. Also, a series of Original, Useful, and Convenient Tables. By Christian Ropp, Jr., Bloomington, Ill.: Published by the Author, 1873.

18mo, 76 pp.—A. M.

1873. DAVID WHITE GOODRICH.

The Art of Computation, designed to teach Practical Methods of Reckoning with Accuracy and Rapidity. By David White Goodrich, Late Lightning Calculator, Erie Railway. Third Edition: Revised and Enlarged. New York: D. W. Goodrich & Co., Publishers. 1873.

12mo, 206 pp.—A. M.

ED 99—51

1874. EDWARD OLNEY, LL. D.

This distinguished educator and mathematician was born in Moreau, Saratoga County, N. Y., July 27, 1827, and died in Ann Arbor, Mich., January 16, 1887.

In 1833 his father removed to Oakland County, Mich., but afterwards settled in Weston, Wood County, Ohio. The son, accustomed to hard labor on a farm and with no educational advantages except such as were furnished at a log schoolhouse, early developed a marked fondness for mathematics and natural science. In this school of early toil he used a plow beam and the front part of a wheat fan (fanning mill) for a blackboard, and in the short space of six weeks he "went through Day's Algebra."

At the age of 19 he began teaching district school, devoting his evenings to the study of Latin. At 21 he taught in Perryville, the county seat, and a year later he took charge of the union graded school, which he organized. Here he had to teach Latin and other higher studies, and by private effort outside of school he qualified himself admirably for the task. For five years he occupied this position, when, in 1853, he was elected professor of mathematics in Kalamazoo College, where he remained till 1863, when he entered upon similar duties at the University of Michigan, and which he ably discharged till his death.

The honorary degree of LL. D. was conferred upon him, owing to his distinguished services as an educator, author, and teacher. Having come up directly from the laboring people, he took a lively interest in their education and influencing them in whatever tended to their welfare. A ready and easy speaker, apt in illustrations, he was a great favorite with the teachers at institutes and State meetings. He took deep interest in all humanitarian enterprises. An active member of the Baptist Church, his whole influence was in the line of his religious convictions of right and duty.

He is well and favorably known as the author of the following series of mathematics, published by Messrs. Sheldon & Co., New York: First Lessons in Arithmetic, 1831; Primary Arithmetic, 1874; Elements of Arithmetic, 1875; Practical Arithmetic, 1879; Arithmetical Exercises, 1875; Science of Arithmetic; Introduction to Algebra; Complete Algebra; Test Examples in Algebra.

#### HIGHER MATHEMATICS.

University Algebra; Elements of Geometry; Geometry and Trigonometry, University Edition; General Geometry and Calculus.

#### THE ARITHMETICS.

First Lessons is a book of 144 pages, and is the introductory volume to the author's Practical Arithmetic. It is so simple that the lowest grade pupils may pursue it easily. The pupil is gradually conducted through the four fundamental rules and the simplest exercises in fractions and weights and measures. As a text-book it is beautifully illustrated.

The spirit of the author is well expressed in the Primary Arithmetic, in which he announces the following principles:

1. A text-book should be arranged with reference to sound principles of teaching.
2. One thing at a time in primary teaching.
3. Unity of purpose and infinite diversity of means characterize successful teaching.
4. The method by which we determine what the result of a combination is, and the fixing of that result in the mind.

The Primary Arithmetic is divided into two parts: Part I for first and second grade pupils and Part II for third and fourth grade pupils.

The first includes the fundamental rules, fractions, and denominate numbers, and the second reviews these subjects and also includes short chapters on interest and mensuration.

The Elements of Arithmetic is a volume of 392 pages. Proportionally it is much stronger than either of the others, although it is exceedingly simple in the beginning. It includes all topics usually found in practical or common school arithmetics, and it can be used in ungraded or graded schools; if in graded, it should follow the author's primary work. While it appears to lack system in its arrangement, yet it contains a great variety of useful and interesting exercises, and the pupil that masters it has a very fair knowledge of the subject.

The Practical Arithmetic is hardly equal to the Elementary, although it is almost identical with it. It was prepared because of the diversity of tastes in regard to schoolbooks on the subject of arithmetic.

It is rather difficult to form a correct estimate of Professor Olney's arithmetics. They are characteristic of the man in being a wonderful mass of information in all kinds of shapes. He saw clearly the theoretical, which he endeavored to render extremely practical, and while he succeeded well in carrying out his own views of teaching the subject, it is doubtful if many are able to adopt his methods and follow them successfully. In my opinion, he was a much better teacher than writer of text-books. The living soul was in his instruction, which he was unable to put into his books. And yet his books are not weak, but strong ones, and the suggestive hints he throws out to teachers are invaluable and worth many times the price of each book.

1874. WILLIAM G. PECK, LL. D.

Prof. William G. Peck was born in Litchfield, Conn., October 16, 1830, and resides in the city of New York (1892). He graduated from the Military Academy in 1844 and was promoted to the Corps of Topographical Engineers, and served on the survey of Portsmouth Harbor a short time, and later with Fremont's exploring expedition till the beginning of the war with Mexico. He was now assigned to duty under General Kearny in the Army of the West, and served in this position till the close of the war, when he was ordered to West Point as an assistant instructor in mathematics. He remained there eight years, then resigned his commission and was for two years professor of physics and civil engineering in the University of Michigan. In 1857 he was elected to the chair of mathematics, mechanics, and physics in Columbia College, New York, which he now holds.

Professor Peck, in connection with Dr. Charles Davies, compiled a dictionary of mathematics; he is the author of an elementary treatise on mechanics; the editor of Ganot's Physics; and author of a brief course in mathematics beginning with arithmetic and including determinants. His books are published by Messrs. A. S. Barnes & Co., New York.

#### ARITHMETICS.

Peck's arithmetical series includes three books: 1. First Lessons in Numbers; 2. Manual of Practical Arithmetic; 3. Complete Arithmetic.

The author in this series of books includes such matters only as are essential to the student, business man, and the artisan. Consequently the First Lessons introduces the beginner to the subject by easy steps, while the Manual occupies a grade between the first book and the Complete Arithmetic. The theory and the more abstruse principles are excluded from the Manual, yet it and the Complete differ only in regard to the extent of matter.

#### THE COMPLETE ARITHMETIC.

This arithmetic was issued in 1874, and a fuller edition again in 1877. The former contains 313 pages and the latter 415 pages.

Of the three books the last is the best. The exercises are well selected; repetitions are avoided; extraneous matter is excluded; and the explanations are given in such a way as to help the pupil when he needs assistance.

1874. JOSEPH FICKLIN, LL. D.

This distinguished mathematician was born in Winchester, Ky., September 9, 1833, and died September 6, 1887. His father, Joseph Ficklin, was a native of Mercer County, Ky. Professor Ficklin received his first schooling in a little school at Salvisa, in his native State. Here he began his mathematical studies by learning the "multiplication table" from the back of his copy book. Reared under conditions unfavorable for the cultivation of his mental faculties, oppressed by poverty, compelled to work early and late each day, he yet, by the inherent force of his energy, became one of the first scholars of this country. Having picked up such rudiments of an education as he could at intervals while learning the blacksmith's and wagonmaker's trade, he started with his father from Kentucky to Grundy County, Mo., in 1851, but went, instead, to New Madrid,

Mo., where he taught school a few months, and then returned to his grandfather's, in Kentucky, where he attended school nearly a year.

In September, 1853, he joined his father in Missouri. By this time he had mastered all the common branches and had made some progress in the higher ones. Next he went to the Masonic College, at Lexington, Mo., but on account of lack of means he was forced to leave before graduating. However, the institution subsequently conferred upon him the degree of A. B. After leaving Lexington he went to Trenton, where his father lived, and took charge of the high school, which position he held from 1854 to 1859.

In 1859 he was elected professor of mathematics in the Female College, Bloomington, Ill., but he soon came back to Missouri. He taught the public school in Linneus, and afterwards taught a private school there. In September, 1864, he accepted the chair of mathematics and chemistry in Christian College, Columbia, Mo. During the year he heard some classes also in the State University. At the beginning of the fall term he entered upon the duties of the regular professor of mathematics, philosophy, and astronomy in the university, which chair he filled till the time of his death.

The University of Wisconsin conferred upon him the degree of Ph. D. in 1874, and in 1884 the additional degree of LL. D. He was a fellow of the American Association for the Advancement of Science and a member of the American Astronomical Society.

As a mathematician his talents were of a high order, and he had few equals in handling difficult problems in mechanics. He was equally skillful in integrating complicated differentials. Except to a few mathematicians he is better known to teachers through his text-books, which are: 1. Complete Algebra and Key, New York, 1874; 2. Algebraic Problems and Key, 1874; 3. First Lessons in Arithmetic, 1881; 4. Elementary Arithmetic, 1881; 5. Table-Book and Primary Arithmetic, 1881; 6. Practical Arithmetic, 1881; 7. Advanced Arithmetic, 1881; 8. National Arithmetic and Key, 1881; 9. Elements of Algebra, 1881.

These books are published by one of the oldest firms in this country, that of Messrs. A. S. Barnes & Co.

The Primary Arithmetic is a book of 104 pages. It includes the Table Book and Primary Arithmetic. This book contains copious exercises for slate, blackboard, and oral drill, plentifully interspersed with pictorial illustrations. Only such definitions as the pupil should know are inserted. The elementary rules, United States money, fractions, and the useful tables are treated of in such a way as to attract and interest children. It is an excellent work for beginners.

The Elementary Arithmetic is a continuation of the previous volume. The exercises are of a practical character. In this volume the author begins to develop the subject more systematically. Arithmetic must be taught as a science. Each question is designed to require search and thought before an answer can be given, and the how and the why are taught by inductive exercises more than by the statement of formal propositions.

This book takes the pupil through the elementary rules, fractions, denominate numbers, and the metric system. It is a 12mo, 180 pages.

The Practical Arithmetic is a neat volume of 312 pages. Of all text-books recently published this is one of the very best. The inductive method of treating each subject is strictly adhered to. Nothing is anticipated before the pupil is properly prepared for it. The author has kept in view the pupil's mental powers in the gradation of the exercises. The work is especially strong and clear in the treatment of fractions and percentage. The chapters on mensuration and short methods are invaluable acquisitions to practical men.

The National Arithmetic is the same as the Practical Arithmetic to page 209, and the remaining 186 pages form the Advanced Arithmetic. These two parts form an excellent common-school arithmetic, in which all essential subjects are included and all useless matter is excluded.

1874. GEORGE SOULÉ.

Soulé's Contractions in Numbers, designed for the Use of Schools, Clerks, Accountants, Mechanics, Planters and Private Learners. It elucidates the principles of the science of numbers, and the most practical and rapid methods of

handling figures. It embraces the Vicenary System of Addition, an entirely new System, and the most lightning-like method known. It fully illustrates Subtraction by the Addition method, Simultaneous Multiplication, and all the other approved contracted methods of multiplying and dividing whole and fractional numbers. Percentage and Interest computations are extendedly elucidated by our Philosophic System, and many practical questions in Stocks and Bonds, Compound Investments, etc., are presented for the first time. English, French, German, Austrian, Russian, and Brazil Exchange are presented and Philosophically explained. Practical work in Mensuration of Surfaces and Solids constitutes a Special Feature of the Book. It contains a vast amount of important information not to be found in any similar treatise. It is replete with new and practical examples, the rarest gems of the science of numbers, which are of great value to the Accountant, Merchant, Mechanic, Planter, Student and all classes of business men. By Geo. Soulé, Practical Accountant, Commercial Lawyer, President of Soulé's Commercial College, New Orleans, and Author of Soulé's Analytic and Philosophic Commercial and Exchange Calculator. New Orleans. Published by the Author. 1874.

12mo, 264 pp.—A. M.

1874. HEYER M. NEXSEN.

Mental Calculation. The Science of Figures and Numbers, or How to Multiply, Divide, Add, Subtract, &c., ANY Set of Numbers In the Mind alone, Correctly, and Quick as Lightning. By the New Science of Mental Calculation, Based upon New Scientific Principles, Methods, Ideas, Contractions, Rules, etc. By Heyer M. Nexsen, Formerly Expert Calculator, P. R. R. Pier 38, N. R. Volume I. New York: H. M. Nexsen, Publisher, 267 W. 16th Street, N. E. Corner 8th Avenue.

12 mo, 120 pp. In some respects a remarkable book. The following is the dedication: "TO ALMIGHTY AND OMNISCIENT GOD, FATHER OF ALL TRUTH, SOURCE OF ALL SCIENCE, GIVER OF EVERY GOOD AND PERFECT GIFT, AND AUTHOR AND FINISHER OF EVERY GOOD WORD AND WORK; this little volume is DEDICATED by the AUTHOR, H. M. Nexsen."

I will add a few extracts from the preface:

"This work is full of MARVELOUS METHODS OF CALCULATION EASY to learn, based on SCIENTIFIC PRINCIPLES, SIMPLE, GRAND, and NEW, that have ASTONISHED the Author and Discoverer himself and others who have watched him calculate day after day, for 14 men, rapidly making out freight bills for him to extend for them, which were as quickly required to send off with the loaded freight trains. To INSTANTANEOUSLY give results was a daily wonder to them and to visitors.

"Such INTUITION is a GIFT FROM GOD, and the author believes he has SOLVED THE MYSTERIES OF QUICK and EASY CALCULATION BY PRAYER and BY THE GRACE OF GOD, WHOSE INSPIRATION CAN IMBUE THE MIND and GIVE IT UNDERSTANDING and POWER.

\* \* \* "Nexsen's Scientific Methods of Calculation are easy to learn, because the Principles discovered are based on COMMON SENSE, and therefore easy, though never before known. They are the GRANDEST MASTER STROKES of CALCULATION ever invented or discovered by man, or revealed to man, by THE OMNISCIENT GOD WHO shows HIS SOVEREIGNTY in the minds of men, to whom HE grants the Gift of INTUITION, which impresses the thoughts of the endowed one, whose mind and thoughts are thus controlled by the Mental Inspirations from GOD, until the purpose and mission of such gifts of genius is accomplished," etc.—A. M.

1874. WILL STARR HAMLIN.

Hamlin's Arithmetical Self-Instructor, containing The Most Simple and Comprehensive Rules for the Shortest and Most Rapid Methods of Computing Numbers, Applicable in Every Day Business Transactions. By Will Starr Hamlin, the Lightning Calculator. Energy is the Price of Success. Chicago: Fergus Printing Company. 1874.

18mo, 56 pp.—A. M.

1874. ANNE M. RICE.

Slate Exercises in Numbers, for Primary Schools. 300 Lessons, Arranged for Two Years' Work. With Suggestions for Oral Recitations. By A. M. Rice. H. Rude, 375 Main St., Springfield, Mass., and Nichol & Hall, 32 Bromfield St., Boston. 1874.

Oblong, pp. 114.—A. M.

1874. J. C. MIDDLEBROOK.

Middlebrook's Lightning Calculator Embracing all the Practical Parts of Mathematics, and a full Exposition of Cancellation, with Numerous Examples for Practice. Carefully Adapted to the Purposes of Teaching in Schools of Every Grade, and to the General Use of Merchants, Mechanics, Farmers, and All Others. By J. C. Middlebrook. Meridian, Miss.: Powell & Malone, Book and Job Printers. 1874.

16mo, 39 pp.—A. M.

1875. EDWIN A. WILLIAMS.

Business Manual, containing a Correct and Useful Method of Solving any Problem in Simple or Compound Interest, Currency, Etc., beside numerous Miscellaneous Examples. Invaluable to All Classes. By Edwin A. Williams, San Francisco, Cal.

Small 18mo, 20 pp.—A. M.

1875. JAY F. LANING.

Contractions in Arithmetic. Every Rule and Operation Shortened. Hours of Labor Performed in as Many Minutes. Everybody's Companion and Friend. Address all orders to the Author, Jay F. Laning, New London, Ohio. Price One Dollar. Robison, Savage & Co., Printers, Etc. 1875.

18mo, 86 pp.—A. M.

1875. G. M. FURMAN.

Arithmetical Problems for the Use of Advanced Classes in Schools. By G. M. Furman, Teacher in the Binghamton High School. Binghamton: Carl, Stoddard & Co., General Book and Job Printers. 1875.

Small 18mo, 60 pp.—A. M.

1875. RICHARD NELSON AND HENRY A. FABER.

The New Mercantile Arithmetic for Book-Keepers, Schools and Colleges. By Richard Nelson, Author of "Nelson's Book-Keeping," and Henry A. Faber, President Queen City Commercial College. Published by Faber and Langdale, 200 and 202 Vine Street, Cincinnati, O. 1875.

1875. G. ERLKENKÖTTER.

Rechenbuch für Deutsche Elementarschulen in Amerika. Zweiter Theil. Die Rechnungsarten des bürgerlichen Lebens, (nebst Antwortenheft), Streng Stufenmäßig bearbeitet von G. Erlenkötter, Lehrer. Philadelphia und Leipzig. Verlag von Schäfer und Koradi. 1875.

18mo.—A. M.

1876. GOFF'S ARITHMETICS.

Milton B. Goff, LL. D., president of the Western University of Pennsylvania, is the author of the following books: 1. First Book in Arithmetic, 12mo, 144

pages, 1876; 2. Elementary Arithmetic, 12mo, 224 pages, 1888; 3. Complete Arithmetic, 12mo, 452 pages, 1876; 4. Arithmetical Problems, 12mo, 240 pages, 1877.

With the exception of the Elementary Arithmetic these books were first published by A. H. English & Co., Pittsburg, but they are now published by Messrs. Taintor Bros. & Co., New York.

The First Book is a neat little volume, nicely printed and beautifully illustrated. The chapters on fractions and the tables are admirably presented.

#### ELEMENTARY ARITHMETIC.

The author had in mind the wants of graded schools when he wrote this book. He included such subjects as pupils should know, whether they leave school or study a more advanced work. The problems are selected with direct reference to business transactions. The book is a fine specimen of the printer's art.

#### COMPLETE ARITHMETIC.

This is by far the best of the author's works. In many respects it is a very superior text-book. Here the author shows most clearly his strong powers of generalization. To aid pupils and teachers in putting their arithmetical knowledge into good form, this is one of the best and safest guides. Every teacher should keep this book for handy reference.

#### ARITHMETICAL PROBLEMS.

This is a drill book for either teacher or pupil. The problems are well selected, and cover all subjects usually found in the best arithmetics.

#### 1876. PROF. ALFRED KIRK.

Prof. Alfred Kirk was born in Harrison County, Ohio, in February, 1832, and shortly after his birth his father's family removed to Jefferson County, of the same State, where Alfred grew to manhood. Here he attended district school until 16 years of age, when he entered Richmond College, an institution that ranked as a first-class academy, where he remained four years pursuing the regular classical course. Upon leaving the institution he began his career as a teacher in the same county. Afterwards he went to Chicago, where he now resides. On the 1st of May, 1889, he will have completed twenty-one years as a principal in the Chicago schools.

#### KIRK AND BELFIELD'S ARITHMETICS.

These arithmetics are published by Messrs. George Sherwood & Co., Chicago. They are arranged under two distinct heads, "Condensed Series" and "Two Book Series." The first embraces Model First Book, Model Second Book, and Model Third (Business) Book, and the second Model Elementary and Model Complete; also a separate volume, "The Little Folks' Model Arithmetic."

#### MODEL ARITHMETIC COMPLETE.

This is a 12mo. of 359 pages, and was entered for copyright in 1875. Its essential features are: 1. Accuracy and perspicuity in the statement of definitions; 2. Philosophical discussions of principles and their applications; 3. Combination of oral and written exercises in each subject; 4. The unusually large number of examples, carefully prepared and arranged; 5. The grouping of miscellaneous examples for reviews and examinations.

For this arithmetic it is enough to say that it is one of the very best text-books issued in this country. The authors know what the average boy and girl can do in school. They had before them children of such capacity while writing each page. Truly it is a "Model Book." What the authors claim for the book is fully carried out in the text.

The Complete Arithmetic is bound in three parts for those who prefer it in that form.

#### ELEMENTARY ARITHMETIC.

This is a volume of 208 pages, published in 1876, and it may be used as an introductory work to the Complete Arithmetic or as a finishing book for pupils who do not have time to complete the grammar-school course. It carries the pupil through interest.

#### REVISED ELEMENTARY ARITHMETIC.

A 12mo, 288 pp.

This book was prepared by Mr. Belfield, and was published in 1887. The table of contents exhibits most clearly the scope of the work. It assumes that the pupil has had oral instruction

in numbers from 1 to 10, and that he can read in the Second Reader. The exercises are arranged for pupils through the second, third, and fourth grades.

There are some points especially worthy of commendation in this volume. For instance, "Suggestions to teachers" contain the kernel of all that is essential in teaching arithmetic to beginners. The mechanical work of the book is admirable. It is better type for the schoolroom than any other arithmetic I have ever examined. The exercises are excellent in every respect. It is a pleasant book to look at or to look through.

#### THE LITTLE FOLKS' ARITHMETIC.

The authors designed this book for the first two years of the child's school life. It is planned after the Grube method.

The exercises are well graded, and the book itself, from the Grube standpoint, is one of the very best. The volume is a thin 12mo, 92 pages.

#### 1876. SINGER'S ARITHMETICS.

The Model Series of Arithmetics, prepared by Edgar A. Singer, principal of the Henry W. Halliwell Grammar School, Philadelphia, comprises the Model Primary, 128 pages; the Model Elementary, 256 pages; the Model Practical, 400 pages; and the Model Mental, 184 pages. These books were entered for copyright in 1876 by Messrs. Eldredge & Bro., Philadelphia.

The Primary Arithmetic is designed for beginners of tender years. There is a method, beginning with the first book, carried through the entire series. No sudden transitions are made, but the pupil passes along naturally and easily from what he already knows to that which he is to acquire. First the concrete problem and afterwards the abstract one is the plan the author adopts to impress the pupil with the relations existing between the processes. From this book the child learns the four fundamental rules as applied to whole numbers.

The Elementary Arithmetic follows the Primary, but includes the following additional topics: 1. Properties of numbers; 2. Fractions; 3. Decimals; 4. Denominate numbers, including some of the simple cases in mensuration. The problems are well graded and combine written and mental exercises. It is well adapted to children of the third, fourth, and fifth grades in city, town, and village schools, or to children of from 9 to 12 in country schools. The definitions are clear and sharp, the model solutions brief and pointed, and the principles and rules forcibly expressed.

The Practical Arithmetic is a beautiful volume, handsomely bound and tastily printed. It naturally follows the Elementary, but not necessarily. In my opinion, it and the Mental Arithmetic form an excellent course, and one that is sufficiently extended for all ordinary schools below the very highest grades. A model text-book by a teacher who knew well what to do and how to do it.

The Mental Arithmetic shows the same painstaking care as the other books of the series, and it is well adapted to the average child.

Throughout the series it is very evident that the author places a proper estimate on the value of mental arithmetic.

#### 1876. WILLIAM R. G. HUMPHREY.

The Western Abbreviated, or Practical One-Rule Arithmetic; where the Rules are Illustrated, and the Principles Made Plain. Second Edition. Enlarged and Revised. By Wm. R. G. Humphrey. St. Louis, Mo.; Printed by Jno. J. Daly & Co., 213 N. Third Street. 1876.

18mo, 133 pp.—A. M.

#### 1876. J. W. FLEMING.

An Essay on Arithmetic, by J. W. Fleming, Maquoketa, Iowa. January, 1876. W. S. Belden, Printer, Maquoketa, Iowa.

8vo, 48 pp.—A. M.

#### 1876. ALFRED COLIN.

The Universal Metric System: Prepared especially for Candidates for Schools of Science, Engineers and Others. By Alfred Colin, M. E., Principal of a Preparatory Scientific School. New York: D. Appleton & Co. 1876.

49 pp.—A. M.

1876. HENRY A. FABER.

Concise Mercantile Arithmetic, for Commercial Colleges: A Hand-Book for the Counting-Room. Containing all the more useful and practical calculations of every-day application, explained on Scientific principles. By Henry A. Faber, President Queen City Commercial College and Author of "Faber's Manual," "Statistical Account Book," and Co-Author of the "New Mercantile Arithmetic." Cincinnati: Queen City Commercial College, N. W. Corner Fifth and Walnut Streets. 1876.

16mo, 200 pp.—A. M.

1876 JOSEPH J. SKINNER.

Principles of Approximate Computations. By Joseph J. Skinner, C. E., Instructor in Mathematics in the Sheffield Scientific School of Yale College. New York: Henry Holt and Company. 1876.

16mo, 98 pp.—A. M.

1877. THE NEW AMERICAN ARITHMETICS.

This excellent series of arithmetics was prepared S. Mecutchen, A. M., and George M. Sayre, and published by E. H. Butler & Co., Philadelphia, in 1877.

This is either a two-book series or a three-book series, owing to the way the school prefers. That is, Part First stands as an independent volume; while Part Second and Part Third are bound separately, or when combined form "The New American Practical Arithmetic."

Part First is a handsome little book of 84 pages. The object of the authors is to present the first principles of arithmetic in a simple and practical manner without burdening the child with theories. Constant labor is held to be the only way to gain knowledge. It is a book that demands work.

Part Second begins with the fundamental rules, and in 137 pages the following subjects are adequately treated: 1. Simple numbers; 2. United States money; 3. Common fractions; 4. Bills and accounts; 5. Denominate numbers; 6. Decimal fractions; 7. Denominate fractions.

Part Third includes: 1. Percentage; 2. Ratio and proportion; 3. Partnership; 4. Equation of payments; 5. Averaging of accounts; 6. Analysis; 7. Involution and evolution. 8. Mensuration; 9. General review problems; 10. Matters belonging to higher arithmetic. This book contains 202 pages.

The Practical Arithmetic is designed for those schools which prefer the second and third parts in one volume of 326 pages.

This series of books combines in an eminent degree the following features:

1. Oral and written arithmetic; 2. Clear, concise, and comprehensive definitions; 3. Examples that actually occur in business transactions; 4. Fewer formal rules than any other series; 5. They can be mastered by the average child in a reasonable time.

1877. NUMBERS FOR JUNIOR CLASSES.

Miss Martha Roe put into this book just what the pupil is supposed to need. A few definitions to stimulate inquiry; no rules, but a great number of examples, decimal fractions, and denominate numbers are given great prominence.

It is a well-bound volume of 160 pages, published in 1877, by C. W. Bardeen, Syracuse.

1877. FIRST STEPS AMONG FIGURES.

This is a drill book in the fundamental rules of arithmetic, divided into two parts, "The Teachers' Edition," of 192 pages, and the "Pupils' Edition," of 143 pages. The key to the work is: 1. Counters; 2. Figures; 3. Abstract numbers; 4. Practical problems. The book was prepared by Levi N. Beebe, and is published by C. W. Bardeen, Syracuse, N. Y. The first edition was printed in 1877.

1877. RAUB'S ARITHMETICS.

This series embraces two books—Elementary Arithmetic and the Complete Arithmetic, published by Porter & Coates, Philadelphia, in 1877. The author,

Albert N. Raub, A. M., was for many years principal of the Central Pennsylvania State Normal School, and is widely known as a writer on educational methods and of schoolbooks.

The Elementary Arithmetic treats in a very perspicuous manner of the following subjects: 1. Fundamental rules; 2. United States money; 3. Properties of numbers; 4. Fractions; 5. Decimal fractions; 6. Denominate numbers; 7. Percentage and review problems. It covers the ground well in 164 pages.

The Complete Arithmetic is an excellent treatise which, in connection with the Elementary, constitutes an admirable two-book series. This book is one of the best common-school arithmetics published.

The chapter on "Building Associations" is a new feature in arithmetical literature.

The author has united oral and written arithmetic very skillfully in these books.

Albert N. Raub, A. M., Ph. D., was born in the county of Lancaster, Pa., March 23, 1840. His early educational advantages were only such as were afforded by the common country schools of the times. At the age of 16 he became a student at the State normal school at Millersville, Pa., from which he graduated in the scientific course in 1860, being one of the leading members of the first class which graduated from the institution as a State normal school. Soon after graduating he was made principal of the Bedford Union School, and a year later principal of the public schools of Cressona, Schuylkill County, where he remained three years, when he became superintendent of schools in the town of Ashland, in the same county. At this time he wrote and published two spelling books and acted as educational editor of a country paper. From this time he has continued to hold important educational positions. In 1877 he succeeded in establishing a State normal school at Lockhaven, of which he became principal. Since August, 1885, he has been principal of the academy of Newark, Del.

1877. H. H. HILL.

A New and Simple Method for Square and Cube Root. A Handbook for the Use of Teachers and Pupils. By H. H. Hill. Chicago, Ill. Max Stern, Goldsmith & Co., Printers. 1877.

16mo, 15 pp.—A. M.

1877. JAMES E. RYAN.

The Standard Arithmetic, for Schools of all Grades and for Business Purposes. In Two Numbers. Number One. By James E. Ryan, Principal of School No. 26, Brooklyn. New York: Lawrence Kehoe, 9 Barclay Street. 1877.

12mo, 184 pp.—A. M.

1877. HENRY E. SAWYER.

Metric Manual for Schools. The Decimal System of Measures and Weights. With Exercises and Problems. By Henry E. Sawyer, A. M. Boston, n. d.

64 pp. Copyrighted 1877.—A. M.

1877. HOY D. ORTON AND W. H. SADLER.

Orton & Sadler's Business Calculator and Accountants' Assistant. A Cyclopædia of the most Concise and Practical Methods of Business Calculations, including many valuable labor-saving Tables, together with Improved Interest Tables, Decimal System: showing the Interest on from \$10 to \$10,000. Rate, Ten per Cent. per Annum. By Hoy D. Orton, Lightning Calculator, formerly Teacher of Rapid Calculations in the U. S. Naval Academy, and W. H. Sadler, President of Sadler's "Bryant & Stratton" Business College, Baltimore. Designed for the practical use of the Banker, Merchant, Accountant, Mechanic, Farmer, Business Man and Student. Containing the shortest, simplest and most rapid methods of computing numbers, adapted to all kinds of business and every-day life. Written and arranged so as to be within the comprehension of every one having the slightest knowledge of figures. Baltimore, Md.: W. H. Sadler, Publisher, Nos. 6 & 8 N. Charles St.

18mo, 304 pages. Copyright, 1877. I have another copy, 323 pages. 1889.—A. M.

1877. J. PICKERING PUTNAM.

The Metric System of Weights and Measures. By J. Pickering Putnam, Architect, Member of the American Metrological Society and of the American Metric Bureau. Second Edition, Revised and Enlarged. Boston: American Metric Bureau, 1 Tremont Place. 1877.

8vo, 70 + 13 pp.—A. M.

1877. P. T. LINDHOLM.

Försök till Praktisk Lärobok i Aritmetik of P. T. Lindholm. Vasa, Goodhue Co., Minn. 1877. (Norwegian.)

12mo, 128 pp.—A. M.

1877. JOHN H. METCALF.

Self-Instructor, Rapid Calculator, and Key to the Business and Important Rules of Arithmetic; for Calculating Grain, Hay, Lumber, &c. Useful to Farmers, Mechanics, Grocers, Bankers and Business Men Generally. All Performed by Rule and Examples. By John H. Metcalf. Dubuque: Newcomb & McCraney, Printers. 1877.

16mo, 58 pp.—A. M.

1877. JAMES E. RYAN.

The Standard Arithmetic, for Schools of all Grades and for Business Purposes. In two Numbers. Number Two. By James E. Ryan, Principal of School No. 26, Brooklyn. New York: Lawrence Kehoe, 9 Barclay Street. 1877.

12mo, 203 pages, and 22 pages of answers.—A. M.

1877. C. FRUSHER HOWARD.

Howard's California Calculator, and Golden Rule for Equation of Payments. The Newest, Quickest and most Complete Instructor for all who desire to be "Quick at Figures." By C. Frusher Howard, San Francisco, Cal. Entered at Stationers' Hall, London, England. 1878.

18mo, 94 pages. Copyright, 1877.—A. M.

1877. LYDIA NASH.

A Table Book and Introductory Arithmetic. By Lydia Nash. New York: Press of Francis Hart & Co. 1877.

18mo, 68 pp.—A. M.

1878. MACVICAR'S ARITHMETICS.

Malcolm MacVicar, Ph. D., LL. D., is the author of: 1. Elementary Arithmetic; 2. Teacher's Manual; 3. Practical Arithmetic; 4. Key; 5. Complete Arithmetic, Key; 6. Handbook; Drill exercises.

THE COMPLETE ARITHMETIC.

This is published in two parts. Part first takes the pupil through reduction. The problems are of two classes, those to be solved orally and those for written work. Definitions are terse; problems are numerous. Fractions are ingeniously represented by heavy lines. Part second is stronger in proportion than Part first. Both, united, form a good, practical, business arithmetic. Part first contains 223 pages and Part second 249 pages. The other works I have not seen. The author is principal of the State normal school at Potsdam, N. Y. The book was published in 1878 by Messrs. Taintor Bros., Merrill & Co., New York.

1878. THE FRANKLIN ARITHMETICS.

Edwin P. Seaver, A. M., and George A. Walton, A. M., are the joint authors of the Franklin Arithmetics, a series consisting of the following books: 1. Pri-

mary Arithmetic, 1879, 12mo, 96 pages; 2. Elementary Arithmetic, 1878, 12mo, 144 pages; 3. Mental Arithmetic, 1884, 12mo, 172 pages; 4. Written Arithmetic, 1878, 12mo, 348 pages.

#### THE PRIMARY ARITHMETIC.

This book appeals directly to the eye, and "numbers are treated as numbers of things" instead of abstractions. Analysis and synthesis, or the breaking of a number into parts, and putting these together, constitute an essential feature of the work which the pupil is required to perform. Small numbers are thus used to familiarize the pupil with processes.

#### THE ELEMENTARY ARITHMETIC.

The distinguishing feature of the Elementary Arithmetic is that it is a drill book in numbers and not a dissertation on the science. The four fundamental rules are so arranged and combined that they can be learned in much less time than when studied separately.

#### THE WRITTEN ARITHMETIC.

This is the last and the best book of the series. It is an intelligent text-book and it demands that kind of work from the pupil. All operations are referred to as few principles as possible. These are illustrated at the outset.

The imprints of the Franklin Arithmetics read variously, J. H. Butler, and Butler, White & Butler, William Ware & Co. They are now owned and published by Messrs. Taintor Bros. & Co., 18 and 20 Astor place, New York. This comes from a union of the firms Butler, White & Butler and Taintor Bros. & Co.

#### 1878. BAKER'S ARITHMETIC.

Andrew H. Baker's Complete Arithmetic was published by P. O'Shea, New York, 1878.

This is a concise book of 195 pages.

#### 1878. BARDWELL'S ARITHMETIC.

A Course in Arithmetic, by F. W. Bardwell, professor of astronomy in the University of Kansas, is a 12mo of 365 pages, published by G. P. Putnam's Sons, New York, 1878.

This is a unique treatise, and it is radically different from any other work prepared by an American author. It is intended to present within the compass of a single volume all that the average pupil needs to study. Sufficient is given to perfect him in the science. The subject-matter is arranged logically into three distinct parts, and in which the pupil gives his attention to a specific thing which is complete within itself.

Of the logical divisions, the first includes the simple operations which are explained, and exercises are given for practice. The second, in which numbers are chiefly used, in the measure of quantities of weight, surface, volume, time, and value; and in the third division, the general principles of the science are presented and applied to the solutions of problems.

Part I assumes that the learner is able to comprehend the principles of numerical operations, when they are presented to him properly. Consequently the definitions are clear and expressed in simple language. The points enforced are rapidity and accuracy in the four fundamental rules. In Part II the pupil should learn all the tables, committing them to memory, and if well drilled in the four fundamental rules he is prepared to make all reductions from one denomination to another.

The last part is arranged to develop the reasoning faculties by requiring an explanation of principles involved in the solution of each problem, and a direct analysis in terse, vigorous English.

In comparing this with other American arithmetics, it must be classified as a book of definitions, principles, and explanations of arithmetical terms and phrases. It is a valuable reference book for every teacher of arithmetic to possess. "An Essay on Methods of Arithmetical Instruction" by Professor Bardwell should accompany the arithmetic. The one throws light on the other.

#### 1878. GRUBE'S METHOD.

A little, thin volume of 44 pages on how to teach elementary arithmetic, with a large number of practical hints and illustrations, by Prof. F. Louis Soldan, principal, St. Louis Normal School, and published by Messrs. S. R. Winchell & Co., Chicago, in 1878.

The work, in brief, is an exposition of Grube's method of teaching arithmetic. A suggestive work for teachers.

## 1878. NASH'S TABLE BOOK.

Another introductory arithmetic by L. Nash, copyrighted in 1878, and published by Benziger Brothers, New York, Cincinnati, and St. Louis.

A 12mo of 90 pages. This is a very simple book.

## 1878. MILNE'S ARITHMETIC.

This series contains three books: 1. First Lessons, 1878, 12 mo, 144 pages; 2. Elementary Arithmetic, 1882, 12 mo, 205 pages; 3. Practical Arithmetic, 1878, 12 mo, 391 pages.

These books were first published by Messrs. Jones Bros. & Co., Cincinnati; but the right to publish and sell the books belongs now to Messrs. Van Antwerp, Bragg & Co., Cincinnati.

First Lessons is prepared upon the inductive and objective methods. It is an average book of the kind.

The second volume is, comparatively, a shade stronger than the first one. Between First Lessons and the Practical was a gap, which the Elementary fills. The author gives a large number of oral exercises, which will answer the purpose of a separate work on Mental Arithmetic.

In the Practical Arithmetic each subject is presented inductively, and the pupil goes over the path as an original investigator. After each induction he generalizes. The language of business, when not inconsistent with scientific accuracy, is largely employed in the text. The book is a clear but concise presentation of the fundamental principles of the science.

Professor Milne was born in 1843, and was educated in the public schools of New York State, the Brockport Collegiate Institute, Brockport, N. Y., and at the University of Rochester, Rochester, N. Y. He graduated from the University of Rochester in 1868, received the degree of Ph. D. from the University of Rochester, and the degree of LL. D. from Indiana Asbury University (now DePauw University). He taught in the public schools of New York State, the Brockport Collegiate Institute, the Rochester Collegiate Institute, the State normal school at Brockport, and the State normal school at Geneseo, of which school he has been principal since 1871.

## 1878. JOHN S. ROYER.

Problems in Mathematics prepared for the Ansonia High School. By John S. Royer, Principal of the Ansonia Public Schools. Ansonia, O.: Printed at Novelty Office. 1878.

12mo, 16 pages. Contains 23 "introductory problems," 14 "percentage" problems, 61 "junior problems," 58 "senior problems," and 50 "geometrical problems."—A. M.

## 1879. THOS. P. O'BRIEN.

Beauties in Mathematics. Comprising a choice selection of United States Weights and Measures. Most wonderful operations in Multiplication and Division. A complete revolution in Commercial Arithmetic, Rule of Three, Fractions, Interest, Discount, Partnerships, Series of Progressions and Polygonal Numbers, Permutations and Combinations. Analysis and a complete series of Choice Problems, together with a dissertation on the Gregorian Calendar—Day of the Week and Easter-time, which will be found most useful by students pursuing their studies in Mathematics, and by Business Men in general. To these are added a choice selection of Amusing Problems as applied to Games, Very Curious Squares and Properties thereof. To which are added a Small Treatise on Land Surveying and Mensuration, and a copious selection of Promiscuous Examples. By Thos. P. O'Brien, A. M. San Antonio, Texas. M. M. Mooney, Power Book and Job Printer. 1879.

8vo, 63 pp. A very full title for so thin a book. The "Small Treatise on Land Surveying" is so very small that I have not been able to find it.—A. M.

## 1879. C. E. BAKER.

The Student's and Book-Keeper's Manual. A Practical Guide in Business, containing short, simple and rapid methods of calculation in Multiplication, Division,

Interest, Bank Discount, Partial Payments, Equation of Payments, Etc., Etc., Etc. Designed for the use of Business Colleges, Commercial Students, Book-keepers, Etc.

By C. E. Baker, Professor of Book-keeping and Business Arithmetic in the Evergreen City Business College of Bloomington, Illinois. Bloomington: Democratic News Print. 1879.

A little volume, 125 pages.—A. M.

1879. J. R. SPIEGEL.

Live Questions on the English Branches. A Handbook for Superintendents, Principals, Teachers, and Students. By J. R. Spiegel, A. M., Superintendent of Public Schools of Westmoreland County, Pa. Philadelphia: Eldredge & Brother, 17 North Seventh St. 1879.

12mo, 294 pp. Pages 63-106 devoted to arithmetic.—A. M.

1879. SAMUEL M. ADAMS.

Adams' New "Shorthand" Arithmetic, being mostly a Compilation of the Shortest Known Methods of Solving Business Arithmetical Problems, to which are added some New Features by the Compiler. Outside appearances would indicate the price of this book to be high: an examination of its contents will prove it to be cheap. Book and Job Rooms of Messenger: Troy, Ala.

Small 18mo, 70 pp.—A. M.

1879. L. M. SNIFF.

Arithmetical Solutions, and Mensuration: comprising Model Solutions with Explanations. By L. M. Sniff, A. M., President Tri-State Normal College, Angola, Indiana. Cleveland, O.: J. R. Holcomb & Co., Publishers. 1890.

18mo, 82 pp. Copyright, 1879.—A. M.

1879. HENRY E. SAWYER.

Words and Numbers. A Lesson-Book for Primary Schools. By Henry E. Sawyer, A. M., Associate Principal, State Normal School, New Britain, Conn. Boston: Thompson, Brown, & Company. 1880.

18mo, 69 pp. Copyright, 1879.—A. M.

1879. FRANCISCO WIEDEMANN.

Libro Primero de Aritmética Para Niños que Trata de los Números de 1 á 10 para la Enseñanza en las Escuelas Primarias y en las Familias por Francisco Wiedemann, Director de la Cuarta Escuela Municipal de Dresde. Nueva York D. Appleton y Compañía, 549 Broadway 551. 1879.

16mo, 112 pp.—A. M.

1879. C. FRUSHER HOWARD.

Howard's Art of Computation and Golden Rule for Equation of Payments for Schools, Business Colleges and Self-Culture. A New, Concise and Comprehensive Teacher and Manual of Business Arithmetic. By the Author of the California Calculator, C. Frusher Howard, San Francisco. 1879.

16mo, 118 pp.—A. M.

1879. L. M. SNIFF.

Analytical Methods of Arithmetic, comprising Model Solutions with Explanations. By L. M. Sniff, Professor of Mathematics in N. W. O. Normal School. Ada, Ohio, Millar & Thompson, Printers. 1879.

18mo, 50 pp.—A. M.

1879. COL. FRANCIS W. PARKER.

Quincy Course in Arithmetic. By Col. Francis W. Parker, Cook Co. (Ill.) Normal School. Chicago: A. Flanagan, Publisher.

16mo, 33 pp.—A. M.

1880. SEYMOUR'S ARITHMETICS.

No teacher is better prepared to write a series of arithmetics than Hon. George E. Seymour, of the St. Louis high school. His course in arithmetic is a vigorous reaction against a half dozen or more books in a common-school course. The central thought underlying this series of arithmetics is that after the fundamental rules common fractions and analysis must be thoroughly mastered.

The series is composed of three books—Elementary Arithmetic, Practical Arithmetic, and Mental Arithmetic.

The Elementary Arithmetic is a book of 204 pages. It is a clear-cut book, definite, analytic, and intellectual. Good drill in oral and written work is afforded to the pupil. Instead of lengthy explanations suggestive hints are given whenever they are deemed necessary.

The Mental Arithmetic is different in one respect from all others hitherto published. In the main body of the book problems are grouped. For instance, "fish problems" are classed together; so "horse and saddle problems," "hound and hare problems," and so on. This I regard as an excellent feature.

Practical Arithmetic: "No attempt has been made to make this book either a complete dictionary of mathematical terms or a mere encyclopedia of useful mathematical knowledge."—Author.

In this book, as in the elementary, the operations are all reduced to the fewest principles possible.

For common and graded schools this is one of the best arithmetics published. The keen analytical skill of the author's mind is imprinted on every page of this volume. In 310 pages the foundation is laid for the mastery of the entire subject of arithmetic.

This series was published in 1880 by the American Schoolbook Company, St. Louis, Mo.

1880. GRANT'S ARITHMETIC FOR YOUNG CHILDREN.

This little book is by Horace Grant, and the American edition is edited by Willard Small and published by Messrs. Lee & Shepard, Boston. It is a handbook for teachers, and it is well adapted to the instruction of children from 4 to 7 years of age. No number greater than 20 is used by the author. All primary teachers ought to have a copy. Lee & Shepard copyrighted this edition in 1880. The directions to teachers and the exercises form a volume of 134 pages.

1880. GRADED PROBLEMS IN ARITHMETIC AND MENSURATION.

This is a companion volume to the New American Series of Arithmetics. The problems cover subjects usually found in arithmetic and the simple cases in mensuration. To interest classes and to keep them at all times fresh and active, this collection forms an excellent tonic. For reviews and examinations of classes it is well adapted. There are nearly 3,500 examples, carefully graded, in the book, which is a 12mo, 204 pages, by S. Mecutchen, A. M. Philadelphia: E. H. Butler & Co.

1880. JAY F. LANING.

Newly Discovered Methods for Arithmetical Computation (Simplified and Improved.) Based on New Principles. Short, Simple, Practical and Scientific. Every Subject of Arithmetic Treated. Old Works Superseded. New London, Ohio.

18mo, 194 pp.—A. M.

1880. C. F. R. BELLOWS.

Arithmetic its What How and Why. A Manual for the Use of Teachers. By C. F. R. Bellows, M. A., Professor of Mathematics Michigan State Normal School; Author of Analysis of Arithmetic; of Elementary Algebra its What How and Why; of a Classification of Geometrical Facts; and of a Treatise upon Trigonometry. Ypsilanti: Michigan State Normal School.

12mo, 178 pp.—A. M.

1880. COUNTY SUPERINTENDENTS' QUESTIONS.

County Superintendents' Questions, embracing Theory and Problems, carefully selected from lists now in use by The County Superintendents of Iowa, Indiana, Illinois, Wisconsin, Pennsylvania. Classified Under Proper Headings for Convenience of Reference. Chicago: T. S. Dennison.

18mo, 48 pp. Copyright, 1880. A classified collection of arithmetical questions.—A. M.

1880. Z. L. BURTON.

Burton's Business Arithmetic especially adapted to Class Teaching, Commercial Schools and Colleges. The Shortest, most Rapid and Simplest Method ever known; adapted to every kind of Business; suitable for the Beginner, yet will give the Finishing touch to the Graduate. "Time is Money." By Z. L. Burton, Professor of Mathematics. Address all orders for this Book to the Author, Sherman, Texas. 1880.

Small 18mo, 115 pp.—A. M.

1881. G. A. WENTWORTH'S ARITHMETICS.

This series of books, published by Messrs. Ginn & Co., Boston, is composed of three books: Grammar School Arithmetic, 1885, 372 pages; High School Arithmetic, 1881, 362 pages; Primary Arithmetic, Teachers' Edition, 1884, 474 pages.

The Grammar School Arithmetic is by Professor Wentworth and Rev. Thomas Hill, D. D., LL. D., ex-president of Harvard College; and the Primary Arithmetic by Professor Wentworth and E. M. Reed, principal of training school at Plymouth, N. H.

One of the chief characteristics of these arithmetics is the absence of rules. The pupil is to learn arithmetic "by doing," and to use his own judgment intelligently when he is doing. There is also a noticeable absence of formal definitions, with which many arithmetics fairly bristle. The pupil is expected to make an arithmetician of himself by working and thinking, rather than by blindly following the directions on guideposts telling him which way to go at each turn. In the selection of well-graded problems for the Common School and the Higher arithmetics the authors exercised excellent judgment. The problems present a great variety of arithmetical work, and they illustrate the principles of the science in an admirable manner.

In the Higher Arithmetic unusual prominence is given to the metric system, and in the Common School Arithmetic the chapter on mensuration forms an excellent illustration of the close connection existing between arithmetic and geometry. The vocabulary of terms supplies largely the omission of definitions in the text. These books, although on a new departure, are good books.

The Primary Arithmetic is intended to occupy the child's attention four years. The first year he works from 1 to 10, the second year to 20, and the remainder of the work for two years more. The authors introduce fractions with integers from the start. "Fractions" and "Percentage" are the best chapters in this book.

1881. GILMAN C. FISHER.

A Teachers' Manual in Arithmetic for Primary Grades. By G. C. Fisher, Superintendent of Schools, Dover, N. H. Boston: New England Publishing Co., 16 Hawley Street. 1881.

12mo, 70 pp.—A. M.

1881. J. J. MILLS AND N. CROPSEY.

Graded Exercises in Arithmetic. No. 2. Fundamental Operations. Designed for The Third and Fourth Years, Indianapolis Public Schools. By J. J. Mills, N. Cropsey, Ass't Supt's. Published by Order of the Board of School Commissioners. Indianapolis: Merrill, Hubbard & Co., Publishers, No. 5 East Washington Street. 1881.

16mo, 235 pp.—A. M.

1881. DARÍO GONZALEZ.

Aritmética Elemental para la Enseñanza en las Escuelas y Colegios de Centro-America. Por el Doctor Dario Gonzalez. Cuarta Edición corregida y notablemente aumentada. Nueva York: D. Appleton y Cia., Libreros-Editores. Guatemala: Librería y Papelería de Emilio Goubaud. 1881.

12mo, 181 pp.—A. M.

1881. SOME TEACHERS.

Practical Arithmetic, designed for Elementary Schools. Part II. Union of Mental and Written Arithmetic. By Some Teachers. Buffalo, N. Y. "Volksfreund" Print, 46 and 48 Broadway. 1882.

16mo, 107 pp.—A. M.

1882. HARPERS' GRADED ARITHMETICS.

Two books form this series, which was published in 1882 by Harper & Bros., New York.

The First Book is for the third and fourth year pupils in a graded course of instruction. The problems are both oral and written. The general plan of the book is that known as the Grube method, which is made to include the following separate processes: 1. Induction; 2. Measuring, 3. Table; 4. Comparison; 5. Combinations; 6. Applications. The numbers treated of in this book, exclusive of miscellaneous problems, according to the Grube method, are from 1 to 100, inclusive.

The book is aptly illustrated, substantially bound, and contains 140 pages.

Harpers' Second Book combines oral and written work throughout. The definitions, principles, and rules are stated in plain language. Blackboard outlines for reviews and examinations form an excellent feature of this work. The compilers of this arithmetic knew what to put in and what to omit. In 364 pages all important matters are treated.

1882. ARITHMETIC FOR DEAF MUTES.

This is a little volume of 200 pages, designed for deaf mutes, prepared by D. C. Dudley, M. A., principal of the Kentucky Institution for the Education of Deaf Mutes.

The work was published at Danville, Ky., 1882. The scope of the work embraces the fundamental rules and common fractions.

1882. STONE'S ARITHMETIC.

Dudley C. Stone, the author of this book of graded problems, was deputy superintendent of the San Francisco schools, and his opportunities for observation enabled him to prepare a manual which would guide teachers in concentrating arithmetical instruction. His effort was along the line of business arithmetic, and in which he had found pupils mostly deficient. To give the pupil the power of correct and concentrated thought and skill and accuracy in computation, the plan which suggested itself to Mr. Stone was to place before the learner such problems as occurred in business affairs.

The title of the work is: Essentials of Arithmetic, consisting of 1,000 graded problems.

The grading is "back-end first," that is, the lowest grade is seventh, when rationally it, being the lowest, is the first grade. According to the author's arrangement the number of problems in each grade is, seventh, 100; sixth, 100; fifth, 100; fourth, 100; third, 100; second, 100; first, 100; supplementary, 200; bills in United States money, cash accounts, etc., 100.

The book is a 12mo, 141 pages, published by A. L. Bancroft & Co., San Francisco. 1882.

## 1882. HUTTON'S MENSURATION.

The Manual of Mensuration, by Henry H. Hutton, M. A., principal of the High School, Waverly, N. Y., is an excellent treatise for common and high schools. The definitions are concise, the rules briefly stated, and the exercises sufficient in number.

The areas and solids of elementary geometrical figures, the conics and theiroids, as well as irregular bodies, are included in this work. A bright class can "cipher through this book" in four months. It is a mechanical drill book in which the demonstrations are not given. Published by C. W. Bardeen, New York, 1882, 168 pages.

## 1882. HOOSE'S ARITHMETIC.

The author, James H. Hoose, A. M., Ph. D., and principal of the State normal school at Cortland, N. Y., has given the essentials of Pestalozzi's system of teaching numbers in this little book. It is a helpful manual for the primary teacher. The introduction is worth the price of the book. It is a 12mo, 216 pages, published by C. W. Bardeen, Syracuse, N. Y.

## 1882. SAMUEL H. GOODYEAR.

Business Calculations. A Brief Arithmetic for the Office and School Room. Containing Principles, Explanations, Rules, and Oral and Written Practice in all Computations pertaining to Business. "*Order and method render all things easy.*" By Samuel H. Goodyear, A. M., (Principal Cedar Rapids Business College). Author of "Book-keeping and Business Practice," and "Actual Business for the School Room." Cedar Rapids, Iowa: E. J. Hubbell & Co., Publishers of Commercial Text Books and Blanks. 1882.

12mo, 222 pp.—A. M.

## 1882. G. DUVERNOY.

Arithmetical Examples in the Fundamental Rules with Abstract Numbers, for Slate Exercise. By G. Duvernoy, Professor in Houston High School. Houston: M. J. Sherwood, Publisher. 1882.

Small 18mo, 58 pp.—A. M.

## 1882. J. C. DOLAN.

Dolan's Drill Tables in Addition, Subtraction, Multiplication, and Division, adapted to Graded and Ungraded Schools. By J. C. Dolan, Principal Hancock Public Schools, Pittsburg, Pa. James M'Millin, Printer, 111 Third Avenue. 1882.

12mo, 36 pp. The second edition, enlarged, 12mo, 1884, contains 50 pp.—A. M.

## 1882. J. M. PYLE.

Arithmetic by Analysis. By J. M. Pyle, Manager of Dixon Business College and Instructor in Anatomy and Physiology in the Northern Illinois Normal School. Dixon: W. M. Kennedy, Printer. 1882.

16mo, 110 pp.—A. M.

## 1882. J. H. MILLER.

Miller's Common-Sense Arithmetic: Upon the Principle of "Cause and Effect." Published by the Author. 1882.

18mo, 64 pp.—A. M.

## 1882. SOME TEACHERS.

Thoroughly Graded Arithmetic, designed for Elementary Schools. Part I. By Some Teachers. Buffalo, N. Y. "Volkfreund" Print, 46 and 48 Broadway.

18mo, 45 pp.—A. M.

## 1883. ARITHMETICAL-ANALYSIS.

In this book the topics are outlined, and the problems are solved as models to be followed by teacher and pupils. The main object is to show how to do the work in a neat, logical, and elegant manner. While it applies more particularly to Ray's New Practical Arithmetic, it can be used almost as well with any other treatise. The Arithmetical Analyses and Outline Lessons fill 118 pages which close the text-book course, and in an Appendix of 63 pages are given model analyses and unique solutions of many interesting problems.

This is a good manual to assist the teacher in putting his knowing into convenient shape for instant use.

The work was entered for copyright by the author, W. H. F. Henry, in 1883, and it is published by J. E. Sherrill, Indianapolis.

## 1883. THOMAS TUTTLE.

Practical Application of the Slide-Rule, or Logarithmic Solution of Mechanical and Practical Questions by Inspection; with Rules for the Use of the Steel Square, and a Comprehensive Arithmetic, containing Rules and Explanations for the Solution of all Practical Questions required by the Mechanic, Farmer, or Business Man; to which is added a Scientific Method of Ascertaining the Dominical Letter for any Year, and the Day of the Week for any Date, from the Christian Era to the End of 10,000 Years; Historical Data, Etc., Etc. By Thomas Tuttle. Boston: Published by the Author. 1883.

12mo. 144 pp.—A. M.

## 1883. S. C. DANFORTH.

The Mathematical Gem, being a Treatise on all the Peculiarities in the Use of Figures, and containing New Rules and Methods designed for the Use of the Teacher and the Mathematical Student everywhere. By S. C. Danforth. Omaha, Neb.: Samuel Rees, Printer and Book Binder. 1883.

Small 18mo, 101 pp.—A. M.

## 1883. JOHN H. LEONARD.

Leonard's New and Time-Saving Method for Subtraction of Fractions, with many Corollaries on Simple Numbers deduced from the Fractional Treatise. Sacramento: H. S. Crocker & Co., Printers. 1883.

Small 18mo, 55 pp.—A. M.

## 1883. H. G. SQUIRES.

The Rapid Reckoner Manual, containing Answers to nearly 7,000 Problems in Addition, Subtraction, Multiplication & Division, also, explicit instructions for Using the Rapid Reckoner. And a Full Exposition of the Pittsburgh System of Rapid Arithmetic. By H. G. Squires, Principal Thirteenth Ward Public Schools Pittsburgh, Pa.

12mo, 84 pp.—A. M.

## 1883. JUDGE JOHN WELCH.

Mathematical Curiosities: being a series of Puzzles, Surprises, New Rules and Short Cuts, including a cheap and novel form of Interest Table, or Method of Computing Interest, by Judge John Welch, late Chief Justice Supreme Court of Ohio. Athens Messenger. 1883.

8vo, 55 pp.—A. M.

John Welch was born in Harrison County, Ohio, October 23, 1805. He was graduated at Franklin College in 1828, studied law, and was admitted to the bar in 1833. Was prosecuting attorney 1834-1839; State Senator 1846-47; in 1850 was elected to Congress, serving one term; in 1852 was

a member of the national convention that nominated Winfield Scott for the presidency: in 1856, elector on the Fremont ticket. Was judge of the court of common pleas in 1863-65, and was then raised to the supreme bench, serving thirteen years. Franklin College gave him the degree of LL. D. in 1867.—A. M.

## 1883. CHARLES L. HOWARD.

Graded Examples and Problems in Arithmetic. By Charles L. Howard. Second Edition. St. Louis: American School Book Company. 1883.

16mo, 80 pp.—A. M.

—— Charles L. Howard. A Complete Arithmetic for Common and Graded Schools. By Charles L. Howard. Knight, Loomis & Co., Boston, New York, Chicago.

12mo, 192 pages + 32 pages of Answers, and "Notes, Suggestions, and Solutions for Difficult Products." No date nor copyright.—A. M.

## 1883. M. FRENCH SWARTHOUT AND M. A. FARNHAM.

Sheldon's Graded Examples in Arithmetic. First Book. By M. French Swarthout, and M. A. Farnham. Sheldon and Company, New York and Chicago. n. d. Copyright, 1883.

12mo, 205 pp. Second Book. By the same authors. 12mo, boards, 221 pp.—A. M.

## 1883. S. A. MORROW.

Brevity, Simplicity and Utility, Applied to Business Calculations. By S. A. Morrow, of Eutaw, Ala. Published only by the Author. Price fifty cents. Address S. A. Morrow, Jackson, Tenn.

24mo, 78 pp.—A. M.

## 1883. D. M. GARRETT. (?)

How to become Quick at Figures. Comprising the Shortest, Quickest and Best Methods of Business Calculations. Thirteenth Edition. Troy, N. Y.: H. B. Nims & Company. 1886.

12mo, 190 pp. No name on title page. Copyrighted by D. M. Garrett, probably the author, 1883.—A. M.

## 1883. NATHAN NEWBY.

Outlines of Number Science. By Nathan Newby, Professor of Mathematics in the Indiana State Normal School, Terre Haute, Indiana. Terre Haute: Heleb & Goodwin Press. 1883.

16mo, 186 pp.—A. M.

## 1883. FISH'S ARITHMETICS.

A two-book series of arithmetics by Daniel W. Fish, A. M., published by Messrs. Ivison, Blakeman & Co., New York, in 1883, as follows: 1. Arithmetic Number One, Oral and Written, 176 pages. 2. Arithmetic Number Two, Oral and Written, 336 pages.

Number One is a real live book for pupils just beginning the subject. Children never need an arithmetic till they can read the problems. "Baby arithmetics" have no place in a well-conducted schoolroom. This is by far the best primary arithmetic the author has written. A fit companion volume is Number Two. For the average school these two books, with Robinson's Intellectual, form a good course. They are published by Messrs. Ivison, Blakeman & Co., New York.

## 1884. JOHN W. COOK'S ARITHMETIC.

Methods in Written Arithmetic, by John W. Cook, is a neat little volume on the How to teach, consisting of 189 pages, printed in Chicago. It was published in Chicago in 1884.

1884. W. H. SADLER AND W. R. WILL.

Sadler's Inductive Arithmetic. A Comprehensive and Practical Treatise, embracing the latest and most approved methods of performing numerical computations. Complete Edition. By W. H. Sadler, Associate Author of "Orton & Sadler's Business Calculator," "Sadler's Counting-House Arithmetic," President, Founder, and Proprietor of the Bryant, Stratton & Sadler Business College, Baltimore, and W. R. Will, Principal of the Mathematical Department of the Bryant, Stratton & Sadler Business College, Baltimore. Second Edition. Baltimore, Md.: W. H. Sadler, Publisher, Nos. 6 and 8 N. Charles St. 1885.

8vo, 721 pp. A very comprehensive work.—A. M.

1884. HENRY A. JONES.

An Aid to Numerical Calculation. Mental and Written. Containing New and Valuable Methods of Computation. Embracing a System of Abbreviated Multiplication, also a New Process and General System of Abbreviated Division. Adapted to and designed for the Use of Academies, Higher Schools, Private Schools, and the Higher Grade of Scholars in the Public Schools. Arranged by Henry A. Jones. Southington, Conn.: Jones & Savage. 1884.

16mo, 202 pp.—A. M.

1884. C. C. FIELDS.

Practical Treatise on Cancellation and How to Cancel, Elemented in Common Sense Terms that All Can Understand. Giving Clear and Explicit Instructions How to Solve any Practical Mathematical Problem by Cancellation, Together with Many Different Methods of Multiplication, Addition, Division, and Their Proofs. Designed to Instruct All in the Shortest Possible Way of Solving Problems. Bristol, Tennessee: Published by C. C. Fields.

36mo, 124 pp.—A. M.

1884. GEORGE H. WOODWARD.

1000 Test Problems in Arithmetic, arranged for Drill in High Schools, Academies, and Normal Institutes. With an Appendix of Practical Outlines, Rules and Formulas. By George H. Woodward. Indianapolis, Indiana: Normal Publishing House, J. E. Sherrill, Proprietor. 1889.

12mo, 114 pp. Copyright 1884.—A. M.

1884. J. W. FREEMAN.

Arithmetical Problems. A Choice Collection of Carefully Prepared Problems, Embracing all the Leading Operations of Arithmetic. By J. W. Freeman, Author of The Improved Geographical and Historical Cards. Chicago: A. Flanagan, Publisher.

18mo, 27 pp.—A. M.

1884. EDWARD ROTH.

A Short Arithmetic Part First: The Four Rules especially prepared for Beginners at School and for those desirous of giving Instruction at Home. By Edward Roth, A. M. Philadelphia: No. 1135 Pine Street. 1884.

12mo, 100 pp.—A. M.

1884. MISSES ELLEN W. BOYD, JOSEPHINE S. SCHOFIELD, AND AUGUSTA HAYES

St. Agnes School Arithmetic. Inscribed to the Graduates of the School. Albany, N. Y.: H. H. Bender, Publisher, 71 and 73 State Street. 1884.

18mo, 146 pp.—A. M.

## 1884. B. FRANK PINKERTON.

The Practical Mental and Written Arithmetic, uniting Oral and Slate Work, and containing over 4500 Practical Problems. By B. Frank Pinkerton, Superintendent of Schools, Holidaysburg, Pa. 1884.

12mo, 279 pp.—A. M.

## 1884. G. H. DISMUKES.

The Practical Calculator, a Teacher and Guide for Solving all Practical Questions, in a Quick, Easy and Simple Manner, containing Rules that have never been Introduced to the Public. By G. H. Dismukes. Published for the Author. Paris, Texas.

24mo, 96 pp.—A. M.

## 1884. J. NEWTON SMITH.

Handy Helps for those who Help Themselves. "Practice makes Perfect." Published by J. Newton Smith, New York.

A very small book, cloth, gilt edges, not paged. Apparently of but little account.—A. M.

## 1884. K. W. DYNIEWICZ.

Arytmetyka czyli Książka Rachunkowa. Opracował Podług Arytmetyk Amerykańskich K. W. Dyniewicz. Chicago, Illinois. Drukiem i Nakładem Władysława Dyniewicza. 1884.

18mo, 120 pp.—A. M.

## 1885. NICHOLSON'S ARITHMETIC.

There are three books in this series: 1. Primary Arithmetic, 91 pages, 1885; 2. Intermediate Arithmetic, 224 pages, 1885; 3. Complete Arithmetic, 329 pages, 1885.

Prof. J. W. Nicholson, A. M., professor of mathematics in the Louisiana State University, did good work in the preparation of these books. The subjects are well arranged, the matter admirably selected, and the illustrations apt and pointed.

F. E. Hansell & Eros., New Orleans, are the publishers.

## 1885. TOWNSEND'S ARITHMETICS.

These arithmetics are published by Scranton, Wetmore & Co., Rochester, N. Y. Three books constitute the series. Each is a book of problems. Julius L. Townsend, the author, is principal of Franklin Grammar School, Rochester. The Primary Arithmetic contains 625 problems; the Intermediate Arithmetic, 700 problems; and the Grammar School Department, 2,000 problems.

Good judgment is displayed in the selection and graduation of the problems.

## 1885. RICHARDS'S NATURAL ARITHMETIC.

This is a 12mo. of 192 pages, published in 1885 by The Interstate Publishing Company of Boston and Chicago. The author, Hon. Zalmon Richards, Washington, D. C., is a teacher of wide experience, and the Natural Arithmetic embodies his views of what should be taught in elementary schools as well as what should be omitted. The author claims that the Natural Arithmetic, "if properly used, will obviate most of these difficulties and shorten the time necessary to master it to one-half or less, at the same time secure greater efficiency."

This statement is made to depend upon the following fundamental principles: 1. The name and meaning of every unit must be kept in mind; 2. The number of units of any name that makes one of the next higher must be kept in mind; 3. Numbers or units of different kinds must be reduced to the same before they can be added or subtracted.

Numbers are again divided into four varieties, based upon the unit principle, namely: 1. Whole numbers or common units; 2. Decimal units; 3. Common fractional units; 4. Denominate units.

These four varieties of numbers can each be used in four ways—added, subtracted, multiplied, divided.

It remains now to teach the pupils to understand and to read the language of numbers, and then to use numbers in the ways indicated; but the application of numbers to the demands of life is regarded as the most difficult branch of this art.

The volume is divided into the arithmetic proper, consisting of 122 pages, and an "Appendix for the Teacher's Use" of 70 pages. The size of the volume indicates the brief treatment of topics; yet the exercises, explanations, suggestions, etc., are admirably calculated to help both teacher and pupil.

1885. THE NEW ARITHMETIC, BY 300 AUTHORS.

This is a compilation of problems by some 300 different contributors, arranged and edited by Mr. Seymour Eaton, and printed in Detroit by The Supplement Company.

The exercises are grouped into 8 departments, each of which includes about 25 pages. The problems are such as require a moderate effort for the pupil of average ability. The book can be used advantageously by the teacher where the regular text does not supply enough problems for exercise. It is simply a book of problems.

1885. HERMAN MARTIN.

Hawkeye Educational Series. Elementary Arithmetic. By Herman Martin, B. S., B. D. Miller, Girton & Waters, Des Moines, Iowa. 1885.

16mo. 179 pp.—A. M.

1885. FRANK H. HALL.

Arithmetic of the Farm and Workshop. Designed for the More Advanced Pupils in District Schools, and for Supplementary Work in City Schools. By Frank H. Hall, Principal of Sugar Grove (Ill.) School. Chicago: Geo. Sherwood & Co. 1885.

16mo. 76 pp.—A. M.

1885. H. BRODT.

Elementary Lessons in Arithmetic for Schools and Families. By H. Brodt, Professor of Pedagogy in Elmhurst College. Elmhurst, Illinois: H. Brodt. 1886.

12mo. 52 pp.—A. M.

1885. PRACTICAL TEACHER.

An Appendage; or the Complete Arithmetic, Mental and Practical; with the Tables of Weight, Measure, Money, &c. By a Practical Teacher. New York, n. d.

Pp. 170-217. Copyrighted 1855.—A. M.

1885. R. S. DAVIS.

The Arithmetical Reviewer. Five Hundred Questions, Five Hundred Problems, and Five Hundred Mental Examples, embracing all the Leading Subjects of Arithmetic; together with numerous Notes, Diagrams, and Tables of Valuable Information. In Two Editions. The Pupil's Edition, containing only the Questions and Problems. The Teacher's Edition, containing Questions, Problems, Mental Examples, Notes, Diagrams and Tables; together with the Answers to both the Written and Mental Examples. By R. S. Davis, Principal of the North Hill School, Burlington, Iowa. Copyright by R. S. Davis, 1885.

Small 18mo, not paged.—A. M.

1885. B. A. HATHAWAY.

1001 Questions and Answers on Arithmetic. Lebanon, Ohio: Published by the Author. 1887.

161 pp. Copyright 1885.—A. M.

1885. ELLEN L. BARTON.

Language Lessons in Arithmetic. Written and Oral Exercises. By Ellen L. Barton, Principal Portland School for Deaf. Boston: Published by Ginn & Co. 1885.

239+195 pp.—A. M.

1885. S. W. GOODHUE.

The Geometrical Bird Method in Mental Multiplication. The Inverted Pyramid Process in Written Multiplication. By S. W. Goodhue, Chicago: Printed by H. H. Hoffmann & Co. 1885.

18mo, 94 pp.—A. M.

1886. SHELDON'S TWO-BOOK SERIES.

This series of arithmetics consists of the Elementary and the Complete Arithmetic.

The Elementary Arithmetic takes the pupil through simple interest. The exercises judiciously combine oral and written work, while the Complete Arithmetic embraces all that is necessary in a work that is not a higher arithmetic. Together they contain 618 pages of printed matter, of which the Complete Arithmetic has 400 pages. In matter and form these two books reflect credit on the firm of Messrs. Sheldon & Co. The series was published in 1886.

1886. WELCH'S INTERMEDIATE PROBLEMS.

This manual contains more than 2,000 problems in fractions, reduction, and decimals. It is a 12mo., 96 pages, prepared by Emma A. Welch, a teacher, and is published by C. W. Bardeen, Syracuse, N. Y., 1886.

1886. GEORGE SOULÉ.

Soulé's Intermediate, Philosophic Arithmetic, embracing Oral and Written Problems involving the Great Principles of the Science of Numbers, and their Application to Practical Computations. The Philosophic System is used throughout this work. This System gives Strength, Acuteness, Expansion, and Depth to the Mind, and thus prepares it for active service in the field of practical Mathematics and upon the Highest Planes of Thought. Contractions in Numbers and Practical Work in Percentage, Interest, Mensuration of Surfaces and Solids, constitute special features of the Book. It is replete with new, practical problems, and it sparkles with the rarest gems of the Science of Numbers. The Metric System is also fully presented and clearly elucidated. By Geo. Soulé, Practical and Consulting Accountant, Commercial Lawyer, President of Soulé's Commercial College and Literary Institute, Author of Soulé's Scientific and Practical System of Book-keeping. The "Introductory Philosophic Arithmetic," "Contractions in Numbers," "The Philosophic Drill Problems," and the "Analytic and Philosophic Commercial and Exchange Calculator." New Orleans. Published by the Author. 1886.

16mo, 511+52 pp.—A. M.

1886. D. J. O'DONNELL.

O'Donnell's Perfected Science of Arithmetic, embracing New Principles, and Instant Methods of Solution. Instructions to Teachers, illustrating Methods of Developing the Powers of Reason, Judgment, Observation and Instant Perception, thus enabling the Private Student, without other Assistance, to become a Master of the Science. Rules and Formulas are Discarded. (Those "make-shifts for brains," which authors and teachers use to assist the student by taking away

the necessity of REASONING, which is the principal means of mental development, and *this* is the chief object of Higher Mathematics.) D. J. O'Donnell, Author and Publisher, East Saginaw, Michigan. 1886.

16mo, 300 pp.—A. M.

1886. SAMUEL MECUTCHEN AND GEORGE M. SAYRE.

Butler's Series. The New American Practical Arithmetic. By Samuel Mecutchen, A. M., and George M. Sayre. New Edition, Revised and Enlarged. Philadelphia: E. H. Butler & Co. 1886.

12mo, 382 pp.—A. M.

1886. B. FRANK PINKERTON.

Easy Steps to the Practical Mental and Written Arithmetic. By B. Frank Pinkerton, Superintendent of Schools, Hollidaysburg, Pa. Address, for Information, etc., B. Frank Pinkerton, Hollidaysburg, Pa. 1886.

12mo, 80 pp.—A. M.

1886. A. C. HUMMER.

Essence of Arithmetic. By A. C. Hummer. Copyrighted by the Author in 1836. 52 pp.—A. M.

1886. J. B. WELLINGTON.

Wellington's Rapid Calculator and Accountants' Assistant. By J. B. Wellington, Chicago, Ill. For the benefit of Schools, Teachers, Merchants, Clerks, Bookkeepers, and the General Public. Chicago: Brown, Pettibone & Co., Printers. 1886.

Small 18mo, 52 pp.—A. M.

1886. WILLIAM H. CADWALLADER.

The IXL Lightning Calculator, a Mathematical Compendium for Students, Farmers, Laboring Men, Mechanics, Merchants, Clerks, Bankers, Etc., by William H. Cadwallader, Ludlow Falls, Miami Co., O. Computations of Percentage and all of its Applications Made Easy. Something far superior to anything of the kind ever before offered to the Public, being a collection of brief, lucid, comprehensive and accurate methods of solving all problems relating to Percentage, its applications, Etc. Charles S. Kessler, Printer, West Milton, O. 1886. First Thousand Edition.

18mo, 55 pp.—A. M.

1886. INDIANA EDUCATIONAL SERIES.

Elementary Arithmetic. Combining Oral and Written Exercises. Indianapolis, Ind.: Indiana School Book Co.

16 mo, 192 pp. Copyright, 1886.—A. M.

—— Complete Arithmetic. Combining Oral and Written Exercises. Indianapolis, Ind.: Indiana School Book Co.

16mo, 352 pp. Copyright, 1886.—A. M.

1886. ANDREW J. RICKOFF.

Numbers Applied: a Complete Arithmetic. By Andrew J. Rickoff, A. M., LL. D. New York, Boston, and Chicago: D. Appleton and Company. 1888.

16mo, 416 pp. + 33 pp. of answers.—A. M.

Andrew Jackson Rickoff was born in Mercer Co., N. J., Aug. 23, 1824. He was educated in Woodward College, Cincinnati, Ohio, and afterwards taught, and has been superintendent of

schools in Portsmouth, Cincinnati, and Cleveland, Ohio, and Yonkers, N. Y. At the International Exposition in Philadelphia in 1876, Mr. Rickoff received a medal as the designer of the best plans for school buildings. He is the author of many schoolbooks.—A. M.

1886. HERMAN MARTIN.

Hawkeye Educational Series. Complete Arithmetic, by Herman Martin, B.S., B. D. Miller, Girtton & Watters, Des Moines, Iowa.

16mo, 315 pp.—A. M.

1886. R. K. BUEHRLE.

The Lancasterian Exercises in the Fundamental Rules of Arithmetic. Prepared by Supt. R. K. Buehrle. Philadelphia: Sower, Potts & Co., 530 Market street.

Small 18mo, 36 pp.—A. M.

1886. JAMES HOGG.

A practical Course of Instruction with Hogg's Improved Slide-Rule in Arithmetic and Mensuration; also Rules, Examples, and Tables for Making Calculations by Logarithms; also a Practical Course of Instruction in the Calculations of Machinery for the Superintendent and Overseer in the Textile Manufacture, with Rules, Calculations, and Tables. By James Hogg. Boston: Rand Avery Company. 1887.

18mo, 161 pp.—A. M.

1886. LUCINDA ISABELLA ELLIS.

The Teachers' Aid: A New and Easy Method for Teaching the Fundamental Rules of Arithmetic. By Lucinda Isabella Ellis, Superintendent of Primary Schools, Salem, N. J. Copyrighted October 22, 1886. Salem, N. J. Gwynne, Printer. 1889.

8vo, 144 pp.—A. M.

1886. ED. M. MILLS AND S. A. KAGY.

The Dollar Method in Stocks and Bonds, Exchange and Commission, including Problems in True and Bank Discount, Profit and Loss, and Interest, all Neatly Analyzed and Explained, together with Notes and Suggestions to Teachers, by Ed. M. Mills and S. A. Kagy.

18mo, 70 pp. Copyright, 1886. No date nor place of publication on title page.—A. M.

1887. OUR NEW ARITHMETIC.

First Steps in Number, by William M. Peck, A. M., is published by A. Lovell & Co., New York, 1887.

It is designed to furnish pupils work in arithmetic for four years, beginning with the First Reader. The general plan of the book is that of the Grube Method up to the number 20. No illustrations adorn the pages, but it is, nevertheless, a working book. In the time allotted to study the pupil is expected to learn well the four fundamental rules and a few simple exercises in fractions. "The Hints to Teachers" are first class. The book is well printed, and it might be used to good advantage as a supplementary reader, as well as an arithmetic. It is a 12mo, 144 pp.

1887. THE NEW PRACTICAL ARITHMETIC.

This book was written by Waite A. Shoemaker and Isabella Lawrence, of the State Normal School, St. Cloud, Minn. It is one of the State Series of text-books of that State, and it was published by D. Appleton & Co., New York, in 1887.

It is designed for use in grammar and high school grades, according to the preface. The appearance of the book is pleasing to the eye, and every one of the 412 pages<sup>1</sup> shows the finest skill of the printer's art.

<sup>1</sup> The 1890 edition contains only 404 pp.

## 1887. PAYSON'S PRACTICAL ARITHMETIC.

Mr. John P. Payson, the author of this treatise, was the former master of the Williams School, Chelsea, Mass. Lee & Shepard, publishers, Boston, Mass., 1887.

This book is strictly a "drill book," the examples being such as occur in the business world. The author believes that "pupils should be taught to think, rather than to become expert in solving difficult problems." The work is practical, direct, and energetic. Every page bears the impress of a live teacher. In 145 pages the author has presented the most useful as well as the most important topics found in arithmetic. It is an excellent elementary work.

## 1887. CALIFORNIA ARITHMETICS.

The California State Series of arithmetics consists of two books—Primary Number Lessons, and Advanced Arithmetic. The first is a 12mo, 149 pages, and the second a 12mo, 288 pages. Both were published in 1887. The author's name does not appear.

Primary Number Lessons is a beginner's book, and it conducts the learner through simpler exercises in the fundamental rules, not including long division. Till the pupil reaches page 109 he encounters no number greater than 144. From page 133 to 141 the exercises in fractions form a good section. The numerous exercises illustrating the uses of the signs on pages 126, 132, 141, 142, 143, 144, 145, 146, 147, 148 are poorly and erroneously expressed. The use of the comma (,), thus: " $5 \times 6, \div 3, \times 6 - 5 - 3 - 7 + 3 = 70 - ?$ ," destroys the sense.

*Advanced Arithmetic.*—This is a brief practical treatise, filled with problems. Problems are classified under appropriate titles, and a few explanations of problems are inserted to aid the pupil in his work. The best topics are "Abbreviations" and "Glossary," yet many of the problems are well chosen. As a series for a State the books are not up to the ordinary works on this subject.

## 1887. H. C. SYMONDS.

Abstract of the Elements of Arithmetic arranged in Tabular Form. By H. C. Symonds. (West Point.) New York: D. Van Nostrand Co.

18mo, 130 pp.—A. M.

## 1887. BROTHERS OF THE CHRISTIAN SCHOOLS.

Elements of Arithmetic, Mental and Written. New Series. By the Brothers of the Christian Schools. 46 Second Street, New York. 1887.

16mo, 198 pp.—A. M.

— Commercial Arithmetic, Mental and Written. New Series. By the Brothers of the Christian Schools. 46 Second Street, New York. 1887.

16mo, 242 pp.—A. M.

## 1887. CHARLES E. SAYWARD.

A Book of Practical Exercises in Commercial Arithmetic prepared for exclusive use in The Bryant & Stratton Commercial School of Boston. By Charles E. Sayward, Teacher of Arithmetic in the Bryant & Stratton Commercial School, Boston, Mass. H. E. Hibbard, Publisher, 608 Washington Street. 1887.

8vo, 155 pp.—A. M.

## 1887. SEYMOUR EATON.

One Hundred Lessons in Business. By Seymour Eaton, Author of "The New Arithmetic," and several other works.

8vo, 32 pp. devoted to "Short Cuts in Figures."—A. M.

## 1887. LARKIN DUNTON.

Methods of Teaching Arithmetic in Primary Schools. By Larkin Dunton, Head-Master of the Boston Normal School. Silver, Burdett & Co., Publishers, New York, Boston, Chicago. 1891.

16mo, 165 pp. Copyright, 1887.—A. M.

1887. B. H. WORD.

Word's Double-Quick Calculator. By B. H. Word. The Shortest, Simplest and Most Rapid Method Known. It contains all the Business Rules of Mathematics and in the Simplest Method Possible. Union City, Tenn.: Cartan's Steam Printing House. 1887.

18mo, 200 pp.—A. M.

1887. JESSE D. SPRAGUE.

Rapid Addition. A Paper on Practical Methods. By Jesse D. Sprague. New Edition, Rewritten. Boston: published by Ginn & Company. 1887.

Small 18mo, 39 pp.—A. M.

1887. W. V. WRIGHT.

Mechanics' Arithmetic; or, Practical Mensuration. For Schools and Colleges. By W. V. Wright, B. A. Twelfth Thousand. Boston: New England Publishing Co., 3 Somerset St.

8vo, 62 pp.—A. M.

1887. S. S. PACKARD AND BYRON HORTON.

The Packard Commercial Arithmetic. By S. S. Packard, President of Packard's Business College, New York, Author of the Bryant and Stratton Book-keeping Series, and of Packard's New Manual of Book-keeping and Correspondence, and Byron Horton, A. M., Principal of the Mathematical Department of Packard's Business College. New York: S. S. Packard, 101 East 23d Street. 1888.

12mo, 300 pp. School edition.—A. M.

Silas Sadler Packard was born in Cummington, Mass., April 28, 1826. He was educated at Granville Academy, Ohio, and afterwards taught at the age of 17 years. In 1858 he established a business college in New York City, and he has contributed much to the advancement of business education in the United States.—A. M.

1887. PATRICK MURPHY.

Division Simplified and Abbreviated; also Contractions in Multiplication and an Easy Method for Addition. To which is added a Short and Simple Rule by which any day of the Week, commencing with the year 1600 (N. S.), may be readily told for that year, or for any year or Century thereafter. By Patrick Murphy. Albany, N. Y.: Weed, Parsons and Company, Printers. 1887.

12mo, 132 pp.—A. M.

1888. D. SANDS WRIGHT'S ARITHMETIC.

The Teachers' Hand Book of Arithmetic is a "manual of helps and methods" published at Cedar Falls, Iowa. 1888.

The author states the object of arithmetical teaching: 1. To cultivate the reasoning faculties; 2. To secure accuracy; 3. To secure expertness; 4. To secure language culture. In the preparation of this volume needs of the following were kept in mind—private students, teachers, and normal institutes. The problems are used for the purpose chiefly of showing by appropriate methods of solutions how each important subject should be taught. Intense mental activity and rapid work are demanded of the learner.

The contents of the book are divided into three parts: 1. Methods; 2. Supplementary discussions; 3. Problems. Within the 104 pages comprising this little manual will be found much useful and valuable instruction to any student or teacher of arithmetic. Anyone reading it will want more of it.

1888. MISS JEANIE M. FOSTER, AND J. W. GRAHAM.

Lessons in Arithmetic, for Third Grade, prepared by Miss Jeanie M. Foster, Principal Primary Department of Public Schools, Clarksville, Tenn., and J. W. Graham, Sup't Public Schools, Clarksville, Tenn. Clarksville, Tenn.: Brandon & Barksdale, Printers. 1888.

18mo, 80 pp.—A. M.

1888. SETH T. FARNSWORTH.

Farnsworth's New System of Addition; also, Explanation of the Use of Decimals in Multiplication and Use of New System of Addition in Connection therewith. By Seth T. Farnsworth, Cincinnati, O.

12mo, 16 pp. Second edition, edited and revised by Oscar B. Todhunter, A. B. 12mo, 58 pp. Published by The Farnsworth Company, General Offices: 74 and 75 Johnston Building, Cincinnati, Ohio. 1889.—A. M.

1888. STANISŁAWA SZWAJKARTA.

Arytmetyka na podstawie dzieł Stoddard'a, Quackenbos'a, Ray'a, jakoteż polskich dzieł europejskich opracowana, i do użytku parafialnych szkół polskich w stanach zjednoczonych. Zastosowana przez Stanisława Szwajkarta. Część Pierwsza. Działania liczbami całkowitymi. Chicago, Ill. 1888. Drukarnia "Wiary i Ojczyzny" 156 W. Division Ulica, Chicago, Ill.

12mo, 106 pp.—A. M.

1888. ANNA B. BADLAM.

Aids to Number. Oral and Written Work for Primary Schools. First Series. 1 to 10. By Anna B. Badlam, Rice Training School, Boston. Author of "Suggestive Lessons in Language and Reading," "Little Folks' Alphabet of Number," "Aids to Number" (Teachers' Edition). Pupils' Edition. Boston: D. C. Heath & Co., Publishers. 1888.

Square 12mo, xxv pp.—A. M.

1888. OLE E. TROAN.

"Short Method" Arithmetic, Perpetual Calendar, and Tabulated Compilation of Facts and Figures. By Ole E. Troan. Madison, Wis. 1888.

Small 18mo, 96 pp.—A. M.

1888. L. J. WOODWARD.

Number Stories. By L. J. Woodward. Boston: Ginn & Company, Publishers. 1888.

16mo, 166 pp.—A. M.

1888. A. H. CONRAD.

Normal Methods of Arithmetic: a Complete System of Analysis upon the Inductive Method of Instruction. By A. H. Conrad, Professor of Natural Science of Arithmetic in Western Normal College, Shenandoah, Iowa. Des Moines: Miller & Waters. 1888.

12mo, 92 pp.—A. M.

1888. OLE O. APLAND.

Praktisk Regnebog for Skolebrug og Selvstudium. Af Ole O. Apland, Skolelærer. Chicago. Skandinaven's Boghandel. 1888. Danish?

12mo, 167 pp.—A. M.

1888. GRANVILLE LEE.

Lee's Lightning Calculator; Containing the Shortest Process of Mathematical Solution. By Granville Lee, B. S. Sold only by the Author. 1888. Cartan's Steam Printing House, Union City, Tenn.

24mo, 56 pp.—A. M.

1888. H. N. WHEELER.

Second Lessons in Arithmetic. An Intellectual Written Arithmetic upon The Inductive Method of Instruction as Illustrated in Warren Colburn's First Lessons. By H. N. Wheeler. Houghton, Mifflin and Company. Boston, 4 Park Street; New York, 11 East Seventeenth Street. The Riverside Press, Cambridge. 1890.

16mo, 282 pp. Copyright, 1888.—A. M.

1888. L. B. TRIPLET.

Natural Method of Number Teaching. By L. B. Triplet. Chicago: A. Flanagan, Publisher. 1889.

12mo, 143 pp. Copyright, 1888.—A. M.

1889. JULIA McNAIR WRIGHT.

A Temperance Arithmetic for Schools and Families. By Julia McNair Wright. New York: The National Temperance Society and Publication House, No. 58 Reade Street. 1889.

18mo, 32 pp. "Apart from all other methods of its discussion, temperance has an arithmetical side. \* \* \* The object of this Temperance Arithmetic is to bring the economic statement of the question forcibly and simply down to the comprehension of the children in our homes and schools, stamping on the plastic mind of youth figures which will not lie, and shall ineffaceably impress the relative dollars and cents value of sobriety and inebriety."—*Preface.*

A few of the examples are subjoined:

Page 7, example 1: "A woman spent 5 cents in the morning for a glass of beer and 10 cents at night for a jug of lager. What did she spend for both?"

"2. This woman said she was starving for food. She could have got a loaf for 5 cents and a pound of meat for 10. How much would they have cost?"

"Then she could have had food for a day for the price of her drink."

Page 8, example 13: "Pat gave 5 cents for 2 cigars, 1 cent for matches, 12 cents for lager beer; 3 cents he lost playing pitch penny; 15 cents he gave for a lottery ticket, worth nothing at all. What did Pat spend in all?"

"14. This same Pat had no cap, and his toes stuck out of a hole in his shoe. 'Pat,' said a lady, 'why do you not buy a new cap and have your shoes mended?' Pat said: 'It would cost 25 cents to get a cap and 11 cents to have my shoe mended.' What would that be? Had not Pat wasted as much money as that?"—A. M.

Julia McNair Wright was born in Oswego, N. Y., May 1, 1840. She was the daughter of John McNair, a well-known civil engineer, whose father emigrated from Scotland in 1798. She was educated at private schools and academies, married Dr. William James Wright, the mathematician, in 1859, and has devoted her life mainly to literary work. Her books are mostly religious stories, anti-Catholic, and temperance.—A. M.

1889. J. L. PATTERSON.

Arithmetical Reviews. By J. L. Patterson, Mathematical Master in the Lawrenceville School. Boston, U. S. A.: Published by Ginn & Company. 1889.

16mo, 26 pp.—A. M.

1889. CHARLES A. HOBBS.

An Arithmetic for Preparatory Schools, High Schools, and Academies. By Charles A. Hobbs, A. M., Master of Mathematics in the Belmont School, Belmont, Mass. New York: A. Lovell & Co. 1890.

12mo, 343 pp. Copyright 1889.—A. M.

1889. HELEN F. PAGE.

Fractions. Color Diagrams for use in connection with the Teachers' Manual of Objective and Oral Work. By Helen F. Page, State Normal and Training School, New Britain, Conn. Boston, U. S. A.: Published by Ginn & Company. 1889.

12mo, not paged.—A. M.

1889. J. W. GRAHAM.

Second Grade Lessons in Arithmetic. By J. W. Graham, Superintendent Public Schools, Clarksville, Tenn. Printed for the Author. Brandon & Barksdale, Book and Job Printers, Clarksville, Tenn. 1889.

12mo, 64 pp.—A. M.

1889. R. S. GALER.

Practical Methods in Arithmetic. By R. S. Galer, A. M., Principal of the Iowa City Academy, Iowa City, Iowa. Second Edition, Revised. Chicago: A. Flanagan. 1892.

12mo, 117 pp. Copyright 1889.—A. M.

1889. R. S. ANDERSON.

Anderson's Philosophical Arithmetic. Book Three. By R. S. Anderson, of Anderson's Normal School, San Francisco. The Hicks-Judd Co., Printers and Bookbinders, San Francisco.

8 vo., 111 pp.—A. M.

1889. A. JONES.

Model Solutions in Arithmetic, embracing a Full Solution of the Written Problems in The Complete Arithmetic of the Indiana Series. By A. Jones, Supt. Danville Public Schools. Indianapolis, Indiana: The Normal Publishing House, J. E. Sherrill, Proprietor. 1889.

12mo, 302 pp.—A. M.

1889. GEORGE JACKSON.

Essentials of the Metric System, with full explanations of its Theoretical Principles, and Numerous Examples for Practice. Comprising an Introduction on Decimal Arithmetic; Tables for the Interconversion of Price, Cost, and Quantity between Metric and Common Measures; and a list of Useful Constants with their Logarithms. A Hand Book for Technical Schools, and for Self-Instruction. By George Jackson, A. M. Boston: De Wolfe, Fiske & Co., 361 and 365 Washington St.

Small 18mo, 106 pp.—A. M.

1889. WILL P. HART.

Outlines of Arithmetic. For the Use of Teachers and Students. By Will P. Hart, M. S., Editor of "The Teacher and Examiner," and Author of "American Poets," "English Poets," "Normal Methods of Teaching Arithmetic," "Memory Gems of Poetry and Prose," "The Practical Examiner and Teacher's Manual," "Outlines of Grammar," "Outlines of Physiology," "Outlines of History," "Outlines of Geography," "Notes and Queries," Etc., Etc. Indianapolis, Ind.: The Normal Publishing House, J. E. Sherrill, Proprietor. 1889.

Small 18mo, 93 pp.—A. M.

1889. FRANK H. HALL.

The Arithmetic Reader, for Second Grade Pupils. By Frank H. Hall, Author of "Hall's Helps in the Study of History, or the Backbone of Universal History," "Hall's Arithmetic of the Farm and Workshop." Geo. Sherwood & Co., 307 and 309 Wabash Avenue, Chicago. 1889.

16mo, 96 pp.—A. M.

1890. LEVI SEELEY.

Elements of the Grubé Method. Containing the latest improvements made by Grubé's followers in Germany. Revised, Explained, and illustrated for the Use of the Primary Teachers of America. By Levi Seeley, M. A., Ph. D. (Leipzig), Author of Grubé's Arithmetic. New York and Chicago: E. L. Kellogg & Co.

16mo, 64 pp.—A. M.

## 1890. JAMES M. GREENWOOD.

A Complete Manual on Teaching Arithmetic, Algebra, and Geometry, including a Brief History of these Branches. By J. M. Greenwood, A. M., Superintendent of Schools, Kansas City, Mo. New York: Effingham, Maynard & Co., Publishers, 771 Broadway and 67 & 69 Ninth Street.

12mo, 277 pp. Pages 9-100 are devoted to Arithmetic, pp. 9-21 being occupied with a history of the subject.—A. M.

James M. Greenwood was born November 15, 1836, near Springfield, Ill. He obtained his early education in the common schools. When he was 16 years old he removed with his parents to Adair County, Mo., where he worked on a farm, studied by himself, and began to teach, also spending a year in Canton Seminary. He was professor of mathematics in the normal school at Kirksville, Mo., 1867-1874, and in the latter year he became superintendent of schools in Kansas City, Mo., which position he still holds (1892).—A. M.

## 1890. FRANCIS COGSWELL.

Lessons in Number. By Francis Cogswell, A. M., Superintendent of Schools, Cambridge, Mass. Boston: Thompson, Brown, and Company, 23 Hawley Street.

12mo, 140 pp.—A. M.

## 1890. J. MILAM WREN.

Wren's Lightning Calculator, a Concise, Simple, and Rapid Method of Manipulating Figures. By J. Milam Wren, Lampasas, Texas. "It is Better to Know Everything About Something, than Something About Everything." Price, One Dollar. 1890.

18mo, 61 pp.—A. M.

## 1890. I. L. UNTERBRINK AND S. H. SIBERT.

Manual of the Assistant and Progressive Arithmetical Charts, with Suggestions for Successfully Managing the Common School. By the Inventors, I. L. Unterbrink and Dr. S. H. Sibert. The Teacher and Pupil's Aid Co., Wapakoneta, Ohio. 1890.

12mo, 70 pp.—A. M.

## 1890. C. C. COCHRAN.

Rapid Addition Drills and Short Cuts to other Commercial Calculations. By C. C. Cochran. C. C. Cochran, Publisher, Chicago, Illinois.

8vo, 51 pp.—A. M.

## 1890. S. M. HORTON.

The Texas Arithmetic, or Arithmetic Made Easy. A Thorough, Practical Work, Designed for the use of Public and Private Schools, Business Men, Farmers, Mechanics, Masons, Laborers, Etc. By S. M. Horton, Wheelock, Texas. S. A. Horton, Proprietor. Austin: Eugene Von Boeckmann. 1890.

18mo, 350 pp.—A. M.

## 1890. L. B. MCKENNA AND D. L. MUSSELMAN.

Revised Edition of a Practical Business Arithmetic designed for Use in Business Colleges and all Schools where Commercial Branches are Taught, and as a Book of Reference for Business Men and Private Learners. By L. B. McKenna, M. A., and B. L. Musselman, M. A. Quincy, Illinois. 1890.

8vo, 479 pp.—A. M.

## 1890. O. M. POWERS.

The New Business Arithmetic, a Treatise on Commercial Calculations. By O. M. Powers. Chicago. 1890.

8vo, 171 pp.—A. M.

1890. MERRITT L. DAWKINS.

The Science of Numbers and their Practical Application. For Teachers and Private Learners. By Merritt L. Dawkins. Downing, Mo. Peerless Publishing Co. 1890.

16mo, 112 pp.—A. M.

1890. R. C. INGALLS.

Factor and Product, the Essential Terms of Arithmetic. By R. C. Ingalls, Thomasville, Georgia. Richmond, Va.: Everett Waddey, Publisher and Printer. 1890.

16mo, 108 pp.—A. M.

1890. L. S. ROWELL.

Reasons Why and What to Say in Explaining Arithmetic. By L. S. Rowell. Second Edition. Chicago: A. Flanagan, Publisher.

16mo, 210 pages.—A. M.

1890. CHAUNCEY H. BICKFORD.

The Least Common Multiple and Greatest Common Divisor. Two Difficult Subjects in Arithmetic fully explained and demonstrated. By Chauncey H. Bickford, A. B., formerly Teacher of Mathematics in the State Normal School at Indiana, Pa. Chicago: The Blakely Printing Company. 1890.

12mo, 27 pages.—A. M.

1891. CHARLOTTE ANGAS SCOTT AND J. B. LOCK.

Arithmetic for Schools. By the Rev. J. B. Lock, M. A., Fellow of Caius College, Cambridge, England. American Edition, Edited and Arranged by Charlotte Angas Scott, D. Sc. (London), Bryn Mawr College, Pennsylvania. Macmillan and Co., New York and London. 1891.

16mo, 338 pages.—A. M.

1891. A. G. GUERÍN.

Arithmética Elemental para el Uso de las Escuelas. Por A. G. Guerin. San Francisco de California: The History Company Libreros Editores. 1891.

16mo, 152 pp.—A. M.

1891. HENRY GOLDMAN.

New Method for Averaging Accounts. 100 Days Average Method. Simple Average, Equation of Payments, Accounts Current, Overdrafts and Balances. By Henry Goldman, Author of "The Arithmetical Detector," "Advanced System for Locating Errors without Rechecking or Copying Entries," "The Expert Calculator," "Improved Time Calculator," "Combination Discount Calculator," "Goldman's Instantaneous Combination Index," Etc., Etc. Chicago: The Office Men's Record Co. 1891.

18mo, 24 pp.—A. M.

1891. LIZZIE STANLEY MARTYN.

The Multiplication Chant and Gesture Drill. A New and Attractive Arrangement of the Multiplication Tables for Primary and Kindergarten Work. By Lizzie Stanley Martyn, Author of "Arithmetical Rules in Rhyme." Copyrighted by Lizzie Stanley Martyn, 92 Hodge Ave., Buffalo, N. Y. All Rights Reserved.

8vo, 47 pp.—A. M.

1891. JAMES BALDWIN.

The Industrial Primary Arithmetic. By James Baldwin, Ph. D. Boston U. S. A.: Published by Ginn & Company. 1891.

12mo, 204 pp.—A. M.

1891. N. CROPSEY.

Graded Exercises in Arithmetic. Fundamental Operations. Designed for Primary Schools, Third and Fourth Years. Adapted to be used Supplementary to any Series of Arithmetics. By N. Cropsey, Superintendent Primary Instruction, Indianapolis Public Schools. Indianapolis: Bowen-Merrill Co., Publishers. 1891.

16mo, 131-71 pp.—A. M.

1891. E. E. VOYLE.

Voyle's New Process, the Latest, Quickest, Easiest and Shortest Method of Computing Interest and Discount. By E. E. Voyle. 1891. New York: Press of J. J. Little & Co.

8vo, 19 pp.—A. M.

1891. THOMAS R. VICKROY.

Complete Course in Arithmetic, Written and Mental, for Higher Grades. By Thos. R. Vickroy, A. M., Ph. D., a Principal in the St. Louis Public Schools. St. Louis: Published by the author and for sale by all booksellers. 1891.

16mo, 368 pp.—A. M.

— Elements of Arithmetic, Oral and Written, for Lower and Middle Grades. By Thos. R. Vickroy, A. M., Ph. D., a Principal in the St. Louis Public Schools. St. Louis, Mo.: Published by the Author and for sale by all Booksellers. 1891.

16mo, 126 pp.—A. M.

1892. J. W. GRAHAM.

Lessons in Arithmetic for Fourth and Fifth Grades. By J. W. Graham, Author of "Third Grade Lessons in Arithmetic," "Second Grade Lessons in Arithmetic," "Jessie Number Card," and "The Pearl Speaker." Printed for the Author. Publishing House of the Methodist Episcopal Church, South. Barber & Smith, Agents, Nashville, Tenn. 1892.

12mo, 184 pp.—A. M.

1892. J. K. ELLWOOD.

Table Book and Test Problems in Mathematics. By J. K. Ellwood, A. M., Principal of the Colfax School, Pittsburg, Penn. New York, Cincinnati, Chicago: American Book Company.

16mo. Pages 111-129 are devoted to arithmetical problems, the solutions of which are given on pp. 155-185.—A. M.

1892. FRANK A. HOILES.

The Teachers' Pocket Arithmetic, a Supplementary Work for the use of both Teachers and Pupils, and designed as a Complete Manual of Arithmetic. By Frank A. Hoiles. Revised Edition. Alliance, Ohio: Published by the Author. 1892.

Small 18mo, 200 pp.—A. M.

1892. CHARLES E. WHITE.

Number Lessons. A Book for Second and Third Year Pupils. By Charles E. White, Principal Franklin School, Syracuse, N. Y. Boston, U. S. A.: D. C. Heath & Co., Publishers. 1892.

16mo, 201 pp.—A. M.

1892. FREEMAN H. ALLEN.

Manual of Arithmetic Methods. Freeman H. Allen, State Normal and Training School, Potsdam, N. Y. Potsdam: Courier and Freeman Print. 1892.

8vo, 80 pages.—A. M.

## ALPHABETICAL AUTHOR AND EDITOR INDEX TO PARTS I AND II.

NOTE.—I and II before the page numbers indicate Parts I and II, respectively. Part I appeared in the Report of 1897-98, and the pages refer to that Report.

	Page.		Page.
Abbott, Charles E. (A. M.)	I, 849	Davis, E.	I, 824

## CHAPTER XVI.

### PUBLIC EDUCATION IN ITALY AND ITS REFORM. (1895-1899.)

BY PROF. ALEXANDER OLDRINI.

Scholæ, ut recte procedant, praeceptoribus optimis opus est—et sana doctrina imbutis. Igitur, caveant consules, ne quid Respublica detrimenti capiat.

---

### INTRODUCTION.

Eppur si muove!

The development of public education among the masses is not only the loftiest attainment of progress, in the perception of the intellectual of every civilized nation, as a means to surely raise their people to destinies marked with superiority and glory; but it is also a problem the masses themselves nowadays begin to appreciate as the most powerful and objective means by which to foster their social and material redemption.

So that, at the end of the wonderful century that heralded to humanity at large the conception that frontiers can no more exist between nations under the enlightenment and subsequent growing applications of science, education ceases to be the patrimony of the few, a literary tournament for the mind, but affirms itself as an accomplishment of the first order for one and all in the competition for the betterment of life, and for the mastery of nature's eternal, creative forces.

Italy, the atavistical "alma mater gentium," could not, on the threshold of her third resurrection (1859) as a worldly power, fail to be strongly and immediately impressed with the truth that pervades the modern world, and her first national parliament, led by such famed men as Count Cavour, the staunch supporter of the principle of the supremacy of the civil power for Italy, "a free church in a free state," promptly decreed the necessity of compulsory instruction. Then, so soon as the Peninsula, through the holocaust of 45,000 lives, lost all along the Via Crucis of her martyrdom, and the (for her) ruinous expense of \$300,000,000, could proclaim her independence from foreign rule, the first national census was ordered (1861). Although an initial measure, difficult therefore and incomplete in its methods and results, that very first census brought to light the manifold moral and material evils of which the once glorious land had become a helpless victim.

In certain districts of central and southern Italy it was then found that illiteracy had reached the average of two-thirds of the entire population, Reggio di Calabria and Catania furnishing the amazing proportion of 93 per cent of illiterates.

Marquis Massimo d'Azeglio, one of modern Italy's most brilliant

statesmen, artist and scholar, summed up the abnormal situation thus revealed by the figures of the first Italian census of public instruction and other vital matters in these memorable words: "Italy is made: we must now make the Italians."

Following his call, amid the proverbial indifference of the Italian wealthy class, and almost without means, an élite of thinkers, legislators, and enlightened progressive citizens put themselves at once to the ungrateful task of stamping out ignorance, indolence, and superstition, against the will of the seemingly degenerated Italian masses. Public men they were and humble pioneers of human progress, working together as a sacred phalanx to raise their historical country to the apprehension of modern civilization.

That some results, although not thoroughly satisfactory, were obtained within the comparatively short period of forty years, is thus due practically to their action, of which the law Casati, enforcing public primary education (1859), was the first move in the right direction. Afterwards followed the law of 1877, that expelled sectarianism from national education, permitting the adoption by the communes of Italy of new programmes for primary schools more in touch with modern aspirations and the real wants of the Italian people.

Under the law of 1877 compulsory education was enforced by requiring the appointment of teachers for children between 6 and 9 years of age as follows: First, in all communes of less than 5,000 inhabitants, one teacher of inferior class for each 1,000 inhabitants; second, in the communes having between 5,000 and 20,000 inhabitants, one teacher for every 1,200 inhabitants; third, in the communes having over 20,000 inhabitants, one teacher for every 1,500 inhabitants. At the end of 1896 all of the 8,260 communes of Italy had complied with the requirements of this law.

The nature of this sketch is such that the writer must refrain from quoting the names and the works of all the worthiest pioneers of educational reform in modern Italy. However, with a view to offering all the necessary information with regard to the fundamental difficulties that still stand in the way of its systematic development, he will offer, besides the regular statistical figures by Prof. L. Bodio, the illustrious chief of the Italian department of statistics, a survey of the most recent official documents, such as laws and reports on public education, etc., and consider with special care the reports for 1897 and 1898 of Prof. Francesco Torraca and Prof. Giuseppe Castelli, both superior officers in the department of public instruction, addressed to the present minister, Dr. Guido Baccelli, "pensatore e scienziato insigne," the originator and the energetic center of the recent movement, that marks a turning point in the reform of the whole system of education, on the following lines of his programme: "Absolute autonomy in Italy in superior and special education; decentralization and specialization of secondary instruction; and public primary and normal schools under the permanent and immediate control of the State."<sup>1</sup>

<sup>1</sup>For the full comprehension of the origin of the educational system in Italy, since the Casati law, the reader is respectfully referred to the information so intelligently collected for a number of years by Miss Frances Graham French, the zealous specialist in the school systems of northern and eastern Europe; and, furthermore, to the three sketches successively prepared by Prof. Oldrini and Prof. Bodio, for 1890-91; Prof. B. A. Hinsdale, 1893-94; and Dr. E. Rossi, 1894-95; and published in the Reports of the United States Commissioner of Education for the years specified.

## I. STATISTICS.

ITALY: Area, 114,410 square miles. Administrative divisions, 69 provinces, 8,260 communes or boroughs. Population, 31,500,000 (January, 1899). Italians abroad estimated at 4,000,000, of whom about 1,500,000 are in the United States.

*Number of pupils in kindergartens and primary and normal schools in 1895-96.*

	Pupils.	Per 100,000 inhabitants.	
		Pupils.	Schools.
Kindergartens.....	317,117	1,020	9
Public and primary schools.....	2,379,349	7,650	147
Private schools.....	210,074	675	29
Evening schools.....	101,025	325	9
Sunday schools.....	50,344	162	6
Superior female complementary schools.....	7,319	24	0.69
Normal schools.....	24,152	78	0.48
	3,089,380	9,934	-----

This number of pupils is about 10 per cent of the total population of Italy, besides 28,455 pupils in Italian schools abroad.

## KINDERGARTENS.

Kindergartens have been instituted by the communes into which Italy is divided for purposes of administration, also by corporations, private societies, and citizens.

There are 2,813 kindergartens in 1,888 communes, frequented by 317,117 children, of whom 160,185 are males and 156,632 females; or one kindergarten to each 708 children between 3 and 6 years of age, and 15.9 per cent of the children between those age limits attending kindergartens.

*Comparison for the last decade (1886-1896).*

	1886.	1896.	Increase.
Kindergartens.....	1,489	2,813	1,324
Pupils.....	252,763	317,117	64,354
Teachers.....	5,603	6,884	1,281

In 992 kindergartens all the children were admitted free; in 1,208 only the children of the poor were admitted free; in 613 all children paid (of which 418 kindergartens were private and 195 public).

Four hundred and seventy-eight kindergartens had adopted the method of Froebel, 135 that of Aporti, and 2,200 both methods.

The expenditure for the year 1896 for all kindergartens appears to have been \$1,332,000, this amount having been supplied by the state, the provinces, and the communes, as well as by donations, bequests, contributions, etc. Recently the kindergarten institution has been brought under the control of the scholastic authorities, under the initiative of Minister Baccelli.

## COMPULSORY PRIMARY INSTRUCTION.

*Teachers.*—The number of public-school teachers in 1896 was 51,505, or 1.65 to every 1,000 inhabitants—that is, 1.47 for primary courses and 0.18 for normal and superior female courses complementary of the former.

*Public day schools.*—There were 50,526 opened in 8,247 communes; that is, 40,705 obligatory of the inferior degree and 4,798 of the superior, besides 5,023 not obligatory, of which 4,046 were of the inferior and 977 of the superior degree.

*School buildings.*—For the inferior degree there were 44,751 buildings, with 44,431 teachers and 1,341 assistant teachers; for the superior degree, 5,775 buildings, located in 1,831 communes, provided with 5,447 teachers and 286 assistants.

*Pupils.*—The total number of pupils that attended public day schools of the inferior grade in 1896 was 2,212,325, of whom 139,577 were in private schools duly recognized by the Government.

The primary inferior degree, divided into three courses, had 1,123,929 pupils for the first elementary year, 655,830 for the second, and 432,566 for the third.

The number of pupils attending the primary superior course, a complementary course of the inferior, was 167,024, of whom 106,171 attended the fourth year's course and 60,853 the fifth and last; in all, 167,024, of whom 21,560 belonged to private schools recognized by the Government as equal to the public ones.

So that the grand total for the five classes constituting the inferior and superior complementary courses in primary public day instruction was, including both public and private schools, in 1896, 2,212,325 plus 167,024—that is, 2,379,349, or 8.33 for every 100 inhabitants in 1896—whereas in 1872 the attendance was 6.43 per cent of children between 6 and 12 years of age. The full 100 per cent in attendance, under the obligation of the law relating to public elementary schools, was possible only in the northern provinces of Piedmont and Lombardy.

The number of public school buildings regularly opened in 1896 averaged 1.62 for each 1,000 inhabitants.

The pupils registered in each of them averaged 49 for the inferior three courses and 29 for the superior two courses.

The number of private day classes in schools where there was no regular division between the inferior and the superior degree, as is the case in Government schools, reached 4,210; these were located in 9,000 buildings, with 9,565 teachers having a diploma and 1,088 without one. They were attended by 210,070 pupils (69,424 males, 140,650 females), divided as follows: 165,011 in the inferior three courses (51,114 males, 113,897 females) and 45,064 (18,310 males and 26,753 females) in the superior.

The proportion of private school buildings to the population was 0.29 per 1,000 inhabitants, the pupils attending them 6.73 per 1,000 inhabitants, or 23 pupils to each building and 1 teacher to every 22 pupils.

There was, therefore, a total, both in public and private primary schools, of 59,526 buildings, 62,077 teachers, and 2,589,423 pupils, of whom 2,377,336 were in the three inferior and 212,087 in the two superior grades, or 19 buildings per 10,000 inhabitants on an average and 83.26 pupils per 1,000 inhabitants, this latter proportion being identical with the 8.33 per cent of the total population of Italy before

mentioned. Evening, Sunday, female complementary, and normal pupils are not included in these figures.

*Enrollment.*—The children subject by law to attend primary schools in 1896 numbered 2,353,165. There were actually found to be enrolled the following number:

Inferior degree:			
Under 7 years of age .....	72,225		
From 6 to 9 years of age .....	1,558,977		
Over 9 years of age .....	726,968		
Not classified .....	19,166		
			2,377,336
Superior degree:			
Under 10 years of age .....	31,391		
From 10 to 12 years .....	117,427		
Over 12 years of age .....	62,442		
Not classified .....	827		
			212,087
Grand total .....			2,589,423

The excess of the actual inscriptions (2,589,423) over the obligatory (2,353,165) or 236,258, is to be attributed to the eventual admission to school of children under 6 and children over 12 years of age.

*Graduation.*—The pupils of the three inferior classes of primary instruction, whether they come from public or private schools, obtain at the end of the third scholastic year after the examination a diploma that admits them to the two next superior classes. Those having graduated from the superior courses are admitted to the normal school or to the first class of secondary instruction, either classic education (ginnasio) or technical and commercial courses. A royal decree (April 26, 1896) prescribed that all pupils having received during the year a monthly average of seven-tenths points should not be required to undergo examination at the end of the scholastic year. This provision seemed not to have proved practicable, however, in every case, since a subsequent decree (1898) reestablished the obligation of the examination for the pupils of the first, second, and fourth elementary classes.

*Results of the examinations for the year 1895-96.*

	Male.	Female.	Percentage of Graduation.	
			Male.	Female.
Three inferior courses:				
Examined .....	154,526	121,063		
Graduated .....	107,113	88,928	69.32	73.46
Two superior courses:				
Examined .....	16,203	8,359		
Graduated .....	11,556	6,478	71.32	77.63

*Night and Sunday schools.*—With a view to complete the instruction of children that have discontinued their studies after graduation from the third year of compulsory instruction the law of 1877 compelled them to attend night or Sunday schools for one year longer. However, the law has not made it compulsory upon the communes to keep night and Sunday schools, so that this kind of public instruction can not give good results, lacking, as it does, proper direction and control. Adults are admitted in them from the fact that they

are public and free of charge and supported by the State and (voluntarily) by the commune when not by private contributions.

In 1896 night and Sunday schools were regularly opened in 1,969 communes only; that is, night schools in 1,059 communes and Sunday schools in 498, and night and Sunday mixed in 412. There were none open in 6,291 communes. The school buildings occupied numbered 4,687, 2,808 for night and 1,879 for Sunday schools. The attendance amounted to 151,369 pupils, 101,025 taking night and 50,344 Sunday courses (110,468 male and 40,901 female).

*Superior and complementary female schools.*—The programmes for these schools are such as to correspond to preparatory courses for admission to normal schools. They include drawing, foreign languages, bookkeeping, and other branches pertaining to both arts and professions.

In some of these schools, especially if annexed to conservatories of music or private colleges, the pupil being prepared at once for the diploma of teacher, all the subjects are taken up according to the programme of normal schools, with the addition of pedagogy, morals, hygiene, and rights and duties of a citizen.

The superior elementary female schools, however, have been instituted with the main object of securing to girls, the majority of whom do not pursue special or higher instruction, a degree of instruction superior to the one imparted in the two elementary courses, with a view to enable them to enter at once upon practical bookkeeping, correspondence, etc., whether in a store or with a commercial firm, or to prepare them to make a living in other practical industrial fields, such as artificial flowers, gloves, hats, dresses etc., where young women are mostly desired.

In 1895-96 there were 142 schools complementary to the elementary courses, and 72 schools so complementary and also preparatory to the examinations for the diploma of admission to normal schools. These schools had in all 1,765 teachers and 7,319 girls. The majority of them were private, that is, there were 137 private to 77 public. Of the public schools, 45 were supported by bequests and public donations, 24 by the funds of the commune, and 8 directly by the Government.

*Normal schools.*—In 1895-96 there were 148 normal schools, of which 138 were for superior instruction (32 for males and 106 for females) and 10 for inferior instruction. The new law, promulgated in 1896, reduced them to a uniform basis, with three courses, at the end of which the pupil receives a diploma of teacher for the two degrees of primary or elementary instruction.

The majority of the normal schools, 117 out of 148 (34 for males and 83 for females) are now under the control of the Government; the remaining 31, not following the official programme, are free, and are divided into 2 schools for males and 29 for females, with a total of 2,253 pupils.

The total number of pupils in Italy's normal schools in 1895-96 was 24,152 (1,836 males and 22,316 females), averaging 163 pupils to each school, of whom 161 were females and 2 only males. Of the total population, 4.76 per million were normal pupils.

The disproportion between the attendance at normal schools of young men and young women really indicates the increasing tendency of the latter to control the teaching in the field of primary education throughout the country, while the male element, as will be explained later on, pursues almost exclusively its way toward secondary, special,

and superior instruction. It is gratifying to be able to state at this juncture that the standard of efficiency of female teachers for primary instruction is considered by competent authorities such as to insure continued progress in the efficiency of the elementary schools themselves, considered as a whole.

The attendance of the two sexes at normal schools will be better appreciated by comparison with the statistical figures of the last decade.

	1885-86.	1896.
Normal schools .....	133	148
Male pupils .....	1,267	1,896
Female pupils .....	9,255	22,316
Percentage of males .....	12	8
Percentage of females .....	88	92

In 1895-96 the examinations in normal schools for teachers' certificates were attended by 7,681 pupils, of whom 5,183 were admitted; 52 per cent being males and 48 per cent females.

*Italian schools abroad.*—It may be interesting to learn of the efforts made by the Italians, under the intellectual initiative of the National Literary Society Dante Alighieri, for the preservation of the national language in foreign countries.

In Turkey, Asia Minor, Egypt, Greece, Tunis, and Tripoli elementary instruction is given in 33 schools for males, and 22 for females, attended by 4,945 boys and 3,145 girls—or, for 55 schools for primary instruction, 11,087 pupils, besides 11 kindergartens with 1,786 children.

There are, moreover, Italian schools in a number of European States, as well as in South America and in the United States, with an attendance of 11,215 pupils of both sexes, and a number of parochial schools having about 6,053 pupils.

These figures, published by the Italian department of foreign affairs, have been prepared by the consular authorities in the above-mentioned countries, and are for the year 1898.

#### EXPENDITURE FOR PRIMARY AND NORMAL PUBLIC INSTRUCTION.

The communes of Italy are compelled by law to support, out of their income, a number of public elementary schools proportional to the population; to pay all salaries to teachers, clerks, and school employees; to contribute to their pension funds, and to provide for all rentals and furniture, including gymnastic apparatus.

The minimum yearly salary for teachers paid by them is determined by law as follows:

Teachers of the superior degree:	
Cities, males .....	\$200 to \$264
Cities, females .....	160 to 211
Country, males .....	160 to 180
Country, females .....	130 to 144
Teachers of the inferior degree:	
Cities, males .....	180 to 200
Cities, females .....	144 to 160
Country, males .....	140 to 150
Country, females .....	112 to 130

These salaries are increased by one-tenth every six years of uninterrupted service, and four times in a period of twenty-four years of service.

The communes, however, without obligation under the law, pay also for kindergartens, evening and Sunday schools, and a number of primary schools beyond the obligatory ones, as well as for special normal schools and colleges thereto annexed, for which they furnish the buildings and the furniture and eventually grant a certain amount of purses for poor pupils.

The total expenditure of the communes for 1895-96 was about \$12,150,000 of which almost a third was for salaries paid to teachers. Of that amount \$880,000 constituted a voluntary contribution by the communes for the aforesaid purposes, thus affording an average of \$1.05 for each pupil attending day (primary and normal) schools, and \$1.01 for those attending night or Sunday schools or kindergartens. Considering the total population of Italy, this expenditure amounted to 39 cents per inhabitant.

The 69 provinces contributed to the same end the amount of \$150,000 only.

The State contribution for primary and normal education for the year 1896-97 was about \$1,200,000, covering particularly the expenses of the two special superior normal institutes for females of Rome and Florence, and of a number of female colleges, besides special subsidies to deaf-and-dumb institutes, to sick teachers and their widows, to special didactic publications, libraries, for the purchase of scientific instruments, etc.

#### THE TEACHERS' PENSION FUND.

At the end of 1896 the pension fund for the benefit of elementary teachers, their widows and orphans, amounted to \$11,899,132.

The annual dues from the communes to the fund, being equal to the 5 per cent of the salaries paid and that of the teachers themselves to 4 per cent of their salaries, amounted to \$497,550, while the State has contributed annually since the year 1878 to said fund the sum of \$50,000. This contribution is expected, however, to come to an end in 1900.

The full pension is due to a teacher after twenty-five years of regular teaching, on the basis of the average of his salary, provided that the amount does not exceed the average of his salary of the last three years. In case of his death the widow and orphans are admitted to the benefit of his pension in proportion to his already acquired rights, but in no case shall the pension thus revertible to the widow and orphans exceed two-thirds of the pension enjoyed or that the teacher previously was entitled to at the time of his demise.

The number of communes obliged by law to contribute to the teachers' pension fund in 1896 was 8,133. The kindergartens and schools subject by law to contribute to the pension fund numbered 40,462, besides 404 other special institutions.

The number of teachers likewise compelled by law to contribute to it was 39,708 in primary schools and 462 in kindergartens and other educational institutions.

#### ILLITERACY.

The grand total of illiterates between 6 and 20 years of age amounted in 1888 to 61.94 per cent (64.09 between 6 and 12 and 54.30 between 6 and 20), proportionally divided as follows:

Northern Italy .....	40.86
Central Italy .....	64.61
Southern Italy .....	83.52
Insular Italy .....	80.92

The progress thus realized in public elementary instruction in Italy between 1881 and 1896 is shown by the present percentage of 55.24 of illiterates (63.04 male and 47.43 female) or a decrease of 6.70 per cent in the number of illiterates in fifteen years.

II. REPORT FOR 1895-96 OF PROF. F. TORRACA, DIRECTOR OF PRIMARY AND NORMAL INSTRUCTION, TO THE MINISTER OF PUBLIC EDUCATION.

Says the director: "To courageously face the reality, however sad and painful it may be, means spurring the people to the realization of much different ideals." He starts by stating that the 227 scholastic inspectors of Italy, whose annual reports are gathered by him through the 69 provincial "provveditori," upon whose authority the inspectors directly depend, did not perhaps perform their inspection according to the expectation of the department. "When," writes Professor Torraca, "once for all I decided to know the whole truth about the real condition of public, primary, and normal instruction of the country, and began to read and compare said reports, rather tardily and with difficulty obtained from our inspectors, I found that some abounded in detail, others offered only scanty and incomplete information, while the remainder were only empty rhetorical generalities." Even in the matter of statistical data "some reports offered only a small amount, and others none at all." Whenever statistics were given in sufficient quantity, he found that they were prepared on no uniform basis, either with regard to matter or method.

This criticism of the director had the real merit of spurring public opinion and determining the movement of reform, of which an account will be given further on. One of the main points of Professor Torraca's criticism is that in which he particularly reflects on the inspectors' zeal; but it must be said in their defense that the law did not yet arm public inspectors enough to successfully fight the wayward policy of many communal authorities, especially with regard to questions of hygiene, buildings, teachers' qualifications, pupils' attendance, etc.; and, furthermore, that to overcome the evils and the incompatibilities blocking the onward march of public instruction many an inspector ("whose chief duty is to indicate to the Government how to force a new life into the national system of education") made some fearless, at least, if not very methodical, expositions of the real state of things as they found it, as appears from the following quotations:

From a letter of the "provveditore" of Campobasso (southern Italy), accompanying the report of the inspector of his province: "The laws of 1878 and 1888, providing for the construction of new buildings suitable for schools and for the repair of existing ones, found the communal authorities of this province reluctant. The commune of Casa Calenda only (and there are 133 communes in the province) has built a good schoolhouse. Many of the buildings that are now in use for school purposes should be absolutely given up, hygiene, pedagogy, and morals imperiously requiring it." A special law seems to be necessary to that end, as in the rural communes "there is not a single case of decent premises that could contain fifty to seventy pupils;" and this, in certain instances, notwithstanding the good disposition of the municipalities themselves. The inspectors of Oristano (Sardinia): "In most of our communes the schools are in unhealthy hamlets, are without a ceiling or a floor," and are "badly

protected with out-of-joint windows." That of Sanremo (Liguria): "Low garrets, without air, light, space, and toilet rooms." That of Pallanza (Lombardy): "So badly built and located that no child can assuredly learn propriety or cleanliness there." That of Susa (Piedmont): "The nonclassified school buildings are in fact stables, where the noise of the animals there gathered, such as oxen, donkeys, sheep, chickens, etc., constitutes a great distraction." "I felt repugnance," says the courageous inspector, "on entering, and as the air that one breathes in them is highly vitiated, I could not endure to stay long, so that my visit did not amount to much. The municipal administration, however, holds that the pupils, being for generations used to stable schools, do not suffer by them."

Such a state of things, deplorable in itself, but which, however, seems to be an exception with the rural schools of northern Italy, assumes a more general character in the southern provinces: "In almost all rural schools in the district of Isernia there are no toilet rooms." In the district of Avellino, "seven communes excepted" out of 66, "the school buildings are small, dirty, without light or air, or even toilet closets." The same observation holds good for the districts of Alghero and Ozieri, "with only four exceptions." The inspector of the district of Caltanissetta (Sicily) writes of "schools that are real prisons, not temples of morality and teaching, where the children suffer so much that they hate to go there; where, besides, they can not find room enough," etc. The inspector of the district of Clusone reports that "the atmosphere of the schools is so corrupt from the miasma of the water-closets that they constitute practical centers of infection." In the commune of Carife "the second and third courses of male primary schools are located in the building of an old cemetery, in the rear room of which there is still a pile of bones," etc. An inspector from Sicily concludes, after the darkest picture of his own district, and almost in despair, that "veritas odium parit."

The main cause for this incredible state of things, affecting the rural districts, is given by Professor Torraca in these words: "It appears that the buildings rented for school purposes, in most cases, are not what they ought to be, because they are selected by either incompetent or interested people. Inspectors report that in a number of communes the school buildings are selected, however unfit and at a rental of two or three times their value, simply because the owners of them are aldermen." He then adds: "Whenever the department of public instruction saw its way clear to act, the communes have duly been recalled to the fulfillment of their duty." However, after so detailed and open an exposure of facts he finds grounds to praise many communes of northern Italy and Tuscany, and a few of southern Italy for the progress realized in school buildings, which, as one naturally anticipates, are generally up to expectation in the largest cities of Italy. The logical conclusion of the director's report on the subject is that, "in order to eradicate such evils, the inspector ought to be given full authority with regard to the choice of school buildings; enough power, in fact, to cancel if necessary the rental contracts made by the commune, even when they have the approval of the local board of health." But, as is urged by many an inspector, "the only radical measure that would bring a remedy in a short time to the school-buildings evil, would be a law compelling every commune to build outright a school at its own expense or with the help of the subsidies and loans for that purpose granted by the Government to

the communes in pursuance of the above-quoted laws of 1878 and 1888."

*School furniture.*—Inspectors report in a general way that the furniture has been found good in 16,129 schools, deficient in 20,403 and bad in 13,497. To quote the statistics furnished by the inspector of Noto, it appears that in 1895-96 in his district, "6,952 children being under legal obligation to attend school, 4,371 of them were actually inscribed on the school rolls, but only 3,943 could be accommodated." Other inspectors complain also of the quality of the accommodations: "Contrary to hygiene and discipline," says the inspector of Gallipoli, although "the school furniture prescribed by the scholastic by-laws, aiming only at the strictly necessary, should come within the means of every commune." It is reported, however, that in many instances "no regular inventory of the scholastic furniture is ever made, and that consequently there is no regular delivery made to the teachers;" so that "they do not take proper care of it, with the result that even new furniture, bought with the subsidies of the Government, becomes in a few years useless.

*The apparatus and material* used in instruction, "of which many communal officials fail even to appreciate the usefulness," have been found to be in very much the same condition as the furniture, viz, good in 15,790 schools, insufficient in 19,560, and less than that in 16,679; so that, observes the much dissatisfied director, "from the land where the orange tree is in blossom our thoughts turn with melancholy to the northern countries of Europe, where the schools have benches rationally made; where the teacher's chair is respected; the cabinets for collection of objects plentiful; the library of a good size; the wall maps and the models for manual training efficient; where there is to be found a musical instrument to accompany the singing of moral songs, of psalms, or of patriotic hymns; \* \* \* because in those countries not only the Government or the municipal authorities look out for the schools, but also the family itself."

However there has been some progress realized on this point, as well as toward the organization and circulation among the people of scholastic and popular libraries.

As to the important question regarding the heating and cleaning of the schools, there are still very many complaints, especially on account of unhealthy stoves, the lack of proper water, and cleanliness of the halls and of the pupils themselves. At Fondri, Itri, and in other communes, reports the inspector of Gaeta, "I found the pupils to be dirty in their persons and wearing dirty clothing; the heads of many of them being covered with sores that infected the atmosphere, so that I had to order them out of the schools, although the official of the local board of health assumed that they were not contagious." These evils are due in part to the scarcity of school janitors, and to the lack of authority and energy of some teachers.

The second part of Professor Torraca's report bears on the following important subjects: The teachers and their teaching in general, the national language, arithmetic, history, geography, rights and duties of a citizen, penmanship, gymnastics, drawing, singing, female education, elements of agriculture, manual training for males, etc. He states that almost all the inspectors report to him that, as a whole, the teachers' education, both moral and intellectual, which is the most important point, is generally reputed to be good; that they have

dignity and that they conscientiously perform their duties; so that during the year 1895-96 the scholastic authorities very seldom have had occasion to summon, to reprimand, or to punish them.

In the year 1895-96, out of 50,048 teachers, 18,773 were considered very good and efficient, 23,995 tolerably good, while 7,280 were teachers whose education and training proved to be below the requirements. Female teachers are in general more appreciated than males and their instruction more efficient. Some inspectors charged teachers with indolence, with discouragement, with giving up the studies that would enable them to keep in touch with progress. Especially was this the case in the rural districts, where many also are blamed for taking up after school hours other occupations, sometimes very inconsistent with their purely moral mission. "But," observes one inspector, "how could the teacher and his family live, if he has one, with the meager pittance, for instance, of 35 cents per day, that the rural teacher of the third course earns?" "In fact," says another inspector, "the State contribution is not such as the straightened circumstances of the teachers require, since, for the 69 provinces, this year the State only contributed the pitiful amount of \$342,113, distributed among 6,741 communes, to help rural teachers out of their distress."

As to the efficiency of the teaching itself, as imparted throughout the country in rural districts, the director could not gather sufficient information from the inspectors' reports to form a definite opinion; but, while one may say that it is still lacking, and probably very much so from the point of view of new didactic methods and conceptions of what teaching should be to prove effectual, yet some progress has been realized of late, and besides the subject is being taken up with increasing attention and intelligence every day, and for this purpose all inspectors urge "the organization of local school committees to serve as a permanent and active bond between the schools and themselves and as a constant spur for the teacher to perform his duty, keeping in touch with progress and new methods."

Now, it may be permitted to the writer of this sketch to say, after this rapid survey of Professor Torraca's report, that by his candid and dispassionate statements, although with a tinge of pessimism, of the real condition of primary and normal instruction in Italy on the basis of the most reliable information he could secure, he has powerfully contributed to a reform of education in Italy and rendered the cause of public education a signal service; in fact, the greatest service that an official in his high capacity could render by proving to be "Amicus Plato, sed magis veritas."

Hon. G. L. Pecile, in a speech before the Italian Senate, in July, 1897, summed up the whole situation in these words: "Out of 8,253 communes, only 1,800 have an elementary superior course, 6,453 having only the first course of three classes. Of the 2,166,497 registered pupils, only 412,000 reach the third year; that is, one-fifth, and of these only 176,351 (according to the statistics for 1893-94), or 8 per cent, graduate." It appears natural, therefore, that from the category of nongraduates come almost all the 40 per cent of illiterates at the time of their enlistment in the army, or 20 per cent in northern Italy, and 57 up to 63 per cent in the islands of Sardinia and Sicily; and, as delinquency and illiteracy go together, this last island has the record for both in Italy.

## III. THE REFORM AND THE REFORMER.

[Extracts and survey of the report of Prof. G. Castelli, director chief of division of the department of public instruction for the year 1898.]

Nothing could give a clearer and more exact idea of the progress of the reform going on in the system of public education in Italy the last two years under the guidance of Dr. Guido Baccelli than the recent report of Professor Castelli on the most important matters already added to the program of primary and normal schools, viz, agricultural instruction and manual training, which are destined to dispose and keep the Italian people in a closer and more effective connection with the schools than before.

Professor Castelli, one of the foremost and most intellectual leaders in the field of public education, and a staunch supporter of agricultural instruction and manual training since the beginning of the agitation for their adoption, in his report states that the present Minister Guido Baccelli's efforts since 1881 toward the reform of the administration, discipline, and teaching in the public schools have awakened emulation for new attainment, "both with the family, the teachers, the pupils, and municipal authorities." "A happy change this in public opinion; the teachers being now more appreciated and cared for than in the past, and all discrimination having ceased to exist between them and the authorities, while they are animated with a greater faith in their mission." Whereupon the director announces that the school, with its course of study enlarged by the addition of practical agriculture and manual training, is no longer the traditional place where spelling, ciphering, and grammar rules were taught only with a view to preparation of the pupils for secondary instruction, at the highest, but "it has become a self-relying institution, provided with sufficient resources, and realizing the great moral ideal involved in the duties and rights of a modern State toward public education." And this, however, without assuming that everything is done; since two laws are still most necessary for the attainment of the end aimed at by the minister in these words: "To impart sufficient instruction to the masses, and to morally educate them as far as it is possible;" that is to say, (1) a law for the betterment of the condition of the schools (with regard to hygiene, discipline, attendance, etc.), and of their teachers (professional training, salary, and authority); and (2) a law regarding complementary schools for the education of youth in the three years that precede their compulsory enlistment for military service; and these laws were ready, but general questions kept the Parliament from voting them as urged and expected by Minister Baccelli this year.

As to agricultural instruction, this subject was added, in fact, to the branches taught in the normal schools some twelve years ago—elements of agriculture for male schools, and of horticulture and silk-worm culture for the female ones—but this verbal teaching of the elements never amounted to much indeed, because not supported by their practical application.

Dr. Baccelli sought the means of attaining such a desirable end; and for that purpose he addressed a warm and patriotic appeal in July, 1898, to the provincial authorities, to the communes, to all charitable and benevolent organizations and corporations, as well as to merchants and the rich at large, urging that "each and every rural

school be freely provided with a farming ground ('campicello') in which the modest rural teacher, personally benefited by the proceeds of its crops, might practically teach the land-tiller's son intelligent farming together with the elementary branches." "From that very farming ground," concluded the learned and noble minister, "upward through secondary instruction and special courses, let the Virgilian doctrine of the blessings of agriculture raise the people to the height of the Atheneum, where the enlightenment of science and the experimental synthesis will be associated in a lofty work of justice and national redemption."

Numberless expressions of approval from every class of citizens, inspired by a patriotic and a social idea, answered this public call for a piece of land for the village school, "thus," writes Professor Castelli, "attesting that, without distinction of class or political lines, when duly consulted, the Italian nation can show how passionately it has education at heart; no less in fact than order, peace, dignity, and the integrity itself of the country."

During the exposition of Turin in 1898 the National Congress of Farmers, and many other congresses there held, took up for immediate consideration Dr. Baccelli's circular, and passed in effect the following resolutions on the subject: That the department of public instruction should develop the teaching of agricultural science in national schools (63 schools existed in 1896 in which agriculture was regularly taught, while the next year none were to be without it), and in all secondary technical schools there should be established sections of agriculture and land surveying; that also chairs of agriculture be established in all those universities having already the two faculties of mathematics and physical sciences; that complementary courses to the primary degree and manual training be instituted in all the rural communes having none; that in order to multiply the number of agricultural schools the Government should inaugurate winter itinerant courses for adult peasantry.

At the end of 1897 the elements of agriculture were theoretically taught in 471 primary schools, but as they were considered by the inspector as very inefficient and far from the mark, especially on account of the teachers' shortcomings, Dr. Baccelli, taking advantage of the meeting of 117 teachers, delegates at the opening of the Tenth National Course of Manual Training at Ripatransone (of which mention will be made further on), ordered a series of theoretical practical lectures on agriculture to be delivered then and there by Prof. A. Rossi, the rector of the practical school of agriculture at Ascoli Piceno, authorizing in the meantime the "providitore" of that province to deliver certificates of attendance to all the teachers who should have attended that entire course of lectures.

This example was immediately taken up by other provinces, where lectures on agriculture were delivered by the most capable professors belonging to the universities, superior schools of agriculture, technical institutes, practical schools, and itinerant classes of agriculture, with the aim of determining what the teachers should know in order to usefully teach agriculture in their school. The result was that 184 chairs of lectures on agriculture were established, securing the attendance of about 12,000 teachers, "a fact, this," says Professor Castelli, "worthy of the highest consideration, as it represents an imposing spontaneous contribution to that work in all the sections of the country by the most learned and experienced men." This was a

new start indeed for the Latin nation, so habituated to the principle of centralization inherited from the Roman world, therefore so dependent at times for everything upon the central authority, "and one," argues Professor Castelli in his patriotic enthusiasm, "showing that self-government is not an endowment of the Anglo-Saxon alone." Now, to offer proofs of this assertion, that "there are in Italy latent forces making self-help a possibility with the masses," he adds: "Very deserving citizens began teaching silkworm culture in many schools, leaving the profit of the sale of cocoons to pupils and teachers; others took up rational bee farming, practical cheese making, aquiculture, rural hygiene, and zoology." Many a society for the development of industrial manufacturing stood ready to subsidize the schools for the training of children in small household industries. Some offered implements or fertilizers, others periodicals, technical books, didactic material, etc.

Concurring with this unprecedented outburst of individual initiative toward public education, the department opened a competition for a practical treatise on agriculture for the normal schools, granting a prize of \$1,500 for the best ones. "While it is still impossible," says the report, "owing to the continued progress of this movement, to offer positive statistics of the number of 'school fields' now being cultivated, we know already of 2,257 fields, the size of which varies from that of a 'small orchard' to that of a real important 'property,' and of 8,000 rural schools where agricultural instruction was given in 1898; so that Italy has practically covered in a few months the ground that it took France many years to cover."

#### IV. IL LAVORO EDUCATIVO (MANUAL TRAINING).

As in preceding sketches of education in Italy this important subject has only been hinted at, I think it useful to state here more at length, and on the authority of the chief of the department of public instruction, how the subject has been taken into practical consideration, briefly noting the different steps toward its adoption in Italy, viz: (1) A circular (1885) of former Minister Coppino opening the door to the teaching of positive pedagogy by recommending the addition of a kindergarten course to the courses for normal preparation; the study of drawing in two superior courses; the transformation of the elementary courses in the large cities into popular schools with manual training. (2) A report of former Minister Villari (1898), now president of the National Society Dante Alighieri, on the schools for manual and professional training visited by him in Switzerland, Germany, Denmark, Sweden, Norway, and Belgium. (3) The reports of Professors Zaglia, Agostini, Cavazzuti, and Castelli on the special courses at Ripatransone. (4) A circular embodying the programme for elementary and normal schools in 1894. (5) The debates and resolutions of several congresses on pedagogy and manual training (1897); but above all, (6) the famous ringing circular of Dr. Baccelli (July, 1898), reasserting the Roman motto, "Non scholæ sed vitæ discere," that raised at last the problem of agricultural and manual training in Italy out of the field of unfruitful discussion, closely followed by a circular thus determining the sphere of action for primary instruction henceforth: "For each rural school a field (*campicello*); for each urban school the experimental industrial shop; and for females training in female occupations and domestic economy." A school

with a field and shop, to bring a new activity into primary instruction; a popular school, that in time will make up "in tenui labor" for the didactic and pedagogical inadequacy of the present Italian primary instruction, due, above all, to the brevity of the period of compulsory attendance at school.

The history of the rapid and successful pedagogical crusade in Italy for manual and professional training is well worth being shortly recounted here, owing to the very important results already realized.

On former Minister Coppino's initiative, a committee of 14 distinguished Italian teachers was sent (1897) to Nääs to study practically manual training as a means of education in "the free alphabet of industrial arts" in the seminary of the illustrious Swedish philanthropist, August Abrahamson. On their return, after a visit to German, Danish, and Swiss training schools, a system of manual training was devised especially for Italian pupils, based on the "marvelous unity of pedagogical intuitions." Prof. Emidio Consorti, of Ripatransone, has been recognized by all as the pioneer and the intellectual leader of the new scholastic innovation, in promoting which he is considered a master "for practical common sense, firmness of purpose, and vigor of action." The fundamental principles of his pedagogical system may be summed up as follows: The natural activity of the child; his spontaneous impulse to work; his freedom of action; the pleasure of observation; the sentiment of individuality.

The characteristics of his experimental methods are these: Rationality, science, naturalness, and modernity; having for elements: Observation, experimentation, induction, and deduction, to be didactically developed as follows:

To show the child the object, with a brief description of the same.

To make the analysis and the sketch of the object.

To proceed to its synthesis and complete its design upon a plane and in relief.

The school of Ripatransone, owing to the merits of Professor Consorti, its founder, has recently been raised by Dr. Baccelli to the rank of State normal institution, and has already prepared 2,500 teachers for manual and professional teaching in primary and normal schools through an annual course extending over fifty days, to which, besides teachers of both sexes of kindergartens and of primary and normal schools, are admitted, as well school directors and district inspectors.

Its programmes include: Elements of agriculture; domestic economy; female industries, and work in paper, pasteboard, straw, willow ware, clay, wire, tin, cloth, wood, etc.; household employments and small rural industries; design.

As an appropriate conclusion to this chapter, and with the object of illustrating the spirit of reform now spreading in the educational world of Italy with regard to the philosophy of pedagogy, I think it pertinent to quote from a recent study by Miss Alessandrina Gariboldi, one of the worthiest pupils of Professor Consorti, a few characteristic observations on manual training:

Work is a social law. In its triumph over nature, humanity owes everything to work.

Work may eventually spur, convince, persuade, but its practice alone can impart to man those energies and aptitudes and habits that render work at once necessary and pleasant, as well as useful, active, and skillful.

The child is happy only when he plays; and when he plays so that he can exert all his energies and activities, muscles and intelligence, senses, heart, and will power, he really works. Surely, everything that comes to his hand—paper, clay,

wood, stone, iron, etc.—he inexorably modifies, changes, breaks, destroys; but through that cutting, shaping, constructing, or copying objects and forms, he finds out and creates; thus unconsciously revealing and actually practicing the universal law of analysis and synthesis.

## V. SECONDARY EDUCATION.

### “GINNASII” AND “LICEI” (CLASSIC SECONDARY SCHOOLS).

Pending the Parliamentary debates on the reform, Hon. Senise, in his somewhat pessimistic but splendid survey of the whole educational field of Italy, sarcastically alluded to the “plebeians” invading the secondary schools of the country, especially the “licei,” to be turned by these, an indigestible mass of students, into the universities and superior and special institutes, which in turn they overcrowd, and of which they are the actual curse; urging for such a national evil a remedy, and a radical one.

Since then something has already been undertaken in that direction by the introduction of a reformed curriculum involving a reduction of hours in purely scientific matters and in the Greek language, and introducing in their stead mathematics and one modern language. This experiment has been undertaken in six “licei”: at Rome, Milan, Turin, Florence, Venice, and Palermo.

Thus, the ensemble of measures and new conceptions for the reform of primary and normal and secondary technical and classic instruction is expected to rationally transform in a few years public education in Italy, and to prepare for university and superior special instruction qualitatively better elements in such a degree only as the country has use for; and as to the quantity, more rationally distributed with regard to an agricultural training’s increase.

The abnormality of the educational system of instruction in Italy is clearly illustrated by statistics showing the existing proportions between the different types of schools and their object, as follows (for 1898):

	Number of students.
Universities.....	23, 285
Superior and special institutes.....	3, 166
Industrial and commercial schools.....	30, 398
	56, 849

There were only 1,137 students in practical and 112 in the superior schools of agriculture.

The reform is expected to correct such disproportion in favor of agriculture, “one of the most important features of the new educational policy,” says Prof. G. Gorrini in his biography of Dr. Baccelli, “as the increase in the study of agrarian matters and laws will restore to healthy conditions the masses of the urban populations by directing them to the conquest of the uncultivated national lands, still unredeemed from ignorance and the latifundia,” the curse of the Roman Empire and of modern Italy still.

STATISTICS OF “GINNASII” (5 YEARS COURSE) AND “LICEI” (3 YEARS COURSE) FOR 1895–96.

*The Ginnasii.*—In 1895–96 there were 708 ginnasii, of which 183 were State institutions, 83 equaled in rank the State ones (57 supported by the communes, 24 by bequests, 1 by the clergy, and 1 by

donations), and 442 did not equal the State ones (1 supported by a province, 31 by communes, 24 by bequests, 257 by religious corporations, and 129 by donations). The number of ginnasii, compared to those of 1893-94, has been augmented by 3 in the Venice Province, 3 in Sicily, 3 in Sardinia, 2 in Liguria, 1 in Piedmont, 1 in the Campania, and has been decreased by 2 in the Province of Umbria, 2 in Calabria, 1 in Abruzzi, 1 in the Puglie, and 1 in the Basilicata, making a net gain of 6.

Their total number of students was 54,137 in 1893-94, and 55,515 in 1895-96, or 1,378 more. In 1893-94 the number of girl pupils registered for classic education was 732, and 912 in 1895-96, an increase of 180.

*Examinations for promotion.*—In the first four courses of the ginnasii 46,542 pupils were present at the end of 1895-96, of whom 6,217 were promoted, without examination, for merit, and 3,147 passed their examination for admission to a superior class; 8,773 were refused promotion, and 1,405 did not attend examination.

In 1893-94, in the first four gymnasial courses, of each 100 pupils 16 were promoted without examination, 63 were promoted after examination, 17 were refused promotion, and 4 did not take the examination. The corresponding proportions for 1895-96 are as follows: 13, 65, 19, 3.

The examination for admission to the licei was given for 1895-96 in 280 ginnasii, and the number of those promoted amounted to 6,686 (including 130 girls) out of 9,668 candidates, as against 9,221 candidates and 6,268 promoted in 1893-94.

The professors in the ginnasii for 1895-96 numbered 4,739, not including 333 directors without a chair and 328 gymnastic teachers. Of the given total, however, 847 held courses also in another institute. In 1893-94 there were 4,468 professors, of whom 759 taught as well in another institute, besides 258 directors and 294 gymnastic teachers.

*The licei.*—During 1895-96 there were open 332 licei (116 State institutions, 29 ranked as equal to State ones, and 187 not thus ranked). Of these last, 3 were supported by the commune, 3 by bequests, 136 by religious corporations, and 45 by private donations. The total number was 21 greater than in 1893-94.

The following classification may be made of the licei and the students registered in them for 1893-94 and 1895-96:

Licei supported by—	1893-94.		1895-96.	
	Licei.	Students.	Licei.	Students.
The State .....	113	10,292	116	10,945
Communes, ranked .....	18	1,100	19	1,195
Bequests, ranked .....	9	447	10	587
Communes, not ranked .....	3	49	3	62
Bequests, not ranked .....	4	103	3	67
Religious corporations, not ranked .....	117	3,063	136	3,461
Private funds, not ranked .....	47	1,300	45	1,349
	311	16,414	332	17,689

The table shows an increase of 1,275 students in the two years; among the students in 1895-96 there were 216 girls, as against only 111 in 1893-94.

*Examination for promotion* from the first two of the three lyceal courses to the third and last (giving number of students):

	1893-94.	1895-96.
Promoted without examination .....	1,581	1,533
Promoted after examination .....	7,373	7,639
Not promoted .....	1,817	2,113
Not examined .....	482	616

Per cent promoted in 1894, 79.57; per cent promoted in 1896, 77.16; or 13 per cent promoted without examination, 64 per cent after examination, 18 per cent not promoted, and 5 per cent not examined.

*Examination at the close of the third course* for admission to the University or to a superior institute, for 1895-96: Students examined, 6,600, of whom 4,252 passed. In 1893-94 there were 5,933 examined, of whom 3,788 passed.

Per cent of students examined, promoted to the university or to a superior institute, from each class of licei: Percentage from State licei, 85.68; paregiate or ranked as State, 72.87. Not ranked: Communal, 29.31; endowed, 60.00; corporations, 78.87; private, 44.14. Among those promoted for 1896 there were 44 girl students.

#### *Teaching force.*

Year.	Licei.	Profes- sors.	Direct- ors.	Gymnas- tic teachers.
1893-94 .....	311	1,806	141	135
1895-96 .....	352	1,852	167	156

The number of students seeking admission to and instruction in licei is such that a number of "licei annexes" have sprung into existence in late years.

#### SECONDARY INSTRUCTION: AGRICULTURAL, COMMERCIAL, INDUSTRIAL, AND NAUTICAL.

When one realizes that for success in life, besides the ethical object of instruction, to wit, the training of the intellect and of the heart, there must immediately follow the consideration of the usefulness of some practical training, he has grasped the full purport of secondary instruction, in that department especially in which it prepares youth for agricultural, industrial, and commercial pursuits. It takes, indeed, a man of good ethical and practical education to make of commerce not only a mere matter of business, but a congenial pursuit leading to the welfare of a given country, in the expectation that this twofold moral and practical training may one day blend the natural law of "love and hunger," of which wrote the immortal Goethe, into a by-law of fraternity of all nations. I think that in the modern effort of bringing nations into closer contact, the Anglo-Saxon race, the most powerful one to-day, owing to the spirit of reform of the Middle Ages that revolutionized her life, deserves the greatest part of the merit. Because, if it is true that the Italian genius of Columbus, Polo, Amerigo, Cabot, etc., leading humanity across mysterious and dreaded seas, marked the highest triumph of the Latin race, and

that Latins and Anglo-Saxons alike followed in the wake of the discoverers to conquer and populate this continent, hoisting their flag here and there, the first result was that there, where the Anglo-Saxon settled, a new civilization, symbolized by moral, civil, and religious liberty and equity among men, spread over land and sea.

No wonder, therefore, that to-day, a consequence of yesterday, the Anglo-Saxon commercial schools, based on the most improved pedagogical methods, know how to efficiently train youth for the world's competitive arena of trade and commerce.

Italian secondary instruction has made of late a marked progress; but when its programmes are compared with those of other nations, they still appear to be far below the training of the German and English or American schools. Nothing short of the full carrying out of the reform now going on in this branch of education in Italy will, eventually, arm the Italians in a fitting manner to stand a chance in the markets of the world.

Hon. G. Baccelli, in planning his reform for secondary instruction, has distinguished three types of technical schools, to wit, the agricultural the industrial, and the commercial, to correspond to the local wants of the different sections of Italy, the programme for the first type of school being farming and natural sciences; for the second, practical and theoretic industrial technology, experiments in mechanics, and the like; for the third, a general education, equipping youth especially for home business, but as well for international commercial affairs, adding to it that ethical training, by which "blighting egotism," so easily engendered by the study of commercial branches, shall not prevent a young merchant from becoming a good and a refined citizen.

It is understood, however, remarks Professor Chiarini, director of secondary instruction, in his quite recent report, that the reform bearing on the three described types of schools for secondary instruction preserves to them the character of "schools of general culture," therefore they are not to be confused with the "practical schools of agriculture," the "schools of application" or "arti e mestieri," the "special schools of commerce," and the "industrial schools" now under the direction of the department of agriculture and commerce.

At the beginning of this year 19 state secondary schools had already been re-formed to the new type—6 agrarian, 2 industrial, and 11 commercial—and many others were in process of reformation.

That Italy, a maritime nation "par excellence," situated by nature on the sea, in a unique association with three continents, Europe, Africa, and Asia, may through its re-formed commercial educational methods gain in time a respectable rank in international commerce, will be easily conceded, owing to its marvelous faculty of assimilating the perfected methods and sciences of other nations; and also to the recent awakening of her maritime genius, that once, before the growth of the English genius for commercial conquest, had made of the Republics of Venice, Genoa, Pisa, and Amalfi, for centuries, the queens of the sea.

#### STATISTICS OF TECHNICAL SCHOOLS OF GENERAL CULTURE AND COLLEGES (CONVITTI).

The technical school has a three-years' course, leading to the technical superior institute of a two-years' course. In 1895-96 there were 381 technical schools, with a registration of 36,654 pupils, reduced at

the end of the year to 33,351, as against 32,775 for 1893-94, as follows:

Class of technical school.	Number of schools.	Students.	
		1893-94.	1895-96.
State.....	181	20,430	21,591
Provincial, ranked.....	2	257	187
Communal, ranked.....	80	7,601	7,715
Endowed, ranked.....	9	495	515
Communal, not ranked.....	35	1,451	1,139
Endowed, not ranked.....	12	555	578
Religious corporation, not ranked.....	2	96	86
Private, not ranked.....	65	1,890	1,540
	337	32,775	33,351
Free attendance.....		186	300
Total students.....		32,961	33,741

Girl students for 1893-94, 1,963; for 1895-96, 2,818.

*Examination for promotion from the first to the second class.*—In 1895-96 there were 25,533 students examined, of whom 1,131 (276 girls) were promoted without examination, 14,017 (1,404 girls) after examination, 8,661 (430 girls) were not promoted, and 1,721 (84 girls) were absent at the time of the examination.

Out of the total attendance for 1895-96 on the two first courses, 4 per cent were promoted without examination, 55 per cent after examination, 34 per cent were not promoted, and 7 per cent were not present, as against the corresponding percentages of 4, 57, 32, and 7 for 1893-94.

The results of the examination of "licenza" (1895-96), admitting to the superior technical institute (two years' course), in 286 technical schools, were as follows:

Class of school.	Examined.	Passed.	
		Number.	Per cent.
State.....	4,729	3,624	76.63
Ranked.....	2,151	1,590	73.82
Provincial, not ranked.....	201	123	63.68
Endowed, not ranked.....	101	66	65.35
Corporation, not ranked.....	5	3	60.00
Private, not ranked.....	583	292	50.08
Family instruction.....	671	305	45.45
Total.....	8,444	6,608	-----

Passed examination.....	470
Passed after first examination.....	2,813
Passed fall reexamination.....	2,725

The total number promoted for 1895-96 was 6,008 (484 girls), as against 5,941 for 1893-94.

*Teaching force.*

Year.	Professors.	Directors.	Gymnastic teachers.
1893-94.....	2,825	115	276
1895-96.....	2,755	123	323

## TECHNICAL INSTITUTES.

The following table shows the number of technical institutes and students attending them for the two years specified:

Year.	Number of institutes.	Students.	Special students.
1893-94	72	8,259	930
1895-96	74	9,144	263

Or an increase of 1,027 registered students in 1896 and a decrease of 849 special students, owing to a decision of the department of public education (1895) denying to all nonpromoted or not-admitted outside students inscription as "special" in the class to which they aspired, or to a superior one.

The attendance for 1895-96 in the 74 institutes was as follows:

Common year	3,342
Physico-mathematical section	1,581
Surveying section	1,504
Agricultural section	18
Commerce and accounts section	2,576
Industrial section	123
	9,144
Special	263

Making a total of 9,407. Included in this number were 50 girls, as against 23 for 1893-94.

At the examination for promotion to the second year 69 per cent were promoted, 20 per cent not promoted, and 3 per cent were absentees; 550 were without examination.

Examination of "licenza" in 69 institutes: Out of 2,304 pupils (including 4 girls) of the second year course, 1,543 passed, or 66.97 per cent of the candidates, as against 1,521 licensed, or 68.79 per cent, in 1893-94, as follows:

	1893-94.		1895-96.	
	Number.	Per cent.	Number.	Per cent.
Physico-mathematical section	481	67.27	441	67.25
Surveying section	393	64.85	442	65.97
Agricultural section	5	62.50	12	60.00
Commerce and accounts section	613	72.46	618	67.17
Industrial	29	80.18	30	78.85
	1,521	68.79	1,543	66.97

The lowered percentage of the "licensed" in 1895-96 is due to the participation in the examination of students prepared by private instructors or private institutes; the licensed students of State courses amounted to 83.81 per cent of the candidates.

The number of instructors in technical institutes was as follows:

Year.	Number of institutes.	Professors.	Presidi.	Professors of gymnasium.
1893-94	72	1,250	10	65
1895-96	74	1,314	10	64

## NAUTICAL INSTITUTES.

In 1895-96 there were 21 nautical institutes, of which 19 were State schools, 1 communal, and 1 private, with 550 attending students, 44 special students, and 309 registered for the two years of the preparatory course.

The attendance on the various sections was as follows:

	1893-94.	1895-96.
Sea captains .....	45	4
Naval constructors of second class .....	32	5
Machinists of second class .....	15	4
Captains of high seas .....	256	157
Constructors of first class .....	23	14
Machinists of first class .....	410	306
Preparatory course .....	781	550
Special .....	132	309
	75	50

In the examination for promotion, out of 336 students attending the different sections (excepting the last year, when the examination for letters patent follows), 21 were promoted without examination, 214 after examination, 83 were not promoted, and 18 were absent; or, out of each 100 students having attended courses, 70 were promoted, 25 not promoted, and 5 were absentees.

In the examination of "licenza" in 18 institutes there were 419 candidates, of whom 285 passed, or 68 per cent, as against 461, 280, and 61 per cent in 1893-94.

Of the 285 in 1895-96, 141 passed at the first examination and 145 at the fall reexamination; 5 received letters patent of sea captains, 4 of naval constructors of second class, 7 of machinists of second class, 69 of high-seas captains, 6 of naval constructors of first class, and 194 of machinists of first class. Of the 285 naval students thus licensed, 173 belonged to State, 6 to nonranked, and 4 to private institutes, while 102 studied privately for preparation.

Number of professors in twenty-one nautical institutes: In 1893-94, professors, 181; presidi, 6; professors of gymnasium, 19. In 1895-96, professors, 183; presidi, 7; professors of gymnasium, 18.

## STATISTICAL SUMMARY OF SECONDARY INSTRUCTION.

The following table shows the changes that have taken place in fifteen years (1881-1896):

Class of schools.	Year.	Number of schools.	Students registered.	Graduates (licenza).
Ginnasii .....	1881	701	41,124	4,820
	1896	708	59,578	6,686
Licei .....	1881	298	11,133	2,981
	1896	332	17,689	4,272
Technical schools .....	1881	383	22,120	3,233
	1896	381	36,654	6,008
Technical institutes .....	1881	79	6,578	1,098
	1896	74	9,943	1,543
Nautical institutes .....	1881	26	816	540
	1896	21	907	285

Thus it is shown that while the number of schools for secondary instruction is about the same in 1896 as in 1881, except the nautical institutes, all branches of instruction have an increased number of students, the increase being 45 per cent for the ginnasii, 67 per cent for the licei, and 67 per cent for the technical schools.

The following is a summary of the latest figures on secondary instruction, from advance sheets of the reports for 1896-97 and 1897-98:

	1897-98.		1896-97.	Pupils.	
	Number of schools.	Pupils.	Pupils.	Increase.	De-crease.
State ginnasii .....	183	25,551			
Ginnasii ranked as State .....	81	8,095			
Total .....	264	33,646	34,357	711	-----
State licei .....	116	19,675

Increase of pupils between 1896-97 and 1897-98, 1,213.

Since 1888 the statistics of the convitti have included also the institutions for the blind and the deaf and dumb, but the convitti annexed to the practical schools of agriculture and to the agricultural schools, and also the convitti attached to exclusively professional schools, are not included.

In 1895-96 there were 919 convitti for males, 50 of which were State schools, 15 provincial, 62 communal, 220 endowed, 297 supported by religious corporations, and 275 private, being an increase of 6 over 1894.

As to attendance, in 1893-94 there were 60,105 male pupils in all the convitti (86 per cent in the schools annexed to the convitto itself). In 1895-96 there were only 58,839, or a decrease of 1,266 pupils from the previous year.

In 915 out of the 919 convitti in 1895-96 there were 915 directors, of whom 557 were priests. In 255 convitti the teachers were all priests, in 240 partly priests and partly civilians, and in 100 there were no teachers besides the director. As in preceding years, "secular priests," viz, those not inscribed in any religious order, constituted the majority.

As to the annual contributions of the pupils, the following figures were gathered by the general director of statistics (915 convitti furnished in season their figures): In 120 convitti all the inmates were admitted gratuitously, in 473 on payment, and in 322 partly on payment and partly gratuitously.

## CONVITTI FOR FEMALES.

In 1893-94 there were 1392 convitti for females, with 50,162 pupils, and in 1895-96 there were 1,456, with 49,367 pupils. Of these convitti, 11 were State schools, 25 provincial, 47 communal, 718 endowed, and 665 private.

The number of girls attending "special schools" of singing, music, embroidery, etc., was 4,629; normal schools, 4,620; elementary or complementary and superior schools, 40,118; total, 49,367, as against 35,543 in 1885, or an increase in ten years of 13,824 female pupils. Out of the 1,456 directors, male and female, of the female convitti, 917 were priests and 539 civilians. The instructors were divided as follows: 665 priests, 462 civilians, and 236 unclassified.

Of the female convitti, 436 were free, 592 admitted pupils on full payment, and 415 admitted part free and part on payment.

"In the female convitti," states the director of statistics, "instruction is, as a rule, given by nuns," thus making evident that in Italy the education of girls, outside of those attending State schools, is still almost exclusively in the hands of the clergy, to the extent of at least about 50,000 girls. The same thing can be said of male convitti enrolling 58,839 students.

## OTHER INSTITUTIONS.

Of the 8 special schools of agriculture founded between 1879 and 1898, 5 are devoted to vine culture, 1 to olive culture and oil making, 1 to pomology and horticulture, and 1 to zootechny and cheese making.

In 1897-98 these 8 schools had 90 instructors and assistants and 410 students; in 1898-99, 496 students. There were 89 diplomas granted for 1897-98.

There are 28 practical schools of agriculture, having 112 teachers and assistants; number of students in 1897-98, 951; in 1898-99, 1,085. There were 201 diplomas granted in 1897-98.

There are thus in all 36 agricultural schools, which had in 1898-99 a total of 202 teachers and 1,581 students. The 4 schools of mines had 14 teachers and 42 pupils, and issued 6 diplomas in 1897-98.

*Industrial and commercial schools.*

Kind of schools.	Schools.	Pupils.
Superior schools of art applied to industry .....	6	847
Schools of arts and trades .....	65	14,417
Schools of art applied to industry .....	105	11,256
Special schools for males .....	12	1,004
Professional schools for females .....	14	4,998
Schools of design and plastic art .....	174	12,256
Total .....	376	44,778

These last schools are located in the 69 provinces.

There are also 26 academies and institutes of the fine arts, of which 13 are national and 13 private. These had in 1897-98 230 teachers and 3,886 pupils. The Institute of Fine Arts, at Florence, dates from 1350, the Academy of Carrara from 1769, the Academy of Milan from 1776, the Institute of Modena from 1786, and the Institute of Parma from 1756. The others have been established during the present century.

Italy has 6 national institutes and conservatories of music, which had 145 teachers and 875 pupils in 1897-98. Of the pupils, 555 were males and 320 females. The College of Music, at Naples, the oldest of them, dates from 1806.

There are also in Italy a great number of private institutes and conservatories of music; among these 5 musical lyceums and 40 private or municipal conservatories and musical institutes attain to the standard of the national institutions.

Normal schools of choral singing are attached to the conservatories of Naples and Parma. Their two years' courses embrace, beside the theory and practice and the art of singing, elementary harmony and practice on the keys of an instrument; also anatomy, physiology, hygiene, and their applications to singing.

There are in Italy 11 military institutes and superior schools. The Military Academy of Turin, dating from 1669, teaches the art of war, the use of artillery, engineering, and military sanitation. There is also a normal school of infantry and another of cavalry. In 1897-98 the 11 institutes had 299 instructors and 1,616 pupils, and 988 pupils were promoted at the end of their courses of study.

The Naval Academy, at Leghorn, founded in 1881, and the School of Pupil Machinists, at Venice, founded in 1862, taken together had 79 instructors and 301 students, of whom 116 were promoted.

Of the 32 State libraries the largest is the national library at Naples. This and two others contain more than 100,000 volumes each. The total number of books and manuscripts in 1897-98 was 1,690,825, of which 12,711 were manuscripts. The number of readers was 1,294,869. One library dates from the sixteenth century, 3 from the seventeenth, 7 from the eighteenth, and 2 are of this century.

The libraries of Italy may be grouped into the following 11 classes:

	No. of libraries.		No. of libraries.
1. National libraries:		7. Libraries of academies, scientific institutes, and chambers of commerce.....	172
Autonomous.....	17	8. Libraries of private or moral bodies, foundations, mutual benefit societies, reading cabinets open to the public.....	478
University.....	15	9. Religious seminary libraries.....	175
National, properly so called	12	10. Libraries of hospitals, congregations, and benevolent societies....	26
	44	11. Private (most important ones)...	40
2. Libraries of superior institutes....	9		
3. Provincial and communal libraries.	418	Grand total.....	1,831
4. Primary and secondary school libraries.....	378		
5. Libraries of military institutes and academies.....	45		
6. Archives and departmental Government libraries.....	46		

## VI. STATISTICS OF SPECIAL SUPERIOR INSTRUCTION.

The following list gives the names and locations of the 11 superior special schools, with the dates of their foundation:

- Bari: Superior School of Commerce, 1886.
- Florence: School of Social Science, 1875.
- Florence: Superior Institute of Work for Women, 1882.
- Genoa: Superior School of Commerce, 1884.
- Genoa: Superior Naval School, 1870.
- Milan: Superior School of Agriculture, 1870.
- Portici: Superior School of Agriculture, 1872.
- Rome: Superior Institute of Work for Women, 1882.
- Turin: Museum of Italian Industry, 1862.
- Vallombroso: Institute of Forestry, 1869.
- Venice: Superior School of Commerce, 1868.

These schools had, in 1895-96, 137 professors, 748 students, 65 auditors, and granted 97 diplomas. The following courses are taught in them, among others: Social sciences, jurisprudence, courses for public notaries (who in Italy correspond to public registers and recorders), consular courses, superior courses of commerce, of normal economy, of statistics, of public law for accountants and computers, of foreign languages, of chemical and mechanical industries, of ornamentation, of electrotechnic science for civil engineers, of customs and tariffs, of naval mechanics and hydrography, of agrarian sciences, and of forestry.

## VII. SUPERIOR INSTRUCTION—UNIVERSITIES.

Superior instruction in Italy is given in 17 State universities and 4 independent ones, twenty-one in all.

The State universities are located at Turin, Pavia, Padua, and Genoa, in northern Italy; Bologna, Pisa, Rome, Modena, Parma, Siena, and Macerata, in central Italy; Naples, in southern Italy; Palermo and Catania, in Sicily, and Cagliari and Sassari, in Sardinia.

The 4 independent universities are located in central Italy at Camerino, Ferrara, Perugia, and Urbino.

In southern Italy there are also university courses attached to the *licei* of Aquila and Bari, as well as at Catanzaro, in Sicily. There are besides in Italy 13 superior institutes, viz: Four autonomous schools of applied engineering, at Bologna, Naples, Rome, and Turin; 1 superior technical institute, at Milan; 3 superior schools of veterinary medicine, at Milan, Naples, and Turin; 1 institute for superior studies, at Florence; 1 scientific and literary academy, at Milan; 1 superior normal school, at Pisa, and 2 superior normal female institutes, at Florence and Rome.

There are, besides the above, 2 schools of applied engineering connected with the universities of Padua and Palermo, 3 more connected with the universities of Genoa, Pavia, and Pisa, with one single course, and 4 schools of veterinary medicine connected with the universities of Bologna, Modena, Parma, and Pisa.

All of the above-mentioned institutes are under the direction of the department of public education. A list will be given farther on of other superior schools controlled by other departments, such as special superior schools of agriculture, military and naval colleges and academies, and superior schools of antiquities, cartography, oriental languages, art, singing, music, etc.

The students registered in the 21 Italian universities and the 3 university courses numbered 21,813, besides 346 free students. There were included in this total 132 female students.<sup>1</sup>

<sup>1</sup>The young women students were divided among the different faculties as follows:

Jurisprudence.....	4
Medicine and surgery.....	18
Mathematics, physics, and natural sciences.....	30
Philosophy and letters.....	72
Pharmacy.....	8

Total..... 132

The division of students by faculties was as follows:

	1895-96.	1896-97.
Jurisprudence .....	6,096	6,376
Medicine and surgery .....	6,516	6,634
Mathematics, physics, and natural sciences .....	2,155	2,595
Philosophy and letters .....	1,355	1,357
Solicitors and notaries public .....	670	656
Political, administrative, and consular courses <sup>1</sup> .....	8	.....
School of pharmacy for the "laurea" .....	256	278
School of pharmacy for the diploma of practice .....	2,352	2,384
School of veterinary medicine .....	299	598
School of obstetrics .....	1,580	1,332
School of applied engineering .....	352	857
School of agricultural sciences .....	165	.....
Free students .....	345	.....
Grand total .....	22,158	23,285

<sup>1</sup> Nineteen students for these subjects, besides following the jurisprudence courses.

<sup>2</sup> Showing an increase in one year alone of 1,127 students in Italian universities, besides an increase of 1,498 in thirteen superior institutes, making a total increase in superior instruction between 1896 and 1898 of 2,625 students—a cause this of the reform in this branch of public education, as will be shown farther on, since, according to the latest statistics quoted by Hon. Senise in the parliamentary debates on the reform referred to, there are turned out 1,200 laureates in excess of the national want every year.

The results of the examination for the "laurea" and the diploma of practice in 1895-96 were as follows:

In the 17 State universities .....	3,972
In the 4 independent universities .....	116
In the 3 university courses attached to Licei .....	54
In the 13 superior institutes .....	594
Total .....	4,736

Out of this total 4,557 secured, according to the use, one of the three degrees of doctor's "laurea," diploma, or simple "certificate" of admission to practice.

Eighteen "laurea" have been obtained by female students, and 58 of them secured also the diploma of superior magisterium.

*Students and courses in the superior institutes, 1895-96.*

	Stu- dents.
Bologna .....	114
3 years' course for civil engineers; 3 years' course for architects.	
Milan .....	432
2 years' course, preparatory; 3 years' course for civil engineers; 3 years' course for industrial engineers; 3 years' course for architects; 4 years' course in normal natural sciences; 4 years' course in physics; 4 years' course in chemistry.	
Naples .....	237
3 years' course for civil engineers; 3 years' course for architects.	
Rome .....	172
3 years' course for civil engineers; 3 years' course for architects; 2 years' course in scientific architecture for students of fine arts schools.	
Turin .....	381
3 years' course for civil engineers; 3 years' course for industrial engineers; 3 years' course for architects.	
Milan .....	102
4 years' course in veterinary medicine.	
Naples .....	177
4 years' course in veterinary medicine.	
Turin .....	88
4 years' course in veterinary medicine.	
Florence .....	587
4 years' course in philosophy and letters; 4 years' course in physics and natural sciences; 6 years' course in medicine and surgery; 5 years' course in chemistry and pharmacy; 4 years' course for diploma of pharmacy; 2 years' course for midwives' diplomas.	

*Students and courses in the superior institutes, 1895-96—Continued.*

	Stu- dents.
Milan 4 years' course in philosophy and letters; 4 years' course in modern languages.	114
Pisa 4 years' course in philosophy and philology; 4 years' course in natural and physical sciences.	39
Florence 2 years' course in foreign languages and literature; 2 years' course in history, geography, pedagogy, and sciences.	127
Rome 2 years' course in foreign languages and literature; 2 years' course in history, geography, pedagogy, and sciences.	98
Total for 1895-96	2,668
Total for 1896-97	2,935
Total for 1897-98 <sup>1</sup>	3,166
Showing an increase in two years of about one-fifth.	

<sup>1</sup> The division by institutes was in 1897-98 as follows:

Students in 11 superior institutes	2,589
Students in 2 female normal institutes	280
Students in 3 university "licei" courses	259
Students in 1 institute for oriental languages	38
Total	3,166

## THE UNIVERSITIES.

One of the greatest problems for the next century to solve with regard to superior instruction in every civilized country, although from different points of view, is to reach a conclusion on the much-debated point of the minimum and the maximum of superior education conducive to a nation's usefulness, and that not only with a view to keeping a permanent rational balance of instruction between the classes in which society is divided, but also to avoiding causes of personal distress among the learned classes. A most dangerous element of social disturbance this the more the distressed individual is put, by his superior education, in a position to analyze the right and the wrong of life and of society.

The far-sighted remarks of C. P. Huntington on "Overeducation of the masses," deeply criticised of late because in the United States there seems to be rather a necessity for superior education than otherwise, had a broad counterpart in Europe, at Rome, pending the most important parliamentary debate that has taken place there (in 1883-84 and last year) on university and superior education; there, and as will eventually be the case everywhere else in Europe and in America, I would like to be permitted to say, since the field covered by a score of learned university orators, with a view to comparison, indeed embraced the history of superior instruction the civilized world over.

From the circumstance that in Italy also, the very land of classicism, as in France and Germany, the legislator should have been brought to consider as a necessity "the limiting of the extension of superior and university education," one may find a suitable explanation in the far-sighted purpose of "timely protecting new generations from the mania of graduation for the purpose of office-seeking only;" a destroyer—this tendency—of ambition, and a disorganizer of the energy and spirit of initiative of youth, so precious to nations, in the field of scientific farming, manufacturing, mechanics, commerce, etc. The idea of barring in part the inflow to the university seemed, of course, a sacrilegious attempt to many an Italian sabeau of the "alma

mater;" yet, on the one hand, the invasion of science into every realm of life, revolutionizing old truths and methods, thereby rendering new educational conceptions and new boundaries unavoidable, and the fact, on the other hand, that within the last twenty-five years the rate of gain in graduates from the 21 Italian universities has been seven times the corresponding rate of increase of the Italian population, were such a statistical indication as could not pass without attracting the deepest attention and calling for a remedy. Hence the reform, with the final result that the legislators, whether in favor of or opposed to the bill presented by Hon. G. Baccelli in 1898, agree at least on these points as being demanded by the future welfare of their country:

First. That all allowance being made for the national hereditary tendency of the Italians to high and classic education, the modern rush for it is such as to justify the conviction that besides that noble tradition the crowding of universities and superior institutes is rather a run for the "laurea" than anything else, since this parchment and the diplomas open the doors to all public offices.

Second. On the absolute necessity of a "State examination," after the attainment by the student of the "laurea" and "diploma;" and this with the double view of keeping high the standard of superior education and of affording protection to society itself from certain consequences of a wholesale free practice of all professions, as well as preserving unimpaired the many and important moral and material rights that such documents secure to their recipients.

Third. On the much debated point of free teaching by professors, "libera docenza" being considered the proper counterpart of the "libertà di studiare"—a free curriculum of studies.

#### THE BILL FOR THE REFORM OF SUPERIOR EDUCATION IN ITALY.

Presented to the Parliament July 4, 1898, by Hon. G. Baccelli, minister of public instruction (for the third time) of Italy.

In introducing his bill the minister compared "superior instruction to an arm of precision in the struggle of nations." Although Italian science, which has generally originated in the university, he said, has kept on of late in the admirable work of assimilation of the science of other countries, as well as in advancing capitably on its own lines, especially as regards the biological sciences, the scholastic curriculum in existence did by no means favor such a result. It handicapped it rather, owing to the rigidity of its old and new by-laws alike, and to obligatory courses—a real burden to students, sterilizing superior instruction. Hence the necessity of a new law destined to pour, through freedom of teaching and learning, a modern life into the university, as he had already advocated some fourteen years ago, and he presented such a law to-day for adoption.

The first article will give the reader the measure of the reform, viz:

The 17 State universities and 12 superior institutes, as per list annexed, are granted a juridical personality, and didactic, administrative, and disciplinary autonomy under the supervision of the State, through a representative.

The by-laws of each faculty will be obligatory upon both professors and pupils.

Article 2, as modified or completed by the Parliamentary commis-

sion, determines the rule for the direction of the university. The rector, appointed by the Crown on the nomination of the college of professors, is to represent the university, and govern it together with the academic bodies.

The representative of the State to see to it that the administration of the university's own patrimony and the scholastic one be carried on according to the law and the by-laws; and that the discipline be duly maintained.

Article 3 provides that for the nomination of "ordinary" and "extraordinary" professors, and the promotion of the latter to "ordinary," the right of nomination is vested in the faculties, the sections of superior institutes and the schools of superior instruction, the appointment being made by royal decree.

Article 5 establishes the right of the universities and any of the institutes exclusively to confer the title of "doctor" (laurea); and secures to the State the right of granting admission to practice a profession, after a State examination.

Article 8 provides that the students' contributions toward superior instruction are to be for the following: For registration, for admission to the universities, registration for special courses, examination of maturity, of laurea or diploma, and State examination. Also contribution for admission to the position of professor, ordinary or extraordinary, and for "libera docenza" of independent teachers.

This bill, owing to the Parliamentary debate that followed the uprising at Milan and other cities of Italy in May, 1898, failed to pass, but is expected to become a law in the fall session of this year (1899).

By it, according to the explanations of Hon. G. Baccelli, university independence is asserted with regard to determining the limits and the duties of each faculty; and the opportunity is offered of creating eventually new faculties, such as the proposed "superior faculty of philosophy," aiming at a closer union between the exact and the speculative sciences; a "polytechnic faculty," for the positive sciences and their applications; an "agrarian scientific faculty;" and, in a word, all those didactic experiences that the academic body of the university shall deem useful, pursuant to the progress of science, to adopt; all this being based on the principal of freedom of teaching for the professors, and of studying on a personally chosen curriculum for the students. I think it useful to quote here what—in the course of the Parliamentary debate (March 10, 1899) pending the comparison of the methods adopted by each nation regarding the problem of superior education—the Hon. De Marinis, speaking in favor of the reform, had to say of the United States:

I shall remember the type of university in the United States, where of the 370 universities or colleges, previous to 1885 only 35 had been created by States holding some sort of control on them, without proving, however, better for that. \* \* \* Yet that is the most advanced type of autonomy. \* \* \*

In the United States there is no department of public instruction, the United States Bureau of Education of Washington being mostly a bureau of statistics, very different from, and undoubtedly much more useful than our own scholastic bureaucracy. No department proves more useful to the branch it supervises than this central office at Washington, that does not dare to upset the functions of the university organisms, but on the contrary shows them ways and means to progress and to explicate their own initiative. There, in the United States, the political power is so cognizant of the right of superior schools to independence that in case, according to the aspiration of Washington, his successors should create a national university, this very university would still enhance the importance of the free and autonomous type of the modern atheneums of America.

The "jus erigendi academias," it was stated as a conclusion, claimed three centuries ago on one side by the church and on the other by the state in continental Europe, when the foundations of the modern States were being laid, has foundered in the subsequent transformation of modern social organisms, and has become a tradition of the past.

The school of to-day must be independent, not only and capitally of the church, but even of the State itself, which, however progressive, has no claim on and no right to the control of science.

The learned of the United States will undoubtedly hail with favor the triumph of the reform so energetically prosecuted, although scarcely yet assured for Italy, under the enlightened leadership of Hon. Guido Baccelli and his colaborers.

## GENERAL REMARKS.

---

Special education for railway service is an innovation both in education and in railway practice. The subject has only recently aroused the interest its importance deserves. The ideas of railway men on the subject may be said to be very diverse. To only a limited extent have they crystallized into actual practice. For this reason a treatment of the subject at this time must be largely confined to description of proposed plans rather than extended systems now in use. The bearing of any education on railway practice is not fully conceded. Experience must always be so large a part of the training of railway men that special education in schools of railway practice can at best be only supplementary to the training received in the service. It must be closely related to the work done on the railroad and the plan of organization there prevailing. The largest side of the subject is the training had in the service. This involves the study of apprenticeships that now exist, and the system of promotion and tenure, because all railway employ is in very large measure apprenticeship. This is true because it is the spirit of railway organization that all positions in the service are open to the aspiration of the humblest. The subordinate positions are in line for the higher positions and furnish the training for them. The recognition of individual merit, the spirit of professionalism that prevails in the service, the methods of coincident instruction, of disciplining and promoting men, are all essential factors in this great apprenticeship.

The special education, as well as the general education, by the railroad, of the great body of men in the service, as contrasted with the special education of individuals, is so important in its economic bearings that its methods can not be overlooked. Such methods are the library, the reading room, the evening class, the traveling library, the instruction car, etc.

### RELATION OF HIGHER INSTRUCTION TO RAILROAD OPERATIONS.

In pure instruction every other idea is subordinated to the single purpose of teaching. By outside instruction we mean that which is conducted at a different time or place from the actual experience in railroad service. In this survey we do not include those forms of instruction which are purely educational and disciplinary, but those that are intended to be of definite and direct economic value. They must be judged by how economically they accomplish their particular purpose, and how closely the purpose, which is the finished product, is related to the actual needs which it seeks to meet.

The degree of civil engineer conferred on the class of Rensselaer Polytechnic Institute that graduated in 1835 was the first C. E. degree ever conferred in any English speaking country. The classical course and the humanities were slow in yielding their monopoly of the higher education of the country. The rupture began in the recognition accorded to mathematics. Perhaps the first marked cleavage in college work was at Union College, in the mathematical work which early became a specialty at that institution. But West Point, founded in 1802, was the first institution to lay special stress on mathematics in this country. It

has been called the "nursery of the early engineers." Previous to 1863 there had been established in the United States only four important scientific institutions, namely, the Rensselaer Polytechnic, at Troy, N. Y., the Lawrence Scientific School of Harvard, the Sheffield Scientific School of Yale, and the Chandler Scientific School of Dartmouth. Only one of these was a separate institution. But with the educational land grant of 1863 there was opened a new era for scientific and technical education. Institutions rapidly increased, so that in 1870 there were twenty-one of good standing. The progress was very rapid during the seventies.

In 1867 specialization in engineering began. In that year mining engineering was made a separate department, in 1870 mechanical engineering, and in 1885 electrical engineering. Engineering education, that began with pure mathematics and natural science, developed the theory of applied mathematics and applied science. But for a long time the student learned by instruction, not by experiment and demonstration in the laboratory. When finally the laboratory was set up, his education still was purely theoretical. About 1876 the agitation for a "practical" engineer, who should unite in one person the skill of the artisan with the scientific attainments of the engineer, brought fruit in an effort to supplement the theoretical training with shop practice or technical instruction. The impetus given to the movement was said to be due to the Russian technological exhibit at the Philadelphia Centennial Exposition.

Shopwork in connection with instruction has been developed under two theories. Under one theory, which is very ably demonstrated by Dr. C. M. Woodward in his manual-training school at St. Louis, it is simply one means, with many others, of training the whole man. It is primarily disciplinary. As stated in his own words, "An exercise, whether with tools or with books, is valuable only in proportion to the demand it makes upon the mind for intelligent thoughtful work. In the school shop the stage of mechanical habit is never reached; the only habit is that of thinking." Such a training, in its relation to acquisition, is defined in the further quotation from Dr. Woodward: "We have distinctly stated that our pupils do not become skilled mechanics, nor do we teach the full details of a single trade. The tools whose theory, care, and use we teach are representative, and the processes, employed just far enough to make every step clear and experimentally understood, equally underlie a score of trades."

The other theory is that education in the shop should be for definite acquisition. Where the acquisition requires a specific skill, and the training is more especially in mechanical habit, we have what is generally called industrial education. Where the object is to familiarize the student with how a thing is done rather than specific manual skill in a particular thing, and where the approach is from the scientific side, so that all construction is connected with general principles of design, we have what is generally called technological education. The term technical education is variously used, but if it could be given any exact meaning it would imply a shop education somewhere between the industrial and the technological. There are also theories as to whether the product of the student's work in the course of instruction shall be limited to the strictly commercial article, or whether it shall be simply what is made in experimental work and which is not intended to be sold.

When the necessity of technological instruction in connection with the engineer's education was conceded there arose a tendency toward a training which in some quarters was thought to be too technical, and perhaps it may be said that there has been a reaction.

The first engineers largely worked out their own applications of pure mathematics to railroad work. Except the comparatively few who had enjoyed a higher mathematical education, the great body of the early engineers were self-trained in a sort of apprenticeship. The Franklin Institute, of Philadelphia,

which was founded in 1826, did great service in assisting engineers who had not enjoyed larger opportunities. It especially taught mechanical drawing. But the great demand for field engineers for the location and construction of railroads stimulated the teachers of engineering to offer some special work in railroad surveying and bridge design and construction.

The first great problems were of construction, requiring accurate measurements and mathematical formulæ. The civil engineer was the man of exact measurements, scientific knowledge, and mathematical formulæ. He became a necessity. From his supervision of construction he passed naturally into the positions of administration when the road was completed and came into operation. Railroad operation, at least at the outset, was more especially a problem of dealing with major and physical things in a limited way than administration involving high order of organization and commercial detail. The engineer handled the traffic, maintained the roadway, and supervised the machinery, with the help of skilled mechanics. He was the only trained man in the service. While the volume of construction continued, as a general thing, he was the principal officer in the service.

The early railroad engineer developed his own railroad science. He brought to bear his mathematical and scientific attainments on every department. He not only built the roadway, but he made his locomotive drawings in some cases, devised the accounting, and dictated the traffic agreements. The mechanical work was largely done by rule of thumb. "The size of any part of a machine was guessed at," says Gen. Herman Haupt, one of the early chief engineers of the Pennsylvania Railroad, "and if it broke a larger part was substituted until the requisite strength had been found." But there was generally only one generation of managing engineers on a railroad. With their passing the young men who had grown up in the service and were without any special education took their places. As the mileage that had been under operation for a long time grew greater, the engineer became less potent a factor in directing railway practice throughout the country. On a few roads there was still maintained the policy of putting the direction of affairs in the hands of educated men. The only educated men for this service were the engineers. Thus on the Pennsylvania Railroad the civil engineer's profession was the avenue to promotion. But this was not so on many roads. The effect of this was to produce the "practical man," who had little use for anything to be learned in a school.

But if the uses for the civil engineer declined the field opened for the mechanical engineer. When the specialization in engineering began and the mechanical engineer was set apart, he did not come at once into railroad work. Perhaps this was due to the fact that the great body of rolling stock was not built by railroads but by private concerns. As explained by Prof. Wade Hibbard, "In the newness and vast expansion of American railroad business the general managers until recently did not feel the need of small economies, large though the aggregate might be, which the educated engineer alone could introduce." But these economies could not be long deferred. The scientifically trained mechanical engineer holds no longer a disputed place in the railroad staff. Very recently the importance and the special nature of railway mechanical work has come to be recognized, so that to-day several of our large technological institutions are offering special courses in railway mechanical engineering. Perhaps the specialization for railroad work in university instruction has been more fully realized to-day in the mechanical department than in the civil-engineering course.

That special railway education so far should be almost entirely confined to the engineering side was most natural. Specialization occurs more naturally in the field of exact science. The advantages to the railroad of higher-trained men are more immediately obvious and definite on this side of operation.

What shall be the character of the specialization in railroad subjects is yet very unsettled. It still is a matter of question in some quarters whether the professional school has taken the place of the college or is to follow the college course. The added specialization of railroad professional training has come in so recently that it has as yet little status. In some courses it begins in the third year; again it is little more than some electives in the fourth year of the course, and again it is a graduate year. The relation of the graduate year to previous work is defined in the catalogue of Sibley College:

The courses in the Graduate School of Railway Mechanical Engineering can be elected separately by seniors in other departments or by juniors who may have the proper preparation and time. It will not be possible to take the railway subjects of the graduate year without first taking the railway subjects of the senior year.

N. B.—It is particularly recommended and desired that at least one entire summer vacation, previous to taking any work in this school, be spent in the shops of a railroad or locomotive builder.

Specialization in the engineering schools is generally into study of the structures peculiar to railroads and their uses. Next it is a development of the inquiry as to the relative cost of materials and as to different types of construction and their efficiency under varying traffic conditions. Supplementing the special economics of the branch of railroad practice specially taught is usually a course in the general economics of railroad operation and railroad organization and management. Prof. W. F. Goss, of Purdue University, describes the method of specialization in technical schools as follows:

It may be noted that the modern view of a technical or professional course is one involving great flexibility. Such courses can no longer be made to embrace all the topics which their title would naturally include. As a result, we find courses arranged in parallel, all those of the same class dealing with the same fundamental subjects, but each differing from the others in the particular subject emphasized. It is noticeable, also, that one of the results of this arrangement is that in many cases the subject emphasized in school does not directly enter into the work of the engineer after graduation. There is no loss in this, for while he may have no use for the specialty, he will need to specialize, and his ability to enter upon new lines of work will have been strengthened by his research as a student. In other words, it appears that within limits the value of a university course, even when designed to serve a specific purpose, does not depend entirely upon the subjects it embraces.

There are sometimes special features added, as the course in railroad block signaling and the interlocking system at Rensselaer. Quoting from their catalogue:

A special lecture course on railroad signals has been added to the curriculum and is now given to the members of Division A. The various systems of interlocking are discussed and illustrated by diagrams and models, and different arrangements of tracks are provided with signals. Visits to and examinations of both electrical and mechanical block signals in the immediate vicinity are also made.

At Sibley College there is, in connection with the railway mechanical engineering course, a chemistry course in railway quantitative analysis, as follows:

*Chemistry—Advanced railway quantitative analysis.*—Two hundred and seventy hours of actual work in the laboratory, subdivided as follows, will be sufficient: The irons, 50; oils, 30; paints and varnishes for wood and for iron, 30; boiler-feed water, 30; feed-water compounds, 30; alloys of copper, tin, zinc, lead, antimony, phosphorus, 50; steam-pipe coverings, 20; waste, 20; sulphur in coal, 10. Also chemistry, course 10. M. E., 21, 30, 31. X. E., 21, 40 in railway equipment and supplies. E. E., 23, 31. M. D., 20, 21, 22. C. E., 10, 13, 38, roofs, cranes, and turntables, 39, 42. Law: Contracts, specifications, torts, corporations, carriers, patents. Political economy: Elementary 51, transportation 62, wages 55.

Other features of this advanced railway course of graduate work at Sibley are:

20. *Rolling stock.*—The design, construction, operation, and maintenance of locomotives, tenders, and cars. Four lectures.

21. *Locomotive designing*.—Fall and winter terms, elective spring.
22. *Seminary*.—Discussion upon previously assigned railway journals. Special papers and reports. Juniors, seniors, and graduates.
30. *Advanced railway mechanical engineering*.—Lectures and directed reading in amplification of course 20, taking up also shop arrangement, equipment, and methods, government of labor, drafting-room management, railway testing and test department, organization, methods, and records of motive-power department, foreign railway engineering, compound locomotives, freight-car design.
31. *Railway designing*.—Advanced work. Locomotive road testing.

#### HIGHER MECHANICAL INSTRUCTION SPECIALIZED FOR RAILWAYS.

The general nature of the railway mechanical engineering course is well described by Prof. Wade Hibbard, of the University of Minnesota, in a paper read before the Northwestern Railway Club, from which the following excerpts are taken:

In considering the place of railway mechanical engineering as a technical school study the question of time is at once confronted. The fundamental studies of the four years must not be neglected, which form the foundation necessary for whatever special engineering structure may afterwards be erected. A man who is given sufficient shopwork to make him not an expert mechanic, but familiar with shop processes and what can be accomplished by the molder, at the forge, and in the machine shop, and who has been thoroughly drilled in mathematics as a tool, practical physics, engineering chemistry, modern technical languages, drawing, the principles of the sciences of machine design, and of the action of steam and other motive powers—a man thus thoroughly grounded is more truly upon the road to success than one who lacks in this training and has had extensive instruction in the details of the profession he is going to follow.

It is, however, not necessary to omit these requirements. During the senior year much can be accomplished by using the time allotted to electives, to the Journal Club, to designing and drawing, to work in testing, and to the graduation thesis. This is the plan which, inaugurated by the writer a year ago in the University of Minnesota, has proved entirely satisfactory. To fill out the electives a course of daily lectures is given throughout the year upon the following lines, quoting from the catalogue:

Past and future development of the locomotive.

Materials of construction. Motive-power specifications and standards.

Locomotive and train resistance: The track from motive-power point of view.

The locomotive boiler: Types, proportions, details, accessories and attachments, grates and heating surfaces, lagging, fuels, smoke prevention, water circulation, testing, effect of temperature upon metals, shopwork.

The locomotive engine: Details, piston speed, reciprocating parts, bearing surfaces, link and valve motions, steam distribution, heat insulation.

The locomotive as a carriage: Limitations, frames, spring and equalizing rigging, journals, engine trucks and wheels, drivers and their counterbalancing, brakes, steam heat, cab.

The tender: Tank and attachments, wood and iron frames, built up and solid trucks.

Locomotive management: Engine loads, coal premiums, crew systems, expert instructions, wear limits and repairs, lubrication, performance sheets.

Compound locomotives: System and types, conditions for economy, cost of building and repairs.

European locomotive engineering and conditions of competition with American locomotives.

The domain and outlook for electric traction: The involved problems from electrical, railway, and business standpoints.

Drawing-room practice: Preparation, management, and classification of work, preservation of records, relations with the shops.

The shops: Their arrangement, tools, cost, and subdivision of power, labor paying, apprentices, reduction of costs and wastes.

The railway test room and test department: Inspection and purchase of supplies, service tests of equipment, relations of general storehouse.

The railway mechanical engineer and superintendent of motive power: Their qualifications and duties.

In these lectures the students are constantly being required to read articles in the railroad papers, the proceedings of the Master Mechanics' and Master Car

Builders' associations and of the American Society of Mechanical Engineers, complete files of which are always open to the men for free access. The literature of the railway clubs is, of course, found extremely valuable as recording the results of the most recent practice. The library of railway blue prints is consulted in illustration of both past progress and the present "state of the art." This collection, dating from 1867 and now numbering nearly 1,500, is being frequently enriched by large additions from the leading railroads and locomotive builders of the country, 85 drawings having just come from the Pennsylvania and West Shore roads. Visits to shops and road houses emphasize the facts of the lecture room.

The Journal Club meets weekly for discussion of the technical newspapers. Each member is allotted one weekly and, if possible, also one monthly, which he reads with care and reports to the club whatever of their contents he judges of sufficient value. As an example of the methods, a particular case may be taken. One paper has an article upon the uses and costs of compressed air in a railroad shop. A preliminary discussion by the club makes it evident to the instructor that a more extensive reading up upon the subject is needed by the members before it can be profitably discussed, and it is put over one week to permit this. Each member fills out a blank slip relating to each important item presented to the club, and it is placed in its proper alphabetical order in his private "card index" of technical information and references.

Designing and drawing is of course intended to teach the general principles involved in such work. Some special design, different for each student, so that more may be gained by the class as a whole, is taken up and carried through to its completion—such methods, with proper modifications for purposes of teaching, being followed as have been found successful by the writer in commercial drafting-room management. There are perhaps no problems involving such a variety of outlook and treatment as those relating to railway design, and if a senior develops a taste that way he may choose such a problem. It is the constant endeavor to keep the designer thoroughly in touch with the best railway work, having always in sight the limitations to strictly theoretical design which railway experience has found financially and practically to exist. Among the designs have been a locomotive boiler for lignite, connecting rods, crosshead, steam riveter, boiler suitable for car shop, equalizer and spring rigging, hydraulic shop or yard crane, and engine truck and brakes.

In locomotive testing, valuable experience was gained for the students in locomotive engineering the past year by road tests of five locomotives upon one of the lines leading out from the Twin Cities. These tests included the use of a dynamometer car, following completely the Master Mechanics' Association standard directions. Locomotive road tests are by far more difficult to conduct than stationary engine and boiler tests in the obtaining of trustworthy results. It is therefore not in any sense a loss if those students engage in them who do not eventually follow railway work.

In valve gears the latter part is devoted to the Stephenson shifting link motion as ordinarily found on locomotives, marine engines, and reversing stationary engines. It is first analyzed geometrically by the excellent Bilgram diagram, giving a close approximation to the desired result in steam distribution, and is then designed practically in all its parts by a full-sized model, largely after the Auchincloss method.

There thus has been described what is now being done in the State University without making any radical change in general foundation studies. As the demand increases for technical men in the railway service, the number of men desiring to study railway mechanical engineering will increase, and some modifications in the fourth-year course may be indicated in other ways. For instance, the work in valve gears and valve design might omit many types of high speed stationary design and then treat that most important part of the locomotive exhaustively. Thermodynamics would treat the locomotive much more thoroughly. Windmills and water motors would be omitted, and gas engines be but briefly examined. Problems in design could in lectures be related solely to railway work. The electrical laboratory would give manipulations and tests of electric railway appliances solely. The senior year in locomotive engineering would then be made to take a place similar to the senior year in electrical engineering at Cornell University.

It is, of course, apparent that the preceding scheme for locomotive engineering can not be expected to give the thorough teaching which the addition of a graduate year in railway mechanical engineering would permit. The latter would deal with the subject much more extensively, as well as intensively, and would permit the study of more of the problems that the railway mechanical engineers and superintendents of motive power are called upon to settle. Some of these

may be mentioned in a general way. It may be necessary to change to compound motives, and it must be decided which of the 25 types is best for the road. The department must be familiar with steel manufacture, particularly of boiler, axle, tire, and rod steels, as also the adaptation of steel and malleable iron castings and pressed steel to latest car and locomotive design. Stationary boiler design, chimney work, standardizing of equipment, selection of new equipment, frequent visits of inspection to the shops of the road or of other roads, car shops or locomotive works—these hint at the varied duties and responsibilities. In shop management modern methods of arrangement and equipment must be understood and practiced, electric, pneumatic, and hydraulic appliances used, each as most suitable, and the economics of labor must be studied. Electricity is recognized as a motive power and competition to be absorbed, and on short lines where passenger traffic is fast and frequent, with light trains and the line to itself, it will probably be necessary in the near future to have plans ready for its adoption. The general consensus of expert electrical and railway opinion is that for long distances or infrequent trains its possible adoption is very remote. The present efficient locomotive is capable of greater speed than the public is willing to pay for, than the signal system could safely permit, or more profitable traffic make way for. The cost of installation is a commercial hindrance, and even if installed, the low efficiency of intermittent and long-distance operation, interest on investment in costly power stations and large conductors, would give no saving over the present steam traction.

Turning to the plan for a graduate year, the arrangement of courses is made independent of the senior year, and would be suitable for a college attracting many graduate students from other institutions. The hours are credit hours per week, designing and testing requiring 2 hours' work for each credit hour:

	First term.	Second term.	Third term.
Locomotive lectures.....	5	5	5
Locomotive designing.....	5	5	5
Testing.....	3	1	3
General railway mechanical engineering lectures.....	2	2	2
Seminar work, railway journals, and thesis.....	2	2	5
Car lectures and designing.....	2	4	0
Elective, subject to approval, but preferably electrical engineering.....	3	3	2
Total.....	22	22	22

I have thus far referred solely to the technical studies that are apparently the most important. I feel that as an educator in the university of this great State I should be unmindful of my duty if I were to forget our aim to produce a symmetrical character in the young men coming under our influence.

At Purdue is a special railway mechanical engineering laboratory. A locomotive mounted on spools, instead of track, is subjected experimentally to all the running conditions of actual practice. Describing the work there done, in a paper before the New York Railroad Club in 1897, Prof. W. F. M. Goss says:

Purdue University has given careful attention to the matter of preparing men for positions with railway companies. Six years ago a locomotive laboratory was established, and since that time a considerable amount of railway mechanical engineering has been done. The scope has broadened each year, and it is expected that this process of natural growth will continue. It may be that in time we shall reach a four-years' course in railway management; but for reasons which I have already indicated, we do not at this time see our way clear to so comprehensive a scheme. The indications are, however, that if such a course is established at Purdue it will be an outgrowth of present engineering courses; that is, solid engineering subjects will underlie and bind together the other topics, many of which must be treated descriptively or by process of debate.

In further explanation of the work already accomplished, I may add a summary of the railroad topics which will be open to students in mechanical engineering during the next school year, a portion being required, while the remainder will be subject to election. The scheme is as follows:

1. *Railway equipment.*—Recitations and lectures on locomotive construction; principles of locomotive design; a comparative study of locomotive details; car design; train brakes and signals, and car lighting, heating, and ventilating.

2. *Locomotive performance.*—An analytical study of the performance of simple

and compound locomotives, as shown by the results of road and shop tests, and a study of conditions affecting locomotive efficiency.

3. *Laboratory work.*—(a) Locomotive testing, involving practice in taking all observations incident to complete efficiency tests of locomotive "Schenectady," and in working up observed data obtained from such tests; also tests of Purdue's Baldwin compound locomotive engine. (b) Locomotive tests in series, arranged for the purpose of showing the effect upon the efficiency of the machine, of changes in the proportion of parts, or of changes in adjustment or condition. (c) Tests to determine the performance of air pumps, of several elements of the Westinghouse brake system, and of systems of car lighting. (d) Tests to determine the strength and other physical properties of various elements common to railway construction, such as links, pins, turn-buckles, axles, channels, rails, and rail joints; also tests of standard specimens of different constructive materials.

4. *Locomotive design.*—Drawing-room practice in the design of locomotive details and in calculating their strength and deflection.

5. *Railway chemistry.*—Lectures and laboratory practice concerning the general application of chemistry to railway interests; the chemistry of iron and steel; the chemistry of fuels, water, lubricants, and paints; and concerning chemical requirements in specifications.

6. *Railway economics.*—Lectures on the industrial importance of the railways, their business management, the railway and the labor question, the interstate-commerce act, and railway rates.

7. *Railway law.*—A series of lectures on the rights and liabilities of the railroad and the rights of the public.

8. Special lectures to be given by men eminent in their profession, representing different departments of railway organization, upon subjects relating to their department.

#### CIVIL ENGINEERING SPECIALIZED FOR RAILWAYS.

As a general description of the civil engineering course specialized for railways, there is given below a statement by Prof. N. O. Whitney of the work done at the University of Wisconsin:

Our railway course is included in the general civil-engineering course, and was organized by me eight years ago, when the board of regents of this university appointed me to the chair of railway engineering. This is the only such chair, to my knowledge, in a technical institution, except that in the Massachusetts Institute of Technology.

The aim of the course is to prepare our graduates for the engineering, transportation, and operating departments, and not for the motive-power department in particular, although we have an excellent mechanical engineering course. Our railway course begins in the junior year and extends through both junior and senior years. Starting with the actual laying out of a few miles of line in the neighborhood, the students do all the work necessary to locate and build such a line—obtain right of way, let contracts, make monthly and final estimates of various work, detail plans, etc. This is followed by lectures and assigned readings on maintenance of way, standard structures, and safety devices, including signaling. In the senior year the economics of railroad operation, the sources of income, operating expenses, nature and extent of influence of alignment and traffic upon net receipts, train resistances, classification of locomotives and rolling stock are studied. Opportunity is afforded of electing several other courses of advanced railway work along the same lines, both in technical and in historical and economic lines.

The four-years' course in civil engineering requires about 4,200 hours' attendance, nearly 60 per cent of which is required to cover languages, mathematics, physics, chemistry, mechanics, and preliminary studies; the remaining 40 per cent being devoted to specific studies in engineering, subdivided as follows: Fifteen per cent topographical, 7 per cent structural, 7 per cent railway structural, 8 per cent railway, 2 per cent steam, 2 per cent electrical engineering.

In further description of the work done at the University of Wisconsin, Professor Meyer writes:

As to our regular courses, in the engineering departments, besides the fundamental branches usually given in civil engineering courses in our best universities, viz, shop practice in wood and iron, surveying, drafting, mathematics, mechanics, testing of materials, physics, chemistry, geology, astronomy, structural design, short courses in steam, electrical, and hydraulic engineering, sanitary

engineering—all which lead up to specific training in railway construction, operation, and management, we offer and give courses in railway reconnaissance, surveys, location, construction (including tunneling), maintenance of way (including signaling), and operation.

Under "operation," the following are studied: Sources of income; operating expenses; relative values of distance, gradient, and curvature, and their influences upon net receipts; classification of locomotives and their relative power, rolling stock, and train resistances; trunk lines and branch lines; the improvement of old lines; terminals.

But, for the most part, railway specialization in the civil engineer's course is not carried out to the same degree as in the mechanical engineer's course. We quote Prof. J. C. Nagle, of the Agricultural and Mechanical College of Texas:

Our technical schools are prepared to give general training along civil engineering lines, but so far as railway track work is concerned, it has thus far been general only. Of course the underlying principles necessary for the understanding of all engineering operations must be given, together with such laboratory and experimental work as will familiarize the student with the uses and strength of materials of construction. But no institution, as far as I know, has as yet made any very extensive effort to familiarize students with the many details of track work. As regards the details connected with the maintenance of way, it is difficult to secure even descriptive literature, to say nothing of experimental knowledge, of the subjects treated.

#### HIGHER COMMERCIAL INSTRUCTION SPECIALIZED FOR RAILWAYS.

Among the later movements in education is that for higher commercial education. It may be said to bear the same relation to those courses of liberal education in history, politics and economics, and sociology that the technical courses do to those in pure science and mathematics, which they follow. Perhaps the transition has not yet been so far accomplished as to warrant the claim that an applied science of these principles has been worked out, but this is the goal toward which it tends. They aim to reduce to effective business usefulness the theories of these sciences, and connect them with the uses of the world. This idea is not a new one in Europe. Commercial education has there come to be a recognized factor in exploiting and holding the trade of a country.

In this country the pioneer in the movement was the Wharton School of Finance and Economy of the University of Pennsylvania, which was established in 1881. In 1898 the Chicago University and the State University of California each inaugurated a "College of commerce," and the authorities of the University of Missouri have such a course under contemplation. Something analogous is the School of Jurisprudence and Diplomacy, established at Columbian University in 1898. These schools bear to the business schools something of the relation of the higher technical schools to the trade schools.

They do not fit for specific occupations immediately, but offer the equipment that with ready adaptation can be turned to practical use. As expressed by Prof. Emory R. Johnson, of the Wharton School of Commerce of the University of Pennsylvania:

The ideal should not be to train pupils in the arts of business; the aim should not be to turn out skilled clerks, but young men with an education that will enable them in due time to take their place in the ranks of educated business men. Before the would-be physician begins those studies which have to do with the art or practice side of his chosen profession he takes a course of study whose core is made up of certain natural sciences. He studies the interaction of forces in that large world of life of which man is a part, that he may understand the relation of man to that larger world and be able to know and deal intelligently with the forces which control man's physical well-being. Similarly, the boy who expects to enter some particular field of business needs to study the laws and forces which obtain in the larger realm of business, and to analyze the political and social forces which dominate the social world in which he is to live and carry on the special business of his choice.

It is possible that in time these schools will offer special courses as do their prototypes in Europe, in connection with commercial museums and commercial laboratories, both physical and chemical, fitting for the grocery trade, wine trade, etc.

In the commercial colleges railroad subjects naturally occupy a larger place than in the ordinary academic courses of the university. The Wharton School of Commerce has a department of transportation under the deanship of Prof. Emory R. Johnson. The University of Chicago also has a course in transportation. The catalogue describes the nature of the work at the Wharton School as follows:

At the University of Pennsylvania the course of finance and economy of the Wharton School extends through four years and leads to the degree of bachelor of science in economics. The studies are grouped under the heads of public law and politics, business law and practice, economics and social science, journalism, history, logic, ethics, English, German, and mathematics.

The practical purpose of the course lies in its outlook toward certain definite careers of public life. The course has been arranged to give the future man of affairs an elementary knowledge, at least, of the complex problems of modern life. It was early perceived that the groundwork of such a course should be training in politics and economics. Around this basis has been grouped work in history, logic, language, and mathematics, as well as special work in transportation, commerce, banking, journalism, and kindred topics.

The courses bearing on railways are:

*Commerce.*—A study of the political and economic forces that have controlled the world's commerce since the fifteenth century. The last third of the course is devoted to American commerce, lectures, reports, and readings.

*Theory and geography of commerce.*—A study of the theory of commerce. Commercial products and foreign trade of the United States, and of the principal commercial countries. Chisolm's Commercial Geography.

*Physical and Economic Geography.*—A study of elementary physical geography and geology, and their relation to the industrial and social life of the people of the United States, Tarr's Elementary Physical Geography, Monographs I to IX of the National Geographic Society. Lectures, essays, and readings.

*Transportation.*—A study of railway transportation, inland navigation, and ocean shipping, with special reference to the United States. Lectures, essays, and readings.

At the University of Chicago the College of Commerce occupies the second two years of the university course of four years. The strictly transportation work is comprised in three major subjects for one-fourth year each. One-third of the time must be given to these, another third is optional within a certain limited range of coordinate subjects, and the remaining third from anything in the general department.

The general purpose of the work is explained in their catalogue:

The purpose of the new college, like that of those already existing, is twofold: First it aims at the attainment of general culture. In the second place, the weight of work is put in the lines of the courses offered by certain specified departments. In the new college those departments include political economy, political science, history, and sociology—in the other colleges the distinctive work being in the classics, modern languages and literatures, and science, respectively.

The courses of study afford instruction concerning the place of America in the general development of civilization; the origin and characteristics of our national institutions; the physical resources, moral traditions, and intellectual standards of our country; the commercial, domestic, and foreign relations of our industries and our politics; and the principal economic, social, and political problems which confront the leading nations of the world,

It is intended by the College of Commerce and Politics to provide for those whose tastes lie along the particular lines indicated, and at the same time to open a way for special training in the direction of certain forms of business, of politics and journalism, and of diplomacy.

The college is by no means a technical school, but is intended to give a kind of knowledge and training which may enable those who enter commerce, politics,

journalism, or diplomacy to begin their work with a certain degree of special equipment.

Those who develop an especial aptitude for the subjects pursued will in many cases continue their work in the Graduate School.

The courses in railway subjects are described as follows:

*Processes of leading industries.*—The student who proposes to prepare for a career as a railway manager, a manufacturer, or as a banker should be familiar with the essential parts in the processes of production of the several leading articles of exchange. These processes are interwoven with the imposition of custom duties, and with the changes in price which are constantly taking place. The interdependence of industries is so great that adverse conditions in one will show an influence on many or all; and an understanding of the methods followed in the leading industries will give a larger power and broader judgment to the man of affairs. At the same time it will give a knowledge of the manufacturing resources of our country. Study will be made of the materials used, the machinery employed, the economic ordering of the manufacturing plants, their financial management, and the methods of handling and marketing the products. It is intended to show the operations in such industries as those of iron and steel, copper, petroleum, sugar, cotton, wool, flouring, shipbuilding, boots and shoes, meat products, harvesting machinery, the locomotive, and the like. The course is also recommended to economic students in general having had little previous experience in practical affairs, as providing data for their assimilation of principles. The grouping of so many large industries in Chicago will give to the student unusual facilities for making personal investigations. This course does not require a previous course in economics.

*Railway accounts, exchanges, etc., lectures, reading, and reports.*—A study is made of the financial methods of leading railways as shown by an analysis and examination of their accounts. In the interests of both investor and manager the training in methods of railway accounts and auditing will be valuable, but this can be done to advantage only after taking the courses treating of the general problems of railway management (railway transportation and comparative railway legislation).

Together with this work, grouping allied topics, the student will be trained in a study of the construction of bond tables, the causes regulating the prices of bonds and railway securities at home and abroad, the calculation of foreign and domestic exchange, and an introduction to annuities.

*Comparative railway legislation—Lectures, reading, and reports.*—It is the aim of this course to give the student who has already passed satisfactorily course 12 (economic theory) a study of the development and present nature of the railway systems of Great Britain, France, Germany, Austria-Hungary, Russia, Brazil, and Australia. From this comparative examination it will be learned what light the experience of other countries will throw upon our own railway problems.

*Railway transportation—History and development of railways—Theories of rates—Combination investments—Speculative managements—State ownership or control—Lectures, reports, discussions, and readings.*—The economic, financial, and social influences arising from the growth of modern railway transportation, especially as concerns the United States, will be discussed. An account of the means of transportation developed in Europe and America during the early part of the century, the experiments of the States in constructing and operating canals and railways; national, State, and municipal aid to private companies; the rapid and irregular extension of the United States railway system in recent years, with some attention to railway building in other countries, will form the historical part of the work. A discussion of various theories of rates; competition, combination, discrimination, investments, speculation, abuse of fiduciary powers; State legislation and commissions, and the interstate-commerce act with discussions under it; and the various relations of the State, the public, the investors, the managers, and the employees will form the most important part of the work. A comparison of the United States railway system with those of other countries will be made with special attention to the problems of State ownership.

This course gives a general view of the subject. Students who wish to continue the work by investigating special problems will have an opportunity to do so under the guidance of the instructor.

The graduates from these courses so far have become teachers, publicists, journalists, and business men, but only a very few have gone into railway service. But it is too soon to judge what part they may ultimately have in railroad operation. That the railways are alive to the practical bearing of the courses there taught

is evidenced by the recent selection of one graduate as economist and statistician of a great railway system in the Northwest. Their training would fit for the accounting, the financial, and the traffic departments. It should also furnish experts in special investigations and in the management of any sociological efforts, as relief, superannuation, and insurance funds, and as assistants to executives. While such talent could be of great value on railroads at present, it is not a need that is generally conceded. For some time it is probable that the supply of men will be too far advanced of the general practice in the organization of railway staffs to receive substantial recognition.

#### UNIVERSITY AND COLLEGE INSTRUCTION SPECIALIZED FOR RAILWAYS.

So far as railroading, specifically as railroading, is taught in the colleges (I mean outside of the technical engineering schools), it is treated in the department of political economy. There it is treated only on the side of the relations of the railroads to each other, to the citizen, and to the State; railroads are considered in the sociological relations, which after all is the most important part of the whole subject.—H. G. Prout, editor Railroad Gazette.

Transportation occupies so large a place in all commerce, economics, and sociology that no course can go far without touching on the subject in some way. Thus, all the universities that offer courses in economics that are in any way thorough devote some of the lectures to railroads. At Yale, Prof. A. T. Hadley, who is so well known as author of the excellent treatise, *Railroad Transportation*, conducts a course in transportation. At Harvard is Professor Taussig, whose name is specially connected with transportation economics. At Cornell one term is devoted to transportation, with text-book, lectures, and reports. There is also a course in economic and commercial geography, which bears directly on the subject. At Ann Arbor, Prof. Henry C. Adams, the statistician of the Interstate Commerce Commission, conducts a course in the "Railroad Problem." Leland Stanford University offers a special course every second year, and enjoys considerable prestige as having the finest railway library in the country. Even Smith College for women conducts a course in transportation.

As a sample of the character of the work done at some of the universities we give below a topical outline of the lecture course by Professor Meyer at Wisconsin University, in the School of Economics:

#### RAILWAY TRANSPORTATION.

##### *Preliminary survey and general considerations.*

1. The nature of this course.
2. The beginnings of railway building.
3. Internal improvements in the United States.
4. The railways of the world.
5. Examples of notable railway undertakings.
6. What is a "railway"?
7. Classification of railways.
8. Influence of railways:
  - (a) Economic.
  - (b) Political and social.
  - (c) Educational, scientific, and æsthetic.
  - (d) Military.
9. The relation of railways to the public and to the State.

##### *Railway history and administration.*

1. The leading railway systems of the United States.
2. Leading systems of foreign countries.
3. Railway charters.
4. The administration of a typical American railway.
5. Prussian railway administration.
6. Railway administration in England and other countries.
7. Railway clearing houses.

*Railway rates, theory and principles.*

1. The place of railway rates in economic theory.
2. The various principles on which the administration of railways may be based.
3. An analysis of the services which railways perform.
4. Characteristics of transportation objects in their relations to railway equipment and service.
5. Measurement of the relations between transportation objects and railway service.
6. The formation of railway rates.
7. Different systems of railway rates.
8. History of classification.
9. What is a reasonable rate?
10. The effects of changes in rates on persons and goods.
11. The postal principle in railway transportation.

*Railway rates, practice and machinery.*

1. The history of railway competition.
2. Railway pools and consolidations.
3. Traffic associations.
4. The classification of freight.
5. Classification in passenger traffic.
6. Passenger tickets.
7. Scalping.
8. Free baggage.

*The regulation of railways through State authority.*

1. The various methods of railway regulation.
2. Early general railway legislation in the different States.
3. Early general railway legislation in Wisconsin.
4. The Grange movement.
5. The Potter law.
6. Amendment of the Potter law and subsequent legislation.
7. State commissions. The Wisconsin commission.

*The regulation of railways through Federal authority.*

1. The history of Federal railway legislation.
2. The interpretation of the courts.
3. Reports of the Windom, Reagan, and Cullom committees.
4. Methods of discrimination. Just and unjust discrimination.
5. The Congressional debates on the act to regulate commerce.
6. The interstate-commerce law.
7. The interpretation and enforcement of the interstate-commerce law.
8. Amendments to the act.
9. Important decisions of the Interstate Commerce Commission.

*Railway financing.*

1. Railway securities.
2. Railway land grants.
3. Railway crises.
4. Railway receiverships.
5. The Pacific Railway debt.
6. The taxation of railways. History and theory.

*The railways and their employees.*

1. Railway labor. Legal relations of employers and employees.
2. Injunctions.
3. Railway accidents and safety appliances.
4. Railway relief and insurance.

*Special service.*

1. The Railway Mail Service.
2. The express business.

*Foreign railways.*

## General description.

Thus the colleges are recognizing the railroads not merely as a factor in the student's general field of economics, but as a profession holding out a life career to the graduate. Mr. Walter G. Berg, principal assistant engineer of the Lehigh Valley Railway, says of these extensions of college work which mark the first stages of the transition to a special course:

Every attempt to extend the scope of our colleges so as to prepare men more specifically for the higher general railway profession should be considered as the second important step to be taken in the solution of the problem before us, thus filling one great void in our present educational system. Our mechanical, civil, electrical, and mining engineers, our architects and lawyers, who enter railroading after graduation will be not only specialists in their particular profession, but will possess a broad knowledge of the general principles underlying the railroad business, while the special graduates in the course devoted to the general railway profession proper will furnish to the executive, financial, traffic, transportation, and general railroad departments much valuable material to be shaped into future managers and leaders in railroad circles.

The number of men who pass from the academic courses of the universities to railway service is most inconsiderable. From a large number of inquiries the only answers received are given below:

*Harvard, class of 1896.*—Murray Forbes, Pennsylvania Railroad; J. T. Hayes, Boston and Maine Railroad, auditing department; A. S. Ingalls, Cleveland, Cincinnati, Chicago and St. Louis, transportation department; A. Howland, Mexican Central; H. R. Storrs, Seaboard Air Line, general inspector.

*Class of 1897.*—"To my present knowledge, but few of my classmates are in the railway service."—Class secretary.

*Class of 1898.*—"I have no definite record of any of my classmates being connected with the railway service. Three or four men signified their intention of taking up railroading, but whether they did so I can not say."

*Amherst College, class of 1897.*—Two out of a class of 100 have gone into railroad service. One is a large stockholder in the Canadian Pacific Railroad and is in the general offices of that road. The other is in the chemical laboratory of the Philadelphia and Reading Railroad.

*Dartmouth College, class of 1897.*—One man out of a class of 114 entered railway service. He is in the freight department of the Vermont Central.

*Specialization by lectures by practical railway men.*—Many institutions are able to intersperse and supplement the theoretical instruction of their regular teaching corps by talks by practical men, each speaker describing his special department. This gives the student insight into practical conditions of administration. The talks bear more especially on the organization and general methods of the work in each department than technical detail. They have been given both in connection with economic studies and with engineering courses. Naturally those in connection with the economic courses bear more on organization and general principles. Those lectures to the engineering students bear on methods and things, if any distinction may be said to exist. At Cornell the past year Mr. W. H. Baldwin, jr., president of the Long Island Railroad, has delivered to the students in economics a series of eight lectures on railway management. At Wisconsin University the lecturers and subjects for the past two years have been:

J. N. Barr, superintendent Chicago, Minneapolis and St. Paul Railway; subject, "A screw loose."

G. H. Noyes, LL. B.; subject, "Law of common carriers."

H. M. Sperry, National Switch and Signal Company; subject, "Railway signaling."

Onward Bates, superintendent bridge and buildings, Chicago, Minneapolis and St. Paul Railway; subject, "The superintendent of bridges and buildings."

W. E. Baker, general manager Metropolitan Elevated Railway; subject, "Electrical equipment for elevated railways."

O. W. Wason, president of Cleveland, Painesville and Eastern Railway; subject, "Interurban electrical railways."  
 Also several lectures from L. F. Loree, general manager of Pennsylvania lines west of Pittsburg.

*Lecturers in the department of mechanical engineering, Purdue University.*

For the year 1897-98:

J. T. Brooks, second vice-president Pennsylvania lines west of Pittsburg. "Problems in the management of a railway system."

Frederic A. Delano, superintendent freight terminals, Chicago, Burlington and Quincy Railway Company, Chicago. "Signaling."

Addison C. Harris, attorney at law, Indianapolis. Three lectures. "Relation of railroads to the State," "Railroads and the people," "Railroads and their servants."

Melville E. Ingalls, president Big Four System, Cincinnati. "Railways; their past, present, and future."

John W. Noble, ex-Secretary of the Interior, St. Louis, Mo. "The mutual obligations of railroad corporations and the people."

Robert Quayle, superintendent motive power and machinery, Chicago and Northwestern Railway Company, Chicago. "Business problems of the motive-power department."

Godfrey W. Rhodes, superintendent motive power and machinery, Chicago, Burlington and Quincy Railway Company, Aurora, Ill. "Experience in the motive-power departments of railroads."

Angus Sinclair, editor Locomotive Engineering, New York City. "Reminiscences of a locomotive engineer."

Arthur W. Waitt, general master car builder, Lake Shore and Michigan Southern Railway Company, Cleveland. "Car designing and construction."

For the year 1898-99:

W. H. Baldwin, president Long Island Railroad Company, New York. "The routine of a railroad president."

Jacob N. Barr, superintendent motive power, Chicago, Minneapolis and St. Paul Railway Company, Milwaukee. (Subject to be announced.)

Charles B. Dudley, chemist, Pennsylvania Railroad Company, Altoona. "The application of chemistry to the railroad."

S. M. Felton, president Cincinnati, New Orleans and Texas Pacific Railway Company, Cincinnati. (Subject to be announced.)

William Forsyth, mechanical engineer, Chicago, Burlington and Quincy Railway, Aurora, Ill. "The part of a mechanical engineer in the organization of a railway."

Addison C. Harris, attorney at law, Indianapolis. "Railway law."

E. M. Herr, superintendent of motive power, Northern Pacific Railway Company, St. Paul. "The construction and maintenance of railway equipment."

J. F. Wallace, assistant second vice-president, Illinois Central Railway, Chicago. (Subject to be announced.)

#### SPECIAL UNIVERSITY RAILWAY COURSE.

With the close of the epoch of railroad construction the civil engineer has been largely crowded out of general administration by men who have not been professionally trained, but who have grown up within the service. The duties of the office have become highly administrative. Commercial talent has come into greater demand. But all of this has been developed within the ranks. There now comes forward a proposition to recognize these changed conditions and train men professionally for this specific service. It involves in this country much of the novelty of higher education in business. But it goes further and proposes to specialize in one particular business.

While the need has not been actually met, it has been much discussed, and a movement is already on foot for establishing such a course at one of our leading universities. The claim of the promoters is that mechanical and civil engineering courses, or even commercial courses, are not to be superseded, but that they are for the education of the railway specialist, not that of the general manager or administrator. They insist that the varieties of talent employed by railways

have become so highly specialized that there has arisen need for the man of a comprehensive general training in the organization and general principles of administration.

Such training involves education in methods, organization, sociological and economic principles, laws, usage, industrial and commercial conditions, etc. They would make general administration a specialty.

At the meeting of the New York Railroad Club in January, 1897, this subject was very ably presented by Mr. George B. Leighton, president of the Los Angeles Terminal Railway. The thoroughness with which it was discussed at that meeting, and the representative character of the railway managers present, give to their expressions especial importance:

Mr. Leighton, in presenting his views, said:

The course as herein planned is under consideration at Harvard. It will be divided under several headings, the whole requiring several years' work, and the graduate will receive some proper degree. The first year would be devoted principally to subjects which belong to any course of liberal education, such as modern languages, history, and political economy. During the second year a beginning will be made of subjects pertaining directly to railways, and the third and fourth years wholly devoted to railway and transportation subjects.

The following titles suggest themselves under which most of the instruction would naturally be grouped:

1. Economics:

(a) Historical—Relating to the conditions of commerce prior to the advent of railways. Transportation and distribution in 1800, both by land and water. Limitations of commerce and travel.

(b) Traffic—The principles governing traffic, especially in relation to various kinds of commodities. State and other railway commissioners; their history and necessity and duties. American and foreign commissioners; how they may be of great assistance to the corporation and public, or disastrous to the interests of both.

(c) Social—The railway as a social factor, showing the conditions of harmonious relations with the people and with the authority of the State; the government control or regulation of railways at home and abroad.

(d) Labor—The relation of labor to railways. Labor organizations, beneficial and harmful. Examples of profit sharing. Future relations as reviewed to-day.

(e) Geographical—Difference in geographic conditions affecting traffic, such as Eastern system of dense traffic and those built in advance of actual need in the West. The difficulties attending operation of light traffic over long distances.

2. Legal:

(a) Position of the railway under the common and statute law—What a railway may and may not do. Leases and ownership of other lines from a legal standpoint. Receivers; their duties and responsibilities. Liabilities to the State and individuals.

3. Business management:

(a) The operation of the railway—Duties of various officers, and their relations to each other. Detailed study of organization, with special study of approved examples in America and Europe. Duty of general manager. The economical handling of traffic from an operative standpoint. The telegraph as used on railways.

(b) Financial—Railway accounting. Study of some approved examples, with remarks on other methods. Duties of treasurer and auditor. Capital and securities of railways. Bonds, stocks, car trusts, etc. The status of the holders of these to the control of property.

4. Mechanical:

(a) Machines—The locomotive, steam engine, dynamo, and motor. Conditions under which the work must be done. Cars and their moving parts.

(b) Equipment—The adaptation of it to the work in hand. The varying demands of traffic necessitate material differences, but the elements of efficient equipment now fairly understood.

5. Civil engineering:

(a) Historical—Development of the tramway from the cart road, and the further development of the modern railway. The surmounting of early difficulties, public opposition, and the lack of proper track and equipment.

(b) Location—Fundamental principles of economical permanent ways. Proper location of line. Grades; their effect on operation.

This was intended as a professional course, which preferably should only be taken after the regular course at college, but that was not essential. The outline was purposely most meager, in order to invite the fullest discussion and suggestion. There was some criticism that it was too broad, and again that it was not broad enough. Some doubted the recognition that men who were trained in this way would get from the managers to whom they would look for employ. But for the most part the comments were in support of the position that there was such a need and that this was very definitely in line of its solution. The day of the uneducated man had passed. This had been proved in the technical department of the service, and it was already assured in the general administration.

A feature incidental to Mr. Leighton's plan, but left to be brought out by others, was the fact that it proposed a fitness which, in the ordinary course of events, came into play only long after the man entered the service, and then rather as an incident than as the direct purpose for which he was employed. But in the interest of the best railroad management the difficulty reduced to a very simple question, as stated by Mr. W. H. Baldwin, president of the Long Island Railroad: "Can not men with broader education be injected into the service, and can not we get those men into particular branches of the railroad to do those particular things that belong to such branches?" This plainly is the problem of the railroad manager, not of the educator.

Touching on this special education of railway men for administration, Mr. H. S. Haines, for many years president of the American Railway Association, writes:

The subject of fitting educated young men for railway service is one in which I have felt a great interest. Here seemed to be a field as yet not sufficiently recognized, either in the interest of young men or in that of the railroad corporations. I do not refer to the positions which call for special technical knowledge, but to those in which mental discipline and some general culture would add to efficiency in an office of administration, of accounts and statistics, of traffic, or of transportation. Such places are generally filled by promotion of youths who have been office boys, etc., and who in those humble positions have acquired a certain facility in the routine in which they have been employed that induces their superiors to promote them as occasion may offer, rather than to be put to the trouble to train better educated men for the same places.

As a fact, a college graduate entering business life fresh from academic groves is not only without a business training, but he is in a measure wrongly trained. He has first to rid himself of the attitude that he has before assumed toward the outside world. He must become painfully conscious of this before the habit of mental discipline and the substance of the culture which he has acquired in college will be available for himself or for his employer.

This is not surprising in the young graduate, since in my limited opportunity for observation I have found his teachers equally unconscious of it. I had occasion some years ago to discuss this matter with a professor in one of our principal universities. In the course of our correspondence I submitted to him a list of subjects on which I thought that a young man should be informed who was about to enter railway service. In return he sent me a list of the subjects which he thought better suited to the purpose. My list referred to matters of everyday routine with which even an office boy would be familiar, yet which are but partially understood outside of the railway service. The professor's list included, as I remember it, an inquiry into the origin and development of traffic by rail, the relation between the railway and the state, the rights of labor unions, and some other politico-economic subjects to which the average railway is entirely indifferent or antagonistic, or on which the college teachings, if upheld in a railway office by a subordinate, would be more likely to preclude him from promotion than to help him along.

The relation of the administrative to the technical course was described by Mr. H. G. Prout, of the Railroad Gazette, at a meeting of the New York Railroad Club:

Granting the value of thorough education in the schools, we are not here to discuss the special education which fits a man to be a railroad civil engineer, a railroad mechanical engineer, a railroad lawyer, or railroad doctor.

But there are other branches of railroading for which almost no provision is made in the colleges. For example, there is a branch of railroading much more difficult than engineering, much more difficult than law, because it includes more variables; much more important, because it involves the very life of the railroads and the life of modern society itself. I mean that branch which is handled within the railroads by the traffic departments; in their relations to each other, by the traffic associations; and which the railroad commissioners of the States and of the nation attempt to handle. The great branch of the art and science of railroading is practically untaught, except by a few fragmentary lectures in a few of the colleges, and a large part of the college teaching is bad, for a reason that I shall mention later.

Many railroad men say that this part of railroading can not be taught except by experience; that the variables are so many that the problems can not be generalized. This is partly true, but it is also true that a great deal of human experience has been gathered and might now be made useful to the men of the traffic departments, to the men in the railroad commissions, and to the teachers in the colleges. Specific questions of rates which arise, and which are fought over in the associations and before the commissioners, have arisen time and again in the last twenty-five or thirty years and been fought over. A few competent college lectures which would group and generalize these questions, which would teach a man where to go to find the records of past fights, would go a great way to prevent waste of time and of human energy, both in the form of actual work and stored in the form of money.

Another special branch of railroad education is that of organization of the working force and the distribution of powers and duties. This is a field in which competent general instruction, given in the years when a man is preparing for his work, might often be of great assistance in his after life. I know that railroad officers will tell you that every organization, to have its highest efficiency, must be largely special; it must be adapted to the specific work which it has to do and to the actual men available. That is true; but the man who is undertaking to evolve the most efficient organization for his own railroad can not neglect, and if he is a man of sense he will not neglect, the organizations of other roads in his own country and of roads in other countries.

Again, there is a whole unwritten and unformulated science of yards and terminals and sidings. The officers of each railroad go on working out their own systems from within their own intelligence, or collecting with a good deal of difficulty a few examples of what other men have done, and so modifying their own schemes. Surely they could start easier and go on with less effort if the work of collecting, comparing, and coordinating and generalizing had been done beforehand by a specialist, and if they had been made somewhat familiar with this work before they got into actual railroad life.

Much the same can be said of signaling. It is only within a very few years that the majority of railroad men have realized that there are certain well-established principles in signaling. Indeed I am not sure that the majority of railroad men to-day recognize that there are any established principles in this art; but every active railroad officer of intelligence has some time or other regretted that he had not been made familiar with the fact that there are principles which govern the application of signals, and been made familiar at least with the sources of information with regard to this art.

The young men who come out of the schools in mechanical engineering have received a very valuable training in machine design and steam engineering, but they, as a rule, know practically nothing of the relations between steam engineering and the work to be done by a locomotive on a railroad track. The loading, the manning, the care of the locomotive, the adaptation of it to the special work to be done in special cases—all this is to them an entirely unexplored field. They have learned their multiplication table, and some of them can use it with considerable facility, but it is still an abstraction.

These examples suggest a few of the directions in which preliminary teaching might be profitably given to the young men who aim to go into railroading as a profession. But now comes still another question. Is it desirable to try to take all these many branches of applied science and of social and business economics, and attempt to coordinate them into one general four years' course which shall fit a man to be a railroad officer? Presumably it is desirable if, first, such a course will better fit him for the vocation of railroading, and, second, if those of whom he may seek employment later recognize that the chances are that he is better fitted than the man who has had no such course. That is, will a university railroad course make a man a better railroader, and will it increase his value in the market?

It seems as if both of these questions answer themselves. Given a young man

whose mind has been cultivated, whose faculties have been developed, whose outlook over human affairs has been broadened by a fairly good college course in the languages, in history, in English literature, in mathematics, and in the physical sciences, and who has added to that a considerable special education in those branches of the railroad art to which I have already alluded, and in a dozen more, and one would say that he has an excellent preparation for taking a position as a clerk in a freight office, or as an assistant in a station, or as a secretary in the office of an operating officer, or as a supervisor in the track department, or in some other very subordinate place. We may take it for granted that, other things being equal, he will go faster and go farther than a young man who has had no college education at all, or than the young man who has gone through his four years' course with the general notion that he was cultivating his mind and strengthening his faculties.

But the contention between the technical school and the school of law and economics as to which form of training better leads up to the highest administrative positions, is an old one. In Germany, where systems of promotion are very rigid, there has been recently waged a war of pamphlets. A candid statement of the case by the technical man is the following by Prof. W. M. F. Goss, of Purdue University:

Economics and law are fundamental subjects and can not be omitted; but I doubt if they have any better claim to emphasis than questions of operation or matters of equipment.

I have already intimated that the process of establishing a course of railway management is less simple than would appear from a published outline. Facts alone will not make a course of instruction, and it requires time to convert facts into principles and to group principles into systems for students' use. Moreover, no single course can successfully stand alone. It must have affiliation with other courses, from which it may draw support, and its own character will depend largely upon the nature of its affiliations. Thus, a course of railway management in a technical school would naturally be affiliated with the technical courses, and in a classical school with more general courses; and in either case the end will be reached with equal directness.

Mr. W. W. Wheatley, superintendent of the Brooklyn City Railroad, says:

In this age of highly specialized departments of the railway service, the average young man, whose time is devoted to routine department work, has no opportunity to lay a broad foundation for his railroad career. He is exceedingly fortunate if his time and opportunities permit him to gain actual experience in more than one department. What he learns by actual experience is undoubtedly better learned than could be done in any college, but he is often deprived of the coveted opportunity to extend his experience or to learn by studying the experience and the achievements of others in the several departments. This is the opportunity which the college course, suggested by Mr. Leighton, proposes to supply. The graduate of such a course may not at first have experience, but he has knowledge. He will get experience later.

Mr. C. W. Bradley, general superintendent of the West Shore Railway, urges the need of the educated administration man:

If any of the railways want men to fill any technical position—either in the engineering or mechanical departments, they can get scores of men, but they can not get a man—the men can not be found, they do not grow in colleges—that can go before the public and sell what we have got to sell and get cost and a fair return on our plant. That is what is the matter with the railroads to-day. We are all selling our goods—"transportation"—too cheaply—in many cases less than cost.

#### SECONDARY EDUCATION FOR RAILWAY SERVICE.

This kind of education has so far been almost untouched. There is the instruction of the secondary technical school and the business college, which fit in specific things that are of use in the railway service, as they are of use in other avocations.

The secondary technical school, of which there are very few in this country, so far as inquiries made would show, does not enter largely as a factor in training men for railway service. However, where it is conducted as a night school, as at

Cincinnati, it does have some men who are at the same time in the shop. The manual-training school differs from the trade school in that its object is primarily disciplinary. That it does and can have a bearing on the railroad work in the shop is attested by the testimony of Mr. L. Bartlett, master mechanic of the Missouri Pacific Railroad, who says:

In selecting apprentice boys for our shops I always give the graduates of the manual-training school preference where it is possible to do so, for we consider that any young man who has the capacity to absorb the education which may be acquired in this school is fitted to obtain a trade more rapidly than the average boy with no education. You are well aware that there are sometimes boys who without much education—that is, school education—are very apt and quick to learn. These boys make excellent workmen, but they are exceptions; while it is very rare that a graduate of the manual-training school ever fails to become a valuable employee. I believe that if we could make selections from the ranks of the graduates of the manual-training schools of the country for all of our apprentices, in the course of a few decades we should not only solve the apprentice problems, but also solve many of the labor problems.

Mr. Bartlett's experience was with the school in St. Louis, which has been the pioneer in this country. And referring to the work there he adds: "I am a great admirer of the system established by Prof. C. M. Woodward, of the city of St. Louis, in what is known as the manual-training system. In practice the graduate of the manual-training school, on entering the Missouri Pacific shops, is placed on a par with the apprentice who has been at work three years."

But manual-training schools can hardly be said to be special training schools for anything but the mechanical department. The business colleges offer courses in telegraphy, but these graduates do not go into railroad service generally. There is so much else required of the operator on a railroad that the ranks are generally recruited from the helpers about the country stations, who have learned to handle the key while about the station.

Mr. G. C. Kinsman, superintendent of telegraph of the Wabash Railroad, says:

The question of the advisability of taking students in regular telegraph offices is one that will bear much discussion. It has some advantages, and is surrounded with many elements of danger.

We take a boy into an office to learn telegraphy and invariably forbid his touching the wires or instruments, a command which is necessary if we wish to avoid wire trouble, but which is sooner or later broken. My opinion (and I have for the past twelve years been, until recently, connected with a school for the sole purpose of preparing operators for our service) is that it is far better to give the beginner a technical education in a suitable school before taking him into the office, thus laying the foundation for greater efficiency than can be otherwise acquired.

The Wabash Railroad Company is at present taking a limited number of students into its offices. Applicants are required to furnish evidences of character and their school certificate.

But this practice of the Wabash is not general.

Stenography is another acquisition which has a definite value in railroad service, and this can only be acquired outside. Its use is not so special as that of the telegraph operator, but is general for all departments wherever clerical work is found. With stenography is always included typewriting.

Bookkeeping is taught very elaborately in the business colleges, but on the railroad the system is so highly organized that each man's assignment is very much confined. Except the general bookkeeper, very little knowledge of bookkeeping is required. It is never the practice of railroads to take men direct from the school and place them in charge of the general books. We do not know of any school where the blanks and kinds of books used on a railroad are specially taught.

In absence of any systematic special railroad instruction of the secondary grade which actually exists, we may take the plan outlined by Mr. Walter Berg, principal assistant of the engineer of the Lehigh Valley Railroad.

## PROGRAMME FOR A SPECIAL RAILROAD TRADE SCHOOL.

These schools would be to the subordinate branches of railroad work what commercial schools, or so-called business colleges, are to business. They would, as a rule, be interpolated between the regular public-school course and a boy's entrance into practical railroading.

The institution should be conducted according to the spirit and on the basis of a trade school, not of a college. Its success will lie in doing its work thoroughly within its proper sphere and limits, without making a display of its great learning or advertising its workshop system as a leading feature.

The entrance requirements would be limited to a general common-school education, more or less advanced, according to which department the applicant desired to enter.

The school would consist of a regular course of one year, and of an advanced course of one year; also a general course.

The scholars for the regular course would be young boys direct from public school and young men who, after a few years' work in a shop, office, store, or railroad department, begin to realize that their rapid success in life may depend largely on a better general knowledge of and familiarity with one subject or some specialty.

The advance course would be open to such scholars who had completed the regular course and whose means and abilities enabled them to pursue their special studies to a higher point. Also, men whose former education and subsequent railroad experience would qualify them to omit the regular course.

The general course, consisting of lectures on general railroad subjects, would be open to all comers in order to spread a better knowledge of the general conditions, laws, and public policy governing railroads among the general public.

The studies in the regular course would be so arranged that the course in itself would be complete from a practical view; that is, giving the scholar a general idea of the subjects taken up, the elementary principles governing his selected calling, and acquaintance with the principal details. Practical railroaders could attend this course without fear that the matter presented would be too high or extended for their purposes. The course would be divided into two terms, and the studies of the first term would be common for many scholars, who would then in the second term branch off to their chosen specialties.

In the advanced course the fundamental idea would be to build upon the general basis established by the regular course, to extend the different subjects to a higher grade, treating them in a more thorough and scientific manner, and to afford more time and opportunities for illustrative examples, demonstrations, laboratory, workshop, and drawing-room exercises.

The general course would consist of evening lectures, at stated intervals, on the most general laws and conditions governing the control, operation, and management of carrying companies, their relations to the State authorities and the public at large, their history, and influence in industrial, trade, and labor questions.

All illustrations, examples, demonstrations, laboratory and workshop exercises would be taken from appropriate practical problems and conditions connected with railroad work. The workshop feature should be considered as an important adjunct to the lessons, illustrating in a practical way the principles and methods developed and explained in the schoolroom. Any suggestion that regular skilled workmen could be turned out of school workshops should be promptly discounted.

The choice of the teachers and managers would be most important. For many of the branches, theoretically educated men, with a subsequent long practical experience in their particular line, would be most desirable. In other branches, experienced railroaders would be preferable, who, in spite of the neglect of their early education, had, by innate common sense, observation, and study in later life, become masters of all the questions connected with their branch of work. A European element should be strictly avoided, and knowledge of the actual working and status of the conditions existing on American railroads be absolutely requisite. The salaries offered should be such as to induce practical men, whose standing in the railroad service is well known, to relinquish their positions and devote their talent and energy to the furtherance of the school as a life object.

The special departments or groups of railroad callings for which provision should be made are about as follows: Accounting and auditing; general railroad appliances and supply business; traffic; transportation and operating; telegraphy and signals; motive power and mechanical; car building; construction and roadway; buildings; bridges.

The studies for each group would be similar to the programme outlined below, which is not claimed to be final, but simply indicative of the general character,

trend, and scope of the work for each particular department. Many of the studies would be taken up in joint classes by the scholars from several departments; other studies are special for the individual department.

*Accounting and auditing department.*—Regular course, first term: Elementary bookkeeping; railroad department reports, material accounts, pay rolls, time distributions, recapitulations; general description of railroads, their equipment and management. Second term: Double-entry bookkeeping; supply and shop accounts; balance, performance, and mileage sheets; elementary business law. Advanced course: General railroad accounts for revenue and disbursements; auditing and collection systems; general balance sheets, reports, and statistics; stocks and bonds; mortgages and securities; trust and construction companies; law and general policy of accounting and auditing questions.

General railroad appliances and supply business department.—Regular course, first term: Elementary bookkeeping; department reports and accounts; general description of railroads, their equipment and management; general description of railroad appliances; properties of materials. Second term: Railroad supplies and their properties; quality, elementary, physical, and chemical tests; detail explanation of railroad appliances; special instruction for tie, lumber, rail, iron, and steel inspectors; storehouse systems. Advanced course: Chemistry and physics in connection with examination of materials; chemical and physical examination of railroad supplies, materials, and preservatives; independent laboratory and shop experiments; general industrial technology and metallurgy; description of important industries and trades producing railroad materials.

Traffic department.—Regular course, first term: Elementary bookkeeping; department reports and accounts; general description of railroads, their equipment and management; freight, passenger, baggage, express, and mail service; duties of freight and ticket agents, baggagemen, and expressmen; local terminal, and transfer stations; forwarding offices. Second term: Double-entry bookkeeping; accounting systems in passenger and freight business; freight classifications and rates; clearing houses and car-record systems; elements of law. Advanced course: Preparation for rate sheets and freight classifications in regard to special conditions, special rates and drawbacks; freight lines; pooling systems; foreign freight systems; general principles governing passenger business; the law and general principles governing all traffic questions; history of traffic and transportation lines; the proper relations between legislative bodies, State railroad commissions, and railroads in regard to traffic business.

Transportation and operating department.—Regular course, first term: Elementary bookkeeping; department reports and accounts; general description of railroads, their equipment and management; duties of conductors, brakemen, switchmen, yard masters, inspectors, repairmen, station masters, dispatchers; movement of heavy bodies and hoisting machinery, clearing wrecks; train service; general description of railroad appliances. Second term: Train orders and regulations; dispatcher's duties and authority; preparation of time-tables; detail description and illustration of railroads, their equipment and management; car records, mileage, and performance sheets. Advanced course: General administration of railroads in relation to condition of road, equipment and trade; economy in train service and equipment; influence of grades and curves; quality and capacity of rolling stock and general principles governing its use and construction; examination of advanced methods and improvements; special railroad appliances and inventions; the law governing train service, road, and grade crossings, corporate property, liabilities for damages, etc.; history of transportation and traffic lines.

Telegraphy and signals department.—Regular course, first term: Elementary bookkeeping; department reports and accounts; elements of telegraphy, with practice in use of instruments; duties of operators, linemen, repairmen, etc., with appliances and methods in use; details of signal apparatus and methods in general use; construction and repairs of instruments and signal apparatus; general description of railroads, their equipment and management. Second term: Practice in rapid transmission and use of complicated instruments; train dispatching; elementary science of telegraphy and elements of chemistry; descriptions and applications of electricity to special purposes, as alarms, tickers, telephone, automatic recorders, electric light, etc.; complicated signal systems, their use, construction, and repair. Advanced course: Practice in the use of complicated telegraph methods employed at central stations and on heavy lines; submarine telegraphy; application of electricity to complicated and delicate machines for recording tests, measuring time, etc.; electricity as a scientific subject, with experiments and laboratory exercises; detail history of electrical inventions and methods, with careful examination of instruments and specific features of each

method; electrical engineering and construction of telegraph lines and electrical machines; electrical mechanics; physical and chemical properties of electrical materials; electricity as applied to railroad signals; railroad signals as a general study in connection with history and detail of foreign railroad signal systems; the law governing inventions; mechanical and free-hand drawing.

Motive power and mechanical department.—Regular course, first term: Elementary bookkeeping; department reports and accounts; general description of railroads, their equipment, and management; practical mechanics; movement of heavy bodies and hoisting machinery, clearing wrecks; properties of materials; general description of machinery and locomotives, with distinguishing features and nomenclature of parts; duties of engineers, firemen, engine-house men and foremen, road foremen of locomotives, car inspectors; mechanical and free-hand drawing. Second term: Elements of theoretical mechanics and physics; practical mechanics; details of locomotives, their use, construction, and repair; elementary theory of the steam engine; general shop machinery, its construction and uses; railroad orders and regulations; designing locomotive and machine details; mechanical and free-hand drawing; railroad appliances and supplies used in rolling stock and shops. Advanced course: Theory of machinery; theoretical mechanics and physics; the general principles and rules governing the construction and use of locomotives and rolling stock, machine design, and economy; general machinery; construction and setting of stationary machines; transmission of power; locomotive designs and construction; mechanical and free-hand drawing and coloring.

Car-building department.—Regular course, first term: Elementary bookkeeping; department reports and accounts; general description of railroads, their equipment and management; practical mechanics; movement of heavy bodies and hoisting machinery, clearing wrecks; properties of materials; general description of car-building machinery and rolling stock, with distinguishing features and nomenclature of parts; duties of various car-shop mechanics, foremen, car inspectors; mechanical and free-hand drawing. Second term: Elements of theoretical mechanics and physics; practical mechanics; details of cars, their use, construction, and repair; general shop machinery, its construction and uses; railroad orders and regulations; designing car and machine details; mechanical and free-hand drawing; painting and painters' supplies; railroad appliances and supplies used in rolling stock and shops. Advanced course: Theoretical mechanics and physics; calculation of strength for minor parts; the general principles and rules governing the construction and use of cars and rolling stock; machine design and economy; general machinery; car designs and construction; mechanical and free-hand drawing and coloring; artistic ornamentation and designing.

Department of buildings.—Regular course, first term: Elementary bookkeeping; department reports and accounts; general description of railroads, their equipment and management; practical mechanics; movement of heavy bodies and hoisting machinery, clearing wrecks; properties of materials; building mechanics and building trades; general description of railroad buildings and structures, with illustrations; mechanical and free-hand drawing. Second term: Structural details; bills of material, estimates; designing details; manufacture of building materials; laying off work; erection of buildings and structures; building laws; elements of theoretical mechanics and physics; ornamental work and designs; mechanical and free-hand drawing. Advanced course: General construction and details of railroad buildings and structures; calculation of strength for minor parts; the chemical and physical properties of building materials for strength, durability, inspection, and testing purposes; theory of hoisting machinery; artistic ornamentation; designing; free-hand drawing and coloring.

Department of bridges.—Regular course, first term: Elementary bookkeeping; department reports and accounts; general description of railroads, their equipment and management; practical mechanics; movement of heavy bodies and hoisting machinery, clearing wrecks; properties of materials; general description of bridges and trestles, with illustrations; mechanical and free-hand drawing. Second term: Wooden and iron bridge details; bills of material, estimates of weight; designing details; manufacture of iron and steel; shopwork on bridges; erection of bridges; test of materials; elements of theoretical mechanics and physics; special machinery and appliances of moving heavy bridges; mechanical and free-hand drawing. Advanced course: General construction of bridges and details; theoretical mechanics applied to calculation of minor structures for strength and material distribution; the chemical and physical properties of bridge materials; the duties of bridge foremen and inspectors; maintenance of bridges; complicated bridge erection; theory of hoisting machinery; designing; history of bridge construction.

Construction and roadway department.—Regular course, first term: Elemen-

tary bookkeeping; department reports and accounts; general description of railroads, their equipment and management; practical mechanics; movement of heavy bodies and hoisting machinery, clearing wrecks; properties of materials; duties of section men and supervisors, and means and methods at their command; description of track material and implements, with their use; mechanical and free-hand drawing. Second term: Construction of roadbed; laying track; maintenance of way; grading and masonry, with tools, methods, and designs in use; explosives and their use; staking out work; laying off frogs, switches, yards, and track systems; grades and curves; general regulations and orders; special machinery and appliances for clearing heavy wrecks. Advanced course: Grade lines and curves in reference to rolling stock and operation of the road; details and designs for frogs, switches, yard systems, crossings, signals, and gates; complicated track systems and methods of shortening up leads; designs for culverts and masonry structures; economy in grading and track work; tunnel work, methods and appliances; rock machinery and properties of high explosives.

#### INSTRUCTION COMBINED WITH WORK.

The desirability of combining theory with practice is obvious. The technical schools endeavor in part to overcome the objections of a purely theoretical training by encouraging their students to seek employment during vacations in railroad shops. The plan has met with the cooperation of the railroads in the Northwest, and they are enabled to testify cordially that the young men earn all that is paid to them. The benefit to the student is unquestioned. Often young men enter the shop after their theoretical work is done, and thus consecutively combine theory and practice. But where the apprenticeship which they enter is inflexible and holds them to the same pace as those whose capacity and training do not enable them to go as fast, the educated man suffers, because his theory and practice are divorced.

The objections to the purely "practical" course of work are quite as patent as those that are urged against a purely theoretical course. The man comes to work automatically and not by intelligent self-direction, and he loses all power of adaptation. In any instruction that has value, theory and practice are combined in some way. The various combinations will be made by the differing proportions in which they enter, and this will be determined by the ultimate use to which the course leads. As stated by Dr. Barnard, late assistant to the president of the Baltimore and Ohio Railroad, in the apprentice course school instruction should be made secondary to the shopwork, while in the higher courses shopwork should be always secondary to the mental training.

In the very thorough canvass of the subject which he made for the board of directors of his own company Dr. Barnard was quick to see the defects of an apprenticeship without instruction. He began by examining the apprentices who were on the road. The questions asked were no more difficult than those required for admission to the ordinary public grammar schools. Out of 147 examined not one passed. He says further:

When learning their trades railroad apprentices were generally placed under "railroad men" of the "practical" type I have described, who despised, or affected to despise, scientific knowledge and scientific methods of operation, generally not because they understood or were able to weigh their bearings and value upon present pursuits, but because, knowing absolutely nothing about them, they thought thus to disguise their ignorance. Under such circumstances apprentices received little, if any, special instruction, but were mostly left to pick up their trades as best they could. Of course, under such a system, instead of having their special aptitudes developed, they in turn become "practical" men, and of this type is the present rank and file of railroad operatives.

Where the theory and practice are consecutive the question arises, What shall be the order in which they shall come, or shall they be intermingled? In some employments in the railroad service physical strength and a certain maturity of powers are essential. In such cases there could hardly be any question that the

theoretical should come first in order. Referring to the training of roadway engineers, Prof. J. C. Nagel, of the Agricultural College of Texas, writing in the *Railway Engineering Review* of February 11, 1899, says:

Few students entering college are old enough to have been physically able to do such work. Moreover, since the mind is most receptive at the age usually allotted to college work, it would be wasteful of time and energy to require a young man to postpone the period of mental training until after having attained the physical development necessary to enable him to secure practical training as section hand, track walker, and foreman. Among 80 young men who have graduated from our civil-engineering course during the last eight years, I know of only one who has been through even a part of the course suggested by the *Railway and Engineering Review* [viz, the theoretical following the practical].

A general auditor counsels a college course before entering the auditing office. The consensus of practical men is for the theoretical first and the practical later, where they are separated. It is noticeable that the courses of sons of railroad managers are directed along this line, as witness the sons of the presidents of the Cleveland, Cincinnati, Chicago and St. Louis, of the Great Northern, and of the Southern railways. The sentiment of the railway clubs, as expressed in their discussions, would seem to point to a general theoretical course first, followed by a year of practice, and then one or more graduate years. Thus the manager of the *Railway Gazette*, who has rare opportunity for observation, first gives his son a general theoretical education; then he puts him in an auditing office for a year, and after that puts him to his engineering specialty in the engineering school. Prof. Wade Hibbard, of the University of Minnesota, suggests the necessity for a graduate year, but says: "The graduate year is best for a man after he has had a couple of years in railroad practice. Let two years of practical work come between the technical course and the graduate year."

Where the theoretical and practical courses are simultaneous the instruction may be at the pupil's expense, or be supported by the railroad, or it may be partly supported by the railroad and a nominal charge made to the student. The work may be paid for on regular commercial basis, or it may be on the apprenticeship plan, either of no value to the railroad or of value to the railroad at the expense of the student. On the Baltimore and Ohio, under the system proposed by Dr. Barnard some years ago, the larger considerations of loyalty to the company outweighed the small cost of tuition. Concessions were made to the children of employees, half rates to those of less than five years' standing, and tuition was gratis to the children of employees who had been in the company's service more than five years.

The instruction there was a fixed part of the apprentice's training. A minimum of three hours a week was given to such instruction, and in addition if the apprentice was deficient in general qualifications he was required to attend the free night school of the city.

It is sometimes thought best to leave the instruction to the individual enterprise of the apprentice. Trade schools are established in the neighborhood, with evening classes, and the rates are actual or nominal. The work is in line of their daily duties, the instruction being adjusted to the apprenticeship perhaps more often than the apprenticeship to the course of instruction.

Under another plan which has been ably advocated, the railroads at large centers would cooperate in the establishment of a self-supporting trade school, with night classes. The instruction there given would be supervised by the railroads so as to best meet their necessities, and the work done in the evening classes would be given some recognition in the advancement of apprentices in the shop.

The Master Mechanics' Association complains of the instruction generally found that there are "as many different methods as there are schools, and a large amount of waste energy, from the fact that when the course is complete it does

not tie onto any other course for further advancement, and leaves the student's efforts suspended in the air, with little or no probability of getting credit for his labor should he desire to continue his studies in an engineering institute."

To meet the difficulty the committee commended the plan to put this instruction in relation with the institutions of higher education by selecting the instructors from their faculties. By providing several of these schools within easy radius, the instructors could take care of them on a circuit and thus make the expense merely nominal. Such a proposition from the University of Chicago and also from Purdue University has been under advisement of the Master Mechanics' Association.

#### OUTLINE OF SCHOOL WORK FOR SHOP APPRENTICES.

[Submitted by Prof. W. F. M. Goss, of Purdue University.]

##### 1. *Administration.*

The administration of the school should be in the hands of local talent. It is believed that every shop which gives employment to a sufficient number of apprentices to warrant the organization of a school will have in its drafting room or office force some one or more persons capable of giving the necessary instruction. In order, however, that the instruction may be made as systematic as possible, and that its value may be recognized by institutions of standing, it is proposed that the work of local instructors be subject to the supervision of certain technical schools.

##### 2. *Plan of supervision.*

It is probable that the cooperation of a sufficient number of the larger technical schools can be secured to insure the success of a plan of supervision involving conditions somewhat as follows:

1. A permanent committee of members of the American Railway Master Mechanics' Association on apprentice schools.

2. The selection by the committee of a number of representative schools of high standing in engineering work, each of which shall be requested by the committee to act with other institutions selected, first in organizing and afterwards in supervising the work of apprentice schools.

3. The assignment of a definite territory to each college or university cooperating, said college or university to assume the supervision of all apprentice schools which may be established within its territory.

4. If, after the system as first organized by the committee has become operative, other schools of approved standing shall express a willingness to assume a share in the supervision of the apprentice schools, such institutions may, at the discretion of the committee, be given a territory, said territory to be deducted from that previously assigned to some other institution or institutions, to the end that there may be secured the fullest cooperation of the educational institutions of the country.

5. Each college accepting the responsibilities of supervising a territory would place each apprentice school for which it is responsible in the charge of some member of its faculty, who would become responsible to the college authority for the work of the schools assigned him. For the purpose of this outline persons thus detailed will be hereafter referred to as the "college representative."

6. It would be the duty of the college representative to attend the organization of each apprentice school for the purpose of advising with the school instructor, and to assist in awakening enthusiasm among the pupils.

7. It would be his duty also to make trips of inspection to all apprentice schools under his charge at intervals of not more than three months for the purpose of examining the school as to progress made and to advise with instructors as to future work.

8. To be ready at any time to respond to the call of instructors of apprentice schools under his charge by sending them mailed directions or advice; or, in case of special need, by a special trip of inspection.

9. When any subject or subjects shall have been completed by an apprentice school, the college representative having the school in charge would conduct an examination and report results to the office of his institution. Students who successfully pass such examination shall be entitled to a certificate issued under authority of the college having jurisdiction, which certificate shall be at any

time accepted at the college by which it was issued, or by any of the other cooperating institutions, as a full credit for the line of work which it covers.

10. It would be understood and agreed that the authority of the college representative would be advisory only. He will not seek to deal with details excepting as he may be requested to do so.

11. The cooperating institutions would make no charge for the supervision, except to cover traveling expenses of the college representative.

3. *The course of study and practice.*—*Time, three years; two evenings a week.*

First year—Subject: Arithmetic and drawing.—Much that is usually taught under the head of arithmetic might be left out altogether or deferred until the corresponding topics are reached in algebra. The topics selected for treatment would preferably be the following: Common and decimal fractions, denominate numbers, percentage, interest, ratio, proportion, square root with applications, similar volumes, convex surface and volume of solids, metric system of weights and measures, greatest common divisor, least common multiple. Examples for practice in these topics should be taken from familiar facts of the shop and clothed in simple, everyday language. Such examples, constructed expressly for the class of men to be reached, should shun, for the most part, the stereotyped forms based upon the store and counting room.

The drawing should consist chiefly in geometrical construction, so that while the use of drafting instruments is being acquired the students may be at the same time making progress in the study of geometry. It would perhaps be well to base the work upon Spenser's *Inventive Geometry*, a little book well calculated to stimulate the ambitious student to do much valuable work at home.

Second year—Subjects: Algebra and machine drawing.—The mathematics of this year would consist in a thorough mastering of arithmetic and a study of algebra through quadratic equations.

The drawing should develop the principles of simple projection and give practice in machine drawing from copy and from detail of actual machines.

Third year—Subjects: Higher algebra, geometry, and drawing.—The algebra of this year would include binomial theorem, logarithms, infinite series, progressions, solution of higher numerical equations, etc., and in studying some of the elementary properties and applications of continuous numbers. During this year formal geometry should be pursued, and rigorous demonstration of geometrical truth insisted upon. Geometry thus undertaken would clarify the mind for invention, and strengthen it for logical and consecutive thinking.

The time for drawing this year should be divided between machine drawing and the solution of problems of a severe nature in projective drawing.

If the apprentices are bright and unusually quick, it is not necessary that three years be consumed in mastering these subjects. In a majority of cases, however that amount of time would be found necessary. Where either the ability or previous preparation of students will allow, this course can be extended under the direction of the college representative. It is expected only that the students, with whatever preparation they may chance to have, will fall in line as rapidly as convenient, and, having made a start, will advance into the various subjects in the order indicated. A year's work, as here defined, may, in some cases, require two years, or in others may be done in six months.

Prof. I. H. Howarth, on the part of the University of Chicago, submitted the following proposition:

If the Master Mechanics' Association, through responsible parties, will assume the entire responsibility of organizing classes, providing rooms, furnishing free transportation, and the expense of board for the instructor, and will agree to furnish at least three circuits of six centers each, each center to take a course of twelve evening lectures at the price of \$50 for each course, the university will provide a competent instructor and direct the work. Assuming that each class is limited to 30 members, and that it would bear the expense of board for the instructor, and estimating that expense at \$18, the expense to each member of the class would be \$2.26 $\frac{2}{3}$ , or a fraction over 18 cents a lesson. This proposition, of course, involves a guarantee on the part of the roads of \$900 for the first year's work.

We are anxious, if we undertake the work, that the instructor be a first-class man, and we think that such a man could hardly be secured unless we are able to guarantee a certain salary.

You will understand, of course, that it will be necessary to arrange the centers so that it will be possible for the instructor to go from one to another without spending too much of his time upon the road.

The instruction car offers still a further plan. It contemplates short, definite courses at one place at a time. The instructor is able to carry his laboratory around with him, and can seek his pupils anywhere, instead of the pupils seeking the instructor. The pecuniary value of instruction in air-brake practice has been already conceded. For the purposes of this instruction the instruction car has been found to be the best method. Many railroads have their air-brake instruction car, but perhaps the most complete is that put on the road by the Westinghouse Company. The following from the Railroad Gazette of January, 1899, as a full description of this car and the methods employed, will serve to explain the system:

#### THE WESTINGHOUSE AIR-BRAKE INSTRUCTION CAR.

A group of remarkably able mechanical engineers were taken into the employ of the company and a number of the most intelligent and enterprising locomotive engineers in the country have gradually been absorbed into this service. The systematic education of railroad officers and employees has been carried on by these men by various means—by conversations and correspondence, by writing and publication, by discussions in the associations and societies, and by the air-brake instruction car, the work of which is the special topic of this paper. If a railroad accident happens which might have been the result of inefficient braking, a Westinghouse inspector is apt to appear on the ground pretty promptly, and if there was any defect in the maintenance of the brake or brake gear, or in the manipulation of the apparatus, the responsible officers of the railroad concerned will probably know it before the Westinghouse man has done with the case, although the public may never know it.

Probably the Westinghouse Air Brake Company spends \$50,000 a year in work which has nothing to do directly with the manufacture and sale of air brakes or with defending its patents. This sum is expended merely to increase the efficiency of the brakes owned by the railroad companies. Naturally, this is not done for philanthropy, but the work carried on with so much ability at such cost, and with results so valuable to the railroads and the public is a fine example of the utility of "enlightened self-interest." It is perfectly safe to say that in the art of train braking we in the United States are years ahead of any other country in the world. While this is true of the apparatus itself in power and quickness, it is perhaps still more true in the widespread and accurate knowledge of the possibilities of the mechanism. Of course, the Westinghouse air brake is used largely in England, on the continent of Europe, and in the British colonies, but among all the Westinghouse equipment used abroad the percentage of the latest quick-action brake is doubtless considerably less than it is in the United States, and we suppose the "high-speed brake" is entirely unknown in foreign practice. Furthermore, there is a large amount of passenger equipment in Great Britain (and, relatively, a smaller amount on the continent) equipped with the automatic vacuum brake, which can not be compared with the Westinghouse for all-around efficiency for fundamental mechanical reasons which we need not go into here but which the mechanical engineer will appreciate at once.

But, as we said above, it is probable that the difference in the knowledge and skill of officers and men is greater than the difference in apparatus, when comparison is made between the United States and other countries, and this superior skill is due more to the intelligent and systematic efforts of the Westinghouse Company than to all other influences combined, and one of the most important influences in this valuable education is the instruction car, the work and equipment of which we propose to briefly describe.

The Westinghouse air-brake instruction car has been in service now for about ten years, and on November 17 the number of men who had passed through it amounted to 126,850. Mr. Hutchins, who has long been the president and principal lecturer in the faculty of this modern college of applied science, claims that his institution has more alumni than any other college in the world. Furthermore, it is a very agile sort of college, and up to November 17 of this year had traveled 58,856 miles.

The car is moved from one road to another in the order of application for its services, and remains at any one point as long as may be necessary. The course of training is excellently organized. Before the car arrives at some one point for work a list has been prepared of all the men who can be instructed at that point. This includes engine drivers, firemen, conductors, trainmen, and any others whom the officers of the railroad wish to put through the car. In fact officers' classes

are sometimes organized. These lists are written alphabetically, on well-designed blanks, on which the record of each man's attendance and performance at the air-brake college is made. At the end of his course, longer or shorter, he receives, if he is qualified, a certificate, an example of which follows:

## FORM 110.

No. \_\_\_\_\_ The following-named employee of the \_\_\_\_\_ Railroad was examined as to his knowledge of the construction and operation of the Westinghouse automatic air brake:

Name, \_\_\_\_\_.

Occupation, \_\_\_\_\_.

General average proficiency, \_\_\_\_\_.

Averages: 10, perfect; 8, excellent; 6, good; 4, fair; 2, poor.

Each man who receives instruction is rated, the highest rating being 10, which, Mr. Hutchins tells us, has never been attained by any man. Every employee is required to get a rating of 7 at least.

Beginning at half past 8 in the morning there is a lecture and demonstration for, let us say, engineers. Men who have been selected to attend this lecture are present in the car, and a lecturer explains all of the mechanism and its operation. This lasts for an hour and a half. This class then moves into a coach, where another man takes it and examines it for two hours. He goes thoroughly over the ground covered by the morning lecture, questioning the men to ascertain how much they have learned and to correct any misapprehensions that they may have carried away. The result of this quiz gives to each man a rating for the time that is entered on the record blank in the office of the instructor. Each of these men at a subsequent lecture and quiz may be raised to a higher rating, and it sometimes happens that a man loses rank at his second lecture. This process of lectures and examinations is continued until the men have reached a satisfactory rating, or until it is no longer practicable for them to attend the lectures.

When the one class leaves the instruction car another class enters and is lectured for an hour and a half, and then passes to another car for examination. In this way three or four lectures and as many examinations are held every day, which keeps the staff of the car pretty busy. Ordinarily there are two employees of the Westinghouse Company with the car, and they are helped in demonstrations and examinations by men detailed from the railroad on which they are at work. In this way 80 or 100 or 125 men are handled in a day. The men detailed from the railroad to help in the car are carefully selected and are assigned to the car during its stay on the road, which may be three months or one year. After this experience these men are, as a rule, used to carry on for the railroad company the work begun on the car.

By the help of sections of apparatus the men are instructed in the details of the mechanism of pumps, the engineer's valve, the triple valve, the brake cylinders, the air signal apparatus, and all the parts of the air equipment. They are taught the use and care of all these; they are taught how to handle the engineer's valve in emergency and in service stops, and why it should be handled as they are taught to handle it. They learn not only how they can make a smooth and accurate station stop, but why by certain manipulation they can do this. They are taught also the art of handling the air whistle signal, which in itself is not so simple a matter as the man who never has tried it may think. They are taught that if the pulls on the whistle cord are not properly spaced the blasts in the cab will run together and the signal will have no meaning or wrong meaning, and the reason why these things happen is made clear. In fact, the most minute details of operation are gone into.

The direct work of this car has been done in the education of the great number of men who have passed through its lecture courses, but beyond that it has done a very important indirect work in that it has been the model for a number of instruction cars built and equipped by individual railroads for the education of their own employees. We would advise any operating railroad officer who has the opportunity to do so to visit this car during the lecture hours and see for himself the admirable and thorough method of training the men for the use of the air brake and the air signal. He will then realize that the business of a great brake company is not confined to the mere manufacture and sale of the apparatus.

This instruction car is very completely equipped. Steam is supplied by a Westinghouse 12-horsepower boiler carrying 130 pounds pressure, which is equipped with a Worthington pump, size 3 by 2 by 2 inches, and a Nathan No. 2 injector. A water tank is provided, with a capacity of 800 gallons, and coal storage for 1½ tons of anthracite. It often happens, however, that steam can be

taken from the plant at the station where the car may be at work. The power consists of a 5-horsepower Westinghouse engine and dynamo, and there is a storage battery of 28 cells, which serves to keep the lights going when the dynamo is not running. The car is lighted with 27 incandescent lamps, 16-candlepower, 50 volts. Air pressure is provided by two Westinghouse pumps, an 8-inch and a 9½-inch, and these pumps are shown in section as well. The main reservoir has a capacity of 30,000 cubic inches. There is a complete brake equipment for a 30-car train. This includes the full number of feet of 1½-inch pipe, also hose connections, angle cocks and cut-out cocks, triple valves, auxiliary reservoirs, and brake cylinders. Air-pressure gauges are connected to the cylinders and auxiliaries, and convenient means are provided for cutting in any required number of cars. There are also an 8-inch and a 10-inch brake cylinder, with stirrups on the pistons to demonstrate the results of variation in piston travel and for other experiments. Sectional models are provided of brake valves, triple valves, cylinders, and, in fact, of all the equipment which can best be shown in this way. There is also a complete air whistle signal apparatus for a 15-car train, with the full amount of piping and all the connections. It will be seen that the equipment of this car gives a means for very clearly demonstrating the mechanical construction and the working of all the apparatus.

The circuit instructor or the instruction car are simply devices for seeking the students instead of the student seeking the instructor. It must not be overlooked that there is a very definite system of instruction going on all the time on the railroad, which is conducted by the inspectors of different departments. Thus, speaking from the standpoint of the traveling engineer in the report of their committee to the general association in 1898, which describes their duties, they say: "The traveling engineer who has not the essential qualifications to make a teacher will not be successful as a traveling engineer."

A writer in the Station Agent of September, 1898, writes of the traveling auditor:

We here see clearly how largely his function is that of instructor. Beginning with the one definite duty for the auditor, to check the agent, to install or transfer him, to watch him tirelessly, if necessary, to do the most aggressive detective work, to accumulate evidence against him, to initiate criminal proceedings and take every precaution that the guilty man does not escape, he passes over by natural sequence to the office of inspector, instructor, confidant, and helper through the whole cycle of his duties.

Thus by easy stages we pass over to another form of instruction in the notion of discipline as defined by the American Society of Railroad Superintendents in 1897:

Discipline, as applied to railway service, is that method of education, government, instruction, which causes and maintains efficiency and loyalty. On a railway, under a system of discipline administered by the officer, the officer is the teacher and in a sense the leader, and the employees are the disciples under discipline.

Referring to the usual notion of discipline, the report of the committee to the association says:

The word discipline is primarily defined as education, government, instruction. It is not believed to be the generally accepted idea of discipline on railways that it is primarily educational. We believe that the general idea is that it is punitive instead. Is not discipline generally applied more with the idea of punishing the offender than to educate him, the educational feature being lost sight of too frequently by the railway officer who is the teacher?

From the standpoint that discipline and instruction are essentially the same thing, and that therefore the methods and spirit of both are one, the report proceeds:

In American railway practice to-day there are two distinct methods of application of discipline. The one, which educates by laws and regulations issued in the form of books of rules, time-tables, special instructions, and the oral opinions of the officer, and thence by the exercise of authority in the form of reprimand, fines, suspensions, and dismissal, including a record of same. The other, which adds to the educational feature record bulletins of occurrences and decisions

relating thereto, which are posted for the information of all concerned, and eliminating from its feature of government fines and suspensions and substituting therefor a system of record, where the deeds of the employee, whether good or bad, are recorded. The former is the original method, and up to a few years ago generally in use. The latter is known as the Fall Brook method, which has been recently adopted, with varying modifications, by lines aggregating 23 per cent of the 180,000 miles of railway lines in the United States.

The Fall Brook system is related to education because it enforces the principle of selection, dealing directly with the individual. The premium system employs the same principle, but not to the same extent. As stated by a writer in the Railroad Gazette of January, 1898, "The payment of premiums, recognizing the difference between excellent work and that which is only ordinary, is a means of meeting one of the most vicious principles of organization, that would put all men on one level, regardless of ability, pluck, or thrift." But the difference between the different levels is only the amount of the premiums, whereas in the Fall Brook system it may be the whole range of promotion and the certainty of tenure as against gradual expulsion from the service.

The correspondence school supplies the need of instruction where the instructor and the instructed can not come into personal contact. Where wisely conducted, in connection with the duties that are in the line of the studies, it has large possibilities. It is entirely elastic and has many of the advantages of personal instruction. So far as this elasticity adapts it to conditions that can not be changed it is advantageous. It nowhere takes the place of the regular school, but it wonderfully facilitates, directs, and makes effective the efforts of the self-making man. If the methods of education are nothing more than an elaborate system of selective processes, tending to develop each power to its largest growth, and each man to his largest fitness and efficiency, the correspondence school is no insignificant factor. It continues his education after the boy has taken up his work at the bench or in the office.

The effect of any environment or situation, however well chosen, is to direct a man's mental development along one or more lines more or less confined. By the correspondence school he may be enabled to look out broadly upon other lines of effort, and, if his vocation is unfitted to him, to make a change without violence to himself, but especially to fit himself for higher grades of the same kind of work. In testimony to the value of work done in this way we quote Mr. H. F. Ball, general car inspector Lake Shore and Michigan Southern Railroad: "A good theoretical mechanical education can be obtained at little cost by taking a course in one of the correspondence schools if a man has the necessary perseverance to carry him through."

The method of instruction is best given in the words of the school itself. The following is from the circular of the International Correspondence School, at Scranton, Pa.:

The method of instruction in such subjects as can be taught without the use of apparatus or instruments is as follows:

The instruction papers which are the text-books for our students are printed pamphlets or books of 30 to 150 pages, and are accompanied by question papers.

When a student enrolls he receives the first two sets of instruction and question papers. Accompanying these are printed instructions telling him what his class letter and number is, how to proceed with his work, and how to study. After reading these instructions the student studies his first instruction paper. The first subject is either arithmetic or drawing, but whichever it is it is commenced at the very beginning, on the assumption that the student knows nothing of it, and the ground is covered in the clearest and most concise language. Usually the first subject is arithmetic.

After having mastered the first instruction paper, the student lays it aside and takes up his question paper (which contains many practical problems), and answers in turn every question, upon sheets of foolscap, writing on one side of the paper only; he then puts his work in an addressed envelope (which is provided for the purpose) and mails it.

When a set of answers is received by the school it is examined with the utmost care; all errors are corrected in red ink, and the work is returned with such suggestions and criticisms as enable the student to understand the subject. Every mistake is pointed out and everything fully explained.

The instructors take pains to make the student feel that the comments made are for his best interests. Experience has shown that written criticisms make more lasting impressions than verbal ones.

A percentage mark is given according to merit. If the paper does not deserve 90 per cent, the student is required to rewrite the incorrect part until he satisfies the instructor that he understands it. If necessary, additional work is given him. The student is kept at the subject until he has learned it.

When students do not receive 90 per cent, which is not often, the trouble is almost always traceable to their failure to study the instruction papers carefully. The instruction papers are so plain that any who will study them as directed can understand them, and so complete that any who understand them can readily answer all the questions asked.

When the student mails his work on question paper No. 1 he commences the study of instruction paper No. 2, and proceeds with it as with the previous paper.

When he has gained a passing mark in question paper No. 1 his work is returned to him to keep, and at the same time instruction paper No. 3 and question paper No. 3 are sent him.

When he receives No. 3 papers he lays them aside until he has finished No. 2. When he mails his work on No. 2 he takes up No. 3, and when his work on No. 2 is returned to him he is sent No. 4 papers, and so on. By this system he has always a set of papers on hand to study while the work on the other set is going through the mails.

When a student meets with difficulty in understanding anything in the papers the instructors of the school come to his assistance through the mails.

For this purpose each student is furnished by the school, free of charge, with addressed envelopes and information blanks.

When the student has given a subject a thorough trial and can not understand it, all he has to do is to state his difficulty on one of these blanks, and mail it.

When this is received the instructor answers it by return mail. He explains fully, if it requires a dozen sheets of paper to do so.

We would rather have a student write to us for explanations every day than to fail to understand a principle or anything treated of in the instruction paper.

In addition to the instruction and question papers furnished to him to study from, the student receives when he enrolls, and without extra charge (except for expressage or freight), a complete set of bound volumes of all the instruction papers, question papers, keys, etc., used in the said course of instruction, together with the tables belonging thereto and an abstract of all the formulas used in the course—all fully indexed, and bound in half leather.

The instruction and question papers are the only text-books the student requires. They become his property, and are not returned to us.

We pay all postage in sending all other books, papers, or communications to the students. They pay the postage on their mail to us.

When a man has completed a course he must pass a final examination before he is given a diploma or certificate of proficiency.

The records kept are very full. They form a complete school history of the student from his enrollment until he receives his diploma.

They contain not only the percentages given upon each plate and question paper, but such details of his work as to enable us to form an accurate opinion of his ability and status as a student.

As samples of some of the courses offered that bear on railway work, the following are selected from their catalogue:

*Locomotive running scholarship.*—Subjects taught: Technical division, locomotive boilers, steam, cylinders, and valve gears, management of locomotives, the air brake.

This course is intended for locomotive engineers and firemen only. Our efforts in preparing it have been to present just the knowledge needed. It is not intended for those who wish an elaborate theoretical knowledge of locomotive running, but is intended to be a practical aid to those who sit in the cab.

The subjects are treated fully and clearly throughout. Matters relating to valve motions and gears have been given special care. The construction and operation of compound locomotives is given the same pains in preparation. In the paper on air brakes we think we present the subject better than has heretofore been attempted. New drawings of the parts have been made; we mention the

9½" pump, the engineer's brake valve, and the triple valves as being more clearly described and illustrated than in any other work. The high-speed air brake is given the attention it deserves as one of the most important factors in running at the high speeds maintained on many of the prominent railroads.

*Complete locomotive scholarship.*—Subjects taught: Preparatory division, arithmetic; intermediate division, formulas, mensuration; advanced division, mechanics; drawing division, geometrical drawing, mechanical drawing (locomotive division); technical division, steam and steam engines, locomotives, dynamos and motors, locomotive boilers, steam, cylinders, and valve gears, management of locomotives, the air brake.

This course is a combination of the locomotive engineers' scholarship and the locomotive running scholarship. The engineer or fireman who wishes to understand the theoretical design and the detailed construction, as well as the manipulation and care of the machine on the road, will find this course well adapted to his needs.

*Complete mechanical scholarship.*—Subjects taught: Preparatory division, arithmetic; intermediate division, algebra, logarithms, geometry and trigonometry; advanced division, elementary mechanics, hydromechanics, pneumatics, heat; drawing division, geometrical drawing, mechanical drawing (mechanical division); technical division, steam and steam engines, strength of materials, applied mechanics, steam boilers, machine design, dynamos and motors.

Those who will be most likely to be interested in this scholarship are machinists, machine-shop laborers, inventors and designers, tool makers, rolling-mill workers, pattern makers, and draftsmen; shop foremen, superintendents, and master mechanics; manufacturers, salesmen, and inspectors of machinery and boilers; office men in establishments manufacturing machinery; mechanics of all kinds.

*Railroad engineering scholarship.*—Subjects taught: Preparatory division, arithmetic; intermediate division, algebra, logarithms, geometry and trigonometry; advanced division, elementary mechanics, hydromechanics, pneumatics; drawing division, geometrical drawing, mechanical drawing (bridge division); technical division, strength of materials, surveying, land surveying, mapping, railroad location, railroad construction, track work, railroad structures.

This scholarship constitutes a complete course of instruction in the survey, location, and construction of railroads, and is of great value, not only to those who contemplate becoming railroad engineers, but to those already engaged in the practice of civil engineering.

*Telegraphy scholarship.*—Subjects taught: Preparatory division, arithmetic; intermediate division, mensuration, elementary algebra and trigonometric functions; advanced division, elementary mechanics; technical division, principles of electricity and magnetism, electrical measurements, batteries, telegraphy.

The object of the above course in technical telegraphy is to make the student thoroughly acquainted with every feature of telegraph and cable work, and to qualify him to fill any position in the profession to which he may aspire. Every telegrapher will find it to his advantage to take this course.

*Bridge engineering scholarship.*—Subjects taught: Preparatory division, arithmetic; intermediate division, algebra, logarithms, geometry and trigonometry; advanced division, elementary mechanics, hydromechanics, pneumatics; drawing division, geometrical drawing; mechanical drawing (bridge division); technical division, elementary graphical statics, strength of materials, analysis of stresses, proportioning the material, details of construction, details, bills, and estimates.

The bridge engineering scholarship is intended for those who desire to obtain a knowledge of the principles of bridge design and construction. The course covers the general design of bridges, and at the same time enters into a fuller and more complete consideration of the designing of practical shop details than any other literature on the subject.

The scope of this kind of work is further illustrated by the courses offered by the railway correspondence school, whose work is confined to railway men.

#### CORRESPONDENCE INSTRUCTION FOR LOCOMOTIVE ENGINEERS.

[To fit engineers for promotion to roundhouse foremen, traveling engineer, or assistant master mechanic.]

*General course and special lessons completing the first year's instruction (fifty lessons).*—The principles of natural philosophy which underlie steam engineering; instruction in the proper management of locomotives to secure their most eco-

nomical and efficient operation; the best methods of boiler feeding, the best methods of using steam, explanation of the action of friction, and the objects and best methods of lubrication; illustrations of the construction and explanation of the uses of all locomotive appliances; instruction in the proper care of locomotives at terminals and on the road; treatment of breakdowns; illustration and explanation of signaling systems; management of men.

*Special lessons.*—Fifty lessons in air-brake practice; 50 lessons in the science of mechanics; 50 lessons in mechanical drawing; 50 lessons in electricity as a motive power; 50 lessons in arithmetic; 50 lessons in grammar and composition; 50 lessons in writing, spelling, and pronunciation.

#### CORRESPONDENCE INSTRUCTION FOR LOCOMOTIVE FIREMEN.

[To fit firemen for promotion to the post of engineer.]

*General course and special lessons completing the first year's instruction (fifty lessons).*—The proper duties of firemen; the composition and combustion of coal; principles of natural philosophy which underlie steam engineering; the best methods of boiler feeding; the best methods of using steam; explanation of the action of friction, and the objects and best methods of lubrication; illustrations of the construction and explanation of the uses and operation of all locomotive appliances; treatment of break downs; illustrations and explanation of signaling systems.

*Special lessons.*—Fifty lessons in air-brake practice; 50 lessons in the science of mechanics; 50 lessons in mechanical drawing; 50 lessons in electricity as a motive power; 50 lessons in arithmetic; 50 lessons in grammar and composition; 50 lessons in writing, spelling, and pronunciation.

#### CORRESPONDENCE INSTRUCTION FOR RAILWAY MECHANICS.

*General courses and special lessons completing the first year's instruction.*

*First general course—natural philosophy (fifty lessons).*—Heat, the source of power. Steam, its formation and properties. Coal, its formation, composition, and combustion. Steam engines, a résumé of their history. Matter, and its properties. Mechanics, the laws of motion; gravity, its laws and actions. Mechanical powers, the lever and pulley, the wheel and axle, the inclined plane, the wedge, the screw. Hydrostatics, hydraulics, the nature, properties, and effects of water at rest and in motion. Pneumatics, the nature, properties, and effects of air. Friction and lubrication. Friction of fluids.

*Second general course—locomotive construction and maintenance (fifty lessons).*—Locomotives, types and details of construction. Modern shop tools, their proper care and speeds. Modern shop appliances and practices. All locomotive appliances, their construction, operation, and maintenance. The air brake, its history, construction, diseases, and maintenance.

*Third general course—economic locomotive management (fifty lessons).*—Firing locomotives; advantages and disadvantages of different methods. Boiler feeding; great importance of correct methods of boiler feeding as affecting fuel consumption and the preservation of boilers. Use of steam; advantages of high pressures and early cut-offs; cylinder condensation; effects of lowering rates of combustion; advantages of close notched reverse-lever quadrants. Duties of enginemen; respective duties of engineers and firemen. Care of locomotives at terminals; proper methods of "firing-up;" importance of having the fire cover the grates; importance and methods of preventing the rapid cooling of boilers; utilization of surplus steam. Those who affect locomotive fuel consumption.

*Fourth general course—car and locomotive standards (fifty lessons).*—Car equipment standards; résumé of the work on car equipment details by the thirty-three annual conventions of the Master Car Builders' Association; illustrations of car equipment standards. Locomotive equipment standards; résumé of the work on locomotive equipment details by the thirty-two annual conventions of the American Railway Master Mechanics' Association; illustrations of locomotive equipment standards.

*Special lessons.*—Fifty lessons in mechanical drawing; 50 lessons in electricity, its nature, uses, and effects; 50 lessons in arithmetic; 50 lessons in grammar; 50 lessons in writing, spelling, and pronunciation.

## CORRESPONDENCE INSTRUCTION FOR TRAINMEN.

[To instruct trainmen in the proper performance of their duties and the care of equipment and fit them for promotion.]

*First general course — train movements (forty lessons).*—General duties of trainmen; special duties of yardmen; special duties of freight brakemen; special duties of passenger brakemen; general duties of conductors; special duties of freight conductors; special duties of passenger conductors; special duties of train baggagemen; rules for the movement of trains by time-table; rules for the movement of trains by special orders.

*Second general course—care of equipment and appliances.*—The air brake: its history, construction, operation, disorders, and proper treatment. Cars and locomotives; describing and illustrating different types and details of construction; names of details; treatment of breakdowns. Courtesy to patrons; the effects of discourtesy. Heating and ventilation of coaches; composition of air; injurious effects of foul air; discomfort of passengers; proper temperature of coaches; heating arrangements (stoves, steam, and electrical apparatus) and their proper use and care; ventilating arrangements and their proper use and care. Illuminating appliances; oil, gas, and electric lamps; their proper care and treatment.

*Special lessons.*—Forty lessons in electricity, its nature, uses, and effects; 40 lessons in arithmetic; 40 lessons in English grammar; 40 lessons in writing, spelling, and pronunciation.

## CORRESPONDENCE INSTRUCTION FOR TRACKMEN.

(In course of immediate preparation.)

The whole question of successful theoretical courses while the student is at regular work largely reduces to a matter of stimulus and careful direction. There must be quick recognition of the individual employee's excellence that shall put a premium on his extraordinary efforts. There must also be some relation established between the foreman of the shop or chief clerk of the office, so that instruction shall become supplementary to the experience of the regular work. The immense educational opportunity of the experience of daily duties, when united with the proper theoretical training, is obvious to anyone. Many young men are seeking to make use of it. Referring to this, Mr. Mackenzie, superintendent of motive power of the New York, Chicago and St. Louis Railroad says: "The tendency to educate boys after they have entered the service by the night schools, drawing rooms, and testing departments opens up the possibility to all who have the liking to make them fitted for any position in the railway service."

## APPRENTICESHIP.

Apprenticeship is generally thought of as a method of education, but it is doubtful if the educational feature has at all times been the most prominent one. It has passed through many stages. At the time of the guilds of the Middle Ages it may have been an essential institution in the uncertain conditions of industry in which it originated. But it soon took on a form of monopoly, which in England, confirmed by the statutes of Elizabeth, became most oppressive. Originating under the guise of an educational institution, it came to be principally a bar to restrict entrance upon a trade and preserve the monopoly of that trade intact quite as much as a means of qualifying men for a trade. Although it flourished for so long, it yet never was entirely congenial to the temper of English institutions, as the utterances from the bench bore witness. Adam Smith used some of his most spirited arguments against it to expose its errors. As it then stood, no man could legally prosecute a trade without having previously served his time, which was always out of all proportion to the necessities of mere instruction. Early in the present century the compulsory feature, as a means of preserving a monopoly, was abolished in England. This feature never got a firm hold in this country.

But as a means of qualifying for a trade its advantages could not at once be denied, and it continued as a general practice, but under conditions less severe. However, with the growth of great industrial enterprises revolutionizing the form of industry and abolishing the servant and master, there were evolved new conditions. The rapid progress of division of labor, with the introduction of machinery, broke down the carefully drawn lines between trades and bewildered the old journeyman. The corporation had succeeded to the master. The old legal indenture of apprenticeship in railway work gave way to a loose form of contract that was not designed to have any binding force except in relieving the railroad from embarrassments that might arise in dealing with a minor. In time it fell into little more than a form of registry, and in this form it has almost invariably been confined to its traditional place, which is the mechanical department.

Any apprenticeship contemplates a definite end or goal. In entering upon such a diversified service as that of a railroad, with all grades of skill and ability of every kind, no one man can compass the whole. There will be orders of skill that are entirely useful in their place but that can never be equal to the demands of higher grades of service. In a general way it is said that any order of skill that is fit for a higher position is fitted for all subordinate stages. But in the case of the railroad this can not be so. The different kinds of skill are so many that they do not all advance by progression along one line, nor can they be said to converge on one particular point. The superintendent of tests could as well be in a large manufacturing establishment, the lawyer in other corporation practice.

It is possible there is not as full appreciation of this principle as it deserves. There is a certain theory that an individual can be thrown into the mass and by law of the survival of the fittest, without any facilitation, he will fall into his place.

Whatever is the final goal, although it be wrongly chosen, very often it is better that the course of movement be trained on it than that all be by accident.

Apprenticeship, therefore, as it is understood to-day, would seem to be the selection of men with reference to their capacity for a certain and definite ultimate fitness and the movement of them along lines that bear on the ultimate object to be attained, but at a rate slightly slower than they would go if they did not do work at the same time. The old notion of apprenticeship as a thing of advantage to the master has almost altogether given way. Such value as the master or corporation now gets back is often not equivalent to the money paid. Indeed on larger roads the policy with reference to their apprentices has come to be on larger lines, and is aimed to protect the railroad against a scarcity of the skilled labor for which it has a continual demand. It may further be made serviceable in stimulating the loyalty to the company and perfecting the esprit de corps of the organization.

The pay that the apprentice gets and the considerations that pass are not with reference to one day's work, nor a year's work, or even a full term of apprenticeship possibly, but are with a view to the ultimate need of the railroad for the skilled labor which it is training. While no legal conditions are resorted to for insuring to the railroad return for the advances so far as they may exceed the value of the services received in exchange during apprenticeship, yet the employee is generally bound by so many considerations of loyalty, local and family interests, that he is practically a fixture.

It is very clear that to accomplish any definite point we must bear down steadily upon it by carefully determined stages of successive fitness. But in the lines of any particular work the question arises, Shall we separate the party to be instructed from the body of the men? One practice is to put the man to be taught right in with the men in the ordinary work under the ordinary foremen; the other is perhaps to put him at the ordinary work but under a specially

selected foreman who has certain fitness for instruction, and has a responsibility for turning out a high class of apprentices. In the shop perhaps the latter plan has no chance because there are so many foremen and different kinds of work, but in the roadway department he can be put under a foreman of a floating gang and carried through all parts of the work, earning his pay at the same time. It is largely the question of the "awkward squad" that is turned over to the sergeant of the military company.

Time must always be an essential element in any scheme of apprenticeship. But, perhaps, it is that element which most depends on the personal equation of the individual apprentice, and can least be put down as an unchangeable, rigid quantity. In the older days of apprenticeship, it came to be more useful as a bar to keep down the number of entrants to a trade and to reduce the competition than a means essential in training the crude boy. Says Mr. Quayle, superintendent of motive power of the Chicago and Northwestern:

I do not believe in holding one boy back because another boy is stupid. If I prescribe a certain length of time that a boy shall stay on a certain tool, and I find that that boy can do just twice as much work and has twice as much intelligence as some other boy, I do not think it is right because I have some fixed rule, that he should remain there. I think the boy ought to be pushed ahead as fast as he is capable of going. I do not believe that you or I would like it in our business. I do not believe you would like to be promoted on that scale because somebody is in the shop who claims seniority over you, that you ought to be held back because he is an older man, or because you have some fixed rule that can not go beyond that point.

Not only do the individuals differ, but the nature of the work and the skill to be acquired may very measurably change and a rigidly prescribed time specified for each detail would be most unfortunate.

Up to a certain point time is an unconsidered element to the interested learner; but if he has held to it after it has ceased to be essential, it then becomes a burden and dulls his faculties. Unfortunately in lack of a better measure throughout all apprenticeship there is the disposition to lay too great stress on time as the measure of acquired ability, when too often it has acted each succeeding year to produce the opposite effect. The whole mental process has settled down to a narrow groove from which with each added year it is more hopelessly unable to get out.

So long as time is the incident and not the object of the instruction, it is within bounds. It may go further and be the object far enough to effect that saturating process of thorough familiarity and unconscious use; but after that, which is necessarily a very indefinite point, its usefulness has ceased.

The great expansion of this country's industries, the consequent lack of settled conditions, and the unrest and change among workmen, has made the rigid apprenticeship an unpopular thing. The legal status of the apprentice has long since practically ceased to exist, and the shops in turn have not often adopted a settled form of handling apprentices. Employers could not hold their apprentices for a definite term, and the grade of skill suffered much. Shops have developed a set of "helpers" who have never had any regular training.

To meet the difficulty there has been adopted a plan among the mechanics of Cincinnati, which has sometimes been called the American system of apprenticeship. It involves the notion of a loose system, of a trade school and shop course combined. The standard is largely maintained by the trade school, and the work is had at different shops. The employee can go as fast as he pleases in the school and also in the shop, but must present credentials and must be examined from time to time. The standard is maintained by the school curriculum and the examination, supplemented by the shop work, which may be under any or several different mechanics

Graded apprenticeship, sometimes called preferred apprenticeship, is found on some roads. The theory of the special or "preferred" apprentice is that he has more ability and is therefore trained for larger responsibilities than the ordinary apprentice. Perhaps he has had a better mental development and perhaps he has had a technological course. He begins at the same work as the ordinary apprentice and does it in the same way, but he is moved on more rapidly. Perhaps he is not required to reach the skill of mechanical habit to such degree in each kind of work done as the ordinary apprentice or the workman.

Railroads do not readily take to the idea of a special apprentice. But the Pennsylvania has long had a system of preferred apprentices at its Altoona shops. With few exceptions all of their present higher officials have had their education there. They are registered at headquarters at the office of the general manager and a special record and report is made of their progress. On entering they must have a diploma from some recognized technological school. There are certain prescribed parts to the course of movement, such as firing the engine for a definite period, but for the most part the course is left to the discretion of the local officer.

In the roadway department a system of preferred apprentices was set up on a division of the Southern Pacific in 1894. The engineer of maintenance thus outlined his plan:

We propose to establish on the line of the Southern Pacific a system of apprenticeship in the track department, the plan being to furnish employment for about a dozen young engineers in the capacity of track walkers. The duties of a track walker are to pass over certain portions of the road (from 8 to 10 miles each day), to keep tight the bolts and to report any defects in the track which he can not repair. He has to lend a hand with tools when necessary and to assist in general section work when not on his daily walk. The track walker is regarded as an assistant foreman, and we propose to pay these young men \$1.85 per day. Such as are worthy will be promoted in the proper time to section foremanships and will be given preference for promotion to vacant roadmasterships or assistant engineerships in the track department when qualified for such positions.

Our idea is that in this way we shall not only secure roadmasters (and perhaps superintendents) thoroughly versed in the construction of the road and its maintenance, but will also furnish the engineering department with assistant engineers who know practically, as well as theoretically, all the features of this department. The work will, of course, be hard and we do not hope to have all who undertake it follow the lines laid down, but that out of a dozen we may secure three or four who will remain with us until they can reap the reward of their apprenticeship.

You will see, therefore, that this is no place for society men or young men who expect to be chief engineers within a few months, but that there is an opening for those who really wish for advancement in the railroad service. Our experience has taught us there are very few of the large number of engineers applying for positions who are of any service beyond the mere instrumental service in their professions. I hope that the idea may strike you as a good one and that you will assist us in procuring these young men when needed.

Prof. J. C. Nagle, of the Agricultural and Mechanical College of Texas, referring to this in the *Railway and Engineering News* of February 11, 1899, says:

My civil-engineering students took kindly to the proposition from the first and there were more applications than openings. Those who were accepted went to work as section hands and were assigned to sections in western Texas, where they worked side by side with Mexican laborers. If I am not mistaken they were paid \$1.50 per day at first instead of \$1.85, as was originally intended. As opportunity offered they were transferred from one position to another, so that they might become thoroughly conversant with all branches of the work, and, so far as I have heard, they all remained with the road in spite of the hardships encountered.

When Mr. Cushing, the engineer in charge, was called later to another road, evidently for lack of an aggressive support, the system was abandoned. Referring to what was accomplished, he writes:

I obtained permission to inaugurate the system and placed four young engineers on the road as laborers, from which position they, by their own merits, worked out their own promotions, and three of the four became section foremen. One is

the foreman of a large extra gang and is giving the best of satisfaction; two others are still working as foremen and giving satisfaction, while the fourth, by his own merit and attention to business, attracted the attention of a large contractor, who offered him a position far more remunerative than he could hope to have for some time, hence he left the service. Thus you see that as far as the experiment went it was eminently a success, but a move of this kind will always meet with opposition from certain sources, and these young men labored under serious disadvantages, and the extent of the opposition was such that the plan is no longer carried on in the maintenance of the way department. I have never changed my opinion—that such a training as this, based on a thorough technical education, was the best qualification for responsible positions in the railroad service.

I found no trouble in obtaining young men ready and anxious to work in these humble positions when they felt that they had assurance of promotion should their work merit it. Furthermore, I have always found that engineering graduates are anxious and willing to work in subordinate positions in engineering corps and that they give better satisfaction, as a general thing, than the other men employed in this capacity.

If any experiments have been tried elsewhere along this line I should be glad to learn of their results.

In Dr. Barnard's plan on the Baltimore and Ohio, where there was contemplated a course of instruction at the same time, the apprenticeship was still further divided into three grades. They were called, respectively, the ordinary apprentice, the cadet, and the cadet officer. The differences were largely emphasized by the differing amounts of theoretical instruction required in the parallel work in the shop school.

The idea of formal apprenticeship for the most part has been confined to the mechanical department. In some few cases it has extended to the roadway department. On the Pennsylvania there has been set up a standard of entrance qualifications in the accounting department and certain general rules of promotion that approximate an apprentice system. But with these exceptions we do not know of any apprenticeship existing in any other department than the mechanical. On all roads there may be found men who are irregularly given special opportunities to learn, by flexibility in the lines of movement and frequent promotions. But when their preference is a matter of personal favor it can hardly be called part of a regular apprentice system.

*Apprenticeship in the roadway department.*—The committee of the Roadmasters' Association of America, appointed to report on the best method of instructing section laborers with a view to promotion to foremen, submitted the following (1890):

In view of the extremely low wages paid to track men generally in comparison with that of men in all other departments of railroad service, while the qualifications of a good track man are those of a first-class mechanic, it is desirable to overcome, if possible, this discouraging influence in some manner, so as to secure more proficient foremen.

Apprentice gangs have proved successful on some roads in the Southern States as a means of encouraging a better element of labor to become track men. This want is felt in the railroads in the Northern States, but they require to as great extent some system of encouragement, so that the suitable men will continue in the track service, and thus create more efficient track laborers and foremen. It is self-evident that this encouragement must be bestowed locally, so that its influence may be felt in every gang on the road, whereas it is apparent that an apprentice gang centralizes this encouraging influence and would be detrimental to the majority of railroads.

We believe that, to meet both the cases, the following system will be found quite available:

First. That there shall be an assistant foreman on each section and floating gang, and, if at all possible, selected from men who are laborers on the sections, floating gangs, and repair or construction trains.

Second. That the assistant foreman shall be appointed and discharged by the foreman.

Third. The assistant foreman shall work with the laborers except when the

foreman finds it necessary to leave the gang, then the assistant foreman shall have charge during the absence of the foreman.

Fourth. Should the assistant foreman be found at any time incompetent or unfit he shall be reduced to a laborer or discharged and another assistant foreman appointed in his stead.

Fifth. The assistant foreman shall be paid an increased rate of pay beyond that paid for laborers, according to his qualifications.

Sixth. When a vacancy occurs in the foremanship, from whatever cause, the assistant foreman shall fill the position until a foreman is duly appointed.

The discussion brought out other methods of apprenticeship. One plan, which was in force on one of the roads represented at the convention, was described by its road master as follows:

I have an apprentice-gang foreman. He is a man above the ordinary ability and intelligence. He is thoroughly conversant with all departments of repair work. In his hands and under his control are placed these young men; they are given special instructions in all the various branches of their work. That instruction applies to all as well as to one; it is uniform; it is the same. They go out with the same ideas. They are able to carry out the ideas of the road master and management better than if placed under the charge of a number of irresponsible foremen.

Under the system as reported by the committee on our road we had difficulty in securing good men. We found one cause of that difficulty was jealousy of the foremen. They would not give these young men the opportunity that was necessary to make them thoroughly competent foremen. One of the young men gave me his experience. He said whenever the foreman went to raise the track—and I will state that the foreman in charge of the gang was a man trusted by the management—that foreman would send him off to do some other work and would raise the track himself, and that young man never did learn how to raise track until he took personal charge of a gang and learned it from one of the hands. It is not so under the apprentice-gang system. They are required to learn every branch of the work which they may be expected to superintend afterwards.

Under the old system a foreman is placed, perhaps, on one part of the road where the conditions are entirely different from what they are on another part of the road. If these young men are scattered over different parts of the road some of them will learn one thing, perhaps proficiently, but may never learn other things of equal importance. But if they are placed in one gang and are located at a point where there are the largest number of conditions possible the greater will be the benefit derived. For instance, the gang which I employ for that purpose has charge of a few miles of main-line track. They have charge of a yard where they have to put in and maintain all kinds of frogs and switches—the Wharton switch, the split switch, switch crossings, and various kinds of spring and stiff frogs and crossings. They are required to build new tracks and do a great variety of work. We also use them for going out to wrecks. We divide the gang in two parts, and in case of a wreck, or accident, or washout one part of the gang is sent out and a chance is given them to see how such work is done.

The gang is composed of 30 men. These men are also given instructions in making reports. We all recognize the fact that reports are a very important part of railroad work. Records we must have in order to know how to economize in railroad work. Reports are kept by that gang, and every man who goes out has the necessary experience in keeping records and making reports accurately. We have him under our eye and know exactly his qualifications. I do not have to depend on discharged or disaffected men from other roads for foremen. We could not be with these men if they were scattered all over the road; we could not talk with them and learn their qualifications, and thus we would be unable to discard or avoid getting into our ranks unsuccessful foremen, whose incompetency is not discovered until we have lost money by them. We sift out the chaff and preserve the wheat.

#### THE MECHANICAL DEPARTMENT APPRENTICE.—REPORT ON THE APPRENTICE BOY.

[American Railway Master Mechanics' Association, June, 1896]

Your committee believe the necessity of the times changes the environment of the apprentice as well as the mechanic. With the passing of the small shop with a few boys, bound under written agreements and bonds signed with legal formality, there must be a new era for the apprentice.

1. Is the ancient and time-honored method of training apprentices falling into disuse by reason of the modern methods of shop organization?

We see with the modern corporations a breaking down of the old method of shop organization, suitable for the fathers and grandfathers, but no longer suitable for progressive organization. While in the past it may have been possible to hold a boy bound under agreements, such methods do not answer with great corporations such as our railroads are fast becoming, extending through several States, with their aggregation of shop employees gathered from the heart of great cities, from the suburban districts, and sometimes from small villages which are almost dependent on the corporation for their existence, the bond gives way to a comity. The boy is taught fidelity, and is given examples in the principles of loyalty, and the time is fast approaching when the young man will feel a loyalty to the corporation second only to the state or church. To bring about this is the duty of men handling large bodies of workmen.

Your committee, with a view of learning what could be done to improve and systematize the technical training of the apprentice, got into communication with several educational institutions and sent out circulars asking a series of questions.

2. Will the shopman of the future be simply an operative? Has evolution evolved a handy man who has come to stay, in the form of a skilled laborer, standing between the mechanic and the laborer?

To the question "Will the shopman of the future be simply an operative, and has evolution evolved a handy man who has come to stay, in the form of a skilled laborer, standing between the mechanic and common laborer?" to the first part of the question there are a large number of replies in the affirmative, yet a majority think there will always be a large field for the skilled mechanic, and belief that the handy man and special tool man has come to stay is very general, and they should be recognized and classed.

3. Do you think these men should be recognized as a class of skilled artisans by themselves?

To question 3 we believe Mr. Sanderson, of the Norfolk and Western, gives the best answer, and would suggest the general adoption of his suggestion, viz, to class mechanics as is the common practice in marine matters; the full-fledged mechanic might be distinguished as an able mechanic, the special tool man or skilled laborer as an ordinary mechanic.

4. Do you have a fixed ratio of apprentices to mechanics? If so, what is it?

To question 4, "Do you have a fixed ratio of apprentices to mechanics?" replies range too widely for classification. Replies indicate some large shops employ as much as 50 per cent apprentice labor, while others indicate as low as 1 per cent, but from a careful study of the replies your committee think that within the ordinary railroad shop the best results are attained with one apprentice to five able mechanics.

5. What is the ratio of skilled laborers receiving less than mechanics' wages to apprentice boys in your shop?

To the question of the ratio of skilled laborers and special tool men to able mechanics the replies indicated that such shops as carry on a large amount of manufacturing employ a larger class of this help, and the shops of the East use a larger per cent of such help than the same in the West.

6. What is your apprentice system?

To the question, "What is your apprentice system?" the replies are such that the committee believes that it would be useless for the association to recommend an apprentice system.

7. Have you a system of technical instruction for apprentices? If so, explain your methods and means of defraying expense.

To question 7, "Have you a system of technical instruction for apprentices? If so, explain your methods and means of defraying the expense of the same," the replies are gratifying in the large number of evening schools in mechanical drawing and mathematics that are conducted at various points.

8. Do you have any general instructions of a general character by lecture or reading of papers among your employees generally?

9. Do you believe your apprentice boys would take an active interest in a night school if one could be provided at a reasonable expense?

In reply to question 9, "Do you believe your apprentice boys would take an active interest in a night school if one could be provided at a reasonable expense?" replies are varied, but your committee believe much interest can be awakened by the heads of the mechanical departments taking a very little interest in the matter.

10. Do you believe an active interest could be secured in your community for a

series of six lectures or more on mechanical subjects, followed by questions and answers and a general discussion, during the winter of 1896, if the association could see its way clear to provide suitable talent on reasonable terms? The number in attendance would not necessarily have to be large, and probably could not be for a technical and scientific lecture and discussion.

In reply to question 10 we find there is quite an awakening in some sections in reference to the benefits to be gained through railroad men's Young Men's Christian Associations, but your committee would also call attention to the courses of instruction offered by the University Extension of Chicago on the lecture study plan, and believe many lecture centers could be established to include large numbers of railroad men on such subjects as general history of philosophy, development theories of rates, combination investments, speculative management, State ownership or control, financial history of the United States, Karl Marx's Political Economy, tariff history of the United States, and such other courses as they may be prepared to offer.

We would also like to call attention to the proposed organization of the Purdue Mechanics' Institute. Many of you have received circulars sent out in this cause, and it is to be hoped this movement will receive such a warm response by members residing in the central Western States as to assure its success. As it is stated in their circular, it is proposed to make the lectures valuable from a purely technical point of view, and at the same time by abundant illustrations to render them sufficiently popular to interest all who may attend.

11. Do you believe members of the American Railway Master Mechanics' Association would respond to a call from neighboring communities of railway mechanical men to read papers on some particular subject that they have given study and attention to?

In reply to question 11—to read these replies fills one with ecstasy. This association is composed of the busy men on the railways to-day, and men who have come to the front by the force of their own character, yet so many stand ready to give a helping hand to those who can be benefited by their assistance.

EXCERPTS FROM REPORT OF THE COMMITTEE ON THE APPRENTICE BOY TO THE AMERICAN ASSOCIATION OF MASTER MECHANICS, 1897.

The first question to be considered is the length of term of service which an apprentice should serve. On this subject there are two diametrically opposed views held, respectively, by those who would insist on a rigid term of service consisting of a certain number of years or months on the one hand, and on the other hand by those who believe that the length of the term should be governed entirely by the merit and ability of the individual apprentice. From reports received from the large majority of the bigger shops of this country it is evident that the more general custom is the prescribing of a definite length of service. On the other hand, what the committee will call the merit system is in force in some shops whose practice it is recognized ought to command our highest respect; also the practice in other countries is in favor of the merit system as opposed to a rigid term of service, and in the discussion in the Western Railway Club, at the May meeting, already referred to, the majority of opinions was distinctly in favor of the merit system. If a rigid term of service is fixed the very great preponderance of practice in this country is in favor of a four-year term. There are one or two cases where a three-year term is considered sufficient. The committee knows of one case where the term is fixed at five years. The four-year term, however, is almost universal. The committee believes that this term has been fixed as the result of long experience and is in accordance with good judgment. In four years a boy ought to be able to acquire a thorough training if he is a boy capable of ever becoming a mechanic. At the same time four years is not too long a time to make the average boy spend on his training.

In drawing up any shop course, therefore, it should be based on the assumption that it is to cover a period of four years. Your committee, however, does not believe that it is fair to make all boys spend precisely the same time on the same work. Any course must be more or less elastic. Boys differ largely in capacity and ambition. Moreover, the same boy will show greater aptitude for one part of his course than he will for another. While, therefore, we believe that four years should be regarded as the proper time of service, and a course should be based on that length of time, there must be left discretion in whoever has charge of the apprentices, either to permit a boy to go forward more quickly or to hold one who is slow longer than the average at a particular class of work. Your committee, however, would not by any means have this to be interpreted as meaning that the discretion of the individual in charge is to be unlimited. With

the brightest and most ambitious boy the committee would under no circumstances recommend the shortening of the term below three years. The committee does not believe that any boy ought to spend more than five years. A boy who requires five years of service to go through his course will certainly at an early age of his training show such assurance of incapacity as to make it evident that he will never make a good mechanic. In such cases the boy should be promptly sent elsewhere. The power to discharge not only in cases of misbehavior, but for the reason stated, namely, of a general incapacity in the boy, must be reserved by the railway company, and ought to be unsparingly and conscientiously used both in the interests of the shop and of the boy himself.

With this understanding the committee submits herewith a schedule of machinist apprentices which is in use on the Norfolk and Western, and which has been found very satisfactory:

Department.	Gang.	Apprenticeship course.	Time (months actually served).	
Tool room .....	-----	General use of tools, names, etc., work on smaller planer, drilling machine, shaper and lathes, provide tools.	6	
Erecting shop .....	No. 1	Helping on general work .....	1	
	No. 2	do .....	1	
	No. 3	do .....	1	
Machine shop .....	-----	General instructions, milling machine, boring mill, horizontal machine, axle lathe, and helping in general.	3	
	-----	Boring, driving, and truck brasses, and quartering machine.	2	
	-----	Cylinder boring machine and planer .....	1	
	Rod ..	Rod gang .....	3	
	-----	Small lathe (alone) .....	2	
	-----	Large slotter .....	1	
	-----	Brass lathe .....	2	
	-----	Small planer .....	1	
	-----	Large and small planers .....	2	
	-----	Driving wheel lathe .....	1	
	-----	Large lathe (alone) .....	2	
	-----	Motion lathe .....	1	
	-----	General vice work .....	3	
	-----	Surface table .....	3	
	Erecting shop .....	No. 1	General work .....	5
		No. 2	do .....	3
		No. 3	do .....	4
		Total .....	48	

Your committee submits that as a basis for an adequate course of training in the machine shop, with the distinct understanding that it is to be qualified as to the term of service to be spent in the different items, and also in the whole course, by the quality and capacity of the individual boys, under the discretion of whoever has them in charge.

The course in the machine shops of most of the railways in the country corresponds very closely to the above schedule. In few of them, however, is the time so closely divided as in the above. The committee is well aware that there must be frequent difficulty, perhaps impossibility, in complying in detail with such a close division of time.

Referring to the suggestion that experience should be given first as boiler-maker blacksmith's helper and secondly as boiler-maker's helper, the committee was in accord, but would prefer to say that an apprentice should be given every possible opportunity to acquaint himself in a general way with other departments of the service, not only with other shops than his own, but with the drafting room and the storekeeper's office as well as with the transportation and the railway departments. Many apprentices will get little or no benefit from contact with other departments outside of their immediate office work, but among them there will be some who are capable of taking in a wide horizon, and these should be given the opportunity to make railroad men of themselves as well as good machinists.

Very little attention seems to have been given to the outlining of a systematic course in the blacksmith's shop. In a very large number of shops no regular apprentices are taken. If young men go in as helpers, and if they have influential friends among the mechanics, they are pushed forward and ultimately become mechanics in some haphazard way without any regular rule governing their

advance. Your committee believes that the course of training in the blacksmith's shop should be just as carefully supervised and directed as that in any other department. As a basis for a course in this shop, subject to the same modifications as suggested in the course for the machine shop, the committee begs to submit the following.

#### BLACKSMITH'S COURSE.

1. To start the apprentice on a bolt machine for six months. Here he will learn the rudiments of heating iron; also the setting and adjusting of dies, and at the same time by observation will learn the names of the tools and their use in that portion of the shop.

2. The next six months in operating a steam hammer. In this position he has a good opportunity to note how the blacksmiths handle and form iron; at the same time require him to help at the fires in the immediate vicinity of the hammer.

3. The next six months should be as helper on a small fire, with a man who is quick and handy with light work.

4. The next six months on a light fire, without a helper, here he will learn to handle the hammer.

5. For the next three months give him a light fire with a helper; the fire should be so located that he will be called upon to help assist in taking heats for the larger fires.

6. For the next six months on heavier work that does not require great skill.

7. For the next three months put him helping at the tool-dressing fire, and if the shop has two tool-dressing fires, the next three months on the second tool-dressing fire.

8. The next twelve months put him on a heavy fire with as much of a variety of work as can be arranged.

Much the same comments apply as to the general lack of system in case of the boiler shop. Again the committee believes that the course should be definitely marked out and carefully supervised.

As a basis for such a course, subject to the aforesaid qualifications, your committee submits the following:

#### BOILER-SHOP COURSE.

1. The first three months heating light rivets.

2. The next three months helping on the heavy sheet-iron work, such as wheel covers, ash pans, etc.

3. Three months holding on rivets for tank work.

4. Three months holding on rivets for boiler work.

5. Six months riveting patches, chipping and calking, and general riveting.

6. Six months setting flues.

7. Six months patching, bracing boilers, chipping and calking, and general riveting.

8. Six months blacksmithing, to learn how to make and to fit braces, to dress necessary tools, and assist in fitting up his work.

9. The fourth year to lay out flange and do general boiler work.

Your committee would also recommend a general code of rules and regulations governing the relation of the company to all apprentices on the following lines:

1. For machinist apprentices, only those who are over 16 years of age or under 20 years of age.

2. For blacksmith apprentices, those who are over 16 years of age and under 24.

3. For boiler-maker apprentices, those who are over 16 years of age and under 24.

4. All applicants for positions as apprentices must pass a creditable examination in all studies taught in the public schools up to and including the eighth, or grammar, grade.

5. Each person so employed, under the age of 21, will be obliged to furnish the company with a minor's release (on form provided for this purpose) properly executed by his parent or guardian.

6. Apprentices are subject to the shop rules and the general rules and regulations of the company, and are liable to discipline or discharge for violation of these rules.

7. Apprentices will be paid for the actual number of hours worked each day, overtime to be paid for in accordance with the rules of the company; each day's work will be regarded as but one day in the apprentice record (apprentices will not be required to work overtime during the first three years of their apprenticeship, except in special emergencies).

8. Apprentices who are working with mechanics on piecework jobs will be paid their regular hourly rates; mechanics thus assisted by apprentices on piecework jobs will be paid only the proper proportion of the piecework rate.

9. Apprentices will be given the best opportunity to learn their trades and to become good mechanics.

10. Apprentices will be expected to comply with such regulations as to attendance on night schools or other classes as the company may see fit to prescribe.

Your committee strongly recommends a careful record being kept of each apprentice by a system of merit and demerit marks, allowing a maximum number of marks for each week or month. The record should be carefully and regularly kept in a book, and while the essential thing to be considered in the marks is the application of the apprentice and the excellence of his work, his general behavior should be considered, and the maximum number of marks should not be attained by an apprentice who in any way is not well behaved, quite apart from his actual work done.

There should be a definite scale of payment per hour for the first year, and that scale should be increased yearly. This scale must perhaps necessarily vary in different parts of the country. Uniformity, however, all over the country is desirable. Your committee would suggest as an equitable scale of pay, 50 cents a day for a ten-hour day; that is, 50 cents a day for the first year and an increase of 25 cents a day for each year thereafter. For an eight-hour day, 40 cents a day at the start and 20 cents increase yearly.

The company should not assume any obligations beyond the term of apprenticeship. When the apprentice has served his course the company must be at liberty either to retain him in service and pay him journeyman's wages, according to his merit, or to let him go and seek work elsewhere.

Your committee not only believes, but insists that the charge of apprentices should be given to one particular and well-qualified person, that person to be known as foreman of apprentices, or by some such title.

In the foregoing your committee has not considered the treatment of what may be called advanced apprentices or special apprentices. Apprentices who have already been through the technical school of course need different treatment from the regular apprentices. They are entitled to a larger rate of pay also. The foreman of apprentices should have charge of both classes alike, and the same foreman should have control of the training and education of the apprentices outside of the shop.

#### COURSE OF INSTRUCTION FOR APRENTICES SUGGESTED BY COMMITTEE OF AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.

First year: Plane geometry; geometrical drawing; elementary algebra.

Second year: Solid geometry, elementary descriptive geometry; algebra continued.

Third year: Plane trigonometry; physics; mechanical drawing.

Fourth year: Heat and electricity, or mechanism of mechanics and kinematics; mechanical and free-hand drawing.

*Plane and solid geometry.*—A study of the usual geometrical principles as set forth in any standard text-book, as, for example, Chauvenet's; the work to be constantly reinforced by original constructive work, such as may be suggested by the daily-experience in the shop, or by Spencer's *Inventional Geometry*.

*Geometrical drawing.*—Instrumental work on the drawing board in the development and solution of geometrical problems. This work should keep pace with the study of geometry, which it should supplement in every possible way, and should be made to include a sufficient number of shop problems to disclose the breadth of the subject. Careful attention should be given to the manipulation of the drawing instruments, for this is a preparation for the work of succeeding years.

*Algebra.*—First year: Such an amount of elementary principles as are absolutely necessary in teaching geometry, including a discussion of the equation and of its meaning, addition, subtraction, multiplication, division, and linear equations. Second year: Involution and evolution; factoring, with application to highest common factor and least common multiple; fractions and their algebraic operations; quadratic equations; systems of linear equations; ratio and proportion; theory of limits; logarithms; all principles to be enforced by practical problems, many of which should arise from conditions in the shop. Any of the many good school algebras may be used in this work.

*Elements of descriptive geometry.*—To be made up of problems in the development of surfaces and their intersections, the problems to come chiefly, if not

wholly, from drawings of boilers from boiler department. Some practice should also be given to isometric projection.

*Plane trigonometry.*—Half year. The measurement of angles, trigonometric functions, solution of triangles, trigonometric tables, and derivation of formulæ as found in any elementary text-book, to be enforced by as large a number of problems as practicable.

*Elementary physics.*—A study of the facts and laws of physics, chief attention being given to elementary mechanical principles, such as those included under the older term "natural philosophy." A suitable text-book would be Avery's School Physics, which contains a very clear, simple, and accurate text, with numerous illustrative experiments to be performed by the student.

*Drawing.*—Practice with instruments in drawing details of machines from copy and from the machines themselves; practice in lettering; original designs of simple tools or machines, or jigs, to meet certain specified requirements, which should be stated in the form of a problem for solution; during the last year of the course, instruction in free-hand drawing.

For the fourth year it is proposed to allow a choice between advanced physics and kinematics. Though both of these subjects are presented below but one should be taken by any individual student.

#### ADVANCED PHYSICS.

*Heat.*—A study of the facts and principles of heat by the use of such a book as Garnett's Heat, a work written chiefly for mechanical engineers.

*Electricity and magnetism.*—A study of the facts and principles, in which only elementary algebra and trigonometry are used. This course is covered in a clear and compact way by Perkins's Electricity and Magnetism.

#### PRINCIPLES OF MECHANISM.

Analytical study of the fundamental principles governing the transmission of motion by rolling contact, sliding contact, by belts, link work, and reduplication. Robinson's Principles of Mechanism will be found well adapted to the requirements of this course. Students selecting this subject should give a considerable portion of the time allotted to it in the development of such problems as are involved in the design of gear wheels, cams, and other elements of machine construction, in addition to the regular time allowed for machine drawing.

Every apprentice should be expected to read at least one technical paper.

The car builders' apprentice on railroads is generally given little attention, primarily, perhaps because few railroads build their own cars.

The following is the report of the committee on this subject to the Central Railroad Club:

Roads building new passenger and freight equipment should advance their apprentices about as follows: The first six months, freight-car repairs, to familiarize them with different designs and their weaknesses, the remainder of the year to new freight-car construction. The earlier portion of the second year should be devoted to repairs of passenger cars and the construction of new passenger-equipment cars and repairs to old. The fourth year should be given up to interior finish, first at the bench, getting the material in shape, and later in putting the finished work in place. By bench work I do not mean the dressing up, scraping, and sandpapering of moldings, fascia boards, etc., but the framing of partitions and such work, requiring mechanical skill both in the laying out of the work and putting it together. If the brighter ones were selected at the close of their apprenticeship to fill vacancies in the drafting office, where the work was not limited to two or three men, great benefit would be derived by some railroads where at present all car designing is being done by theoretical locomotive men.

Referring to the quality of labor generally employed by railroads in car repairs, Mr. John Mackenzie, superintendent of motive power of the New York, Chicago and St. Louis Railroad, says:

We get our car builders nowadays, I think, from the car inspector. We have not on our line any car apprentices at all. When we want somebody to do wood butchering, as we call it, we go out and hire a man that we pay \$2.50 a day. I do not know of a railroad in this country, where they have a large car shop even, that has very many apprentice boys in the woodworking department.

The telegraph learner is not dignified with the status of an apprentice. For the most part he has "picked up" his art and his information without any direction or supervision. In a paper on the telegraph apprentice system to the National Association of Superintendents of Telegraph, Mr. G. C. Kinsman, of the Wabash Railroad, says:

The selection of employees for minor positions may be regarded as one of the most important questions with which the superintendents have to deal. If, in filling all unimportant places, he secures young persons of character and capacity for increased responsibility, if these employees are then so treated as to induce loyalty and a knowledge of the fact that their interests and the interests of the company are identical, the standard of efficiency will be raised and the conditions for revenue correspondingly improved.

Those who have given this subject serious thought and trial will appreciate that the ideal is not of easy accomplishment. Students in offices, messenger boys, and apprentices must serve for a time for little or no money compensation, for the reason that they can earn for the company no more than it must give in the time of its skilled labor for their proper advancement.

If this instruction is omitted or indifferently given, as will be found true in many cases, the beginners are apt to lose interest in their work and to seek associations more congenial but less honorable, and the railroad company will stand before their parents and before the community as exerting an undesirable influence.

If the selection of students and messengers is left to agents and operators, it will be found impossible to eliminate the influence of relationship, religious and political prejudice, and personal favor. These reasons alone seem to make it most imperative that the selection of employees for minor positions should, so far as possible, be placed in the hands of persons not directly interested.

My idea would be a board of not less than five officials, selected with the greatest care from the different departments, this board to hold stated meetings for the purpose of acting on applications, its secretary making investigations in accordance with its formulated rules, the heads of the departments to refer to the board for investigation and approval the applications of persons thought desirable for future employment, and to have authority to employ such persons in cases of emergency subject to the action of the board.

#### GRADATION IN RAILWAY EDUCATION.

We can not go far in the discussion of a thorough railway education before we are confronted with the different grades of fitness within the same department to be fitted for. Special education recognizes readily the division between different kinds of work, but it is not so easy to concede the necessity for different kinds of education according to the grade of attainment to be secured.

In Europe, with its well-established castes, there is little difficulty in adjusting education to meet this necessity. They have the common apprentice's course, the foreman's course, and the manager's or engineer's course. This is very clearly defined in Russia, Germany, and, to a degree, in England. Referring to this, Mr. Walter G. Berg, who prepared the data for a consular report on technical education abroad, says: "The European governments long ago recognized the necessity for a strict distinction between professions and trades or callings. They emphasize throughout their national educational schemes the fact that an institution can not accomplish two different objects at the same time." He therefore advocates in education of railway men:

First. A clear division should be maintained between the higher and middle class of railroad men and the preliminary educational systems kept distinct and separated from each other.

Second. The higher class, offering the material from which, as a rule, the future managers, professional men, and heads of departments will be drawn, should be provided for by special railway departments at existing colleges and by adding general railway subjects to the present curriculum of the technical departments of colleges.

Third. The middle class of railroad employees, comprising young men entering the railroad service in subordinate positions of all kinds, many of whom will

some day fill a large number of responsible minor railroad positions of trust, should receive, after leaving the ordinary school course, a special short preliminary schooling adapted to the particular departmental work they expect to take up on entering a railroad shop or office. This special education will be obtained most advantageously in special railroad trade schools, to be established wherever desirable and possible throughout the country. The curriculum to consist of one-year "regular course," divided into suitable departments. Further, an "advanced course," covering a second year, for such scholars who desire and have the means and qualifications necessary to continue their studies to a more advanced point.

It is claimed that the aptitude for different grades of service is different. Fitness for the higher grades may not always include fitness for all the lower. Because men do not often move backward, it is seldom demonstrated how unfit they may be for lower positions, even sometimes when they may have previously passed through these very positions. The failure to recognize in the training of men the different grades of service to which their capacities apply results in a great amount of misdirected effort and energy. On the one hand men struggle for what their capacities unfit them to attain, and get no benefit to themselves or their employers; and on the other hand many men who have a fitness and talent for the higher grades of service are sometimes held back by work for which they have no fitness simply because it lies in line to that for which they have capacity. Efficient organization, no less than education, is essentially a process of selection and adaptation. The standpoint of the one is the work to be done; the standpoint of the other is the man to be trained. So far as organization does not facilitate to the uttermost the principle of selection, it is inefficient.

But while theoretically the European system may be a good thing, it has serious defects which can not be too greatly emphasized. The proposition to do a definite thing and to use each kind of material just in that part of the structure where it best serves is very attractive, but it rests on the assumption that this selection can be made with certainty, and because of this certainty, when once made it is irrevocable. And even granting that this assumption is correct, we have placed our men within well-defined lines which they clearly see they can not pass. We have taken away their native spring to give certainty to the work of each part of the organization. The great strength of an industrial nation is in their ability to devise and originate. It is conspicuous of Americans in manufactures, in commerce, in war, in every department of activity. Any system that imposes a rigid gradation, although set up on an impartial basis, among men of differing fitness, which is a great assumption, is claimed by some to be full of menace.

There would seem to be a median system, and that is suggested by the excellent scheme of instruction outlined by Dr. Barnard on the Baltimore and Ohio Railroad some years ago. In that, provision was made for three grades of fitness, but he did not make the lines between them so rigid that one could not easily cross them.

The importance of flexibility in any scheme either of education or organization can not be too greatly emphasized. The great ideas in any line seldom come from those who are given to thought in that particular line habitually. Inventors and originators are those who get chance views of things.

#### GENERAL EDUCATIONAL AGENCIES OF RAILROADS.

For general education the railroad has extraordinary opportunities to throw around its employees the environment of, and general stimulus to, thrift, temperance, manliness, culture, and refinement, as few agencies ever had. For thrift one of the means resorted to is the superannuation, death, or disability insurance. Most companies will collect the premiums for this insurance from the pay roll, on request. Some companies bear the expense of managing local insurance funds,

and others contribute regularly to the fund as well as undertake the expense of managing it. One road pays 45 per cent of the premiums on all insurance of conductors, engineers, firemen, brakemen, bridge carpenters, signalmen, yardmen, and foremen in its employ, which are taken out in a designated standard insurance company. Some roads merely offer these as facilities, while others require certain classes of their employees to be insured.

Another form of general educational activity, where the railroad has great facility, is the circulating library. The opportunities of accomplishing much with small outlay was early realized. In 1850 Gen. Herman Haupt, then general superintendent of the Pennsylvania Railroad, when the new shops were opened at Altoona, went among the wealthy men of Philadelphia and got subscriptions for a library for employees at Altoona. In view of the ease and inexpensiveness of this kind of work, it is remarkable that the railway library has not been more fully developed. By use of the baggage car and the highly organized train and station staff, the books can be circulated over a wide territory at no expense. The sketch of the traveling libraries below is by the librarian of the Baltimore and Ohio Railroad:

The earliest railroad traveling library of which I have any knowledge, that of the Boston and Albany Railroad Company, was opened in Boston, free to all the employees of the company, in February, 1869, and was moved to the general office of the company at Springfield, Mass., its present location, about 1881. The library now numbers in the neighborhood of 3,000 volumes, all of which are for circulation (except some 500 reference books). The circulation is about 3,000 per year. It has received numerous donations of money and books, but it is chiefly supported by annual appropriations of the company. Its government is vested in a committee of five—two members of the board of directors, the clerk of the Boston and Albany Railroad Company, the assistant superintendent, and the master mechanic.

The rules state that "books from stations must be in the library Wednesday morning, in order that more may be sent the same week. Any book received after that time will be checked off, but no more sent until the following week." Orders for books are answered every Wednesday, and each borrower may draw two books at a time. Books may be retained two weeks and may be renewed; otherwise they are subject to a fine of 1 cent a day. A revised catalogue was published in 1889, and since then four supplements have been issued; from these the borrowers select their books.

The library of the Railroad Branch of the Young Men's Christian Association of New York City was founded in 1887 by Mr. Cornelius Vanderbilt, who supports it. It contains about 7,500 volumes, 750 of which are classed as railroad books—more or less technical. Mr. Stevens, the librarian, tells us that "during last year 12,337 volumes were drawn by 1,377 readers, 5,713 volumes were delivered by train service to other railroad branches of the association at points along the line of the road, and 1,131 were delivered to members at stations holding special library tickets." The books delivered by train service were sent to 724 readers along the lines of the New York Central.

Almost every town in Massachusetts has its free public library, and the people who live along the lines of the Boston and Albany Railroad have freer and easier access to books and libraries than any other people in the world. During the last half century the State of New York has spent millions of dollars on books for the people. It is therefore not unnatural that there should be a larger use of the traveling library of a railroad in a section where, until within recent years, the free circulating library was almost unknown. Such a library, in some of its features both original and unique, is found in the Baltimore and Ohio Employees' Free Circulating Library. This library, after having been moved several times, is now at home in a large second-story room in the building at the corner of Pratt and Poppleton streets, Baltimore, at the Mount Clare shops.

In 1884 the late Dr. W. T. Barnard was "assistant to president" of the Baltimore and Ohio corporation, and to him the library is largely, if not entirely, due. Dr. Barnard was actively interested in the Baltimore and Ohio Relief Association (now the Relief Department), and thus acquired a knowledge "of the sad lack of educational facilities along the main stem and branches of the Baltimore and Ohio Railroad." He therefore undertook to establish a free circulating library "exclusively for the use of the employees and families of employees of this

service." His plan was outlined in a circular dated December 1, 1884, from which the following is taken:

"The establishment of a free circulating library for the employees of the company is undertaken in the belief that such an institution will be welcomed by all classes as a popular and desirable measure, and that through its agency and development much-needed opportunity will be afforded employees to qualify themselves for promotion and advancement in life, while at the same time their children, wherever located, will have at hand facilities for study and instructive reading matter seldom obtainable outside large cities. This will be done without cost to employees and in such a manner that the books furnished can be utilized not only at reading rooms (not always convenient of access), but also amid the comforts and society of their homes.

"The plan, in brief, is, by means of contributions of money and books, to establish a compact general and technical library, selected with special reference to the wants and tastes of employees and their families; to print inexpensive but carefully prepared catalogues and cards on which to make requisitions for books, and to so distribute them that every member can receive and return literature, without delay, through the company's train service. \* \* \*

"This library is therefore to be exclusively for the use of all employees, their wives, and more particularly their children. Its mission will be to exert an elevating and educating influence on those it reaches. It will supply current periodicals, standard works on the sciences, general literature, poetry, historical, text, and other books of practical utility to engineers, mechanics, firemen, and other railroad employees, and those especially adapted to educating and forming the character of the young. Whatever is immoral in tendency will be rigidly excluded from its shelves, and its management will do all it can to discourage the use of literature from which unhealthy and unreal ideas of life might be drawn.

"It has been created and will be sustained by voluntary contributions of money and literature from the officers and employees of the Baltimore and Ohio Company and outside friends interested in their welfare.

"Its headquarters will be at Baltimore, but it will undertake to distribute books, etc., to any point on the Baltimore and Ohio Railroad lines."

The plan, as outlined by Dr. Barnard, received the official sanction of the company March 2, 1885, through an order of the president, the late Robert Garrett. The order provided for the management of the library by a library committee, said committee to be composed of two directors of the technological school, two members of the committee of management of the relief association, and a representative of the Baltimore and Ohio Company, appointed by the president. The principal instructor of the technological school and the secretary of the relief association were to be members of the library committee ex-officio. The technological school was abandoned some years ago, and since then its representation on the committee has been dropped. When the relief association was changed to the relief department the corresponding officials of the latter became members of the library committee. The library year begins December 1, and the members of the committee are appointed annually. The president of the company appoints the librarian.

The library committee, as provided for in the president's order, organized and began work at once. They appealed for aid to those only who were financially interested in the company. They collected \$5,391 and received about 1,500 well-selected books as donations. The nucleus of the collection was a donation of 600 volumes to the employees at Mount Clare by the late John W. Garrett, in September, 1869.

December 3, 1885, the library began its work with 4,500 volumes on its shelves, 3,000 of which had been purchased. The first year 16,120 volumes were circulated, 4,850 at Mount Clare, and the remainder at different stations on the lines of the Baltimore and Ohio. The circulation for the second year was 23,514; for the third year, 23,470, a slight decrease. The fourth year showed an increase of more than 2,000 over the previous year, and since then there has been a steady growth in the circulation. The circulation for 1895 was 37,702, and in 1896, 2,500 borrowers drew 39,505 volumes from the library. Since 1885 more than 300,000 volumes have been drawn.

These books travel as far westward as the Mississippi River, through eight great States, and over a railway system approximating 3,000 miles. They are delivered to borrowers through local agents, and the average time from the placing of an order for a book in the hands of an agent until the book called for is in his hands is now less than 24 hours for the entire system. The library uses 674 agencies, each agency serving as a delivery station for the employees of the community or department.

Along with the increase in the number of books used there has been a decrease in the percentage of fiction. The first year 64 per cent of the circulation was fiction; the percentage of fiction is now less than 53 per cent.

A book may be retained two weeks, and may be once renewed for a like period, or oftener, if no application for it is on file. There is a fine of one cent per day on books kept overtime, but a margin of three days is allowed to cover the time consumed in transit.

On leaving the service of the company all books must be returned before pay-vouchers are cashed; otherwise the value of the book will be deducted from the wages of the employee.

The whole system of sending out and returning a book is similar to that of the registry department of the post-office. Every person who handles a package receipts for it, so that it is possible to trace anything that may be lost. The company is responsible for all books in transit, and it exacts the same care in the handling of library property that is required for all other property.

The system of ordering and charging books for circulation is very simple. The borrower fills out a requisition blank, that is, by writing the name and call numbers of the books he wants, which he selects from printed catalogues, and by signing his name and address and the department in which he is employed. The requisition is then countersigned by the agent through whom he wishes to get the book, and it is sent to the librarian at Mount Clare, Baltimore. The librarian takes the first book on the list (using his discretion, however, in case of fiction, to select for the reader), and then makes out a record card for the transaction. On this card is entered the date, the requisition, book, agency, and package number, and the name of the borrower. The card is filed in the order of the book number. Another entry is made on a card under the agency number. This entry shows how many and what books are at any agency at any time. When a book is returned its number is marked off on the agency card, and the charge on the card filed under the book number is canceled. A new series of requisition numbers begins every year on the 1st of December, and the requisition number is always the total circulation of the fiscal year to date.

After all entries have been duly made and the requisitions have been stamped and dated the books are wrapped in packages. These packages are then stamped and labeled for delivery, through the baggage department, to the agents along the lines. Several agencies take such a number of books that satchels are used in carrying them back and forth.

To prolong the life and usefulness of the books, and at the lowest possible cost, the librarian uses for binding and repair the leather from worn car seats, which he gets from the passenger-car repair shops. The leather is practically useless when it is removed from the seats, but the pieces he is able to get makes a binding that is both neat and durable.

Once a year the librarian goes over the lines, visiting all the agents in the interest of the library. This is done during the summer, when, for about four weeks, the library is closed.

The library now contains about 14,000 volumes. There have been few additions since the Baltimore and Ohio Company has been in financial straits. Gifts of suitable books will be gladly received.

Corporations, like individuals, are recognizing that their duty to those they employ is not complete on the payment of the stipulated wage. Hence it is that relief departments, young men's Christian associations, and other helpful organizations are established or encouraged by so many of our railroads. These organizations raise men to a higher physical, intellectual, and moral plane of life—the very fundamentals of faithful service. In other words, it pays to have some regard for the men outside of working hours.

The force of good books in our daily lives is being felt and recognized more and more every day. To the section hand and his family, living in rock-bound isolation, to the operator in the signal tower waiting for the click of his instrument to call him to duty, to railroad workmen everywhere along the company's lines, the books from Baltimore are bringing sunshine, and in the economy of the universe I fancy that it is no less important to cause such sunshine than it is to cause two green blades to grow where now there grows but one.

The Wells-Fargo Express Company have for some time had traveling libraries among their employees. Mr. E. A. Stedman, assistant manager of the company, writes describing them:

Mr. John J. Valentine, president of Wells, Fargo & Co., has for years encouraged the organization of library associations by employees of Wells, Fargo & Co. in the different departments of the company's service.

In August, 1890, "The Wells-Fargo Library Association" of San Francisco was organized with 60 members. At first only magazines and other periodicals were purchased and supplied to members. In February, 1892, 400 books were selected and purchased. In 1897, 2,500 books were on their shelves, 72 magazines were on their list of periodicals, and the membership had increased to 400.

On October 14, 1897, at the suggestion of Mr. Valentine, a number of employees at New York organized "The Wells-Fargo Atlantic Library Association," for the benefit of employees in the Atlantic department of the company. We now have 281 members and over 1,600 books, which we believe are well selected for a library of this character.

On June 5, 1898, another association for the benefit of employees in the middle West was organized at Chicago, called "The Wells-Fargo Illinois and North-western Library Association." Their 1899 catalogue indicates that they have already acquired about 1,200 books.

A fourth association is, I believe, being organized in Mexico City, as a request was recently received from there for detailed information regarding our organization, forms, etc.

The organization in each association is practically the same as in the others. The employees who become members conduct the affairs of the association through the officers and trustees whom they elect yearly.

The dues, collected monthly, are 25 cents at San Francisco and 15 cents at New York and Chicago. For the first three years Wells, Fargo & Co. contributes to the new association an amount equal to that paid by the members. Suitable rooms in the company's offices are also provided, when possible, and furnished for use as a reading room.

The president of Wells, Fargo & Co. has also donated to the association many of their best works of reference and historical works.

While the reading rooms are used to some extent, my observation leads me to believe that the circulation of books in the homes of employees is the best work done by these associations.

Books are carried free by Wells, Fargo & Co. Express to and from association members, at any point on its lines. Even in the cities where the libraries are located this service is of value to members, books being delivered at the desks of employees, in offices far removed from the library, who have no opportunity to call at any of the city libraries or that of the association.

A new feature is now being tried in the Atlantic Association. A number of train messengers who "lay over" at Salamanca, N. Y., are provided with 50 books for the "messenger room," which the company furnished for their use. Each month the books are exchanged for others. A case is provided for the books while at Salamanca, and also a box suitable for shipping books back and forth.

The reading room has grown out of necessities in much the same way as the railroad hospital on the great Western railroads. Train men at the end of their run must be provided for in some way, and this was found to be most easily done by the reading room.

Lectures and literary entertainments have sometimes been systematically resorted to in small towns and division headquarters where there is principally a railroad population. The transportation and much of the entertainment expense involve no outlay to the railroad, and from its men it is at little risk to guarantee a reasonable attendance.

Another feature of general education that may not be passed over is the placing of a premium on the education, culture, and moral rectitude of individual employees by giving preference, other things being equal, to these qualities. The return to the railroad is perhaps never from the individual, but from the general influence and tendencies thus set up throughout the service, but it must distinctly be with the proviso "other things being equal," otherwise the demoralization too often follows that is incident to paying a man for one thing under pretext of a different thing.

The great agency which railroads have recourse to in their efforts for the improvement of their employees is the Young Men's Christian Association. It has been long in the field and is so thoroughly equipped with men and methods that it generally succeeds better than the railroad directly can. From the educator's standpoint it is distinctly a moral and educational agency. To the railroad

manager it must be viewed from the economic standpoint alone. The late President George B. Roberts, of the Pennsylvania Railroad, in recommending an appropriation by his company, said to the directors: "If you vote this money for this purpose it means more to the Pennsylvania Railroad than the same amount of money would if invested in steel rails." Mr. Chauncey M. Depew, while president of the New York Central Railroad, said: "The association does more in fitting men to fulfill their duties for the safety of the public than all the patent appliances of the age."

Mr. George B. Hodge, secretary of the educational department, gives the following summary of its work for 1898:

The educational facilities of railroad men embrace reading rooms, libraries, literary societies, lectures, practical talks, and evening class work. Throughout North America are 135 railroad Young Men's Christian Associations. There is a total membership of about 32,000 men and a working force on committees of about 4,000. Every day there is an attendance averaging 13,500 railroad men at these association buildings.

There are 115 reading rooms, in each of which there are from 10 to 150 different periodicals on file. A great many of these periodicals, of course, are technical and concerned with railroad work especially.

There are 95 libraries, containing about 70,000 volumes, and the total number of books drawn from these libraries by railroad men the past year is 84,500.

Twenty literary societies are reported, with an average attendance of 650. Sixty-two railroad associations report 287 lectures and practical talks. Thirty-five of these associations report evening classes, in which there are a total of 109 branches taught, and 1,408 different railroad men students. These classes are for the most part in arithmetic, bookkeeping, mechanical drawing, shorthand, and typewriting.

Considerable work is done in what is called first aid or emergency work; also in the study of steam, the steam engine, the air brake, and other similar technical subjects.

The educational work of the Young Men's Christian Association is generally in the charge of an educational director at each place, who has general administrative charge. The work done in the evening classes is given effect by the system of "International examinations," which are conducted at the same date at all the associations, the papers being passed into the general headquarters for marking. The diplomas issued by this committee are recognized by some forty-four colleges and universities and eleven technical schools.

#### RAILWAY EMPLOYEES—THEIR DIFFERENT FUNCTIONS AND QUALIFICATIONS.

A railway president asks, "What is a railroad man?" The question brings into view the wide range and variety of attainment in railway employ. With the increasing complexity of railway operations the specialization in certain grades of the service becomes too great to be embraced in a single type of talent. There is little in common except the forms and spirit of a common organization and a common point of convergence in the lines of promotion. It becomes a question if the specialties that have so little in common do not classify more readily with analogous trades or professions than as varieties of a common genus of railway talent. President Perkins, of the Chicago, Burlington and Quincy Railroad, says: "The education of railway men has always seemed to me like talking about the education of dry goods merchants. Railways employ engineers, civil and mechanical, chemists, doctors, lawyers, and various other more or less scientific people; and I suppose the education of a railway lawyer is very similar to the education of any other lawyer; so I do not understand what is meant by the education of railway men."

In case the departments of the service are simply railway specializations of different trades and professions, the education would be first in the trade or profession, and the railway adaptation of it becomes a secondary consideration.

This specialization for railways may be had in actual experience, or in a supplementary course of instruction, or merely in general lectures and a few options in the regular course. The degree of specialization depends on what may be the trade or profession. For the lawyer or doctor it would be very little. For the mechanical engineer it would be very considerable. For the accountant and the traffic man it would be practically all of his profession, and for the transportation man it would be the whole profession. The civil engineer's duties have been split up into that of the bridge engineer, the architect, the roadway maintenance engineer. The architect and the bridge engineer are railway specialists of their respective departments of engineering rather than the converse. For the great body of the medical employees there is very little specialization possible. There is nothing in their service for the railway that differs from the regular professional practice, except that there is a prescribed method of making reports, and the physician is to be on the alert to see the legal bearing of the cases which may involve the company in suits. There is only one man, the chief surgeon, who can be said to have any special administrative duties. His are largely judicial. In his case it is more important that he be a good administrative officer than a good physician. Of the railroad lawyer we quote Mr. Fairfax Harrison, solicitor of the Southern Railway:

The kind of a lawyer that a railroad company usually retains is a man who has established his reputation by a long practice in a locality where he has influence and force with courts and juries. In order to obtain such a position it is necessary for him, of course, to be a good lawyer, and his education should therefore be to that end without regard to the railroad business.

A railroad lawyer is called upon to be a specialist in all branches of the railroad business, and, like the counsel for any other client, his practice usually is to prepare himself for the particular case which he is about to try by a special study, and after the case is tried to forget all that he had learned except the law applicable to the case. If this practice did not obtain a lawyer would soon become a "jack at all trades and master of none."

In the very limited number of lawyers attached to the general offices of railroad companies whose duties are not those of trying causes the function desired is more a judicial one than any other; that is to say, the lawyer should be prepared to pass judicially upon claims, having in mind a decision which is not only fair to his client, but to the public. This is necessary, because when an individual consults counsel he asks for advice, which he may or may not follow, but when a railroad officer consults the counsel of the company he asks for a decision on the question presented, which almost invariably he follows without further inquiry or discussion. If, therefore, the railroad lawyer upon which such duty devolves is honest in his work he can not be merely an advocate. For this reason those who attempt to do this class of work should be qualified by nature and character for judicial work; and it is a matter of general knowledge that judges are selected not by reason of special education, but rather by reason of the peculiar fitness or availability of the man selected.

The departments found in the organization of all American railroads are the transportation, roadway, mechanical, traffic, accounting, and executive. The great department is the transportation. Outside of the clerical labor this department consists of train men, enginemen, operators, station agents, and train dispatchers. The enginemen are technically under the mechanical department; but for the most part their duties are with the transportation. The organization above the rank of train dispatcher generally consists of a train master, division superintendent, general superintendent, and general manager. But it differs according to whether the plan of general organization over the whole road is by territorial units or by departments. Under the former plan the superintendent may be said to be general manager of his division. He has full charge of everything on his division, being guided in general policies by the general officers of each department at headquarters. The division officers of the different departments report to him. The train master then becomes the highest official on the division, whose duties are purely of a transportation nature.

Under the other plan each department has its own separate divisional organization, reporting directly to its general officer at the general office. Since under this plan the lines do not unite until we get to headquarters, the tendency is to produce specialists. Under the former plan the transportation department broadens out earlier into a general administrative office, but generally at the expense of the other kinds of service, which do not lead to the superintendency. On some roads this tendency to consider the superintendency a transportation office by right is distinctly thwarted by holding it open for the civil engineer alone. Sometimes they definitely train their superintendents by a mechanical apprenticeship, but nowhere is it general for the superintendent to be appointed in regular succession from the mechanical department. On one road, which is alone in the practice, the superintendents are taken from the auditor's office.

The train master deals exclusively with the movement of trains and distribution of cars on his division. He deals directly with train men and agents, but their appointment and discipline is generally in the hands of the superintendent. It is essential that he be thoroughly versed in the transportation rules. The experience of an operator and train dispatcher is very helpful, though not essential. Sometimes part of his functions are given to a chief dispatcher, and the rest, with added duties, are united in the functions of the chief clerk to the superintendent.

From Mr. Charles Hine, chief clerk to the division superintendent of the Cleveland, Cincinnati, Chicago and St. Louis, we have the following statement as to the qualifications for that office:

#### REQUISITES OF A CHIEF CLERK TO A SUPERINTENDENT.

*Essential.*—Common-school education. Experience as a railroad clerk and stenographer, preferably in the office or on the division where employed. A knowledge of train rules and of the duties required of the various employees on the division.

*Desirable.*—Higher education. Experience as a telegraph operator and as a train dispatcher. Experience in the train and yard service. Experience as a station agent.

The train dispatcher must first be an operator. Train dispatching is a highly technical work. Only persons that have the faculty of continuous attention and precision well developed should ever be train dispatchers. Most men have had their experience and their testing at some terminal or heavy train-order point. They then come into the office as copiers, whose duties are to copy orders sent by the regular dispatcher. The train dispatcher should be familiar with the grades and physical conditions of the road, the sidings and their capacity, the motive power and the ratings and running conditions of the different classes of locomotives, and the nature and delays of different kinds of breakdowns. Except facility with the key, a knowledge of train rules and train orders, and some general knowledge of the running conditions of rolling stock, there is little that can be acquired outside of the school of experience.

The station agent is one of the very largest classes of railway service. In the earlier days the station agent was, and at the smaller places at the present time is, generally a local man who became agent because, perhaps, he was locally prominent. Again, they are exclusively railroad men, who came into the community as railroad employees, and are liable to transfer elsewhere. But generally if they have been first railroad men, relief operators or relief agents, when they accept an agency they become permanent fixtures with highly developed local relations. This so far tends to take them out of the professionalism of the railroad service. If agents are sometimes thought to be to a degree out of the general movement of railroad succession, the reason may be in their isolation and the fact that movement for promotion means the severance of local relations, whereas in other places it is simply a movement from one desk to another.

The station agent is brought into direct contact with the traffic and auditing departments as well as the transportation department which he serves. His duties at a competitive point are quite as much for the traffic as for the transportation department. At the large terminals the agent becomes an administrative officer, ranking next and sometimes on an equality with the division superintendent.

Station agents come into the service as relief operators and as clerks at large stations. It is not essential that all agents be familiar with the key, but it is highly desirable. As the agency becomes larger the commercial talent becomes more important.

The agent is essentially a vender of transportation. He must understand the commercial conditions of his town and adjacent territory, so that he may advise the traffic department intelligently. He must know the usages of business, the common carriers' liability, the packing, shipping, and warehousing condition of the various kinds of freight handled at his station. By his tact and general ability he must be able to command the confidence of the business community. Few places in the service demand such variety of talent. While the importance of a highly trained staff of station agents is often emphasized, there has been little done for their systematic instruction. But among the efforts in this direction may be mentioned the Station Agents' Association on the Southern Railway, a semi-official organization of the larger agents meeting quarterly for the interchange of ideas and discussion of methods and general policies.

At the large terminals the transportation and traffic function of the agent are sometimes separated and the transportation part assigned to a superintendent of terminals. Touching his training and qualifications, Dr. William Taussig, president of the St. Louis Terminal and Bridge Company, says: "A superintendent of terminals must have a good knowledge of traffic, of rolling stock, machinery, maintenance of way, and of operating to become efficient, and while a good knowledge of how to operate switching and engine yards is also necessary, still that knowledge may come by observation (without necessary manual practice) while serving as employee in other departments."

The engineman, perhaps, came in as wiper, hostler, fireman, and sometimes had first been machinist. For the most part they were employed after they were full grown, as physical endurance was one of the essentials. The pay and promotion held out have not allured the man of special education into the service at this age. The engineman therefore generally has not had the preparation by education for large administration, and either from this reason or the independence and fascination of his life, he has seldom moved beyond the place of engineer, unless perhaps to become road foreman of engines or roundhouse foreman. The requirements of his service are a well-balanced mental organization, steady nerve, alert faculties operating with decision, certainty, and dispatch within a limited number of choices. While on duty he can not allow his mind to wander out to generalizations, but must confine himself with the closest attention. The tendencies of such service are to produce some of the most heroic qualities. The education for such duty must be had in the discipline of actual experience. Railroads are beginning to require a high standard of knowledge on train rules, breakdowns, air-brake practice, firing, and economical running, but in some quarters is the feeling that too much theory rather confuses than facilitates the runner.

Trainmen, like enginemen, generally come into the service after they are grown, as physical strength is one of their requirements. Generally speaking, those who have had any special education are not attracted to this service, because with the larger operations of railroads has grown up a staff service which is the more common avenue of promotion. The better positions of pas-

senger conductor on choice runs pay well and offer a certain independence that is attractive. The educational requirements for entering the train service are very simple, and on some roads are neglected altogether. The employee gets his training in experience. As he advances he is given examinations—generally oral—in train rules and certain rules of thumb to guide him in case of breakdowns. When he becomes passenger conductor, he learns by correspondence chiefly, from the passenger department, the special requirements of his new position. Some roads undertake a little technical instruction in the use of the air brake. On the New York, New Haven and Hartford Railroad only have we been able to find any regular instruction given to trainmen systematically. But the beginning there made is not sufficiently advanced to report what has already been accomplished.

The Cincinnati, New Orleans and Texas Pacific Railway has undertaken in a modest way the instruction of trainmen in signal practice by the use of a stereopticon.

The roadway department consists of the section men, section foremen, supervisors, and roadmasters, and also bridge carpenters, bridge foremen, and superintendents of bridges and buildings. At this point there is sometimes a more or less definite line drawn, the next officer, the engineer, being a man of higher education, whereas this has not been the requirement for all those below him. Sometimes the road master is the engineer and sometimes they are separated.

The section laborer is generally the common laborer of the community where the road runs. The section foreman has been boss on general construction, or, if the road has been in operation a long time, was picked out of the gang which he bosses. He generally has had no education except such as he got in his apprenticeship, which was itself more or less indefinite. The supervisor is generally selected from the section foremen for superior knowledge of good track. The road master comes to be an administrative man. Whether he should be an engineer or whether he should report to an engineer is still a much-contested question.

The importance of the track department in the latter-day necessity for cheap transportation, and what has been demonstrated on the Lake Shore and Michigan Southern Railway by the use of division engineers, has tended to restore the engineer's place on the railroad. In its highest development there are two engineers. The distinction made by Mr. Willard Beahan, of the Lehigh Valley Railroad, is: "The bridge engineer becomes responsible for the safety of truss bridges, while the division engineer always does the policing of the division in all things." This division engineer has charge of the maintenance of track, bridges, buildings, and water service on the operating divisions, with his office at the same point as the superintendent, who is his immediate superior. Reporting to the division engineer are the road masters, who have the section foremen reporting directly to them. Under this division engineer is the general foreman of bridges and buildings, to whom all bridge foremen report directly.

Referring to the qualification of the division engineer, we quote Mr. Willard Beahan, of the Lehigh Valley Railroad:

The division engineers must be men who have served an apprenticeship as instrument men on maintenance-of-way work. They can not fill their positions with less than three years' experience in responsible work on maintenance of way. They must also have experience in railroad construction and in the handling of men. They must understand every engineering principle they need to use, and not be men who are copying what they have seen others do. They must be men who have been taught the necessity in railroading of obeying orders. The qualities and discipline an engineer on railroads needs are those an army officer must have. Finally, and we can not emphasize this too much, these men must have studied under road masters and learned much from them.

The superintendent of bridges and buildings bears the same relation to bridges and buildings as the roadmaster to track. Mr. Onward Bates, engineer and

superintendent of bridges and buildings of the Chicago, Minneapolis and St. Paul Railroad, describes him as follows:

He is oftener a mechanic than a so-called professional man, and he has generally risen from the rank of carpenter, through that of foreman of carpenters. The position is one that may properly be held by an engineer, and it is fast becoming such that its holder must be an engineer to be capable of performing the duties pertaining to it. The practical man who fills such a position is something more than a mechanic, and that he is qualified to hold it is evidence that he has added to his mechanical knowledge a considerable amount of that knowledge which engineers sometimes assume to belong strictly to their own profession. On the other hand, an engineer in charge of structural work should be familiar with mechanical construction and capable of executing the work in its details. The engineer who can not make plans and specifications and who is unable to lay out the work and control all the details of its execution and manage the men employed upon it is himself only a workman to be employed under the instruction of others. As our railways become more able to replace structures of a temporary character with permanent ones, there will be a greater demand for the possession of theoretical knowledge by the superintendent of bridges and buildings. There are already a good many engineers so employed, and it has become the policy of some of the large railway corporations to appoint engineers to these positions.

If by superintendent of bridges and buildings we mean a man who can himself design and compute, as well as erect and maintain structures, then the office is justified; this man is really, then, superintendent and engineer of bridges. But if by superintendent of bridges we mean simply foreman of bridges with large mileage, a man who can erect and repair, but can not himself design or compute, then we have a position analogous to general roadmaster, and a bad office established. Giving a foreman of bridges more mileage does not make a general officer of him. The bridges will then be taken care of by the foreman of the different districts, and the so-called superintendent has been placed where his knowledge of bridge building and repairing lies dormant, while he does poor clerical work and gives abortive advice to the manager or vice-president. He can not design a bridge or say whether weight meets strain face to face; he knows nothing of shopwork or tests; he is a tax on railroad capital, and he always was and always will be; he is a carpenter trying to help a superintendent who was never a carpenter.

The education and duties of the bridge engineer are described as follows:

This bridge engineer must be one experienced in foundations below as well as above the water. Pneumatic caissons and dredging cylinders need so much plant and demand a kind of labor such that the work had better never have been attempted save by contractors who make such work a specialty. But coffer dam work has often to be done and requires only such plant as any railroad company owns. It is unpleasant for contractors to do pneumatic work for a railroad which has no bridge engineer familiar with that work, and it is uneconomical for the company not to have a man to attend to it intelligently. When a span bridge becomes too old or too light according to the bridge engineer, and the chief engineer, with the approval of the general manager, decides to buy a new span, it is the duty of the bridge engineer to make the plans, advertise for bids, award the contracts (subject to the approval of the chief engineer), check the strain sheets, attend to shop inspection, receive the bridge f. o. b. cars on the company's tracks, put in the foundations, erect the span, test it, and turn it over to the transportation department.

The mechanical department is a highly technical service. For that reason it is generally widely separated in the lines of movement from the other departments. After the mechanics, there is a variety of organization. There are the road foremen of engines, the roundhouse foremen, the foremen of engine repairs, and of car repairs, car inspector, sometimes engine inspector, draftsmen, chemists, mechanical engineers, master car builder, master mechanic, and superintendent of motive power.

The duties of these officers have been largely administrative within the limits of their department. There was a certain standard to be maintained, after established types and methods.

In general it may be said that railroads do not do much designing, because their work is more especially repairing than constructing. For this reason the tech-

nically educated man has not come at once into request. Railroads are coming to recognize technical training by taking men into the service as special or preferred apprentices when they hold the diploma of some recognized technological institution.

The railway mechanic does not differ essentially from any other mechanic. The inspectors must have knowledge of running conditions. Of the road foreman of engines Mr. Quayle, superintendent of motive power of the Chicago and Northwestern Railroad, says:

He should be competent to conduct such road tests as may be required from time to time for the purpose of determining the haulage capacity of locomotives over certain parts of the road, and make comparative tests of different kinds of fuel or appliances to locomotives. He must be thoroughly conversant with all parts of the locomotive, and an experienced and expert runner. His salary must be such that he will not wish to return to his engine in order to obtain better wages.

The master mechanic is coming to be a technical man who has also served a special apprenticeship.

The auditing department has not until lately been conceded the importance and recognition it deserves. Because anybody can do clerical work in some fashion it was assumed that anybody could be a clerk in the auditor's office. It was used as the comfortable repository for old timber that had survived its usefulness, and was filled up with boys who did the work. It was not considered an apprenticeship to anything better, and hence the incentive to the best talent was lacking. The tendency of the work is to cramp and narrow the mental vision unless the worker relates the great detail to the principles on which it all rests. It is often quite removed from the stir and excitement of the railroad life. The organization of the Railroad Accounting Association has given a very great impetus to this department. The auditor is auditor, accountant, and statistician in one. As accountant there are definite limits to the possibilities, but as auditor and statistician the very highest talent is in request.

The general auditor of one of the great Western railways writes:

A knowledge of the detail of audit work can properly be acquired only in an audit office, and it would be a waste of energy and valuable opportunity to attempt to study this detail before entering such an office. It therefore seems to me that the best preparation for the auditing department is a college course on broad lines, with considerable mathematics for mental training. Such a course tends to breadth of view, which is very important as a foundation to enable a man to resist the narrowing influence which years of drudgery on details is bound to exert. A course in any of our larger colleges tends to broaden a man, and the hard knocks he gets in college are pretty sure to put into him some of that common horse sense which is so necessary in all branches of railroading.

The traffic department represents the commercial side of railroad operation. It deals with markets, prices, and general commercial and industrial conditions. It may be said to be the field of applied economics on the railroad. A knowledge of commercial geography, industrial processes, the nature and kinds of competition, usages of the shipping public, the packing and shipping conditions of various products, their weights and measures, etc., is exceedingly useful in this department.

The traffic department is divided into passenger and freight. The freight business is based more on economic principles, while the passenger deals more with the individual, his personality, humors, convenience, tastes. The passenger department comes naturally to do the advertising and to blaze the way for the pleasant relation of the freight department with its patrons. This cleavage is followed up in the freight department by the distinction between the soliciting and the staff or rate department. Thus the railroad sometimes without much demoralization directly employs advertising talent for this department as advertising agents, press agents, etc. A great deal of the soliciting is done by men

who do not have a technical knowledge of the freight business of the railroad, but have the skill of pleasing address and diplomacy in dealing with shippers. They cultivate acquaintance with a wide clientage of shippers whose shipments they are able to control.

Throughout all the departments is a large force of clerks. From the Railway Clerk of May, 1894, we quote:

The railroad clerk is found to-day in the general office, the large terminal stations, the division headquarters of the mechanical, roadway, and transportation departments, and the general outside agencies. In the United States there are nearly 30,000 in the general offices alone. He has generally had a common-school education with one or more years in the high school. Very few indeed have had a university education except some of those employed as experts in the engineer, machinery, or signal departments, and then their training has been highly special and technical. They may be roughly divided into two classes—one, the clerk who entered the service on leaving school; the other, the man who by force of circumstances has drifted into the service after the prime of life.

In the lower grades of clerical work the nature of the skill required does not differ very greatly among different departments. The two great desiderata are accuracy and rapidity, with a habit of close attention. No mathematics beyond simple arithmetic is ever used outside of the engineer's office. The introduction of typewriters has made less demand for penmen, and instead clerks generally have some facility with the typewriter. But they must be able to make legible, neat figures. Beyond these simple requirements, almost the entire knowledge necessary is acquired in the office. In the mechanical department the clerk must acquire mechanical terms, and some knowledge of the use and relation of different kinds of machinery and supplies used there, and the organization of the force, M. C. B. rules, etc.

In the traffic department, if in the correspondence division he must be able to write a good business letter, must be familiar with traffic rules and usages, and have the power to analyze and sum up evidence in the claim division. The rate clerk is a special man. He must acquire facility in posting himself as to rates in the territory assigned to him, and be able to understand the relation of different markets and producing and distributing centers, and watch carefully the tariffs of other roads that may have an effect on his business.

In the accounting department the clerical force is mostly engaged in handling figures. Bookkeeping is there so highly specialized and subdivided that there are really very few bookkeepers in an accounting office.

#### RAILROADING A PROFESSION.

No small consideration in connection with the education of a railway man is how far the railroad life has the dignity, the spirit, and the methods of a profession.

Dr. Chauncey M. Depew, who was for so long president of the New York Central and Hudson River Railroad, writes: "In the early days of railroading it was a vocation, now it is a profession."

Mr. H. G. Prout, editor of the *Railway Gazette*, in remarks before the Western Railroad Club, said: "Whether or not railroading is a profession, whether or not it can ever be a profession, is a small matter; the vital thing is that railroad officers should have the professional spirit."

The growth of this professional spirit has been very great within the last two decades. It has been greatly enhanced by the railway clubs. Said Mr. Towne before the Northwestern Railway Club: "I was one of the first members of the American Railway Master Mechanics' Association, and I remember very distinctly how difficult it was to get the master mechanics to express themselves in the conventions. Those who were considered the leading men in their profes-

sion refused to attend the association meetings or have anything to do with them, claiming that the information which they might impart to the younger members would be such as to interfere with their own prospects."

Such a spirit could not foster education. It too often affected to despise education. The late assistant to the president of the Baltimore and Ohio Railroad describing it, said: "Entering upon a new field of operations, wholly unrelated to their previous experience, without preparation or instruction, save what they absorbed in the performance of exacting duties on the railway, in the workshop, and in the engine and boiler rooms, men who had been picked up from many walks of life and who altogether lacked scientific training, would naturally be guided solely by 'rule of thumb' practice, and their lives were sure to be narrowed until they acquired pride of being known as 'practical' men. The railroad workman of to-day is largely the outgrowth of this condition of affairs, and yet is not wholly responsible for educational deficiencies."

Referring to the same thing, Mr. Charles Francis Adams, formerly President of the Union Pacific, out of his own experience there, writes: "Every profession, no matter what, goes through a stage where it is zealously maintained that education is an injury. Speaking after the manner of men, this is 'all rubbish.'"

Referring to the process of change from unwritten to defined principles of practice, Gen. James Harrison Wilson writes to the Railroad Gazette in December, 1887: "It is within the last twenty years that the first book of regulations was compiled, and it is probable that not one in twenty roads to-day has at present any regulations except such as are carried in the heads of their officers or are printed on the backs of their time cards for the government of trainmen." Since the date of his writing the change has gone on very rapidly. The standard code of train signals, of train rules, principles of roadway and rolling stock maintenance, of accounting, of settling claims, of dealing with employees on the sociological side, have been evolved and largely enunciated. A literature has been steadily accumulating in our railway journals and proceedings of our railway associations and monthly clubs, which is of great value.

In the mechanical department a great change has come already. Mr. Sinclair, editor of *Locomotive Engineering*, says, "Fifteen years ago or more, I became a member of the American Master Mechanics' Association. At that time there was not a single technically educated man in that association." Referring to the present time he adds, "At the last meeting of that association a college graduate was elected president, and college graduates ruled the association."

Touching on that other unprofessional element that so largely dominated early railroad affairs and demoralized the service, Mr. G. B. Leighton, president of the Los Angeles Terminal Railroad, says: "The man who acquires and owns a railway as a speculation is fast disappearing. Where he has confined himself to this alone, his success has never been of long duration. Where the speculator has desired to retain the property, and believes in its ultimate value as an investment, we find that he has endeavored to change his spots as much as possible, and become, as every railroad officer should become, a student of the economic operation of his line."

There is rapidly emerging what may be considered a system of railway institutes. Here ideas are freely exchanged, details of operation and railway polity discussed, and expression given that has an informal and semiofficial authority. The railway journals extend the educational effect of these bodies, and are the medium for yet further expression. In this intercourse the individual railroad man gets recognition of his ideas. He comes to enjoy a standing that is wider than the particular railroad with which he is connected. Thus is set up the basis of a profession.

The railway clubs as a factor in the education of railway men can not be too

greatly emphasized. They are all comparatively of recent date. They have so far been more especially developed on the mechanical side of operation. The Master Mechanics' Association was organized in 1867, the Master Car Builders' Association in 1866, the American Roadmasters' Association in 1883; the Car Accountants' Association in 1875, and finally the great American Railway Association in 1887. One of the later and most thoughtful bodies is the American Association of Railway Accountants, organized in 1888. The superintendents, the freight claim agents, the traveling engineers, the telegraph superintendents, the superintendents of bridges and buildings, all have their annual meetings. On the commercial side there has grown up the annual meetings of the baggage-masters, the ticket agents, the general passenger agents, the station agents, and the general freight agents. But their meetings are largely social in character.

These several bodies are most potent agencies in determining types and methods. They have come to have a quasi-official force in their several departments of work, legislating, as it were, on the problems of their respective provinces, and shaping a body of opinion and standard practice that is passed up informally for more authoritative action by the American Railway Association. They have been formed in most cases as the outgrowth of some trivial circumstance or as the incident to some immediate necessity, and their growth has been as natural. Thus the Master Car Builders were much concerned at first in those questions of standards that were necessary for the interchange of cars. The American Railway Association was the outgrowth of the time convention.

In addition there are local associations or clubs having monthly, bimonthly, or semimonthly meetings for discussion and interchange of ideas. Here ideas first have expression that pass on to the larger bodies. Of these local clubs the best known are the New York Railroad Club, formed in 1871, the Central Railway Club, The New England Railway Club, the St. Louis Railway Club, and the Northwestern Railway Club. They all print their proceedings and discussions, and these are circulated widely by exchange.

#### COMPENSATION RELATED TO ABILITY.

In any discussion of education of railway men we can not avoid reference to the system of employment, gradation, tenure, and promotion that exists in the service where this education is designed to avail. This is a great practical desideratum. All plans for education, however great may be the theoretical benefits, must come to naught unless the system of organization recognizes individual ability.

I do not suppose that out of the thousands of young men who came out of college the last year 20 went into the railroad business. Some do not know how to get in; or, if they do get in, they drop out because they do not see any future.—Mr. W. H. Baldwin, president Long Island Railroad, at the New York Railroad Club, January, 1897.

To induce any man to enter the service with the intention of making it his business during life, something beyond the mere fact that he will have permanent employment is needed. He must not only feel assured of permanent employment, but he must also be satisfied that he will be likely to better his condition as he becomes more familiar with the business, and when as a natural consequence his services are more valuable. Any bright and intelligent young man, full of energy and sanguine to the highest degree, is very likely to think that if he stands but a slight chance of advancement, whatever his merits may be, he had better start in some other business which presents better promise of future personal advantage.—Writer in the *Railway and Engineering Review*, October, 1884.

A successful general manager writes: "I would warn every young man not to enter railroad service." A bank president advises: "If your boy has any ability, do not let him cross the threshold of a railroad office." An auditor confesses: "When a young man comes to enter my employ I do my best to dissuade him,"

A highly successful purchasing agent, of wide contact with railroad men and affairs, urges a subordinate of ability to leave him "at the earliest opportunity and go into private business."—The Railway Clerk, May, 1894.

Another reason why civil engineering graduates do not accept low positions in the track department on railroads is that as our railroads are now conducted there is no hope held out to them that they will eventually be advanced above the grade of common laborer should they prove deserving; at least they would be given no preference over the uneducated trackman with whom they associated.—Prof. J. C. Nagle, Railroad Gazette, March 18, 1898.

The whole matter is so closely related to the general subject of education, and practice is so various on different roads and in different parts of the service on the same road, that we must inquire closely into all kinds of employment to see how far personal ability is the determining factor in securing to the individual his pay and other considerations.

The simplest first notion of exchange of labor for money differs from no other single transaction in the general market. The commodity bought is the greatest that can be had for the price given, and the price given is the greatest that can be successfully demanded. It is a single transaction in a free market having no relation to any other transaction or any other time except so far as it may affect supply and demand. There is carried with it no implied contract, no payment of past obligations nor discounting of future considerations. The laborer who bids the lowest for the day's wage and the employer who bids the highest make the exchange.

But F. J. Stimson, in "Labor in its relation to law," insists that such view of labor does not take cognizance of the peculiar nature of labor: "The theory that the laborer is like anybody else having property to sell is misleading unless at the same time we recognize, that while he has goods to sell they are goods of a peculiar nature, being, to wit, himself, his time, and his energies."

The next stage is where the employee and the employer still make their exchange in a free market, yet each gives to the other, as it were, a chance for a second bid, and they conform in this way to a ruling market rating. The employee works for just as little as any other man will work for, but every man that underbids him is exposed to the certainty of his meeting the bid. This steadies the market against excessive fluctuations, keeps the same laborer in continuous employ of the same employer, and tends to greater certainty on both sides. To-day's service has no reference to to-morrow's service, except in this respect, that the employee may meet all competition and, other things being equal, has the preference and is therefore not required to underbid the lowest man. This is the condition of the freight handlers, train crews, etc. But after a while the man who has certain known qualities is preferred to the man whose ability may be just as good, but which is an unknown quantity. The incumbent so far enjoys a monopoly value.

The regular employees are always exposed to the competition of outside men, but in usage there comes to be a certain agreement as to the rate of pay per unit of work, which shall be at about some average of the possible daily fluctuations. The market is in this way still further steadied. The compensation now directly depends on the volume of work. By coming to some understanding with the management as to the number of extra, or what the conductors call "platform men," they have interposed a further buffer between themselves and outside competition. They have a fairly fixed volume of work at an agreed rate, and the transition to the next stage, by estimating this volume at some fixed average quantity, brings us to the salaried position.

At this point the original notion of exchange of definite labor for money has been lost sight of. The opportunity to compete in the labor market has, by subtle transactions, come to be a "position" carrying a fixed salary and the com-

petitive notion has been dropped. The labor is parceled out to a lot of "positions," and the pay is divided up among a lot of annuities.

By taking the notion of "position" and "salary" as the starting point many of the misconceptions arise. Mr. John Converse, president of the Baldwin Locomotive Works, in his Founders' Day address at Lehigh University, says: "There is one term too commonly used which is mischievous in its influence. We hear of a young man seeking a position in a business. It is not 'position,' but opportunity of usefulness that should be sought."

An analogous expression often heard in railway service is, "Take care of him." On some roads the rule prevails to make all appointments by promotion from below. Such roads offer no market for any attainment or ability, whatever it be, unless it is already in their service. The policy can never in practice be followed out undeviatingly, but so far as it operates it rests a man's employment and reward upon the accident of his succession in a particular service. It tends to build up an industrial feudalism. It is directly opposed to professionalism in railroading, and puts no premium on education or extraordinary efforts of the individual. If the rule prevailed universally there could be no use for education of railway men. It is not essentially different from the guild monopolies of the Middle Ages.

Work is of different kinds, requiring different grades of ability. One grade differs from another ultimately in the amount of ability relative to the demand. At the outset the rating of each grade will be in this exact proportion. As we pass on into the higher grades of work the range of ability necessary becomes greater and less possible to measure by rigid standards. It is less technical and depends more on the mental and personal qualities of the man. The highest efficiency may not be often called for or only in the supreme moment, but it must exist as a potential quantity. It still is an actual and real thing. Next after direct skill comes that indefinite service of "responsibility," which is an unmeasured thing and may be made to stand for almost any quantity.

The nicety of administration is in assigning men to the kind and grade of work for which they are fitted. But fitness is a very changing thing. It generally is, and ought to be, a progressive thing with experience, which is one of the forms of education. It is the spirit of railway organization that all grades are open to the aspirant, however lowly his starting point.

After this comes in the notion of organization. We have seen how the individual was first paid for direct work and then his services reduced to an average quantity at an average rate, resulting in a salary. Now the whole body of men of different grades and kinds of work is reduced to an average quantity. Upon a certain customary succession of different grades of work for one man and a certain average period required for the movement, the pay to each man is based. He perhaps works in this grade to-day at less than he is worth and later works for more than he is worth. This is the essential nature of "service." For any instant of time it eliminates the individual and compacts him with the mass, but over the entire period of an average service the theory is that he receives his just due.

For the further perfection of the organization the differences between the different grades are often artificial. For instance, one man is selected out of a gang as the assistant foreman, although he has not better ability than the others and is worth no more, but he is paid slightly more and in the emergency of succession to the foreman's place, he supplies the place and has certain perquisites and considerations of dignity, ease, comfort, etc. He is not individually worth what he is paid, for any one of half dozen men would supply the place as well, but the money paid him and the privileges of his position constitute a stimulus to the

entire organization, which holds it more steadily together and even makes possible a less average rate for each man.

Referring to this notion of gradation when related to educational opportunities we quote from the Railway Clerk of May, 1894:

Railway employ is often described as taking service with a railroad. This implies that it is not exactly a free exchange of labor for hire in an open market to the highest bidder, but to a certain degree the relation between the company and the employee is permanent and not to be jeopardized every time the general labor market advances or declines a point. Any elements of permanence justify reciprocal concessions which are never equated in dollars or market value. Where perfect equity and certainty exist the employee can forego his full earning capacity in his preparation stages and the railroad can safely adjust its lines of promotion with a view to fitting the young man for greater usefulness. Many of the earlier stages by a little intelligent thought can be placed in an order that serves all the purposes of a training school.

The notion of service carries with it the notion of cumulative credit. In the language of Mr. Willard in the Northwestern Railroad Club meeting of January, 1897, "Employees should be made to feel that each year of faithful service and clean record adds to their reserve fund from which they can draw in time of misfortune or hard luck." From this we pass over by easy stages to the idea expressed by Mr. L. J. Seargeant, at the time general manager of the Grand Trunk Railway, which further amplifies the notion of service:

The argument may be used that railway service is, like others, voluntary and transferable; that in payment of salary or wage the company does all that it engaged to do, that no contract existed to provide for such contingencies. On the other hand, when the employee becomes as it were part of the service, when the performance of duty results in habit which leads him to neglect opportunities, when his sympathies create an esprit de corps, and when the whole of those cooperating causes lead to lifelong work in the interest of one company, there seems to be a moral claim upon the benevolence of employers who have been benefited by faithful, if not brilliant, services, to provide some scheme of retiring allowance which will protect the individual in those dark days against penury and want.

Without disparaging the benevolence it becomes a nice question of equity how far a railroad may be benevolent without being unjust. If the benevolence feature is carried too far the motive for education among railroad men will be destroyed.

Since we are dealing with ability, which is always a potential and not a real thing at time of engagement, and can not be weighed out and delivered like a pound of bacon, we must have some way of measuring it, as it is to be assigned to various grades of service with their varying amounts of reward. These various ways of measuring in different services here and abroad are, for example, by previous general record, by previous record in work leading up to this, or by previous record in a probationary period in this very work. Such record may be a single-entry system as it were, or merely a record of demerits, or it may be a record of both demerits and credits.

"But especially and primarily there should be a system of individual measure, so that each employee should feel that he, through the records, is directly under the eye of the manager, and is not averaged in a general mass."—Railway Clerk, May 9.

Perhaps there is no more powerful stimulus to the individual in the organization than the individual record, but it can not be too much emphasized that it has its limitations. It is at best only the record of part of what the man has done. It is that part to be sure which, according to the generally accepted standards of excellence in the work done, are necessary to good work. But these may after all be merely an a priori set of conditions, like the civil-service examinations in China, which perhaps never had any relation to the work to be done.

The measurements may be by examinations, either oral or written, or they may be by special test in the work done.

The Fall Brook system is merely a form of demerits and credits. Next in importance to the principles of measurement is the method of administration, that it shall be exact and impartial.

There is a definite tendency to place examination and record having any official effect under careful official supervision, and make it a record of the company as much as its balance sheet.

The relation of such measurements to the actual selection of men is a matter of great delicacy. The unforeseen conditions or circumstances that can not be contemplated in a record are so great that to rely implicitly and rigidly on the record is most unsafe. If we hamper our road master with too rigid specifications, and take away his discretion, he ceases to be a road master. It is quite the same with the employment of men as in the specification for material. Though we may not hamper our man, we yet can measure and record what goes into his structure. If he fails he is condemned by his violation of what we recognize to be safe principles, and so far our standards are confirmed as far as he is condemned.

Because we are dealing with an organization, and each part has reference to some other part, together with the special examination for a specific thing should be an examination with reference to some ultimate thing, which is the general examination.

In most organizations the work in each department when once laid out is supposed to have a certain fixed character and quantity. It is dealt with by a fixed standard of ability. When once a man is assigned to a particular responsibility, except for age or special disability, the burden of proof rests with any change on the ground of unfitness. It is, in fact, life tenure of that particular assignment. It often happens that the fluctuations of business wipe out specific assignments and then the tenure of the man is not something general for the road, but specific for that particular assignment. Assuming that at the time of assignment he was the most efficient man for the place, he may have altered much since then, but until he has failed grossly he continues to hold his place regardless of how many other men may be better able to hold it. Sometimes the tenure is not for life, but rests on contingencies that have a certain periodicity of occurrence. Then it is only better in this respect, that the term is not so long, but the determination of the term has no reference to the efficiency of the incumbent. Finally, it may be for a term, and at such a time measurements are applied anew and the best man gets the place. To secure the stability of an organization, the incumbent is generally given a definite advantage in the competition. It would be most demoralizing to any organization to periodically uproot every man for reassignment.

In measuring a man the dimensions taken are first naturally those that apply directly to the work in hand; next they are those that apply to future work; and finally they may be considerations entirely outside of the work itself, as personal influence with the management or the big shipper, or they may be past service of a special nature, or they may be long fidelity or seniority. Or as in Germany they may be military service, or as in this country political influence in a particular community.

According as a manager tones up his service all extraneous considerations will be eliminated and immediate fitness for the work in hand will be the governing principle, modified by considerations of past and prospective service that shall make the idea of a service prevail.

“Seniority as the basis of promotion is the most pernicious pretext of justice ever devised. No purchasing agent parcels out his orders to supply men according to their age.”—Railroad Clerk, May, 1894.

Fines and premiums are the same thing, only one is expressed in the negative and the other in the positive quality. They are direct penalties for bad, or premiums for good work, and therefore are directly related to personal ability. Pensions or superannuation funds have no relation to education of the individual since they are incurred by contingencies, or the course of nature with which the education of the particular individual pensioned has nothing to do.

#### RAILROADS JUSTIFIED IN PROVIDING MEANS OF EDUCATION.

The great potency of the railroad as an educational agency for its employees may be obvious, but the railroad being a commercial venture, it is not so clear on what ground the money may be spent for this purpose. There may yet be those who recognize the power of the railroad as an educator and also are able to justify its activity in this direction, but it becomes a question of degree how far as a commercial undertaking the railroad may spend money for this purpose.

The justification must first be purely financial. That it may also rest on moral grounds is due to the close interdependence of economic and moral principles when large groups of men are involved.

There are two kinds of education from the standpoint of the railroad—that of individuals and that of the general body or large classes of employees. Education of the general body or classes of men is like the betterment of fixed property. The great body of men do not move from road to road, nor does their education directly affect their wage scale, while it may vastly alter their efficiency, and so their earning power to the railroad. There can be no question of the value of the training of firemen in fring, train men in air-brake practice, car oilers in car lubrication. It is only necessary that the value of the betterment exceed the expense. Such education can easily be seen to be merely an extension of the ordinary superintendence. It suggests the nature of the transition from discipline to education, which by the American Association of Railway Superintendents has been defined as two terms for one and the same thing.

The advantages of the special education of classes of men can not be doubted, but the good effects of general education are not so easily demonstrated because not so immediate. Practical men know best the value of a general tone and high order of morale and efficiency throughout the service. With the moral qualities, the power of adaptability, of independent thought, of initiative, and of judgment makes the industrial prestige of a country. General education tends to produce this.

After the mere immediate value of the work performed there is a vast personal element in labor, which must always distinguish it from material. It is not a machine, but is exposed to violent changes, which are a tremendous economic element, such as strikes.

The more intelligent the men composing the labor element the better will be the relations between the so-called capitalists and their employees. Ignorance can not deal with questions of philosophy or political economy; men who have ideas and are able to discuss these questions can meet capitalists on better terms and be more just to each other than ignorant men, for intelligence will be respected.—L. Bartlett, master mechanic Missouri Pacific Railroad.

Whenever large bodies of men are dealt with on an economic basis, conditions affecting their entire welfare are involved, and the moral element can not be eliminated. It comes to be a definite economic quantity.

Moral responsibility exists only so far as the railroad has become the trustee of individual rights, which by the higher organization of society have become involved in the general property. This principle is recognized in the necessity for justice and impartial dealing between an officer and his employees for honesty and reliability in all things official, and it operates none the less forcibly

when carried over to the field of education of the employee. The railroad is largely controlling the destinies of its employees by the opportunities for learning and perfecting themselves for higher grades of service which it controls. Education of some sort is being constantly dispensed. That it shall be dispensed equitably to each according to his capacity and assiduity and that the environment thrown around the employee shall be as favorable as is consistent with the good business management of the property is not an unreasonable proposition.

The extent and kind of moral responsibility is a nicer question, in that it depends so largely on local conditions. In some places the conditions of the service are such that the employee has no other resource than the railroad for which he works. Then, too, how far the moral idea enters any relations of the railroads to its employees depends on the general standard that may prevail in the community. The moral element has its value in promoting the healthy loyal sentiment and largest efficiency among the men. So much of railroad economy is based on the efficiency and highest development of the individual that any element in this efficiency can not be ignored.

The railroad already has in a very large degree the plant for education. It has the scholars assembled and can command their attention in a way that no other agency can. It has its scholars classified and ready for efficient educational work. Aside from the great outlay in mere material, plant of shop, office, and track, where things may be learned, it has the actual practical working spirit to instill into the learner the notion of discipline, promptitude, accuracy, and practical use. Therefore for all these reasons it can educate men at the least added cost.

As explained by Mr. George R. Parker at the Northwestern Railway Club in January, 1897, "Railroad officials can do a great deal to assist the educator, because all fields of operation are under their control."

Who shall bear the expense of education is still a question that is settled in all manner of ways. After the common-school system there is little that is generally accepted as the basis of educational support. The higher education was first a matter of private beneficence, and then it became little by little absorbed by the State. Where the education has gone farther, on the one hand has been the claim that it should be merely the training of the man for general responsibilities of citizenship and on the other hand that it should be the specific training of the man to earn his living, and so should teach trades, etc. Again, this responsibility for special education is held to be a function of the State, but the support is levied on that particular trade which it is designed to supply.

Regarding the method to be followed by a railroad in special education, the first and simplest plan is merely to register and classify entrants upon the service and in a rude way lay out their courses of advancement. The next stage is to put each man on individual record, then to appoint some one to have general oversight of the learners, to watch their record, and to have power to change a first general plan of movement according to the special fitness of the individual. Such a man is the "foreman of apprentices" recommended by the Master Mechanics' Association. He would be the man whom the employee would consult in any outside instruction he might undertake. Next would come the progressive examination, and then the examination for full promotion, which would sift and rearrange the men, tending further to facilitate the selective process of education. Then follow libraries, clubs, lecture courses, and finally evening instruction, leading up to the development of the full technological institution.

But the conversion of a railroad into a technological institution, while it might offer a rich field for the enthusiastic educator, would hardly serve the purposes of practical railroad operation, except so far as it distinctly did not interfere with regular work.

## PUBLIC ASPECTS OF EDUCATION OF RAILWAY MEN.

It is well known that there is no single organized industry that compares for a moment with the railroads for the number of men employed, the amount of wealth involved, the conditions of life and general prosperity affected. Into the great body of nearly 1,000,000 employees are absorbed every year not less than 75,000 young men. Some drift into it, some enter it under spell of the romance, some few enter it definitely as a life career to which their fitness and their inclinations point.

The potency of intelligence and trained efficiency throughout so compact a body, to affect national life and prosperity, can not well be overestimated. It is at least a matter of remark that the qualifications for this service have until very recent years been nowhere specifically recognized in education.

Mr. Charles Francis Adams, ex-president of the Union Pacific, says: "I am as little able to see why education and the higher standards which it introduces should not be as useful in the railroad profession as it is in law or medicine."

In an industry whose effects ramify to every part of our commercial and industrial prosperity, the highest talent and most intelligent administration should be engaged as in our national finances. Intelligent, broad principles are necessary to enable the management to deal with the highly complex problems presented. Producing centers must be protected in their markets. There must not be too little transportation nor must there be too much for the healthy employment of national energy and resources.

The railroad is peculiarly situated in its relation to social questions, beginning with its own employees and extending indirectly to a wide range. It can not be doubted that it is within the resources of intelligence to create conditions that would have made impossible the great Chicago strike. That the higher principles of sociology are coming to the fore in railway management as mere business expediency is attested by the increased attention to employees' relief associations, insurance, superannuation, and disability funds, and the disposition to canvass carefully and in the light of the best principles the whole question of associations among employees.

The influence of railroad men for general intelligence in a community is very great. In the larger cities they are absorbed into the great body of the population, but along the line of road the employee wields a very great influence. At every small town the station agent, with the editor, the doctor, the minister, the lawyer, is the respected influential man of the place. In business he stands for the promptitude, precision, and infallibility of the great corporation which he represents. Even the section hand in the remoter communities becomes a channel through which the ideas of the larger world percolate. The passenger-train service on side lines and in local service has an influence unknown to those who have always traveled by trunklines. Not a little of the ideas of cleanliness, neatness, and public health in some communities may be traced to the conditions of the coaches that run in that territory. Referring to what existed in his day and is still common in the more sparsely settled communities, President Depew said: "The passenger conductor was the great man in the village where he lived; he was the great man at the terminal where his train went out every morning and came back every night. He could do things that nobody else could do."

All the considerations adduced to show the influence and possibilities of so large a body of men take on new emphasis in light of the fact that they are so highly organized a body, responding so completely to single causes. From the educator's standpoint they are very much of a unit. Their conditions of service, their qualifications of skill and intelligence are practically the same all over the country.

The influence of corporate employ on this great body of men held together in a close, semimilitary organization plays no inconsiderable part in the formation of the national character. Mr. Depew, of the New York Central Railroad, says that railway organization is essentially military. And further, in referring to the effect on the individual: "In the service everyone's eye is on everyone else. There is a generous appreciation of comradeship, at the same time there is a severe criticism of conduct and character of fellow-employees and officers." A writer has said that the tendency of such employ is to produce an abstract sense of duty which no civil avocation has before afforded to such an extent. It trains to habits of promptitude, precision, and responsibility. A considerable part of the service has semipublic functions, which are exercised without any force of civil authority.

In the training and management of this large body of men the State has not interfered to any extent. It has been chary of setting a fixed legal standard for the fitness for different grades of service, even though the safety of the public is vitally concerned. In several States laws have been in force prescribing certain physical qualifications of employees in train service, and again as to hours of labor and the standard complement of men, so far as these conditions affect the safety of the service. But for the most part the railroads have been left to themselves in prescribing the qualifications of their employees and the conditions of safe operation. When accidents occur, the courts determine the negligence from the standard of general railway practice which the railroads themselves have set up. The stationary engineer must have a license from the State to run his little engine; but the locomotive engineer who carries the lives and property of 200 passengers in his hand, the dispatcher who fixes the meeting point, the operator who receives the train order, the signalman who gives the right of track, and the inspector who is responsible for the safe condition of the bridge, have never had their qualifications passed upon by the State.

The principle of State regulation of the qualification of employees is not congenial to the spirit of railway men. The employees look with distrust on such regulations. A proposition made to the grand chief of the Locomotive Brotherhood in October, 1898, fixing a standard of fitness that required one year's experience as fireman, examination in practical mechanics, knowledge of and competency to run a locomotive, and leaving to the discretion of the examining board what is a skilled mechanic, and what shall be "reckless and intemperate habits" to disqualify an applicant, was unfavorably received. The Locomotive Engineer's Monthly, commenting on it said, "We do not believe any license law of any kind can be passed which entirely excludes political factors from the board of examiners."

From the public standpoint there is possible an enormous economic waste in the misdirection of energy and intelligence during their best years of so many young men as every year enter the ranks of the railway service. It is of the highest importance that they be carefully selected and trained with reference to an ultimate fitness, so that there may unfold to each a useful and happy career. It is also of public importance that the general influence of so many in so compact a service be for intelligence, law, and order.

The training of railway men up to a high standard of efficiency has another public significance. Not only does the economical transportation of a country cheapen the cost of production of its exports, and so far give it advantage in the world's markets, but itself constitutes an industry which may look for return in a foreign market. A high type of railway service becomes the pattern for railroads in new countries. Wherever the standards of American railway practice prevail, they carry with them a demand for men trained in American methods, but more especially for the rolling stock, material, and supplies that, together with the service, make that practice distinctive. The standards and practice of

Great Britain are one thing, and of Germany another. According as each prevails the railway manufactures of that country find a market. Mr. H. S. Haines former president of the American Railway Association, has specially emphasized this in several addresses: "If we wait until 50 miles are built from one African seaport and 20 from another into the heart of that continent, all under the British system, we may say farewell for employment thereafter for any American men in those regions, or for the sale of railway appliances of American make."

The place of education in practical railroading is coming to be very fully realized in the last few years. It marks a great transition. Writing in the Railroad Gazette of December, 1887, Gen. James Harrison Wilson says: "After an experience of nearly twenty years in building and managing railroads and studying the economic questions connected therewith, my deliberate conclusion is that the greatest need of the American railroad system at present is technical education for officers and employees of every grade, especially for presidents, managers, traffic managers, and superintendents."

Dr. Chauncey M. Depew, formerly president of the New York Central and Hudson River Railroad, writes: "In these days of thorough training it is almost impossible for a young man of ordinary education to get on in competition with the graduates of Sheffield Scientific School at Yale, the scientific schools of Columbia, the special education of Cornell, the big advantages of the Troy Polytechnic and the Stevens Institute, and the instruction given in many other of the schools and colleges of the United States."

Says a former master mechanic, emphasizing the necessity of education in place of the former indifferent apprenticeship in the shop: "How many shopmen are competent to give accurate reasons for the doing of things; or if competent, care to take the trouble? How many regard their information as their own stock in trade? Some men are too narrow because they have always worked in one shop. Perhaps they are narrow because they have stayed on one road or in one section, or in one country."

The former unreasoning prejudice toward the educated man is rapidly disappearing. Says Mr. H. G. Prout, editor of the Railroad Gazette: "Probably all of us realize that in railroading the day of the educated man has come; the day of the uneducated man is passing."

Mr. L. Bartlett, master mechanic of the Missouri Pacific, writes: "The railroad business of the United States has become a science, and the better educated employees become the more successful in the work performed on our railroads. Of course we must have our 'hewers of wood and drawers of water.' The ranks of this corps can be easily filled, but the workmen in the machinery department, the men in charge of trains, should be men of education and judgment."

The idea has taken most firm hold of the practical men. In an index of the proceedings of the Master Mechanics' Association that comes to the year 1890 the word "apprentice" does not once appear. In the last three annual meetings the education of the apprentice has been made the subject of one of the most important reports of that body. So important has the matter been considered that the committee on apprentices has been made a standing committee to report from year to year. In their report for 1897 they say: "Your committee wishes to say that it considers this general subject as important as any which the Master Mechanics' Association can discuss and in which there is a work to be done ready to hand which is worthy of the greatest pains and best thought of the association."

The Roadmasters' Association of America took up the same subject in 1890.

The relation between the institution of higher education and practical life is more intimate and mutually helpful than ever before. Several of the men who are teachers in our special engineering schools have come out of practical railroad life to accept the chair of the college. There is more conference between

the university and the shop. The mechanical tests made at the shop are the basis of lively discussion at the railway club. The testing plants of the Master Car Builders' Association have just been permanently installed in the laboratories of Purdue University.

Most of the educational activity affecting railway practice has so far been on the technical side, which has evolved a set of distinctively American standards, fitted to the conditions of American operation. There is a feeling, on the other hand, that the economic and sociological sides of railway education have been neglected, to the disadvantage of the railroads and the public, resulting in the growth of theories that are held to be uncongenial to American conditions. Mr. H. G. Prout, editor of the Railway Gazette, voices this sentiment in his remarks at the New York Railway Club in January, 1897:

But the teaching of railroad sociology in the colleges to-day is as often bad as good; perhaps oftener. The young men who lecture on this topic are ordinarily men who have taken a post-graduate course in the German universities or who have been deeply affected by the writings of the German sociologists. They come to their work in American colleges strongly affected by State socialism. They come with an exaggerated notion of what can be accomplished by State control of railroads. They come to work with almost no actual knowledge of American railroads and American railroad men. They proceed, therefore, to project from within themselves a set of railroad officers and a set of railroad conditions as they conceive these officers and conditions to exist, and then undertake to improve them on German principles. The result is a rapid growth in our country of the pernicious notion of extending the powers and duties of Government into industrial enterprises; the rapid growth of the theory that railroad officers are all corrupt and self-seeking and are public enemies just as far as they dare to be.

Mr. Walter G. Berg, principal assistant engineer of the Lehigh Valley Railway, advocating a professional railway course of instruction, says: "A European element should be strictly avoided, and knowledge of the actual working and status of the conditions existing on American railroads should be absolutely requisite."

#### ANSWERS BY A NUMBER OF RAILROADS TO INQUIRIES REGARDING THE MEANS OF EDUCATION OF THEIR EMPLOYEES.

The following questions were addressed to some of the representative roads. Below are given the answers received.

##### MECHANICAL DEPARTMENT.

1. Is it the policy of the road to educate its own men or to depend on outside supply?
2. If the apprenticeship is contemplated as a general policy of the road, does the road bear any part of the expense of coincident instruction by night classes, etc.?
3. Is there one general supervision of apprentices or is their selection, their instruction, and their distribution among the regular employees left to the discretion and individual convenience of the division officer and not made to accord to any general plan?
4. Is the "time" basis rigidly enforced in your apprenticeship or does the "merit" basis prevail? (By the latter is meant a system that allows credit for special work, outside study, or unusual aptitude, and so far shortens the course to the apprentices.)
5. Is there any implied contract or employment at the expiration of the apprenticeship?
6. Upon the completion of an apprenticeship does the road give certificates or does it recognize similar credentials from other roads?
7. Do you have more than one grade of apprenticeship, beginning with different

stages of fitness and looking to different grades of employment? And if more than one, how many?

8. If it is your policy to incorporate outside instruction with the regular shop-work in your system of apprenticeship, is the work done in the instruction named below found to be of any practical value, so that it can be given recognition; and what are the credits allowed for each?

Degree of M. E.

Certificate from a trade school.

Certificate of technical course in a high school.

Some recognized measure of work done in correspondence schools.

In evening classes.

9. Do your helpers and handy men come from boys in the shop or from those who enter irregularly and after they are grown?

APPRENTICE SYSTEM (GENERAL).

1. Do you have any system approximating a formal apprenticeship in other departments than the mechanical? What departments?

2. In absence of formal apprenticeship do you have in other departments any of its elements, as:

(a) Prescribed qualifications for those entering the service?

(b) Definite arrangement of the work and stages of promotion with view to an ultimate fitness?

(c) Registry and individual record of each individual employee?

(d) Is this progression by stages of promotion competitive or mere seniority basis?

(e) If competitive, do you employ the best man for the place, whether within or without the service, or do you limit your appointments to promotion only from within the lines of the service or with further restriction only within the lines of a department, or even yet the smaller unit of an operating division of a department?

GENERAL EDUCATION.

1. Do you employ a merit system of discipline?

2. Does the road give a current effect to a merit and demerit system by an award of premiums and of penalties or fines, or is the effect only had in altering the recorded status of the employee and thus entering to determine his promotion or tenure?

3. Does the road sustain reading rooms, or libraries, or a circulating library, as on the Baltimore and Ohio, by baggage car?

4. Does the road systematically stimulate habits of thrift and providence by contribution toward, management of, or offer of general facilities for or penalties for the neglect of insurance against death, disability, or superannuation?

5. In matter of reading rooms, libraries, literary clubs, and general evening classes and lectures in which the road may undertake any responsibilities, does it act direct or through the agency of the Young Men's Christian Association?

*T. A. McKinnon, first vice-president Boston and Maine Railroad.*

In our machine shops we take a few apprentices and after three years they are given the regular machinists' wages, but as our men remain steadily in the service, as a rule, the number of apprentices is limited.

In all departments of the railroad vacancies are filled by promoting the next in rank, qualification being the first consideration; consequently new men are engaged only for minor positions—as, for instance, in the train service we never go outside the ranks for enginemen or conductors. In engaging men for the position of fireman or brakeman applicants have to undergo an examination, and only men who are fitted for promotion to the position of engineman or conductor are engaged.

I inclose copy of General Order No. 22, which is in effect the Brown system of discipline. We have found this practice to be very beneficial in dealing with our men. There has been a great saving to the men from the discontinuance of suspension, and it enables us to give good men who may have committed a minor offense the benefit of previous good record, etc.

I also desire to state that in connection with the Young Men's Christian Association rooms, which have been established at various points on the road, we encourage a system of evening lectures on various subjects connected with the operation of the railroad, and we have found material benefits from the same. At Concord, N. H., where we have very large shops, the men have evening classes in mechanical drawing, etc.

We also each year take into our engineering department a number of young men, graduates from the Massachusetts Institute of Technology, and after a short term in the office the young men are placed in practical service on the different divisions as assistants to the roadmasters, and we are thus building up a class of men for positions of importance in the roadway department having the technical as well as the practical knowledge of the work to be performed.

General Order No. 22.]

BOSTON AND MAINE RAILROAD,  
FIRST VICE-PRESIDENT'S OFFICE, OPERATING DEPARTMENT,  
*Boston, February 15, 1896.*

Commencing March 1 the enforcement of discipline by suspension will be discontinued.

1. Heads of departments will keep a record of the services rendered by each person in their respective departments, and whenever the record of any is so generally unsatisfactory as to unfit him for further service, dismissal will follow.

2. Each person employed will be notified promptly of unfavorable entries made in the record book opposite his name. He will, upon request, be shown his record at any time, but will not be permitted to see the record of another person.

3. Bulletins showing each case of discipline, omitting name, date, train, and location, but containing facts and conclusions and such comment as is applicable, will be issued from time to time, if considered necessary.

4. Dishonesty, intemperance, disloyalty, insubordination, incivility, willful negligence, incompetency, or other disobedience of the company's rules will be considered sufficient cause for dismissal.

5. In the promotion of employees their previous records will be carefully considered.

6. Subordinate officers will see that information necessary to the proper keeping of the record of each individual is promptly forwarded to the head of his department.

The objects to be attained under the new system are:

First, to avoid loss of wages by persons employed, and consequent suffering to those who are dependent upon their earnings.

Second, to stimulate and encourage all persons engaged in company's service in the faithful and intelligent performance of their respective duties.

This system is introduced with the belief that it will be directly beneficial and that it will meet with the approval and cordial cooperation of all concerned.

T. A. MACKINNON,  
*First Vice-President.*

#### GENERAL EDUCATION.

1. Do you employ a merit system of discipline?—A. Yes.

2. Does the road give a current effect to a merit and demerit system by an award of premiums and of penalties or fines, or is the effect only had in altering the recorded status of the employee, and thus entering to determine his promotion or tenure?—A. Record only.

3. Does the road sustain reading rooms, or libraries, or a circulating library, as on the Baltimore and Ohio, by baggage car?—A. No.

4. Does the road systematically stimulate habits of thrift and providence by contribution toward, management of, or offer of general facilities for, or penalties for the neglect of, insurance against death, disability, or superannuation?—A. No.

5. In matter of reading rooms, libraries, literary clubs, and general evening classes and lectures, in which the road may undertake any responsibilities, does it act direct, or through the agency of the Young Men's Christian Association?—A. Through Young Men's Christian Association.

## MECHANICAL DEPARTMENT.

1. Is it the policy of the road to educate its own men or to depend on outside supply?—A. Promotion generally from the ranks.

2. If the apprenticeship is contemplated as a general policy of the road, does the road bear any part of the expense of coincident instruction by night classes, etc.?—A. Apprenticeship only incidental.

3. Is there one general supervision of apprentices or is their selection, their instruction, and their distribution among the regular employees left to the discretion and individual convenience of the division officer, and not made to accord to any general plan?

4. Is the "time" basis rigidly enforced in your apprenticeship or does the "merit" basis prevail? (By the latter is meant a system that allows credits for special work, outside study, or unusual aptitude, and so far shortens the course to the apprentices.)—A. Time basis enforced.

5. Is there any implied contract or employment at the expiration of the apprenticeship?—A. Employment implied. No contract.

6. Upon the completion of an apprenticeship, does the road give certificates or does it recognize similar credentials from other roads?—A. Not generally.

*A road in the Northwest of over 5,000 miles.*

## MECHANICAL DEPARTMENT.

1. It is the policy of the road to educate its own men.

2. The company does not bear any part of the expense of coincident instruction by night classes.

3. In the operating department apprentices, after having taken the necessary course in the accounting department, are assigned to duty with division superintendents, and their progress watched by the general superintendent, who determines their fitness for further promotion.

4. The "merit" basis prevails in promotion.

5. There is no implied contract of employment at the expiration of apprenticeship. Apprenticeship is not for any specified term.

6. The road does not give certificates of apprenticeship, and does not recognize similar credentials from other roads.

7. Apprenticeships are not graded. Apprentices are selected from young men of good family and education, where practicable, and are also selected from the ranks of the employees on account of proved fitness for promotion.

8. We have not systematized apprenticeships in the mechanical department sufficiently to answer the points raised under this question. Apprentices in the mechanical department have, as a rule, only common school education, and do not rise beyond journeymen.

9. Our helpers and handy-men come as a rule from those who enter the service irregularly and after they are grown.

## APPRENTICE SYSTEM (GENERAL).

1. We have no system approximating a formal apprenticeship in any department.

2. (a) We have no prescribed qualifications for those entering the service. General fitness governs.

(b) We have no definite arrangement of the work and stages of promotion. Each individual is advanced as his ability justifies.

(c) We keep close record of all employees, except common laborers, and all are considered in the line of promotion.

(d) Promotion is competitive, the best man securing promotion.

(e) We employ the best men for the place within and without the service, but endeavor always to find them within the service.

## GENERAL EDUCATION.

1. We employ a merit system of discipline.

2. We award no premiums and inflict no fines and no penalties other than suspensions.

3. We do not sustain reading rooms or libraries.

4. We make no contribution toward insurance fund.

5. We have no reading rooms for employees.

As in answer to question No. 3 reference is made to operating department apprentices taking a course in the accounting department, I assume that you will desire to know something about such a course.

For the past two or three years we have been taking young men of good education, preferably college men, into the office with the idea of educating them for the position of division superintendent. On this road the superintendents try to find out what the work they are doing costs, and how every little expense they incur or every little saving that they may make will affect the cost of transportation. To that end candidates for these positions are given a preliminary training in the accounting department, so that they may understand how the different items of expense reported by storekeepers, superintendents, and others come into the office, and how they are compiled, to make the total operating expenses of the road. Our course takes about two years. Of course the men have absolutely no knowledge of railroad work and it is necessary during the time to have them spend more or less time at the shops, store houses, and on the road, so that they may become familiar with the sources from which charges are made. After they have had this course they thoroughly understand what we call our "operating sheet," and can realize how any saving that they may make will affect that sheet, and consequently the cost of transportation.

When they have gained this knowledge they are turned over to the operating department, which assigns them to duty with a division superintendent in order that they may gain the practical knowledge necessary to be successful operating men.

Yours, truly,

R. I. FARRINGTON, *Comptroller.*

*The Boston and Albany Railroad, W. H. Barnes, general manager.*

THE BOSTON AND ALBANY RAILROAD COMPANY,  
GENERAL MANAGER'S OFFICE,  
*Boston, Mass., February 6, 1899.*

The operation of railroads in this section has not yet arrived at a point where the education of persons is carried on according to methods indicated by your questions, and I am able to answer only a very few of them.

#### GENERAL EDUCATION.

We have a circulating library at Springfield, which is about the center of the line, from which books are distributed weekly to employees on their request. We have no merit system of discipline.

#### MECHANICAL DEPARTMENT.

We have three or four apprentices at a time; our shops are not extensive enough for more. We pay them nominal wages at the start and increase the amount each year until the end of the third year, when they are paid wages according to their merit.

Our helpers come from persons entering our employ irregularly.

#### APPRENTICE SYSTEM.

No formal apprenticeship other than in the mechanical department.

Yours, truly,

W. H. BARNES, *General Manager.*

*The Atchison, Topeka and Santa Fe Railway System, C. M. Higginson, assistant to the president.*

The Atchison system extends over a very wide extent of country and the needs of the road and also the labor conditions vary widely. This necessitates variety in our dealings with labor matters, and the methods of furnishing our supply of employees differ accordingly.

To start with, the future value of a young man in any branch of the railway service depends largely upon himself, and any young man who is willing to learn and work and who is adaptable will get along and be useful, while one who sees only his day's work and whose object is to get it over will never rise materially or be a person we can depend on. I am glad to say that the average tone of railway

employees is improving, and we are getting more intelligent work done than formerly. In some lines, where rates of pay seem high, we are demanding better service and getting better results accordingly.

To proceed with your several inquiries.

#### GENERAL EDUCATION.

1. We employ on all lines a merit system of discipline.
2. No fines, but a change in status by merits or demerits. A sufficiently bad record generally can lead to a discharge.
3. We have either reading rooms or Young Men's Christian Association rooms at all important points. We have a superintendent of reading rooms to look after the manner in which they are kept, the character and supply of books and literature, and who, as far as possible, guides the men he meets toward useful reading.
4. The only thing is by making collections for accident insurance companies which have policies upon the men. A benefit association like that on the Pennsylvania, Baltimore and Ohio, and Burlington is a good thing for both the company and the men, but is a point of development which most roads and their employees are not advanced enough for.
5. We act directly in reading rooms, as stated above, and at some points by aiding Young Men's Christian Association work.

#### MECHANICAL DEPARTMENT.

1. Our policy is to bring up our own men as far as possible, but in the fluctuations of business we often have to get men faster than we can educate them.
2. Our practice varies locally, due to differing conditions. We do not, as a rule, have any classes directly run by the road, but through the Young Men's Christian Association classes and the correspondence schools, to whom we give facilities for reaching the men, we do have regular instruction for men on such matters as air-brake working and have rooms for this purpose at all large shops. As Western roads grow older and the labor supply more stable there will be more done in this direction.
3. No general supervision of apprentices, the matter being under the local officers for reasons mentioned before, except that we give general instructions as to character of young men we wish to enter the service in all departments.
4. As a rule the "time" basis governs, as we wish to have the apprentice have that amount of manual drill. In some cases we make graduates of technical schools "special" apprentices when there is no regular time limit.
5. We agree to give work at a certain rate at end of apprenticeship, but no guaranty of length of such employment.
6. Will give certificates if desired, and to a certain extent will recognize such, but the individual's work governs when he comes on the road and not the certificate.
7. Only one grade at each shop.
8. If by outside instruction of any nature the boy or man does his work better he gets on faster. No credits for items mentioned.
9. As far as possible helpers and handy men are taken from boys in shop, but we have to hire many after they are grown.

#### APPRENTICE SYSTEM.

1. No regular system, except that in all departments men have to go through a routine of work and experience before being promoted.
  2. (a) There are prescribed qualifications for entering any branch of the service.
    - (b) The stages of the work and promotion depend mainly on the work done by the individual.
    - (c) A record is kept of all employees in the operating departments.
    - (d) Both features are considered; neither is sufficient alone for the best service.
    - (e) All promotions made from our own service if there is a man we can find anywhere on the system fitted for the work. Sometimes we have to go outside.
- One great trouble we have with young men is that those who have the education we would like them to have are not willing to do the amount of ordinary manual work (it may be more or less hard or dirty) which is really needed to insure fitness in a number of departments. After a young man has had a good English,

or better, a high-school education, he can do better work in any department, but as a rule higher than this the average young man will do better at work than at study. The years from 18 to 22 spent at actual work are generally more useful for railway work than the same time at a technical school. Even in departments where technical knowledge is necessary, the facilities for acquiring knowledge are so general that a young man can post up as he goes along on anything he feels deficient in.

*New York Central and Hudson River Railroad Company, E. Van Etten, general superintendent.*

#### MECHANICAL DEPARTMENT.

1. If a general education is referred to, the employees are expected to acquire it outside. If a knowledge of railroad methods is meant, there is no special provision for education made by the company, but the foremen in the shops and round-houses are expected to explain, to a certain extent, the company's methods to those wishing the information.

2. No night classes are maintained. An air-brake instruction car, with an instructor, is maintained by the company, and applicants for position of engine-man or fireman are obliged to pass an examination.

3. The instruction of apprentices is looked after by the foremen; there is no general supervisor.

4. The standing of an apprentice is based upon his ability to comprehend orders and to do his work accurately and quickly, which standing is determined by the foremen.

5. No.

6. No; but a letter of recommendation as to merit can be obtained upon application.

7. No.

8. Degrees and certificates do not entitle their holders to any special consideration. If a graduate of a trade school or a technical school enters the mechanical department, the manner in which he performs his work and the ability he exhibits for greater responsibility are the chief factors in determining his advancement when there is an opportunity.

9. Both boys and men are employed as helpers.

The railroad branch of the Young Men's Christian Association, with its headquarters at 361 Madison avenue, New York, exerts considerable influence toward improving the mental condition of the men in the mechanical department. A library well supplied with books on general and engineering subjects is open to all members; annual dues, \$3. This association has branches at most of the important railroad stations on the line, and through these members may draw books from the main library, and the use of said library is encouraged as much as possible.

Unless a new employee has given special attention to railroad subjects and consequently can apply his knowledge directly, the benefit he derives from his education is of an indirect character, but works, of course, to his advantage by rendering him capable of comprehending his work more fully, performing it more quickly and accurately than he could otherwise.

#### APPRENTICE SYSTEM.

1. We have no formal apprenticeship in any other department than the mechanical.

2. Take, for instance, our train service. Persons entering the employ as a brakeman are required to be intelligent, and before they are put to work are required to pass a certain examination on our rules. Brakemen are promoted to firemen and freight conductors, and from freight conductors to passenger conductors, etc., all of which depend upon their faithful discharge of duty and capacity for increased responsibility. Passenger trainmen are also promoted to baggagemen and sometimes to conductors.

#### GENERAL EDUCATION.

1. We do not employ a merit system of discipline.

2. We award no premiums and have no penalties or fines.

3. See remarks under mechanical department.

4. We have a building and loan association which is conducted under the auspices of the Young Men's Christian Association; a very large number of our employees are insured against accident, which action is encouraged.

5. In the matter of reading rooms, etc. All such arrangements, such as reading rooms, libraries, clubs, evening classes, and lectures are arranged under the auspices of the Young Men's Christian Association, railroad branch.

*Pennsylvania Railroad Company, M. Riebenack, Assistant Comptroller.*

In regard to the employment and promotion of clerks in the accounting department, applications for positions, to receive consideration, must be made upon a formal blank. Sample is herewith inclosed, being the one upon which a junior clerk makes application; those for senior clerks varying but very little in the arrangement of the text. Upon the receipt of this formal application, if the same is satisfactory, an examination in simple mathematics<sup>1</sup> is granted, and if passed successfully according to our standard, which admits of so much time being occupied and a maximum number of errors, the name of the applicant is placed upon our satisfactory list in the order of correctness of examination and time occupied in performing the same. As vacancies occur in our force, selections are made from this list accordingly.

It is our custom to engage in the service young men about the age of seventeen, educate them in the business, and when they attain their majority and are fully qualified for advancement, promote them to fill the vacancies as they occur in our regular force.

At the time of examination, the conditions under which clerks are employed are specially set forth in printed form, so that the applicant may know, if employment is granted him, just what he may expect in the way of advancement and promotion (sample of this form for juniors inclosed). When employment is offered anyone a letter is written to them, practically reiterating the facts as contained in this blank, which the applicant retains in his possession as his part of the agreement, the printed blank filled out by the applicant being the company's portion.

You will note that we require all junior clerks to take up the study of shorthand and typewriting and attain a certain degree of proficiency therein before they are advanced at certain stages.

We have a regular system for increasing salaries, according to length of service and merit. When the time expires for a clerk to be considered for promotion, report is made upon him by the superior officer, and if his services have been satisfactory and recommendation made that his salary be advanced as provided under the classification, the same is approved; otherwise it would not be made.

While our promotions can not be said to be strictly competitive, basis of seniority alone is not a factor, as outside of the regular stipulated term of service necessary for advancement to a higher rate of pay it is also a rule that if a vacancy occurs in a class, the next meritorious clerk in the classes below is advanced one higher. To a great extent promotions in positions are dependent upon the result of efficiency in previous lines of work and demonstrated ability to fill higher positions. The work done in business colleges, etc., while tending to give the applicants increased knowledge as to accounting methods, is of no material advantage in connection with their employment by us, as we require all applicants to begin on the same grade of work, study the geography of our road, names of its stations and locations thereof, become thoroughly familiar with the titles and names of officers, grades of work on which engaged. They are gradually advanced from one class to another, and transferred from office to office, an effort being made to have them familiarize themselves with the various branches of accounting from an auditing standpoint.

We occasionally employ senior clerks for the purpose of training them in the duties required of clerks in ticket receivers' offices and various other outside positions coming under the jurisdiction of the accounting department. For this class we engage young men who must be single and agree to accept these outside positions, either temporarily or permanently.

In no instance do we employ experienced clerks to fill vacancies in our general office force, except when we have no junior clerks who have been in the service long enough to graduate from the minor classes of work and fill the positions in our regular force, which seldom occurs.

---

<sup>1</sup> Include proportion and percentage.

APPLICATION TO THE COMPTROLLER OF THE PENNSYLVANIA RAILROAD COMPANY  
FOR A SITUATION IN THE ACCOUNTING DEPARTMENT AS CLERK IN THE JUNIOR  
CLASS.

[NOTE.—The information required below is to determine the eligibility of the applicant, and whether an arithmetical examination will be accorded. The name of applicant will not be placed on the list for consideration, if replies to the questions are not satisfactory, nor if the result of the examination is below the established standard. This application must be made in the handwriting of the applicant.]

1. Name in full.
  2. Address.
  3. Birthplace.
  4. Date of birth and present age.
  5. Persons dependent for support.
  6. Extent of education.
  7. Experience at shorthand and typewriting.
  8. If ever employed by this company, in what capacity.
  9. Previous employment, length of same, and with whom.
  10. Present employment, if any, and with whom.
  11. If ever suspended or discharged from any position, by whom and for what cause.
  12. Extent of defect, if any, in sight or hearing.
  13. If crippled or deformed, in what manner.
  14. Nature of any chronic illness.
  15. Names and addresses of not less than three responsible persons as reference.
  16. Application made at suggestion of \_\_\_\_\_.
- Dated, \_\_\_\_\_ 18 \_\_\_\_\_.

CONDITIONS OF EMPLOYMENT IN THE ACCOUNTING DEPARTMENT AS CLERK IN THE  
JUNIOR CLASS.

Upon entering the service of the Pennsylvania Railroad Company in the accounting department, as clerk in the junior class, employment is on probation for a period not exceeding six months, at a salary of \$20 per month.

At the end of the probationary period, if rendering has been satisfactory, employment will be continued and salary increased to \$25 per month, with the understanding, however, that further retention and advancement in the service will depend upon competency and a strict observance of the rules for the government of clerks in the accounting department.

When salary is increased to \$30 per month, clerks must at once commence the study of shorthand writing. At the expiration of one year from that time and before their salary will be further advanced, they will be required to pass a preliminary examination to demonstrate the progress made, and at the end of the following year's service, before being again promoted, will be expected to show such proficiency as will enable them to write verbatim, from dictation at moderate speed, and transcribe same correctly.

From the junior class selections are made to fill vacancies in the regular clerkships, preference being given to those most worthy of promotion.

The applicant will signify below, in letter form, whether or not he is willing to accept the above conditions.

PHILADELPHIA, PA., \_\_\_\_\_, 18 \_\_\_\_\_.

Mr. \_\_\_\_\_.

DEAR SIR: \_\_\_\_\_.

Respectfully, \_\_\_\_\_.

*Norfolk and Western Railway Company, J. M. Barr, vice-president and general manager.*

MECHANICAL DEPARTMENT.

1. It is the policy of this railroad to educate its own men and from them draw our supply of mechanics and officers.

2. The railroad company does not bear any part of the expense of the apprenticeship of its employees coincident to instruction by night classes, etc.

3. There is a general supervision of apprentices, and their selection and placement in the different shops is handled by a superintendent motive power and his general foremen. The steps taken by apprentices in entering our service are

about as follows: Applicants must be not less than 17 years old, of good parentage, good health, and a fair book education. The first step they take is an application in writing, stating age and other facts common to all applications, and what branch of the service they desire to educate themselves for. This application is passed upon by the superintendent motive power, who in turn forwards it to either of the general foremen under whose charge the departments are in which the applicant desires to engage employment. If there is a vacancy into which the applicant can be placed, he is called for and questioned closely by the general foreman, who assigns him to a place as messenger and helper in the tool room, in which room he is required to stay for one year, becoming thoroughly familiar with all of the tools and their respective usages. As soon as he is known to be familiar with all tools and their usages, he is passed into the erecting shop, where our machinery is erected and torn to pieces. He is kept in this shop from one to two years, until he becomes thoroughly familiar with all of the tools and machines in this shop, and when it is known, by questioning from the foreman of this shop, that he has become entirely familiar with the details of this shop, he is passed to the machine shop, wherein are all of the tools and machinery with which all of our mechanical department work is done. He is taken in charge by the foreman of this shop, and after close questioning, worked from one lathe, planing mill, or other machine to another of the same or different class, until he has passed the rounds of all of the machines and has become thoroughly familiar and perfectly efficient in working each and all of them. If then, after close questioning by the foreman, he is found to be fit to be placed in independent charge of work, he is assigned as a regular machinist; this, however, providing that he has served his full four years' course as an apprentice. The four-years' apprenticeship is insisted upon, regardless of merit or conditions. The compensation for this work is 7 cents per hour for the first year, 9 cents per hour for the second year, 12 cents per hour for the third year, and 15 cents per hour for the fourth year, and when he is pronounced an efficient machinist he is paid according to his ability to perform work promptly and satisfactorily. It is after his full apprenticeship has been served that his merit is decided upon as to ability. We have machinists who are paid 18, 20, 22, and 24 cents per hour, and the determining factor in the payment of these salaries is their ability to do work assigned to them.

You will note that the above paragraph answers the questions asked in your question No. 4.

5. There is no implied contract at the end of the apprenticeship; but we draw from the apprentices for so large a percentage of our skilled labor that I believe it is considered among the men equivalent to a guaranteed position when the apprenticeship has been finished.

6. Upon the completion of apprenticeship we give certificates specifying the number of years served as an apprentice and the ability of the graduate classed as "fair," "good," "very good," and "excellent." These certificates, I believe, are issued in nearly all well regulated railroad machine shops of magnitude in the country, and are recognized in the mechanical department of the several railroads as evidence of their ability in the placing of these men in situations. I understand that small railroads, which necessarily do not require any large amount of shop work done, do not, as a rule, furnish such certificates to their apprentices. If, however, we were in need of machinists, or skilled laborers of any kind, and they could not be drawn from our apprentices—that is, if we did not have these apprentices who had completed their full four-years' course—we might employ such skilled labor from the outside, and accept the credentials of outside parties as to the ability of the applicant. This is a matter decided upon wholly by the superintendent of motive power.

7. We do not have different grades of apprenticeship. All apprentices must serve their full four-years' course.

8. We do not issue degrees of M. E.; we do not accept certificates from a trade school; we do not accept certificates of technical courses in a high school; neither do we recognize measure of work done in correspondence schools, nor in evening classes.

9. For our helpers and handy men we require men of considerable physical strength, and therefore they are drawn from outside sources, unless men in other departments can be promoted and better wages paid them.

#### APPRENTICE SYSTEM (GENERAL).

1. The general organization of railway employees requires that all departments must have apprenticeships. For example: men in charge of engines, as engineers, are promoted from firemen; firemen, as a rule, are promoted from brakemen

on the head end of the train; conductors are promoted from flagmen; men whose duty it is to assist the conductor in his reports and protect his train by proper flagging and other attention, are stationed on the rear of each train, and are known as "flagmen"—separate and distinct from "brakemen"—and are promoted from brakemen. The brakemen on the head end of the train and in the center of the train are the only men upon each train who can properly be called "brakemen." Our agents, train dispatchers, chief train dispatchers, trainmasters, and superintendents are, as a rule, made from our operators, their fitness for an agency or position as train dispatcher, and promotion from an operator to that situation, being in the hands of the superintendents; their fitness for a position as chief train dispatcher or trainmaster from that of train dispatcher or conductor being in the hands of the superintendents and approved by the higher officers. The line of promotion in the road department necessarily calls for apprenticeship; that is, from a common section laborer to the foreman of a section; then the foremen of extra gangs of men in charge of special work, and going from that position to that of roadmaster; and from that position ordinarily to that of general roadmaster, fitness and experience being the entire factor in such promotion.

2. (a) The rules of all well-regulated railroads require that employees be able to read and write, have a common-school education, and such other merits as would fit them for the class of work which they expect to perform. Operators are usually made from messenger boys, who pick up the art of telegraphing while engaged in messenger service about the telegraph offices.

(b) Already answered.

(c) A registry and individual record is kept of each and every employee, and either an actual or record suspension is recorded against all employees. If deeds of merit are performed and are brought to the attention of the officers, credits are given these employees on these records. The Brown system of discipline is practically in force on this line.

(d) In the road, train, engine, and station service the promotions are made from employees most competent to fill the positions, regardless of seniority.

(e) We aim to make promotions from ordinary positions to those of higher position from employees of each and all departments, without drawing from other departments or men outside of the service. If it is decided that there is not competent material in these departments from which to make these selections, outside sources are drawn from; but this is not done until it is absolutely known that there are not men in the several departments already employed by us who can fill these more important positions.

#### GENERAL EDUCATION.

1. We do employ a merit system of discipline, which has been explained in a previous paragraph.

2. No rewards or premiums are paid for efficiency of service, and no direct money penalties are imposed upon the employees, their entire fitness for the services of the company being determined by the merit and demerit system of accounts, such as is explained by Brown's system.

3. This railroad does not sustain circulating libraries or reading rooms; that is, wholly sustained by support of this company, but does contribute largely to the support of such libraries and reading rooms under the direction of the Young Men's Christian Association.

4. We do not operate an insurance feature in connection with this railroad, but have given the exclusive privilege of issuing insurance to our employees to one company, because of a material reduction in the rate given to the employees by this company on account of this privilege. No employee is, however, restricted from insuring in any other company which he may see fit by these instructions.

For your information I beg to advise that the Great Northern Railway line had some years ago a system of reading rooms and circulating libraries, maintained wholly by the employees, with some aid from the railway company; that is, some money contributions and rooms provided in buildings of the company. These reading rooms were conducted somewhat after the style of the Young Men's Christian Association reading rooms, and always contained the leading daily papers and periodicals, and it was aimed to give entertainments in these rooms occasionally. Several very enjoyable entertainments have been given in St. Paul, Minneapolis, and other terminals of that line. This is the only railroad that I know of that has such an arrangement as this.

## RAILWAY SCHOOL AT Breslau.

By Dr. HILSCHER.

[From the Oesterreichische Eisenbahn Zeitung, No. 9, 1898.]

On October 4, 1897, under the control of the royal railway directorate, a railway school was opened at Breslau, which is intended to provide candidates seeking appointments as secretaries and superintendents in the traffic and goods departments with a practical education, and to teach them also as much theoretical railway science as possible. Civil supernumeraries and candidates for posts in the railway offices are obliged to attend the courses, while this is optional for men residing in Breslau who have recently been appointed and wish to prepare for the examinations for the posts of secretary, traffic or goods superintendents, or for those who desire to attend some or all the courses of lectures.

Disregard of instructions given by the teachers will be considered as equivalent to disobedience to a superior officer.

Officials selected by the railway directorate deliver the lectures, and one of them has been specially chosen to manage the school. The teachers meet together to discuss the interests of the school and to suggest what improvements are advisable. At the end of a school year a report is sent to the royal railway directorate, in which the teachers express their opinion as to the result of the teaching, the discipline, attendance at the courses, the use made of the library, and as to any alterations they deem advisable in the organization of the school.

The lectures take place between 8 and 11 a. m. on three days in the week, two classes being held, if necessary, from the beginning of October to the end of March. The pupils are not made to write papers, but now and again oral examinations are held to find out whether the courses are being properly followed and understood.

The courses are as follows:

1. Constitutional law of the state and the empire, organization of the departments of the state and the empire, executive government of the Prussian state railways, internal regulation of the offices: Thirty lectures.

2. Principal provisions of the law of procedure, of the law as to the tutorial functions and jurisdiction of the administration, discipline, law, and the regulations applying to officers and employees: Fifteen lectures.

3. Geography: Ten lectures.

4. Officers' benevolent institutions: Ten lectures.

5. Workingmen's benevolent institutions: Twelve lectures.

6. Political economy: Ten lectures.

7. Cashier's department: Twenty lectures.

8. Account keeping: Twenty lectures.

9. Arrangements as to fares and freight rates for and additional pay to the train staff: Six lectures.

10. New lines (laws dealing with railway undertakings, preliminary works, compulsory purchase, survey, regulations as to construction): Seventeen lectures.

11. Stores department: Eight lectures.

12. Workshops department: Six lectures.

13. Audit department: Nineteen lectures.

14. Rates department: Fifteen lectures.

15. Customs and taxes: Fifteen lectures.

16. Utilization of rolling stock: Eight lectures.

Obviously it is not yet possible to predict how far this school, which has been organized on novel lines, will come up to what is expected of it. Its special object is to prepare candidates for examination, and there is little doubt that this end will be attained when we consider that attendance at the school will be obligatory and that in Germany departmental regulations must be obeyed.

As for its producing traffic engineers "by teaching as much theoretical science as possible," this can hardly be expected, for nobody becomes an engineer by virtue of simply knowing the laws and regulations as to construction.

Nevertheless, it is a matter for congratulation that Germany, too, has realized the necessity of special teaching for railway men, and that the initiative in this matter has been taken by the only properly authorized body, namely, the State.

---

CHAPTER XVIII.

UNIVERSITY EXTENSION IN GREAT BRITAIN.

By HERBERT B. ADAMS,

*Professor in Johns Hopkins University.*

---

“Promote as an object of primary importance institutions for the increase and diffusion of knowledge.”—George Washington.

“Universities are, in their first function, places and centers of research. They are designed to add to and augment the fund of knowledge. They have also the other functions of diffusing and distributing knowledge.”—John Morley, at Newcastle, September 22, 1887.

“The higher education of citizens has become an urgent need of the modern democratic state.”—M. E. Sadler.

“A man needs education not only as a means of livelihood, but as a means of life.”—G. J. Goschen, D. C. L., M. P.

“We advocate education not merely to make the man the better workman, but the workman the better man.”—Sir John Lubbock.

“A mere system of popular lectures has no right to the name of University Extension. The business of a university is to promote sound and thorough study and to make thinking men of its alumni. The business of University Extension is the same, the difference is only in the field of operation. \* \* \* I am persuaded that if the University Extension movement loses its character as a student-creating movement and comes to be regarded as a scheme for popular lecturing it is doomed as University Extension; it will fritter itself away without leaving any deep or permanent mark upon the higher educational system of the country.”—R. D. Roberts, at World’s Congress on University Extension, Chicago, 1893.

“If the Extension lectures had effected nothing more than what is universally admitted they have effected—raised the standard of popular lectures throughout England—they would have justified their institution.”—J. Churton Collins, 1899.

“Education of the People is the first duty of Democracy.”—Jules Siegfried, President of French Committee, social economy group, Paris Exposition, 1900.

## UNIVERSITY EXTENSION IN GREAT BRITAIN.

---

### PREFACE.

The first American account of University Extension in England appeared in the Report of the Commissioner of Education for 1885-86, pp. 748-749, in the Johns Hopkins University Studies in November, 1887, and in the Amherst Literary Monthly, December, 1887. About that time the writer began to collect materials for this present report. In the American Review of Reviews for July, 1891, he published some preliminary account of "University Extension and its leaders." In The Forum for July, 1891, he described "University Extension in America." This more elaborate report is published as an American contribution to English educational history and withal as an introduction to "Educational Extension in America" or to the more significant popular educational movements now in progress in America.

While the present report is more strictly historical, relating to the origin and development of the English University Extension movement, the writer, in the summer of 1896, personally attended summer meetings of University Extension students at Cambridge and Edinburgh and contributed to the Education Report for 1897-98 an account of "Summer schools in England, Scotland, France, and Switzerland." In that supplementary account attention was devoted to the following special subjects: (1) The National Home Reading Union and its summer meeting at Chester; (2) A summer meeting in Cambridge; (3) The Edinburgh summer school; (4) An Oxford summer meeting; (5) Vacation courses in Paris; (6) Summer schools in Switzerland.

### I. HISTORICAL INTRODUCTION.

University Extension is undoubtedly a part of a larger democratic movement which in England has gradually advanced during the nineteenth century. It is remarkable that so many great landmarks of popular progress in our mother country have been established within the memory of living men. The widening of the suffrage by successive reform bills, the emancipation of Catholics, Jews, and women, the institution of compulsory education for children, the establishment of local examinations, local lectures, local colleges, and colleges for women, these are all very recent events and indicate the popular direction in which England has been moving. The extension of political privileges to the English people only foreshadowed the extension of the universities and of higher adult education. The democratization of learning, religion, government, and society is the essence of modern history.

Popular education, like popular government, reformed religion, and classical revivals, is not absolutely new in principle or practice. There is nothing new under the sun, not even electricity, or the gold of Klondike. Men simply find things; they rediscover old facts, ancient principles, the primordial laws and forces of Nature; they make fresh applications of eternal truth to wider human needs. Education, like all science, comes as fast as the growing wants of society and the developed capabilities of man. In a certain sense, as Lessing and Herder showed, true educa-

tion and revelation are identical. New inspirations continually break forth from sacred scriptures and from the infinite books of Nature and human experience which men call history.

Out from the heart of Nature rolled  
The burdens of the Bible old.

Popular education is as old as the recorded experience of the chosen people, who were, in a religious sense, the educators of Europe, the heralds of the essential truths of Christianity. The Priests and Levites "went about throughout all the cities of Judah and taught the people" (II Chronicles, xvii, 9). Itinerant teachers and preachers were thus foreordained. In the year 64 A. D. the high priest Joshua Ben Gamala imposed upon every Jewish town and village the obligation to sustain a common school. Thus, by nearly sixteen centuries, was anticipated the Massachusetts' idea of compulsory education. Rabbinical schools, with popular teaching in synagogues, flourished throughout the Middle Ages, as did the catechetical, monkish, and cathedral schools of the Christian Church. The educational essays of Brother Azarias, that faithful Catholic scholar and true poet, the lamented head of Rock Hill College, Ellicott City, Md., proved conclusively to American readers that the mediæval church did not neglect either primary or popular education. All was given that the times really needed or demanded.

The rise of colleges and universities can not be explained without reference to the cathedral and cloister schools of the Middle Ages. Even the education of women, which some modern universities still obstruct, was provided for in mediæval nunneries, the historic forerunners of all modern seminaries and colleges for women. Witness that cloistered school at Gandersheim in north Germany, where, in the tenth century, a clever nun Roswitha<sup>1</sup> wrote Latin plays in imitation of Terence, for her companions to act. Verily there is nothing new in education. The miracle plays of the Middle Ages were popular dramas. Monks and nuns, priests and friars, Christian poets, and wandering minstrels were teachers of the common people. Folk-lore, folk-songs, popular lives of the saints, Christian art and architecture, frescoes or wall paintings, cathedral portals, and parish churches were veritably open books, known and read of all men and women in the "Dark Ages" (falsely so called) before printing was invented and learning made easy.

The gymnasia of modern Germany were based upon mediæval and monkish foundations, upon confiscations of ancient religious endowments. In reading an autobiographical account of the German school training of the late Dr. Frederic Henry Hedge, of Harvard University, one is impressed with a graphic account of the first gymnasium which he attended. It was situated in a romantic valley on the southern side of the Harz Mountains:

The school buildings, a congeries of quadrangles with other structures, including a church, had once been a monastery; the boys' rooms, stretching along two or three corridors, were the identical cells formerly occupied by the monks, rooms about 10 feet square, with little bedrooms (*Kammern*) attached. \* \* \* Underneath the portion of the building inhabited by the officers and scholars was the crypt, lined with perpendicular tombstones, each faced with an effigy in relief of the sainted brother who slumbered beneath.

Is not this a striking picture of the historic relation of modern schools and schoolmasters to their mediæval forerunners? Frederic Henry Hedge, taken when a little boy to Germany by George Bancroft to be educated, was probably one of the first native Americans to discover with his own eyes the monkish foundations of European culture. He spent two years in that German gymnasium in the Harz Moun-

<sup>1</sup> Pertz, *Monumenta Germaniæ*, iv. 306-335; Giesebrecht, *Deutsche Kaiserzeit*, i. 730. On the subject of "Nuns" in mediæval times, see Montalembert, *Monks of the West*, v. 213-361; Lingard, *Anglo-Saxon Church*, i. chap. v; ii, 263-266; Alice C. Osborne, *Roswitha, the Nun of Gandersheim*, New Englander, Nov. 1881; On the learned women of Bologna, see Madame Villari in *Popular Science*. Monthly, 1878, p. 185, or the *International Review*, March and May, 1878.

tains and there learned to talk with his masters and fellow-students the scholastic language inherited from old Rome and semi-popularized for all the churches, schools, and colleges of Christendom by pious monks and friars, the so-called "schoolmen" of the Middle Ages. The American schoolboy Hedge went from the Harz monastic school to Schulpforte, then the pet institution of the Prussian Government. This model modern German gymnasium lies on the river Saale, about 16 miles from Weimar, in Goethe's time the Athens of German culture. Dr. Hedge, in his autobiography, said Schulpforte was "a community of itself, independent of any municipal control. The main building, or collection of attached buildings, including a church, like the other school had once been a monastery. \* \* \* The whole was inclosed with a wall of a mile or more in circumference. \* \* \* For Prussian citizens, Schulpforte was a free school." The educational history of Germany can doubtless show many similar examples of the historic transition from the old order to the new, from the cloistered school of the monk to the free schools of modern Prussia, the pedagogue of nations.

Turning from Germany to England we find that from monkish beginnings, mediæval church foundations and modern confiscations of religious endowments proceeded the older endowed public schools, those famous Latin or classical grammar schools, from which historic types the Boston Latin School<sup>1</sup> and all the earlier academies and preparatory schools in America were derived. England was never destitute of educational provision for the sons of the people. We have only to study English local history to discover what generous endowments were made for public schools like Rugby, founded in the days of Shakespeare. And yet these educational institutions were usually for the benefit of boys. The education of girls was not publicly provided for in Old England or New England. Although the Puritan Fathers of Massachusetts established compulsory education in 1647, girls were not admitted to the public schools of Boston until 1802. English or American colleges for women were unheard of before the present century. Indeed, by formal academic vote, as late as May, 1897, women were denied degrees at Cambridge, England. While many popular features of school, college, and university education have come down to us from the Middle Ages, there was, after the Reformation, a manifest narrowing<sup>2</sup> of educational privileges, even for young men, under the English ecclesiastical establishment, in favor of the sons of the rich and prosperous. Until the second half of the nineteenth century there was no legal right to university education for nonconformists, for women, or adult citizens.

Europe has witnessed a succession of great popular extension movements in the broad fields of education, religion, and politics: 1. The revival of learning, which extended the influence of classical culture, at least for the educated classes, the humanists, down to our own day. Education, like society, has its seasons of wintry decay and of springtime revival. The fresh enthusiasm of the early schools of Ireland, England, and the Frankish Empire of Charles the Great was succeeded by Scholasticism, which, in its turn, was followed by the Italian Renaissance or the Revival of Learning, which brought new life and energy to Europe. From impulses then received, from the popular extension of this revival of learning a new world sprang into being. On this revival the colleges and universities of Europe have been living now for more than four hundred years. While humanism will doubtless long remain as vital in the process of education as are the forces of nature in the renewal of life, nevertheless it can well be understood how inherited methods of classical and

<sup>1</sup> See "Boston's First School," in *Evening Transcript*, April 15, 1899.

<sup>2</sup> Lord Salisbury once said: "It is the inevitable law of affairs that whenever you establish educational facilities for the poorest classes, gradually higher classes take possession of them. This is not the first time in our history that efforts have been made to educate the people; efforts were made centuries ago to do this by means of endowments. We have had public schools, universities, and grammar schools, all of them representing the efforts of benevolent persons to educate the poorer classes; but in each case the richer classes stepped in and appropriated what was meant for the poor."

the earlier philosophical training should have become somewhat antiquated and insufficient for the needs of the nineteenth century. New interests have dawned upon society. The lessons of antiquity and the finespun systems of mediæval and modern theology can no longer monopolize the attention of youth who are eager to become active citizens of a modern republic. Society itself is now an object of scientific study. The languages and literatures of the modern world have awakened attention. Politics and economics, laws and institutions, the modern state in which we live and move and have our civic being have become more interesting to many university men than were once antique forms of thought and speech. The great world of external nature, too, has begun to attract the minds of teachers and students. New methods of university education, new ways and means of bringing it into harmony with the needs of a democratic age, have been gradually developed.

Among these new methods is University Extension, which is a movement toward educational democracy. College men have come out from the cloisters and quadrangles of those conservative old universities of Oxford and Cambridge and have brought to the English people, in their towns and rural districts, some of the best fruits of sound learning in the form of local lectures, given in systematic and instructive courses. University Extension is an organized effort "to bring the university to the people when the people can not come to the university." University Extension is "advanced systematic teaching for the people, without distinction of rank, sex, or age, given by means of lectures, classes, and written papers during a connected course, conducted by men 'who believe in their work, and intend to do it'—teachers who connect the country with the university by manner, method, and information."

2. A second wave of popular extension which has swept over Europe is called religious reformation, Catholic and Protestant, which originated far back in the Middle Ages in the teaching and popular preaching of pious monks and friars, and gradually introduced a more individual as well as a more democratic spirit into the church and all its branches. The translation and printing of the Bible into English, German, French, and all the modern languages; the conversion of many old forms of religious service into the vernacular, or familiar speech of everyday life, aided the democratization of religion. The common people heard the gospel gladly in Palestine, Old Rome, and throughout the Middle Ages, when it was interpreted to them; but there were no mediæval preachers or teachers so powerful as the humanists, who printed Bibles and other good books, which awakened the intelligence of common readers. The spirit of religious liberty, like the revival of learning, was not absolutely new. Modern history, largely viewed, is simply the extension or popularization of ancient freedom and knowledge, both divine gifts to men. What once belonged to the privileged classes now belongs to all.

3. A third great wave, or a succession of waves, still mounting higher, may be seen in the political revolutions of England, America, France, Germany, Italy, Portugal, Spain, Cuba, and South America; in fact, throughout the world. These movements extend everywhere the spirit of Germanic self-government and of ancient civic freedom. The extension of culture and the growth of the spirit of liberty in church and state prepared the way for popular government upon a large scale. It is the expansion and popular character of modern republics and federations; it is the extension of suffrage and representation with other political privileges; it is the democratization and gradual Christian socialization of united states and federal empires that distinguishes the modern from the ancient world. Popular education is inseparable from modern democracy. This vast and growing educational movement is the ground swell of the nations, lifting them to greater moral power and to more efficient combination—

When the common sense of most shall hold the fretful realm in awe  
And the peaceful earth shall slumber lapt in universal law.

The civic education, not merely of youth, but of men and women, education continued for life, as are religion and morals, will be a powerful means for the salvation of modern society. Christian education is a larger catholicism which will yet redeem the world. In the higher education of the people, human culture, religious reformation, and political progress may perhaps find at last their synthesis. In fact, they seem to be doing so already in America, where schools, universities, churches, and states, although apparently distinct, are, after all, united in spirit and represent a common people.

## II. HISTORIC DEFECTS OF ENGLISH UNIVERSITIES.

In the eye of the law all English colleges and universities were originally charities and still are charitable institutions. Vernon Lee, in an article on "Democracy and our old universities," published in the *Contemporary Review* November 18, 1892, said:

The colleges were originally, like the old hospitals, eleemosynary establishments, and like the monasteries, under a common rule of life, and intended primarily for religious purposes. From the original statutes of the colleges, moreover, it is abundantly clear that they were, in many cases, founded "ad studendum," i. e., with the idea that the inmates should devote themselves to study, not to teaching. Their founders desired their inmates to acquire more learning themselves, but did not require them to impart more learning to others.

This was an educational ideal not unlike that of many monkish or religious establishments, where the various acts of worship were primarily for the love of God and the brethren, and not for the multitude at large. This religious ideal was the historic and natural forerunner of the modern ideal of science as fostered for its own sake rather than for the benefit of the people. Both ideals have their historic rights, but there are no rights without social duties.

The Protestant Reformation had, on the whole, a bad effect upon English university education. In the first place, the intolerance of church parties forced many Catholic scholars to withdraw from the country and seek refuge in the new Catholic seminary founded at Douay in 1568, as Greek philosophers found shelter in New Persia from the intolerance of that orthodox emperor, Justinian. In the second place, the yoke of the established church was laid heavily upon Oxford by Robert Dudley, Earl of Leicester, who became chancellor of that institution in 1564 and who, in 1581, introduced the religious test. Every student above the age of 16 years was required at matriculation to subscribe to the Thirty-nine Articles.

"Thenceforth," says the Hon. G. C. Brodrick, in his *History of Oxford*, p. 92, "the University of Oxford, once opened to all Christendom, was narrowed into an exclusively Church of England institution, and became the favorite arena of Anglican controversy, developing more and more that special character, at once worldly and clerical, which it shares with Cambridge alone among the universities of Europe."

Critics of modern English university education have not been lacking since the days of John Milton, the Puritan publicist, who, in his *Reason of Church Government*, thus spoke of Cambridge, his alma mater: "As in the time of her better health, and mine own younger judgment, I never greatly admired her, so now much less." Edward Gibbon, in his autobiography, said: "To the University of Oxford I acknowledge no obligation; and she will as cheerfully renounce me for a son as I am willing to disclaim her for a mother." Gibbon regarded the time he spent at college as the most unprofitable in his life; but Huxley says, "If Gibbon could revisit the ancient seat of learning of which he has written so cavalierly, assuredly he would no longer speak of the 'monks of Oxford sunk in prejudice and port.' There, as elsewhere, port has gone out of fashion, and so has prejudice—at least that particularly fine old crusted sort of prejudice to which the great historian alludes."

Adam Smith, in his *Wealth of Nations*, declares that "The discipline of colleges and universities is, in general, contrived, not for the benefit of students, but for the

interest, or more properly speaking, for the ease of the masters." He said also that in the University of Oxford the professors had given up even the pretense of teaching. It is a well-known fact that, throughout the eighteenth century, English universities were not largely productive of good results either in science or education. The best scientific and literary work was done outside academic walls. Professors regarded their chairs as founded for comfortable professorial support and took little pains to lecture or to instruct. It is said that one nonresident professor felt himself seriously aggrieved because he was compelled to make a journey to the university four times a year for the purpose of drawing his salary. After many fruitless efforts to persuade the authorities to send him his hard-earned money in quarterly installments, he began to devote himself to original research sufficiently to discover an ancient statute which required the university to forward his stipend without delay or inconvenience to himself. Such was the self-sacrificing spirit of at least one English professor in the eighteenth century.

Mr. Gladstone, in his address to Oxford students upon the subject of "Universities,"<sup>1</sup> speaking of this period of decadence after the Reformation, said:

To her manifest and, indeed, hardly measurable superiority in the earlier centuries Oxford had now bid a long farewell. It was, indeed, a century too polemical to be favorable to the development of a vigorous academic life. It seems, however, that other and not unimportant influences helped to lower the academic pulse. Ascham says that among the prevailing evils there was none more grave than the large admission of the sons of rich men indifferent to solid and far-reaching study, while Bucer recorded his opinion that the indolent fellows who were growing old on the different college foundations were an incubus to the university.

Huber, writing of English universities in 1839, said:

At the present day there prevails, without any doubt, in public opinion a more or less unfavorable judgment, and in its extremes an implacably hostile feeling against Oxford and Cambridge, which is proclaimed in every variety of tone and manner from the most different quarters.

Cardinal Newman, in his discourse in 1852 on the Idea of a University, said of Oxford that it was "about fifty years since that university, after a century of inactivity, at length was roused, at a time when it was giving no education at all to the youth committed to its keeping, to a sense of the responsibilities which its profession and its station involved."

As regards college students, note this satirical account of a Scotch university given by Thomas Carlyle in his *Sartor Resartus*:

Had you, anywhere in Crim Tartary, walled in a small inclosure; furnished it with a small, ill-chosen library; and then turned loose into it eleven hundred Christian stripplings, to tumble about as they listed, from three to seven years; certain persons, under the title of professors, being stationed at the gates, to declare aloud that it was a university, and exact considerable admission fees—you had, not indeed in mechanical structure, yet in spirit and result, some imperfect resemblance of our high seminary.

These criticisms are doubtless somewhat exaggerated and probably present one-sided pictures of English university education, but there is often a certain historic truth even in caricatures. In any case they serve to illustrate, in a striking manner, the weakness of the old order which was destined to yield to the strength of the new.

### III. ACADEMIC PIONEERS.

DR. GEORGE BIRKBECK (1776-1841).

This man deserves a foremost place among the historic leaders of the nineteenth century movement toward the higher education of the people. He early received a medical education in Leeds, London, and Edinburgh, where he took his degree of

<sup>1</sup> London Times, weekly edition, October 28, 1892. See also The Guardian, October 26, 1892.

M. D. Afterwards elected to a professorship in the Andersonian Institution at Glasgow, he began in 1799 to lecture upon natural philosophy or physics. Having no good apparatus, he was obliged to construct certain instruments for the conduct of his experiments. He had to employ unskilled workmen and was so impressed with their lack of training that he proposed to give them a course of instructive scientific lectures. The trustees of the Andersonian Institution, to whom he communicated his project in March, 1800, did not encourage the idea. They looked upon Dr. Birkbeck as a dreamer, but he actually realized his dream. His lectures to over 500 mechanics in Glasgow, at the beginning of the present century, were the practical beginnings of Glasgow Mechanics' Institute, the first of its kind in the world.

Dr. Birkbeck removed to London in 1804. Here he practiced medicine for many years, but never lost his early interest in the higher education of workingmen. In the *Mechanics' Magazine* for October 11, 1823, appeared his "Proposals for a London Mechanics' Institute." This was organized in the following December.

The *St. James Chronicle* of May, 1825, greeted this first popular establishment for higher education with these cheerless words: "A scheme more completely adapted for the destruction of this empire could not have been invented by the author of evil himself, than that which the depraved ambition of some men, the vanity of others, and the supineness of a third and more important class has so nearly perfected." More than 1,000 workingmen were enrolled as members of the institution the very first year of its history and paid their subscription. Dr. Birkbeck was chosen president, and he held that office until his death in 1841.

In the *University Extension Journal* for May 1, 1890, there was a good account of the Birkbeck Institution and a report of an interview with Mr. G. M. Norris, LL. B., who had then been principal of the institution for six years. Mr. Norris said:

Some time after the death of Dr. Birkbeck on December 1, 1841, the institution became known by its present title. Its history from that day to this has been the history of growth—and growth in spite of many difficulties. In 1844 the number of members diminished to 750, but this state of things did not last long. The present building [in Chancery Lane] was opened by the Prince of Wales on July 4, 1885. An idea of the magnitude of the present work of the institution can only be formed by a detailed examination of the comprehensive class list. Nearly every department of knowledge is represented and in each branch—whether technical, secondary, or higher—classes are arranged to meet the needs of students in various stages of progress. Our students have met with remarkable successes in the London University examinations, and at those of the science and art department. Last year Whitworth exhibitions were gained by two students, while our candidates gained 36 prizes and 833 certificates. The total number of students attending the institution last session during the four terms was 11,735, while the number of entries for the various classes was 14,104. It is estimated that nearly a third of the number of students are women.

It is often said that mechanics' institutes are now monopolized in England by people who are not mechanics. Upon this point Mr. Norris observes that a great change has taken place in the condition and status of the working classes. The mechanic and the artisan are no longer to be numbered among the great unwashed. The persons attending the classes are drawn from all ranks of society. "We do not require our students to state their occupations, as a rule, but in the register of entries for the science and art department examinations these particulars are recorded. On one page you see," said Mr. Norris, referring to the register, "we have a dental apprentice, clerk, draftsman, elementary teacher, engineer, clock maker, and carpenter." Birkbeck Institution is to-day one of the most active centers of University Extension work.

Dr. Birkbeck was one of the original founders of the University of London, which represents the beginning of the modern secular and democratic movement in university education. Glasgow and London were the original points of departure for the first great popular movement for higher adult education throughout Great Britain and America, by means of so-called mechanics' institutes. They were originally

designed for workmen, but, like many other popular institutions—for example, mercantile libraries—they have proved of great practical benefit to all classes. In 1852 there was formed a union of over 300 mechanics' institutes in England. Two years later the Society of Arts in London established for these institutes a system of examinations for the encouragement of adult education. The success of this experiment suggested, in 1857, the idea of local examinations, under university auspices, throughout England for the improvement of schools and teachers. This was one of the historic beginnings of University Extension, as we shall further see.

THOMAS ARNOLD (1795-1842.)

Thomas Arnold was educated at Oxford and spent several years at that university as a graduate student. He pursued an extensive course of historical reading in the libraries of Oxford, and there received his first impulse to become an historian. After a few years of local experience as a tutor of boys he became head master of the great public school at Rugby. It was once prophesied that Arnold would transform the educational system of England, and this he actually did. At the time of his entrance upon the head mastership the moral and intellectual condition of English preparatory schools was at low ebb. Arnold succeeded in reforming Rugby by infusing into the school a better moral and religious tone. He believed that in English boys were to be found all the defects of English citizens and of English social life. The same arrogance on the part of the rich, the same contempt for the poor, the same tyranny of class over class, and the same lack of sympathy and tolerance prevailed among schoolboys and in society at large. Dr. Arnold believed that if he could reform public school life, he could reform England. How well he succeeded may be judged from the spirit which the graduates of Rugby carried to the University of Oxford, and from Oxford into the world. Arthur Penrhyn Stanley and the Broad Church movement indicate what Arnold's influence was upon English religious life and thought. Thomas Hughes and other progressive university men entered Parliament and became the exponents of those liberal ideas which they had learned from the head master of Rugby.

Dr. Arnold was positively the first teacher to introduce into the school life of England the fresh current of modern studies. Before his time the curriculum had been confined to classical culture. While devoting himself in his own private studies to the history of Rome and to his edition of Thucydides, Dr. Arnold had such a keen appreciation of the importance of modern history, of the modern languages, and particularly of English literature, that he determined to introduce all these elements of nineteenth century culture into the school course at Rugby. The influence of this generous policy soon became apparent. The young men who went from Rugby to Oxford showed minds of broader sympathy, of more positive grasp, and of sounder learning than did schoolboys who had been trained merely to a knowledge of syntax and verse making.

So great was the interest created by Dr. Arnold's teaching and writing upon historical subjects that in later life he was called from Rugby to Oxford to lecture upon modern history. Up to that time the historical department at Oxford had been more dead than alive. Dr. Arnold brought a spring flood of enthusiasm into the old course of university study and from his time until now there has been a steady increase of academic interest in historical and political science.

An earlier incumbent of the chair of history at Oxford, Prof. Edward A. Freeman, made no secret of the fact that his entire philosophy of history was colored by the writings and teachings of Thomas Arnold. Freeman's great doctrine of the essential unity and continuity of human history was the idea of Arnold. The thought that there is no break between ancient and modern history, that Greek politics, when properly studied, are but an introductory chapter to modern politics, was

derived from Arnold's course of lectures given at Oxford in the year 1842. This idea was transmitted to America in many vital ways.

There is another aspect of Arnold's educational work which is not so well known. Amid all his numerous labors as a practical teacher of boys, as the head master of a great public school, as an editor of the classics, as the historian of Rome, and as a writer for English periodicals, Arnold found time to engage actively in the work of popular education in the town of Rugby. As early as 1834 he wrote to the Archbishop of Dublin: "Do you know that we have got a sort of mechanics' or tradesmen's institute in Rugby, where I have been lecturing twice upon history, and drawing two great charts, and coloring them to illustrate my lecture? I drew one chart of the history of England and France for the last three hundred and fifty years, coloring red the periods of the wars of each country, black the periods of civil war, and a bright yellow line at the side to show the periods of constitutional government, etc. I have some thoughts of having them lithographed for general use."

Dr. Arnold not only lectured to the Mechanics' Institute of Rugby, but he also took a decided interest in the improvement of the condition of the working classes throughout England. He contributed articles to the newspapers, and at one time even founded a journal, the expense of which he defrayed from his own purse. He expended about \$1,000 in this enterprise, which proved for him a losing venture, but the educational effect was not lost. The articles were copied into the *Sheffield Courant*, a more popular organ conducted in the interest of the workingmen of England, and, by the request of its editor, Dr. Arnold continued to write upon economic and social subjects. His papers were said by Dean Stanley to have been read with great interest by the mechanics and working classes. Dr. Arnold once wrote Mr. Justice Coleridge: "I would give anything if I could organize a society for the purpose of inquiring into the actual condition of our English workingmen." His desire was later realized by the authority of Parliament, and by the organized statistical inquiries of England and America.

In his own individual labors for popular education Dr. Arnold insisted upon one idea, which should prove of permanent and suggestive value to all would-be popular educators. He insisted upon continuity of instruction,<sup>1</sup> whether through lectures or writings for the press. He said, "All instruction must be systematic, and it is this which the people want." He said they need to have the origins of things explained, and comprehensive outlines of development, "not a parcel of detached stories about natural history, or this place, or that man, all entertaining enough, but not instructive to minds wholly destitute of anything like a framework in which to arrange miscellaneous information. And I believe, if done spiritedly, that systematic information would be even more attractive than the present hodge-podge of odds and ends. And above all be afraid of teaching nothing. It is vain now to say that questions of religion and politics are above the understandings of the poorer classes. So they may be, but they are not above their misunderstanding, and they will think and talk about them, so they had best be taught to think and talk rightly."<sup>2</sup>

Dr. Arnold's views of popular education were perpetuated by his pupils, especially by Thomas Hughes ("Tom Brown"), one of the founders of the Working Men's College in London (1854).

FREDERICK WILLIAM ROBERTSON (1816-1853).

When Thomas Arnold gave his first and last courses of lectures on modern history at the University of Oxford (1842) there was present in the vast audience of students

<sup>1</sup>This is now the main feature of all University Extension work in contradistinction to that of the old-fashioned lyceum or single-lecture system for popular entertainment.

<sup>2</sup>Stanley's *Life of Dr. Arnold*, 197.

a young man named Frederick William Robertson, who afterwards publicly described the scene. Says Robertson:

It was my lot during a short university career to witness a transition and a reaction, or revulsion of public feeling with respect to two great men. \* \* \* The first of these was one who was every inch a man—Arnold, of Rugby. You will all recollect how in his earlier life Arnold was covered with suspicion and obloquy; how the wise men of that day charged him with latitudinarianism, and I know not with how many other heresies. But public opinion altered, and he came to Oxford and read lectures on modern history. Such a scene had not been seen in Oxford before. The lecture room was too small; all adjourned to the Oxford Theater, and all that was most brilliant, all that was most wise and most distinguished, gathered together there. He walked up to the rostrum with a quiet step and manly dignity. Those who had loved him when all the world despised him felt that at last the hour of their triumph had come.

Robertson went forth from Oxford a thorough convert to Arnold's broad and liberal views of Christianity. Like Arnold, he felt that the Church of England had a social mission beyond her religious pale, and that the growing antagonism between the classes and the masses ought to be broken down. "Though his tastes were with aristocracy, his principles," he said, "were with democracy. His duty to the race was stronger than his sympathy with a class."<sup>1</sup>

The period of Robertson's most remarkable social activity was from 1847 to 1853. During this time he was settled in Brighton as the incumbent of Trinity Chapel, a post which he held until the end of his life. Aside from his wonderful preaching and writing, the record of which has been given us in Robertson's Life and Letters, edited by Stopford Brooke, perhaps the most interesting of all his public labors was the upbuilding of the Workingmen's Institute at Brighton. This was a kind of workingmen's club, embracing 1,500 members. They paid a penny a week for club privileges, which consisted of a library, a reading room, and opportunities for lectures and discussions. The clubhouse was papered and furnished by the men themselves. They paid for a large part of their books and papers. Robertson secured some practical aid and cooperation from his wealthy friends. Here is an extract from a letter written to Lady Henley:

I am anxious to enlist your sympathy in the cause which I am trying to assist. The case is this: About 1,100 workingmen in this town have just organized themselves into an association, which by a small weekly subscription enables them to have a library and reading room. Their proceedings hitherto have been marked by singular judgment and caution, except in one point—that they have unexpectedly applied to me to give them an opening address. A large number of these are intelligent Chartists, and there is some suspicion in a few minds as to what will be the result of this movement, and some suspicion of its being only a political engine. My reasons for being anxious about this effort are these—it will be made. The workingmen have as much right to a library and reading room as the gentlemen at Folthorp's or the tradesmen at the Athenæum. The only question is, whether it shall be met warmly on our parts, or with that coldness which deepens the suspicion already rankling in the lower classes, that their superiors are willing for them to improve so long as they themselves are allowed to have the leading strings. The selection of books for the library is a matter of very great importance, as I have become aware, since getting a little insight into the working of this institute, of an amount of bitterness and jealousy and hatred of things as they are, which I had not before suspected in its full extent. And people go on saying, "Peace, peace, when there is no peace."<sup>2</sup>

Robertson, in his opening address before the Workingmen's Institute, took strong ground against French socialism, which was then (1848) creeping into England. In fact, we should regard the revolution of 1848 as a tidal wave of popular uprising throughout all European countries. In this wave there was much that was good and some things that were wholly bad. Robertson endeavored "to destroy the errors of socialistic theories, not by denouncing them, but by holding forth the truths which lay beneath them and gave them their vitality; to show that these truths

<sup>1</sup> Life and Letters of Robertson, 117.

<sup>2</sup> Robertson's Life, 116.

were recognized in Christianity, and placed there upon a common ground, where the various classes of society could meet and merge their differences in sympathy and love."

Robertson never hesitated to speak frankly and boldly to workingmen concerning the dangerous tendencies of the times, the antagonism toward religion and the church and the introduction of skeptical literature into the institute library. He endeavored to promote "a healthier tone" and develop greater social harmony among the members of the institute. Indeed, he succeeded in stemming the tide of irreligion and social anarchy at Brighton. He was so highly esteemed by the workingmen for his fearless and manly leadership that they offered him the presidency of the institute. "The workingmen of Brighton felt that at last a minister of the Church of England had entered into their aspirations and their wrongs. And because they were sympathized with as men, and neither patronized nor flattered, neither feared nor despised, they were ready to lay aside prejudice and hear what a man of another class than their own had to say upon the subjects which were agitating them." Robertson's biographer says that "of all the small band who in 1848, 1849, and 1850 set themselves to remedy the evils which oppressed the poor mechanic, he has the greatest influence. While in other quarters the breach between the rich and poor was at least temporarily widened, in Brighton it was narrowed." (Life, 363.) It may be added that the force of Robertson's personal example, like that of Thomas Arnold, has never been lost among social and educational workers in England.

For a close study of the popular teachings of that noble man, Frederick W. Robertson, the reader is recommended to the American edition of Robertson's Lectures and Addresses on Literary and Social Topics (Boston: Ticknor & Fields, 1859). These were chiefly given to the Workingmen's Institute, or Athenæum, at Brighton, an association numbering at one time about 1,300. Robertson gave the opening address, beginning with the words "Brother Men and Fellow Townsman," words well illustrating Robertson's spirit: "There are two bases of union on which men may be bound together. One is similarity of class, the other is identity of nature. The class feeling is a feeble bond. \* \* \* There is another and a broader bond of union. \* \* \* When all external differences have passed away one element remains intact, unchanged, the everlasting basis of our common nature—the human soul by which we live. 'We all are changed by slow degrees. All but the basis of the soul.' Our tendencies to evil, our capacities of excellence are the same in all classes. It is just in proportion as men recognize the real, original identity of all human nature that it is possible on this earth to attain the realization of human brotherhood. It is the only possible ground of union for the race. Let us hear the Ayrshire plowman in his high prophetic strain:

'For a' that, and a' that,  
Its coming yet, for a' that,  
That man to man, the world o'er,  
Shall brothers be for a' that.'

While encouraging the educational objects of the Workingmen's Institute Robertson laid particular stress upon the importance of history and politics as means of mental improvement. He said: "Political science is the highest education that can be given to the human mind." Robertson used the term "political science" in its noble Greek sense—knowledge pertaining to the state or civic society in which civilized man lives and moves and has his own well-being or individual share of the Commonwealth. "When I use the term 'politics,'" he said, "I use it in the sense in which it was used by all the great and noble authors of the ancient world, who meant by the science of politics the intelligent comprehension of a man's position and relations as a member of a great nation. You will observe that in this sense politics subordinate to themselves every department of earthly science. \* \* \*

Everything that man can know is subservient to this noble science. Understood in this sense, the workmen of the country have an interest in politics" (pp. 10-11).

Robertson lived in the time of English political reform, and, although a liberal churchman, he was evidently not in sympathy with the Chartists and failed to understand the importance of the secret ballot in protecting and emancipating voters. He had the churchman's idea of reform, which is, of course, good and entirely safe in all crises. "There are two ways of improving a nation's state. The one is by altering the institutions of the country; the other is by the reformation of its people's character. The one begins from things outward and expects to effect a change in things inward; the other takes this line: from things inward to things outward. The latter is the right plan."

On the educational issue Robertson was quite clear. "I see one thing clearly—the laboring men in this town have a right to their reading room and library just as much as the higher classes have a right to their clubs and the middle classes to their atheneums. Let no cowardly suspicion deter from generous sympathy. Give them their rights. Let the future take care of itself" (33).

Robertson was the avowed friend of labor. "My friends, the workmen. Would to God they were my friends. Would to God I were more their friend. I look back once more two thousand years and dare not forget Who it was that was born into this world the Son of a poor woman, and probably labored for thirty years in a carpenter's shop, a Workingman!"

#### IV. MAURICE AND THE WORKINGMEN'S COLLEGE.

FREDERIC DENISON MAURICE (1805-1872.)

Another strong educational influence upon young England was Frederic Denison Maurice. Like Arnold, Robertson, and Kingsley, he was a university man and a clergyman, with an historical and social tendency of mind. Early settled in London as the chaplain of Lincoln's Inn, the center of legal education in England, he had a rare opportunity for practical observation of the actual needs of the workmen of London at the time of the great Chartist movement. He soon determined that education was the only practical way in which to help the people. He and his friends had tried certain cooperative experiments in the interest of the working classes, but these experiments had failed in consequence of popular ignorance and lack of economic training. In vain he essayed the power of the press. At a considerable loss he instituted a newspaper, called *The Christian Socialist*, designed to meet the wants of the Chartists. But they were suspicious of the enterprise. Only after its business failure did the workmen begin to realize what a good friend they had lost. Up to the time of its suspension they had looked upon the journal as one of the organs of capital, designed to accomplish some secret purpose at the expense of the people.

Maurice and his friends, Hughes and Kingsley, in 1848 instituted another journal called *Politics for the People*, a journal in which appeared short and timely articles upon subjects of educational and vital interest to the workmen of England. But this second enterprise never proved very successful. At that time the English people were not ripe for education through the agency of the press. Maurice determined to try a new method which should enable him to meet the workman, as it were, face to face.

#### WORKINGMEN'S COLLEGE.

The idea of a workmen's college appears to have been suggested to Maurice (1) by the need of popular education for the better training of English workmen in the principles of cooperation and self-help; (2) by the example of the so-called People's College in Sheffield, founded by an Independent preacher as early as 1842,

but taken up and supported by the workingmen in 1848. Maurice felt the necessity of giving higher education to the industrial classes before they could successfully cooperate in industrial undertakings. Early in 1854 he drew up and had printed a scheme for organizing a workingmen's college in London. He had a house already on hand, for the rent of which he had become responsible, in the interest of a cooperative association, which had failed. In this house he proposed to initiate courses of instruction.

Colonel Maurice, in his life of his father, says:

Though for the moment the nucleus of the teachers would naturally consist of his old friends, he believed that it would be always possible to recruit the teaching portion of the college from the number of men who yearly come up to London from the older universities, who have sufficient leisure and knowledge, and who would gain in teaching as much as their pupils in learning. *He had great hopes that in this way, if the movement extended to the university towns and the great commercial centers, a connecting bond between the universities and the mass of the people might be found; that the "church" would show that it could educate the nation;*<sup>1</sup> that sectarian difficulties would be overcome; that another motive than the money one would be furnished for national education, viz, the effort of each portion of the nation to turn to account the powers it possessed to supply what others lacked, to the common good of all.

The institution was the direct outgrowth of associations between university men and workingmen in the vicinity of Lincoln's Inn. Maurice and Ludlow rallied around themselves enthusiastic students and teachers. Evenings were devoted to the instruction of young men of the neighborhood and the daytime to classes for young women. Frequent reunions of the leaders were held in the private rooms of Maurice, where fresh inspiration for the work was received from his suggestive words. He and other Christian socialists used to visit taverns and places where the workingmen congregated for the purpose of getting acquainted with them and of discussing popular and economic questions.

The direction and government of the Workingmen's College were in the hands of a president and a chosen faculty of lecturers, many of them distinguished, who gave their services gratuitously. Classes were formed for the study of history, geography, political economy, chemistry, physics, physiology, arithmetic, geometry, mechanics, bookkeeping, ancient and modern languages, drawing, Christian ethics, and the relations of religion and science. There was a system of elective studies, combined with familiar conference in class room, where the conversational method of question and answer was encouraged. The classes were held in the evening for the convenience of the workingmen. On Sundays there was instruction in the Bible and in ethics.

Maurice himself gave a course of public lectures in the interest of the college and raised the sum of £87. The subject of the course was "Learning and working." No sooner had Maurice fairly launched the project for a workingmen's college than he undertook to establish a similar enterprise for the benefit of women. A course of lectures was given by himself and friends and was afterwards published as "Lectures to ladies on practical subjects." The first of these lectures was by Maurice and suggested a "Plan of a female college for the help of the rich and the poor." Classes for women were speedily organized at the Workingmen's College and they are said to have been fairly successful. Queens College for Girls was the historic result of Maurice's work in this direction.

Among the teachings of Maurice the following points are worthy of special note: Put society upon a Christian basis; give the workingman the necessary instruction, better sanitary conditions, the faculty of taking proper recreation, and you will have men who love labor and will not attempt to overthrow society. Thomas Arnold

<sup>1</sup>The above passage is italicized in order to call attention to Maurice's ideas of university and church extension.

held that it was the duty of society to place the poor man, being a freeman, in a situation where he might live as a freeman ought to live. Maurice said the greatest works which have contributed to the progress of humanity have been accomplished by disinterested men; the greatest results that have been attained have been by the cooperation of several men and not by individual interests that seek to destroy it. It is not necessary to invent the principle of association, but to organize society upon this principle. Maurice agreed with Owen, St. Simon, Fourier, and Louis Blanc in opposing the spirit of association to that of competition in industry and commerce; that is, to personal interest. He regarded the principle of association in commerce and industry as only Christianity transported into social life. The result is, he said, that the Bible is the only guide in the line of social reforms. Nothing responds better to the demands of the workingmen than the Bible. Its main object is to recall the rich to their duties. Justice of God to all that are oppressed is the keynote of the Bible. Such were the views of the founder of Christian Socialism, which university men and church men in both England and America have attempted to revive.

Among the men who early assisted Maurice in teaching at the Workingmen's College were John Ruskin, Dante Gabriel Rossetti, J. S. Brewer, Westlake, Frederic Harrison, Grant-Duff, C. H. Dasent, C. H. Pearson, Burne Jones, Cave Thomas, Arthur Hughes, Madox Brown, Stacey Marks, Flower, T. H. Huxley, and J. J. Sylvester (in 1876 called to the Johns Hopkins University and afterwards (1883) back to Oxford as professor of mathematics). The biographer of Maurice says:

The more general subjects of university education—Latin, Greek, logic, and general history—had been taught by some ten clergymen, by almost as many men subsequently best known as members of Parliament, by university men of almost every profession. But, on the whole, the most promising fact connected with it had been one which has, with some occasional interruptions, continued up to the present time. *A continual fresh stream of young men from the universities had gradually succeeded to those who were from various reasons no longer able to take part in the work of the college.*<sup>1</sup>

Colonel Maurice adds:

My father was fond of using the illustrations of a London hospital and the unpaid work given to it by medical men as a proof that there was real advantage gained by the teachers in the time they gave as well as by the workingmen.<sup>2</sup>

#### HISTORICAL SIGNIFICANCE OF THE WORKINGMEN'S COLLEGE.

This was clearly recognized in the University Extension Journal for February, 1890, in these words:

Few, if any, other educational institutions of its kind in the metropolis can so readily enlist our interest, both on account of past associations and present activity, as the Workingmen's College, in Great Ormond street. Since its foundation thirty-six years ago the great changes which have taken place in the educational outlook render it difficult to fully appreciate the step in advance which was taken when the idea of a college for working people was put into practice. It may fairly be claimed, moreover, that *this was the first attempt to extend the power of the universities and bring within reach of busy adults, without the leisure and without the means of otherwise securing it, the benefit of their influence.*

An interesting account of this pioneer institution may be found in the University Extension Journal for February, 1890, in the form of a "chat" with Mr. Thomas Hughes, who was one of the original founders of the college in 1854, and succeeded Maurice as principal in 1872, holding that office until 1883, when Mr. Hughes resigned

<sup>1</sup> Here were the apostles of that interesting educational work which university men have still further developed at Toynbee Hall, Oxford House, Wadham House, and other college settlements in London.

<sup>2</sup> Life of Maurice, II, 305.

to take a county court judgeship. The writer for the *Extension Journal*, who interviewed Mr. Hughes, gives the following graphic report:

As I made my way to Messrs. Macmillans's, in Bedford street, where Mr. Hughes—on a flying visit to town—was staying, I thought it was a very appropriate place in which to talk about the Workingmen's College, for Mr. A. Macmillan was himself one of the original members of the committee which framed the scheme for its establishment. The author of *Tom Brown's School Days* greeted me in a room, the walls of which were lined with portraits of illustrious men—the molders of modern thought. Mr. Hughes pointed out the excellent likeness of his friend, James Russell Lowell, of whom he spoke with great enthusiasm, and I suggested that the sentiment expressed by the poet, to “make a man, you must think him one,” put in a nutshell the spirit which animated the little band of Christian socialists who founded the college, concerning which I asked Mr. Hughes to give me some particulars.

“As you probably know,” he said, “we had come together under the leadership of Mr. Maurice to promote workingmen's cooperative associations, and to apply the principles of Christianity to trade and commerce. We found workingmen utterly uneducated, jealous of one another, and untrustworthy; and we felt that the spirit of association could only be promoted by creating a closer bond of union between the thinker and the worker.

“It was Maurice's idea to establish a college, for he believed that those who had acquired any degree of knowledge ought to share it with their fellows, and we therefore sought for some definite means of doing so. A people's college was already in existence at Sheffield, and on January 11, 1854, I proposed a resolution for the establishment of a similar institution in London in connection with our trade associations.”

“Were the difficulties very great, Mr. Hughes,” I asked, “at the outset?” “No; we had a comparatively easy task, as there were about a dozen trade associations going on in different parts of London, and there were a few members, at any rate, of each section anxious to avail themselves of the opportunities which we offered.

“On October 31, 1854, the college buildings at 31 Red Lion square were opened to the public, and the first prospectus offered among a number of others, a class in drawing by Mr. Ruskin, English grammar by Dr. Furnivall, and classes in history by the late Professor Brewer. Social and political, or ‘human studies,’ were regarded to be the primary object of the institution, and while it was established especially for hand workers, no one was to be refused admittance who was not ashamed to be called a workingman, to whatever class he belonged. I tried a class in law,” continued Mr. Hughes, “but as soon as the members of it had learnt what the law was with regard to friendly societies and trades unions, they dropped off, and I started a boxing class, which proved a much greater success.”

“A most valuable addition to the work of the college,” I suggested. “It was,” said Mr. Hughes, “and soon developed into a sort of social club, at the meetings of which we had political discussions. Men of distinction often spent an evening with us, and among many others who did so I remember Hawthorne, Emerson, and Lowell. It was at one of these gatherings, by-the-bye, that Hawthorne, after hearing ‘The Tight Little Island,’ sung with considerable vigor, remarked that it made him better able to understand something of England's narrow patriotism.

“One of the best features of the college,” said Mr. Hughes, in answer to my question, “is the Old Students' Club, by means of which the past is interwoven with the present, and our best traditions sustained. The annual gatherings which take place just before Christmas are quite as interesting as those of my old college, Oriol, and I like them better. The frank intercourse between the teachers and the students is, to my mind, as valuable a means of education as intellectual or physical training.”

With regard to its present work, Mr. Hughes said that the best answer to that question would be to pay a visit to the institution when the work is in full swing. The number of students attending the various classes had very largely increased, for while in the Michaelmas term, 1888, there were 800 class entries, representing 644 individual students, there were no less than 1,106 class entries and 875 individual students for the corresponding term last year. Of these 41 per cent were bona fide workingmen, and 30 per cent clerks, the others being teachers, Government officials, and professional men. In the higher division “bread studies” attracted the largest number of students; the entries for the French classes being 176, shorthand 137, while Latin and Greek numbered 46 and 21, respectively. “And for the future,” concluded Mr. Hughes, “I shall be content if the college, assisted by a substantial grant from the charity commissioners, still continues to fill the measure of its early promise and the purposes of its foundation.”

To unite teachers and students in the bond of fellowship, and to place the means

of liberal education at the smallest possible cost within reach of all, have been and are the objects of the Workingmen's College. The list of classes, which are divided into three divisions—preparatory, lower, and higher—is comprehensive and complete. From the most elementary stages of elementary subjects the student can graduate to advanced classes in special branches of literature, science, and art, and, above all, every opportunity is provided to assist and foster the spirit of *camaraderie*, which is the best fruit of college life.

The results of this social and educational experiment were of permanent value, for the Workingmen's College still endures. Similar experiments were attempted in other cities of England.

JOHN RUSKIN, 1819-1900.

One of the most famous teachers in the Workingmen's College was John Ruskin, the nineteenth-century apostle of art education for the English and American people. He was a Londoner by birth, and the son of a Scotch wine merchant, from whom he inherited a fondness for art and travel and a fortune of \$1,000,000, which he largely devoted to educational and philanthropic schemes. While in many respects reactionary and mediæval, Ruskin taught the students and workingmen of England the gospel of sincerity and truth, the close study of nature and the appreciation of Turner, the English landscape painter, and also of early Italian art (Preraphaelism). Ruskin lectured to students at Oxford and Cambridge, but he was especially devoted to the improvement of the intellectual life of English artisans. From the commencement of the Workingmen's College he took charge of the drawing classes every Thursday evening.

W. G. Collingwood, author of the *Life and Work of John Ruskin*, Volume I, page 213, says:

Only the reader who has engaged in this form of philanthropic labor—old-fashioned night schools, or modern lads' clubs, or carving classes—quite understands what it involves, and how difficult it is for an artist or a literary man, after his sedentary day's work, to drag his tired brain and overexcited nerves to a crowded room in some unsavory neighborhood, and to endure the noise, the glare, the closeness, and worst of all, perhaps, the indocility of a class of learners for whom the discipline of the ordinary school or college does not exist; who have no fear of deans or examiners; who must be coaxed to work and humored into perseverance, and for whom the lowest rung in the ladder of culture is a giddy elevation. Such work has indeed its reward, but never exceeding great, and it has more discouragements and difficulties than one cares to reckon up.

Mr. Ruskin kept up his classes at the Workingmen's College at intervals for several years, and sometimes his London class followed him into the country to sketch. Along with this interest for the art education of artisans went Mr. Ruskin's zeal for University Extension. He endeavored to show its friends and managers that the teaching of art to the people might be made to work in with the new scheme. He did not believe in attempting to form artists by art education, but aimed at these three objects: "The first, to give every student the advantage of the happiness and knowledge which the study of art conveys; next, to force some knowledge of art among those who are likely to become patrons or critics; and the last, to leave no Giotto lost among hill shepherds. The study of art history he considered unnecessary to ordinary education, and too wide a subject to be treated in the usual curriculum of schools; but the practice of drawing might go hand in hand with natural history, and the habit of looking at things with an artist's eye would be invaluable."

Mr. Ruskin's educational influence upon the English universities was profound. He taught the young men of England to appreciate both art and nature and to broaden their sympathies with the working classes. He was an early advocate and representative of academic instruction in art matters. Once before the Royal Academy Commission he was asked whether it would be advantageous to art if there were professors of it at the university who could give lectures and instruction upon it to

young men, as lectures were given on geology and botany. He replied: "Yes, assuredly. The want of interest on the part of the upper classes in art has been very much at the bottom of the abuses which have crept into all systems of education connected with it."

In 1858, Mr. Ruskin became professor in the Cambridge School of Art. In 1869 he was called to the Slade professorship of fine arts at Oxford; he was reelected in 1876, but resigned in 1879. Doubtless Mr. Ruskin's success in persuading Oxford students to repair roads near the university was somewhat mistaken zeal; but he had many warm admirers, among whom were W. H. Mallock and the late Arnold Toynbee. In talking over some of his failures in life, Mr. Ruskin said, not long ago, that "it was some comfort to him that he was not without successors, and he instanced Count Leo Tolstoi as one who was, in a way, carrying out the work he had hoped to do." Ruskin is now dead, but the lessons of his life are to be found in his books.

Among his writings that are of special educational significance to the American people are *Fors Clavigera*, a series of letters to workingmen; *Unto this Last* (Ruskin's views on political economy); *The Political Economy of Art*; *Courses of Lectures to Workingmen on Art and Architecture*. Selections from his *Modern Painters* were published in New York City. His greatest works are *The Seven Lamps of Architecture* and *The Stones of Venice*. His most popular essay is, perhaps, *Sesame and Lilies*, known to many American readers.

Dr. Newell Dwight Hillis, the successor of Dr. Lyman Abbott in Plymouth Church, Brooklyn, N. Y., has given in Baltimore and various Eastern cities a commencement oration on John Ruskin's *Message to the Twentieth Century*. The following is a brief but suggestive report published in the *Boston Herald*, June 15, 1899:

What we want to-day, said that immortal man, is not men who teach truth, but men who do truth. Ruskin showed through all his life that he was able not alone to teach, but to do. His life among the poor, when he himself was practically rolling in wealth, gained by his writings and through inheritance, showed this ability. He taught that all men, however rich, who fail to produce more than they consume are paupers—patrician paupers possibly, but paupers nevertheless.

The university extension, which is doing good to-day among the poor and unlearned classes, originated as a movement in the brain of this seer. Seven, in fact, of the nine great social movements of the century can be traced to John Ruskin's great love for humanity. The great sage's message to the century is in that principle which ruled his own life—the making of all evanescent beauty into something permanent. To do this one must copy, copy, copy. There is nothing original. There is nothing new. Raphael gazed into the eyes of the flower girl holding in her arms her babe, and said: "This beauty must die, or if it lives it will grow old and will pass away. Therefore I must make it permanent, so that the world may see what my eyes have looked upon."

The message that Ruskin's own personality brings to us is of the highest, the purest, and best, but he represents in that only the law of Moses. He comes of a line of scholars and litterateurs, and, say what you will, you can not avoid the great power of heredity. Artists, financiers, ministers, musicians, are all built tier on tier, higher and higher, generation after generation, until the forehead of the last touches the stars of the heavens. He is called the child of genius. Such was Ruskin. At a comparatively early age Ruskin was voted at Oxford the greatest and most unique writer of prose in the English language for three hundred years. On hearing of this, Ruskin wrote to the authorities of Oxford, saying that his mother gave him his style on the Sabbath day. It was she to whom the praise should be given. A thousand eloquent speakers are worth but one thinker; a thousand thinkers but one seer. The power of the man who sees is infinite. \* \* \*

From Ruskin's life we find out what genius is, and why some men are great. They have been great seers. John Ruskin went on foot, because he could not lose time by riding. When did man grow wise by going rapidly? You want to see things. Education is not stuffing the mind with Greek roots. It is the giving the soul vision power. Culture is opening up windows in the soul. Education is the art of taking down the blinds. A fully awakened soul is an educated one. This was John Ruskin's message to scholars.

The teachers are making genius universal, and the anarchist comes in to establish equality by destroying all that is great and good and wise. In comes the Christian

scholar, who says: "With Christian schools, churches, and colleges, let us put jack-screws under the feet of the foreigners' children, and lift up the low until they look with level eyes into the eyes of the greatest!" \* \* \*

John Ruskin gave away his money, labored for the poor, and inaugurated social reforms, continued the speaker. England broke his heart. The world never cared for nor understood John Ruskin, who said that there was a day when, if England had said a kind word to him or done something for the poor, she would have brought a flush of pride to his cheek. The world has never cared for its best men. We will discover after a time that Ruskin brought us a message that is to save us from trampled cornfields and bloody streets.

#### V. CHARLES KINGSLEY AND CHRISTIAN SOCIALISM.

CHARLES KINGSLEY (1819-1875).

Kingsley spread Maurice's new gospel of higher education for the people throughout all England. Like Arnold and Robertson, Kingsley wished to reach the classes as well as the masses. Accordingly he wrote a series of remarkable sociological novels which, from their striking character, found a wide and appreciative reading. The two most famous of these novels are *Alton Locke* and *Yeast*. The former describes the actual condition of the working classes in the great city of London. Kingsley had learned his facts from acquaintance and association with Chartist leaders, one of whom is the chief character in the story. The novel concerns more especially the miseries of the journeymen tailors of London, who, fifty years ago, were in a very pitiful condition. Indeed, the system continues unto this day in the so-called "sweating system," and, in the sad case of the poor sewing women, not only in England but in our own country. Kingsley made *Alton Locke*, "tailor and poet," the mouthpiece of suffering English labor and of the rights and wrongs of Chartism. The story is a painful one, but not without historical value as revealing a condition of economic society from which the world has not yet freed itself.

Kingsley's novel, *Yeast*, is so entitled because it shows what was brewing in the minds of young England; what ideas of social reform the more heroic men and women entertained. The story pictures the condition of rural England and the terrible demoralization that had come over day laborers. The story is not without interest as showing Kingsley's views, which were those of Maurice and Arnold with regard to the duty of the Church toward social problems.

Kingsley was a broad churchman, and once said: "In plain truth, the English clergy must Arnoldize if they do not wish to go either to Rome or to the workhouse before fifty years are out. There is, I do believe, an Arnoldite spirit rising; but most 'laudant non sequuntur.' \* \* \* I would devote soul and body to get together an Arnoldite party of young men if we could but begin a periodical in which everyone should be responsible by name for his own article, thereby covering any little differences of opinion, such as must always exist in a reforming party (though not in a dead-bone galvanizing one, like the Tractarians)."<sup>1</sup>

The relation of Kingsley to Maurice is indicated by the part Kingsley took in writing for the *Christian Socialist* under the signature of "Parson Lot," and his remark after he had completed his novel called *Yeast*: "I think this will explain a good deal of Maurice." Kingsley was the popularizer of Christian socialism. By his romantic writings, his ballads, and his splendid eloquence, Kingsley carried Christian truth into the hearts of the common people of England. He opposed the riotous demonstrations of the Chartists in 1847 by placards affixed to the walls of buildings in London. He recognized the need of reform, but maintained that it must begin with the individual. Christianity alone could effect healthy social changes. The influence of

<sup>1</sup> Charles Kingsley's Life and Letters, 143.

Maurice had been chiefly confined to the city of London. Kingsley worked in the rural districts, and, through his popular writings, affected all England. He was a simple country curate, doing the hardest kind of practical work in his parish. But he found time for one or two noteworthy educational experiments. Most interesting was his institution of "Penny Readings," described in Kingsley's *Life and Letters* (II, 231).

#### KINGSLEY'S PENNY READINGS.

During his heavy parish work, which was done single-handed the greater part of this year (1866), he was more than ever struck by the monotonous, colorless existence of the English laborer, varied only by the yearly benefit club day and the evenings at the public house. The absence of all pleasure from their lives weighing heavily upon his heart, more especially in the case of the poor hard-worked wives and mothers, who, if respectable, were excluded from even the poor amusements of the men; and for their sake, as well as for his men and boys, he began a series of penny readings, which now have become so common. It was characteristic of his chivalrous spirit that at the first meeting, when the schoolroom was crowded with men and boys, he made an appeal to them for their wives and mothers, dwelling on the life of toil they led, and saying how anxious he was to give them a share in this amusement, which they so sorely needed. It was therefore arranged that while the men and boys paid their pennies the widows and poor overburdened mothers should have free tickets.

These meetings, in which his parishioners would kindly help him, occurred once a fortnight, and though set on foot for the poor, brought all classes pleasantly together during the autumn and winter nights. They had music (the best that could be got), the best poetry, the most heroic stories. Sometimes he would give simple lectures on health; accounts of his own travels; and latterly extracts from his eldest son's letters from abroad, in which stories expressly for the Penny Readings at home were not forgotten. Village concerts too were given, got up by his daughter and son, in which friends from London helped for his sake; and the sight of the well-lighted and decorated room to people who saw nothing at home from one year's end to another but a farthing dip candle was a pleasure in itself. The poor mothers were gratified at seeing their sons in Sunday garments step up on the platform to help in choruses and part songs, while the young men gained self-respect and refinement by the share they took in the preparation as well as the performance. "It was to him most curious," he used to say, "to watch the effect of music upon the poor people—upon, alas! seemingly unimpressionable drudges, in whom one would expect to find no appreciation for refined sound;" but yet who would walk 2 miles to the village schoolroom on a wet night and sit in rapt attention the whole evening, showing their approbation of good music, not by noisy applause, but by a kindling face and eye during the piece, and a low hum of approbation after, that hinted at a deep musical undercurrent below that rugged exterior. Penny readings are common now, but in his own immediate neighborhood the rector of Eversley took the lead in inaugurating these pleasant gatherings.

#### CHRISTIAN SOCIALISM.

The rise of Christian socialism in England occurred in the time of the Chartists and of the revolutionary striving in the period of 1848.<sup>1</sup> Historically considered, the Christian socialistic movement represents an organized effort by certain English churchmen and social economists—Maurice, Kingsley, Hughes, E. Vansittart Neale, Furnivall, Lord Goderich, Ludlow, and Mansfield—to apply the doctrines of the New Testament to a settlement of economic evils. Maurice was a clergyman of the Church of England, and professor of religious philosophy in the University of Cambridge. At the time of the popular uprising he was acting as chaplain of Lincoln's Inn, in London. This institution was a law school in a quarter of London where many poor people live. From this center Maurice, aided by other university men, endeavored to carry relief to the suffering and instruction to the ignorant. His great idea for

<sup>1</sup> The demands of Chartism were all reasonable, as we now view them, but at the time of the revolution of 1848 they were thought to be incendiary in spirit. The six points were: (1) Manhood suffrage; (2) abolition of the property qualification; (3) vote by ballot; (4) annual Parliament; (5) payment of members of Parliament; (6) equal electoral districts.

the improvement of the industrial situation was to substitute the principle of association or cooperation for competition in trade and manufactures. In this object he was strongly aided by the writings and teachings of Charles Kingsley, who drafted placards or posters for the enlightenment of the London populace and for the prevention of extreme measures by the Socialists or Chartists. Kingsley and Maurice united for the support of a journal called *Politics for the People*. In this weekly journal the Christian Socialists gave expression to their ideas and condemned not only the teaching of doctrinaires, but the manifest evils of English industrial society in 1848. The clergy of the Church of England did not escape the denunciations of these reformers.

The Christian Socialists were ably seconded by John Malcolm Ludlow, a lawyer and political economist. He had been brought up in Paris, and had belonged to a society of Friends of the Poor, founded by a Lutheran clergyman. Ludlow had been greatly influenced by the writings of Fourier and of the great educational reformer, Dr. Arnold. From Fourier, Ludlow derived his faith in cooperation, and from Arnold his faith in religion as a practical means for the remedy of social and economic evils. Ludlow, after his settlement in London, used to visit the poorer quarters of the city and there make the acquaintance of workingmen, among whom he endeavored to establish Bible classes. He obtained the hearty alliance of workingmen like Walter Cooper and Thomas Shorter, who became very prominent in the formation of workingmen's associations and the Workingmen's College, described in connection with the work of Maurice.

In the educational campaign by the Christian Socialists there was no spirit of propaganda for the Church of England. No workingman was refused admission because he differed in faith from the leaders or because he was an infidel or an atheist. The college was simply a means of intellectual and social union for university men and workingmen, who, in common studies and common pleasures, forgot their differences of class and station and worked together for social reform and cooperation.

Another fruit of Christian socialism was a line of experiments in practical cooperation for production and distribution; but these experiments did not succeed. English libraries were not yet sufficiently developed for business management. The necessary self-control, intelligence, and experience were all lacking. Gradually the reformers learned to direct their attention more to education than to practical economics.

Very prominent among the Christian socialists was E. Vansittart Neale, a member of an old English family and a man of considerable wealth. He endeavored to encourage the formation of cooperative societies for production, but was unable to carry out his ideas. He became the general secretary of the Cooperative Union of Great Britain, and was among the chief representatives of this idea of industrial association. He spent his life in endeavoring to ameliorate the condition of the working classes, and carried on a correspondence with industrial reformers in all parts of Europe, America, and Australia.

#### CITY OF LONDON COLLEGE.

In 1848 the Rev. Charles Mackenzie, a friend of Frederick Denison Maurice, opened in Salvador House, Bishopsgate, the so-called Metropolitan Evening Classes, to improve the moral, intellectual, and spiritual condition of young men. Removed first to Crosby Hall and afterwards, in 1860, to Sussex Hall, Leadenhall street, into quarters once occupied by a Jewish literary institute, these evening classes became known as the City of London College. Students educationally qualified were allowed some share in the management of the institution.

By 1882 the number of students had increased to 1,500, and Sussex Hall was no longer adequate to their needs. The following year a new building, costing £16,000,

was opened in White street, Moorfields, by the Prince and Princess of Wales. This building is said to be capable of accommodating 4,000 students. It contains a large laboratory, art rooms, a coffee room, and a reading room, which is open from 10 in the morning until 10 at night all the year round. Lectures and entertainments are given once a week in the large hall. There are about 150 classes and 66 different subjects taught in the City of London College. There are about 40 teachers and professors who for their compensation are entirely dependent upon fees, two-thirds of which go to the instructor and one-third to the college. Favorite courses are those in art, science, modern languages, and subjects which lead to higher commercial education. Indeed, this is par excellence the college of commerce. The aim is not so much to afford technical or liberal education as to train clerks, warehousemen, and artisans to greater commercial and industrial efficiency. Women, as well as men, are admitted to all classes, except those in law, mechanics, and bookkeeping, and those which prepare students for the civil-service examinations. The City of London College, since its beginning, has had as many as 60,000 students. In the plans for the educational reorganization of London it is probable that this popular commercial college and the Birkbeck Institute will be associated with the City Polytechnic. (See *University Extension Journal*, March, 1890.)

#### THE SPIRIT OF 1848.

The effect of the spirit of the revolution of 1848 upon the student class in England is illustrated in the following extract from Frederic Harrison's autobiographical article in *The Forum*, October, 1890. He was a boy at King's College when the great revolutionary movement of 1848 swept over Europe. He says of himself and his fellow-students:

We were too continually impressed by the burning questions which arose day by day to be satisfied with any abstract politics. London and Oxford corrected each other. Plato and Lord Palmerston taught very different codes of politics. We were interested by both, and by a thousand new events which neither of these masters seemed to me to explain. Like most of my companions, I came to the conclusion that society in the middle of the nineteenth century was an extraordinarily complex thing—a thing of intrinsic and of profound meaning. Gradually I settled into a deep, lasting, and passionate sympathy with the popular cause everywhere and in all forms. Having no hereditary or acquired prejudices in favor of any class or of any special type of society, I slowly parted with my boyish liking for conquerors, cavaliers, and princesses in distress, and took my side with the cause of oppressed nations and the struggling people.

## VI. UNIVERSITY REFORMS SINCE 1850.

### UNIVERSITY EXTENSION FOR THE POOR.

From the time of the Chartist movement there was on the part of English university men an ever-increasing interest in the higher education of the people. The idea of extending academic privileges more widely found special favor at Oxford, where so many intellectual and religious movements have originated. As early as 1845, men prominent in church and state, among them Mr. Gladstone, petitioned the university to admit students of more limited means, and offered to give pecuniary aid to this object. Dr. Pusey, the High Churchman, afterwards commended the plan, and recalled the fact that in mediæval times the monks of Durham used systematically to send talented boys to be educated at the university. It was early felt by Oxford professors that the university ought "to do something to meet the wants of the increasing numbers of the population, and especially to make more opening for those for whom a great part of its advantages were always intended, the youth of promise who have not at present the means of obtaining university education for themselves."

This revival of the original idea and mediæval purpose of college endowments, marks the theoretical beginning of modern University Extension. Mr. Osborne Gordon, of Christ Church, said: "I look for the extension of the university to the poor." In this thought we discover at once a pious return to the spirit of the Middle Ages, so characteristic of the Oxford and High Church movements, and, at the same time, what is equally characteristic, a growing sympathy with the democratic and social tendencies of the age. This double aspect of University Extension, at once historic and progressive, is very remarkable.

Mackinder and Sadler, in their interesting account of how University Extension came to be, thus describe the condition of Oxford in the transitional period marked by the year 1850:

There was indeed much in the condition of the University of Oxford which called for change. The expenses of collegiate life, especially when compared with the standard of that time were great, while the subscription to the thirty-nine articles required at matriculation, and the subscription to the three articles of the Thirty-sixth Canon, on presentation for a degree, excluded one class of the community from university education. As to the propriety of making any alteration in the religious tests, there was of course grave difference of opinion both in the university and outside it; but men of all parties seem to have felt the importance of facilitating the admission of a poorer class of students to the privileges of university life. The strength and prevalence of this feeling is proved by the evidence given before the Oxford University Commission of 1850. "I believe," said Mr. Arthur Clough, in the considerations which he submitted to that commission, "I believe in the possibility of a gradual, sure, and ultimately large extension of the old universities." "The ideal of national university" Mr. Mark Pattison argued before the same body, "is that it should be coextensive with the nation, it should be the common source of the whole of the higher (or secondary) instruction for the country." "The university," he continued, quoting from Gordon, "should strike its roots freely into the subsoil of society and draw from it new elements of life and sustenance of mental and moral power."

#### SEVEN OXFORD SCHEMES, 1850.

The authorities already quoted mention seven different "plans for University Extension" proposed at Oxford in 1850. Briefly enumerated, they were as follows:

1. The establishment of new halls<sup>1</sup> for student residence. This plan was approved. The custom of lodging outside the regular college buildings is growing in favor at Oxford, as in American college towns. It is said now to be the almost invariable experience of every Oxford undergraduate to reside elsewhere than in his own college during some part of his academical career. This fact is not without significance in the history of College Extension. Everywhere students are leaving monkish dormitories and are becoming citizens. The revolution was practically effected in Germany years ago.

2. Permission to undergraduates to lodge in private houses. This proposition was also approved. It is the most natural civic solution of the dormitory question in America. It enables students to live like other members of society, according to their means and inclinations.

3. Permission to become members of the university and to be educated at Oxford without connection with any college or hall. This concession was also made.

4. Admission of students to professorial lectures without further connection with the university, professors having power to grant certificates of attendance. This was simply the recognition of an existing custom, which still prevails. The idea is worthy of consideration by American colleges and universities.

5. Abolition of religious tests on matriculation and graduation. At that time (1850) the Oxford Commission did not feel empowered to consider this radical measure, but expressed some dissatisfaction with the test system as then imposed. That system

<sup>1</sup> Oxford "halls" differ from "colleges" in not being corporate bodies. The university holds hall property in trust.

had shut out Nonconformists from Oxford University and was one of the prime causes of its narrow and exclusive spirit after the sixteenth century.<sup>1</sup> Greater liberality now prevails at Oxford, where religious tests are no longer requisite.

6. The foundation of theological schools in cathedral cities and the affiliation of these schools to the university. The affiliation to Oxford of Lampeter College and of the theological school of Birkenhead. This policy of institutional affiliation was adopted by Oxford and has been widely extended. It has led in England to the healthy development of local and provincial colleges as organic parts of a national university system. This should be the policy of the State universities in America. The new University of Chicago seems to have apprehended the Federal thought in higher education. "In union there is strength." This holds in education as well as in politics.

7. Provision of funds by the University of Oxford for professorial chairs in Birmingham and Manchester, with the idea of giving nonresident degrees for satisfactory local work. This proposition was not approved in 1850, but it is of historical interest as foreshadowing the idea of University Extension and College Affiliation.

#### FIRST SUGGESTION OF "UNIVERSITY EXTENSION," 1850.

The seventh scheme in the above list was proposed by the Rev. William Sewell, subrector and senior tutor of Exeter College, in a letter to the vice-chancellor of Oxford in the year 1850. The project was entitled "Suggestions for the extension of the university."<sup>2</sup> Mr. Sewell's phrase and suggestions bore no immediate fruit. It was thought unwise to employ university funds for general purposes of education at Birmingham and Manchester and throughout the country, when there were such pressing academic needs at Oxford. This sensible view would undoubtedly be indorsed by all academic corporations. It is important to bear in mind that the problem of University Extension in England has not been solved by expenditure from the university chest. The idea of affiliation with local colleges and the term "University Extension" were, then, simply proposed at Oxford as early as 1850. Oxford afterwards developed the scheme for local colleges, but it was reserved for Cambridge first to invent and carry out (1867-1873) a practical system of University Extension.

#### EXAMINATIONS FOR MECHANICS' INSTITUTES.

One of the historic germs of higher education for the people was the system of mechanics' institutes, which flourished extensively in England long before the middle of the nineteenth century. It was before such an institute at Rugby that Dr. Arnold had lectured on English history. In 1852, the Society of Arts in London formed a union of more than 300 mechanics' institutes and established for them two years later a system of examinations. The examinations were designed to promote and test the studies of adults, of persons not regularly connected with school or college. The present Archbishop of Canterbury, Dr. F. Temple, served as one of the examiners of mechanics' institutes and thus became deeply interested in higher popular education.

<sup>1</sup> Cambridge was under the narrowing Elizabethan statutes of 1570 and Oxford under the tyranny of the Laudian statutes of 1636 down to the universities reform act of 1854. The enormity of these long outrages upon academic and religious freedom was bitterly felt by all Nonconformists. The University of London and the local colleges were founded for the purpose of meeting the needs of dissenters. The good effect of the abolition of religious tests at Oxford was seen in the rapid increase of students from 1,300 to twice that number.

<sup>2</sup>The writer of this report has received from a friend in Oxford a copy of the original and now very rare pamphlet in which University Extension by means of local colleges was first proposed. Upon Mr. Sewell's proposal the Oxford men now base their claim to an historic anticipation of the idea of extending university influence. See Oxford University Extension Gazette, November, 1890, article on "Inventor of University Extension teaching." Compare pamphlet by Sadler and Mackinder on "University Extension; has it a Future?" (Henry Frowde, 1890.)

## BEGINNING OF LOCAL EXAMINATIONS.

The success of the system of examinations for mechanics' institutes suggested the idea of local examinations of middle-class schools at Bath, and in the west of England. Prominent in this movement was Sir Thomas Acland, who, in 1857, proposed a local examination committee at Exeter, representing that locality. A board of examiners, embracing such prominent men as Sir Stafford Northcote, Professor Max Müller, and Sir Henry Acland, was instituted to give prestige to the experiment. Two of Her Majesty's inspectors of schools were appointed by authority to cooperate with the local examiners. An official character was given to the whole system and the Rev. F. Temple (then Bishop of London) was asked to afford assistance to the scheme. The first local examination was held in June, 1857, and it was characterized by Dr. Temple as the "first step toward the improvement of middle-class education." The system was gradually extended through the counties of Staffordshire, Cheshire, Shropshire, Warwickshire, and into South Wales.

The next step was the adoption and development by the University of Oxford of this system of local examinations, which had been evolved in the west of England. Sir Thomas Acland, in 1858, published an "Account of the origin and objects of the new Oxford examinations for the title of associate in arts and certificates," and pointed out the advantages of university supervision over local education. He alluded to the fact that the religious exclusiveness of the universities had now been removed by act of Parliament, and that university men were already experienced in the official work of public education. Graduates of the universities were holding important positions in the large towns of England, and were already connected with the administration of local justice and the management of local institutions. These men, he suggested, would naturally be loyal and efficient supporters of any university system of local examinations. He added:

A career of almost unbounded usefulness seems open to the universities if they will respond to the call of the nation for aid in supplying a better general education to the great body of their countrymen. Their fortunate position within reach of, but not within, the metropolis, their traditional associations, their comparative independence of pecuniary interest, their connection with so many parishes and grammar schools, all seem to point them out as eminently qualified to give a healthy and liberal tone to school education as a preparation for the busy occupations of agricultural and commercial life, no less than for literary and scientific pursuits.

The first decided step toward university extension was taken when Oxford adopted the system of local examinations. This step was largely due to the influence of Dr. Temple and of Sir Thomas Acland.<sup>1</sup> The example of Oxford was immediately followed by Cambridge, and together the great universities of England have since labored for the promotion of higher standards of public education. At first local examinations were given for the benefit of boys' schools. The first year 300 boys were examined; now as many as 18,000 are annually tested. The system has been extended to girls' schools, and gradually to more and more advanced students. University examinations are given at the present time to local colleges, endowed schools, church schools, high schools, grammar schools, and, in general, to institutions preparatory to the university. Class lists of students who have obtained honors or satisfied the examiners, together with the names of schools and schoolmasters, are printed at the University Press of Cambridge. Three kinds of certificates are issued—higher, lower, and commercial. Fees are charged in all cases. The examination

<sup>1</sup>The provost of Queen's College, Oxford, says: "It is to the Bishop of London and Sir Thomas Acland that is due the credit of the first organization of these examinations which are really at the base of this movement."

James Stuart, M. P., formerly a professor in Cambridge, the first practical organizer of university extension (1867-1873), says very frankly: "The first and most important step of all was taken when Oxford founded the local examinations."

papers, with lists of committees and examiners, and with all the regulations, are also published by the university (London: C. J. Clay & Sons).

The example of English universities in the institution of local examinations was followed by the University of Virginia with very encouraging results. A system of local examinations, under the authority of the University of the State of New York, has long been in successful operation. Every term over 300 academies and high schools are examined. Certificates are issued to students who pass the requirements. The University of the State of New York legally comprises "all the institutions of academic and higher education which are now or may hereafter be incorporated in the State." The regents' examinations of teachers and pupils and of candidates for honors have already been carried in the State of New York to a remarkable degree of development.

In Great Britain local examinations are now conducted under the authority of the following universities: Aberdeen, Cambridge, Dublin, Durham, Edinburgh, Glasgow, Oxford, and St. Andrews. The London Society of Arts, the College of Preceptors, Trinity College, London, and other institutions also represent the system. Examinations are usually held at local centers by local committees, often consisting of graduates of the university which authorizes the examination. Cambridge local committees are known as syndicates; Oxford committees, as delegates. In 1873 a joint board was instituted, representing the Schools Examination Delegacy and Syndicate of Oxford and Cambridge. This board is quite distinct from the local boards. The joint board has to do mainly with secondary schools which have a governing body and send students to the universities.

#### OTHER UNIVERSITY REFORMS SINCE 1850.

In the year 1850 a royal commission was instituted to inquire into the state, discipline, studies, and revenues of the university and colleges of Oxford. This was the virtual beginning of English academic reform. The then condition of things certainly justified Parliamentary inquiry and some reconstruction. Oxford was a close corporation of conservative college presidents called the "Hebdomadal Board," because they were supposed to meet weekly for the government of the university. All general academic legislation originated with these heads of colleges, who were so sluggish in their methods of administration that it was satirically characterized as "organized torpor."

The only remnant of the ancient power of resident masters and fellows, comprising the real teaching force of the various colleges, lay in that surviving institution called the "House of Congregation." That body had become merely perfunctory. It still granted degrees, however, and thus retained the immemorial right of conferring academic privileges, especially the right to teach, which is the primary significance of the degree of master of arts or the equivalent doctorate. The masters and fellows of an English college or university constitute the corporation or academic body. They alone have the right to vote in university convocation, which includes all Oxford masters of arts, whether resident or nonresident. When any very important change of university policy was proposed, it was referred to university convocation. The country curates and schoolmasters flocked loyally to Oxford and could always be depended upon for a conservative vote in harmony with the wishes of the hebdomadal board. There was no longer any public discussion of academic measures, for the old custom of speaking Latin, as the rules of disputation required, had fallen into disuse. The alumni of Oxford, like the old Romans in their popular assemblies, could only vote "yes" or "no" to the measures proposed. The Hebdomadal Board virtually had things their own way, for the clerics and the masters always agreed with the academic or degree-giving powers at Oxford.

The heads of colleges were of course all good and influential churchmen. They

were naturally interested in maintaining at Oxford the authority and prestige of the church establishment. In the year 1850 the Church of England enjoyed an absolute monopoly of all academic privileges at Oxford. No honest dissenter could win a degree or even enter the university, for at matriculation every student had to sign the Thirty-nine Articles. All the scholarships and all the fellowships were regulated by religious tests. "The great majority of fellows," says Brodrick (*History of the University of Oxford, 195*), "were bound to take holy orders, and the whole university was dominated by a clerical spirit, which directly tended to make it, as it had so long been, a focus of theological controversy."

To such an extent did this spirit survive, even after the reforms of 1850 and 1854, that theology was encouraged as an undergraduate course for the degree of bachelor of arts, and is actually the chief subject in one of the six honor schools (the other five being the classics, mathematics, natural science, jurisprudence, and modern history). The old restrictions were thus characterized by the *Quarterly Review* in an article on University Extension, April, 1891:

At Oxford a student had, at his matriculation, to subscribe to the Thirty-nine Articles, and to the three articles of the Thirty-sixth Canon on taking his bachelor of arts degree. At Cambridge, where the wall of exclusion was less unbroken, there was, indeed, nothing in the oath taken at matriculation which could be resented by the most conscientious dissenter, but a theological test prevented him from taking his degree of bachelor of arts.

We have already seen to what a low estate professorial duties had fallen in the eighteenth century. The situation was not very much better in 1850. Teaching functions were largely in the hands of college tutors, while the regular incumbents of professorial chairs gave only a small number of perfunctory lectures, which students attended or not, as they liked. To some extent this condition of things still exists; but certain wholesome changes and reforms began to be instituted in the year 1854, according to the recommendations of the royal commission of 1850.

Professorships then began to be reorganized. New chairs were instituted by means of contributions from individual colleges, but for the benefit of the whole university. The government of the university was made more liberal. An elective academic council was substituted for the old "torpid" Hebdomadal Board. New life was infused into the administration by adding a chosen number of college presidents, an equal number of select professors, and the same number of select masters of arts resident at Oxford. Thus the best academic abilities were brought to the front.

From the student point of view the most noteworthy reforms were: (1) The revival of the ancient system of "hostels," or noncollegiate "halls," so that the cost of living at Oxford was greatly reduced. The result of this liberal extension policy was that, within a generation, the number of undergraduates was nearly doubled. It rose from 1,300 to over 2,500. (2) All religious tests were removed from candidates for matriculation and for the bachelor's degree. (3) The number and value of scholarships were increased. (4) Restrictions began to be removed from the fellowships, but the religious test was still exacted before one could enjoy the honor of a fellowship, or even before one could win a master's degree. The point to be guarded was that masters became voters in University Convocation.

The following interesting summary of English educational emancipation was given to the author of this report by Dr. J. L. M. Curry, author of a valuable little book on Establishment and Disestablishment:

Up to 1854 the honors and emoluments of the universities were exclusively monopolized by the members of the favored sect, but in that year the Oxford University act (17 and 18 Victoria, c. 81) threw open the scholarships and the degree of bachelor of arts. Two years after the Cambridge University act threw open, in addition, the degree of master of arts. In 1871 the "Act to alter the law respecting religious tests" threw open all university offices, with the exception of professorships in divinity, to all Her Majesty's subjects, and all college offices, with the exception of the so-called "clerical fellowship" and headships (34 Victoria, c. 26).

In 1882 this measure of reform was supplemented by the action of the university commissioners, appointed under an act passed in 1877, who have thrown open, with some exceptions, the headships and fellowships of the various colleges, and made them eligible to persons of merit without regard to ecclesiastical distinctions. The law recognizes completely religious equality, but, of course, it has not been applied to all the details of the university system. Prerogative, prescription, prejudice, and tyranny die slowly.

Vernon Lee, in an article on "Democracy and our old universities" (Contemporary Review, November, 1892), said:

The three great advances along the path of democracy which the old universities have taken during the last forty years are the admission of unattached or noncollegiate students, the abolition of religious tests, and the University Extension movement. Each of these advances must be followed up further. \* \* \* The University Extension movement must be recognized as an integral part of university work. \* \* \* A true democracy will admit women equally with men to the advantages of university life and culture. The old universities must pass from being—what they once were entirely and are still far too much—the English gentlemen's universities, and become the British citizens' universities.

## VII. CAMBRIDGE UNIVERSITY EXTENSION.

### LADIES' LECTURES.<sup>1</sup>

The first practical step in the direction of what is now called University Extension was taken in 1867. That year an association of lady teachers in the north of England invited Prof. James Stuart, of the University of Cambridge, to give them a course of lectures on the art of teaching. Professor Stuart was regarded as an educational reformer as well as a friend of the higher education of women. He had come to Cambridge from a Scotch university, where better methods of instruction were in vogue than at that time in England. Professor Stuart felt complimented by the invitation which he had received from the ladies' association, afterwards known as the North of England Council for the Education of Women. He told the ladies that he had not had experience enough to lecture upon the art of teaching, but that a thing was often best described by showing a piece of it; and that if they would accept it, he would give a course of eight lectures in which he would endeavor to teach something. This proposition was accepted, and it was agreed that his lectures should be about astronomy.

Professor Stuart had long been dissatisfied with the inadequate and superficial character of the single-lecture system, which had hitherto prevailed in connection with the mechanics' institutes and literary societies of England. He proposed to introduce the element of continuity into his course, and this has become one of the most characteristic features of all University Extension work in contradistinction to English methods of popular instruction by lectures. In the autumn of 1867 Professor Stuart gave a systematic and progressive course of astronomical lectures to local societies of ladies in Liverpool, Manchester, Sheffield, and Leeds. He went

<sup>1</sup>"In 1848—the great year of revolution—the professors of King's College had opened the classes which speedily developed into Queen's College, the forerunner of Bedford and Cheltenham colleges. In 1850 the Rev. David Laing, who had been associated with the Queen's College movement, gave his valuable help in the expansion of Miss Buss's first small school on similar lines into the North London Collegiate School for Ladies." See Ridley's biography of Frances Mary Buss and Her Work for Education, p. 5 (Longmans, Green & Co., 1895). This book well illustrates the origin and progress of the English movement for the higher education of women.

In 1863 the University of Cambridge opened to girls its local examinations, and in the following year, by authority of the House of Commons, a royal commission extended its inquiries into the state of education for girls. In 1870 were published in extenso the results of these inquiries, which embraced the education of both sexes. A digest or summary of the evidence was compiled by Miss Beale, author of the History of Cheltenham College.

From this era of inquiry and agitation regarding the education of girls in England dates the whole movement toward the reconstruction and extension of girls' schools.

from one town to another each week for a period of two months. This idea of an educational circuit is a noteworthy feature of University Extension work. In connection with these local lectures were developed two other distinguishing characteristics of the new system of popular education. The first was the use of the syllabus, or an outline of the topics treated in the lecture.

#### THE SYLLABUS.

Professor Stuart says:

I started with a syllabus at the very first lecture. It came about in this way: During the autumn a good deal was talked about the coming lectures, and it was often said that they would be over the heads of the ladies; that these were unaccustomed to follow such discourses; that they were unaccustomed to take notes. I endeavored to meet this by preparing rather a long syllabus of my first lecture—about four pages of large printed octavo—which was designed not only to enable them to follow the lecture better, to give them resting places, if I may say so, for the mind, but also to furnish them with fairly adequate notes of what was said, and to be in fact a lesson in note taking. In fact, in the days which succeeded, and for a considerable time even after the university had taken the matter up, the syllabus was frequently described as such notes of the lecture as would be taken by a person skilled in note taking. I got the idea from Professor Ferrier in St. Andrew's, who used, when I attended his class in connection with some of his more difficult lectures, to dictate to us a series of heads, which we always found to be of immense assistance. Such a syllabus was found very useful; and you will see from what I have said why it is that all through this work we have always been so insistent with the lecturers that the syllabuses should not be merely perfunctory, or short and carelessly drawn up. In fact, it is my experience that our best lecturers have been those who have given most care to the preparation of their syllabuses.

To one acquainted with German and American methods of academic instruction the use of dictations or a printed syllabus in connection with class lectures is no new thing; the good old scholastic idea of giving the heads of a discourse has only been adapted, by the aid of printing, to the intellectual needs of popular audiences. This clever device of the canny Scotchman has already revolutionized the educational methods of public lecturers in England and America. Perhaps the time will come when, in our large cities, even ministers, like lawyers and professors, will talk from a printed brief and give their hearers a chance to review the sermon at home, to look up biblical references, to study the law and the testimony, and to learn by heart good hymns and quotations. The use of printed notices in modern city congregations greatly relieves the minds of both minister and people. Why should not the parson give a syllabus of his sermon on the same sheet with the printed notices and preach from such useful notes? Whatever the clergy may do, this popularization of the printed syllabus is destined to exert henceforth a most stimulating influence upon all forms of education by lectures, even in colleges and universities, where ancient professorial manuscripts must sooner or later give place to "winged words."

#### WEEKLY EXERCISES.

Besides the printed syllabus, Professor Stuart introduced another good educational method in connection with his first course of lectures for lady teachers. This second device was a system of written exercises in answer to certain questions proposed by the lecturer.

Before the course began some people said it would be no use unless there was an examination, and others—these were very early days, remember—said it would be unlady-like for women to go into an examination. There was like to be a great difficulty, and people came to the first lecture, some intending to denounce the whole thing if the ladies had to stay and go through an examination, especially if it was to be so young a man who was to ask them questions, and others were ready to belittle the whole affair if I did not ask them questions and see how they had understood what was said. I was in great straits; but, at the last moment, I thought on a compromise. I read out three or four questions when the lecture was over and I said

nobody need answer them who did not like, but they should take them home, and, if anybody sent me written answers, I would correct them and return them to them next lecture. I gave my address and named a day. I thought I would get perhaps 20 or 30 papers. Wretched man that I was; judge of my feelings when I got 300! At each post the postman came loaded! At first I was in despair, for, remember, I had promised to correct them all; but I soon saw that I had fallen unintentionally on a most useful arrangement. I worked very hard and I got them corrected in time; and from that day to this the system of these weekly papers has never been omitted from an University Extension course. I found them not only valuable from the pupils' point of view, but from my own, for they enabled me to judge where my explanations of the previous lecture had been faulty or inadequate.

Experience has shown that a lecturer or examiner can get through a large number of exercises by noting and classifying upon paper errors and excellences of certain kinds. He can then report these orally to his class from private memoranda, thus influencing and stimulating many persons at once by his words of criticism or commendation, and all without mentioning individual names.

#### LADIES' LECTURES IN EDINBURGH AND CAMBRIDGE.

The system of lectures which Professor Stuart has so successfully inaugurated for lady teachers in the North of England was continued under his general direction for several years. Other local associations were formed and ladies' lectures became more and more fashionable. In the city of Edinburgh, in 1864, university professors began to lecture to audiences of ladies. Inspired by the good educational example set by women in the north, the ladies of Cambridge began to utilize their own academic vantage ground and to attend public lecture courses offered by Mr. Sidgwick and others. Soon ladies from a distance were attracted to this old university town by the educational advantages there enjoyed. It was not long before a house was opened for lady students resident in Cambridge. Newnham College was the direct outgrowth of this new establishment. The close connection between this college for women and the original movement for teachers' lectures may be seen in the fact that Miss A. J. Clough, the secretary of the North of England Council for the Education of Women, became the first manager of what is now called Newnham College.

#### HIGHER LOCAL EXAMINATIONS FOR WOMEN.

Another interesting result of the first experiment in University Extension was the institution of higher local examinations for women. Mrs. Josephine Butler, the president of the North of England Council, visited Cambridge for the purpose of securing a committee of university men to test and attest by examinations the attainments of teachers and governesses. She obtained the cooperation of Professor Stuart and others, and a direct appeal to the university was duly made. The request was granted and higher local examinations for women were soon instituted. "There was opposition to it," says Professor Stuart, "by those who wished the same examinations for men and women; but we thought that the end would be that many of our ideas introduced in this examination would find their way into the university examinations, and so it has been; and they, too, thus improved, are open to women as well."

#### UNIVERSITY LECTURES FOR WORKINGMEN.

The next step in the development of University Extension was academic instruction for the working classes. It is a remarkable and interesting fact that school-teachers and mechanics have been the pioneers in this great movement toward educational democracy. Women who are brain workers and men who are hand workers have unconsciously worked together toward the same great end. About the same time that Professor Stuart was lecturing to lady teachers in the North of England, he received an invitation from an old college friend, Mr. Moorson, one of the managers

of the railway works in Crewe, to come to that town and give a lecture in the Mechanics' Institute for the benefit of the workmen. It was thought that they could not stand more than one lecture from the same man, and so Professor Stuart, contrary to his principles on the single lecture system, agreed to give a popular talk upon the subject of "Meteors." His lecture was advertised for the evening of the 14th of November, 1867. The night before, by singular good fortune, there occurred one of the most brilliant meteoric showers on record. Neither the lecturer nor the local management had counted upon such an advertisement from heaven. When Professor Stuart entered the lecture hall he found it packed with eager and excited people. He had never before addressed a large audience, but he now was confronted by at least 1,500 expectant faces. The professor was of course somewhat dismayed at the sight, but he understood his subject thoroughly and was equal to the occasion. His lecture was a pronounced success, but the true genius of the man came out after the popular expression of a vote of thanks. He said he would soon return and give in the town of Crewe a regular course of public lectures on astronomy, and the present company must see to it that he had a good audience. The proposal was received with tremendous applause and the true principles of University Extension were thus established among the workmen of Crewe.

For six weeks in succession Professor Stuart afterwards came to the Mechanics' Institute of that town and gave there a systematic course on astronomy, exactly as he had done for the lady teachers of Leeds, Sheffield, Manchester, and Liverpool. The same method of lecturing from a printed syllabus, with weekly voluntary tests by written answers to set questions, was followed in the case of the men, just as formerly in the case of the women, and with very gratifying results.

#### THE ROCHDALE PIONEERS.

From Crewe this novel educational experiment was extended to other great centers of English labor and industry. Professor Stuart regards it as the next important step when this kind of work began to be encouraged by the great cooperation societies, such as the Rochdale Equitable Pioneers. Receiving an invitation from this flourishing association to lecture at Rochdale, Professor Stuart consented upon the condition of their supporting a course of several weeks' duration. The society agreed and great enthusiasm was shown in distributing the syllabuses, in advance of the lecture, to the men who came to purchase goods at any of the fourteen cooperative stores of Rochdale.

#### THE CLASS.

In connection with this course of lectures at Rochdale there originated a third original and characteristic feature of University Extension, namely, the class or conference, which is for modern popular education what the seminarium is in university work. Professor Stuart shall tell his own story of the origin of the class:

It arose in this way: My lectures were held in the great common hall, and I had a number of diagrams. I used to take them down each day when the lecture was over. But one day I was in a hurry to get away, and so I asked the hall keeper if I might leave them hanging up till I came back next week. He demurred a good deal, as in the interval the annual business meeting of the society was to take place in that hall. However, he at last consented, and when I came back next week he said: "It was one of the best things you ever did, sir, leaving up these diagrams." "Why, so?" said I. "Because," he replied, "our people were all here last night, and there were a number who had been attending your lectures who stayed after the meeting, and they were discussing your diagrams and explaining them to one another for a whole hour; and they have a number of questions to ask you, and they are coming here before the lecture to see if they can, and I promised them to ask you to meet them and not to take down the diagrams till they had seen you." So I went before the lecture and saw them, and I found it one of the most useful of half-hours, and ever after that I never gave a course of however few lectures without, at the beginning of each lecture, giving an opportunity for some time to any who liked to meet me to discuss special difficulties. Such was the origin of the class.

## COOPERATIVE SCHEMES.

From Rochdale Professor Stuart extended his work to Bury, Leeds, Dewsbury, and to other places where cooperative enterprises were already in successful operation. The cooperative spirit had early been awakened among English workingmen by the teachings of Robert Owen, Vansittart Neale, Ludlow, Maurice, Thomas Hughes, and others, and the cooperators were especially friendly to the new system of popular education. Indeed, from the very outset, intellectual, moral, and social improvement was among the avowed objects of cooperative societies. They were accustomed to devote 2½ per cent of their profits to the maintenance of reading rooms, libraries, and newsrooms. Professor Stuart endeavored to enlist these societies in the support of a kind of cooperative or peripatetic university, the plan of which he drafted and published in the *Cooperative News*. But the times were not ripe for this kind of an institution. Many lecture courses were given by Professor Stuart and his university friends for the benefit of the cooperators, and these efforts bore good fruit in evening classes for various branches of art and science.

Professor Stuart early perceived that it was impossible to found a peripatetic or cooperative university upon a merely popular basis, like that supplied by workingmen's societies. He determined to fall back upon a strong central body—the University of Cambridge—and to make that the base of supply for the higher education of the people.

## THE PHRASE "UNIVERSITY EXTENSION."

It was in the summer of 1871 that he began to advocate this idea in various towns where individual lecture courses had been already given. This plea for the coordination of local and central effort was subsequently printed, and the title given to the pamphlet was "University Extension." The phrase was felicitous, and described exactly the idea of enlarging academic influence among the people. In one form or another the idea had been in the minds of educational reformers ever since 1850, when it was proposed to extend the influence of Oxford. But to Professor Stuart, above all others, belongs the honor of originating, by his own experience and ingenious methods, the first practicable scheme for what is styled "University Extension." From the year 1871 down to the present time that name has served to describe a great popular movement in modern university life. The movement was in existence, as we have already seen, in the system of local examinations, dating from 1857, and in the still earlier popular work of academic pioneers like Birkbeck, Arnold, Robertson, Maurice, Kingsley, Hughes, Denison, and many others. Professor Stuart found new channels for the rising academic stream and engineered its fertilizing flood into courses which now meander over all England.

## PETITIONS TO CAMBRIDGE UNIVERSITY.

It is interesting, however, to observe that in England the popular demand for local lectures arose before the university supply. Petitions began to be sent in to the University of Cambridge in the autumn of 1871, following Professor Stuart's summer campaign. His old friends and constituents—the Rochdale Pioneers, the Crewe Mechanics' Institute, the North of England Council for the Education of Women, the mayor and citizens of Leeds—were among the petitioners who prayed that the University of Cambridge would undertake an organized inquiry into the actual demand for higher popular education in the places named and throughout the country at large. These petitions, together with the letter from Professor Stuart, were printed and circulated in Cambridge. Other and stronger memorials followed in 1872. A fresh ally was found in the Mechanics' Institute of Nottingham and in the cooperation of the Rev. Dr. Paton, who represents the transmission of Chautauqua ideas from America to England. Many men and many forces combined to

promote Professor Stuart's idea of University Extension. At last, in February, 1873, academic sentiment had risen sufficiently in favor of the idea to warrant the appointment of a so-called "syndicate" or committee to consider the various petitions and to report upon the existing demand for higher local education.

In order to test public sentiment, questions like the following were sent to various towns by the Cambridge committee :

I. What demand is there for instruction in your locality among (1) young men of the middle classes who have left school, (2) women of the middle classes who have left school, (3) young persons and adults of the working classes—(a) men and (b) women?

II. What provision is there in your locality for affording instruction to such persons?

UNIVERSITY EXTENSION AUTHORIZED, 1873.

A great mass of information on these questions was received by the university, and a digest of the replies was published in the *University Reporter*. The syndicate reported, May 24, 1873, that the information they had received "afforded sufficient evidence of a demand for university teaching in several populous centers." The following temporary measures were recommended: (1) That the present syndicate be empowered to organize courses of lectures at a limited number of centers, and to make provision for holding such examinations as they may consider expedient, on condition that the requisite funds are guaranteed by the local authorities; (2) that the powers of the syndicate shall continue only till the end of the Easter term, 1875. This report was adopted by the university senate June 5, 1873, and thus University Extension was definitely authorized and established.

The system of University Extension lectures was first applied by Cambridge to a group of towns—Nottingham, Derby, and Leicester—which had been organized for the work by Dr. Paton and others. Professor Stuart admits that the first experiment was made upon too ambitious a scale. It was attempted to provide distinct courses of lectures for three classes of persons: (1) Clerks, (2) Artisans, (3) Women. Moreover, the lectures and class discussions were held upon different days. Some of these arrangements were wasteful of time and energy. Experience has led to greater simplicity in local arrangements and greater economy of educational and social forces.

A report upon these early courses of University Extension lectures was made to the syndicate in 1874 by one of the lecturers, the Rev. W. Moore Ede, who made some very interesting observations upon the relative success of the different classes. He showed that the day course for ladies had been well patronized, although the charge had been comparatively high—1 guinea for 12 lectures. The evening classes, designed for young men, had attracted the largest number of hearers, but they were a thoroughly miscellaneous audience of both sexes. Young men were by no means conspicuous. The most surprising fact was that the lectures seemed to be especially attractive to adults, to business and professional men, and sometimes to persons past middle life. In fact, the same kind of people that one would expect to see at any public lecture or meeting of good citizens were to be found attending University Extension courses.

"It is astonishing," says Dr. R. D. Roberts<sup>1</sup> in his comments upon Mr. Ede's report, "to find the enthusiasm with which persons of advanced age have devoted themselves to study in connection with this movement. There are few lecturers who have not received letters from individuals who have attended their lectures, speaking of the personal benefits which they have derived and of the new world opened up to them by the establishment of the University Extension lectures in the

<sup>1</sup>Eighteen Years of University Extension. By R. D. Roberts, M. A., D. Sc. (Lond.), Cambridge, 1891, p. 15.

district." Dr. Roberts suggests a reason why these courses did not attract young men to a greater extent. He thinks they saw no sufficient motive "to follow up laborious days by laborious nights." They perceived no definite attainable end, such as academic recognition. Young men usually prefer to work for some immediate purpose or concrete object.

Speaking of the general results of the first experiments in University Extension at Derby, Nottingham, and Leicester, Dr. Roberts says:

The experience of the first term's work in the three Midland towns showed conclusively that it was, as a rule, unnecessary to arrange special courses with a view to particular classes of persons, for not only was it unsuccessful in the case of young men, but the lectures intended particularly for artisans were by no means exclusively or even mainly attended by that class. Still the working people who did attend were full of an enthusiasm and earnestness that gave life and vitality to the movement.

#### FIRST PRINCIPLES OF UNIVERSITY EXTENSION.

The first principles of teaching and of study, under the new system, were elaborated by previous experience and were fully stated in connection with the first courses of regular University Extension lectures. The following were the first published rules and regulations:

(1) Each course consists of weekly lectures accompanied by weekly classes extending over a period of twelve weeks, conducted according to the following regulations: The teacher to remain in the lecture room for some time after the conclusion of each lecture and class in order to answer questions or solve the difficulties which have occurred to pupils and to give advice as to the reading of text-books and other means of efficiently studying the subject.

(2) Each lecture to be accompanied by a syllabus distributed to the pupils and by questions. Those who desire to answer these questions to do so in writing at home, and to be at liberty to submit their answers to the teacher for correction and comment.

(3) The class in each subject to be formed only from among those who attend the lectures in that subject, and to consist of those who are desirous of studying it more fully. The class, at the discretion of the teacher, either to take up the subject of the lectures or cognate subjects bearing directly thereon and necessary for the better elucidation of the subject of the lectures. The teaching in the class to be more conversational than that in the lecture.

(4) Written examinations to be held at the conclusion of each course by examiners appointed by the syndicate, open to any pupil who has attended the course; and certificates to be granted to the candidates who manifest sufficient merit in these examinations.

#### INFORMATION FOR CAMBRIDGE LOCAL SECRETARIES.

The following circular of instructions was early issued from Cambridge to the local secretaries:

1. The local secretary is requested to keep as accurate a record as possible of the attendance at each lecture and class, so as to be able to furnish details on the form which will be sent to him before the date of the examination. The figures should be obtained by counting the attendance at each lecture or class, adding the total, and dividing by the number of lectures or classes.

2. The local secretary of any town where an examination is about to be held will be supplied a few days before the date of the examination with a packet containing the requisite number of question papers, which packet must not on any account be opened till the hour of examination.

3. Some qualified person or persons must be appointed by the local committee to superintend the examination.

4. A sufficiency of paper, pens, ink, and blotting paper must be provided, and the students must be placed at sufficient distances (at least 4 feet) apart.

5. The "Directions to students" should be read out on the class night preceding the examination. The superintendent of the examination is requested to see that the students comply with the "directions" and that no candidate is admitted to the examination who has not received the approval of the lecturer.

6. The superintendent (or one of the superintendents) must be present during the

whole time of examination, and is responsible for giving out the question papers, for preserving quiet, for seeing that there is no copying from books or otherwise on the part of any of the students, for collecting the papers when the allowed time has expired, and generally for the examination being conducted in an orderly manner.

7. No student is to be allowed to leave the room during the first half hour after the time at which the papers are first given out. No paper should be given to any student who comes more than half an hour late, unless he has for urgent reason obtained special leave from the local secretary to do so, and even then only if no student or copy of the examination paper has left the room.

8. The superintendent of the examination must write out in a clear hand an accurate list of the names of those who give in papers, on the form which has been supplied to him from Cambridge, with one Christian name in full and the rest in initial, the initial in such cases as I., T., or J., being written as printed, to avoid mistake; and this list, together with a copy of the examination paper, must be inclosed with the papers of the students. If there are examinations in more than one subject, each set of papers must be made up in a separate parcel. Each package is to be sent to the secretary local examinations and lectures, Syndicate Buildings, Mill Lane, Cambridge, by post or rail, with the name of the place from which it comes and of the subject written on the outside.

9. When the local secretary receives the certificates granted to those who pass the examination, he is requested to look them over carefully and, if there are any mistakes, to communicate with the secretary at Cambridge as quickly as possible.

#### CAMBRIDGE DIRECTIONS TO CANDIDATES.

1. Be at your seat in the examination room five minutes before the time fixed for the examination to commence.

2. Write your full name and address in the right-hand top corner of the first sheet of your answers.

3. Write only on one side of the paper. Write the number of each question before the answer.

4. As soon as notice is given (which will be five minutes before the end of the time allowed), arrange your papers in proper order, so that the first page may be at the top. Fasten them together with string or metal fasteners and give them, unfolded, to the superintendent of the examination.

5. No student can be allowed to leave the room until half an hour has elapsed from the time at which the papers of questions are given out. A paper will not be given to any student who is more than half an hour late.

#### CAUTION.

Students must not bring any book or written or printed paper to the examination room.

No communication whatever between students under examination will be allowed.

#### GROUPING OF CENTERS.

If four centers combine together to take the same course, or three centers, of which two take a repeated course, each center is charged £41 5s. for a single course and £62 10s. for a repeated course. If five centers combine, or four centers, two taking a repeated course, each center is charged £38 for a single course and £56 for a repeated course.

This reduction can only be made in the cases where centers are grouped in the manner above described. In cases where the number of weekly papers for the lecturer is large, the syndicate may have to make an addition to these charges.

In the southeastern counties and in Northumberland and Durham, district associations of centers have been formed for the purpose of facilitating the grouping of centers.

All the local expenses in any town, such as rent of rooms, advertising, printing, etc., are borne by the local committee.

#### MODE OF LOCAL ORGANIZATION.

The method of instituting a local course of University Extension lectures is usually as follows. Diligent propaganda is made in a given community by friends

of the extension movement; influential people are interested in the project of a local course of lectures; a public meeting is called, over which the mayor or some prominent local magnate presides; a spirited address is given by a university man, who explains the most attractive features of the University Extension system; a University Extension society is then duly organized, with a secretary and local committees; these latter canvass the town, secure subscriptions to the proposed course, and, if necessary, obtain a guaranty fund to meet any possible deficit. As many course tickets as possible are sold, and the price is made as low as circumstances will justify. It is not expected in England that University Extension courses shall always pay their own way. If two-thirds of the requisite expense can be met by the sale of tickets, the remaining third can generally be defrayed by the aid of philanthropy and public spirit. Sometimes a course of lectures is arranged in connection with some existing institute, library, school, or local college, which by means of endowments or other resources materially contribute toward the payment of expenses. It has been found in England that such affiliation with local institutions is one of the very best means of promoting University Extension. It is well said by Mr. Moulton that University Extension "interferes with nothing" and "can combine with anything."

#### COST OF CAMBRIDGE LECTURES.

The following Cambridge circular is an early authoritative statement of the cost of University Extension:

The expenses incurred by any place for one course (including one lecture and one class a week) for a term of from ten to twelve weeks, are as follows:

- (1) A sum of £45 payable to the university for teaching.
- (2) A fee of £2 for the examination at the end of the course. This fee will be divided equally among the towns which have a course in common. A charge of 1 shilling will be made for each student who enters for an examination.
- (3) The share of the traveling expenses of the lecturer, which are divided among the towns associated in securing his services.
- (4) The expense of printing the lecturer's syllabuses.
- (5) A small fee for the use of slides when the course is illustrated with the lantern, or to meet the cost of experiments and hire of apparatus in the case of such subjects as chemistry and experimental physics.
- (6) If the same course is given afternoon and evening of the same day, a fee and a half, £67 10s., is charged.

#### NECESSARY EXPENSES.

The cost of a regular University Extension course of twelve lectures varies somewhat according to the traveling expenses of the lecturer and the amount of money expended for advertising and hiring a hall. Very often a good lecture room can be obtained without expense from some educational institution. The traveling expenses of the lecturer, advertising and other local expenses do not usually amount to more than \$100. The fee paid to the university is \$225 for twelve lectures. Twenty-five dollars a lecture is a fair price for class lectures in America, if the lecturer's expenses are paid. The syllabus is usually sold in England for a sixpence in connection with the lectures or with the course ticket.

#### UNIT OF UNIVERSITY EXTENSION.

The Cambridge men, at the outset, took a firm position with regard to the so-called unit of University Extension. They insisted upon a course of at least twelve continuous lectures upon one great subject. They were reluctant to give any single lectures except for purposes of local organization. Lyceum lectures upon individual and disconnected themes they absolutely declined to give. This position of the Cambridge men, while perfectly justifiable from an educational point of view, has been found not altogether tenable, and half courses are now occasionally given in

communities that are not entirely able to sustain a full course. Cambridge Extension lecturers usually arrange their work for a three months' course of weekly lectures. The university season falls naturally into two terms of three months each, from October to Christmas and from the middle of January to Easter. An effort is made to arrange for lectures in circuits of towns or districts, so that the lecturer may occupy his time to good advantage, without traveling over wide areas and wasting his time.

#### GROUPS OF SUBJECTS.

Three groups of subjects are usually offered by the Cambridge syndicate for University Extension: (1) Literature and history, (2) science, (3) art appreciation. By far the most attractive courses in England are those on literature and history, although science is very popular in industrial and mining communities. In art less attention is given to technical instruction than to simple appreciation of art for its own sake. Each unit course of extension lectures is accompanied by a printed syllabus or outline of topics, which saves the taking of notes and aids the student in reviewing the substance of each lecture.

#### WEEKLY EXERCISES.

Printed questions accompany the outline of each weekly lecture and are answered by the student in his own leisure at home. The answers are sent by post to the lecturer, who corrects them at his convenience and returns them, with comments, written or oral, at the next lecture or class exercise, but without mentioning names. Whether praised or criticised, every student, it is said by Mr. Moulton, is glad to be singled out as an educational example.

#### CLASS CONFERENCE.

Before or after each lecture a half hour or more is devoted to a class conference, in which the weekly exercises are discussed. In this class are gathered the most studious and interested attendants upon the University Extension course. This class constitutes the saving remnant, educationally speaking, of a popular audience, and the best work accomplished by University Extension is done through this instrumentality, which may be called a kind of popular seminarium. The class of conference is for University Extension students what the class room and seminar are for university men in general.

#### FINAL EXAMINATION.

At the end of the course a written examination is instituted, by university authority, for those who have done satisfactorily a certain proportion of the weekly exercises required by the lecturer. The examination paper is prepared at the university by an examiner who is quite independent of the lecturer, although familiar with his syllabus and course of instruction. In fact, every syllabus and course of instruction must be approved by university authority before the lecturer can take the field. The chief advantage arising from this independent system of conducting University Extension examinations is said, upon good authority, to be the fact that the expenses are thrown upon the university board of local examinations, an existing system of fostering public instruction which gave the first strong impulse to the development of University Extension.

It is believed by Mr. Moulton and by some of the best University Extension lecturers in England that it would be vastly better for the lecturer himself to conduct his own local examinations, for he best understands the exact nature of his own teaching and the character of the students with whom he is dealing. It is said that great injustice is frequently done by university examiners to the very ablest and most original students. Just here, indeed, lies the evil of all college and university examinations.

## CERTIFICATES.

Certificates are issued to men who have been elsewhere taught or in ways unlike the examiner's ways by the university examiners of extension students. These certificates are of two grades, "Passed" and "Distinction." Local prizes are sometimes awarded to the best students by the University Extension Society under whose auspices the local lectures were given, or by benevolent individuals in the community. For one year's systematic work a special certificate is issued by the university.

*Affiliation to the University.*—Many towns in England have carried University Extension so far that they now support several courses in a year and thus maintain a kind of local college or university of their own, with an inviting curriculum of study. Such towns or centers of University Extension are in many cases affiliated to the university, and thus become, as it were, local branches of Cambridge. This institution has gone so far in the direction of recognizing good local work that a student living at a distance from Cambridge may now become recognized as a "student affiliated to the university." Indeed, an extension student may now be admitted to one year's advanced standing at Cambridge, provided he will pass a satisfactory examination in six consecutive unit courses (that is, of twelve lectures each) all in one group (for example, in literature and history, or in science, or in art), thus embracing a three years' course, and provided also that he pass in two other unit courses, and also in Latin and one other foreign language, and in the elements of higher mathematics (that is, Algebra and Euclid). This amount of work is regarded as a fair equivalent, not only for the work usually done by students who are preparing for Cambridge, but also by students at Cambridge during their first year. To anyone who realizes how little college boys know and how thoroughly in earnest all University Extension students are, the above concession by academic authority will appear nothing very extraordinary.

## ORIGIN OF PERMANENT SYNDICATE.

When the term of appointment for the temporary syndicate came to an end in 1875, the senate of the University of Cambridge appointed a permanent syndicate, or committee on local lectures. Professor Stuart was made one of the honorary secretaries and was succeeded in 1876 by the Rev. G. F. Browne, who was at the same time secretary of the committee on local examinations. Professor Browne, afterwards Canon of St. Paul's, and now Bishop of Stepney, long continued to be one of the most active and efficient promoters of University Extension. In 1878 the two committees (Local Examinations and University Extension) were formally united. In 1881 Dr. R. D. Roberts became assistant and organizing secretary for the Cambridge system of local lectures. Since that time the Cambridge movement has been largely under the skillful direction of this accomplished lecturer and able advocate of a national system of higher education. He is one of the leading authorities upon the subject. (See Roberts's *Eighteen Years of University Extension*.) He became also secretary of the London Society for the Extension of University Teaching and an earnest promoter of the idea of a teaching university for the great metropolis.

## VIII. THE LONDON SOCIETY FOR THE EXTENSION OF UNIVERSITY TEACHING.

The good example of the University of Cambridge in extending higher education to the people inspired university men in London to attempt the formation of a society for the promotion of the same object. In June, 1875, a public meeting, at which the lord mayor presided, was held in the Mansion House for the initiation of the project. It was moved by the Hon. G. J. Goschen, M. P., who afterwards became

the president of the society, "that the principle of the Cambridge University Extension Scheme be applied to London and that the various educational institutions of the metropolis be requested to cooperate in the endeavor to apply it."<sup>1</sup>

The society was organized with 32 members, 10 of whom are nominated by the following London institutions: Bedford College, Birkbeck Institute, City of London College, College for Men and Women, King's College, London Institution, Queen's College, Royal Institution, University College, and the Workingmen's College. Thus London's higher educational forces, including that popular foundation by Maurice, were brought into efficient cooperation.

#### UNIVERSITIES' JOINT BOARD.

In 1876, the universities of Oxford, Cambridge, and London consented to appoint three members each, to constitute a universities' joint board for the selection of lecturers and examiners and to supervise the educational work of the society in conjunction with the above council. "The existence of this board," says Dr. Roberts, "in addition to giving university status to the work, has secured for the London society the advantage of a wide choice of lecturers and a close connection with both the old universities, without the disadvantages of undesirable competition."

The object of the London Society is "to bring university teaching within reach of persons of all classes and of both sexes living in London and its neighborhood and to work in as close connection with the universities of Oxford, Cambridge, and London as may be possible." The London Society for the Extension of University Teaching thus defines the aim and scope of the whole movement:

The purpose of the University Extension movement is to provide the means of higher education for persons of all classes and of both sexes engaged in the regular occupations of life. It is, in fact, an attempt to solve the problem of how much of what the universities do for their own students can be done for persons unable to go to a university. The fundamental idea throughout has been education for busy people. The majority of the courses have been given in the evening, and the audiences have included persons drawn from all ranks of society and of the widest diversity of previous education and training. Ladies, business and professional men, clerks, tradespeople, and teachers in school have all been represented in the lecture audiences, while the courses at the East London afternoon courses in the suburbs, at a high fee, have been almost exclusively attended by ladies.

#### LOCAL INSTITUTIONS IN LONDON.

The earliest courses of lectures given under the auspices of the London Society were in connection with local institutions like the London Institution and the City of London College. This policy of utilizing existing educational machinery has been continued. The greatest variety of institutions, from high schools and mechanics' institutes to Toynbee Hall and the People's Palace, have opened their doors to extension lecturers. At first the attendance at classes in permanent institutions was small and the society began to encourage the formation of special committees for various districts in and about London. Local halls, convenient for the people, were engaged for local lectures. This policy greatly increased public patronage of extension courses.

The work of the London Society became better appreciated through this adaptation to localities, and now the older and better equipped institutions are beginning to be of greater service, especially to advanced students, who require more special teaching than that afforded by the local lectures. The need of a central and well-endowed educational establishment is now clearly recognized by the London Society.

Mr. Roberts, writing in 1891, said:

Two years ago the society, by the kindness of the Gresham committee in placing at their disposal the lecture theater at Gresham College, were enabled to establish

<sup>1</sup>Dr. R. D. Roberts, in his *Eighteen Years of University Extension*, pp. 76-81, gives a full account of the London Society, its origin, development, and present tendencies.

central courses for students from the various local centers, and thus to increase the efficiency of the work. Two or three central courses have been arranged, each term in definite sequence, and the lines of a system of continuous study are being laid down. In the reports of the council, attention has frequently been drawn to the improvement in the quality of the work done by the students in recent years. The institution by the universities' board of the sessional certificate and the certificate of continuous study has given something of form and direction to this effort after greater continuity, and an ideal of systematic work has been held up before the students.

In order to keep students together and to encourage work during the long summer interval between extension courses, the London Society has arranged for so-called "supplementary summer classes" to enable students to prepare themselves for the honor of a sessional certificate. This is given for nine months' work, comprising examinations upon two consecutive winter courses of lectures upon one great subject and a course of private reading in summer, with at least five fortnightly meetings in class, with satisfactory written exercises. Some of this summer work is done in field classes of natural science. Other classes enjoy special advantages for art study in the British Museum.

A criticism frequently made against University Extension teaching in natural science is that no adequate advantages are offered in the way of laboratory work for students. Dr. Roberts says:

The two London colleges, University and King's, through their representatives on the council of the London Society, have offered to arrange practical classes in their laboratories for extension students, with the view of providing facilities for practical work which have hitherto been wanting. A similar spirit of readiness to aid in the development of this important movement has been shown by other bodies in the metropolis. This aid, valuable as it is, can necessarily only be temporary. The laboratory accommodation of the two colleges is heavily taxed to meet the requirements of the day students. It is difficult, if not impossible, to use the same laboratory for two sets of workers, one in the day the other in the evening. Furthermore, the hard-worked staff of professors and lecturers, fully employed during the day, can not advantageously undertake evening work in addition. It is clear, in order adequately to meet the needs of the metropolis in this respect, that a great central college for evening students is needed, taking rank and status with University and King's colleges and, united with them, to form the nucleus of the Teaching University of London.

#### PEOPLE'S LECTURES IN LONDON.<sup>1</sup>

In order to prepare the way for systematic University Extension courses in the industrial districts of the metropolis a system of so-called "People's lectures" was instituted in 1887, under the auspices of the Gilchrist Trustees and the London Society for the Extension of University Teaching. The idea was to give short and attractive courses upon subjects of real educational value to the people. During the first two years the lectures were given in the more central industrial districts, and proved so popular that in most cases they led to the establishment of regular centers of University Extension work. The method of organizing the work was by means of special and, as far as possible, representative committees for the localities concerned. In one district—Battersea—the local arrangements were undertaken by a committee representing the London Polytechnic, which adopted this among other measures for promoting educational work among the people. The experiment led to a full course of ten lectures, which was supplemented by a summer course in connection with a Students' Association.

Courses of people's lectures have been given in the following districts of London to large and appreciative audiences: Battersea, Enfield, Edmonton, West Norwood, Wandsworth, Kensington, Shoreditch, Westminster, St. Pancras, and Bethnal Green. In eight out of ten of these districts full courses of University Extension lectures have

<sup>1</sup>On this subject see *University Extension Journal*, July, 1890, p. 65.

been established. The reports of local secretaries indicate the remarkable success of these popular experiments. The Enfield secretary says: "We have never seen in this town larger or more appreciative audiences than have attended the three lectures which have been generously placed at our disposal, while the character of the lectures themselves has been of a most excellent description and admirably calculated to engross the attention of all who have heard them and enlist their sympathies." The secretary of the Battersea district says: "We visited all the large firms during the daytime and gave out tickets to the employees. By this means over 500 tickets were distributed. So great was the demand, however, at the workshops for the tickets that we might have distributed 2,000. \* \* \* The workmen's clubs were supplied, and, as an instance of the great demand, we may state that a paper containing one hundred and twenty signatures from members of the Social Democratic Federation in Battersea asking for admission tickets was left with us."

Dr. R. D. Roberts, from whose report these extracts and the above facts have been taken, expresses his strong conviction that "these short courses are an invaluable means of awakening interest in the different branches of knowledge and of encouraging the adoption of some permanent scheme of educational work."

The London experiment in University Extension began in the year 1876 with 7 courses of lectures and 139 students in attendance. In 1894 there were 152 courses with a student attendance of 12,951. In a recent session there were recorded 13,155. These figures show the wonderful and steady growth of the University Extension system in the city of London. All of the students are pupils of mature years, either adults past the school age or young people who adopt this method of continuing or supplementing their school work. The motive of the students is purely that of self-improvement. Attendance is not required, but wholly voluntary.

The unit course of extension lectures in London numbers 10, with accompanying class exercises. A so-called sessional certificate is awarded to those students who pass a satisfactory examination upon the required work. To illustrate the growth of systematic study in London, this result may be stated: In 1889 there were issued 12 sessional certificates; in 1896, 348.

#### A TEACHING UNIVERSITY IN LONDON.<sup>1</sup>

There is now a strong movement in the direction of restoring the original teaching function of the University of London. It is felt that the power to conduct examinations is not enough for an institution bearing that academic name. Those who are in favor of a teaching university propose to form in the city of London a great educational alliance or federation, embracing the higher institutions and corporations of learning in the metropolis, such as the Royal College of Physicians and Surgeons, King's College, University College, Gresham College, Inns of Court, etc. It is said that such an association is favored both by King's College and University College. It is hoped that Gresham College, that old sixteenth century endowment for the people of London, may become the great center of higher popular education, particularly for evening classes, while the two modern institutions above named shall continue their regular work in day classes.

Perhaps the most earnest champion of this movement for a teaching university in London is Dr. R. D. Roberts, secretary of the London Society for the Extension of University Teaching and also secretary of Cambridge University Extension. In an article published in the *Journal of Education* for August, 1888, Dr. Roberts says:

The existing University of London was founded at a time when the doors of the old universities were closed to Nonconformists. It was really founded for the purpose of affording university privileges to a new class, and, to satisfy the particular wants of the time, was constructed on a somewhat different plan from any previously

<sup>1</sup>The subject of a teaching university for London has been discussed by W. T. Thiselton Dyer in *Nature*, May 21, 1891.

existing university. It has done a great work, and has still an important work to do as an imperial university. But there is an educational work, even more important, which it can not do. It examines, but it does not teach, and it is time now a new university was founded to organize and direct university teaching in London. If such a new university is, therefore, founded, it should not only fulfill the highest ideal of a university, as the home of learning and research, by affording facilities for original investigation and providing for the education of day students, but should have a department established to afford special facilities for the extension of higher education to evening students, and courses of study for degrees should be arranged to meet the needs of this new class of students. In matters of practical administration, experience only can lead to the satisfactory adjustment of the many difficulties involved, and if it were not for the work which has been quietly carried on by the University of Cambridge in the country for the last fifteen years, and by the London Society for the Extension of University Teaching in London for ten years, under the title of University Extension, this question could hardly have been approached with so fair a hope of arriving at a satisfactory solution. The results of this University Extension work justify the enunciation of the three following propositions:

(1) That there is a growing demand for higher education of the university type amongst busy adults of both sexes engaged during the day in various occupations, whose study must necessarily be carried on in the evenings.

(2) That it is possible by the special method of teaching adopted under the University Extension scheme, continued over a period of years, to give to evening students an education and training worthy of university recognition.

(3) That the work now being done in connection with the University Extension scheme has already led to a demand for greater systematization of the work and continuity of study, which can best be secured by the incorporation of this work into the degree system of a university controlling and directing the education.

All the universities engaged in extension work are teaching universities, and in their capacity as such have organized extra-mural university teaching where the need for it was felt. London, possessing only an examining university, has been dependent upon the efforts of a voluntary association, the London Society for the Extension of University Teaching, for what has been done in that direction. It is true that the University of London is represented upon the Universities' Joint Board, under whose control the educational work of the London society has been carried on. This board consists of three representatives appointed by each of the universities of Oxford, Cambridge, and London. There is, however, no direct and vital connection between the University of London and this work, such as exists between the old universities and their extension work in the country. The remarkable progress of the work of the London society, in spite of the manifold disadvantages under which it labors, proves how great a need exists in the metropolis for the organization and extension of university teaching among busy adults. It can hardly be doubted that these higher educational needs would be more adequately satisfied and organized by the establishment of a teaching university for London.

This teaching university should organize and direct teaching of university rank, whether given within the walls of certain special colleges or not, so that it might be possible for the university to have its lecturers and teachers at work at convenient centers all over London.

University College and King's College would naturally be the university institutions, where complete courses of study for degrees for day students would be, as now, provided. But, in addition, the university should have a special staff of teachers for the evening work, which could, as above suggested, be carried on all over London at convenient centers. In fact, the university professorships and lectureships should be duplicated, for it is impossible that professors busily engaged during the day with their day students can also be expected to undertake evening work, nor can a teacher who is taking large classes in the evening, with the necessary work connected therewith, find much time for other teaching during the day. This point can not be too strongly emphasized, as it is a condition on which the success of such a scheme would largely depend.

Courses of study for degrees should be arranged to be taken by the students either at the colleges or under the recognized teachers of the university at the various centers where university work might be going on. Special courses of study would be laid down to meet the needs of evening students, in which the regulation that has been found to work so admirably on the University Extension scheme should find a place, viz, that the students would not only have to attend the lectures of the professors or lecturers and pass the examination at the end of the course, but would be required to do regular work for the teacher, either on paper or in the laboratory, from week to week during the term.

It is necessary to point out further that the degree course would need to be arranged in such a way that the student who could give his whole time as a day student would complete the work in three years, while the student employed during the day and able to give only his evenings to higher education might take the work in sections, so that the whole course of study might be extended over a period of six or eight years, or even longer.

It should be noted that no lowering of the standard for degrees is contemplated; on the contrary, it is believed that more efficient work would be done under this system, as the student would have to satisfy a double test, viz, that applied by the lecturer at regular intervals during the term and that applied by the examiner in the final examination.

It will be seen that the fundamental principle is the recognition of organized university teaching, rather than of certain permanent institutions of university rank. This would make it possible to bring under the control and direction of the university all the higher teaching of the metropolis. Courses of study forming a part of the curriculum for degrees should be arranged at institutions like the City of London College, the Birkbeck Institute, and the Working Men's College. Although these may not have facilities for higher work, there is no reason why the teaching in certain special branches, which are well equipped at these minor institutions, should not be organized so as to have recognition in a university system for London. While it might thus be arranged that the student should find classes covering the necessary ground for the earlier work at institutions like those above named, or at centers conveniently situated all over London, the lecturers being in all cases appointed by the university and entirely under its control, the advanced and practical laboratory work would have to be done at some central college for evening students. Thus, in a period of six or eight years, evening students would be able, slowly and without undue pressure, to cover the same ground that day students, giving their whole time to study, would cover in three years, and they would find themselves in early manhood or womanhood not only possessing a knowledge of their trade, business, or profession, but also with a valuable mental training and a broad liberal education.

Let it be well noted that the scheme here sketched is already in germ, actually in existence, in the University Extension movement. The method of teaching has been tested and proved by the experience of years, and it only remains now to build upon that foundation a university department which shall give more permanent form and coherence to so natural and vital an educational movement.

The beneficial influence which a real teaching university, controlling and directing the higher education of the metropolis, might exert would be inestimable. It would number among its staff brilliant men of learning and research, and distinguished and successful teachers, and it would hold up a high ideal and intellectual life. To touch the imagination and stir the enthusiasm of Londoners, the university will need to be constituted on broad and bold lines, adequate to the immensity of London itself.

#### A POPULAR UNIVERSITY.

Percy W. Bunting, editor of the *Contemporary Review*, said in an article on "A popular university," published in that magazine, May, 1892: "Oxford and Cambridge have in late years accepted two great functions as belonging to their proper business, which in principle cover the whole of what is needed in London." He says, in brief, they examine public schools and they promote University Extension. He adds:

If education is to thrive among us, its basis can not be too broad. We must give as much attention to the many who can learn a little as to the few who can study a great deal. Whatever may become of the higher education, we want a system which shall by oral teaching carry knowledge round to the doors of the people, break it up small, and suit it to the powers of the busy crowd. There are many institutions not considered to be of academic rank, which afford a basis for such a system: The Polytechnics, the University Settlements, the Workingmen's Colleges, and so forth; and if these are not enough, it is easy to create more. There are plenty of buildings which can be utilized; what is wanting is good organization, a central authority, skilled, determined, and endowed, which shall inspire, regulate, and extend all this scattered work—an educational council for London.

Mr. Bunting proposes that such a council should itself constitute the London University. It would be a popular institution from the outset. Like a public library it would foster higher education for all good citizens. He says: "Let us try

the experiment of a new municipal university, with the motto, 'Every citizen a scholar.' \* \* \* A university for London should have, by its very existence, a profound educational effect upon the citizens if it be their university, in touch with their daily life, and guiding upward their ambition for their children."

Mr. Bunting would like to see a "metropolitan university" under municipal control. He suggests that King's College should remain a separate institution, devoting itself "to the great interests of theological teaching, and be supplemented by a parallel theological school, representing that other view of theology which is taught at Mansfield College." King's College represents the established church. Mansfield College stands for independency. University education, from its very nature, ought to be public, and free from sectarian control. Theological education, being at the present time chiefly in the interest of particular churches, may not improperly remain upon a private and sectarian basis. Mr. Bunting argues that some rich, powerful, and independent force, representing the interests of the whole metropolis, must take in hand the establishment of a popular London University.

More than sixty years ago the project of a nonsectarian university in London was defeated. To-day the opponents of this great cause are less pronounced, but conservative and institutional forces will probably oppose for some time to come a metropolitan and nonsectarian university in England. London and the free spirit of the age must finally prevail. We have had a similar struggle in America for every State university, and there will be continued opposition to every larger project for university education. The democratic and secular spirit of the times will doubtless assert itself more and more strongly in America as in England with regard to education. Although good sectarian foundations for the higher education have been laid in Washington and in every State of the American Union, as well as in England, sooner or later there will be in both countries a recognition of a type of university coextensive with the nation.

#### A UNIVERSITY FOR THE PEOPLE.

In the Nineteenth Century for March, 1899, Churton Collins published a very suggestive article entitled "A university for the people." He proposes the combination of University Extension courses with the scientific and technical work of the London polytechnic institutes, of which there are now 11, many of them occupying "superb palaces," rivaling the best local colleges in England and America. These institutes now have a total student following of 45,000 pupils, a remarkable increase since 1882, when the total number of evening students in London was under 8,000. Mr. Collins would have at least ten hours weekly in these polytechnics devoted to liberal studies, history, literature, and philosophy. Indeed, the experiment has already been tried successfully at the Regents Street Polytechnic, South-west London Polytechnic, Goldsmith's Institute at New Cross, Birkbeck Institute, and the City of London College. "A more important step in popular education," says Mr. Collins, "has, I venture to think, never been taken." John Morley and Mr. Balfour, in addresses to the Battersea Polytechnic, have both favored the proposed combination of liberal with technical studies.

This project is one of the latest features of higher popular education in the metropolis of London. The fulfillment of the idea awaits only a more generous policy on the part of the polytechnic institutes themselves where the work has already begun. Mr. Collins says: "The polytechnics would be the most appropriate centers to those teaching. They contain in themselves immense numbers, estimated at the present moment (1899) at about 45,000, and they have a convenient rendezvous for the thickly populated districts which surround them. They are as amply provided with the means and appliances for liberal study as they are for technical and scientific teaching, for they already have literary societies; they

have all of them excellent libraries. \* \* \* They are the natural colleges of a People's University."

Mr. Collins thinks that the time is soon coming for a department of higher civil education, whereby the interests of the citizen, whether social, intellectual, or material, may be subserved by the combined forces of liberal, scientific, and technical training. He believes, as does Mr. Goschen, that a man needs culture not only as a means of livelihood, but as a means of life. "Nothing," says Mr. Collins, "can be of more concern to a State than the education of its citizens, not simply as it relates to what equips them for the practical duties of life and the means of livelihood, but as it relates to temper, tone, and character."

## IX. OXFORD UNIVERSITY EXTENSION.

### EARLY BEGINNINGS.

We have seen that as early as 1850 the idea of early University Extension, by means of local colleges, was proposed at Oxford.<sup>1</sup> The suggestion bore no immediate fruit, but the old idea was revived in 1876, when two Oxford colleges, Balliol and New College, began to make generous appropriations for the support of a university college at Bristol. This new institution owed much to the friendly labors of an Oxford man, Dr. Percival, then Headmaster of Clifton.

In 1877, Mr. Jowett, the master of Balliol College, called the attention of an Oxford Commission to "the considerable movement for secondary adult education then going on in the large towns" and advised the university "to take a little pains about it." He suggested the institution of a central office and a paid secretary for promoting Oxford University Extension. He further suggested that nonresident fellowships might be held by honor men engaged in lecturing or teaching in large towns. All of these excellent ideas have since become realities. Arrangements for local lectures were first authorized in 1878. Oxford, like Cambridge, had simply to utilize and supplement existing machinery. A committee of the academic delegacy of local examinations was empowered to superintend lectures and teaching in the towns of England and Wales. The first secretary appointed for the practical management of the work was Mr. Arthur Acland, whose father, Sir Thomas Acland, had been most helpful in instituting "the parent system of local examinations." The next secretary to the delegacy was Mr. Michael E. Sadler, a well-known lecturer upon economic and social subjects, to whose energy and skillful adaptation of University Extension to the actual needs of the people much of the democratic success of the whole movement in recent years is due.

From the beginning the work of Oxford has been more popular than that of Cambridge. Coming later into the field, after the first enthusiasm of the new movement was spent, the older university realized from experience, perhaps more keenly than did Cambridge, the peculiar limitations of extension work, particularly in the less populous industrial centers and country towns. Here public spirit was not always sufficiently developed for the maintenance of long courses of lectures. Financial difficulties arose in many places. Deficits occurred, and it soon became clear that it was demanding too much from small and rural districts that they should come up to the high standards which Cambridge had set when she first began educational work among prosperous and progressive communities. Oxford had a hard struggle during

<sup>1</sup>In the Quarterly Review for April, 1891, there is a good account of the origin of University Extension at Oxford. The first beginning of the movement is said to have been in the year 1845, when a memorial signed by influential persons was sent to the governing authorities of the university. Complaint was made that university education had not been extended, whether for clergy or laity, in proportion to the growing population of the country, its increasing empire, or deepening responsibilities.

the first few years of her missionary labor. Mr. Sadler says: "In most towns it was an uphill fight to keep the courses going. In many the work flickered, and then for a time went out. For the great majority of towns in England University Extension was before its time." Some of the noblest educational and social experiments in both England and America were the indirect outcome of the apparent failures of Oxford men in those early years of University Extension.

## NEW DEPARTURE IN 1885.

A fresh start was taken by Oxford men in 1885, when they boldly declared in favor of short courses. "In that year," says Mr. Sadler, "the whole movement started forward. Oxford began work on a larger scale, its new vigor being largely owing to the initiative of the present head master of Rugby [Dr. Percival], then president of Trinity College. A conspicuous feature of the Oxford work was its employment of the short-course system. There were naturally serious objections to the policy. Half a loaf may be better than no bread, but towns which can afford a complete system of teaching need not be encouraged to content themselves with one that is incomplete. The offer of a shorter course might relax energies which were really capable of securing a full one. It is undeniable that there was great weight in this view of the question. However, the policy of offering short courses has been amply justified by its results. It has practically brought University Extension within the reach of every town in England."

Cambridge men have been inclined to criticise Oxford's more popular methods of promoting University Extension, but a happy compromise seems to have been reached in the practical operation of the two systems. Cambridge lecturers frequently consent to give half courses, that is, only six lectures, where circumstances require such limitation. Oxford gives full courses wherever she can, and both Oxford and Cambridge reserve their certificates for full unit courses.

## TRAINING OF LECTURERS.

The success of English University Extension has turned chiefly upon the ability of the lecturers. It is considered very important that incompetent and poorly trained men should be kept out of the lecture field, for, in some cases, good and hopeful centers of educational work have been set back or utterly discouraged by a disappointing course of some ill-prepared lecturer. Accordingly, in England, university authorities early took in hand the preliminary training and proper testing of candidates for local lectureships.

Mr. Robert A. Woods,<sup>1</sup> in his chapter on "University Extension," says:

Any young university man may apply for an appointment as lecturer. His college record is examined. He must have had experience in speaking in public. He must be thoroughly acquainted with the extension system. Finally, he must deliver to a private audience the course of lectures he proposes to give. If all tests are satisfactorily passed, a small sum of money is voted to send him to some typical centers, in order that he may see senior lecturers at their work.

It is an important fact, and the promoters of University Extension do not forget it, that the extension lecturer needs to be of a different type from the resident lecturer at a university. He can not expect to find his hearers already interested in his subject, but must begin by arousing them to its significance. His way of presenting it must be very clear and simple. He must have some of the traits of a public speaker, so as to hold the attention of a general audience. He needs to have a turn for organization, in order to bring up to their highest efficiency the centers to which he goes. Not the least important thing is that he should enter his work with a desire for the improvement of social conditions and a belief that University Extension may be made a valuable factor in bringing about the good change.

One of the best educational results of actual experience as a University Extension lecturer is a dawning consciousness of his own ignorance of the subject which he is

<sup>1</sup> English Social Movements, Charles Scribner's Sons, 1891.

undertaking to teach. A well-known extension lecturer on English literature said that when he began his public work, he was amazed to discover, from the class conferences and weekly exercises, that many of his pupils in English towns and villages knew more about certain literary topics than he did himself. He admitted, however, that this fact was not very surprising when he considered that the English universities did so little for the training of their students to a good knowledge of English literature, while many English men and women in the common walks of life were earnestly devoting themselves to this special study. Political economy is another of those subjects in which a university man often finds his weakness when he attempts to lecture to workmen and manufacturers, who are often well versed in special branches of this wide domain.

A second good result of the training process in actual extension work is the attainment, by university men, of a more intelligent sympathy with the common people, with the very heart of England. College-bred men who have traveled throughout their own country, who have observed closely the modes of life in English towns and villages, who have met men and women of various classes, who have made friends with artisans and miners, and who have entered their homes and domestic circles—such men know England and her people better than do the dons and student-gentry of Oxford. No American who has met varying types of English university men can fail to be impressed with the generous, humanitarian, and truly democratic spirit which characterizes an extension lecturer. This type is more truly English, in a national sense, than are the ultra forms of Anglomania. The same broad and sympathetic views are conspicuous in the young Scotchmen who have entered the national and international fields of educational, social, or religious endeavor. There is a missionary spirit among educationists and extensioners. Professors Drummond and Geddes and Messrs. Roberts, Moulton, Sadler, Mackinder, and Herbertson have made the Scotch and English student types at once more national and more cosmopolitan.

A third result of training as a public teacher in a larger academic field is the favorable reaction upon the lecturer himself. He becomes a better university instructor by reason of his experience with the people. Like the fabled wrestler, he gains in strength from contact with mother earth. From necessity he has learned to be simple and clear in his language and mode of instruction. He has acquired the rare faculty of telling what he knows in a way that is at once intelligible and interesting. College professors are not always lucid. They are sometimes positively dull. Students quickly discover the superiority of the new type of academic lecturer, who has acquired some knowledge of the world and of the art of public speaking. College graduates who have had experience in extension work recognize in themselves the advantage which they have gained over their former scholastic heaviness. The conduct of one or two courses of popular instruction shows a man his defects and limitations.

A suggestive story is told of an extension lecturer in England, who was also a college instructor. When urged to present one of his favorite academic subjects in an extension course, he declined, on the ground that he had not thought out the matter clearly enough for the people, although he was lecturing upon the subject at college. "You know," he said, "anything goes down at college." Old professors and routine lecturers understand this fact only too well. Their unfortunate students are obliged to follow ancient academic courses in preparation for examinations. The old school or cloister method of teaching is thus "protected." The new school, on the contrary, represents free trade in the academic world. Under the old system, unfit professors sometimes survive. The dead hand restrains the living. In the larger world of academic competition and university extension only the fittest survive. The law of life becomes supreme. Thus, in training graduates for the public service in matters of higher education, the universities are preparing the way for a more efficient class of college professors.

## OXFORD INSTRUCTIONS.

Oxford extension lecturers are urged by the delegates, who have supervision of the work, to pay particular attention to the formation of classes. Lecturers should encourage students to remain after the lecture and receive further instruction on points which were not made quite clear in the public course. Lecturers are instructed to remind their students that, in order to obtain admission to the final examination, they must attend not less than two-thirds of the whole number of classes held after lecture and not less than two-thirds of the whole number of weekly exercises. At the conclusion of his course the lecturer prepares a list of students qualified to take the final examination and sends the list to the office of the delegates in Oxford. The lecturer is expected to indicate in this list the names of students whom he regards as eligible for distinction. This honor is awarded only to those who are recommended to the delegates by both the lecturer and the examiner. In the preparation of the examination paper the examiner is guided by the printed syllabus used by the lecturer. If the latter has departed in any way from his plan of instruction, he is expected to inform the delegates. The lecturer makes a report to the local committee as well as to the delegates. He reports the average number of students attending the lecture, the average number attending the class, and the average number of weekly exercises, and any other facts of interest or importance. He is expected to encourage the formation of students' associations and to cooperate in every possible way with the local management. The increasing number of written exercises which the lecturer is required to look over has led to this resolution, passed at a lecturers' conference: "That the lecturer should receive additional payment for the looking over and correction of weekly papers above a certain number, e. g., an average of twenty-one per lecture."

To Americans it is an interesting illustration of the survival of mediæval custom in University Extension that lecturers are expected to wear academic gowns, unless they see special reasons for the contrary. It was an interesting sight for a Baltimore university man to see in a Quaker meetinghouse in that city an English churchman, the Rev. Hudson Shaw, dressed in the scholastic Oxford gown and lecturing to a mixed audience of men and women, including some worldlings and a few Johns Hopkins students. Some of the good Quakers were dressed in Quaker drab.

## PRINTED LECTURES.

For the benefit of isolated students who can not attend a local course of University Extension lectures Oxford men early devised short educational courses of printed lectures which are circulated among individuals and read in local groups. For example, in 1887 six lectures were printed at the Clarendon Press, Oxford, on "The worker and his welfare" for members of workingmen's cooperative societies. The first lecture was introductory and contained a discussion of the "Action of the state and public opinion," and also a good list of books on cooperation and other topics referred to in the lectures. The subject of the second lecture was "Association and cooperation;" of the third, "The intelligence of the worker;" of the fourth, "Cooperative production;" of the fifth, "Industrial partnership;" and of the sixth, "Pauperism," and the conclusion of the whole course. Each printed lecture was accompanied by a list of questions well calculated to stimulate inquiry and discussion among workingmen. These lectures were circulated fortnightly in 17 towns, in 1887, and were extensively read by groups of workingmen, who talked over among themselves the subject-matter of the course. This practice, early begun, has been continued in varying forms in both England and America. Chautauqua made it widely popular in this country and great publishing houses have given a large circulation to both popular and academic courses of lectures. The press is now perhaps the most

useful and efficacious means of extending university influence and the results of modern scholarship.

#### TRAVELING LIBRARIES.

The University Extension courses of Oxford are locally organized, supported, conducted, and supervised in much the same way as are the local lectures of Cambridge. A few strikingly original features have been added to the system by Oxford. One which deserves special attention is the English "Traveling Library." This ingenious device has been introduced into America in connection with well-regulated systems of University Extension like that now proceeding from the regents of the University of the State of New York and from the State library at Albany. The greatest practical difficulty which Oxford lecturers experienced in provincial towns and rural districts was the lack of good books and easily accessible libraries. And yet the encouragement of private or class reading upon topics suggested by the course is absolutely essential to its educational success. Accordingly, in 1885, the delegacy, or Oxford committee on University Extension, provided choice selections of text-books and standard authorities for the use of the lecturers in connection with their local courses. These books, neatly packed in small, portable cases, are the Oxford traveling libraries. They are duly exhibited to local classes and are placed at their service, under proper regulations, during the entire period of the lecture course. Sometimes, in the case of large classes, extra loan collections of standard books are lent by Oxford, for an additional fee. In towns where there are good circulating libraries a so-called "University Extension table" is sometimes provided for the temporary grouping of books which are of special interest in connection with the lectures then in progress. The University of Oxford endeavors to encourage private reading by offering prizes in books to those students who pass the best local examinations on University Extension work.

#### THE OXFORD SYLLABUS.

Another excellent feature in the Oxford system is the interleaved syllabus for note taking. It is a great stimulus to an intelligent student attending public lectures to have before him not only a good printed outline of the subject-matter of the lecture, with important dates, names, and quotations, but also, in proper connection, blank pages for noting additional points of particular interest. The student has at once "a set of model notes" and the opportunity for further note taking. The Oxford syllabuses are remarkably suggestive for their skillful display of striking quotations and for their references to good books. Just enough matter is printed to quicken the imagination and to excite interest in further inquiry. The ordinary syllabus of lecture topics is a bare skeleton, as unattractive as dry bones or tables of contents usually are. But the Oxford syllabus is in many cases rounded out with a certain literary substance and has sufficient color to captivate the reader's fancy. It is, so to speak, an illuminated syllabus.

#### SCHOLARSHIPS FOR EXTENSION STUDENTS.

In order to encourage good work in local extension courses and to give students an opportunity to study for a short time in Oxford, scholarships yielding from \$25 to \$50 were offered by generous individuals like the Marquis of Ripon, Mr. J. G. Talbot, M. P., the rector of Exeter College, Mr. F. D. Mocatta, the Rev. W. H. Shaw, Miss E. G. Kemp, and others. These scholarships were awarded for English essays on subjects drawn from English literature, English history, natural science, and political economy, including industrial history.

The subjects at one time proposed in history were the following:

- (1) A comparison of Edward III and Henry V as conquerors and military leaders;
- (2) Cromwell and the permanent results of the English rebellion;
- (3) describe an

English county, its administrative organization and social life in the reign of Edward III.

In literature the following topics were suggested:

(1) Contrast in their general characteristics the literary productiveness of the age of Anne and that of the reign of Queen Victoria. To what causes would you ascribe the differences between them? (2) Compare Milton and Spenser; or Wordsworth and Tennyson.

In political economy the candidate was to discuss the economical and social effects of the introduction and use of machinery.

In science one of the following topics was to be taken:

(1) The effect of minerals and other constituents of the earth's crusts, and the effect of the form of the earth's surface, upon the industries and the distribution of the different races of man in any country. To be illustrated chiefly from Great Britain.

(2) The relation borne by various physical forces to one another.

Each candidate was allowed to write an essay on one subject only, but he might select it from any one of the four groups, history, literature, economics, and science.

- All competitors were required to have a certificate of attendance upon at least one course of instruction and to have attained "distinction" in the examination in that course. They must also be recommended by their local committee as in all respects suitable candidates for election to a scholarship. The university authorities, however, reserve to themselves the right of admitting any student to competition or of rejecting the name of any candidate. Students elected to scholarships are invited to visit Oxford and attend the summer meeting.

#### PRESENT METHODS, 1899.

The present aims and methods of Oxford University Extension are clearly stated in the official pamphlet of February, 1899. The delegacy or committee on Oxford University Extension declare it their aim to bring within popular reach opportunities for the higher education, so as to widen English intelligence and enlarge the sympathies. Instruction is still organized by means of local lectures, classes, written exercises, final examinations, and certificates of proficiency. The best books on the subjects of instruction are recommended. Good use is made of public libraries and traveling libraries composed of good selections of literature appropriate to the subject treated. The lecturers who conduct the local work are carefully chosen not only for their knowledge but for their gift of public teaching. They constitute a kind of extension faculty, whose circuit of influence ranges through perhaps 200 towns of England and Wales.

During the session 1897-98 there were no less than 18,242 students attending Oxford University Extension courses. They are given in small towns as well as great. If a community can not afford a full course of twelve lectures, which is the unit of Oxford, shorter courses of six or even less are allowed. The subject of the course is usually selected by a local committee acting in concert with the university delegates. The favorite subjects are drawn from ancient and modern literature, history, science, political economy, and art. The lectures are given at weekly intervals when there is a full course of twelve; but at fortnightly intervals when there is a half course of six lectures. This method gives time for students to read in connection with the lecture and to prepare for the class or conference which follows the ensuing lecture. Questions are still read out or distributed after each lecture to be answered by students at home. The answers are returned to the lecturer by post, and, after having been read and corrected by him, are returned to the writers at their next class meeting. Here criticisms of the papers are publicly given and difficulties are explained.

The final examination is open to students who have attended the lectures and at least two-thirds of the classes, and have written answers to at least two-thirds of the questions set after each lecture. The examination is entirely optional, but is restricted to students who are over 15 years of age. Examinations are often set for short courses, but are credited only by the examiner. So-called "terminal certificates" are given only after a course of twelve lectures. "Sessional certificates" are awarded for a complete session's work, embracing two unit courses of twelve lectures each.

The examiner in England is usually quite distinct from the lecturer and is specially appointed by authority of the university delegates. The examiners are almost always chosen from those who have been recent examiners in the "final schools of the university" and who know what the standards of a "pass examination" and an examination with "distinction" really are. Honors are awarded to extension students in such cases only as would be distinguished at the university. A prize locally instituted is often awarded to that extensioner who is considered by the examiner to be the student of greatest merit.

For the encouragement of continuous and progressive study under the direction of Oxford, local centers now guarantee to provide support for instruction in definite subjects over a period of years. Such towns are recognized as "centers affiliated to the university," and a higher grade of testimonials called "affiliation certificates," or higher certificates of systematic study, are granted in recognition of progressive study or a definite sequence of subjects. Oxford recognizes certificates granted by Cambridge, Victoria University, and the London Society.

A high award for local work is the vice-chancellor's certificate, which is awarded to those who have won a certificate of systematic study and have also passed an examination in (1) arithmetic, (2) Euclid, Books I, II, III, (3) algebra to quadratic equations, inclusive, and (4) Latin, and one of the following languages: Greek, French, German. This certificate is accepted by the education department of the English Government as qualifying the holder to be recognized as an assistant teacher.

The education department also gives recognition to holders of University Extension certificates for those who wish to compete in the Queen's scholarship examination in one of the following branches of knowledge: (1) English language and literature, (2) geography, (3) history, (4) languages.

#### X. LOCAL COLLEGE EXTENSION IN ENGLAND.

In America much is said about the evil of multiplying local colleges. On the part of certain of our educational reformers there seems to be a growing disposition to centralize the higher education in the greater universities and to reduce the colleges to the level of local gymnasia, or preparatory schools. There are some good reasons for favoring this scheme, but on the other hand it should be noted that in England there is at the present time quite a different and more national spirit. There is a marked inclination, if not to decentralize, at least to distribute higher education and to foster the growth of local colleges by a system of affiliation with the great universities. Something can be learned by American educators from a careful study of the origin and rapid increase of local colleges in England, in connection with University Extension. Perhaps by an adaptation of English experience to the American situation a way may be discovered of combining university and college interests in a confederate or federal, if not a national, system of higher education for the whole people.

#### UNIVERSITY COLLEGE.

The beginning of the local college movement in England will be found in the differentiation of University College and King's College from the University of London. This latter university was the institutional result of the successful agita-

tion begun in 1825 by Thomas Campbell, Lord Brougham, Joseph Hume, and others, in the interest of nonecclesiastical education. For two centuries or more dissenters, unless willing to commit perjury, had been virtually excluded from university privileges at Oxford and Cambridge.

## ENGLISH PROFESSORS IN VIRGINIA.

The men who began agitation for a nonecclesiastical university were friends and correspondents of Thomas Jefferson, who had already matured a scheme for the first secular university in the English-speaking world. Jefferson's friend and agent, Francis Gilmer, went to England in the year 1824 with letters to Thomas Campbell and Lord Brougham and with full knowledge of Jefferson's educational plans for the University of Virginia. These plans were already in print and were well known in England. Whether they influenced Thomas Campbell and Lord Brougham in shaping the University of London is now a matter of conjecture. The coincidence of the two nontheological establishments in England and in Virginia is certainly striking. The close academic connection of the two institutions is evident from the fact that the first professors<sup>1</sup> called back to England and to the University of London, or University College, when it was opened in 1828, were George Long, professor of Greek, and Thomas Hewett Key, professor of Latin.

The idea of a possible connection between the University of London and the University of Virginia was first suggested by Mr. William P. Trent in his monograph on English culture in Virginia, published in the Johns Hopkins University Studies, volume 7, page 110. Mr. Trent says some such project as the University of London had been in Campbell's mind since his visit to Germany in 1820, "but it was not brought prominently forward until January 31, 1825, at a dinner given by Brougham."<sup>2</sup> The matter was then pressed warmly by Brougham, Joseph Hume, Dr. Birkbeck, and others, and was brought to a successful issue in 1827. Now, as Campbell had allowed the idea to rest for five years, I do not think it at all improbable that Gilmer's visit, connected as it was with a similar movement in a kindred country, had a great deal to do with giving a fresh impetus to the scheme. Then, too, Gilmer had been thrown into intimate relations with Brougham and Dr. Birkbeck, and probably with Leonard Horner, and had doubtless by his enthusiasm kindled afresh their own natural impulses toward educational work—and these three were prominent among the founders of the London University. Besides there is a striking parallel in the untheological basis of both colleges. It is well known that this latter institution drew back two of the professors whom England had lent to America; but it is more than probable that the connection between the two universities began with Gilmer's visit."

## KING'S COLLEGE.

The ecclesiastical spirit in English politics proved too powerful for the new and hopeful institution, although founded by private munificence, in the interest of dissenters and of scientific research. In less than a year after the opening of University College a reactionary sentiment found expression in the institution of King's College (1829) intended to combine with the original plan for teaching languages, mathematics, natural and moral science, history, economics, laws of England, medicine, etc., instruction in "the doctrines of Christianity, as the same are inculcated by the United Church of England and Ireland."

This meant a new religious establishment in the name of university education. So strong did the reactionary sentiment prove that in 1836 University College by a

<sup>1</sup> See H. B. Adams on Thomas Jefferson and the University of Virginia, pp. 116-117, 160-161 (Bureau of Education, Circ. Inf. No. 1, 1888) and W. P. Trent's *English Culture in Virginia*, Johns Hopkins University Studies, vol. vii.

<sup>2</sup> See the article on "Campbell" in the *Dictionary of National Biography*, and also Beattie's *Life of Campbell*.

distinct charter was dissociated altogether from the University of London, which was left henceforth high and dry, as a simple examining body with power to give degrees, but without any teaching force, which is the primary function of a real university. King's College, the ecclesiastical institution, now went rejoicing on its established way.

#### AN EXAMINING UNIVERSITY.

Until the year 1858, it was required that all candidates for degrees in arts, law, or medicine at the University of London should have received their previous training in colleges that were affiliated to the university. Since that time there has been no restriction as to the place of preparation. The University of London has rendered very great service to the cause of higher education in England by encouraging young men who could not afford residence at Oxford or Cambridge to come up for examination, and that without religious tests, before the award of degrees. During a period of fifty years nearly 59,000 candidates appeared for examination; of these, nearly 19,000 matriculated, and nearly 6,500 obtained degrees. Graduates of English middle-class schools are fond of taking the matriculation examination of the University of London and often regard this as their final educational test. The University of London and University College early lent their influence toward the higher education of women (1869), who were first admitted to the London degrees in 1880. Oxford, as we have elsewhere seen, gave a great impulse to University Extension by the institution of local examinations in 1857. Her first academic enterprise outside her own walls was the institution of the College at Bristol, in the year 1876. This was one of the many beginnings of the local college movement in England.

#### UNIVERSITY COLLEGE, NOTTINGHAM.

In 1874, a resident of Nottingham offered £10,000 for the local endowment of University Extension if the town authorities would erect buildings suitable to the accommodation of university lecturers. Additional money was afterwards secured and the corner stone of University College, Nottingham, was laid 1877. This is said to be the first of the local university colleges arising from the influence of University Extension teaching. The buildings were erected mainly by the corporation, at the cost of about half a million dollars. Together with the Central Free Library, the University College forms the most striking architectural feature of Nottingham.

The institution is well equipped with lecture theaters, laboratories, class rooms, and "common rooms." It is attended by over 2,000 students who live in the city. Many others come from neighboring towns to enjoy these local advantages. There is a flourishing technical school connected with University College and also a Free Public Natural History Museum. The American visitor to Nottingham will be favorably impressed with the Central Free Public Library, which is a People's University in itself. It has a dozen or more free branch libraries and local reading rooms scattered throughout the city. One of them is known as the Children's Free Lending Library. Thus in its growing municipal family the city of Nottingham provides for every grade of public teaching. An excellent popular history of Nottingham has been written by J. Potter Briscoe, the public librarian, who takes a commendable pride in the educational institutions of his city. A well-known public-spirited citizen of Nottingham is the Rev. Dr. J. B. Paton, one of the principal founders and promoters of the National Home Reading Union of England (suggested by the American Chautauqua). Dr. Paton is also an earnest champion of Evening Continuation Schools, in which recreation, in some measure, is combined with serious study. Although English educationists have laid great stress upon strictly studious work in the evening schools, nevertheless Dr. Paton's idea finds many warm supporters, and in all vacation and summer schools it certainly will continue to be prominent.

## MASON COLLEGE, BIRMINGHAM.

This institution was founded by Sir Josiah Mason in 1875 and was opened October 1, 1880, with faculties of art and science. The institution was especially planned for the benefit of a manufacturing or industrial town, and at the beginning had only four professorships—mathematics, experimental physics, chemistry, and biology; but other departments—zoology, botany, physiology, geology, and engineering—were soon added. Then a faculty of the arts was established with professors of Greek and Latin, the English language and literature, lecturers on the French and German language and literature. In 1892 the faculty of Queen's College was transferred to Mason College, which is situated in the very center of the municipal life of the city, near "Chamberlain place," and forms one side of a square, of which the other sides are occupied by the town hall, the council house, Corporation Art Gallery, and the free library. The college faces the statue of its founder, Sir Josiah Mason. Toward the further scientific development of Mason College Mr. Andrew Carnegie, the multimillionaire of Pittsburg, has lately extended his bounty.

There are few sights in the world more encouraging to a believer in the education of democracy than the city of Birmingham, with its splendid free library and numerous local branches; the Midland Institute with its intelligent and varied activities for the higher education of the people; the Corporation Art Gallery with its superb pictures and statuary; the School of Art on Edmund street; Corporation street, that grand new thoroughfare with the stately Victoria law courts. If ever a great city was a great educator of the people, Birmingham, Manchester, Liverpool, Bristol, London, Edinburgh, and Glasgow deserve to be in that class.

## UNIVERSITY COLLEGE, BRISTOL.

This institution originated in a desire of public-spirited citizens to provide for the scientific and higher technical training of young people, above the ordinary school age, in the west of England and South Wales, especially for those preparing for manufacturing and commercial pursuits. The college was first opened in 1876. Lectures were given to day and evening classes by resident professors and lecturers of distinction. The Bristol Medical School is affiliated to the college, and now occupies a new building opened by Sir Andrew Clark in 1892. University College has little or no endowment, but it receives annual subsidies from the Government and considerable help from the technical committee of the city of Bristol and from generous citizens.

Balliol and New Colleges, Oxford, have cooperated in the support of Bristol College on the condition that literary teaching shall be included in the curriculum, and instruction be open to students of both sexes. This is an interesting fact, showing that Oxford colleges believe in coeducation for provincial colleges, and in academic life under more modern civic conditions than those now prevailing in the older universities where students are still living in residence. Of course in the local colleges of England, students live at home or in private families. The university buildings, as in Germany and in some American cities, are simply for academic work and not for dormitories.

The University College, of Bristol, supplies persons of either sex with the means of continuing their studies in science, mathematics, languages, history, literature, and music. It affords systematic instruction in those branches of applied science, which are connected with the arts and manufactures. Students who desire to become engineers, surveyors, or architects can obtain their training there. In Bristol there is also a so-called "Merchant Venturers' Technical College," which is doing superior work for day and evening classes, in all branches of applied science. In connection with this college is a "Boys' School," for practical training in science and for those

who wish to enter the royal navy or the merchant service. There is also an applied arts department for the cultivation of the artistic talent of persons of either sex.

Both the University College and the Merchant Venturers' Technical College carry on courses of extension lectures, more especially on scientific and technical subjects, but there are some popular themes. The two institutions are admirably adapted to the needs of a large commercial and industrial population. Americans should never forget that it was from the port of Bristol in 1497 that the Cabots sailed in the Bristol ship *Matthew* and that to them is due the English discovery of North America. When the present writer was in Bristol in the summer of 1896, preparations were being made for the historic commemoration of the Cabot Quatercentenary.

In Bristol, the writer visited with great interest the grammar school, in Tyndall's Park, opposite University College. The school was founded in the time of Henry VIII, 1531. The present buildings date from 1879. There are scholarships awarded in this grammar school, which give the holder \$500 a year for five years at St. John's College, Oxford. Thus the town of Bristol is closely allied to the oldest English university, as well as to the New World.

#### VICTORIA UNIVERSITY.

This was founded by royal charter in 1880 and was enlarged by supplemental charter in 1883. The Queen of England is the Visitor of the university, which takes its name from her. The managing authorities are the chancellor, vice-chancellor, the university court, the university council, and the convocation. The university has power to confer degrees upon persons who have pursued a regular course of study in any college of the university, and who pass the required examinations. The seat of the university is at Manchester, but it embraces the following colleges: (1) Owens College, Manchester; (2) University College, Liverpool, admitted as a college of the university in 1884, and (3) Yorkshire College, Leeds, admitted as a college of the university in 1887.

#### OWENS COLLEGE.

This institution was founded in Manchester, England, under the will of John Owens, in 1846. He left for the foundation £96,654, with the condition that nothing was to be spent on buildings.<sup>1</sup> These were otherwise provided. The college was opened in 1851 with a staff of seven professors and lecturers in a house belonging to Richard Cobden. A chemical laboratory was built by the aid of subscriptions amounting to \$50,000. In 1868-69, the collection of the Manchester Natural History and Geological Societies were transferred to the college, and formed the beginning of that great collection which the American tourist now sees in the new museum.

Owens College was incorporated under two acts of Parliament, 1870-71, and in the latter year received power to admit women students. The following year the Manchester Royal Society of Medicine was incorporated with the college, and in 1873 it was removed to the new buildings on the present site in Oxford road.

In 1852, Owens College had only 62 day students. Ten years later it had 448. In 1892, the total number of day students was 981, and the number has gone on slowly increasing from year to year. Besides day students, it has several hundred enrolled in evening classes. The college does not offer elementary work. It has departments of mathematics, physics, biology, chemistry, mineralogy, geology, geography, engineering, and a great variety of courses. A good sketch of the history and present condition of Owens College was written by Mr. P. J. Hartog for the Record

<sup>1</sup>The University Extension Journal for October, 1890, says of Owens College, Manchester: "The founder, Mr. John Owens, expressly prohibited the use of any part of his bequest in building expenditure, and for the first few years of its existence the college lived and worked in the comparative obscurity of a back street in Manchester."

of Technical and Secondary Education, July, 1895. A fuller account of "Owens College, its foundation and growth, and its connection with the Victoria University, Manchester," by Joseph Thompson, was published by Cornish, of Manchester, in 1886.

## UNIVERSITY COLLEGE, LIVERPOOL.

This local college, a model of what a city university should be, was established in 1882 for the promotion of higher education in Liverpool and vicinity. Two kinds of educational work have been attempted: (1) Day classes for students desiring ordinary academic training; (2) evening classes for persons occupied in business or otherwise during the day.

University College, Liverpool, is finely situated on Brownlow Hill and comprises a magnificent suite of stone buildings devoted especially to the liberal arts and to scientific, as well as technical education, with engineering. The institution has one of the finest engineering laboratories in the kingdom, a good library and the so-called Jubilee Tower, built by public subscription as a memorial of Her Majesty's Jubilee. University College sprang out of the "Royal Institution," an earlier foundation, which has now been absorbed.

In connection with the regular courses of college instruction there are evening classes and lectures, which attract many students from the city of Liverpool after the work of the business day is over. Classes are offered in the ancient and modern languages, in philosophy, education, political economy, commercial geography, mathematics, biology, botany, geology, and many technical subjects. No classes are formed unless five students apply and public lectures are given only to an audience of not less than eight. All courses are open to persons of either sex. The usual fee is six shillings for a course with a registration fee of one shilling. Each course requires home preparation and certain periodical papers representing the work of the class. At the end of the course a simple certificate is awarded to students who have satisfied the professor as to the character of the work accomplished and the regularity of attendance.

## YORKSHIRE COLLEGE, LEEDS.

This institution had its origin in a meeting held in Leeds in 1869 for the purpose of establishing a College of Science in Yorkshire. The college was founded in 1874, and its aims were declared to be the supply of instruction in those sciences which are applicable to the manufactures, engineering, mining, and agriculture of the county of York, and in such aims and languages as are cognate thereto. The institution began with three scientific professorships, one of geology and mining, one of chemistry, and one in physics and mathematics. Chairs of biology and engineering were added in 1876 and soon afterwards chairs of classics and of literature and history. Funds for the institution were obtained by subscription and by special grant from the Drapers' Company.

The first president of the institution was Lord Frederick Cavendish, who was assassinated in Ireland in 1882. His memory has been nobly perpetuated by the Cavendish chair of physics.

The Marquis of Ripon was his successor, who in the twenty-first annual report of Yorkshire College (1894-95) gave a valuable historical address regarding the institution. It appears that there was an early medical school in Leeds, but, in 1884, it was amalgamated with Yorkshire College. The prominence given to textile interests, weaving, dyeing, and the fine arts is due to the influence of the London Cloth Workers' Company. Yorkshire College has now over a thousand students, about 500 coming by day and perhaps as many more in the evening. Yorkshire College applied for and obtained admission to the Victoria University in 1887. The college has obtained from the county councils in the North, East, and West Ridings and from the City of Leeds very substantial help in promoting technical education.

The institution has been of particular service to farmers throughout the county by means of extension lecturers dealing with agricultural topics. The strength of Leeds undoubtedly lies in scientific, technical, and rural courses.

An official circular issued by the authorities of Yorkshire College contains the following interesting information regarding this institution. Usually the English local colleges of the modern type have no residential accommodations for students, but Yorkshire has:

The Yorkshire College is one of the constituent colleges of the Victoria University, for whose degrees in arts, science, medicine, and surgery its students are therefore eligible. It also prepares for graduation in the University of London; and it offers complete courses of training for various professions and employments, including civil, mechanical, and electrical engineering, coal mining, analytical chemistry, the manufacture, dyeing, and printing of cloth and other textile fabrics, leather industries, and agriculture. The teaching staff consists at present of 18 professors, 30 lecturers, and 25 assistant lecturers, demonstrators, and teaching assistants. The object of the institution is to supply students whose homes are at a distance from Leeds with the advantages of a common collegiate life, by providing a hall of residence similar to those which have been established in connection with Owens College, Manchester, with the Edinburgh University, and with some of the London medical schools. Lyddon Hall has been erected upon a suitable site in Virginia road, on elevated ground, within five minutes' walk from the college. The accommodation consists of dining hall, recreation room, and other rooms for common use, and a separate room furnished as a private study and bedroom for each student. A piano and tennis court are also provided for the use of the students. The charge is at the rate of £60 a year for students in the department of arts and science, who keep a session of about 32 weeks, and £70 for students of medicine, whose session lasts about 38 weeks. Fees are payable in advance at the beginning of each of the three terms of the session. The charges cover everything except beer (if taken) and the student's laundry bill. Arrangements can also be made for residence during vacation. The accommodation of the hall is limited to 30 students.

#### VICTORIA UNIVERSITY EXTENSION.

All of the local colleges connected with the Victoria University have undertaken extension work. It is hoped, "as a general result of University Extension, that the audiences may be brought more closely in touch with the thought of the present day, and that their interest in history, literature, art, and science may be both quickened and developed." Practical courses have been given on hygiene, political economy, the rights and duties of the citizen, the chemistry and physics of common things, agriculture, coal mining, etc. Such instruction "forms part of the great system of technical education which is intended to make Englishmen more efficient as a nation of workers."

In order to promote an interest in extension work, single pioneer lectures and short courses of from 4 to 8 lectures are offered. The long courses consist of from 10 to 24 lectures. The ground to be covered by the lectures is indicated by a printed syllabus distributed at the beginning of the course. The syllabus contains a choice list of books. Private study and reading are encouraged by

#### TRAVELING LIBRARIES.

These are issued by the university in connection with definite courses of public instruction. The following regulations will interest Americans, who are now introducing the system in all parts of the United States:

1. Each library contains a selection of books, chosen by the lecturer as the most suitable to be studied in connection with the course concerned.

2. Any committee desiring the use of a library, in connection with a course of University Extension lectures, must make application to the secretary of the University Extension committee, Victoria University, Manchester. (Applications for libraries in connection with courses on natural science, coal mining, and agriculture, delivered under arrangement with the north, east, and west riding county councils, should be made to the secretary, Yorkshire College, Leeds.)

3. The libraries are the property of the university, and are placed by them in the hands of the local committees, who are held responsible for their proper care, and are required to replace any volume or volumes that may be damaged or lost while the library is in their charge.

4. A charge of £1 is made to the local committee for the use of a library, and the committee are further required to pay the cost of carriage from the university.

5. The books are intended for the free use of students attending the lectures, preference being given to those who are regular members of the class.

6. A record of the weekly circulation of each volume must be kept by a member of the local committee, or its representative, on the printed form provided for the purpose. It is suggested that each volume should be issued for one week, at the conclusion of each lecture, and that, at the expiration of the week, the borrower should be permitted to renew his loan if no other application has been made for the volume. At the end of the course the circulation form is to be returned, with the traveling library, to the university. (Libraries issued in connection with courses on natural science, coal mining, and agriculture, delivered under arrangement with the north, east, and west riding county councils, should be returned to the secretary, Yorkshire College, Leeds.)

7. Libraries must be returned to the university within seven days of the examination, or, if no examination is held, within fourteen days of the conclusion of the course.

8. On the issue of each library an invoice in the form of a receipt is posted to the secretary of the local committee. This invoice, acknowledging the receipt of the books entered upon it, must be signed by the local secretary, and sent at once to the secretary of the University Extension committee, Victoria University, Manchester.

#### SECRETARY'S LETTER.

The secretary of the extension committee of Victoria University, Manchester, Mr. Philip Hartog, in a letter to the writer, October 12, 1896, said:

One of the distinctive features of the Victoria scheme is that nearly all our University Extension lecturers are also regular lecturers at the three colleges of the university (Owens College, Manchester; University College, Liverpool, and the Yorkshire College, Leeds). Certain of the lecturers on the staffs of the other schemes are also college lecturers, e. g., Mr. Marriott and, I think, Dr. Lawrence; but it is not the rule. I attach great importance to keeping University Extension lecturers in touch with the general work and life of the university, if this be at all possible.

As you will have gathered by what I said on Saturday [at Cambridge], we attach much importance to the 24 lecture courses for pupil-teachers, for we feel that in liberalizing their education we are doing double work. As I dare say you have found out, elementary education is much better in method than higher education, but somewhat overmechanical. It is very necessary that the teachers of the next generation should have ideas beyond those insisted on in a government code.

#### LECTURE COURSES FOR TEACHERS.

One of the most interesting features of University Extension teaching under the auspices of Victoria University has been in connection with various "pupil teacher courses," which are well described in the following statements by English educational authorities who have had experience in this class of work. For example, the professor of history in Owens College, Mr. T. F. Tout, says:

My experience both in giving separate pupil-teacher courses, as in Salford, and also in giving ordinary Extension courses, as at Stockport, where the pupil teachers form an important element, have convinced me that pupil teachers can derive from University Extension lectures benefits that they are not likely to get from any other sources. Their tendency is to get too much into a groove. They are seldom brought into contact with minds trained differently from their own. They are worked very hard, and much of their instruction is, perhaps inevitably, a kind of routine, which, though excellent in making them efficient teachers of elementary subjects, can have no pretense of giving them a fuller education, breadth of view, or culture. If the University Extension lectures are efficiently conducted, they get from them a wider horizon and a broader interest. They are brought into relations with some one who is more or less of a specialist. They have a chance of seeing that history and literature are not mere matters of isolated names, dates, and facts, but possess human interest and build up connected wholes.

Mr. Thomas Bateson, John Bright's scholar of Victoria University, says regarding these Extension lectures for pupil teachers:

That there are, moreover, special advantages, resulting merely from the new knowledge, which these courses supply, is obvious. Information of the social, political, and economic history of their own country must be of the utmost value to pupil teachers, since it provides them with material, which they in turn may use to build up the minds of their own pupils; and this information, were they confined to their ordinary means of instruction, would, for the most part, entirely escape them. While acquiring it, they are brought in contact with men who, having devoted themselves to the study of one particular subject, are the best qualified to teach it, and who from their eminence in their avocation can not fail to exert a beneficial effect upon these students at a most trying and decisive period of their intellectual life. Moreover, as I can testify from acquaintance with their work, the information is not addressed to the pupil teachers in a manner too difficult for them to comprehend and assimilate.

Mr. James C. Smith, examiner in the University of Edinburgh, said:

It seemed to me that these lectures revealed to many of the pupil teachers for the first time the meaning of literature, the idea that books were things to take pleasure in and have an opinion of one's own about. Besides subsidizing the lectures, the Manchester school board provided a small traveling library, so as to gratify the taste for good reading which the lectures were meant to stimulate and guide. The consequence was (or so it seemed to me) that the students grew not only in knowledge but in taste and style. Accuracy in grammar and spelling they generally had to begin with, but most of them were utterly ignorant of the rudiments of literary history and of the essentials of good writing. Their composition gained steadily in fullness and continuity.

Teachers' courses in geology and history were tried in Baltimore,<sup>1</sup> at the Johns Hopkins University, in the winter of 1898-99. Certificates were awarded after the Oxford model. The Victoria University rules regarding certificates are worth noting.

#### REGULATIONS FOR CERTIFICATES.

Examinations are held at the conclusion of University Extension courses by examiners, other than the lecturers, appointed by the Victoria University, subject to the following regulations:

1. University certificates are awarded, after examination, in connection with courses of not less than 10 lectures. Examinations are also allowed after courses of more than 5 and less than 10 lectures. No certificates are given upon these, but a list is issued of candidates who have passed or have obtained distinction in the examination.

2. Sessional university certificates are awarded on a continuous course of study (which must not extend over more than two years), including not less than 24 lectures and classes, of which the candidate must have attended not less than 20. These certificates meet the conditions under which the education department allows marks for University Extension certificates presented by pupil teachers who are candidates for the Queen's scholarship examination for entrance into training colleges.<sup>2</sup>

3. When an examination is desired, the local committee shall communicate with the secretary of the University Extension committee at least twenty-one days before the date proposed for the examination, and shall state approximately the number of candidates who propose to enter for the examination.

4. A fee of £2 2s. is charged for any examination. When the number of candidates exceeds 20 an extra fee of 1s. for each additional candidate is required. The local committee are required to make arrangements for a suitable room for the examination and to provide the necessary materials.

5. The examination shall be held as soon as convenient after the close of the course of lectures.

6. The examination shall be conducted by means of printed papers and shall be of three hours' duration.

<sup>1</sup>See Public Educational Work in Baltimore, by H. B. Adams. Johns Hopkins University Studies, December, 1899.

<sup>2</sup>Marks will also be given to candidates who shall present University Extension certificates \* \* \* awarded by the Victoria University \* \* \* provided that the certificates shall have been awarded (after examination) during the year preceding the Queen's scholarship examination on a course of study including not less than 24 lectures and classes, of which the candidate must have attended not less than 20.—Day School Code (1894), Schedule V, p. 88.

7. Students shall not be entitled to compete for university certificates unless they have regularly attended the classes held at the conclusion of each lecture, and have worked at least two-thirds of the papers set in connection with the classes.

8. The secretary of the local committee will receive from the university secretary the examination papers, and will be responsible for their safe custody, and for their distribution to the candidates. The packets of papers must not be opened until the commencement of the examination, or in any other place than the examination room.

9. A member of the local committee, or other person approved by the university, must be present in the room during the whole time of the examination. He will be responsible for the maintenance of due discipline during the examination, and for the due forwarding of the candidates' papers to the university secretary.

10. At the completion of the examination, the member of the local committee, or other person in charge, shall send the candidates' answers, together with copies of the examination paper, by registered post, addressed to the secretary, University Extension committee, Victoria University, Manchester, unless he shall have received instructions to forward them to some other address.

11. In all awards weight will be given to the weekly papers as well as to the final examination.

12. The names of the candidates who satisfy the examiner will be published in one list, arranged in alphabetical order. An asterisk is placed opposite the names of any candidates who pass the examination with distinction.

13. The examiner shall send to the university secretary a copy of the examination list, signed by himself, together with a report on the results of the examination. The list shall include the names of all candidates who entered for the examination, whether successful or not. The secretary will send a copy of the list of the successful candidates to the secretary of the local committee.

14. When prizes are offered by the local committee, or by others, information as to their character and number should be sent by the local committee to the university secretary at the same time that application is made for the holding of the examination.

[The following are for the information of examiners, and will not be communicated to the local committees:]

15. The examiner shall send the examination paper in manuscript to the secretary of the University Extension committee at least ten days prior to the date of the examination. The secretary will arrange for the printing of the papers, and will forward them to the secretary of the local committee.

16. The standard for a pass shall be about 40 per cent of the total marks; for distinction, about 70 per cent.

17. The examiner's report shall be sent to the university secretary within three weeks from the date of the examination. The examiner shall retain the candidates' answers for one month after the examination, and shall then destroy them.

#### JOINT LOCAL COLLEGES.

In the Paternoster Review for December, 1890, Mr. Michael E. Sadler, advocated the idea of a joint local college, to be established and supported by a group of four or five neighboring towns. He proposed that they employ an itinerant faculty of, say, five professors, who should "swing around the circle" and lecture every week in each town. One of the faculty should act as principal or president of this joint college, and one of the group of towns might be the head center. Gradually, through public spirit, local endowments, and educational philanthropy, the means could be secured for the permanent maintenance of local or itinerant faculties. Buildings or lecture rooms, library facilities, and scientific equipment might be easily secured. In many towns there already exist institutions and educational appliances that can readily be utilized for the purposes of a local college. This latter idea has begun to bear abundant fruit in England, but the joint local college is still a manifest possibility in connection with "district associations." (See XII.) Of more importance is the federation of local extension colleges with one of the great universities. Such is the

#### CAMBRIDGE EXTENSION COLLEGE AT EXETER.

This college was established in October, 1893, by the cooperation of the municipality of Exeter, the Cambridge University Extension Syndicate, and the Local

University Extension Committee, composed of directly appointed representatives of the public bodies of the city, and of practical educationists. The technical department at Exeter is under the direction of the municipality, who devote to it the whole of the money at their disposal from the technical instruction fund allowed by the Government. It is provided with chemical and physical laboratories and an adequate supply of apparatus. It comprises schools of science and art in connection with South Kensington, and supplies, in addition to the usual subjects taught in these schools, courses in mathematics, building construction, French, German, shorthand, book-keeping, commercial geography, and domestic economy.

The University Extension department, in addition to courses of lectures on history, literature, and science (accompanied by classes for practical work) provides classes in Latin, English, historical geography, French literature, and music. The Exeter center is "affiliated" to Cambridge, so that a certain course of work at the Exeter College is accepted by the university in lieu of "the previous examination," and enables a student to take a degree in six instead of nine terms. Both departments of the college are under the control of the principal, Mr. A. W. Clayden, a distinguished scientist and experienced teacher, who is assisted by an excellent staff of teachers, several of whom are university graduates.

The college aims at supplying the needs of three classes:

1. Those who require more advanced teaching than they can obtain elsewhere in the district, but who are unable to study at any of the great centers of learning.
2. Those who require a special training in science, art, commercial or technological subjects to fit them for their particular calling, or to improve their status therein. This is of course the principal function of the technical department.
3. Those whose education, whether general or technical, requires supplementing. At present the chief part of the work is in the evening, but it is proposed shortly to add day classes. Such a central institution should be of great value at the west of England generally, the fees being low, and there being no similar institution offering a complete curriculum to adult students west of Bristol. As it attracts more students from a distance, a hostel might be opened for the reception of boarders.<sup>1</sup>

The classes are held at the Albert Memorial Museum, a large handsome building, which serves various educational purposes in the old cathedral town of Exeter. The combination of a public historico-scientific museum with a real college for the people is a distinctly modern idea and deserves further extension in England as well as in America. When I was in Exeter in the summer of 1896 I visited with satisfaction the lecture hall and class rooms of this college-museum.

The programme for the lent and summer terms of that year included both day and evening classes, e. g., French, German, Italian, Latin, English history, and geography (taught by Miss Rogers from Newnham College). Classes had also been taught in mathematics and mechanics, music, and drawing. Such practical subjects as sick nursing and ambulance service were noteworthy features. I noted also that pupil-teachers' classes were so organized as to extend over a period of four years. These classes were intended primarily for school-teachers, but prepared also for the elementary civil-service examinations. These educational facilities tended to promote public instruction in Exeter and to connect the local talent of Exeter with the country at large.

I observed with pleasure that public lectures were offered to the citizens of Exeter for evening instruction and entertainment. For example, Mr. Clayden, M. A., Christ's College, Cambridge, the principal of the college, had given a course of twelve illustrated lectures on "Physical geography and geology," with the following specific themes: (1) Volcanic explosions; (2) lava floods; (3) structure of volcanoes, geysers, crater lakes; (4) volcanoes of Great Britain; (5) earthquakes; (6) changes of level, origin of fjords; (7) rocks and rock-forming minerals; (8) the crumpling of

<sup>1</sup> Pollard's Official History and Guide to Exeter, pp. 63-69.

rocks; (9) how the Alps were made; (10) British hills and mountains; (11) metamorphism; (12) the world's interior.

On the occasion of the opening of a new wing at the museum of the Exeter Technical and University Extension College, the Duke of Devonshire, chancellor of the University of Cambridge, visited Exeter and was introduced to the public by the mayor of the city. The mayor reviewed briefly the history of this Exeter institution, and spoke as follows:

In June, 1893, the work of planning the details of the college was begun. It is divided into two sections: (1) Technical department, under the control of the museum and technical instruction committee, which includes school of science, school of art, and other commercial and technical classes; (2) the University Extension department, under the control of the University Extension committee, which includes University Extension lectures and classes, day classes of various kinds, and a pupil teachers' center for teaching them the compulsory subjects. The connections between these subdivisions of the college are: (1) That the classes will all be held under one roof; (2) there is a joint committee for the consideration of matters of common interest; (3) the provost of King's College, Cambridge, has accepted the office of visitor; (4) the various departments are under one head. The income of the college is derived from: (1) The grant for technical education from the city council; (2) payments on results by the science and art department; (3) students' fees, paid either by the students themselves or, in the case of pupil teachers, by their respective school managers, or by the school board for Exeter; (4) private subscriptions, the total income being little more than £2,000 per annum, a sum extremely small when the amount of work done and number of students are considered. About half the salary of the principal is provided by a guarantee of the local lectures syndicate on account of work done for the university. The number of students is gradually increasing. Before the college existed, in 1893, the number was 428; in 1894, 780; in 1895, 924. This total includes 250 students on the University Extension side. These students represent all sections of society, but the majority of them belong to the wage-earning classes. The advantages of such an institution are great; but when it is conducted in the same building with a well-appointed museum and a good library, both for lending and reference, its power of doing good is vastly increased. The college is affiliated to Cambridge University, and is thus kept up to a high standard of education. A great feature is the cordial cooperation between the municipal authorities and the University of Cambridge. By the appointment of Mr. Clayden, our much-appreciated principal, to superintend all the Devon and district University Extension centers, the university has inaugurated a new policy with regard to its external work, and one which, from your own words at the international congress last year, evidently has your approval. Then the union under one building of museum, library, and college is as appropriate as it is unusual, the college work making the museum intelligible, and the museum illustrating the teaching of the college, while education teaches the people how and what use to make of the free library. There is no central educational institution such as this west of Bristol giving anything like a complete curriculum to adult students. It is now my duty and pleasure to ask your grace to be good enough to declare this building open.

The Duke of Devonshire, among other interesting remarks, summed up what England now enjoys in the way of higher education:

We possess, in the first place, our old universities; then, our university colleges; then, our endowed schools—all these extended and developed, as I have attempted to explain to you. These may be called the regular forces of higher education. Then, in addition to the regular forces, we have the militia and the volunteers in the shape of the local science and art classes, technical classes, University Extension lectures, and [local] examinations. It must be admitted that we have made already tolerably large provision for the supply of the higher educational wants of the country. But if we ask ourselves the question, How has all this provision been organized and ordered? I doubt whether we shall obtain such a satisfactory answer. The greater part of what I have described are voluntary educational agencies, and, while being controlled by local committees, are more or less under the control of certain central bodies, such as the science and art department in London or the syndicates of the Universities of Oxford and Cambridge. In such a condition of things as this we might expect to find, and I believe that we do find, a certain amount of waste power—a misdirection of effort—in some cases even a certain amount of friction and misunderstanding. If you would imagine, or attempt to imagine, what would be the con-

dition of a school or a college where there was no head master or principal; where there was not even a council of those who were engaged in the teaching; where every master or professor gave his own series of lectures, and started upon his own course without any consultation as to what his fellow-laborers were doing, you can very easily imagine what state of confusion that college or school would be in. This is what is taking place at the present moment in a great many of our counties and our municipal boroughs.

OXFORD EXTENSION COLLEGE AT READING.<sup>1</sup>

A step forward in University Extension was taken when, in 1892, a local college was established in the town of Reading, halfway between Oxford and London. Reading is an historic and industrial town, with over 60,000 inhabitants. In the Middle Ages it was the seat of a Benedictine abbey, and consequently a home of learning. It is the seat of an ancient grammar school, where Archbishop Laud was educated. Reading in recent times became the first local center of University Extension in the Oxford district. A local association has been formed to sustain Extension lectures. For years there has been at Reading a science school connected with the Government department of science and art at South Kensington. In 1892 the two educational institutions, the Reading Association and the science school, were brought together in the so-called "Reading University Extension College," in conjunction with the schools of science and art.

This union was made possible by the action of the governing body of Christ College, Cardinal Wolsey's foundation at Oxford, in electing to a so-called "studentship" Mr. H. J. Mackinder, one of the Oxford leaders in the University Extension movement. He was assigned to definite duties as "university reader in geography" in special connection with Reading as an Oxford Extension center.

Mr. Mackinder's own statement of his academic relations to this well-established center was made to the Reading Association, May 27, 1892:

Reading is, I believe, the oldest of the Oxford centers of University Extension, and I need hardly tell those who have had so much experience, and who are in such thorough touch with the movement, that for a long time past we have been struggling with two deficiencies to which our critics pointed and of which we were keenly conscious. In the first place, our courses of instruction have sadly lacked sequence; a course on English literature being followed at the same center say by one on chemistry, and a course on political economy by one on the colors of animals. And, in the second place, we have depended too largely on the public lecture as a means of teaching. We have long been casting about for a remedy for this state of affairs, and have gradually evolved the idea of converting our best centers into what, for want of a better name, we have called "University Extension Colleges"—institutions, that is to say, holding a middle position between good University Extension centers, such as those of Reading and Exeter, and fully equipped university colleges, such as those of Manchester and Liverpool. The University Extension center, though it has done excellent work, has not been highly organized enough to perform all the services in the way of higher and adult education required nowadays in a town of 50,000 or 60,000 inhabitants, and yet a university college, with its complete and costly staff of professors, has been hopelessly out of the reach of such a town.

We hope now to work out a plan whereby with unambitious buildings, with a very small staff of resident teachers and assistants, and a comparatively large one of nonresident lecturers, we may give, at one-tenth the cost, a thoroughly efficient institution, quite adequate for the wants of a town such as I have described. In order to test our scheme, in order to prune it and make it practicable, and in order to convince the doubtful, it is necessary to try an experiment, an experiment which, if successful, will become the model and prototype for the entire movement, as well in America as in this country. Reading is obviously admirably situated for such a special effort, easily accessible as it is both from London and Oxford; and Reading, moreover, contains a well-established and healthy university extension center. But we could not fairly ask Reading people, enthusiastic as they have been in the cause, to meet the whole difficulty of such a new departure. At this juncture Christ Church, one of the greatest of the Oxford colleges, has come to our aid in the manner indicated in the letter just read.<sup>2</sup>

<sup>1</sup> See M. E. Sadler's article in *University Extension*, Philadelphia, September, 1892.

<sup>2</sup> Letter from the dean of Christ Church, explaining the appointment of Mr. Mackinder, to the president of the Reading University Extension Association.

We admit that we feel proud of having won from that great foundation so clear a mark of the value it puts on the work we have done and of the faith which it feels in the future of our movement. It is now for you to say whether you will accept the offer made and will help us to make a notable success. The duration of the experiment is in the first instance limited to three years, but though I speak here purely in a private capacity, you may depend upon it that if we can show reasonable success at the expiration of that term the work will not then be allowed to drop. To come now to certain details. I intend residing at Oxford, a place within half an hour or so of Reading by a dozen trains a day. Though I reserve my freedom to adapt my course to any circumstances which may arise, I intend as at present advised to be in Reading regularly on thirty afternoons and thirty evenings a year and on such other occasions as organization or emergencies may require. My services will be at your disposal partly for popular lectures, partly for ordinary Extension courses and partly for more advanced teaching of a tutorial rather than a lectorial type. The fees earned by my work will in the main be at our disposal for the employment of other teachers. But please do not misunderstand me. It is not intended in any way to tie you down. You will continue to employ Mr. Churton Collins, Mr. Boas, and other lecturers as heretofore. Merely the courses will be more numerous and better coordinated.

Mr. Mackinder was appointed to his office by Christ Church, Oxford, "with a view to deepening, systematizing, and coordinating university extension teaching at a chosen center." The experiment proved successful, and he has been continued in office until now the educational interests of the whole city, the old grammar school, the board schools, and the Government science school, have been thoroughly harmonized. The town of Reading has all the advantages of a local college and university, without the expense of a costly and independent "plant." The Government science school supplies the technical and scientific wants of that busy industrial town of Reading. The old grammar school provides all the classical training needed by those who desire to go to Oxford or Cambridge. The universities send to Reading all the extension lecturers that the town can pay for.

Nearly three hundred years ago [says Mr. Sadler] a native of Reading, Sir Thomas White, founded a new college in Oxford (St. John's), attaching to his new foundation two scholarships for Reading boys. It is significant of the continuity of English life that a lineal descendant of Sir Thomas, Mr. Theodore White, was one of the secretaries of the Reading university extension committee at the time when the offer of Christ Church enabled Oxford to repay part of its old debt by helping to found a college in Reading.

#### OTHER LOCAL COLLEGES.

There are now in England, Scotland, Ireland, and Wales many other university colleges and local municipal institutions for the promotion of technical education, in connection with that great department of the English Government called the science and arts department. These local foundations have been securely established by the combined agencies of older institutions, municipal grants, or individual contributions, or all combined. They are generously supported by the aid of the Government and by money allowance, or State aid, conditioned upon educational results, as tested by examinations. The greater the number of successful pupils, the larger the Government grant. Thus a premium on democratic education is set by England herself. The town and county councils throughout England offer large inducements for the promotion of technical education. The commercial and manufacturing life of England, and her successful competition with Germany, France, and America, depend upon the higher training of her sons and daughters in matters of science and artistic taste applied to the industrial arts.<sup>1</sup>

<sup>1</sup>Extensive information on these matters may be found in the published reports on "Art and Industry," by Isaac Edwards Clarke. Four parts have been already issued from the Government Printing Office; Part I. Drawing and Public Schools; Part II. Industrial and Manual Training in Public Schools; Part III. Industrial and Technical Training in Voluntary Associations and Endowed Institutions; Part IV. Education in the Industrial and Fine Arts in the United States. A great deal of English experience is embodied in these reports.

## XI. AFFILIATION OF TOWNS WITH THE UNIVERSITY.

[Ex uno disce omnes.]

NEWCASTLE-ON-TYNE.

For nearly one hundred years there has flourished at Newcastle an institution called the Literary and Philosophical Society, known to natives as "The Lit. and Phil." During this long period the society has rendered great educational service to the community. The organization of the society dates from 1793 and was due to the literary and scientific zeal of a Unitarian clergyman, the Rev. William Turner. The object was to hold monthly meetings for the reading of papers on "mathematics, natural philosophy, and history, chemistry, political literature, antiquities, civil history, biography, questions of general law and policy, commerce, and the arts." These subjects were comprehensive enough for the higher education of any community.

In November, 1798, the Rev. Mr. Turner read a paper suggesting "the propriety of attempting the introduction of courses of lectures on subjects connected with the happiness of mankind as members of society." The society resolved to invite Dr. Garnett, the professor of natural philosophy and chemistry in Anderson's Institute at Glasgow, to deliver a course of lectures in Newcastle the following summer. A committee of the society put on record this enlightened judgment: "The prospect which the society has a right to entertain of rendering itself useful to the interests of general science by furnishing the youth, particularly of this town and neighborhood, with an opportunity of attending the lectures of a gentleman well qualified to instruct them in the principal subjects of natural philosophy and chemistry must be a source of high gratification to every liberal mind."

Although this first project was not carried out, the idea was kept alive and a course of public lectures on chemistry was given very early in the present century. In 1802 it was proposed to establish at Newcastle "a permanent lectureship on subjects of natural and experimental philosophy." The plan was adopted, and the Rev. William Turner, the founder of the society, was appointed lecturer. He held the position from 1802 to 1833 and gave each year one or two courses of public lectures, varying from 12 to 32 in number. The subjects were, for the most part, taken from the domain of physics and chemistry. Probably Mr. Turner had been inspired in some measure by the scientific researches of his Unitarian brother, Joseph Priestley. A valuable collection of apparatus was early formed for the society, and the success of Mr. Turner's lectures grew from year to year. Members were admitted free. Nonmembers paid 1 guinea, ladies and young people under 20 half a guinea, for the course.

The first literary lectures in Newcastle were given in 1830 by the Rev. William Turner, jr., of Halifax, the son of the founder of "The Lit. and Phil." The young man's course of 10 lectures was upon "The origin and progress of civil society." After the retirement of the first permanent lecturer, Professor Johnston, of the University of Durham, was engaged to give a public course of 22 lectures upon chemistry, always a favorite subject in Newcastle. The course was accompanied by a private class, or practicum, for students, and was remarkably successful from every point of view, even from that of finance.

The public work of the society went on from year to year with increasing interest and success. Series of lectures were given by eminent men upon such subjects as British poetry, the science of music, the antiquities of Egypt, the history and prospects of Poland, Gothic architecture, Shakespeare, Dante, Italian life and history. Down to the year 1859 were maintained courses of considerable length upon great subjects. After that year, until the good old practice was reviewed at Newcastle by University Extension lecturers, shorter and more varied courses were encouraged by the management, together with the custom of employing men of great distinction in

fields of literature and science. Among the lecturers may be noted the names of Professor Bain, J. A. Froude, Professors Seeley, Jevons, Huxley, Lockyer, Carpenter, Roscoe, Bryce, John Morley, E. A. Freeman, and many others of celebrity. Until the year 1865 lecturers from a distance were paid £5 5s. a lecture. After that date the fee was doubled on account of the increased demand for lecturers by rival societies.

The original idea of systematic, continuous instruction upon great themes never really died out in the Literary and Philosophical Society at Newcastle. Mathematical and scientific courses of a practical character and of reasonable length were given in 1863 and 1866 for the benefit of mechanics and students. In 1868, regular classes were formed in mathematics, engineering, chemistry, music, the English language, and literature. Courses varying from 12 to 25 lectures were given on each of these subjects. The class courses at Newcastle were given up when the Durham College of Physical Science was instituted in that town. A supply of continuous, systematic popular instruction has been maintained at Newcastle since 1803. From that date, we are told, until 1842, two long courses of scientific lectures were given every year. Protracted courses continued to be given until 1858. They were renewed in 1863 and 1866 and were continued in regular classes from 1868 to 1871.<sup>1</sup>

The Literary and Philosophical Society has become one of the best supporters of University Extension lectures. Upon the suggestion of Dr. Robert Spence Watson in 1882 the society formally adopted the system and made it its own. Several extension courses are now given every year in the lecture room of "The Lit. and Phil." The resources and membership fees of the society, together with subscriptions for lecture courses, make the maintenance of public instruction for adults an easy matter. The existence of a College of Physical Science at Newcastle, with suitable equipment in the way of apparatus and laboratories, renders possible University Extension courses upon scientific subjects. Experienced lecturers upon literature like Mr. R. G. Moulton regard Newcastle as one of the best University Extension centers in all England. The established relation between University Extension and the old "Lit. and Phil." is admirable. It ought to be rivaled by local institutes and libraries in America. Newcastle was the very first town to become affiliated to the University of Cambridge. Educationally speaking, Newcastle is the working-man's paradise. John Wesley said of this town more than a century ago: "If I did not believe in another world, I would spend all my summers here, as I know no place in Great Britain comparable to it for pleasantness."

#### AFFILIATION OF NEWCASTLE WITH CAMBRIDGE.

The scheme of affiliating Newcastle with the University of Cambridge was inaugurated in 1887. There is an interesting printed report of a public meeting held in the Exhibition Theater at Newcastle-on-Tyne September 22, 1887. The Marquis of Ripon presided and gave a significant address. He thus defined the main object and purpose of University Extension: "To bring the highest and the best education which the country can offer, so far as may be possible, within the reach of men and women in all classes of the community." He said, "the highest education is not too good for the body of the people." In his opinion "there is no more important work to be done in these days in which we live than to bring to the homes of the working men and working women of this country [England] the very best education of which their faculties and circumstances will enable them to avail themselves. \* \* \* What do we mean when we say that we live in democratic days? One thing, at all events, we mean—we live in days in which it has become possible to

<sup>1</sup> All the above facts have been obtained from "Some account of the lectures hitherto delivered in connection with the Literary and Philosophical Society of Newcastle-on-Tyne" [by Robert Spence Watson]. Newcastle, 1882.

give the best and highest gifts of life—political, social, and educational—widely and freely to all.” The Marquis of Ripon regarded University Extension as “in many respects the most hopeful educational movement of our time. It is thorough; it is solid; it is in complete harmony with the leading tendencies of the day; and its character is wholly popular in the best sense of the word.”

Speaking of the affiliation scheme and representing the University of Cambridge, the Rev. G. F. Browne, professor of archaeology, said at this public meeting in Newcastle:

After great consideration, we decided that we should allow a man to follow in the main the bent of his own tastes; that is to say, that out of eight courses of lectures no less than six should be in the special line which he chooses to mark out for himself. But because we have a dread of a one-sided man, and the country should have a dread of a merely one-sided man, we require that, besides his special courses—say science—he should attend two courses of lectures in something else—say something of the nature of art; it may be literature, history, political economy—for we give him a wide range. That is our scheme. We require, besides, that a man (I include women) should show proof of having had the rudiments of what we call a liberal education. The requirements are not large. We require them to know something of mathematics and something of languages; and here I will ask those who listen to me to pay special attention to what I have to say with regard to languages, for by an unfortunate mistake the full details of our conditions for affiliation, laid down for other purposes years ago, were not put before you in the first report. We require there should be some knowledge of geometry—three books of Euclid, algebra up to quadratic equations, and, of course, of arithmetic; and we require (not as your newspapers have naturally told you to-day, copying the first report but not the circular which has been issued in this locality and in others) we require not one language only, but Latin and one other language—French it may be, Greek if you like, German if you will, but Latin and some one other language. These are our requirements. We do not ask that you shall pass an examination in these subjects all at one time. You can take your Latin at one time, your Euclid at another, and so on, and you may take them before, or during, or after your courses of lectures. And what we grant in return is that a man (again I include everybody) coming up to Cambridge, having fulfilled these requirements, may say if he likes that he is beginning his second year instead of his first year of residence, and he is free from what is the bugbear of a great many undergraduates; that is, the “previous examination,” or, as I believe it is called, the “little go.” \* \* \*

Now, I may be asked what are the objects in this affiliation matter. Our object is a very simple one; it needs no argument and no apology. It is simply to do, as far as we can, our duty. That is all. \* \* \* The universities are the trustees of the nation for the maintenance and improvement of the intellectual condition of mankind; and it is because we realize that trusteeship very deeply indeed that we say we are simply trying to do our duty in responding to these calls which come to us, not from Newcastle only.

John Morley was also present at this public meeting and spoke as an Oxford graduate and friend of literature, as well as a politician. He said he believed this new educational movement would lead to greater results than any of the great issues in the immediate arena of politics.

The University, I understand, insists upon the combination of science and literature as a condition of their certificates. For my part, I have never felt that there was any of that conflict, of which I have read a great deal, between literature and science. Though their methods are different and their objects different, so far from their being in any sense antagonistic or opponent, they are mutually complementary to one another. Personally, my own taste has lain rather in the direction of literature, and, as I said, speaking upon the subject of University Extension in London in the spring, I think that literature at the present moment is the more likely of the two to go to the wall, because it is the tendency of the age, and it is one with which it would be useless to find fault, for men seek that knowledge which is helpful to them in the practical work of their daily lives. But I do think that it will be a great mistake if those who have the direction and guidance of this movement do not put literature into at least as prominent a place as science. The masterpieces of literature furnish ideas which guide conduct, which raise motive, and which enrich character, and it is conduct, it is motive, it is character—it is upon these the future of this nation will depend.

The University of Cambridge is doing an immense good, not only in the cause of education and of the improvement of the intellect, but it is doing a great good to the cause of social union and amalgamation. \* \* \* I have always been one of those who think that universities are, in their first function, places and centers of research. They are designed to add to and augment the fund of knowledge. They have also the other functions of diffusing and distributing knowledge, and those the University of Cambridge is performing admirably in the movement we now commemorate. \* \* \* I hope that this great city will take an active part in it. I hope that employers and all those who have influence in any capacity with their workmen and artificers will do their best to show these workmen that they value the knowledge and the means of knowledge which are placed within the reach of the inhabitants of this town, and that all classes will unite in availing themselves, and in inducing others to avail themselves of the blessings of knowledge and learning. \* \* \* I am quite sure that in doing that you are widening the basis upon which the fabric of national greatness, national union, and national strength reposes.<sup>1</sup>

Newcastle-on-Tyne has developed the affiliation scheme more fully than has any other town in England. Fortunately for Newcastle, she has two well-organized local institutions of a high educational character, the Literary and Philosophical Society, and the Durham College of Science, which together guarantee the local lecture committee against financial loss. With such strong institutional support, the friends of University Extension in Newcastle have been able to develop a double affiliation series of lecture courses in the liberal arts and natural science, each series running through the same period of three years. Thus students of varying tastes can find continuous instruction in the field which they prefer. Educational sequence is secured without allowing either science or literature to monopolize public attention.

Upon the success of affiliation with Cambridge, Mr. Howson, of Newcastle, is reported in the University Extension Journal for August 1, 1890, as saying at the third Cambridge conference:

The committee had expected to lose about a third of their average audience when affiliation was taken up, owing to the more systematic character of the work; but he was glad to say that instead of reducing their audience by 30 per cent, the numbers had actually increased by 12 per cent, and they had now in Newcastle more than twice as many real students as they had three years ago [1887]. \* \* \* I doubt whether the university is fully aware (indeed, it has no means of gauging it) of the immense influence for good of these lectures amongst the people who are never heard of in examination results. \* \* \* For the encouragement of other centers, I would say that the affiliation scheme has been successful beyond our expectations, and that the impetus given to University Extension by this scheme has been very great, for we have more than doubled the number of our supporters.

#### AFFILIATION OF OTHER TOWNS.

Seven or eight different towns are now affiliated to the University of Cambridge, and they are all maintaining a three years' educational sequence of lectures in arts or science. This means continuous, systematic instruction extending over a period of six terms, each term comprising 12 University Extension lectures, 12 weekly exercises, and final examinations on each term's course. Some towns, like Newcastle, have a double sequence of lectures. The names of seven early affiliated towns are Derby, Exeter, Hull, Newcastle, Plymouth, Scarborough, and Sunderland. At least one has developed an extension college. The number of affiliated towns will undoubtedly increase. Eighteen of the Cambridge courses given in the Lent or spring term of 1890, were in direct continuation of those given in the Michaelmas or fall term of 1889. This good work has been steadily advancing during the past decade.

The way from the people to the university is now entirely open. Any studious

<sup>1</sup>The above extracts are taken from a pamphlet entitled "Cambridge and Durham University Extension. Affiliation Scheme for Newcastle-on-Tyne." Report of a public meeting held in the Exhibition Theater at Newcastle-on-Tyne, September 22, 1887. Newcastle-on-Tyne: Andrew Reid, Printing Court Building, Akenside Hill, 1887.

youth who will pursue a three years' university extension course in the way above described by Professor Browne, formerly of Cambridge (now a bishop), can not only enter that university as a regular student, but have credit for one year's advanced standing and attain the bachelor's degree in two years' time, if he passes the required examinations. It is, perhaps, characteristic of the earnest and ingenuous spirit of English university extension students that the very first inquirer from that class who wrote to Professor Browne asked if an extensioner was obliged to forfeit the first year of his college course. He wanted all three years of a Cambridge college course.

Professor Browne said at a special conference of the Universities' Joint Board in London, February 12, 1890:

He did not think that many of the affiliated students would actually come to Cambridge, and with some at least of those who did, the remission of a year would not be esteemed a privilege, for if they came to Cambridge for two years they would want to stay for three. There was, however, a distinct incentive to a much larger number of students to undertake the three years' course of work, inasmuch as those who did so with success could claim the privilege of calling themselves "affiliated students of the University of Cambridge." This privilege, said Professor Browne, may seem of small account, but I assure you that even in these modern times there is a great power in the sentiment of being connected with one of the old universities; and there are now hundreds of persons in the North and in the South who are working hard, and with self-denial, to obtain it. (University Extension Journal, March 1, 1890, p. 21.)

The University of Cambridge deserves great credit for the development of this plan of academic affiliation with the various towns of England. Oxford did not at first attempt much in this direction. Of 69 extension courses given under Oxford auspices in the Lent term of 1890, only three are said to have been in any kind of educational sequence with those given in the Michaelmas term. (University Extension Journal, September 1, 1890, p. 94.)

Oxford's highest work, on the other hand, has been the founding and encouragement of local colleges, as already described in X. In her extension lectures she has endeavored to quicken public interest in pioneer ways and to prepare the way for better and higher work. She has recognized facts in the English educational situation and has striven to overcome local obstacles by practicable means.

The following matter is appended here as of suggestive and historical interest:

#### AFFILIATION OF LOCAL CENTERS.

By a statute approved by the Queen in Council June 26, 1886, the University of Cambridge acquired the power of affiliating to the university a local lectures center. The privileges conferred upon affiliated students at such a center are that they can describe themselves as "Students affiliated to the University of Cambridge," and, if they enter as students at the university, are excused the previous examination and can obtain the degree of Bachelor of Arts in 6 terms instead of 9, but only if they pass in a tripos examination. In the case of women, if they enter at Girton or Newnham College they are excused the previous examination and can be admitted to tripos examinations three terms earlier than those who are not affiliated students.

The following are the early regulations:

1. That the local examinations and lectures syndicate shall present to the senate for approval by grace a report on each application for the affiliation of a center.

2. Students at an affiliated center who desire to be admitted to the privileges of affiliation shall be required—

(a) To have passed at some time an examination in (1) arithmetic; (2) Euclid, Books i, ii, iii; (3) algebra to quadratic equations inclusive; and (4) Latin and one of the following languages: Greek, French, German. A certificate of having satisfied the examiners in these subjects in the junior, senior, or higher local examinations of the University of Cambridge or the corresponding examination of the University of Oxford or the matriculation examination of the University of London,

shall suffice; but in the case of the junior local examinations no certificate shall be recognized which does not certify distinction in mathematics and in one of the four languages mentioned. The syndicate may from time to time consider and report upon the propriety of recognizing the certificates of other examining bodies.

(b) To have attended a series of courses of lectures and classes for six terms, extending over such period of years as may be approved by the syndicate in one of the two following groups.

A. Natural, physical, and mathematical science.

B. History, political economy, mental science, literature, art.

(c) To have attended in each of 2 terms a course of lectures in the other of the groups A, B.

(d) To have satisfied the examiners in the examination held after each course of lectures.

3. The selection and sequence of the subjects of the courses of lectures shall in each case have been approved by the syndicate before delivery of the lectures.

4. The lecturers and examiners shall in all cases have been appointed by grace of the senate on the nomination of the local examinations and lectures syndicate.

5. Those who have done all that is required to enable them to claim the full privilege of affiliation shall be recognized as "Students affiliated to the University of Cambridge."

6. Those who have before the affiliation of the center by the senate obtained certificates of having satisfied the examiners in the examination held after a course of lectures may use such certificates toward satisfying the requirement 2 (c), but not toward satisfying the requirement 2 (b).

#### DR. WESTCOTT ON "AFFILIATION."

Dr. Westcott, formerly regius professor of divinity, said in a Cambridge conference on affiliation:

If I felt that the subject which I have been asked to introduce to you depended upon anything I can say for exciting interest, my anxiety would be indeed great, for my anxiety would be only measured by my own interest in the subject. But I am quite sure that the subject itself, as you find it brought before you in the papers which are distributed in the room, will at once command your sympathy. You find there a clear description of what affiliation is from our point of view; and I shall be obliged to speak of the subject simply from the university aspect. I shall speak as if there were no financial difficulty. I shall speak of it simply in its educational aspect. Viewed in this way, affiliation means that the university is prepared to recognize any student who has passed through a course of study in accordance with its spirit, without any distinction of class or place, as having a vital connection with itself. It means that an artisan or one engaged in business may, by attending certain classes and following out certain conditions which are wisely and generously laid down by the university, come among us at once not as a stranger, but as a son, taking his place as a student in his second year. Now, when affiliation is interpreted in this sense you will see that it marks an epoch in the history of higher education, that it affirms a principle as to the character of higher education, and that it lays, I will venture to say, an adequate foundation for a national system of higher education.

Allow me to say a few words on each of these points. I say, then, that affiliation represents a distinct epoch in the history of higher education. Affiliation as I have described it would not have been possible ten years ago. At that time the university was not in possession of sufficient evidence as to the demand for education or as to the supply of teachers to justify such a step. A great university is possessed of a rich heritage and of precious traditions which it is forced to guard jealously. It must not change its methods hastily. But the system of University Extension was begun wisely and vigorously and it has progressed steadily. It has won its way from small beginnings. The University Extension which began here about fourteen years ago, has now found acceptance in every other English university. It is already discussed, I believe, if not begun, in the Scotch universities. It has been adopted in the University of Sydney. The 20,000 hearers of the University Extension lectures last year show the extent of interest which has been excited. The 2,000 candidates for examination show, I think, the loyalty of the students' spirit. Great and solid educational results have been achieved by the system; and they have called out singular sympathy in the great towns. We are inclined to believe that the noble local colleges at Nottingham, Sheffield, Liverpool, owe something to the stimulus which university lectures gave to higher education. When these results, therefore, were presented to

the university, it was felt that it must welcome them; that it must show by some definite act the value which it attached to them. And so when our new statutes were framed the power was granted to the university of giving the important privilege of a year's residence to those who had passed through a specified course in colleges affiliated to the university. At once three colleges, I think, Nottingham, Lampeter, and Sheffield, availed themselves of the privilege. It was, however, soon felt that even so the university has not extended its educational influence far enough. It was felt that there were many students who could not belong to these privileged colleges; and so two years ago further deliberations were entered into. The existence of classes of students outside large towns, zealous and earnest students, was sufficiently proved, and a revised statute was obtained by which the university was empowered to grant the privilege of affiliation to students, solitary students, who had carried out a system of education prescribed by the university. And thus, absolutely for the first time in the history of education, an old university, by offering this privilege, recognizes as its own work in a practical sense that higher education which has been conducted anywhere under its responsible superintendence and in accordance with its own spirit. It recognizes a student of any class and of any place as having a true and living connection with itself if only he has satisfied the reasonable conditions which express what we hold to be the true ideas of a liberal education.

And that brings me to my second point. I say that this affiliation affirms a distinct principle as to higher education. It gives us a view of what higher education should be. We can easily conceive three different aspects in which university lectures may be regarded. They may be regarded, we know, simply as a recreation. They may be regarded, again, as a means of technical equipment. Or they may be regarded as a power not only of communicating knowledge, but of stimulating that passion for knowledge which is really the spirit of a fuller life. The university, I need hardly say, without disparaging the two other objects of lectures, has always regarded this last and higher object of lectures as the only one which it could set before itself. From the very first the lectures of the University Extension scheme have aimed at conveying serious education. They have aimed at thoroughness, at breadth, at continuity, and at personal intercourse between teachers and taught. From time to time, no doubt, short courses of lectures and single lectures have been given in order to stimulate a desire for something more and something better. But the normal courses of lectures have always been of substantial length. They have been supplemented by classes. They have been tested by papers. The teacher has come into living contact with the class that has gathered round him. And I venture to say that no object short of this could rightly have engaged the anxious attention of the university. It is not the business of the university, pressed by its own urgent duties, either to amuse or to train craftsmen. Its business is to inspire men; to give them that passion for higher knowledge which can ennoble every form of life. It is not the business of the university to teach mere bread-winning knowledge, but to communicate that which is, in words familiar to many, not the source of their livelihood but the real inspiration of life. And now you will see why the university welcomes each request for affiliation as tending to organize and to consolidate the policy which it has always kept steadily before it. If you will examine the scheme of education which is proposed for students who seek affiliation, you will see that it satisfies those conditions which I have ventured to indicate as marking the university idea of education. There is first of all an adequate foundation of preliminary knowledge. This school knowledge the university tests but does not give. Then provision is made for breadth, for continuity, for personal influence in the higher teaching. Provision is made for breadth. The student must not only take up one principal subject; he must also take up a secondary subject in some distinct group. His attention must not be given solely to science or solely to literature. If he chooses literature as his main subject, he must supplement the ideas which he gains from that study by the characteristic ideas of science. If he takes science as his main subject, he must add to scientific ideas the influence of literature. Provision is made also for continuity. The student must continue the study of his principal subject through two terms of three years; and this study, as you will remember, includes lectures, classes, papers. And all through from the beginning to the end there is the living intercourse of teacher and pupil, satisfying the principle on which the university has always laid the utmost stress, that education consists not only in the mere acquisition of knowledge, but even more in the manner by which that knowledge is acquired through the intercourse of man with man. So it is, then, that affiliation affirms, I say, a principle as to higher education.

You will say, and say naturally, that the demand which it makes is a great one. It

is a great one, and when we find the desire to satisfy it existing I think you will agree with me that those who do satisfy it are worthy of being welcomed among us as true brothers, not strangers, when they come here. Affiliation in this way, I repeat, marks an epoch and affirms a principle. I venture to add also that it offers an adequate foundation for a national system of higher education. And I am thankful especially that my own university, acting in close sympathy with the other universities, has shown its readiness to undertake, if need be, responsibility in this great work. It is a pressing work, and I can not but think that it will be disastrous if the universities have not a large share in carrying it out. They have received a most precious inheritance. They have a striking hold upon the feeling of the country. Those of us who ever have to speak in the name of a university are touched beyond expression by the confidence which they find reposed in its counsels. And such action on the part of the universities is thoroughly in accordance with the traditions of their founders. We have been reminded that the statutes of Clare College provide that those who share in the benefits of the college are not to be mere solitary students, but men who shall carry elsewhere the light which they had received. The work, then, is such as benefits the universities by their actual constitution and by their old traditions. An organization for fulfilling it exists, tried by wide experience. Teachers are ready to devote themselves to it who have proved their efficiency. Our university offers responsible superintendence; and surely we feel that the work is one which is deeply needed among us now. We feel that we do, indeed, want, both in thought and in work, that which an education, conducted on such principles as I have endeavored to indicate, would supply; we do, indeed, want that patience which comes from continuous labor; we do, indeed, want that sympathy which comes from a wide range of study; and I can not help thinking that this scheme of affiliation contains an answer to some of the difficulties which we heard discussed this morning.

It will meet the wants of the small places. They will be grouped, as we trust, round some responsible teacher, who will be the permanent adviser of education in an educational province, and who will gather round him younger lecturers who need his guidance while learning to continue his work in after time. He will form, as it were, what has been called "a floating college." And I venture even to look further than that. I seem to see hostels rising up in which young men, artisans, and tradesmen, full of enthusiasm, full of the passion for work, will be gathered to support one another in a simple, laborious life, living together in new colleges which correspond to the circumstances of our new life. Thus, I hope that this idea of affiliation will really be not an unimportant factor in solving some of our most serious moral problems. Let a worthy idea of higher education, a power of self-reliant, sympathetic, reverent work and thought, once be realized, and we shall not be far from seeing that the end of life is not material enjoyment, which never can be shared in equal degree by all, but the joy of what I will venture to call spiritual effort, the joy of spiritual service, a joy which grows intenser as it grows wider, supported by a force which increases even as it is used.

Let me, then, endeavor to sum up in the fewest words what I have tried to say. The idea of affiliation, as we understand it here, marks an epoch in the history of education, for by it the university concedes a great and a new privilege. It represents a distinct theory of higher education as being thorough, broad, and human. It marks out the lines on which I believe sooner or later a national system of higher education may be molded. I ask you, then—I ask you with some confidence—to realize the importance of what the university has done. I ask you to affirm the principle which it lays down. I ask you, as occasion may be given, to use the opportunity for establishing a wide system of higher education. I know how imperfectly I have expressed what at least I feel most deeply. When I came back to Cambridge sixteen years ago (if I may touch on one personal recollection), I came back with some dim, vague hope that the Cambridge in which I should work would become in due time a true spiritual power for England. I had not been there long when I found that our friend Professor Stuart had already in a great measure solved the problem. We have seen the solution progressing to completeness through a double apprenticeship of fourteen years. Is it too much to hope that to-day we see at last the beginning of the end?

It does seem to me to be a memorable day when we are gathered in this center of our university life, under the presidency of our natural head, while we have been just assured that our venerable chancellor himself would have been with us if his health had allowed him, not so much to discuss as to welcome a scheme which makes university education practically coextensive with the country. And though I believe that few students, comparatively, will use the privileges of affiliation so as

to come among us as our own students, yet I do believe that there will be not a few who will win the title of affiliated students, not a few who will bear it with honor to themselves and with no less honor to us. So it will be that miners in Northumbrian coal fields, artisans in Midland factories, toilers in the country and toilers in the cities, will repeat with glad pride what is not our motto only but their motto also, "Hinc lucem et pocula sacra," when they find their lives enlightened and purified, I will venture to say ennobled and hallowed, by the conception of higher education which it has been the privilege of this university to bring home to them. They will feel that it is indeed from that source the light comes; and when the light comes such a vision of eternal truth as men can gain will not tarry long.

## XII. STUDENT ASSOCIATIONS.

University Extension students in England in their student associations have developed, in a natural and independent way, an institution which reminds an American of the Chautauqua literary and scientific circles, or local class conferences, and also of the so-called "Round table," or public class conferences, at the Chautauqua Summer School. The English student associations are simply voluntary local unions of students who are attempting to study according to some definite plan, usually in connection with University Extension lectures. The origin and character of the Plymouth Students' Association is thus described in the University Extension Journal for July, 1890:

Our association started at the close of a series of University Extension lectures, when the local committee was not in a position to organize another series. Largely through the enthusiasm and agency of the Students' Association a Cambridge University Extension Society was revived, and the affiliation scheme, a boon to all earnest workers, was started.

During the term before the adoption of the scheme the Students' Association worked independently of lectures. Mr. Moulton, to whose warm sympathy students' associations owe an incalculable debt, kindly sent some syllabuses of lectures and offered to correct one paper each week. This was done, the students writing the papers; and one, being selected by ballot, was forwarded to Mr. Moulton, with a summary of important points in other papers. The comments on this were read at the next meeting. Thus, good work was done without the stimulus of lectures.

Between the lecture sessions the committee organized lectures by leading local men, which served the double object of aiding students and keeping up in the town the interest which is so apt to flag after a course of lectures is concluded.

The benefit of students' associations is not merely intellectual. There is a kindly feeling promoted among members, and the working together for a common object broadens their views and leads to greater toleration and sympathy.

Instead of "classes" and "masses" mixing, we have no "classes," in the somewhat supercilious social sense of the word, for in intellectual work these distinctions vanish, and we do not consider the work which each contributes to the social fabric, but the value of the ideas which each presents, and we are all learners and all teachers, more or less. \* \* \*

Our comradeship is perhaps aided by our social gatherings. Plymouth is, in summer, devoted to picnics, and we always have our annual excursion by road, or river, or sea, and in the winter our lecture session is inaugurated by a *conversazione*, which introduces the lecturer to the students. We all acknowledge with gratitude the great and practical interest which every lecturer has shown in our work, and it is a pleasure to welcome them in a social meeting.

We are contemplating the formation of a library, and hope to be provided before the winter, for though the Cambridge Traveling Library is invaluable we hope to supplement it by books of our own.

I ought to add that we have two secretaries, a lady and a gentleman, which I think is a wise arrangement, as it divides the work and perhaps makes it better.<sup>1</sup>

It is particularly urged by the friends of University Extension in England that local groups of extension students should unite together in students' associations. These societies meet frequently for systematic reading and for the discussion of topics in connection with a course of local lectures. Such organizations have been found

<sup>1</sup> For further illustrations of "students' associations," see University Extension Journal, October, 1890, and later issues, on this topic.

of great service by extension lecturers, who always encourage the formation of such voluntary classes among their hearers. It is urged that such associations should be formed after conference with the local committee. An organized body always affords a nucleus of real students and is, therefore, the best ally of a local committee in providing for future extension courses. Such students are the persons whom the local committee usually consults in choosing subjects and lecturers.

An Oxford circular upon this subject says:

A students' association can generally be established most easily before the conclusion of a course, when the help of a lecturer can be obtained in its arrangement and inauguration. Local committees, by kindly taking the lead in the formation of students' associations, can often be of great service in promoting systematic study, the encouragement of which is one of the chief aims of University Extension teaching. A committee should be formed: A president, and vice-president, treasurer and secretary elected; the rules of the society drawn up and a plan of work arranged for the ensuing months. If practicable, suggestions can be obtained from the lecturer, who is to deliver the next course, as to the best course of preparatory reading. An opening meeting is advisable, and, at this meeting it may be found best to arrange for an inaugural address by some resident in the neighborhood interested in University Extension or other educational work. There should be a small subscription to cover necessary expenses. The number of members varies; it is rarely less than 20 or more than 100. A small ticket of membership, with a programme of the meetings printed on it, is convenient. A suitable place of meeting should be fixed; members asked in advance to contribute papers to be followed by discussion; and, during the session, one or two meetings set apart for social gatherings, or, in the summer, for excursions. The meetings are conveniently fixed at fortnightly intervals; a prize is sometimes offered to encourage essay writing from members. Access to local collections of scientific or artistic interest can often be obtained for the students' associations. It is particularly urged that students' associations should seek to obtain the assistance of university graduates, fellows of learned societies, etc., resident in their neighborhood.

A good plan is to draw up a series of topics to guide the reading of the members, and to hold these topics among the members as subjects for essays to be read and discussed at successive meetings. A good chairman should be found for each meeting to open the discussion. The members sometimes find it advantageous to instruct one of their number to embody the result of the discussion in a brief paper, which a lecturer can be invited to look over and report upon. In discussing a scientific subject, a member will often undertake to write out a brief but complete chain of proof of a selected thesis, appending in the margin the exact evidence (with reference) for each link. This chain of proof is subsequently discussed by the meeting, and in a corrected, condensed, or expanded form, sent to the lecturer for criticism. The lecturer's report is read at the next meeting.

Students' associations may be advantageously combined with a book club, by means of which the students can obtain cheaply all books they have decided to read. When possible, the delegates will lend a small collection of books at a small charge. Existing essay societies, mutual improvement societies, and reading societies, can affiliate themselves to the University Extension movement by forming themselves into students' associations.

#### MODEL RULES (OXFORD).

1. This association shall be called the "——— University Students' Association."
2. The object of the association shall be to encourage and maintain an interest in the University Extension lectures and home reading circles.
3. The management of the association shall be vested in a committee, consisting of a president, vice-president, treasurer, secretary, and 12 other members of the association. Five to form a quorum.
4. The annual general meeting of the association shall be held in the month of March, when the officers and other members of the committee shall be elected.
5. A report of the state of the association shall be presented by the committee to each annual general meeting.
6. The secretary shall conduct the correspondence, keep the minutes of the proceedings of the meetings of the committee, and of the association, and these minutes shall be read and confirmed at the next meeting.
7. The treasurer shall have charge of the funds of the association, and his account shall be audited by the committee, who shall have control of the expenditure.
8. Any past or present member of the University Extension classes, or anyone over the age of 15 shall be eligible for election.

9. Candidates for election shall be proposed and seconded by members of the association; the election of members shall be vested in the hands of the committee and shall take place at such intervals as the committee may find convenient.

10. Members shall pay an annual subscription of —s., in advance, due the first day of April in each year.

11. Honorary members of the association may be elected by the committee, from the past and present lecturers and other university graduates resident in the town, or from persons subscribing not less than 5s. per annum to the funds of the association; such members shall have all the privileges of membership.

12. At ordinary meetings of the association any member will be allowed to introduce a friend, who shall not have power to vote.

13. The ordinary meetings of the association shall be held at such times and places as the committee may appoint.

14. No rule shall be altered or rescinded, nor shall any additional rules be made, without the consent of two-thirds of the members present at the annual general meeting, or at a special general meeting. Due notice of any proposed alteration shall be given to the members seven days before the meeting.

15. Members not paying their subscription on their election, or within the first three months of any current year, shall, ipso facto, cease to be members of the association.

#### DISTRICT ASSOCIATIONS.

There early developed a tendency in England to organize local centers of University Extension into what are called district associations, which are composed of contiguous or neighboring towns and parishes. The purposes of such organization are clearly indicated in the by-laws of the Yorkshire Association: (1) The organization and extension of university teaching; (2) the suggestion of subjects and lectures and the grouping of centers for lectures; (3) the organization of lectures and systematic work in vacation; (4) the formation of students' associations and the lending of books; (5) the promotion of higher education generally. It will be readily seen that such district associations will tend toward strengthening the foundations of the University Extension system, for in the union of interests there is often greater strength. The good example of one town is communicated to another and the general demand for extension courses is increased. Circuits for the lecturers can be instituted and the expense of lecture courses can thereby be greatly diminished. A kind of itinerant university system may be instituted and supported within a single county. This system would present certain analogies to the earlier ecclesiastical system of associated parish churches, under the general supervision of an itinerant bishop. Indeed the whole University Extension system affords a striking parallel to Episcopal administration methods in primitive and modern churches.

In the University Extension Journal for July, 1890, there were the following suggestions upon the subject of State aid to district associations:

State aid, or some form of endowment, will assuredly come in the near future to give permanence to the national system of higher education, into which the University Extension movement is rapidly growing. Meanwhile, however, the important thing is to perfect the machinery of organization and press on the educational efficiency of the work by promoting still greater sequence and continuity of study. One of the chief practical difficulties in dealing with the question of State aid is that of its wise and profitable distribution, and to frame some definite scheme for this purpose is the first step toward its solution. If, as has been suggested, a public grant were to be intrusted to district associations, which are now established in different parts of the country, it is clearly of the first importance so to develop and strengthen their organization that they may come to be recognized as the natural channels through which State aid might advantageously be given to the University Extension system. Each association might become, as it were, a floating local college, having, like the existing institutions, a permanent organization and a representative council, but unlike them, drawing from the universities its staff of lecturers from session to session, and including in its field of work not merely a single town, but the numerous centers in a wide district.

All this helps to explain the remarkable growth of local and university extension colleges in England.

## XIII. UNIVERSITY EXTENSION IN SCOTLAND.

It should never be forgotten that the educational germ of University Extension in England was the Scottish lecture system, with its syllabus of dictated heads. This system was a survival of the old scholastic method of university teaching, and was simply adapted to a popular purpose by Prof. James Stuart, of Cambridge, who admits that he got the idea from one of his Scotch instructors, Professor Ferrier, of St. Andrews. Prof. Patrick Geddes, in the abstract of his evidence given to the Scotch Universities Commission, says: "The Scottish lecture system has directly given rise to the University Extension movement, and ultimately to the English university colleges, and has profoundly modified Oxford and Cambridge themselves."

## PART I.—WEST SCOTLAND.

The beginnings of the university movement in Scotland have usually been associated with the University of St. Andrews and the town of Dundee (1874); but Prof. R. M. Wenley, in his authoritative study of "The University Extension movement in Scotland," 1895, calls attention to the fact that as early as 1845 Prof. Hutton Balfour, then of Glasgow University, gave a course of lectures to women, and that similar extramural courses by Glasgow University professors, notably by Edward Caird, were continued from 1868 down to 1877, when the Glasgow Association for the Higher Education of Women was instituted. At that time women were not admitted to academic classes.

It is significant of the University Extension movement in Scotland, as well as in England, that one of the permanent historic results was the founding of a college for women. Queen Margaret College, founded in 1883, and named in honor of the best woman in Scotch history, was the direct institutional outgrowth of the work of the above association, which for six years had furnished academic lectures to women in Glasgow. Those individual professors, Young, Veitch, and Caird, and the ladies who supported them, were truly "pioneers of what was tantamount to a University Extension movement, of that form of it too which has achieved by far the most important practical results in Scotland."

It is noteworthy that the first attempts to extend university instruction from Glasgow to other towns in the west of Scotland were made under the auspices of the Queen Margaret Guild, a social union of students of Queen Margaret College and of former members of the Glasgow Association for the Higher Education of Women. The guild undertook to provide lectures for factory girls and to other female workers in the vicinity of Glasgow. In 1883 local educational centers were formed at Ayr and Helensburgh, where afternoon lecture courses (ten each) on English literature and the French Revolution were given to women. The following year three other centers were established: Kilmarnock, Paisley, and Hamilton, with lectures on history, political economy, English literature, and physiology.

The next step was the formal constitution of an extension board by the University of Glasgow. Queen Margaret's Guild promptly transferred its extension scheme to this newly-constituted extension board and paid over the surplus funds from local lectures towards the further endowment of Queen Margaret College, which soon became an organic part of Glasgow University.

## GLASGOW UNIVERSITY EXTENSION.

Lectures on literature, philosophy, and scientific subjects had been given in the East End of Glasgow by various graduates of that university as early as 1834. In April, 1886, the question was discussed in the general council of the University of Glasgow whether the university should not place itself at the head of this movement. The general council favored the adoption of University Extension and represented the matter to the university court. With the approval of this body the Senate

organized in 1887 a scheme resembling that of the English universities for the extension of university teaching. For the sake of placing the work on a broad foundation, and securing further cooperation, the Senate appointed "a Glasgow University Extension Board" of over 70 ladies and gentlemen in the city, with the honorable Sir Thomas King, Lord Provost of Glasgow, as chairman, and Robert Gourlay, manager of the Bank of Scotland, as honorary treasurer. The first meeting of this board was held February 1, 1888, when a constitution framed by the university court and the Senate was adopted and an executive committee was appointed to prepare a detailed plan for extension work. Such a plan was duly drawn up and was printed at Glasgow by the university publishers in 1888 under the title of "Extension of university teaching by local lectures and classes—An account of the scheme and the mode of working it."

The purpose of the scheme was to extend the advantages of university education to those whose circumstances do not permit them to attend the university. The proposed teaching was designed to meet the wants of (1) ladies, (2) clerks and other persons engaged in business, and (3) artisans of all classes. Day lectures in the larger towns were organized for ladies and evening classes for clerks, shopmen, and artisans. The method of instruction was to be by courses of lectures, one lecture each week for a period of three months. Before each lecture there was to be a tutorial class conducted by the lecturer. For this class weekly exercises were set and criticised. At the end of each course a written examination on the subject was conducted by a special examiner appointed by the extension board. To this examination only those who had attended the tutorial class were admitted. Candidates passing a satisfactory examination received a joint certificate from the lecturer and the examiner. But regard was shown for the work done in the weekly exercises as well as in the final examination. The cost of a course of 12 lectures, extending through a period of three months, was fixed at £32. The lecturer's expenses and the cost of hall, lighting, heating, advertising, and local management were to be defrayed by the local committee. The total expenses were estimated at £50.

Attention was called in the prospectus to the importance of forming a good local committee, with an efficient secretary. It was recommended that the work of local organization be undertaken under the auspices of the provost or chief local authority in a given town. The extension board promised to send upon invitation a proper representative of University Extension to explain the details of the work. It was urged that the local committees should be fairly representative of the locality, so as to secure freedom from political or sectarian bias. Local committees were advised to obtain subscriptions, or promises to take tickets, rather than depend on the plan of covering deficiencies by a guarantee fund. The importance of personal effort and personal canvassing was urged upon local committees by the extension board. It was suggested that "in a locality in which several small towns or villages are contiguous a combined local association may be formed, and it may be arranged that the lectures be delivered alternately in the different villages." The extension board expressed a desire to avoid all conflict with local arrangements for teaching, and made it a condition "that no boys or girls shall be allowed to attend the class for tutorial instruction except with the consent of their teachers."

Among the academic leaders of University Extension in the west of Scotland have been Prof. Edward Caird (afterwards called to Balliol College, Oxford), Professor M'Kendrick, Mr. Archibald Craig, and Professor Wenley, for some time honorary secretary of the Glasgow University Extension board, but now professor of philosophy in the University of Michigan. His report, printed at the Glasgow University press, is altogether the best source of information upon "The University Extension movement in Scotland." He tells us that, in the academic year of 1888-89, 17 extension courses were delivered, with a total attendance of over 1,450. The following season there were 10 established centers in the Glasgow district and two Glasgow

lecturers were invited into the districts assigned to St. Andrews and Edinburgh universities. The number of courses increased to 19 and the total attendance to over 1,500. However, this meant an average audience of less than 100, which was not very encouraging.

The disappointment of this period [says Professor Wenley], strangely enough, was the attempt to attract sufficient audiences to lectures within the city of Glasgow. Two courses were supplied [in 1888-89] at the Mechanics' Institute in the Calton district, upon which some 130 students attended, while three were held in the evening within the university buildings. These, however, for some unexplained reason (I am quite satisfied that the fault lay neither with the lecturers nor with the management), were a total failure, and the effort to spread the movement in the city was abandoned for some years.

This is very remarkable testimony for a university man in such a liberal and progressive town as Glasgow.

Of course with such poor financial returns as came from the small audiences already indicated, a deficit quickly arose, but it was cleared off by liberally minded ladies and gentlemen who believed in the spirit of the movement and were either members or supporters of the Glasgow Extension board. It is hardly to be expected that any form of higher education should pay financially. Colleges, universities, foreign and home missions never have paid expenses in a strictly mercantile way and never will. But for all that, and all that, they will continue to be supported.

In spite of continued discouragement and financial depression, the missionary movement in Glasgow for the higher education of the people was faithfully kept up and has achieved very considerable success in connection with that remarkable local institution, the Glasgow Athenæum.

To sum up [says Dr. Wenley], the operations of the Glasgow board, making due allowance for the drop of 1890-91, have been steady to a gratifying extent. But, till financial arrangements are somewhat altered, and the board's certificate receives a certain academic value, little expansion need be expected. During the seven sessions over which the work has extended there have been, on the average, 8 centers, taking 11 courses, and drawing as nearly as may be 1,000 students; while, in addition, during the past four years, the board's lecturers have given some 14 courses at the Glasgow Athenæum and elsewhere. Taking these into account the annual average of courses is 13, and the attendance may be stated at between 1,100 and 1,200. Compared with the splendid English results, this seems a meager achievement; but, ere it can be properly estimated, a calculation, based on relative probability, must be made. Were the Scotch movement at the four universities as successful as the English it would now have some 55 centers in operation, drawing about 6,000. Our Glasgow results are, therefore, precisely one-third of what they ought to be, judged by the English standard. Our area includes nearly one-half of the population of Scotland. Accordingly, were we keeping in line with Oxford, Cambridge, and London, we should have not less than 20 centers, and from 2,500 to 3,000 students.

But there are in the Scotch situation, as in the American, some compensating advantages as compared with England's apparent superiority in the matter of University Extension. Both Scotland and America enjoy better education for the whole people. Both have some superior institutions. For example, the Glasgow Athenæum impressed the present writer, when he saw it in the fall of 1896, as a veritable people's club, combining all the essential features of a well-appointed clubhouse, cuisine, billiard rooms, conservatory of music, library, reading rooms, lecture hall, and theater, all for the most modest charges. It is no wonder that Glasgow young men and young women do not care much for University Extension, per se, if the Glasgow Athenæum is a fair type of what citizens can do for themselves. That People's Club and People's University, with all its rambling architecture and extreme simplicity of interior arrangements, outclasses, for popular educational usefulness and social attractions, almost anything else that an American observer can find in Scotland or in all England, outside of Birmingham and London.

Glasgow is one of the municipal and educational leaders of the world. Her university, public schools, libraries, and town hall are models of their kind. American cities may well study Glasgow examples, as Dr. Albert Shaw has done in his excellent book on Municipal Government in Great Britain; but a glimpse of that Glasgow Athenæum convinced me that there is "a more excellent way," even in America, than University Extension. That way lies through people's clubs, public libraries, city and town institutes, or people's universities. In America we are gradually getting our Cooper, Drexel, and Pratt institutes, our Boston, New York, Philadelphia, Baltimore, and Chicago public libraries,<sup>1</sup> our National Museum and our Library of Congress at Washington. Our American people will some day arrive at a Federal or National University without waiting for local university extension.

#### PART II.—EAST SCOTLAND.

We now turn from the west coast of Scotland to the east, from the permanent institutional results of Scotch University Extension in the union of Queen Margaret College and Glasgow University, to other no less remarkable fruits of pioneer planting.

#### UNIVERSITY COLLEGE, DUNDEE.

In the year 1874, five courses of lectures were given in Dundee by professors from the University of St. Andrews. There were three courses of 20 lectures, on chemistry, natural history, and physiology, and two shorter courses on the poetic interpretation of nature and on comparative religion. These latter were given by the two principals of the University. The citizens of Dundee had generously subscribed a guaranty fund for the payment of expenses and the high school of Dundee was utilized for class rooms. This extension work was carried on with success for two years and resulted in the establishment of the University College of Dundee.

#### INTER-UNIVERSITY COMMITTEE.

The beginnings of University Extension in the east of Scotland were due to the pioneer influence of individual university men who, in 1887, formed a kind of provisional general committee representing professors in the three eastern universities, St. Andrews, Aberdeen, and Edinburgh, and other public-spirited friends of education. Public meetings were held. Circulars and specimen syllabuses or outlines of proposed extension lectures were prepared and distributed. Local societies were organized for the promotion of the cause. Courses of lectures on botany and zoology were given in 1887 at Dunfermline. At Dumfries a course on geology was attended by an audience of about seventy. At Perth four different courses were attempted in one winter season, two before and two after Christmas: (1) English literature, with 146 students; (2) physiographical geography, 237; (3) political economy, 113; (4) Greek life and thought, 114; a total of 610.

#### UNIVERSITY OF ST. ANDREWS.

In 1888, a lecture extension association was organized by professors in this university. Professors Knight and Geddes were the secretaries and most active promoters.

<sup>1</sup>Andrew Carnegie has given altogether over \$3,000,000 for the establishment of 84 libraries or institutions in the United States and Great Britain. His conditional offers now outstanding, which will probably be accepted, will amount to \$2,000,000. The list of his gifts shows that \$5,810,000 was expended in founding the institutes and libraries at Pittsburg, Allegheny, Braddock, Homestead, Duquesne, and Johnstown (the cities or towns in Pennsylvania where his former employees live). When American capital and Scotch or Puritan character continue to be combined in such institutions as public libraries and people's institutes, we may look hopefully toward the future triumph of popular educational and enlightened labor. Mr. Carnegie has lately given \$3,600,000 for extending his public library, art gallery, museum, and music hall in Pittsburg.

Thirteen different centers were quickly established and 21 courses of local lectures were given, with a total attendance of over 1,800. Of this number Perth contributed 520.

One of the best accounts of "The University Extension Lecture Scheme in Scotland" is an address upon that subject delivered by Professor Knight, of St. Andrews, to the University Education Society at Perth in the spring of 1889. The following extracts from Professor Knight's address are of historical and educational value. Regarding the origin of the movement he said:

It sprang neither from jealousy of, nor from antagonism to, the universities. On the contrary, while it has been so far due to the unconscious and ever-increasing purpose of the ages, it has also been the product of a true missionary zeal, born within the universities themselves. It has been the outcome of a desire to give back to the masses something of what past generations, by means of our historic university system, had already given to those who started the movement. \* \* \* The universities of the country exist for the sake of the people of the country; and our Scottish universities are popular in a sense in which those of England never have been and can not possibly be. It is well to remember in this connection that there exists in Scotland through the munificence of past benefactors the means of giving a full university training to every boy who proves himself worthy of it at the primary schools of the country. A bursary or scholarship system has been established at all our university seats—through the donations of many in the distant past and by some in recent years—by which the sons of the very poorest in the land can get to the university, if they give evidence at school of ability to profit by it; and there are special county bursaries connecting particular localities with the universities. You in Perth have a notable instance of this in the Macdougall benefaction—a legacy quite recently left by a lady who used to reside in your city—by means of which the cleverest boys from the schools of the city or county can get up for three years either to Edinburgh, Glasgow, or St. Andrews.

Professor Knight endeavored to make the fact quite clear that University Extension lectures were no adequate substitute for study in residence at the university itself. He said:

Depend upon it, much as may be gained in this city of Perth, and elsewhere, from these Extension lectures, \* \* \* you can not possibly receive from them what residence at a university gives to the young men (and let us hope in the near future, the young women) who come up to us as regular university students. One of my own expectations is (as a result of these lectures) that many a father and mother, who have benefited by them, will feel so much the better for the initiation gained, that they will resolve, if possible, to send one of their children to a university, to obtain the larger culture, the fuller and richer knowledge, to which these courses of lectures have only opened the door.

'Speaking of the education of the people Professor Knight said:

This whole movement for the education of the people by means of University Extension lectures has originated in a new perception by the universities themselves of what they owe to the nation. It is the outcome of a desire on their part to bring something of what they possess (and have long possessed exclusively) to bear upon the masses. It has been a purely missionary movement. \* \* \* University men have felt that, since additional power has been intrusted to these classes, the question of the best way of educating them so that they may use that power intelligently is a pressing one. The belief is spread, and has become almost universal, that it will make them better citizens and better politicians, as well as better operatives, and better men and women, if they are educated as thoroughly, as systematically, and as continuously as possible—if they know something of the history of the human race, and of the history of literature, of the nature of the universe in which they live, of the laws that govern it, which are embodied in the sciences, and of the many social forces that surround them; and, further, if they get to know this, not in a haphazard way, from the accidental reading even of the best books which a local library can supply, but by the authoritative exposition of particular branches of literature, by men competent to teach them.

Upon the best means of high popular education Professor Knight said:

An educational system must have a personal element connected with it, and it must gather its inspiration from that personal element. It must, therefore, include within it

oral teaching. It must have the influence of the lecturer superadded to that of his lecture, the influence of the teacher added to that of his teaching. Then it must be education by one who, if not an expert, is at least thoroughly acquainted with the details of his subject; and, further, it must be imparted by one who has the gift of teaching, that rare addition to the gift of knowledge. \* \* \* I heard lately of an interesting classification of persons known to her by a lady who divided them all into two classes—persons who can kindle and persons who can not. She meant those who had this gift of rousing to enthusiasm, of exciting interest, of stimulating, and leaving a fresh, breezy influence behind them; and those, on the other hand, who, however learned or able, lacked this delightful gift, this charm of personality. Now, I take it that the best University Extension lecturers belong to the first of these two classes, persons who can kindle, who can fire their audiences with new interests and new ambitions. Well, then, the universities of Scotland, as well as those of England, have devised the plan of licensing or registering their more accomplished graduates for this purpose. Those persons whom they select and license are either (1) those who hold or have held the office of professors' assistants, or (2) graduates in arts who have taken first-class honors in the department in which they desire to lecture, or (3) doctors of science, or (4) graduates who have given evidence of distinct eminence in the subjects on which they propose to lecture; or, finally, distinguished experts in any branch of knowledge who are known to be competent lecturers.

The criticism is often made that University Extension courses of 12 lectures must necessarily be superficial. Upon this point Professor Knight remarked that, while every regular course upon university premises consisted of 100 lectures, it was quite possible in a course of 12 lectures, given by a competent teacher, "to lay foundations of thorough, systematic, and orderly knowledge in any of the sciences. One of the charges brought against the movement is that such a course must of necessity result in superficiality and the conceit of knowledge rather than its possession; and we are reminded of the stale proverb about a little knowledge being a dangerous thing. But really all of our knowledge, at the very best, is little. It is all a question of degree, of a little more, or a little less, and I think there are very few possessors of knowledge who are in a position to speak of the danger of possessing less than they themselves have. What we all need is some knowledge, be it great or little, and more knowledge and an ever-increasing knowledge, and above all the ability to carry on its acquisition by sound methods of research."

Professor Knight mentions the interesting fact that in both Glasgow and St. Andrews University Extension lectures were delivered within the precincts of the university buildings, not to the regular students but to popular audiences. "In other words local University Extension societies have been formed by the university seats themselves." In conclusion, Professor Knight emphasized the gain which would result to the whole country from the formation of university lecture societies in every town of importance:

It is not only that intellectual life will be combined with enjoyment, education with recreation, the serious pursuit of knowledge with the delights and fascinations of acquiring it; it is not only that social barriers will be broken down, and all classes united in the pursuit of an elevated purpose; it is also that lessons will be taught and habits formed within each community of incalculable value to every one—habits of thoughtfulness and thoroughness, of intellectual ambition, of patient study, of calm judgment, of the reiterated pondering of problems in the pursuit of truth; lessons, too, of humility in investigation, of acquiescence in the limits of our faculties, and modesty in the expression of those convictions in which the results of knowledge are summed up. There is no doubt that attendance at these lectures, and taking part in the work that follows them, has already given a new sense of the dignity and the value of life to thousands. It has opened up fresh horizons of hope and of endeavor to the masses. It has dispelled the life weariness of routine workers and day laborers. It has cheered the lives of artisans and shopkeepers, of young men and maidens, of old men and women. It has checked the gravitation of interest toward the selfish side of life, to which so many are exposed in the hard struggle for existence, and has proved to the onlooker and the critic that the best way to meet any ignoble tendency of human nature is to foster and to stimulate a noble one.

Representatives of the four universities of Scotland, St. Andrews, Aberdeen, Glasgow, and Edinburgh, early apportioned to their own institutions the adjacent or neighboring counties. To St. Andrews were assigned Perth, Fife, Forfar, and Clackmannan. In Perth was established in 1887 a university education society, and by far the most successful and continuous work was done in that city. It furnished a large proportion of the entire attendance on subsequent lectures in the St. Andrews district. Perth alone of all towns in the district remained faithful to the extension cause, and in 1893 declared the local independence of its education society. Henceforth the town went its own way and made its own arrangements for local lectures.

The leaders of the University Extension movement in the east of Scotland have been Professor Knight, of St. Andrews, and Professor Geddes, of the University College of Dundee. Professor Knight is well known in America by reason of his writings and lectures on Wordsworth. Professor Geddes is also distinguished for his remarkable book on the Evolution of Sex and for his suggestive lectures in Boston and elsewhere on sociology and historic evolution. He has been for many years the virtual head of the International Summer School at Edinburgh, described by the present writer in the Report of the United States Commissioner of Education, 1897-98. He is also the founder and promoter of that noble effort toward the architectural renaissance on Edinburgh Castle Hill, where the so-called "University Hall" and the "Outlook Tower" are living monuments to his educational and social genius.

#### EDINBURGH UNIVERSITY EXTENSION.

In 1888 the senate of the University of Edinburgh, with friends of higher education in Scotland, instituted a lecture extension association. Following the example set by Cambridge, Oxford, and London, and encouraged by the success of the experiments in Scotland already made, this association offered to provide a course of 12 lectures on academic subjects by distinguished specialists from the university. The proposed style of treatment, while strict and scientific rather than popular in the ordinary sense, was made attractive to all who were desirous of carrying their education beyond high-school limits. The same methods of local organization as those prevailing in England were recommended. The fee charged by the university for a course of 12 lectures was £32. The burden of local expenses and of the railway fares of the lecturers was thrown upon local committees. It was required that a sufficient sum be subscribed locally before the association would consent to send a lecturer. The regulation of the sale of tickets was put in the hands of the local committee. Two terms of public instruction were provided for, one before and the other after Christmas.

To Edinburgh were assigned by university agreement the counties of Edinburgh, Berwick, Haddington, Linlithgow, Peebles, Roxburgh, Selkirk, and Stirling.

The practical results of the first year's work were 9 courses of extension lectures given at as many local centers, with a total attendance of about 1,000. The only two centers which fell properly within the Edinburgh district were Stirling and the Philosophical Institute of Edinburgh. The remaining 7 courses were given by special request under the auspices of St. Andrew's University Extension. Edinburgh lecturers continued to be invited into fields belonging to other universities, but made comparatively little headway in Edinburgh territory. There was no attempt at rivalry or interference, but the Edinburgh association had more available lecturers than did St. Andrew's or Aberdeen and was, therefore, able to supply local demands. The attendance upon Edinburgh Extension lectures was not large, either at home or abroad. Many courses attracted less than 100 hearers. In one year there were 14 courses, with an aggregate attendance of only 1,190. Of course there could be no permanent success for the Edinburgh Association with such meager and inadequate support. Gradually public interest and academic enthusiasm died

out. Dr. Wenley says: "The ease of access to the universities, the elaborate system of lectures in connection with local societies and churches, and the low rate of admission to the lectures of several trusts, may partly explain the apathy of the people of Scotland."

UNIVERSITY OF ABERDEEN.

In the distribution of county territory to the four Scotch universities there fell to Aberdeen the county of Aberdeen, Banff, Caithness, Elgin, Nairn, Inverness, Kincardine, Orkney and Shetland, Ross, and Cromarty, with Sutherland. This region is good for summer visitors and for the cultivation of the Scotch game of golf, but the north of Scotland is not altogether favorable to University Extension. In 1889 the local examination board of the University of Aberdeen offered winter courses of local lectures, but there was no response to the offer. Only one attempt is on record, and that was in 1889, viz, the individual enterprise of Mr. Bruce, rector of the Royal Academy of Inverness.

OBSTACLES TO SUCCESS.

The University Extension movement in Scotland has undoubtedly quickened public interest in the higher education of women, adults, and the people at large. Queen Margaret College at Glasgow and the University College at Dundee are signal examples of the historic triumph of this movement, but it must be admitted that there are certain obstacles in the way of continued and lasting success. To some extent, the same conditions which Dr. Wenley describes as militating against the scheme in Scotland have been encountered in America.

For example, the general diffusion of popular education in both Scotland and America makes University Extension virtually a luxury. Both countries are devoted to public schools, libraries, institutes, and literary societies, which meet the present needs for public instruction and the diffusion of knowledge. In both countries there are in practical operation certain endowed systems of public lectures. In both, save in large towns, population is too scattered and the distances are too great for successful extension courses. The physical obstacles are enormous. Moreover, it is not easy to find and retain vigorous young men who are really fitted for public teaching over wide areas. The work requires not only extraordinary endurance, but very peculiar intellectual and social gifts. In both Scotland and America there are but few college and university professors with any surplus time or energy for extension work. All regular instructors are overburdened with routine duties.

For these and many other good reasons, University Extension has not been such a decided success in Scotland and America as it has been in England; but enough has been accomplished to show the merits and methods of the system and to demonstrate the necessity of cultivating more favorable conditions. Dr. Wenley believes, as the writer has long maintained, that there must be a specially trained staff, a flying column of University Extension lecturers, quite distinct from the regular college faculty or university staff. Professors can not leave their academic posts for frontier work. It is impossible to do justice to regular classes on academic premises and at the same time meet classes at vast distances from home.

The Scotch reviewer of the experience of his own country in University Extension quotes, in conclusion, and with entire approval, the general principles and conditions of success as laid down by Dr. Roberts, for many years an acknowledged leader of and still an authority on University Extension in England:

1. The teaching should be given in the evening, in order to supply the needs of those engaged in business occupations.

2. The subjects should be mainly those possessing a general interest by reason of their bearing upon ordinary life, notably the various branches of natural science,

political economy, industrial and commercial history, geography, literature, and art (in the sense of art appreciation, not art production).

3. The method of teaching should be designed to give a thorough grasp of principles and a real mental training; to that end there should be opportunities of personal intercourse between the lecturer and students and regular home work for him. In the scientific subjects there should be practical laboratory work in addition to the theoretical lectures.

4. A curriculum of study should be arranged, extending over a period of years and covering a range of subjects sufficiently wide to give a broad and liberal higher education.

5. Students passing through the complete course of prescribed study should at the close receive some university stamp and recognition, such as certificates, and a degree for work done in residence.

#### UNIVERSITY EDUCATION FOR WOMEN IN SCOTLAND.

The institution of local examinations by the university in 1864 was the first practical and academic encouragement of the higher education of women in Scotland. But for them these examinations were only a test of individual work done at home and in purely private ways. There was as yet no provision for giving women advanced instruction in the various arts and sciences. In 1866 Miss Mary McLean (now Mrs. Crudelius), of Edinburgh, began to interest herself in securing for her sex better educational advantages. She had heard of the local lecture courses given by Professor Stuart to the ladies of the north of England, and she determined to obtain equal if not better opportunities for women in the university town of Edinburgh. Assisted by her friends, Mrs. Daniell and Mrs. Rankin, she organized in 1867 "The Edinburgh Association for the Higher Education of Women." She arranged for an opening course of lectures on English literature by Prof. David Masson, upon much the same plan of instruction as that employed by him in his university classes. A ladies' class of 265 members successfully followed the Edinburgh professor through his course of instruction. This was the result of the first season's work.

Beginning at the opening of the next academic year, in November, 1868, three new courses of lectures were organized, in the general field of liberal arts. The first course, in literature, conducted by Professor Masson, was followed by 129 ladies. The second course was in natural science, taught by Professor Tait. The special subject was experimental physics, and it attracted 141 lady students. A third course was that in logic and psychology. Lectures upon these subjects were given by Professor Fraser. It is said to have been the first course of the kind for ladies in the educational history of the British Islands. There were 65 students in this class, and we are told that the average work of the ladies "was higher than the average of the university students, while some of the best women were better than the best men."

The next step was the transformation of the ladies' society into the "Edinburgh Association for the University Education of Women." New courses of instruction were added, and a varied curriculum extending through successive years was instituted. The first sign of university recognition was in 1873, when a certificate was given to lady students who had satisfied the examiners in three subjects. In 1875 a higher certificate, or so-called diploma, was given to women who had passed in seven subjects, with honors in at least one, and with the same standard as that required for the M. A. With this stimulus of honors before it, the association rapidly developed courses in Greek, Latin, chemistry, geology, physiology, zoology, economics, education, biblical criticism, art, and music. Altogether over 6,000 class tickets were issued to ladies in Edinburgh. It is most remarkable that this Edinburgh movement has not been guided by lady teachers or especially followed at first by ladies desiring to become teachers. "It was essentially a fashionable movement

among the leisurely and cultured classes." Pedagogical and preparatory classes were, however, developed. Instruction by correspondence was instituted for the benefit of "lonely workers all over the country."

From such beginnings the friends of the academic training of women in Scotland have gradually advanced until at last, in the year 1892, the arts curriculum of the old university in Edinburgh was thrown open to lady students.<sup>1</sup>

#### XIV. ARNOLD TOYNBEE AND TOYNBEE HALL.

##### I. ARNOLD TOYNBEE.

Thomas Arnold, the headmaster of Rugby, died in 1842. Ten years later was born Arnold Toynbee, the Oxford student reformer. I was first led by a fancied resemblance between the ideas and popular teachings of these two men to conjecture a possible connection between their names. This conjecture was verified upon inquiry made in England. Mrs. Toynbee, the widow of the lamented Oxford reformer, said the name Arnold was given him by his father in memory of Dr. Arnold, for whom Dr. Toynbee had a great admiration. Dr. Toynbee, the father, appears, like Dr. Arnold, to have engaged in popular educational work for the improvement of workingmen. He often employed the services of his young son, Arnold Toynbee, in the conduct of scientific experiments. In this way the youth probably acquired that interest in the elevation of the masses so characteristic of his later work in the East End of London.

Toynbee's early dreams were not in the direction of philanthropy, but of a military education, and afterwards of training for the civil service. He studied for a time in King's College, London, but afterwards retired to a seacoast town in Dorsetshire, for quiet and uninterrupted study. A letter written from this town in 1871, when he was 19 years of age, clearly indicates his character of mind and heart:

For myself I have, since the beginning of April, with the exception of a short interval in July, been reading alone at this quiet little village near the seacoast, ostensibly with a view to a university career; but determined to devote my life and such power as I possess to the study of the philosophy of history. With this object in view, I have no inclination to enter any profession; nor do I think it probable that I will compete for a scholarship at the university. To these pursuits I wish to give my whole life. The small means at my disposal, and those which without the expenditure of much time I hope to be able to add to them, will be sufficient for my maintenance. I do not care to spend my life in acquiring material benefits which might have an evil, and at any rate could not have a good, effect upon me. These ideas may appear ridiculous in one so young and of powers so immature, but they are not the result of mere ambition, or of an empty desire for fame in itself, or for the rewards with which it is accompanied. My sole, and so far as it can be so, unalloyed motive is the pursuit of truth; and for truth I feel I would willingly sacrifice prospects of the most dazzling renown. I do not even think myself capable of accomplishing any work of importance. If my labors merely serve to assist another in the great cause, I shall be satisfied.

Here we clearly see the highest ideal of modern science and of modern scholarship. Truth for its own sake and truth for the service of others. That is the best which modern culture can possibly reach.

At the age of 21 Toynbee proceeded to the university and became a member, first of Pembroke and afterwards of Balliol College. He attempted to compete for a scholarship in modern history at Balliol College, but was unsuccessful. He had studied by himself without much assistance from tutors and was unable to satisfy the

<sup>1</sup>An interesting historical sketch of the Admission of Women to the Scotch Universities has been written by Mrs. Charlotte Carmichael Stopes for the Boston Evening Transcript, December 9, 1892, upon which article the above account is based.

A history of the struggle in Edinburgh for the medical education of women, and how they were driven to Paris, is given by Dr. Frances Hoggan in a book entitled *The Woman Question in Europe*, edited by Mr. Stanton.

demands of regular examiners; his fault, however, appears to have been the possession of too much originality. One of his examiners said to him, "You have been accustomed to talk brilliantly in society, and you have written your papers just as you would talk, with a view to effect." For a man who had deliberately shunned society for the sake of independent and profound study, such a criticism was extremely unjust, but it undoubtedly served, in Toynbee's case, a good purpose; for whatever may be the defects of college tutors and college examinations, there is a great advantage to be derived by every student from the experience and methods of regular teachers.

At Oxford Arnold Toynbee, who had lived more or less in seclusion, came into the current of social life in a great university, and that life was for him the best of educators. English universities have always excelled the German universities in the cultivation of the social instinct and of the humanities. Toynbee's impressions of Oxford are well described in the following extract from a letter dated at Balliol College, October 20, 1875:

The garden quadrangle at Balliol is where one walks at night, and listens to the wind in the trees, and weaves the stars into the web of one's thoughts; where one gazes from the pale inhuman moon to the ruddy light of the windows, and hears broken notes of music and laughter, and the complaining murmur of the railroad in the distance. The life here is very sweet and full of joy; at Oxford, after all, one's ideal of happy life is nearer being realized than anywhere else; I mean the ideal of gentle, equable, intellectual intercourse, with something of a prophetic glow about it, glancing brightly into the future, yet always embalming itself in the memory as a resting-place for the soul in a future that may be dark and troubled after all, with little in it but disastrous failure. The master [Dr. Benjamin Jowett] is very kind; he does not want me to work more than a few hours daily. I am reading Aristotle's Ethics, and shall read Thucydides as well, and I hope a little political economy; that is all this term. With care I may be able to do this, but even this will require great care.

Toynbee's health was extremely delicate and he was forced to spend most of his time in social intercourse with his friends rather than in the study of books. To this fact, perhaps, is due his strong inclination to those subjects affecting real life and the interests of his fellow-men. He early turned his attention to the subject of political economy and social science; and yet the historical spirit survived, giving character and direction to his studies.

Arnold Toynbee was by nature and previous training peculiarly suited to become an academic champion of what is now called the historical school of political economy. Originating in Germany through the teachings of Knies, of Heidelberg, and Roscher, of Leipsic, this new school found in England a few ardent exponents, notably Cliffe Leslie and Arnold Toynbee, through whom it has become known to the rising generation in the English universities. These men have set themselves against the old system of economic thought in England, or what is ordinarily called the orthodox school of political economy. This may be briefly characterized as the dismal science of human selfishness, or the science of wealth, based upon certain abstract laws, popularly known as the laws of competition, the laws of demand and supply, the doctrine of rent, etc. The whole system is based upon certain assumed principles, which are supposed to regulate all economic life, regardless of varying historic conditions and reckless of all interests save those that are bought and sold. Over against this mercantile view of economics the historical school has taken the impregnable position that men are not and should not be absolutely selfish in their economic relations; that there is and always has been a moral element in the business world, in the relations of capital and labor, master and servant; and that this ethical factor must be recognized in any true science of political economy. In other words, the dismal science is being humanized. Doctrines of selfishness and individualism are supplemented by conceptions of generosity and public spirit, which

coexist in human nature and modify economic action, according to the stage of moral development which society has reached in the different nations.

Toynbee well describes the significance of the new school in his chapter on Ricardo and the Old Political Economy. He says:

The historical method has revolutionized political economy, not by showing its laws to be false, but by proving that they are relative for the most part to a particular stage of civilization. This destroys their character as eternal laws, and strips them of much of their force and all their sanctity. In this way the historical method has rescued us from intellectual superstitions. The earlier economists, like Adam Smith, were concerned with production, but when they came to the more delicate task of distribution, they failed. A more equitable distribution of wealth is now demanded and required. But this end can only be attained coincidentally with moral progress, for such an end a gospel life is needed, and the old political economy had none. This was its great fault, a fault which, now that its work is done, has become glaring in the extreme. Such a gospel must now be put forward, or all that work will fail. Morality must be united with economics as a practical science.

This characterizes precisely the difference between the new and old schools of political economy. The distinction can be made clear in the commonplace language of the shop and the street. The old economy says, "Business is business, and that is all there is about it." This is the language of the usurer, the extortioner, the "sweater," the human animal grasping all that he can hold and greedy for more. The new economy says, "Business is fairness; business is economy touched with honor and morality." This distinction makes all the difference in the world. It tends to civilize and humanize the struggle for existence.

Through Toynbee's influence, the views of the historical or ethical school of political economy have taken deep hold upon the consciousness of the university men in England, who will reshape the political economy of this generation. Indeed, the article on political economy in the *Encyclopædia Britannica*, by J. K. Ingram, librarian of the Trinity College, Dublin, is written in the spirit of the new school. The writer speaks thus of Toynbee:

Arnold Toynbee (1852-1883), who left behind him a beautiful memory, filled as he was with the love of truth and an ardent and active zeal for the public good, was author of some fragmentary or unfinished pieces, which yet well deserve attention, both for their intrinsic merit and as indicating the present drift of all the highest natures, especially amongst our young men, in the treatment of economic questions. He saw that our great help in the future must come, as much had already come, from the historical method, to which in his own researches he gave preponderant weight. Its true character, too, he understood better than many even of those who have commended it; for he perceived that it not only explains the action of special local or temporary conditions on economic phenomena, but seeks by comparing the stages of social development in different countries and times to discover laws of universal application. If, as we are told, there exists at Oxford a rising group of men who occupy a position in regard to economic thought substantially identical with that of Toynbee, the fact is one of good omen for the future of the science.

Toynbee's interest in real life and in the social condition of the poorer classes led him to spend one of his long vacations in the East End of London, the workingmen's quarter. Here he took lodgings in a common house on Commercial Road, Whitechapel, and lived in the simplest possible way among the people whose condition and needs he wished to study. He put himself into connection with existing institutions, such as the Charity Organization Society, and certain mission schools, supported by the church. Toynbee always recognized the importance of utilizing social forces already at hand. He even joined the Tower Hamlets' Radical Club in the East End of London, and there, in an atmosphere of bad whisky and bad tobacco, took part in workingmen's discussions of economic and social questions. Such experience gave him considerable popularity and influence with the laboring classes. Although untrained in public speaking, Toynbee found himself able to command popular attention upon serious subjects. Writing from Whitechapel to a friend he

said: "I spoke last night for forty minutes, with hardly a pause, and without hesitating for a word. My friend, who was with me, was warm in his congratulations; the audience were impressed, very friendly, and attentive. I feel as if I had discovered a new power to do God's work with, though I am still doubtful naturally about it; it drains my energy; I must use it sparingly, but I hope always in God's service."

Toynbee was graduated from the university in 1878 at the age of 26. He was engaged by Balliol College as a tutor to prepare young men for the East India civil service. This engagement left him considerable leisure time for the prosecution of economic and social studies. He continued to be an active spirit in university life, and interested himself in the organization of a society of students for the promotion of scientific politics at Oxford. He deplored the fact that university men are so powerless in practical life, and attributed this fact to their lack of organization. He said, "Every one is organized, from licensed victualers to priests of the Roman Catholic Church. The men of wide thought and sympathies alone are scattered and helpless." In the student society formed by Toynbee each member took some important political or economic subject for investigation and report to the entire company. These reports furnished the basis for social discussion.

While giving new life and activity to university thought, Toynbee served as a bursar for Balliol College, collecting its rents and coming into close relation with its tenants, whom he deeply impressed with his generous traits of character. He also took an active part in the work of the Oxford Charity Organization Society, and in all social and municipal reforms which were undertaken in that city. He contributed articles to the Oxford Cooperative Record, and was deeply interested in cooperative experiments.

The most remarkable phase of Arnold Toynbee's work was his lectures to the workingmen of England. His student experience in the Tower Hamlets' Radical Club prepared him for this larger experiment in popular education. He developed great talent for the clear and intelligent presentation of economic and social questions. Indeed, public speaking was easier for him than formal writing. The excitement lent by a large audience inspired him to the noblest effort. He addressed various audiences of workingmen in the years 1880 and 1881 upon such subjects as industry and democracy, free trade, the land question, the law of wages, etc. Everywhere he awakened remarkable interest and popular enthusiasm. The writings of Henry George, particularly his *Progress and Poverty*, were at this time beginning to attract great attention in England. Toynbee felt it his duty to refute some of the extravagant doctrines of that brilliant agitator, who himself visited England and excited great furore among the workingmen. Indeed, Toynbee may be said to have lost his life in a campaign against the doctrines of Henry George. In January, 1883, Toynbee gave a lecture on *Progress and Poverty* at St. Andrew's Hall, London, and found his audience strongly opposed to his views of Henry George. He determined to conquer opposition, and threw himself so powerfully into the discussion that, after the victory was won, he found himself completely prostrated from nervous exhaustion. Always delicate and now overwrought by public work of various kinds, Toynbee was unable to rally. He suffered from constant sleeplessness, which brought on inflammation of the brain, from which he died on the 9th of March, 1883, at the age of 31.

One of his friends, Mr. F. C. Montague, fellow of Oriel College, in an article in the Oxford Magazine, April 18, 1883, soon after Toynbee's death, said:

No words can bring back even the faint image of a beautiful life. No words can tell what we lose in losing our comrade and our guide. Deafened by the din of the importunate world without and distracted by insatiable cravings within, few of us can ever listen to the voice of reason, lead our true life, or fulfill our proper destiny. How many soever our harassed and baffled years, how few soever the years of the wise and brave, it is they who have lived, not we. Yet in the thought of such lives

we may find our strength. The memory of an Oxford student who freely gave up his life to help his fellow-citizens will long live in the hearts of all Oxford men, to silence a cynical despair and to shame an epicurean indifference. His example will perpetually remind us of the service which a great university might render to a great nation.

## II. TOYNBEE HALL.<sup>1</sup>

Since Toynbee's death his Oxford friends and student admirers have built to his memory a noble monument upon the site of his early labors among the workingmen of East London. Toynbee Hall is a living monument, and not a mausoleum. It is a building which might not improperly be called a university club in the workingmen's quarter of London. It is a very different institution from those comfortable and attractive places of social resort, the West End clubs of London, although the so-called university settlement in Whitechapel is not without its material and social attractions. Oxford and Cambridge men live there in Toynbee Hall like civilized young Englishmen, with all the appliances for health and creature comfort that modern art can suggest; but Toynbee Hall is something more than a well-appointed city club. It is a beacon light of intelligence and moral culture in a dark and uncultivated district. Toynbee Hall is the educational center for the workingmen of East London and for their families.

In the building there are class rooms where men and women, boys and girls, are gathered for evening instruction. Lectures and lessons are given upon practical subjects, such as the laws of health, improved modes of living, food, cooking, eating, and drinking; upon books, art, music, morals, and the best things that human beings can learn and do. Concerts, debates, talks, instruction in political economy, English history and English politics, etc., are given in Toynbee Hall.

The best talent of our mother country has been called into requisition for the benefit of the workingmen of London. Samuel Rawson Gardiner, author of the best history of modern England, lectures in Toynbee Hall upon his chosen specialty. Into the dark alleys and dusky courts of the tenement-house quarter of London have come such glimpses of the great outer world of historic life and of the higher mountain ranges of human thought and action as were never before seen from the low plane of human existence in that workingmen's district. The people of the East End look with favor upon those young enthusiasts of Oxford and Cambridge, who teach and lecture in those pleasant class rooms of Toynbee Hall. Gentle manners, kindly natures, and social good will to men are here seen by the laboring classes in concrete, visible form. Good morals, religious life, art, education, and refinement are here seen as object lessons. Toynbee Hall men do not often preach; they practice certain principles which have been talked about in England for many hundred years.

The influence of Toynbee Hall upon the university men who spend useful vacations there is also remarkable. One of these earnest workers, in response to a question concerning his part of the work of Toynbee Hall, said :

I would rather not say what Toynbee has done for me, it has done so much for every side of me. And I think that we are now well known and accepted among the workingmen of the outer hamlets. I find them not only glad but proud to come and visit us and be associated with us. *They set us thinking about them, and I suppose we set them thinking about us.* I only hope they find it as interesting and edifying as we do. The chief practical lesson they have taught me is that of sticking to whatever they take up with; their greatest drawback is, I think, a want of background. Politically they have little background of history; morally they are wanting in background of character. \* \* \* If we do anything for them at all, I think we give them a greater knowledge and a better belief in human kind.

<sup>1</sup> On "The Work of Toynbee Hall," see an article by Philip Lyttelton Gell in the Johns Hopkins University Studies, Vol. VII, pp. 57-64. A little magazine called The Toynbee Hall Record is authoritative on the current work of this institution.

Another student replied:

What do we do at Toynbee? I should say this: We see life under varying conditions and new aspects and attempt to partake in the life we see. We learn much; we unlearn more. We have, too—and this is the most important of all—we have the opportunity not only of enlarging our culture and our sympathies, of gaining broader views and a more catholic standpoint, but of building up a new system of relationship side by side with our old, of forming around the hall a new world of student friends, and guest friends, acting and reacting on one another.

The example of educated young men carrying seeds of culture from university storehouses to the common people of England was quickly followed by the educated young women of Girton and Newnham colleges. An establishment similar to that of Toynbee Hall was formed in Southwark by young lady students who spend portions of their vacations in educational and social work among the women and children of this lowly district. It is possible that this and other social experiments in England were partly suggested to the college women by those powerful novels of Walter Besant: *All Sorts and Conditions of Men*, and *The Children of Gibeon*; but the pioneer influence of Edward Denison and Arnold Toynbee will always be cordially recognized by university men and women. The time is not far distant when philanthropic undertakings like Toynbee Hall and Southwark will be seen in all the large towns and cities of America. Indeed, such foundations are already laid in the cities of Boston, New York, Philadelphia, Baltimore, Chicago, and many other towns.

In connection with Toynbee hall, in East London, is carried on one branch of that larger work called "University Extension." The London Society for the Extension of University Teaching has already dozens of educational centers in the great metropolis, and during the past year has reached thousands of students in that city alone. One of these educational centers is Toynbee Hall, where, at evening hours, various extension courses are given to workmen upon subjects of natural science, English history and English literature. The published fragments of Toynbee's remarkable lectures on "The Industrial Revolution" show what kind of economic thought was developed by one of Oxford's University Extension lecturers as early as 1882. If the blood of martyrs was the seed of the Church, the ideas of Arnold Toynbee and of Dr. Arnold, for whom he was named, will yet be the salvation of "Darkest England." An interesting perpetuation of Arnold Toynbee's scientific work may be seen in the "Toynbee trust lectures," given in such places as Newcastle, Truro, Camborne, Redruth, Falmouth, Bradford, Halifax, Huddersfield, and Bolton by economic specialists like L. L. F. R. Price, H. L. Smith, and that devoted friend of University Extension and Oxford summer schools, W. A. S. Hewins. The Toynbee trust lecturers are appointed not merely to give local lectures, but to study and report upon economic and social questions which have been locally studied in industrial centers.

### III. TOYNBEE HALLS IN AMERICA.

The Neighborhood Guild<sup>1</sup> in Forsyth street, New York, was founded in 1887 by Dr. Stanton Coit, a graduate of Amherst College, who first among Americans made a careful study of Toynbee Hall in London. The New York experiment differed from the English establishment in that the leaders of the guild did not live in their own clubhouse, but took lodgings in a respectable tenement house and devoted their energies to the improvement of the surrounding neighborhood. Although the work was started by Dr. Coit single-handed, he was soon joined by other college graduates, some of whom were theological students. Their work was largely educational and social. They formed boys' clubs upon this simple constitution: "Order is our

<sup>1</sup> See article on "The Neighborhood Guild in New York," by Charles B. Stover, *Johns Hopkins University Studies*, Vol. VII, pp. 65-70.

basis, friendship our principle, and improvement our aim." The clubs met on appointed evenings in places rented by the guild and they were supported, like all clubs, by membership fees and special contributions. Many people in New York gave practical assistance to the guild. Young ladies lent a helping hand in the organization of girls' clubs, where evening classes were instituted upon a plan similar to that adopted for the boys. Occasionally the clubs were brought together for a social evening party, so that newly acquired habits of civility and good order, rare qualities among young barbarians, could be put into practice.

Out of the experience of the Neighborhood Guild grew a still more interesting experiment, very similar, in fact, to that undertaken by the college women of England among the working girls of Southwark. A graduate of Smith College, class of 1883, Miss Fine, was the secretary of the Neighborhood Guild, and at the same time a teacher of mathematics in a fashionable uptown school. She volunteered to undertake the management of a woman's college mission or college settlement for practical social work among the poorer people of a particular neighborhood in New York City. From the start, the project was strongly supported by graduates and students representing American colleges for women. An old-fashioned house was rented in Rivington street, once a fashionable but now a poorer part of the city, and there under the protection of a matron, and with Dr. Robbins, a resident lady physician, Miss Fine organized her social and educational mission. She associated with herself competent graduates from American colleges, women with money, leisure, and sense for serious work. These ladies came into residence for definite periods, paid their own expenses, and engaged in such educational classes or neighborhood visitations as seemed expedient. Opportunity was thus afforded, under skillful direction and prudent conditions, for young women to acquire by observation and practical work some real knowledge of the actual life of the poorer classes and of the economic problems connected with their social and moral improvement. With the exception of the managers, the young lady workers came only for a short period of two months or a few weeks, and then gave place to others, who came and paid their own expenses, precisely as girls do at a boarding school for the privileges of education in French, music, art, history, and literature. The Rivington Street Settlement was simply a kind of graduate school in economics and sociology, with practical lessons in a tenement-house district—a kind of sociological laboratory.

With the development and further extension of this college settlement work in America, we are not here concerned. The psychological connection of the original experiment in Rivington street, New York, with the historic examples set by Toynbee Hall and the Neighborhood Guild is indicated by the following "Appeal for a New Work," issued February 12, 1889, by Miss Katharine Lee Bates, of Wellesley College, and Miss Vida D. Scudder, of Boston:

Nearly everyone knows something about the work done and the idea embodied in the Universities Settlement in East London which goes by the name of Toynbee Hall. Here the young men of Oxford and Cambridge live among the working people, teaching them, amusing them, meeting them freely, showing them from day to day and hour to hour the possibility of beautiful, simple, well-ordered lives.

Such work as this answers to a need not national but universal; the need of escaping from the class isolation produced by the mechanical laws of modern society, into a normal, simple, wholesome fellowship with our fellowmen. Educated Englishmen have felt this necessity summon them with imperative voice. If Englishmen, why not Americans? \* \* \* It is hoped that there may be established among the poorer working people of one of our great cities a settlement of college women, analogous in spirit and aim to that at Toynbee Hall. \* \* \* The plan is not new; for over a year it has been quietly taking shape. But it could not be carried out unless a head could be found for the work, who should organize and direct our scattered forces. She must be a college woman of wisdom, experience, and devotion, and there are not many such. \* \* \* Miss Fine is at present at the head of the Neighborhood Guild in Forsyth street, New York; a work among the poor, which has been carried on by means of clubs and classes with success for two years.

Arnold Toynbee died March 9, 1883, but the soul which he embodied and the ideals which he transmitted from an historic predecessor, Edward Denison, and from those spiritual teachers, Profs. T. H. Green<sup>1</sup> and Benjamin Jowett,<sup>2</sup> will live and grow forever. Toynbee Hall is an institution in which risen souls continue to live a larger, more abundant life. "Good, the more communicated, more abundant grows." Toynbee's Christian gospel of educational and social service is visibly extending throughout England and the United States.<sup>3</sup> It is impossible to mention here the living institutions, the men and women, that have been inspired by Toynbee's example. The many college and social settlements<sup>4</sup> that have sprung up in the Anglo-American world since the planting of Toynbee Hall show the multiplying and ever-widening spheres of influence created by a single human life divinely spent.

American college graduates, young men and young women, sometimes become discouraged at the vastness and hopelessness of popular ignorance. They sit down in despair before the monster wrongs and iniquities of American economic and political life. They forget that the only possibility for uplifting the masses, and for any social and political regeneration whatever, lies in work that is nearest home. It is from constant improvements of the local situation, from the establishment of local connections in our towns and cities with the great moral, social, and educational ideas of our time that general reform is to proceed.

To all Americans who are willing to do something for the elevation of society by modern methods of educational extension, I would recommend a thoughtful consideration of these words of Arnold Toynbee: "Languor can only be conquered by enthusiasm, and enthusiasm can only be kindled by two things: An ideal which takes the imagination by storm, and a definite, intelligent plan for carrying out that ideal into practice."

---

<sup>1</sup>The Witness of God and Faith. Two lay sermons by the late T. H. Green. Edited with an introductory notice by the late Arnold Toynbee, M. A., tutor of Balliol College, Oxford. London, Longmans, Green & Co., 1886. For a further study of Thomas Hill Green's philosophy, see his *Prolegomena to Ethics*, edited by A. C. Bradley. Oxford, 1884.

<sup>2</sup>See Jowett's *College Sermons*.

<sup>3</sup>The American extension of the life and theories of Arnold Toynbee was partly due to F. C. Montague's biography of the man in the Johns Hopkins University Studies in Historical and Political Science, Vol. VII, and Jowett's sketch of his pupil in Toynbee's *Lectures on the Industrial Revolution in England*, London, 1884. A portrait of Arnold Toynbee, copied from a photograph sent me from Oxford by Mrs. Toynbee, now hangs in the historical lecture room at the Johns Hopkins University. Another copy may be seen in the frontispiece to Mr. Montague's biography of Toynbee in the University Studies above mentioned. An English pen portrait describes Toynbee as having "an oval face, a high forehead crowned with masses of soft brown hair, features very clearly cut, a straight nose, and a rather large, full-lipped mouth, only needing more color to produce the impression of beauty."

Articles on Arnold Toynbee by H. B. Adams appeared in the *Chautauqua Assembly Herald*, August 4, 1888, and in *The Charities Review*, November, 1891. The present chapter is a revision and expansion of the articles named. In *Gunton's Magazine*, January, 1896, was published a paper on Toynbee and his work by Dr. M. McG. Dana.

<sup>4</sup>There is a published *Bibliography of College, Social, and University Settlements*, compiled by M. Katharine Jones, of the College Settlements Association. The number, variety, and growing activities of these academic settlements will impress the observer with the vast possibilities of this interesting social work by college graduates. It is a form of laboratory work in social science and ought to be fostered by every church, college, or university which desires to be in touch with the living age.

## CHAPTER XIX.

### BIRD'S-EYE VIEW OF THE ST. LOUIS PUBLIC SCHOOL SYSTEM IN 1880.<sup>1</sup>

By W. T. HARRIS.

#### BOARD OF THE PUBLIC SCHOOLS.

*Organization.*—All powers relating to the management of the St. Louis public schools are vested in a body politic and corporate, styled “The board of president and directors of the St. Louis public schools.”

1. This board consists of 28 members—one from each ward.

2. The officers of the board are: First, a president and vice-president; second, a secretary; third, a superintendent; fourth, two assistant superintendents, one of whom must speak German; sixth, attorney; seventh, bailiff; eighth, treasurer; ninth, architect; tenth, supply agent.

3. The board and its officers are all the persons who have any official connection with the public schools.

4. The members of the board are elected by the people for a term of three years—one-third go out of office each year.

5. No member of the board can hold his seat if interested in any kind of contract touching the schools.

6. An important feature in the organization of the board is its standing committees, consisting of one member from each district (composed of two wards). These committees, thus made up of members from different parts of the city, have in charge the business of recommending teachers, regulating the course of study, selecting plans for buildings and supervising their erection, leasing the real estate, etc. The advantage of this arrangement in protecting local interests from local influences is obvious.

#### REMARKS.

*I. Relation of public schools to the State.*—The principle on which the Government in this country is based requires that there shall be no authority exercised by the General Government in matters of merely local interest. The National Government shall not interfere unless in national interests; each State only in what interests that State. To the municipal authority shall be left all purely local affairs. Hitherto in the history of the nation, education has not been deemed a subject for national legislation, except in so far as to make grants of land for the support of schools and colleges, and to appoint a national commissioner of education, whose duty it is to collect statistics and disseminate information. While it assumes the authority to legislate for education, it does not assume the local management, but only furnishes material

<sup>1</sup> From the St. Louis School Report for 1878-79, pp. 252-264.

aid. The individual States, however, have recognized education as a matter of legislation, and have constitutional and statutory provisions to provide funds, and to enjoin upon municipalities the duty of establishing schools.

The general participation of all the people in the functions of electors makes it a matter of concern to each and every man what the educational qualifications of all his fellow-citizens are. The fact that local self-government is the rule makes universal education necessary. The National Government and the State and municipal governments regard education as a public necessity; therefore, on the ground that the people are not only to be law-abiding citizens, who are intelligent enough to read and understand the laws which they are expected to obey, but are also to be the law-makers, and who should therefore be intelligent enough to perceive the social and historical conditions that make occasion for new laws, and have the ability to shape their provisions.

Productive industry makes no less demands on educated intelligence for the directive power to manage its machinery and control its combinations. If the laborer is not educated, and his productive capacity thereby increased, he can not accumulate the wealth necessary to afford him the leisure to give sufficient attention to public affairs to comprehend them, nor does he have the intellectual capacity for this purpose.

Thus, democracy is impossible without universal education.

The State therefore enjoins upon its municipalities the duty to establish and maintain schools.

*II. Upon the advantages of the St. Louis style of organization for the management of schools.*—The powers relating to the management of city schools are often vested in boards, the members of which are appointed by the mayor and confirmed by the city council or aldermen. In such cases the school board is dependent upon the legislative branch of the municipal government for appropriations from the treasury to pay the salaries of teachers and officers and to meet the current expenses of the schools. New buildings and building sites are in that case usually provided by the city government directly, but in some cases by the school board.

The city council is more interested in municipal improvements and in questions of a semipolitical or partisan nature than in schools, and is apt to stint the supply of the school funds at unseasonable times. Moreover, the school buildings which it erects are likely to be ill adapted for school purposes and disproportionately costly, for the reason that school architecture has its peculiar conditioning laws, and ordinary city architects, under building committees appointed in the city council, very rarely know these peculiar conditions or give heed to the statement of them by experts.

Where a cumbrous machinery of auditing and paying bills is in existence it is a well-known result that it adds to the expenses of running the schools. Dealers who trade for cash, and who are too honorable to resort to lobbying or "logrolling," do not undertake jobs in such cases, and there come in their stead a class of "middle-men" who make contracts at extortionate rates or else at ruinously low rates, with the intention to recover extra remuneration through their skill in influencing the members of the board.

A board elected by the people direct, for the special purpose of managing the schools, and vested with limited powers of taxation is sure to look after school interests, at least to the extent of the popular demand in that direction, and is not liable to be diverted from the care of the schools so much as to sacrifice them to other municipal interests.

*III. Internal organization of the board.*—The St. Louis school board, as before stated, appoints annually a president, vice-president, secretary, bailiff, attorney, treasurer, architect, supply agent, and a superintendent, the president and vice-president being elected from its own body. The president appoints from the board

seven large standing committees, having charge, respectively, (a) of the examination and appointment of teachers; (b) choice of text-books and course of study; (c) erection and repair of buildings and supervision of janitors; (d) leasing the property of the board which is held for revenue purposes; (e) ways and means; (f) public-school library; (g) supplies. These important committees are composed in such a way as to represent all sections of the city, each district of four wards being entitled to one member on each of the committees, which are thus, in fact, subboards, consisting of eight members each (the president being member *ex officio*). These subboards have frequent sittings and digest the details of the administration of the schools, and report the results to the board at its regular monthly meetings. Besides these large committees there are three small committees, having charge of salaries, auditing, and rules, respectively.

It frequently happens that school boards form a loose aggregate of local committees, each charged with the supervision of the schools in its ward or district and exercising the important functions of appointing teachers (and sometimes of examining and deciding upon their qualifications), as well as of visiting and superintending the schools of its district, examining classes, admitting pupils, etc.

Such local authority inevitably leads to great inequalities in the school system, and those districts which need the most enlightened management and the best teachers get the poorest supervision and the poorest instructors by reason of the incompetency of their representatives in the board. Local committees, even when composed of good men, are unable to withstand sudden local gusts of popular feeling or prejudice, while large committees, composed of representatives from all parts of the city, can afford protection to each section against its own extreme tendencies. Not one single locality, but the entire interest of the whole city is consulted in transactions relating to the examination and employment of teachers, regulation of the course of study, selection of building sites, and plans for buildings, supervision of their erection, etc.

#### REVENUE.

The revenues of the board for school purposes are derived from three sources:

1. From rents: The property owned by the board consists of a large landed property donated by the General Government; value estimated at \$1,279,027.93, yielding the past year an income of \$50,285.65.

2. A tax levied by the board annually, at a rate not to exceed 5 mills on the dollar of city property, of which only 4 mills can be used for current expenses and the balance collected to pay the bonded debt. Last year the board assessed  $4\frac{1}{2}$  mills, which yielded \$759,856.98.

3. Other revenues: From the State school fund, including annual interest on the school fund, together with 25 per cent of the State revenue, amounting to \$71,268.85 the past year. There is also a considerable sum from fines in criminal cases.

4. Income of the board from sources named, for year ending July 31, 1879:

From 4-mill tax.....	\$759,856.98
From rents.....	50,285.65
From State school fund.....	71,268.85
From fines.....	3,586.61
Total.....	<u>884,997.09</u>

## GRADES OF SCHOOLS, ETC.

1. There are three grades of day schools—the high, normal, and district. The latter includes grammar, intermediate, and primary departments in the same building. The two sexes are educated together. Besides these, there is held, for four months in the year, a system of evening schools.

2. There are two sessions per day, except in the High and Normal. First session commences at 9 a. m. and closes at 12 m.; second session at 1.30 p. m. to 3.45 p. m. In the High and Normal there is one session from 9 to 2.30 o'clock, with one intermission. Evening schools hold from 7 to 9 p. m. on Mondays, Tuesdays, Thursdays, and Fridays.

## TEXT-BOOKS AND APPARATUS.

1. The pupils generally purchase their own text-books, which are uniform throughout the city. The board provides them for indigent pupils. The board keeps a stock of all books needed, and furnishes the same, through its teachers, to the pupils at wholesale prices. Ink, pens, and pencils are furnished by the board.

2. Apparatus, maps, charts, globes, and reference books for the teachers' desks are furnished by the board.

## TEACHERS.

1. There are comparatively few male teachers in the employ of the board, it being the policy to appoint males as principals of first and second class district schools only. There are a number of male German teachers. The corps of teachers in the Central High School consists of seven males and seven females.

2. Annual salaries of principals in first-class district schools (18 assistants) are fixed at \$2,000; of second-class schools, at \$1,500, with an annual increase of \$100 until a maximum of \$1,800 is reached. Principals of third-class schools (10 or 12 assistants) receive \$1,200 to \$1,500. The class of school is determined chiefly by the number of assistant teachers. Assistants of the ordinary grade, called "third assistants" get \$400 the first year, with annual increase until the fifth year, when they receive \$550. "Second assistants" get \$50 more; first assistants receive \$700 per annum; head assistants receive \$850. Pains are taken to secure the most skillful teachers for the primary grades, and higher salaries are paid accordingly.

3. The board employs four music teachers. These visit the schools, give special lessons, and supervise the work of their special department.

4. A rule of the board prohibits the teachers "from using a text-book in conducting any recitation, whenever the pupil is expected to recite without the book;" "in lieu thereof, the teachers are recom-

mended to use a syllabus of topics or questions, either written or printed, for the purpose of securing order and method in the treatment of the subject of the recitation."

5. There is no religious instruction or reading of the sacred Scriptures in the public schools of St. Louis. (Before 1840, on the occasion of the opening of the first public school, the question was decided against the introduction of religious exercises by a mass meeting of citizens held at the North Presbyterian Church, Rev. Dr. W. G. Eliot offering the resolutions, which were adopted without dissent.)

6. Corporal punishment is permitted, but discouraged. The reports show that there has been an average of two cases a week for each 500 pupils.

#### REMARKS.

*I. The necessities of discipline in the schools of the United States.*—The education of people in schools is not all, but only a portion, of their education. There is education in the family, which antedates the school and continues beyond it. The education in the duties of one's practical vocation in life usually succeeds the school. The school embraces only that portion of education lying between family nurture and the necessary initiation into the specialties of a vocation in practical life. In the United States, the peculiarities of society and the political organization draw the child out of the family earlier than is common in other countries. The frequent separation of the younger branches of the family from the old stock renders the family influence less powerful in molding character. Particularly in the West, and wherever the population is of recent aggregation, there are few old people; and it is the old people who give substance and strength to the family. The consequence of this weakening of the influence of the family is the importance of the school in an ethical point of view.

In order to compensate for a lack of family nurture, the school is obliged to lay more stress upon discipline, and to make far more prominent the moral phase of education. It is obliged to train the pupil into habits of prompt obedience to his teachers, and to practice self-control in its various forms, in order that he may be prepared for a life wherein there is little police restraint on the part of the constituted authorities.

*II. Corrective versus retributive punishment.*—School discipline, in its phase of substitute for the family discipline, uses corrective punishment, which presupposes a feeble development of the sense of honor in the child. It is mostly corporal punishment. But in the phase wherein the school performs the function of preparing the pupil for the formal government of the State, it uses retributive punishment, and suspends the pupil from some or all of the privileges of the school. In this phase of discipline a sense of honor is presupposed and strengthened.

*III. Corporal punishment in city schools and country schools.*—In commercial cities and towns the tendency preponderates toward forms of punishment founded on the sense of honor, and toward the entire disuse of corporal punishment. In the country schools, where the agricultural interest prevails, the tendency is toward the family form of punishment—corporal chastisement.

A further difference between the discipline of the city schools and that of the country schools is founded partly on the fact that the former schools are usually quite large assemblies, from 300 to 1,500 pupils in one building, while the latter commonly have less than 50 pupils. The commercial tone prevalent in the city tends to develop in its schools quick, alert habits, and readiness to combine with

others in their tasks. Military precision is required in the maneuvering of classes. Great stress is laid upon (a) punctuality, (b) regularity, (c) attention, and (d) silence, as habits of self-control that are necessary through life for successful combination with one's fellowmen in an industrial and commercial civilization.

#### RECORD BOOKS AND REPORTS.

1. Each principal keeps (a) an annual register, in which is entered the name of the pupil, age, date of admission, birthplace, parent's name and occupation, residence, and attendance for each quarter of the year; (b) a "per cent" book, in which are entered daily the items of "number belonging," "number absent," "number tardy," and the names of those transferred or received by transfer from other schools, also the attendance record of the teachers of his school; (c) a record of supplies received from the office of the board for the school.

2. Each teacher keeps a "roll book" containing the names of all the pupils under her charge and the record of their attendance, absence, and tardiness for each half day. Each pupil's name is accompanied with the number attached to it in the annual register, so that its items may be transferred to that register at the close of each quarter and no difficulty be experienced in finding the same.

3. The principal makes out the pay roll for his teachers at the close of each five weeks in accordance with a printed list, an edition of which is revised at the superintendent's office and furnished to each principal at the date the pay roll is required. These pay rolls are carefully revised in the office of the superintendent and certified to. They are then given to the secretary, who draws separate checks upon the treasurer and delivers them on the receipts of the teachers.

4. An annual report summing up the items of the annual register is made out at the end of the year, also a report of the supplies used or left on hand; a "block report," containing the residences of all the pupils in the school, classified by the blocks wherein they reside. From the latter report a large map is shaded, so as to give a bird's-eye view of the location of the school population. This map is studied to find the proper locality of a new building to relieve a crowded district.

5. A quarterly report of items from the "per cent book" is required, and a quarterly programme showing the time, subject, and length of each recitation of each teacher in the school, and also the grade and quarter of advancement of each of her classes; also a quarterly report of all the cases of corporal punishment, with names, dates, and causes.

#### SCHOOL BUILDINGS AND FURNITURE.

1. It is the policy of the board to build twelve-room buildings, three stories in height, having four rooms to the floor, and each one placed in a corner so as to get light from four large windows, placed two in the rear of the pupils and two on the left side. Of late it has become the

practice to group schools near each other—on the same block, if possible—and place the whole group under one principal, thus giving him charge of twenty or more rooms. The school yards usually contain about 22,000 square feet, of which about 6,000 feet are covered with the buildings.

2. These buildings are furnished with “combination furniture,” each seat adapted to two pupils. Each room seats about 60 pupils, if in the primary grades; 50, if in the higher grades of the District schools.

3. The two rooms on either side of the hall which runs through the house, dividing it into two parts,<sup>1</sup> are separated by movable partitions, so that they may be united for general exercises, such as singing, etc.

<sup>1</sup> Plan No. 1.

Plan No. 2.

Plan No. 1 is preferred, because each room admits light from two sides; while in plan No. 2 the light is admitted to the middle rooms only from one side, and is, therefore, very unequally lighted in its different parts. When the sun is shining directly into its windows, and the protection of curtains or blinds must be used, the pupils are obliged to strain their eyes to see their work, or else sit, without protection, in the glare of full sunlight. "W." indicates the position of the wardrobes or clothes rooms.

4. Each school is furnished with a piano, purchased, in part, by the money raised by the patrons of the school; the board formerly made it a practice to furnish one-half the cost of a piano when the school raised the other half.

5. It is thought that 700 pupils are quite as many as is desirable to bring together in one building. The division of the pupils into classes, and their assignment to rooms containing 50 or 60 pupils each, placed under the special charge of a teacher for instruction and discipline, secures in the maximum degree the personal influence of the teacher upon each pupil.

The old style of school building, in which pupils studied in a large room under the police control of the principal, and repaired to the small recitation room to recite to the assistant teacher, was notably inefficient in securing this penetration of the personal influence of the teacher. The pupils under that system were not humanized as they are under the one now practiced.

6. Smaller buildings than those above mentioned do not furnish pupils enough for a thorough classification, at least in the higher grades of the course of study.

#### EXAMINATIONS.

1. In the higher grades the teachers hold written reviews at the close of the week on the work of that week.

2. The principal inspects daily the work of his assistants, and examines all classes that are pronounced by the assistant teacher in charge to be ready for promotion to the work of the next quarter in the grade. Pupils in the lower grades are not held back at any time to await a general examination by the superintendent, but are advanced into the work of the next grade by the principal whenever, in his judgment, they have completed the work of the previous grade satisfactorily. Promotion from the seventh to the eighth and from the eighth to the ninth years takes place only at the close of each quarter of ten weeks, and upon examination by the superintendent.

3. The supervising principals inspect the subordinate schools under their charge once a week, note their condition in respect to discipline, instruction, and general management, examine classes reported by the principal for promotion to higher work, and make a weekly report to the superintendent of the results of their visit.

4. The two assistant superintendents use all their time during school hours in visiting the schools and inspecting the work, or conferring with the teachers regarding special matters pertaining to the conduct of the schools. One of the assistants gives special attention to the regulation of the German instruction.

5. A semiannual examination is held, by the superintendent, of all the pupils advanced beyond the third year of the course of study.

6. An examining committee, consisting of the superintendent and his assistants, and the principals of the Normal, High, and Branch High Schools, conduct the examination of candidates for positions as teachers in the schools and report the results of the same to the teachers' committee of the board.

## REMARKS.

*I. The course of study.*—The course of study is laid down with a view to give the pupil the readiest and most thorough practical command of those conventionalities of intelligence—those arts and acquirements which are the means of directive power and of further self-education. These preliminary educational accomplishments open at once to the minds of the pupil two opposite directions: (a) the immediate mastery over the world of productive industry—the mathematics and natural sciences; (b) the initiation into the means of combination with one's fellow-men, the world of humanity, practically and theoretically—language, literature, and civil history.

The course of study, therefore, includes reading and writing, arithmetic, geography, grammar, history, and Constitution of the United States, drawing, outlines of natural science (including botany, physiology, zoology, natural philosophy, physical geography, astronomy, and chemistry), and outlines of general history.

In the high schools, the languages, ancient and modern, higher mathematics, sciences, and literature are pursued.

In the normal school, specific preparation is given to qualify graduates of the high school for teaching.

In the St. Louis schools, the primary instruction is considered to be of especial importance. By the use of the phonetic system of learning to read (invented by Dr. Edwin Leigh), at least one year is saved in learning to read. The method uses a modified alphabet, so formed that each character has one sound only. Each letter of this alphabet resembles the corresponding letter of the ordinary alphabet so nearly that the general appearance of the words is preserved, and a transition to the ordinary type is found quite easy after half a year's work in the new alphabet.

*II. The kindergarten.*—The kindergarten grade of instruction has been added in many schools as an introduction to the primary grade.

*III. Natural science.*—In order to adapt the course of study to the wants of a manufacturing community (an office which the kindergarten also assists in performing), and to the general demands of the age, the study of natural science has been introduced into all grades of the district schools. Oral lessons are given one day in the week, one hour in length, and as the course is a "spiral" one, it is traversed anew once in three years; each pupil has the opportunity of coming to the same topics three times in his course through the district schools.

*IV. German instruction.*—German instruction is given in all the grades of school as an optional study for pupils of German descent, and for such Anglo-Americans as are able to take the extra work. The object is to carry the German pupil through the necessary steps to enable him to read and write the tongue of his ancestors, and to give him the key to the possession of its literature. Twenty thousand pupils take this study, one-fourth being Anglo-Americans.

*V. Classification and grading—Frequent promotions.*—An important innovation in the stereotyped organization, as found in the many city schools, has been made in St. Louis, with a view to facilitate proper grading and classification. In order to meet the wants of the pupils, some of whom are slow by temperament or weak in bodily health, and some of whom are strong and of active temperament, frequent reclassification is made, in such a manner as to allow the bright and rapid pupils to advance into the classes above. This promotion and reclassification occurs as often

as once in ten weeks, whereas, according to the old plan, such classification takes place only at the end of the school year, and the consequence is that the difference in ability to do the work of the school grows to be very great between the best and poorest in each class before the reclassification takes place.

*VI. Evening schools.*—For the benefit of those youths and adults who are deprived of their opportunities for education by employment during the day in some useful occupation, evening schools are established, holding sessions during the fall and winter, for four months, four evenings a week.

*VII. Public school library.*—A public school library completes the system by furnishing "what to read" and giving unlimited access to the recorded wit and wisdom of the race to those who have learned how to read. It is open to all at merely nominal fees. One dollar paid once in four months entitles one to a temporary membership; or when \$25 is paid, it makes one a life member.

## CHAPTER XX.

### SCHOOL GARDENS.<sup>1</sup>

By E. GANG, Triptis, Thuringia, Germany.

*Contents.*—Historical Review—Sites and arrangement of School gardens—Different Sections of School gardens—Management—Instruction in School gardens—Educational and Economic Significance of School gardens.

#### I. HISTORY.

School gardens, in the narrow sense of the term, are a very modern institution; but when considered as including all gardens serving the purpose of instruction, the expression of Ben Akiba may be indorsed, "there is nothing new under the sun," for in a comprehensive sense, school gardens cease to be a modern institution. History teaches that the great Persian King Cyrus the Elder (559-529 B. C.) laid out the first school gardens in Persia, in which the sons of noblemen were instructed in horticulture. King Solomon (1015 B. C.) likewise possessed extensive gardens in which all kinds of plants were kept, probably for purposes of instruction as well as ornament, "from the cedar tree that is in Lebanon even unto the hyssop that springeth out of the wall."

The botanical gardens of Italian and other universities belong to school gardens in the broader acceptance of the term. The first to establish a garden of this kind was Gaspar de Gabriel, a wealthy Italian nobleman, who, in 1525 A. D., laid out the first one in Tuscany. Many Italian cities, Venice, Milan, and Naples followed this example. Pope Pius V (1566-1572) established one in Bologna, and Duke Francis of Tuscany (1574-1584) one in Florence. At that time, almost every important city in Italy possessed its botanical garden. The renowned educator Amos Comenius (1592-1671), in his *Didactica Magna*, maintains "that a garden should be connected with every school, where children at times can leisurely gaze on trees, flowers, and herbs, and be taught to enjoy them." In Germany, August Hermann Francke established a school garden at Halle, in 1695, in connection with his orphan asylum. The orphans were occupied with garden work during their leisure. In France, J. J. Rousseau (1712-1778) advanced the school garden idea in his "*Émile*," published in 1762, in which he pointed out the importance of garden work as an educational factor.

The philanthropists Basedow, Campe, and Salzmann likewise included school gardens among educational agencies. Campe, together with his wards, planted in the neighborhood of 10,000 trees during his lifetime. Salzmann wrote concerning this subject: "School gardens have been laid out neither to draw the attention of passers-by, nor to give great returns, but to instruct." Pestalozzi himself (1746-1827) was a farmer for a long time, and occupied his wards at Neuhof with field and garden work. "I wish," he said, "to make my estate the central point of my agricultural

<sup>1</sup>Articles on this subject were printed in the Annual Report of 1889-90, vol. 1, p. 398; of 1897-98, vol. 1, p. 225, also in volume 2 of same Report, p. 1623 and p. 1632. The following article is translated from Rein's *Pedagogical Cyclopaedia*.

and educational efforts. The orphans are to be kept, and to be instructed at work and through work." The school garden idea was further advanced by Fröbel, who founded the first kindergarten at Blankenburg in Thuringia in 1840, and recommended light gardening for the larger children in connection with the play of the younger ones. Besides kindergartens, the first school gardens were established in the larger German cities at this time. In 1848 one was connected with the advanced school for girls in Worms. Dr. V. Stoy, in Jena, possessed a garden connected with his educational institution, from 1855, that was of the greatest use to him for instruction.

With regard to schools in general, however, these isolated attempts are of little significance, since they affected only private and secondary schools. School gardens entered upon a new stage of development when their establishment, in connection with rural elementary schools especially, was required by law. This first occurred in Austria. The Austrian imperial school law of March 14, 1869, prescribes in section 63 that "where practicable, a garden and a place for agricultural experiments shall be established at every rural school." A supplementary regulation, dated August 20, 1870, furthermore requires that instruction in natural history shall be given in an appropriately arranged school garden. At the Vienna exposition, in 1873, a schoolhouse with a perfectly equipped garden was exhibited. This not only gave expression to the new idea, but stimulated further progress. Prof. Erasmus Schwab may be considered the actual founder of elementary school gardens in Austria, although a few such gardens existed before his time; as, for instance, that of Neunkirchen, laid out as early as 1700. Others deserving of merit in their efforts in behalf of developing the school garden idea are: Prof. Alex. Mell, of Marburg; Dr. Francis Langauer, of Vienna, teacher and editor of "The School Garden" (1885-1891); Francis Susnick, of Vienna, teacher; Frederick Staudinger, of Gratz, teacher. In Austria-Hungary, the classical land of school gardens, there are at present (1898) over 18,000, covering an area of thousands of acres. Most of them are found in the crownlands of Bohemia<sup>1</sup> (4,500), Moravia (2,000), Lower Austria (1,000), Styria (800), Corinthia (300), Silesia (500). The idea is best exemplified in Styria, where there is no school without a garden. The Horticultural Society of Styria, under the presidency of Rector Kristof, deserves special credit for establishing and developing school gardens, which it has always been ready to support. It distributes annually, free of charge, a large supply of cuttings, all kinds of seeds, special varieties of flower and vegetable seeds, and the like. At the exposition held in Gratz in 1880 it exhibited a complete school garden, which received general approval and contributed much toward the spread of this useful institution.

The school garden question has also been alive in Switzerland for about twenty years. The government of the canton Thurgovia first recommended the establishment of model school gardens in 1879. Its example was followed by most of the other cantons, and since June 27, 1884, the Federal Government has taken up the question of school gardens, appropriating a yearly sum of 3,500 francs for their establishment. The agricultural society of Switzerland has recommended such establishments since 1881, and given them powerful support. By awarding prizes and other financial aid, it advanced the cause to an unusually great extent. Model school gardens exist now at the normal schools of Schwyz, Berne, Küssnacht, Zürich, and Chur, and at different elementary schools, as, for instance, in Lichtensteig, Hug, Flamatt, Buchs, Langenau, Lübingen, Zürich, and Berne.

Since the war of 1870-71 France has reorganized, improved, and developed its school system in many ways, supplying deficiencies. Besides improving the education of teachers, the law of March 18, 1882, outlined a course of study for primary

<sup>1</sup> It is reasonable to see a causal nexus between the enormous fruit crops and exports from Bohemia and the school gardens in that country.

schools that places the first instruction in horticulture and agriculture in the school gardens in the middle grades, where pupils acquire the knowledge of kinds of soil, fertilization, and field work. In the higher grades they learn farming, agricultural book keeping, and horticulture. A decree of December 24, 1885, requires that instruction on these subjects be not limited to theory, but be combined with experiments in the school garden. According to another decree of December 11, 1887, no plan of a school building in the country to which the State contributes shall be accepted, unless a garden be attached. Model school gardens are found at several normal schools, as, for instance, at Besançon, Nancy, Limoges, Rennes, Toulon, and Lyons. After the course of study has been completed, many French normal schools send their students to agricultural schools to acquire the practical training in agriculture and horticulture that will fit them for rural schools.

In Belgium the study of horticulture is compulsory. For practical purposes the school law of August 14, 1873, requires that each school shall have a garden of at least  $39\frac{1}{2}$  square rods, to be used in connection with instruction in botany, horticulture, and agriculture. A royal decree of January 9, 1897, lays especial stress on vegetable culture, in which female teachers must be sufficiently versed to give theoretical and practical instruction. All public elementary schools in Belgium have gardens; the Government grants 6,000 francs annually as prizes among pupils who have excelled in this department of study.

Naturally the English, with their leaning to the practical, attach great importance to manual labor and agriculture. However, the State government bestows little attention on these things, especially after the pupils have passed the school age (14 years). Private societies receive support from the State for the further instruction of those who have left school. These societies establish so-called continuation or supplementary schools, not only for commercial and industrial but also for agricultural education. Since 1892 some gardens have been laid out in connection with agricultural schools, which serve for theoretical and practical instruction. Besides being present at lessons, the pupils are put in charge of special beds. During the summer their efforts are examined at different times by a commission, and prizes are awarded for the best work. Teachers equip themselves for this department of study by attending lectures that are given free by agricultural societies.

In Sweden an interest in school gardens has been manifested for many years, nearly as early as in Austria. A royal circular of October 15, 1869, required gardens, averaging from 70 to 150 square rods, to be appropriately laid out. In 1876 Sweden had 1,600, in 1881 2,000, and in 1894 as many as 4,670 school gardens. Of late years this number has somewhat diminished, since in the northern parts of Sweden more importance is at present attached to manual training, to which the State likewise contributes a large support. The character of the country, little adapted to agriculture, may be the reason for the lack of attention with respect to school gardens in Norway.

In middle and southern Russia small farms and gardens are beginning to be attached to people's or elementary schools in many villages. As a rule the community or resident landholders give the required amount of land free. The best developed gardens are found in the province of Jekatseinoslaf, in southern Russia, where 257 of the 504 schools possess such small model gardens, divided into sections for grain, vegetables and fruit, kitchen truck, grapes, and mulberry trees for the support of silk worms. In 1895 these schools collectively cultivated  $296\frac{1}{2}$  acres of land, including vineyards, and possessed 12,000 fruit trees and over 1,000 beehives.

In Germany school gardens have not as yet been regulated by law; nevertheless the idea struck root twenty years ago. In some German States legislation for schools requires or defines it as desirable that each rural school should have a garden; but this is meant to serve more especially for the maintenance of the teacher. It is not so often arranged for purposes of instruction as may be desirable. The most

is done in the Kingdom of Prussia for the cultivation of fruit trees; nearly every teacher in the country possesses a small orchard. In the cities gardens are occasionally established to furnish the plants required for instruction in natural history. Such gardens, in which only certain kinds of plants are cultivated, are called *partial school gardens*. To provide pupils with plants for instruction in botany presents considerable difficulties in cities, and has occasioned the establishment of large gardens. Such central school gardens, which furnish at stated periods plant material (thousands of cuttings and specimens) to schools, exist in many of the large cities of Germany. The first was established in the Humboldt-Hain, in Berlin, and covers nearly ten acres. Since 1879 the city of Magdeburg possesses a central school garden in the Herrenkrug park, which contains a section of beds of nearly 62 acres; 17 acres are utilized for tree nurseries and 5 acres for the botanical division. Leipsic ranks next in order, with an area of 3 acres in 1888; in 1889 Breslau possessed 5 acres; Mannheim 5 acres in 1889; Dortmund 5 acres in 1890; Cologne 5 acres in 1891; Altona 3 acres in 1891; Karlsruhe nearly 2 acres in 1894; Elberfeld, Kolberg, Stettin, and other cities have gardens of greater or less extent. In many cases plants are arranged according to families. In the central school garden at Berlin the plants are arranged according to geographical zones.

Besides these, numerous smaller gardens have been established in connection with high schools and elementary schools. In Prussia school gardens have existed at the Wilhelm's Gymnasium, in Berlin, since 1875 (1.24 acres); at the Joachimsthaler Gymnasium, in Berlin, since 1884 (0.37 acre); at the Friedrich Wilhelm's Gymnasium since 1891 (0.11 acre); at the gymnasium at Wollin since 1888 (0.74 acre); at Bromberg since 1892 (0.2 acre); at Oldesloe since 1892 (0.21 acre); at the gymnasium in Witten on the Ruhr since 1891 (0.14 acre); at the high school in Giessen since 1891 (0.37 acre); at the normal school in Weissenfels since 1837 (0.86 acre); besides these various normal and agricultural winter schools are provided with gardens. Gardens are connected with elementary schools in Hamburg, Wiesbaden, Dortmund, Magdeburg, the suburban towns Oedenburg and Neustadt (0.07 to 0.21 acre); in Frankfurt on the Maine, Gerderath in Rhenish Prussia since 1881, and in many rural places.

In the Kingdom of Bavaria gardens are especially numerous in the Upper Palatinate; a ministerial decree requires them to be at least 0.12 acre in size. Special attention is given to the culture of fruit trees. The city schools of Munich are provided with plants for purposes of instruction from the botanical garden of the university. In the Kingdom of Saxony nearly all normal schools have gardens. Most of the elementary, or people's schools, are provided with gardens, even in large cities like Leipsic and Dresden. At the second international agricultural exposition in Dresden, 1896, the Teachers' Association of Saxony for nature study exhibited a complete school garden, which received both the gold and the State medals.

The Kingdom of Wurttemberg has proportionately few school gardens, for the reason that horticulture has flourished there for centuries. The normal school at Nürtingen has a garden of half an acre in size. In the Grand Duchy of Baden the conditions are similar to those in the neighboring State, Wurttemberg. The city of Karlsruhe has three small gardens connected with elementary schools, and the normal school at Meersburg has also a garden of insignificant size. In the Grand Duchy of Hessa gardens have been connected with the normal schools at Alzey and Friedberg since 1886, as also with several elementary schools. The schools of the Thuringian States are better provided. The normal school of Coburg has possessed a garden since 1875, that at Weimar since 1878, and Schleiz since 1890. The normal schools at Eisenach, Gotha, Rudolstadt, and Greiz have all gardens, but the date of their establishment is not known to the writer. The gardens connected with people's, or elementary, schools are mostly only partial school gardens; the one at Coburg with an area of 0.15 acre has existed since 1887; that at Neustadt, near Coburg,

0.62 acre, since 1885; that at Triptis, 0.50 acre, since 1890; that at Altenburg since 1892; that at Pössneck, 0.82 acre, since 1895. Gardens are connected with the burgher schools of Jena, Eisenach, Greiz, Schmölln, Rönneburg, Neustadt and Weida, and with the Luther-school at Gera. School gardens are also found here and there in the other German States. However, if they are to make further progress for the common benefit, they must be regulated by law and receive support from the State.

## II. SITES AND ARRANGEMENT OF SCHOOL GARDENS.

For gardens to fulfill their purpose, they must be located either at, or near, the school building. In the construction of new school buildings this fact must be taken into consideration. With old buildings it is not always practicable to combine the two. However, a garden attached directly to the schoolhouse is of much greater value for educational purposes than one at a distance. If there be a choice of ground, soft, sandy loam of sufficient depth is to be preferred as best adapted for gardening. Moderately sandy or clayey soil possesses sufficiently favorable physical quality to be transformed into garden soil if it is properly improved and carefully worked. The presence or absence of water plays an important part in the selection of a garden site. No garden can thrive without water. Therefore, it is best to have an adequate supply, a stream or a pond, in or near the garden. To bring water from a distance entails too much labor and expense. Furthermore, the garden, as well as the building, should have proper exposure that air and light may have free access. The morning and midday sun should be able to exercise its warming and vivifying influence. All places exposed to violent draughts must be avoided or protected by appropriate planting, since such locations frequently retard garden labor, and many plants suffer from the cold winds to which they are exposed. On the other hand, when a garden is altogether inclosed, there is danger of making the plants too tender; this is especially disadvantageous with young fruit trees, as they are thus more sensitive to frost, and will not thrive as readily when transplanted to less sheltered locations. As school gardens are to exercise a broader influence and serve for the instruction of others, they should be so situated that at least one part faces the street or roadway, so that a survey of the whole can be made from that side.

The size depends upon local conditions, the number of pupils, and the number of sections which it shall contain. If the garden is to serve only for the purpose of instruction, it should cover about one-sixth of an acre. If it includes the kitchen garden for the teacher it must be at least one-fifth of an acre in size. But if grounds for play and gymnastics are likewise to be included, and this is an advantage, it must cover at least one-fourth of an acre. The gardens in Austria average about one-fifth of an acre. The ground for gardens must be donated by the community, and be placed at the disposal of teachers free.

After the site of the garden has been determined the fencing is to be next considered. The height of the fence should be above 5 feet, and the laths or pickets nailed about  $1\frac{1}{2}$  to 2 inches apart, to make it secure against rabbits. Live hedges are never secure against rabbits; many, too—as, for instance, the white thorn—shelter destructive vermin. If for special reasons a hedge is to be desired, it should be of yoke elm or briars, or of privet closely trimmed and planted on either side of the lath fence. Generally it is more advantageous to make use of the fence for wall fruit, which is likewise trained over any neighboring wall or the sides of the school building. After the garden has been inclosed, the next step is its surface arrangement. When the ground has been portioned off, the teacher should make a design, laying off the walks and distributing the squares. The chief walk should not be too narrow—about 5 feet or a little over—as a great number of pupils must pass over it. The other walks may be only 3 to 4 feet wide. If the schoolhouse stands in the middle of the garden, its position must be taken into consideration in mapping out the

walks, as well as the sections. The walks near the schoolhouse, the main walks, and those of the vegetable section, must, one and all, be laid off in straight lines for the sake of symmetry and order. In larger gardens the scenic effect is heightened by laying off in curves the walks in the flower and ornamental plant section. Large city gardens may be arranged like parks, especially those parts that contain the shrubbery and grove sections, and the grounds for play and gymnastics. After the plan has been designed and drafted it should, by way of precaution, be examined by one who understands the subject before being carried into effect, as an impartial critic judges more clearly than one interested in the case. Moreover, the plan must be submitted to the school board for approval.

As soon as the plan is approved the arrangement of the garden may be begun. The walks and squares are first staked off. When the walks are dug to the depth of 15 to 20 inches the earth dug up may be used for leveling or for the manure pile. The walks are then filled in with broken stone, gravel, or cinders, and covered with sand. As firm and clean walks are an important factor in every garden, nothing should be neglected when making them. The squares, according to the plants to be raised, should be dug over to the depth of about 18 to 24 inches. The soil for trees should be furrowed to the depth of about 30 inches. As a matter of course, all large stones must be removed; they are best disposed of in filling up the walks. After the squares have been thoroughly spaded over and leveled, the required fertilizers are spread and worked in. The best fertilizer is stable manure, to which chemicals, guano, superphosphate, kainite, and bone dust have been added. To every 10 square feet of ground about 10 pounds of half-rotten manure, 5 pounds of guano, 5 pounds of artificial fertilizer (containing the required lime and other substances), or 3 pounds of bone dust, and 3 of kainite are required. If stable manure, combined with liquid manure, is freely used, chemical fertilizers containing nitrogen, as guano and saltpeter, may be dispensed with. All the heavy labor that is required to arrange the garden must be done by adults at the expense of the community, as it is not adapted for children. The best season for this work is late autumn.

### III. THE DIFFERENT SECTIONS.

The contents of school gardens must be adapted to given conditions, the same as their size depends on local conditions. The requirements of a rural school are altogether different from those of a city school. Gardens for boys' schools are arranged unlike those for girls' schools, and those connected with normal schools, or other secondary institutions of learning, have not the same appearance as those of country schools, as gardens of private schools are distinguished from those of orphan asylums.

A complete school garden that is to include all important products, must contain a tree section, a vegetable garden with beds cared for by pupils, a botanical division, an agricultural experiment field, a flower garden, a beehive, and different ornamental plants. The given conditions, however, and the governing local necessities must decide which of them is absolutely necessary, desirable, or superfluous at any one place; the selection must be made accordingly. With respect to local necessities three different kinds of gardens may be accepted as standard: (1) the garden of a rural school; (2) the garden of a town school; (3) the garden of a large city serving a school system.

In gardens of rural schools the important sections are the tree section, the vegetable garden, the agricultural experiment field, the botanical division with commercial, textile, medicinal, and poisonous plants, and the beehive. Flowers, dwarf and berry fruits need take up very little space, and can under some circumstances be planted in borders. Where a forest is near, forest trees and shrubs need not be raised in the nursery. According to demand, grapevines, hops, and willows can be raised in the tree nursery.

Gardens in a small town require a tree nursery, a vegetable garden with beds cared for by pupils, a botanical division with commercial, medicinal, and poisonous plants, a small flower garden, and a beehive. The agricultural experiment field may be replaced by a few experiment beds. If woods are far distant, the planting of the most useful forest trees is desirable, as is also a willow section, if willow weaving is an industry of the locality.

Gardens of a large city, as well as those established for secondary and higher schools, consist preeminently of a richly planted botanical division containing the most important types of native flora that will serve as specimens for instruction in natural history and biology. They should also include the most familiar forest trees and shrubs, ornamental trees and shrubs, and poisonous, medicinal, and commercial plants. The tree section should be conducted only on a limited scale, including principally dwarf and tub fruit trees, and might be confined to boys' schools. For girls' schools a number of vegetable and flower beds is desirable, as also a few experiment and pupils' beds. No one expects to find an apiary in a city garden. The grounds for play and gymnastics should be in a close proximity to the school—if possible, within the limits of the garden.

(a) *The tree section or tree nursery.*—The great economic significance of fruit culture in Germany and all other civilized countries requires every school garden, especially those in rural districts, to contain a tree section. Boys must learn how to cultivate fruit trees: In rural gardens the tree section should form one-third of the whole; the second third should be arranged for vegetables, and the remaining third apportioned for the other subdivisions. The ground set aside for the tree section should be trenched to the depth of about 30 inches and be then laid out in squares subdivided into beds 4 feet broad. A portion of the beds should in the beginning be planted with purchased saplings. The others should be annually supplied with seed. The sowing, in rows, should take place in the fall or spring. During the summer the seed beds must be frequently watered and weeded. In the following year the saplings may be transplanted to another bed, at a distance of from about 8 to 10 inches apart, and improved later on. There are three principal methods of improvement: Grafting, budding, and inoculating. A year after improvement the young trees are again transplanted, three rows to the bed, each tree 2 feet from the other. Frequent transplanting makes them take stronger root. The training of the trunk takes place in the next four or five years. Every fall or spring the branches are clipped about 2 inches, and the trunk is allowed to increase naturally in height, provided it develops properly in circumference. If the growth in both directions is insufficient, the head of the trunk branch is clipped annually about one-third of its last year's growth, so that the branches may get thicker and stronger. Specimens that have weak and ill-grown trunks can be utilized to advantage for hybrid improvement. When the healthy young trees have attained a height of about 6 feet, the head of the trunk and all branches are cut off, leaving only the upper five nodes from which the crown, namely the head of the trunk and four branches, are developed at a height of 5 feet. One year after the trimming of the crown the young tree is developed, and can be taken up for permanent transplanting. The cultivation of dwarf trees must likewise be taught. Dwarf varieties presuppose a proper weakly growing stock. Dwarf apples are grafted on what the Germans call "Splittapfel" (French, "doucin"), or the paradise apple; dwarf pears, most frequently on the quince. The improvement must take place as deep down as possible near the root by means of inoculation or budding.

The most familiar dwarf forms are the pyramid, the palmetto, and the cordon. To train a pyramid a one-year-old scion on a dwarf stock should be cut off to  $1\frac{1}{2}$  feet. From the upper nodes in the same year the head of the trunk and four or five branches should be trained. If the tree is of vigorous growth, the second series of branches may be trained 9 to 11 inches above the first by pruning at this height. If the growth is weak, the head of the trunk should be cut back two or three nodes the

following year, and a strong year's growth be permitted to a height of from 9 to 11 inches. The new branch series can be formed the following spring. In this way the pyramid gradually develops. Pyramidal trees are planted either in borders or in special beds. A great variety of apples are specially adapted for that form. The palmetto form is chiefly used near walls and fences. It is raised by taking a one-year-old grafted tree, cutting it down to from 11 to 15 inches, and allowing only the three highest buds to develop. The uppermost bud forms the head of the trunk; the two others directed to the side form the branches of the first stage. In the following spring the head of the trunk is cut again at the height of 9 to 11 inches, so that the second stage is formed at this distance. A new stage of side branches is thus formed every year, until the wall is covered. The branches are tied to laths or wire, and are trained as nearly horizontal as possible. A great variety of apples and pears are suitable for this kind of treatment. Horizontal cordons are trained from one-year-old grafted trees by bending them over at the height of about a foot, and training them along a wire stretched horizontally. This form is especially adapted for edging walks or beds. Perpendicular cordons are trained on wires; they are specially adapted for high gable walls. For this form also certain species of fruit are recommended. In city gardens tub fruit trees may be added to the pyramid, palmetto, and cordon. Two or three year old apple or pear pyramids grafted respectively on paradise and quince are planted in tubs or buckets set in the ground in borders or beds. In winter they are protected from frost by being covered with earth or removed to a warm spot. There are special kinds of fruit better adapted than others for this treatment.

Besides large and dwarf trees, the tree section should contain several beds of berry fruits, more important at present since improved methods of transportation have made this summer fruit easily salable in cities. Preference should be given to the larger fruits, currants, and gooseberries. With limited space, they may be planted in the borders. Raspberries should be planted in a somewhat remote corner on account of their spreading roots.<sup>1</sup>

In city school gardens a part of the tree section is devoted to the most familiar forest trees and shrubs and to some ornamental trees and shrubs. If willow weaving is a flourishing industry in any one locality, attention is likewise given to the cultivation of osiers. In vine-growing districts a small vineyard is a requisite, and in hop raising districts a part of the garden should be planted in hops. In suitable districts an impulse might be given to raising silkworms by planting of mulberry trees and scorzonera.

(b) *The vegetable or kitchen garden.*—The vegetable garden ranks next in importance to the tree nursery, as the immediate utilization of vegetables in the household teaches their usefulness. Girls show the greatest interest in this division, and plant the beds with all kinds of vegetables of their own accord. This section should be laid out in several subdivisions. A comparatively large portion is required to show the complete management of vegetable culture. In school gardens which include the teacher's kitchen garden the latter may be used to exemplify the proper management. The portion chosen for the regular management is best utilized by the "three-field system." After laying out the permanent beds, such as asparagus, the remaining surface is divided into three parts. In the first, plentifully supplied with fresh manure, perishable vegetables, such as kale, turnip-cabbage, celery, gherkins, spinach, leeks, lettuce, and the like, should be planted. The second division is not freshly manured and is planted in better keeping vegetables, such as potatoes, carrots, turnips, and radishes. In the third, which likewise receives no fresh manure, but only a light covering of soot or compost, long keeping vegetables, as pease and

---

<sup>1</sup> The author states the species best adapted in each case (tree fruit and berry fruit), but he gives them German and French names, different from those they are known by in this country. Hence the translator omits them.

beans, all kinds of onions, shallots, cibols, etc., should be planted. The division in which the perishable vegetables were planted the first year receives the moderately keeping the second, and the long keeping the third year. The fourth year it is again plentifully manured, and the rotation begins anew. By applying the "three-field system" good results are obtained from moderate fertilization, and the regular change prevents any one bed from becoming easily exhausted. That part of the garden used to teach the regular management must distinctly bring to view the best utilization of soil in one and the same bed by rotation crops, as well as the value of interplanting with some kinds of vegetables. If the teacher cares to take the trouble, the plants to be set out in the beds can be raised in hotbeds in the garden. Many kinds can be raised by early sowing in flat cases under glass cover, and setting out later. In this way early vegetables can be had in advance of the season. The best adapted for early growth are pease, dwarf beans, cucumbers, lettuce, and potatoes. Of course the species that grow quickly and mature early should be selected.

The kitchen garden must furthermore contain the required beds for pupils, which are much more necessary in the city than in the country, where most children are actively employed in their own home gardens. These beds should border on one side of the main walk, so as to be of easy access. Each should measure about 10 feet square, and they should be planted by the children according to their own measurements. The number depends upon the number of children that report themselves willing to take charge of them. A few beds must be reserved for experimental purposes, either for trial of new kinds of vegetables or for comparison. A few appropriately situated reserve beds should be planted to obtain seeds. The kitchen garden receives the greatest attention in so-called housekeeping, cooking, or domestic-science schools for girls.

(c) *The botanical division.*—In a garden of a large city in which the botanical section furnishes the specimens for instruction in botany and biology, the greatest attention should be given to the most important native plants. These should be arranged and grouped according to the natural system of classification. Only the most important and characteristic representatives of the various families should be considered. The following families deserve a place: Papilionaceæ, Cruciferæ, Gramineæ, Lynamtheræ, Labiate, Umbellifereæ, Liliaceæ, Orchidallæ, Campanulaceæ, Ranunculaceæ, Papaveraceæ, Caryophyllaceæ, Violaceæ, Malvaceæ, Geraniaceæ, Prinulaceæ, Valerianaceæ, Hypericaceæ, Linaceæ, Saxifragaceæ, and a few others. Ornamental shrubs and trees might be arranged in groups without distinct limits. According to space the following may be considered: Elder, snowball, honeysuckle, cornel, spirea, white and red thorn, Japanese quince, lilac, hedge cherry, snowberry, hazelnut, juniper, etc. In sufficiently large gardens, especially when grounds for play and gymnastics are included, groups of trees may be planted. The most familiar foliage trees should be selected, and must be planted in such a manner that the higher trees do not injure the lower. The botanical division must contain special beds of the most important commercial and textile plants, such as flax, hemp, hops, tobacco, chicory, colza, maize, millet, sugar cane, etc. The following medicinal plants can be grown and united into one group: Camomile, mullein, fennel, anise, arnica, centaury, peppermint, sage, balm mint, and wormwood.

A somewhat remote, well-inclosed space should be reserved for the poisonous plants, and warning notices be posted in the beds. The most important specimens should be represented, as nightshade, belladonna, thorn apple, wolfsbane, henbane, digitalis, petty spurge, bittersweet, purge flax, hemlock, fool's parsley, oneberry, poisonous crowfoot, and meadow saffron. The special soil and locality required by some medicinal and poisonous plants must be given, as far as possible, by appropriate soil mixture and grouping. It is advisable to label all the plants, as well as the groups in the botanical division, with small placards of wood, tin, or porcelain, giving the names in the vernacular and also in Latin; but if the plants are

to be first defined and analyzed during instruction in botany, as is often the case in high schools, it is advisable to designate the plants by numbers.

If a small pond can be dug in the garden,<sup>1</sup> it should not be left undone. The banks should be planted with a few characteristic marsh and water plants, as rushes, mace reeds, calamus, water violets, water trefoil, snakeweed, arrowhead, and iris; white and yellow *Nymphaea* should cover the surface of the water. The pond should be stocked with all kinds of small aquatic animals, as frogs, salamanders, newts, water beetles, pond muscels, smerlins, sticklebacks, goldfish, etc. A rockery built of the most important native rocks and some crystallized minerals ornamented with creeping plants, ferns, and sweet broom adds a great deal to the beauty of the garden. In rural gardens only textile, commercial, medicinal, and poisonous plants need be cultivated. Cereals, fodder plants, and grasses are reserved for the agricultural experiment field.

(d) *The agricultural experiment field.*—This section is found only in rural gardens and, as the name indicates, serves for practical experiments. It contains the most useful cereals, fodder plants, and grasses. Cereals should include wheat, rye, barley, and oats; for experimental purposes, maize, spelt, and buckwheat. Special varieties of these grains must be represented. The following forage plants should be planted: Red, white, carnation, and yellow clover, lucerne, sainfoin, serradilla, lupine, white mustard, fodder, sand and bird vetch, beets, cabbage, turnips, and a few kinds of potatoes. The following fodder grasses deserve attention: Sweet-scented grass, couch grass, fescue grass, herds' grass, cat's tail, English and Italian ray grass, hairy reed, millet, yellow oat-grass. These plants should be so grouped as to form small grain and clover fields, beds to be hoed, and meadows. Meadow flowers may be added to the grasses. The weeds will sow themselves; the hurtful properties of each and the means for their destruction must be spoken of during instruction. Finally the agricultural experiment field must contain a few experiment beds in which new kinds of clover and grain and crops to be hoed may be tested. The comparative trials made on these fields refer to the different ways of working the ground, to fertilization, seedtime, sowing, size of seeds, etc. The agricultural experiment field is of the greatest importance to agricultural and continuation schools.

(e) *The flower garden.*—Flowers are favorites with children, especially with girls. This fact is best observed in a walk through fields and meadows. How active the children are in gathering the blue cornflowers, the red poppy, and the brownish cockle, to tie them into bouquets mixed with daisies and forget-me-nots. Joyfully they take their flowers home to mother for her to arrange them about the house. This love for flowers should not be disregarded in the education of children; it must be strengthened in school, directed to a noble purpose and applied to instruction. The culture of flowers, therefore, deserves special attention in school gardens. The very smallest gardens should contain these favorites in the borders: Roses, pinks, pansies, asters, wallflowers, lobelia, phlox, mignonette, fuchsias, primroses, begonias, geraniums, gillyflowers, hyacinths, and others. Larger gardens may include whole groups of magnificent and perhaps more fashionable flowers; carpet beds of various forms and combinations of color may be laid out. In girls' schools, especially, pupils' beds should be laid out, devoted entirely to flowers. A number of flowers and leafy plants in pots should ornament every schoolroom. During intervals of recess the larger girls can attend to them, and so an interest in flower culture may be awakened and fostered. Horticultural societies undertake a gratifying task when they distribute plants in pots among children free, awarding prizes to those who take the best care of their plants. The care of flowers develops a taste for what is beautiful, attractive, and comfortable in a home. It preaches order, cleanliness, and punctu-

<sup>1</sup> That is, if the configuration of the surface facilitates it, and a spring can be led to it to supply the water.

ality; therefore it is an indispensable means for the education of women. Flowers are often the only friendly sight in a small, gloomy dwelling; they are in fact often the only ornament that lends a charm of home to the dwellings of the poor; sometimes they are the only light in a troubled existence! Therefore it is a duty to cultivate the love of flowers as far as it lies within our power. Girls should feel the ennobling power awakened by contact with flowers, and enjoy the pure pleasure, quiet happiness, and contentment derived from it. Even among the wandering tribes of gypsies and rope dancers tender hands are sometimes found that show love of flowers enough to raise a few geraniums or fuchsias on the window sills of their ambulatory home. Considering their uncertain whereabouts and more than modest dwelling, this certainly deserves recognition and rejoices the heart of all who love flowers. The more we cultivate the love of flowers, gardens, and the beauties of nature in children, the surer we lay the foundation for esthetic culture and a contented disposition. The care of flowers also leads to a regard for other creations in nature. The more this is developed the less often trees and all kinds of plants will suffer injury from rude hands; useful animals will not be so frequently persecuted and tormented.

(f) *The apiary.*—The industrious bee plays an important part in the economy of nature. It is almost indispensable for the fructification of some flowers. Bee culture, likewise, brings in material gain through the much-prized products of honey and wax. The observation of these useful insects also affords many pleasures. The attentive observation of their virtues, as industry, sense of order, obedience, and readiness to render mutual assistance, excites many an impulse in the thoughtful student, and exercises a beneficial influence on disposition and character. Unfortunately, bee culture has not received the general attention which its importance deserves. Therefore gardens in rural districts and small towns should give the required impulse and awaken a new interest in these useful insects by accustoming boys to contact with them. That the bees may not be troublesome to the children in the garden, the hive should be located in a remote, dry, quiet place; the direction of flight should be toward the southeast. Four to six swarms are sufficient. The system of movable combs is generally preferred to the antiquated stationary structure. It must be left to the decision of the teacher what system is to be adopted; much depends upon his experience. Plants that furnish food for bees should be raised near the hive and in the space before it. The following can be recommended: Shamrock, mignonette, thyme, sage, borage, sunflower, gooseberry, currant, snowberry, and others.

(g) *Ornamentation of the school garden.*—To combine the attractive with the useful, school gardens should be beautified within their limitation. For this purpose arbors may be constructed in which pupils and teacher can take shelter in a storm, or where lessons may be conducted. They are specially indispensable where gardens do not adjoin the schoolhouse. When location and ground are favorable, a fountain with a roomy basin should not be omitted. The basin can at the same time be arranged as an aquarium, stocked with water plants, goldfish, smerlins, water beetles, and other small aquatic animals and ornamental fish. Small waterfalls, artificial rockeries and grottoes likewise add to the beauty of the garden. Bird houses of various kinds should be provided, and food be scattered in winter, as such arrangements teach and insure the protection of birds. An easily accessible place to procure water, well or tanks for watering the plants is very essential.

(h) *Garden implements.*—In planning a garden the necessary implements and a store or tool house must not be forgotten. The following are required: Several spades, hoes, iron rakes, a shovel, a grafting saw, several rose shears, a sufficient number of scythes or sickles, grafting or pruning knives, several ladders of different length, and a goodly number of watering cans, a hatchet, a hammer, pincers, and a supply of cords, pegs, etc. These implements are to be furnished by the community like all other school appliances, and must be kept in good condition.

## IV. MANAGEMENT.

The management of a school garden requires not only a proper understanding and full command of the subjects to be taught, but a broad view of the work to be done. This can be gained only by an exhaustive plan of work which the teacher must arrange and follow. The plan must cover the work for the whole year from spring to autumn, and define what is to be done each week. Each year the work must be planned anew, changed or supplemented. Two or three hours a week in the afternoon, after school hours, must be reserved for gardening. In urgent cases the hour for gymnastics may be taken up by gardening. In rural schools with a small attendance all the pupils may be occupied with this kind of work, according to their ability. In city schools the intermediate and upper grades only need take part. Applicants for work in the garden are, of course, accepted at any time. If the number of pupils is large, it is desirable and necessary to arrange them in different divisions, ten to twelve in a group, and appoint a foreman. In the tree section the work is done by older boys. Early in the spring the seed beds are dug over and leveled when the seed is sown. They are then covered lightly with moss or brush, to keep the ground damp, and are frequently watered. One-year-old saplings and one-year-old grafted trees are transplanted to beds that have been dug over and otherwise properly prepared for them. Young fruit trees are to be taken up and planted anew. Older fruit trees and berry shrubs must be pruned, if it has not been done in the fall. The ground around the trees is freshly loosened and manured. Single branches of specimen and test trees are again grafted, for which the scions were already cut in January. Strong saplings are improved by budding or grafting. The preparation of mummy is at the same time discussed. Strong stocks are pruned to the crown, while the growth in height of weaker ones is retarded.

After this spring work is done the beds are hoed for the first time and weeded. During the summer the thriving scions are fastened to poles and the wall and dwarf trees are repeatedly nipped and supplied with liquid manure, and, when necessary, watered. In July and August the young saplings are grafted and the bandages of the spring grafting loosened so far as the cord tightens. Injurious influences on fruit are to be counteracted. In the course of the summer the beds are hoed for the second time, leveled with the rake, and the clumps broken and smoothed with the spade. The compost pile is repeatedly spaded. In the fall the branches of saplings and stocks are clipped and cut off smooth, the graft bandages are loosened, and the beds are again roughly hoed. After the harvest the older fruit trees are brushed off, cleaned with moss, straw, and broom, whitewashed, and provided with sticky girdles. The tops of the trees are pruned, the ground around their roots is loosened and fertilized with lime and compost, and the holes for winter or spring planting are dug. Varieties are studied from the ripe fruit. Crops and the preservation of fruit receive theoretical and practical attention. Young trees are freshly tied up and protected for the winter against game by being wrapped in straw or thorns.

The work in vegetable and flower gardens is done by girls, since they, as future housewives, will assume the care and management of the home garden. The borders and beds are dug over and leveled in the spring. The teacher shows the girls how to manage the garden implements and teaches them how the work is to be done. Flower and vegetable seeds are sown and a few early beds are planted. The sprouting seed is weeded and frequently watered. In the course of the summer vegetable beds are frequently weeded, hoed, and watered. The walks are also cleaned and kept in good condition. The beds are staked off by the teacher with the help of some of the boys, and are arranged, as far as practicable, equal in size. They are then distributed among those children who are willing to undertake their care and management. Each child works its own bed independently and plants it ad libitum at

individual expense. It is also entitled to the crops, provided it cares for the plants in its bed during summer. The best pupils' beds are commended in the fall, and those in charge may be rewarded with premiums. A notice giving the name of the child in charge must be attached to each bed. Although the beds are planted according to pleasure, a certain uniformity should be aimed at for the sake of appearance. Vegetable, flower, and kitchen-garden beds should be at some distance apart. Several experimental beds, serving for comparison and the test of new varieties or seeds, are cared for in common.

The work in the agricultural experiment field and in the botanical division takes up very little time; it is confined mostly to weeding and hoeing and is undertaken in common. Boys alone are to be engaged in bee culture. Before they apply themselves to the study of the living insects they are instructed in the most important facts concerning their existence, habits, and characteristics. The three different kinds of bees in a hive are discussed with reference to their outward appearance, and the structures of the cells and the internal arrangement of the hive are explained from an empty hive. In order to show the life in a hive clearly, it is desirable to have a so-called hive for observation, which the teacher can arrange in the following manner: A very small hive with only six frames should have glass walls lengthwise, covered on the outside with wooden doors. The frames are set two by two in three rows, one above the other, so that each comb may be observed from without on both sides. The entrance is at one of the shorter sides. In May the hive is stocked with the necessary material and placed in a somewhat isolated position. The old queen is taken from a populous hive and placed in the lowest section of the hive, together with a brooding comb; next to it is placed a comb with a hatching brood. Above these two frames two empty combs are set with workers' and drone cells, and above these two combs with honey supplies. In this observation hive the teacher can show the three kinds of bees in their occupation, draw the pupils' attention to the laying of the eggs by the queen, and explain the purpose of the structure for workers and drones. Then the queen may be removed and a new one brought up. Now it will be observed how a tribe acts without the queen bee, how the queen cells are arranged and built, and how the bees raise workers' larvæ to queens, how the first queen slips from the egg, the subsequent hatching of the others, which are, as a rule, stung to death by her, and, finally, the time required to hatch a worker, a drone, and a queen (sixteen, twenty, and twenty-four days). If the work during the summer has been favored by fine weather and plentiful crop of honey flowers, the hive may be increased by two frames of artificial combs, whose building may be noticed, together with the storing of the honey, from which the queen is excluded by means of a grate partition. In the fall the killing of the drones may be observed, and, finally, a young reserve queen may be kept on hand during the winter.

The teacher should keep a simple daybook, recording receipts and expenses and notes on the experiments undertaken. The care and supervision of a garden in connection with a school require much time and trouble. The community should therefore pay a small sum annually for the teacher's services as head school gardener. An appropriation should also be made for the purchase of seed, seedlings, props, labels, cord, etc. The produce belongs in part to the teacher, namely, fruit, berries, honey, and vegetables. A great deal, of course, is divided among the children; and seeds, cuttings, fruit, etc., are given free to any one interested. The produce of the pupils' beds belongs entirely to the children. The returns from the tree nursery go toward the school fund, but the commendable custom of presenting exemplary boys with a fruit tree at the time of their graduation deserves to be continued.

#### V. INSTRUCTION IN THE SCHOOL GARDEN.

The laying out of a garden always has a distinct purpose in view. As a rule, this is its economic value. The end and aim of school gardens, however, are different.

They are by no means primarily designed as a source of revenue for teachers and community or for utility in the general sense of the term, but for purposes of instruction and education. It is true that teachers' and pupils' industry is rewarded in a material way. Agriculture in its different branches, especially fruit culture and horticulture, is also promoted, and for this reason, perhaps, school gardens are maintained in some countries. But their chief value consists in their advantage for the education of youth. As schools are institutions of learning and training, so also are school gardens. They bear the mutual relation to each other of egg and shell. Gardens are a necessary part of schools and attain their educational value by being connected with them. "No instruction without observation" is the watchword of our times. By means of gardens this demand can be met. In many cases they furnish numerous specimens for object lessons, or are themselves excellent means for observation; in others they give many points for comparison that have the value of direct observation. Thus they are valuable supports for observation in instruction. Instruction in gardens appears partly as occasional lectures, partly as defined lessons, partly as practical work, and partly as constant nature study. The practical work in gardens affords many opportunities for information of various kinds. In digging the beds the necessity of working the ground is shown, the different kinds of soil may be discussed, the use of implements demonstrated, and the application of the laws of physics in their regard explained. The habits, characteristics, and qualities of insects and small animals which the children find are discussed, and they are made acquainted with the useful and injurious animals, are exhorted to protect those which are of use and to destroy those which are harmful. In sowing, planting, hoeing, weeding, and watering, the teacher can give appropriate hints and show the practical manipulation of the implements. Many natural phenomena give him the opportunity of explaining natural laws and of applying what has been learned. In gathering the crops the attention of the pupils is drawn toward the commercial uses of the different kinds of produce, and the value of each as an article of food is considered.

Besides the occasional instruction the teacher should conduct some of the regular lessons in the garden when the weather permits it. The greater number of lessons in nature study must be given during the summer out of doors, as the garden furnishes the best subjects for direct observation. Thus a lesson in natural history may be given in the garden on the different kinds of soil, their improvement and appropriate working; another on the nutritive organs, growth, and conditions of the life of plants; a third on their transplantation and propagation; besides, a lesson each may be devoted to the different kinds and forms of leaves, flowers, and fruit, useful animals, the destruction of enemies to fruits, the practical protection of birds, etc. In speaking of the tests of comparison which the teacher has appointed the lesson should be conducted at the experiment bed after its examination. For instance, first experiment: In a bed one half of the cabbage plants have been manured with fertilizers rich in nitrogen, while the other half have not been fertilized at all or have received no extra amount of nitrogen; result, the former have attained a luxuriant growth; rule, fertilizers rich in nitrogen promote the growth of leaves. Second experiment: Plant beets, radishes, and the like in one bed; nip all but two heart leaves of one half of them and let the others grow undisturbed; result, plants that have been deprived of their leaves develop small, insignificant roots; rule, loss of foliage is harmful, as it weakens the plant. Third experiment: Plant a bed in carrots; sow one half thick and the other half sparse; plant another bed similarly in cabbage or celery; result, where the plants are close together their development is poor; the others are much better; rule, setting plants too close together injures their growth and consequently diminishes the crop.

Similar experiments can be made with planting deep, with the choice of seeds, the rotation of crops, etc. All such experiments, however, the teacher must arrange in direct connection with the plan of study. He must note where and when he intends

to make use of the garden for instruction and observation. According to Jung, the noted natural-history teacher in Kiel, very serviceable subjects of instruction can be gained by arranging the objects in the garden in groups "en miniature." Lessons and reviews may include: The plants and animals found in the garden; the most beautiful and useful forest trees in the garden; the useful shrubs; flowers and their forms; the apple tree as a protector; the most beautiful field flowers; the best forage grasses; the three-field system of agriculture and horticulture; the useful garden insects; the destroyers of fruit and useful plants; plants injurious and plants useful to man; plants raised for food, clothing, and building purposes or medicine.

Besides natural history, geometry, physics, and mathematics, in part, may be taught in the garden. Thus, a class of pupils, under the teacher's direction, can measure off the garden and beds and calculate areas. The pitch of the ground can be calculated by means of a leveling instrument or a water level; the height of a tree or a house can be ascertained by the length of its shadow and the area of variously shaped beds and subdivisions can be found, and the value per acre of crops estimated; finally, the calculation of surface and volume may be combined with the classification of all kinds of geometrical figures, as circles, ovals, rhombs, triangles, squares, polygons, columns, cones, spheres, etc.

Countless specimens for other studies are furnished by the school garden; as, for instance, for drawing leaves for the study of their outline, parts of flowers and foliage; furthermore, objects for perspective study, as beehives, arbors, nesting boxes, etc. Many physical laws are exemplified for the study in the class room, as, the construction of a fountain as an example of communicating vessels; the well as an example of the suction pump; ripe fruits fall in consequence of the law of gravitation; water poured into the saucers under flowerpots will rise in obedience to capillary attraction; the temperature is higher underneath the snow than in the open air, because of obstructed radiation; the air is cooler after rain on account of evaporation; the sun's rays exert a stronger influence on slanting hot-bed covers the greater the angle of incidence; dark objects get warmer more quickly than light on account of less reflection, etc.

Abundant material for compositions is likewise furnished. Language lessons are plentifully supplied with subjects of discussion. Subjects for compositions are: The garden in summer and in winter. My flower bed. The life of the honey bee. Why are fruit trees planted? How is a bird cage or a nesting box made? The uses of singing birds. How to fight the enemies of fruit. The gardener's friends among animals. Why is the goat of no use to the gardener? The garden also furnishes much material for the study of home geography and singing.

In schools of more than one division, all can receive outdoor instruction. In rural schools of but one division the small children may be left in the schoolroom under the superintendence of an older pupil while the upper and middle classes, either together or alternately, may be occupied with outdoor lessons. Outdoor instruction is warmly advocated by educators of the present day. The December conference of 1892, held in obedience to a call of Emperor William, recommended it in these words: "Outdoor instruction shall be furthered in every way for the study of the natural sciences as well as for the study of the home geography and home history." The school garden is naturally the best place for such instruction.

Finally, instruction in gardens suggests constant observation of natural phenomena which the children can make under the teacher's direction. They refer to weather conditions, sunrise and sunset at different seasons, winds and clouds, development of plants from germination to fruit formation, the actions of useful and harmful animals, blooming plants, and other things. In order to be able to set such tasks, the teacher himself must be a diligent observer of nature, and must have planned a series of lessons for the seasons, months, and weeks. These observations are a preparation for instruction; they render the senses more acute, exercise thought and judgment, and arouse interest.

## VI. EDUCATIONAL AND ECONOMIC SIGNIFICANCE.

The latest efforts of pedagogy have been directed toward harmonizing school instruction with the demands of practical life. Our time demands an education based especially upon a broad knowledge of the natural sciences, by means of which those facts and experiences are acquired by self-observation and self-activity which will benefit the pupil in his later life. As that instruction is best which is based on or derived from actual observation, whose fruits the pupil gains by his own labor, and as the school garden is the richest storehouse for lessons in the natural sciences, it necessarily follows that gardens are a valuable adjunct of the modern school. The reforms in the teaching of natural science, advocated lately, emphasize the grouping of the matter of instruction according to common conditions in life which exemplify the mutual influence of different forms of existence upon one another. This method makes good results justly dependent upon the continued well-directed observation, and that observation on the part of the pupil requires gardens in order to have the means near at hand, under the control of the teacher, and without loss of time. These actual observations awaken intense interest, render the senses very acute and judgment clear. Daily contact with trees, flowers, and other natural objects awaken pleasure in them and love of nature. The knowledge acquired by direct observation necessarily leads to a proper appreciation of the natural forces and their effects, to the admiration of natural beauties manifested in bright colors and lovely forms. A school garden in the full height of its summer glory, moreover, gives to children a proper understanding of poetry; in short, it offers both matter and method to an æsthetic education, such as nothing else can give.

Besides being an invaluable aid for instruction, school gardens are also excellent means of training. Their chief purpose is training for work, a purpose which they have in common with other institutions. All children, large and small, can be occupied according to their capacity, and the very occupation gives them pleasure, develops a liking for labor, and strengthens self-confidence in their own power. Moreover, work in the fresh air is much better for children's health than that in the school workshop. This is to be no reflection on the latter, but merely a statement of fact. Where workshops are a necessity, in industrial districts, they are beneficial and promote national prosperity. They may, in fact, be easily and advantageously connected with gardens. In autumn and winter the boys can benefit by manual training in the school workshop.

Garden work, properly directed, and managed with pleasure and understanding, promotes industry, attention, judgment, skill, and self-reliance; it develops the sense of order, cleanliness, punctuality, beauty, responsibility, and duty, and, consequently, forms the foundation for a firm will and self-reliant action, or, in other words, for a moral character. The free intercourse in the garden gives teachers opportunities of knowing their pupils better in a short time. They are consequently able to direct the education of individuals in the best way and by the most appropriate means. The work in common also arouses public spirit in children, the sense of fellowship, and mutual dependence. It awakens an esteem for all manual labor and a proper judgment and valuation of the work of others. Children learn, above all things, that "in work there is no shame," and that "idleness is the mother of evil." The educational influence of labor is great and lasting. At sight of this or that plant the mature man will, in his own fields and garden, recall the time when he first learned something of it in the school garden. Many things obscure then are clear to him now; however, he does not underrate the early impulse, and will certainly not fall behind the boy in zeal, judgment, accuracy, and activity.

An institution like the school garden, that combines so many educational forces, will hardly be deprecated by prudent educators. Many of them at present maintain a favorable opinion of school gardens and advocate their establishment. M. Vierthaler says: "The example of the ancient Persians deserves to be imitated.

With them a knowledge of agriculture and horticulture was required by law of the King's as well as the slave's son." Kellner, school councillor in Treves, says: "I recommend, above all things, horticulture in all its branches to the teachers of rural schools." "Manual labor, such as gardening, light cabinet-making, and turning, promotes the boy's physical development."—(Sailer.) "The advantages of even the smallest garden are so many and so great that no school should be without one."—(Demeter.) "A school without a garden is like a stag without water."—(Dr. Georgens.) "School gardens are a foundation for the knowledge of nature and its consequent pleasure, and an excellent means of training."—(Professor Schwab.) "Not trees, shrubs, herbs, and grasses alone are what we offer the children in the school garden, but love of nature, labor, and home."—(F. Langauer.) "The question of school gardens in the development of public schools is gaining in importance every day."—(Maresch.) "No public school should be without a garden; every community that resolves to connect a garden with its school is laying up capital whose interest it enjoys in the prosperity of its future members."—(Jablonzy.) "The hour must and will come when the eyes, until now struck with blindness, shall be opened and see that the institution of school gardens has become the greatest blessing for the people."—(Sprengrer.)

Finally, school gardens are of paramount economic significance. Franz Langauer, of Vienna, makes the best characterization by calling school gardens the pioneers of agricultural progress. As elementary schools lay the foundation of all subsequent education, so all beginnings of civilization, all progress of industry and agriculture proceed from them. To manage his affairs at all successfully, and be able to enter into competition, even the farmer of the present day must possess a certain amount of knowledge of natural science. The first elements of this he learns in the elementary school. And the shortest and safest way of attaining this end is through his own observation, his own activity, his own experiments in the school garden. What the boy learns he will later on utilize in the management of his property; therefore the impetus and the progress that are observed in agriculture in several countries are mainly the result of school gardens. The pleasing impression left by them on the residents of towns has its unmistakable influence upon home gardens. The teacher's diligence and punctuality are imitated by the people who try to make their gardens excel in cleanliness, beauty, and productiveness. The closer the intercourse is between teacher and people the surer this favorable influence will be. These conditions are soonest realized where gardens are open to the public on Sunday; teacher and neighbors both benefit by a free and easy interchange of thought. The beautiful fruit raised awakens a desire in visitors to possess one or another kind of seed to raise the same varieties at home. Seed can be furnished in abundance, and thus desirable kinds of fruit and vegetables, beautiful flowers, and the like, are spread, to the advantage of the community. Often new varieties of vegetables, fruit, and flowers, or truck-garden specialties, as asparagus, strawberries, vegetables, and roses and other flowers are introduced especially through school gardens near large cities, and in a short time are so generally cultivated that they become a source of income to the population and help to advance prosperity. The shady arbors, the magnificent rose bushes in the borders, the full vines on the walls, and the laden pyramid fruit trees in the beds are admired by many, who resolve also to do something toward beautifying their homes. Many a one, since his visit to a school garden, no longer lives in a thicket of brush, or surrounded by bogs, hemmed in by gainly willows and alders. Now his vine-covered house stands in the center of a friendly garden and the windows look out upon blooming plants and heavily laden apple trees that shade the broad, level village green. "A good example deserves to be imitated" is justly applicable to the school garden. One that is kept in order serves as a model in many ways. Many a village is indebted to school gardens for its outward attractions.

These gardens also exert an educational influence upon the maturer members of the community, for in them are taught the youth who are beyond school age and attend continuation schools (evening and holiday schools), the most important principles of agriculture, showing by practical experiments how agriculture must be carried on to be profitable, offering productive specimens, and warning against mistakes. School gardens are a preventive against degeneration; they promote excellence of performance. Thus they are pioneers of civilization, promoters of practical progress, and sources of prosperity in communities.

The establishment of a school garden is easy in most places, since nearly all school buildings have some ground that may be reserved for the purpose. Every new school building, however, should be planned with the view to connecting a school garden with it. This should be legally provided for. Not only the State and the community, but agricultural and horticultural societies are interested in the establishment of school gardens, and should give their support in advancing the idea. Special gardens should also multiply in future. At present almost all normal schools in Germany, Austria, Switzerland, Sweden, and Denmark possess gardens in which the future teachers are trained and taught in agriculture and horticulture.

The idea of school gardens is so simple and natural that the coming century will wonder how public educational institutions could ever have existed without them and been true to their purpose.

#### BRIEF CONSPECTUS OF THE SYSTEM OF PUBLIC EDUCATION.

The system of public education in France comprises three departments, primary, secondary, and higher under centralized control. The chief of the system is a cabinet officer, the minister of public instruction (at present, M. Leygues).

To the central administration belong the Superior Council of Public Instruction, the chiefs or directors of the three scholastic departments (superior, secondary, primary), the corps of general inspectors, and a large body of clerks or assistants.

The functions of the Superior Council are advisory and in some cases disciplinary and judicial. The council consists of 60 members, one-fourth appointed by the President of the Republic and the remainder elected by their colleagues (professors and teachers). General inspectors, ten for secondary and a large number for primary instruction, are sent out annually from Paris to investigate and report upon the condition of colleges and schools in their respective jurisdictions.

The State educational system (University of France) is organized in 17 academies (including one in Algiers). An academy comprises the university and associated lycées and colleges, and also the public primary schools within its limits. The head of the academy is the rector who is appointed by the President and subordinate only to the minister. The rector is assisted by an academic council composed of professors and officers of education. The chief officer of primary education under the rector is the academic inspector appointed by the minister. Primary inspectors, 450 in number or about one for every 150 schools, are subordinate to the academic inspector; they come into the most intimate relations with the schools and teachers, as their province is the inspection of the individual schools. The 90 departments of France are districts of educational administration within the academies; the prefect or civil chief of the department has certain authority in respect to primary schools. In particular he appoints the full teachers (*titulaires*), although his choice must be made from lists approved by the academy inspector. The prefect is assisted by a departmental council composed of school inspectors, teachers, and members of the civil council, which gives advice upon matters relating to the primary schools.

The medical inspectors of communes and departments are charged with the sanitary inspection of schools. The only local authorities concerned with education are the communal councils and mayors who select the sites for the school buildings and vote the funds for the expenditures at the charge of the commune, and local school committees (*commissions scolaires*) formed to encourage school attendance. To the

department of superior instruction (Director, M. Liard) belong the universities and special schools of high order, which are under the minister of education.<sup>1</sup> Paris is the seat of these special schools and also of the principal university. Under the law of 1896 fifteen of the former faculty groups have been organized into independent universities. They registered 28,782 students in 1893, an increase of 11,142 or 63 per cent above the number enrolled in the faculties in 1888.

The professors of the State universities are appointed by the President of the Republic in advice with the minister of public instruction. The choice is made from two lists, one furnished by the University Council, the other by the Superior Council. The salaries of professors are paid by the State and they have right to a pension.

To the department of secondary instruction (Director, M. Rabier) belong the lycées or State classical colleges for boys, the State lycées for girls, and the communal colleges established by the communal or local authorities and aided by the State. In 1897 the lycées for boys numbered 109, of which 18 were in Paris and enrolled 11,005 pupils; and 96 in the departments enrolling 41,422 pupils. The communal colleges numbered 227 with an enrollment of 32,412. This gives a total of 84,839 boys in the public secondary schools. The church secondary schools enrolled the same year 84,569 pupils and private secular secondary establishments 12,818.

The professors of secondary instruction (public) are appointed by the minister of public instruction. Their salaries like those of the professors of superior instruction are paid by the State and they are also borne on the pension list.

To the department of primary instruction belong the infant schools (*écoles maternelles*), the superior primary and elementary primary schools, and the primary normals.

The primary normal schools, 87 for men and 85 for women, are established by the departments (law of June, 1833). In 1897 they enrolled 7,736 students (3,865 men, 3,871 women).

Every commune must establish at least one public primary school for children of the legal school age, 6-13 (law of 1833 confirmed by later laws). The establishment of schools for children under 6 years of age (*écoles maternelles*) and of superior primary (high schools) is optional with the communes (see statistics, p. 1086).

Public primary schools of all classes are free (law of June 16, 1881) secular (law of March 28, 1882), and only lay teachers may be employed in them (law of October 30, 1886). Instruction is obligatory for all children (law of March 28, 1882), but parents are free to choose the means. Parochial schools are thus recognized, although they are deprived of State support.

The enrollment in public primary schools (elementary and superior) in 1897 was 4,189,506, a decrease of 5½ per cent below that of 1887.

The enrollment in private primary schools chiefly parochial was 1,341,098, a gain above 1887 of 23 per cent. The total enrollment in primary schools, public and private, in 1897 was, it appears, 5,530,604, equivalent to 14 per cent of the population.

No one is permitted to teach in any capacity in a public primary school unless provided with a State certificate. These certificates are the "*brevet élémentaire*," secured by examination or graduation on a normal school after a probationary term of service; the *brevet supérieur* and the "*certificat d'aptitude pédagogique*," both requiring examination and successful service.

The State pays a fixed annual salary ranging for full teachers in the elementary

<sup>1</sup> Collège de France, Museum of Natural History, Practical School of High Studies (*École Pratique des Hautes Études*), Superior Normal School, School of Charts (*École Nationale des Chartes*), School of Oriental Languages, French School of Archæology at Rome, French School at Athens. The remaining special schools, such as the Conservatoire des Arts et Métiers, *École Nationale Supérieure des Mines*, etc., are under the charge of other ministers.

primaries from \$200 to \$400 for men, and for women from \$200 to \$320. In addition to his salary, every teacher must be provided with a residence or with a money equivalent for the same. The law imposes this provision upon the communes and fixes the rates of indemnity for residences. Primary teachers may be retired upon a pension after reaching 60 years of age, if they have been in the service 30 years. The minimum pension is for men \$120 and for women \$100 annually (law of June 9, 1853).

The total State appropriation for the current expenses of public instruction in 1898 was \$39,775,615, of which amount \$30,890,707 was for primary instruction. The summarized statistics of the various classes of schools for the latest date of report are as follows:

CURRENT RECORD OF THE UNIVERSITIES OF FRANCE.

The most important recent change in the State system of education is the passage of the law of 1896, transforming the "faculties" of higher education into organic universities. The constitution of the faculties had been gradually modified in preparation for this final measure by a series of decrees and laws (in particular, decrees of 1885 instituting a general council of the faculties of each académie with authority in both financial and scholastic affairs. This council becomes the university council under the new law. (Laws of July 18, 1889, and of April 18, 1893, regulating finances).

Before the passage of the law of 1896 higher education was wholly under the control of the ministry of public education, the fifteen universities created under the law (one in each academy having the four faculties of letters, sciences, law, and medicine) have a large measure of independence; their affairs are regulated by their own councils, they have control of their own property and of the fees received from students for registration, matriculation, laboratory and library facilities, etc., and they are authorized to confer a doctor's degree (the university doctorate) which is distinct from the State degrees con-

ferred by the examining bodies designated by the minister for that purpose. This last power greatly enhances the value of the universities for foreign students.<sup>1</sup>

The universities have also to assume responsibilities from which the State faculties were free. The fees which they retain must be applied strictly to increasing the facilities for study and the equipment of laboratories and libraries, the maintenance of new courses, etc. The State no longer makes appropriation for these purposes. Henceforth also the funds for new buildings must come from the private funds of the universities. Thus local pride and local resources must be depended upon for much that is essential to the maintenance of higher education. The outlook for the leading universities is bright, but doubt is expressed as to the ability of the smaller universities to maintain their prestige. In some the tendency is already manifest to concentrate their resources on specialties favored by their location; it is even possible that one or two of the universities will become technical institutions of high grade and attract by this means a new class of students.

Since the passage of the law the University of Paris has effected a loan of \$340,000 for the construction of new laboratories for the Faculty of Science, the University of Lyons has borrowed \$18,000 for the completion of the chemical institute and \$12,000 for the completion of the maritime laboratory of Tamaris and the archæological museum; Poitiers has promised \$14,000 for the installation of its university library; Nancy has received \$80,000 from local manufacturers for the erection or enlargement of laboratories.

Since the 1st of January, 1898, the date at which the new law went into effect, several universities have increased the number of their chairs and assistant professorships. Paris has added in the Faculty of Law a chair of the history of Roman public law and an auxiliary course in the history of treaties; in the Faculty of Letters an auxiliary course in experimental physiology and three assistant professorships in medicine and pharmacy. Lille has added to the Faculty of Letters a special course in French literature and in French grammar for foreign students, and a course in German philosophy for students of medicine who are candidates for the school of military hygiene. Similar growth has taken place in the universities of Lyons, of Aix-Marseille, of Bordeaux, of Caen, of Montpellier. The development of courses of local interest is also noticeable. Among these are: The History of Provence and of the Provençal language and literature at Aix-Marseille; colonial geography and Spanish at Bordeaux; Norman art, literature, customs, and dialect at Caen; Celtic language and literature at Rennes. These and similar movements in other university

<sup>1</sup> For the requirements for foreign candidates seeking admission to the French universities see p. 1089.

centers, says M. Maurice-Faure, in a report to the Chamber of Deputies, "do not destroy but fortify national amity by disclosing the various phases of the French national spirit and by helping to substitute for the ideas of a vague cosmopolitanism a profound attachment for the native land, an attachment solidly founded in love of country."

The following tables show the status of the universities at the latest date of report (1897) with respect to the number and distribution of students and expenditures, with the corresponding data for the State faculties at the beginning of the decade:

## ADMISSION OF FOREIGN STUDENTS TO FRENCH UNIVERSITIES.

The recent efforts that have facilitated the admission of foreign students to the French universities have been fully considered in previous Reports.<sup>1</sup> They are summarized in the following statement addressed to the Commissioner of Education by Prof. H. J. Furber, jr., of Chicago, to whom, in great measure, is due the success that has attended the effort:

During the spring of 1895 the attention of French scholars was called to the partiality shown by Americans for the universities of Germany and the political sympathies which might ultimately attend the schooling of a considerable body of our students in that country. To inquire into the reason for this preference and the measures necessary for advancing the prestige of French learning in the United States, the Comité Franco-Américain was formed in Paris, with an advisory branch in Washington. The French organization numbered among its members the rector of the Academy of Paris, the administrator of the Collège de France, the deans of the different faculties, the heads of the principal special schools, the director of higher instruction, and other prominent men. The American branch included the United States Commissioners of Education and of Labor, the presidents of leading universities, and other men of prominence. (Cf. Report of the United States Commissioner of Education, 1894-95, Vol. 2, p. 305 et seq.)

The first meeting of the Paris committee was held at the Sorbonne the 26th of June, 1895. Others followed, the opinion gaining ground that the discrepancy between the numbers of Americans in the schools of Germany and France was due to the formal regulations affecting foreign students in these respective countries. In Germany the student enjoyed freedom in the election of his courses, in his methods of study, and in the choice of time and place for undergoing his examinations. Admitted to his courses, not always on the highest credentials, he was free from all onerous requirements, until, selecting his own time, he presented himself as a candidate for a degree. In France, also, it is true, he was at liberty to study what and where he pleased, if he did not aim at a diploma; but as a certificate of successful effort is not without value to the student, he would, other things being equal, naturally drift toward the country where the conditions for taking a degree were not unreasonably severe. The licence was in general necessary before the French doctorate was obtainable, and preliminary to the licence the baccalaureate was in certain cases indispensable. To introduce the German method into France in toto was not to be considered. There was an organic difference in the nature of the German and the French degrees. In Germany the doctorate carried with it no professional prerogatives. Not without further qualifications and severe examinations could the student obtain from the State the license permitting him to practice a profession. In France, on the contrary, the degrees were given, not by the university but by the state, and clothed the recipient with special immunities and rights. The licencié en droit could enter on his legal duties. The Doctor of Medicine was already a physician; while the licence of the other faculties opened public careers in various directions. To render degrees more accessible to foreigners was, therefore, to subject the native youth to a sharper competition in acquiring a livelihood,—a competition in which, because of his military duties, the Frenchman was at a disadvantage on his own soil. It was due, in fact, to this consideration that at the very time the friends of a more liberal hospitality were endeavoring to secure the foreign student greater privileges a counter agitation was developed which aimed at curtailing those

<sup>1</sup> See in particular Report for 1897-98, vol. 1, pp. 749-759.

that he already had. To the credit of the Comité Franco-Américain, the arrangement ultimately adopted harmonized the interests of all.

The efforts of the committee were directed along two different lines: First, toward modifying in each particular faculty the conditions affecting the granting of the old degrees; and, secondly, toward establishing degrees of a new order, possessing, as in Germany, full academic value, but conferring no peculiar privileges. Partly through the influence of the committee and partly because of other reasons important changes were made in the faculties of science in January, 1896. The features then adopted—which have, however, in view of recent innovations, since become of less importance to the foreigner—were, briefly, wider latitude in the election of studies, liberty to migrate from one institution to another, and the privilege of taking examinations either singly or en bloc. It was in the summer of 1897 that the committee was, in all except detail, finally successful. The changes then effected tended toward the creation of a new doctorate, similar to that of Germany, and did not aim at modifying the existing system of degrees. The French universities, originally independent, had been consolidated by Napoleon I into one great institution—the Université de France—of which the Sorbonne at Paris and the faculties at Lyons, Bordeaux, Montpellier, etc., were sections, known as academies. The law of July 10, 1896, restored the academies to their old position as independent universities, and a ministerial decree, dated July 21, 1897, clothed them, *inter alia*, with the following powers:

“ART. 15. Besides the degrees established by the State, the universities are empowered to institute titles of a nature purely scientific.

“These titles shall confer none of the rights and privileges attached by law and regulations to the (State) degrees, and in no case shall be declared a substitute.

“The studies and examinations which shall determine their distribution shall be subject to regulations deliberated by the council of the university and approved by the standing committee of the Superior Council of Public Instruction.

“The diplomas shall be delivered in the name of the university by the president of the council, in forms different from the forms of those delivered by the Government.” (Cf. Report of United States Commissioner of Education, 1896-97, vol. 1, p. 33, et seq.)

If there be at present any essential difference between the degrees of Germany and France it lies in the fact that in Germany the university degree may be considered in a sense as leading to the diploma of the State—rarely if ever taken by Americans—whereas the French doctorat universitaire can not be transformed into the doctorat d'état, the latter being dependent upon preliminary qualifications, such as the baccalauréat, licence, etc.

Acting under the authority given by the decree of July, 1897, the University of Paris has since enacted regulations, which were approved by the Minister of Public Instruction April 1, 1898, and became operative at the beginning of the year.

“There is instituted a doctorate of the University of Paris. Candidates for the doctorate of the University of Paris must enter their names upon a special register provided by the secretary of the faculty or school of the university whose courses they intend to follow. They must present, in order to be inscribed, their diplomas or certificates of study or scientific degrees; must fulfill the courses of study prescribed by the present regulations, and must submit to public examination. They are subjected to the academic and disciplinary régime of the university.

“In the Faculty of Letters candidates must, if they are French, present the diploma of licence ès lettres, the faculty reserving to itself the right of accepting equivalents; if foreigners, they must submit certificates of study, of the value of which the faculty is judge. The term of study is at least two years, which may be spent either at the faculty or at one of the scientific schools of Paris, or, in part, at some other French or foreign university. The time of study may be abbreviated at the discretion of the

faculty. The examinations include, first, the sustaining of a thesis written either in French or in Latin, and, secondly, questions upon subjects chosen by the candidate and approved by the faculty.

"In the Faculty of Science candidates must present two certificates of advanced study, such as differential and integral calculus, rational mechanics, astronomy, higher analytics, geometry, celestial mechanics, mathematical physics, physical and experimental mechanics, general physics, general chemistry, mineralogy, biological chemistry, zoology, botany, geology, general physiology, and physical geography. The faculty reserve the right of admitting equivalents in the case of foreign students. The term of study is one year. The examinations include the sustaining of a thesis indicating personal research and questions upon subjects chosen by the faculty.

"At the Superior School of Pharmacy candidates must, if French, present the diploma of pharmacist of the first class; if foreigners, two certificates of study, the first covering pharmaceutical chemistry and toxicological chemistry, the second covering galenic pharmacy and materia medica. The school reserves the right of accepting equivalents. The term of study is at least one year. The examinations consist in the sustaining of a thesis indicating personal research.

"In the Faculty of Medicine the degree of the University of Paris is given to foreign students who have taken their courses and submitted to the examinations of the medical faculty of Paris, the French degree of Bachelor not being required."

The courses of the French universities are open *gratis* to both men and women. Fees are, however, payable by candidates for a degree.

Although there is as yet no mention of the university doctorates of divinity and law, it may be confidently stated that these degrees will shortly be available both at Paris and at the other universities of France where the *doctorat universitaire* is about to be established.

It is unnecessary to say that the reforms described were carried through with no unfriendly sentiment toward Germany. There is in France no disposition to decry the triumphs of the Germans in the field of learning, while to Americans the possibilities which the schools of France afford are most forcibly suggested when contemplating what we have gained from German sources. Nor, in urging the benefits to be derived in France, is there any thought of questioning the excellence of our native institutions. For the vast majority of our students the universities of the United States offer a better preparation for the responsibilities of life than any they could obtain abroad. But there are a few to whom a wider field is necessary; and these should not remain strangers to the resources of France. Nations, too, are subject-matter for investigation; and, in view of our national development and growth, our future welfare as a State demands a more intimate knowledge of the institutions, character, and history of our neighbors than we have hitherto possessed.

The Comité Franco-Américain has been encouraged in the expectation that its friends in the United States would organize in aid of the movement so successfully begun. It is particularly desirable that at each seat of learning the cooperation of some individual or group of persons be obtained who will give publicity to such matter as the committee may from time to time communicate. A means of showing our appreciation of the courtesies the French universities are preparing to extend lies in the establishment of scholarships permitting of a certain residence in France. A further plan, which there is reason to believe would be cordially received in France, is for our universities to invite the attendance of one or more French students every year, offering their hospitality in return, if desired, for services such as it may seem fitting to demand. Under a proper system of selection the students sent from France might become of value not alone within the department of French language. These projects are submitted in the earnest hope that the support necessary for carrying them into execution may be volunteered.

The doctorates created under the decree of 1897, as already announced, are:

University of Paris: Doctorate of letters; sciences; medicine; pharmacy; Protestant theology. The university doctorate has not yet been adopted for law.

University of Besançon: Doctorate of letters and for sciences.

University of Bordeaux: Doctorate of sciences; medicine; pharmacy.

University of Caen: Law (also diploma and certificate of higher literary studies instituted in favor of free students: act November 19, 1886).

University of Grenoble: Doctorate of letters; sciences (also diploma for electro-technical subjects).

University of Lyons: Doctorate of medicine; pharmacy; sciences; letters.

University of Montpellier: Doctorate of pharmacy.

University of Nancy: Doctorate of law; sciences; pharmacy.

The following statement of the expenses to be met by candidates for the doctorate of the University of Paris is furnished by M. Henri Bréal, corresponding secretary of the Franco-American Committee:

*Faculty of Protestant theology.*

	Francs.
4 inscriptions quarterly of 30 francs <sup>1</sup> each.....	120
4 quarterly fees of 2.50 francs.....	10
Examination fees.....	110
<b>Total</b> .....	<b>240</b>

*Faculty of sciences.*

Annual matriculation.....	20
Annual fees for library.....	10
4 quarterly fees for laboratory, from 50 to 200 francs.....	200 or 800
Examination fees.....	140

The total depends on the fees for laboratories and on the number of years of studies.

*Faculties of letters.*

2 annual matriculations of 20 francs.....	40
2 annual fees for library of 10 francs.....	20
Examination fees.....	140
<b>Total if the doctorat is taken in one year</b> .....	<b>200</b>

*Faculty of medicine.*

16 quarterly inscriptions of 30 francs.....	480
16 fees for library of 2.50 francs.....	40
16 fees for practical exercises of 15 francs.....	240
8 examination fees of 80 francs.....	640
<b>Total</b> .....	<b>1,400</b>

<sup>1</sup>A franc is ordinarily reckoned at 20 cents, or 5 francs to \$1, but the exact rate of exchange is at present 19.3 cents per franc.

*Faculty of pharmacy.*

	Francs.
Annual matriculation.....	20
Annual fees for library.....	10
4 quarterly fees for laboratories of 150 francs .....	600
Examination fees.....	100
	<hr/>
Total if the doctorate is taken in one year.....	730

## CURRENT RECORD OF PRIMARY SCHOOLS.

The general development of primary instruction is essentially the work of the Republic. Its spirit and results are thus characterized in a recent report:<sup>1</sup>

The Republic was from the first justly convinced that France, overcome by misfortunes, ought to find in every citizen a soldier and in every soldier an educated man. Hence at the very time when, as the consequence of a foreign invasion, we were obliged to make the heaviest sacrifices, our republican parliaments did not hesitate to declare war against ignorance, to multiply the number of teachers, and to erect school buildings everywhere. "The future of French democracy," wrote Jules Simon, "is in its schools," and under his orders and those of his successors a vigorous movement was produced. Little by little, thanks to the diverse measures taken to promote it, thanks, above all, to the laws, which, in spite of reactionary efforts, established gratuitous, compulsory, and secular education, the movement has had these results: It has put within the reach of all parents the means of educating their children; by the aid of scholarships it has facilitated for the most worthy pupils access to secondary and superior education, and it has given to the children of the poor, by an equality of culture, the same intellectual equipment for the struggles of life as to the children of the rich.

Of the teachers the same report says: In this work they have been "the indefatigable and devoted colaborers of the Government, one may even say its valiant champions, in view of the struggles which they have already undergone and must still undergo in many places in the effort to carry out the law eliminating clerical teachers." The report urges that it still remains for the Government, in recognition of these services, to improve the condition of the teachers as regards both salary and chance for promotion. To this end measures have already been introduced in the Chambers, but with this single reservation the general situation of primary instruction is declared to be satisfactory.

*Enrollment in primary schools.*—The following tables present the principal statistics of the several classes of schools included in the department of primary instruction for 1897, with the corresponding data for 1891-92 and 1887.

The relative strength of public and private schools, classified as secular and church schools, for periods from 1881-82 to 1895-96, in-

<sup>1</sup> Report by Maurice-Faure, chairman of the finance committee (commission du budget), Chamber of Deputies, 1899.

clusive, is shown by the distribution of pupils as indicated in the following statistics:<sup>1</sup>

## Enrollment.

Schools.	1881-82.	1886-87.	Increase (+) or decrease (-).	1891-92.	Increase (+) or decrease (-) 1886-87 and 1891-92.	1895-96.	Increase (+) or decrease (-) 1891-92 and 1895-96.
<b>SECULAR.</b>							
Public:			<i>Per cent.</i>		<i>Per cent.</i>		
Boys.....	2,188,487	2,293,062	+ 4.8	2,274,372	- 0.8	3,768,650	+ 2.29
Girls.....	1,161,286	1,351,497	+16.4	1,409,716	+ 4.3		
Private:							
Boys.....	65,997	60,240	- 8.7	53,574	-11	130,156	-11.42
Girls.....	152,091	114,311	-24.8	93,367	-18.3		
Total.....	3,567,861	3,819,110	+ 7	3,831,029	+ 0.3	3,898,806	+ 1.76
<b>CHURCH.</b>							
Public:							
Boys.....	254,094	169,360	-33.3	36,290	-78.5	431,077	-17.63
Girls.....	755,389	630,649	-16.5	487,050	-22.7		
Private:							
Boys.....	199,932	267,023	+33.6	393,330	+47.3	1,203,628	+ 7.75
Girls.....	563,935	640,223	+13.5	723,703	+13		
Total.....	1,773,350	1,707,255	- 3.8	1,640,373	- 3.9	1,634,705	- .34
Grand total.....	5,341,211	5,526,365	+ 3.46	5,471,402	- .99	5,533,511	+ 1.13

It will be seen from the foregoing that the decline of enrollment from 1886-87 to 1895-96 was in secular private schools and in public schools having church teachers. The former are probably giving place to public schools; the latter are in many cases losing pupils through the enforcement of the law of 1886, forbidding the employment of members of religious orders in public schools. Of the pupils enrolled in public primary schools 48,180 were in superior primary or high schools and courses, and of those enrolled in the private primaries 8,353, or a total of 56,533 in the high schools and courses (primaire supérieur). In 1886-87 the total was 38,441, and in 1891-92 it had reached 45,599. There was then, in the first half of the decade, a gain of 23.9 per cent in the enrollment in these schools, and for the last half a gain of 18.6 per cent.

*Certificate of primary studies and of superior primary studies.*—The certificate of primary studies instituted originally by the law of 1836 and revived by the law of 1882 is sought by an ever-increasing number of pupils. This is the case also with the certificate of supérieur primary studies created by decree of December 28, 1882.

Year.	Certificate of primary studies.			Certificate of superior primary studies.		
	Boys.	Girls.	Total.	Boys.	Girls.	Total.
1887.....	80,941	64,193	145,134	790	422	1,212
1892.....	96,412	79,263	175,675	1,132	718	1,850
1896.....	101,380	86,306	187,686	1,237	767	2,004

<sup>1</sup> Unless otherwise stated, the statistics given in the following pages are from the official reports of the minister of public instruction, viz: Statistique de l'enseignement primaire, 1881-82, 1886-87, 1891-92, and Résumé des états de situation de l'enseignement primaire, 1895-96.

*The teaching corps, number and qualifications.*—The number of teachers of the primary schools at successive dates was:

	1887-88.			1891-92.			1896.		
	Men.	Women.	Total.	Men.	Women.	Total.	Men.	Women.	Total.
Public .....	55,933	44,484	100,417	55,691	46,795	102,486	55,933	48,482	104,415
Private .....	8,698	31,948	40,646	10,672	33,516	44,188	10,920	33,056	45,976
Total .....	64,631	76,432	141,063	66,363	80,311	146,674	66,853	83,538	150,391

The classification of the teachers with respect to their qualification as indicated by the diplomas obtained was as follows:

*Number of teachers having different grades of diplomas.*

Schools.	1891-92.			1896.		
	Inferior diploma (brevet élémentaire).	Superior diploma (brevet supérieur).	No diploma.	Inferior diploma (brevet élémentaire).	Superior diploma (brevet supérieur).	No diploma.
Public:						
Men .....	41,889	13,456	142	39,469	16,369	95
Women .....	33,624	9,748	3,261	32,529	13,426	2,527
Total .....	75,513	23,204	3,403	71,998	29,795	3,622
Grand total .....	102,120			105,415		
Private:						
Men .....	9,099	649	924	9,504	667	749
Women .....	23,269	3,486	6,761	25,581	3,915	5,569
Total .....	32,368	4,135	7,685	35,085	4,582	6,399
Grand total .....	44,188			45,976		

From the foregoing statistics it will be seen that in 1891-92, of teachers in the public primary schools, 96.6 per cent had obtained a Government diploma, and of those in the private (parochial) primaries 82.6 per cent; in 1896 these ratios were, respectively, 96.5 per cent and 86.2 per cent. It should be stated, further, that the men teachers in the public schools having no diploma are, as a rule, graduates who have obtained at least the bachelor's degree.

*School libraries.*—Two classes of libraries, auxiliary to the school work are maintained by public funds, namely, school libraries for the use of the pupils and reference libraries for teachers.

The following statistics show the status of these libraries for successive years:

Year.	School libraries. <i>a</i>				Teachers' libraries.	
	Number of public schools.	Number of school libraries.	Number of volumes.	Number loaned.	Number of libraries.	Number of volumes.
1882 .....	62,997	26,251	2,894,440	.....	2,470	685,651
1887 .....	66,708	35,329	4,453,875	5,465,103	2,688	895,267
1892 .....	67,262	39,645	4,858,120	6,802,350	2,681	1,006,421
1897 .....	67,579	41,498	6,190,973	7,219,438	2,748	1,116,523

*a* Report of M. Maurice-Faure, pp. 255, 256.

The appropriations for the libraries for specified years were:

Year.	School libraries. <i>a</i>	Teachers' libraries. <i>a</i>
1887 .....	\$24,000	\$6,000
1892 .....	22,000	5,000
1895 .....	19,000	.....
1898 .....	16,600	4,600

*a* Report of M. Maurice-Faure, p. 247.

*Finances.*—The State appropriations for primary education were, for the years named, as follows:<sup>1</sup>

1887.....	\$16,948,762
1892.....	24,972,751
1898.....	30,890,707

The total current expenditure for primary instruction (1895) was \$37,890,173, equivalent to \$9.02 per capita of enrollment (public primaries only) and 98 cents per capita of population (census 1896).

The increase of expenditure for the public primary schools from year to year is shown by the following:

Year.	Total expenditure.	Expenditure per capita of enrollment.
1886.....	\$34,051,229	\$5.22
1891-92.....	37,261,215	8.07
1895.....	37,890,173	9.00

#### ANTIALCOHOLIC INSTRUCTION IN FRENCH SCHOOLS.

By official decrees of March 9, 1897, the minister of public instruction ordered that instruction in the evil effects of alcoholic liquors should be introduced into all public primary schools and public lycées and colleges. An official circular which accompanied the decrees set forth as a reason for this action the alarming increase in the consumption of liquors and in drunkenness in France, and gave elaborate directions as to the treatment of the new subject of instruction.<sup>2</sup> In this circular the minister also requested the rectors of academies to report to him by the 1st of April, 1898, how his directions had been carried out, in what various ways the teachers had manifested ingenuity in introducing that instruction, and what the results had been. The returns were very full, carefully prepared, and manifested a sincere interest in the movement against alcoholism. A digest of the contents of these returns is as follows:<sup>3</sup>

##### I. EFFECT OF THE CIRCULAR OF MARCH 9, 1897.

It should be said that the school teachers had for a long time manifested a patriotic uneasiness in view of the progress of alcoholism, and had endeavored to

<sup>1</sup> Report of M. Maurice-Faure, p. 247.

<sup>2</sup> See Bulletin Administratif, March 20, 1897, pp. 382-425.

<sup>3</sup> From summary of the reports by M. Maurice Pelisson, *Revue Pédagogique*, January, 1899, pp. 22-43.

combat it. The inspector of the Académie of Haute Marne, for example, writes that the teachers in his province, living in the midst of a manufacturing and laboring population, considered it their duty to combat, by precept and example, the cause of the ruin and feebleness which they saw all about them. This disposition on the part of the teachers, however, needed direction and support. Before the date of the decrees few teachers had thought of bringing together the results of the chemical and physiological examinations of the poisonous effects of alcohol upon the organisms of drinkers and their descendants and of the social injury it exerts upon the national wealth, the vitality of the population, and public morals. Nearly all confined themselves to attacking drunkenness and showing the advantages of temperance, and their talks upon the subject, too vague and yet too limited, were also too intermittent, because no place was found for them except in instruction in morals. Many also were timid in their propaganda, because they doubted if they had sufficient authority to take the initiative. The circular and the decrees of March 9, 1897, therefore put an end to this hesitation. With a programme to guide them, the teachers could thenceforward give an extended and topical instruction, and their courage was supported by the consciousness of approval by the minister.

## II. ANTIALCOHOLIC INSTRUCTION.

1. *Normal schools.*—By the decree of March 9, 1897, the teachers of normal schools were directed to introduce the new programme into their courses in morals, domestic, social, and political economy, organic chemistry, and hygiene, and they did not confine themselves to the letter of the programme, but endeavored to carry out its spirit, because antialcoholic instruction has a capital importance in normal schools, since it affects the teachers of the future, and it is necessary to impress them fully with the conviction of the greatness of the evil they are to combat. For this reason it was necessary to make this part of the course as complete as possible. Vague exhortations and practical advice for their own individual guidance are not sufficient, but higher ground must be taken, and it must be shown that temperance is an essential condition of human dignity, and that it is the duty of the pupil teachers to propagate the virtue of temperance by precept and example. All the reports show that the antialcoholic instruction was understood in this spirit by all the normal school teachers, and it appeared that they did the work enjoined upon them by the programme not only with intelligence and conscience, but also with fervor. In many departments, after the course of studies was completed, the director would review, or sum up in one view, the scattered or isolated subjects of this programme so as to make a body of doctrine of which the graduates could have an easy grasp, so as to be able to refute the arguments they would have to meet in practice, a method which is calculated to impress the whole matter firmly upon the mind. In other departments, in the pedagogical homilies which are given in the schools and are called "free talks," the teachers incessantly took occasion to call the attention of their pupils to the various points of this complex question, while in still others articles on the subject in journals were pointed out to the pupils and commented upon. Sometimes other teachers than those whose duty it was to give this instruction would give out subjects on the dangers of alcoholism for compositions. This programme was not confined to the normal schools for males, but was carried out also in those for females, the importance being pointed out of having the future mothers of families understand the evil of intemperance, and of acquiring habits of order and economy and the qualities which would keep the father and sons away from the public house.

2. *Elementary schools.*—The teachers of the present have shown as much zeal as those of the future in the normal schools in complying with the spirit of the programme and the ministerial instructions. In order to enable those teachers who

might be slightly at a loss in taking up a subject, in some respects new, to carry out their instructions intelligently, most of the academic inspectors made the question of alcoholism the subject of their pedagogic lectures or talks, and urged the primary inspectors to instruct novices on this question to the best of their ability. In these meetings they discussed the ministerial instructions and scientific reports, pointed out to the teachers the best books or publications on the subject, and indicated the best methods of instruction. In certain meetings of the cantons, too, lessons on the subject were given to a division of scholars. But the teachers did not confine themselves to the strict letter of their instructions, as may be seen from this example where the instruction was given (1) in the lessons on morals; (2) in the scientific lessons; (3) by reading extracts from the works of Steeg, Dupuy, Dr. Galtier-Boissière, and passages from Lamennais, Jules Simon, Loti, Manuel, Souvestre, &c.; (4) by reciting these passages; (5) by dictation; (6) by written exercises, and (7) by exercises in mental arithmetic, such as: "If a glass of brandy costs 20 centimes, and one is taken every day, this would make one franc in five days. How much would brandy at this rate cost in a year?" Such lessons were those of very young children, and the effort on the part of the teachers was not to surpass their understanding. No uniform hour was prescribed for the antialcoholic instruction, but the teachers were allowed to use their discretion; but the primary inspectors were in some cases required to make a report upon the work accomplished in the schools under their charge.

Besides the day schools the evening courses for adults also profited by the antialcoholic instruction, but in them, as the lessons are addressed to mature minds, and as it is not always the prevention of the habit, but a contest with habits already formed, that the teacher has to deal with, the instruction was correspondingly amplified, and assumed the offensive instead of confining itself to the defensive. In girls' schools the character of this instruction was less scientific than in the others, but the teachers impressed upon their pupils the necessity of order and taste in the household, the importance of good cooking, etc., which will tend later on to keep the young men from the public house.

Finally, clearly defined in its programme, supple in its forms, and well adapted for practice as it is, antialcoholic instruction, as it exists in the primary schools, promises much. But with these excellent qualities it must have, above all, delicacy. In saying this the object is to warn teachers against those excesses of zeal which might lead them to raise the voice and emphasize the tone in exposing the dangers of alcoholism. With the best intentions in the world, some of them have endeavored to strike the imagination and, without going so far as to exaggerate, perhaps, have painted the picture in violent and crude colors. This is not desirable, and it is not desirable to strike the imagination; at any rate, it should not be struck with a club, which might crush it, but it should rather be pricked, and so stimulated and put in motion. Here, as in many other cases, to strike hard is wrong; the proper thing is just to touch sufficiently. This is not merely a question of taste. An able teacher would never be willing to darken the youthful imagination by presenting to it pictures of too brutal a reality. In the present case such a course should be especially avoided because of the moral consequences which might result from it, as is shown in the following extract from a report: "The lessons upon the deadly effects of alcoholism make a great impression upon the children. Unfortunately many of them are witnesses of scenes caused by this miserable vice in their own homes. Their embarrassed and constrained attitudes, due, no doubt, to the fear of being looked at or even pointed out by their companions, is painful to see." This shows that unless these lessons are given with great tact and a lively sense of proportion they may sow the seeds of contempt between comrades in the same school, destroy respect for drinking parents on the part of the children, and, while inspiring a horror of the vice of drunkenness, may at the same time kill the sense of pity for

its victims, culpable as they are. So, too, there is another peril in describing the physical deterioration which alcoholism brings with it, and that is that the scholars are in danger of being guided only by selfish motives in guarding themselves against the evil. One report states that the children are mainly influenced by fear of the maladies produced by alcoholism. Finally, account should be taken of the danger of laying too much stress upon alcoholic heredity and of the injurious effect of insistence upon this point without a counterpoise. If, as an inspector remarks, it is essential to explain the consequences of hereditary alcoholism, it is equally important to show that heredity is not invincible, and that, except in the rare cases of advanced degeneracy, the children of dipsomaniacs can, if they will, escape from the paternal curse and overcome the enemy they carry with them. Education should not strengthen the popular belief, already too strong, in irresponsibility and in a fatality which is transmitted from generation to generation.

### III. THE ANTIALCOHOLIC PROPAGANDA.

Antialcoholic education carries in itself a kind of propaganda, for it is evident that if we enlighten children on the dangers of intemperance it is with the idea of forming a generation of temperate individuals who, later on, will take care to preserve their relatives, friends, and fellow-citizens from the evil. The question is whether it is enough to have awakened this disposition, and whether it is not necessary to second it by a particular organization which should assemble the isolated wills and combine them into one. In other words, should not the teachers enroll their pupils into school temperance societies? It must be confessed that the appeal which has been made to teachers to form cadet sections of a central temperance society has in general met with little enthusiasm. One objection is that it is premature and even dangerous to impose an engagement upon young people which, often lightly undertaken, may be too easily forgotten and broken. There is also danger that young scholars who have been somewhat solemnly invested with a kind of social mission may become precociously important. Especially troublesome is the article of the regulations which prescribes total abstinence from strong drinks. With the French temperament and national character moderation is not an abstraction as much as the advocates of total abstinence imagine, and we must remember that, at any rate, rigorous austerity is displeasing to our race. On the other hand, it is urged that it is important to habituate children to the idea of opposition to intemperance by association, and form them for that opposition, so that, even if they do not need to preserve themselves, they may learn to preserve their fellow-citizens. These opposing views are entertained by the officials in the different departments. Yet even those teachers who are reluctant to organize their scholars into temperance societies are none the less zealous in using the resources of their schools in propagating temperance among families, and they encourage the children to talk at home about what they have heard at school on the subject, and by means of text-books and lectures, etc., which are carried home, they hope to enforce the temperance views. With the adults of the evening courses they enter into argument, point out passages in journals bearing on the subject, give lectures and draw up statistics, as was done, e. g., in a certain village where the teacher proved from data furnished by his pupils that 15,000 francs (\$3,000) were spent in the public house for alcoholic drinks, the commune having a population of only 750 souls, which calculation gave occasion for a lecture on hygiene and economy which was of great effect. The teachers even extend their efforts to the entire population of their neighborhood, and invite attendance to their antialcoholic lectures, and lend the school books—entertaining ones, if possible—which are against alcoholism round about. One teacher used to hang one of his antialcoholic wall maps in the window of his school over Sunday for passers-by to read. A great number of teachers have stopped going into the cafés and public houses for the sake of the example, although they had only

been accustomed to visit them for passing the time. All their sacrifices and efforts, however, would have failed without the aid of tact and prudence. In a village, where everyone knows everyone else, it is extremely difficult to touch upon the evil effects of alcoholism without seeming to allude to some particular case which is known to all, and equal caution is necessary in those places where the principal industry which makes them prosperous is the production of alcoholic drinks. Furthermore, it is not the intention to ask the young or older pupils to drink nothing but water, because such a demand would not be heeded. A moderate use of wine, and especially of brandy, is all that can be urged. The use of absinthe, however, is discountenanced without reserve. It can never be the intention of the ministry to make the French people drinkers of water only.

#### IV. THE AUXILIARIES OF THE PROPAGANDA.

Among the means the teachers have employed to advance the temperance propaganda are school savings banks, which, in the department of Doubs, are organized in such a way that the funds can not be withdrawn until the depositor is 16 years old. The population is largely composed of iron workers, who are paid by the month, and who spend their earnings as soon as they get them. As boys begin work at 13, the teachers make it a point to see them on pay days and induce them to continue their savings. This serves as an inducement to deposit their money, instead of squandering it in drink. Another means is the encouragement of outdoor sports of various kinds, as in Ardèche. This serves as an offset to the attractions of less desirable amusements. Courses of temperance lectures have been organized in many places by private societies of an economic nature, but including also a society of natural sciences. Gifts of various kinds have also been made to schools by private individuals or associations to encourage the antialcoholic movement. Thus the "League" of Marseilles gave collections of lithographic plates to spread the antialcoholic principles by thousands. Similar presents were made in the departments of the Loire, at St. Chamond, at Montbrison, and in other places. The council of the University of Toulouse appropriated 300 francs (\$60) for a similar purpose.

#### V. THE RESULTS.

As to the results so far obtained both the rectors and inspectors of the académies speak with great reserve. They deem it premature to base any opinion upon the results of a campaign which has only lasted one year, and point out that in educational matters results are postponed for a long time and that we must wait for future statistics on the consumption of alcohol before reaching any sound conclusion. This reticence does not signify that they feel any distrust of the future of the antialcoholic movement, but only shows their desire for accuracy. They do, however, recognize the fact that some progress has been made, and all the reports show some successes. A few facts in this direction are here collected. They are, to be sure, only anecdotes, but still they illustrate the fact of progress. In the elementary school it is evident that certain prejudices in favor of alcohol have been dissipated. The scholars no longer believe that alcohol fortifies or refreshes or that home made liquors are harmless, etc. They have also been led to renounce certain injurious practices. Little girls who used to bring to school bottles of water fortified with some liquor now bring only water. In Finistère children refuse to accompany their parents to the interminable wedding dinners which are a custom of the country, and in Ardennes children of 12 and 13 no longer go to the café, according to local custom, on the occasion of the fête votive. And many other facts of the same kind might be cited. In many parts of France mothers have been accustomed to give their children a piece of bread soaked in brandy for breakfast, in order to save the trouble of cooking. This murderous custom has now nearly disappeared in consequence of the antialcoholic lessons. Moreover, this movement is not confined to the children, the young men, or

their relatives, but has won its way into the general population to such an extent that the public-house keepers have seen their business diminish, and some of them have been compelled to close their places, and commercial travelers for liquor houses have been heard to complain that the schoolmasters have inaugurated a campaign that has injured their trade. All this is purely anecdotal, as before remarked, but it is encouraging for the schoolmasters, because it shows them that their labors have not been in vain.

#### MOVEMENT FOR PROLONGING THE EDUCATION OF THE PEOPLE.

The obligatory period of primary instruction extends from the sixth to the thirteenth year, but a child who passes the examination for the certificate of primary studies is exempt from the obligation to attend school. Candidates may be admitted to this examination at 11 years of age, and in fact a large proportion of those who seek the certificate do so at that early age. Hence the very means taken to increase the interest of pupils tends to shorten their school term. The majority of the children leave school at an earlier age than 13, and even for those who pass the whole obligatory period in school the wholesome restraints of instruction and constant supervision are too soon removed. It is also true in France, as in other countries, that elementary instruction by its natural limitations does not leave the same lasting effect upon the character or furnish the same intellectual resources as higher education.

The influence of the school [says M. F. Buisson] is fatally limited in two senses:

First, it endures for a period too brief; it is only during the years of childhood. Impressions made then are vivid, people are pleased to say, and often ineffaceable, but they are never more than infantile impressions, and other and stronger influences, those of adolescence and youth, efface them. Moral influence, which ceases to be exercised just on the eve of the first communion, can easily fashion the child, but not the man. The child slips away from it at the very hour when should begin, and in fact, for the children of the bourgeois, does begin, the decisive culture whose impression will last through life.

The school is only one factor in the moral education of youth and even of childhood. If only this factor were assured of the cooperation of all the others! But more often than otherwise it can count upon their opposition. Is the school always seconded by the family? Is it so seconded ordinarily by the church? Later, how do other masters seek, and perhaps easily obtain, over the young man more influence than the teacher ever had over the child? The press (and often what a press!), the theater (and this is not the French theater), the street, the shop, the tavern, the public ball or the café concert, the allurements of companions, of example, of fashion, of juvenile fanfaronade, the brutal incentive of passions, afterwards of self-interest, at every age, the successive passions which arise and speak more loudly than reason, in these behold seductions other than those of schools.

The condition of the young people of the laboring classes thrown thus upon the world with meager attainments and without preparation for any particular industry has long excited the serious attention of the Government and of public-spirited, earnest men and women throughout the country. The recent vigorous movement for extend-

ing the provision for adult education is the outcome of this solicitude. Schools or classes for adults have been maintained in France by the Church or by private efforts for nearly two centuries.<sup>1</sup> The responsibility of the State in this respect has also been recognized from time to time by legal enactments and by public appropriations for the work. This went on fitfully and without satisfactory results until 1877, when M. Gréard proposed measures for systematizing the work in Paris. At his suggestion, courses of general instruction were separated from technical courses for apprentices; the former were graded in three classes—elementary, intermediate, and superior. A diploma, or special certificate of primary studies, was created, open to pupils of at least 16 years of age. Finally, an annual gratuity of 600 francs was assured to the teacher in place of a grant calculated upon the average attendance at his class.

In 1884 a decree was issued by the minister of public instruction authorizing every commune to establish a class for adults, the expenses to be borne half by the State and half by the commune. With this assistance, and animated by the example of the capital, adult classes were formed in the principal cities.

The growing sense of public responsibility with respect to the masses has greatly increased interest in this provision, and classes for the benefit of youths above the school age and for adults are multiplying on every hand. The Government has given substantial aid to the cause. In 1895 a special investigation was ordered, with a view to obtaining complete information as to the status of the work and to determining the means for extending and improving it. This commission was intrusted to M. Édouard Petit, a professor in one of the Paris lycées and an indefatigable promoter of the cause of adult education. He found teachers and professors everywhere alive to the importance of the effort and ready to give their aid in establishing and maintaining classes. Numerous private societies entered into the work with great spirit, and in 1895 the Havre society for "Instruction by Objects" (*enseignement par l'aspect*) celebrated its fifteenth anniversary by calling a congress of all the societies engaged in promoting popular education to consider the subject of the systematic instruction of adults and adolescents. The minister of public instruction presided over the congress and the resolutions of this body have shaped in a measure the subsequent official regulations. These schools and classes, which are held generally in the evening, sometimes on Sunday, offer courses of instruction for illiterates, review courses, and continuation courses. The last named have usually a technical or industrial character and prepare the student, especially in the rural communities, for agriculture and other pursuits. The local adaptation of the courses is carefully studied, and also their relation to the age

<sup>1</sup>See Report of Commissioner for 1894-95, vol. 1, pp. 298-305, and Report for 1896-97, vol. 1, pp. 53-56.

and economic condition of the students. Civic instruction has a large place in the programmes, and the subject is much more thoroughly treated than is possible in the primary schools. The students in general show deep and earnest appreciation of the opportunities thus afforded. The growth of the work is plainly shown by the following statistics:<sup>1</sup>

*Number of regular public courses.*

Year.	For men.	For women.	Total.
1894-95.....	7,322	966	8,288
1895-96.....	13,970	1,808	15,778
1896-97.....	20,099	4,429	24,528
1897-98.....	22,939	7,429	30,368
Total.....	64,330	14,632	78,962

To the total given above should be added 5,000 classes maintained by chambers of commerce and private societies, and also 1,600 "réunions" of young girls held in the schools on Thursdays and Sundays.

*Attendance upon the courses.*

Year.	Number enrolled.	Number of regular attendants.
1895-96.....	400,000	270,500
1896-97.....	700,000	417,481
1897-98.....	850,000	482,907

These courses are supplemented by popular lectures, illustrated usually by the stereopticon. From Paris, where this feature was introduced by the "Ligue de l'enseignement," it has spread, little by little, through the provinces, and has helped to bring to the attention of the common people the beauties of classic art, picturesque and impressive scenes of nature, or events in history, and even scientific facts.

The number of popular lectures reported year by year is as follows:

1894-95.....	10,379
1895-96.....	<sup>2</sup> 61,476
1897-98.....	<sup>3</sup> 117,752

The rapid extension of the classes and lectures is due, in great measure, to the support of the Government, but it should be remembered that the first impulse came from private sources and the greater part of the expense is still defrayed from private funds.

The sums expended in this work by private societies, namely, societies for popular instructions, associations of former pupils, chari-

<sup>1</sup> Report of M. Édouard Petit for 1897-98. *Revue Pédagogique*, December, 1898, pp. 477-484; January 1899, p. 52.

<sup>2</sup> 14,000 illustrated.

<sup>3</sup> 50,052 illustrated.

table associations, is not reported. The subscriptions from individuals amounted, in 1897-98, to \$40,824; the receipts from fees to \$8,340; municipal grants to \$306,748; grants from departmental councils to \$10,800; subvention from the State, \$30,000.

The State appropriation is used chiefly in providing awards for the public school teachers who give their services to this work. These awards take the form of medals, prizes, increase of vacation, and supplements of the salary.

The effect of public instruction in diminishing illiteracy is shown as follows:

*Proportion of illiterates. (a)*

Year.	Conscripts.	Newly married—	
		Men.	Women.
1870.....		26.8	39.4
1880.....	14.4	16.1	24.5
1887.....	10.2	10.7	17
1892.....	6.9	8.1	12.2
1895.....	5.4	6.3	9.4
1896.....	5.3

#### THE DEPARTMENT OF SECONDARY EDUCATION.

The system of State secondary education in France has been the subject of repeated attempts at reform from the downfall of Napoleon to the present time. To the problems that everywhere present themselves in respect to this department of education, there are added in France peculiar complications arising from the central control of the schools and the extreme conservatism of the educated classes.

The purpose of the present Republic to infuse new life into the State lycées and colleges has been shown by successive measures, giving increased freedom to principals and professors with respect to the conduct of studies and the internal discipline of the secondary establishments.

The professors on their part have been stimulated by these measures to a livelier interest in their professional work and relations.

*Congresses of secondary professors.*—This was particularly shown in 1896 by a movement for bringing about conferences of the professors engaged in this department. A memorial was addressed to the minister asking his authorization for a congress of the professors. This was granted with certain restrictions. It was decided that the deliberations of the congress should be limited to pedagogical and personal questions, with avoidance of those pertaining to the administration, and that the programmes of this and other similar congresses should be submitted in advance to the minister, who reserves the right to eliminate questions of which he disapproves. In accordance with this

authorization, three general congresses of the professors of the lycées and colleges have been held. Full reports of the first and second congresses have been published, from which it is seen that the deliberations were kept strictly within the prescribed limits. The subjects that were uppermost were the organization of societies of professors for mutual support and insurance; university extension, and the means of giving greater recognition to the assistant professors of secondary education. A noticeable feature of the second congress (held in 1898) was the presence, for the first time, of delegates from the lycées for girls. - The third congress, held in April of the present year, was organized in three sections. The first considered questions of discipline, of moral education, and of the examinations for the public scholarships offered in the lycées for girls; the second section examined principally proposals with respect to the examinations for the bachelor's degree; the third considered the province of students' associations. This section submitted also proposals respecting university extension and the organization of an international congress to be held in 1900 in connection with the Paris Exposition. The maintenance of the existing baccalaureate was approved by the congress, but it was urged that the composition of the examining jury should be changed. It was originally proposed that the programme should include discussions of the questions entrusted by the Chamber of Deputies to the commission on secondary education, but this subject was eliminated by the minister, who held that the commission itself afforded full opportunity for the professors to be heard on the questions at issue.

*Commission on secondary education.*—The latest official action with respect to secondary education is the appointment of a commission by the Chamber of Deputies to examine the several measures proposed for the reform of the existing system and the conditions that have given rise to these.

The commission has submitted a voluminous report of the depositions presented before it in its sessions from January to March, which cover every phase of the problem of secondary education as it has developed in France.<sup>1</sup>

In the introduction to this report the commission indicates the scope of its inquiry, the conditions that have called it into existence, and the

---

<sup>1</sup> A commission appointed by the Senate to examine the project of law for the reform of secondary instruction, submitted by M. Combes, former minister of education, has just issued its report, which bears the name of the secretary, M. Pozzi. The document is received as this goes to press. It appears that the commission recommends the adoption of the bill by a vote of 5 to 4 members. The bill proposes to do away with the baccalaureate and to substitute for this an examination of maturity to be held within the school (lycée or college) whose course the candidate has followed. The examining body is to be composed of secondary professors, but presided over by a university professor appointed by the minister. A similar examination is proposed for private institutions before an examining committee to be formed by the minister of public instruction. The bill and the report of M. Pozzi have already excited intense discussion. The measure proposed, if adopted, would radically change the nature of secondary education as constituted in France.

trend of opinion with respect to the questions at issue. This introduction is here epitomized.

The programmes and time-tables of the secondary schools and the system of examinations have all been examined, it is stated, with reference to certain essential points. On one side there is a demand for the reform of the baccalaureate and the granting of the same sanctions to the modern as to the classical course; hence, the character of the modern course, its purposes, the length of time to be given to it, should be considered. On the other side, there is a question as to the classical course, whether it should be made uniform, at least up to the class of rhetoric (the last but one of the lyc ee course) for all students, for those who desire the most thorough literary training as well as for those whose preference is for a scientific career. The suppression of the special course (instituted in 1865 by Minister Duruy) is regarded on all sides as having sensibly diminished the number of students seeking to enter the lyc ees. It is thought that families should be able to choose between the classical course and a course shorter and better adapted to the needs of various regions. The programmes, says the report, are, in general, severely criticised; they tend, it is urged, to crowd the young mind with too many subjects learned superficially, to weaken its inclination for independent effort and its scientific curiosity.

The reforms which have been already introduced in the lyc ees and the colleges have not settled in any definite manner the questions pertaining to the management of the boarding departments of the lyc ees, the conduct of physical training, and the relations of the tutors (*r ep etiteurs*) which at present are very unsatisfactory. There must be, it seems, some means of uniting and associating more intimately all those who are charged with the duty of forming the mind and the character of the young.

The administration (university) is convinced that the lyc ees should be freed from that excessive centralization which has destroyed their individuality, paralyzed the personal initiative of principals and professors, and reduced them to the state of mere functionaries, too much isolated from each other and having no close union either with the schools or with the region to which they respectively belong. It is desirable that the lyc ees and colleges should have a certain autonomy and moral responsibility; that the diverse orders of instruction should cultivate more intimate relations with each other. There is in this respect a general tendency of opinion to which, without doubt, the renaissance of the universities has contributed and which is worthy of serious consideration.

The commission was unanimous in the opinion that the time had come for making the inquiry as to the state of secondary education as comprehensive as possible, and the Chamber of Deputies was pre-

pared to give it full authority in this respect.<sup>1</sup> Such inquiries are, it is urged, extremely useful when they are timely and well conducted.

<sup>1</sup> QUESTIONS SUBMITTED BY THE COMMISSION.

I. *Statistics of secondary instruction.*

Variation in the number of students in the public establishments for the period 1879-1898, the number in the lycées and in the colleges to be given separately, distinction also to be made between the number in the classical course and in the special or modern course and the number of day students and boarders.—Variation during the same period in the number of students in private establishments; giving separately the number in classical courses; in special or modern courses; in schools preparing for the bachelor's degree; in "petits séminaires" (preparatory to divinity schools).—Probable causes of these variations.

II. *Administration of the lycées and colleges.*

Direction of the institution.—Manner of nominating the principals.—Necessity of increasing their authority.—The value of conferences of professors and assistants (répétiteurs) and the disciplinary councils.—Should a certain autonomy be given to the lycées and colleges?—Is it desirable to establish in each lycée and college a council composed of representatives of the professors and former students as a means of strengthening the bonds between the institution and the region to which it belongs?—What should be the functions of that council?

III. *Education.*

Conduct of the boarding department.—By what means may the interest of professors in the work of education be increased?—Status of the tutors (répétiteurs).—Is it possible to give them larger responsibility in respect both to instruction and education?—Physical education.—Liberty and responsibility.—Government of the older students.

IV. *Organization of the teaching corps.*

What measures should be taken for improving the professional preparation of professors?—Competitive examination for fellowship (concours d'agrégation).—Value of a university course.

A. *Classical course.*—Should it be extended or abridged?—To what extent?—What should be the normal duration of the course?—Are the programmes overcrowded?—How should they be lightened?—Should certain subjects be made elective; for example, Greek?—How far should the programmes be adapted to local conditions?—What should be left to the initiative of the professors and of the councils of the respective establishments?

B. *The modern course.*—Is there a place for this course?—What should be the normal duration of the course?—Should the programme be modified?—What is your opinion as to the uniformity in the plan of study and the programmes of this course?—Results thus far accomplished by the course.—For what careers are the students who follow this course destined?—What proportion intend entering upon industry or commerce?—What proportion the public service?—Should the teaching force be distinct from that of the classical force?—How should it be recruited?

C. *Relations of secondary instruction to primary instruction and to technical instruction.*—Is it desirable that pupils should not enter the lycées or colleges until they have passed through the primary schools?—Should the superior primary course be correlated with the modern secondary?—Is it desirable to modify the programmes of the superior primary schools so that pupils may pass from these to the higher classes of the modern secondary course?—Statistics of technical instruction.—Results accomplished.—Of the competition of the technical schools with the lycées and colleges.—To what extent can technical instruction be given in the lycées and colleges?

D. *Study of the living languages and drawing.*—Would it be possible to give a practical character to the study of the living languages by arranging for pupils to study for a while in foreign countries?—Local adaptations of the courses in foreign languages.—Importance of instruction in drawing reforms needed.

V. *The baccalaureate and examinations.*

Should the baccalaureate be suppressed?—Of the substitution of a certificate of studies and of transition and leaving examinations (examens de passage et de sortie).—Should the method of the examinations be changed?—Should the diploma of the modern course admit one to the faculty of law and the faculty of medicine?—Is it expedient that the scheme of examination for admission to the special schools (i. e., of engineering, electricity, etc.) should be arranged with the concurrence of the university?

VI. *General inspection—scholarships.*

Should the general inspection (that is, the examination by the State officer) extend to the entire secondary school considered as a unit or only to the work of the individual professors?—Means of correcting the defects of the inspectorial service.—Secret notices.—Scholarships (bourses d'études).—How should they be given?—Is it possible to follow the careers of students who have held these scholarships after their studies terminate?—How many intend entering the public service as teachers or other civil officers?

They are not valuable solely for the information collected—they serve further a moral purpose; they prepare the way for reforms by exciting the interest of the entire country, and by obliging those upon whom the success of the reforms depends to give them careful examination.

Under this conviction the commission sought to obtain the testimony and advice of persons experienced in the administration of secondary education or in teaching in this department, and also of those who are best able to judge of its needs and tendencies and competent to suggest practical measures for its improvement. The volume submitted contains the verbatim reports of depositions heard by the commission. A second volume will present the analysis of the written depositions. As to the recommendations of the commission, these will not be submitted until after conference with the Government and ample deliberation. It should be observed that the inquiry thus far relates merely to secondary education for boys; a distinct inquiry will be made into that provided for girls.

The detailed information and the body of opinion collected by this commission are scarcely of interest outside of the country to which the matter pertains, but the existence of the commission and the ultimate outcome of the inquiry are matters of universal interest, since in every country the question of secondary education is uppermost at this moment, and each may gain some light from the experience of others. A survey of the evidence thus far collected gives the impression that the demand for a more elastic course and a broader conception of education than now prevail in the French lycée has become irresistible. Nevertheless, there were not wanting authoritative voices for adherence with very slight modifications to the established system.

The following discussions and depositions from the report of the commission give a full understanding of the existing system of secondary education, of the points to which criticism is chiefly directed, and also the opinion of eminent men as to the reform measures which are desirable or feasible.

It should be remembered that the term secondary education as used in France is not synonymous with the same expression as used in this country. Boys enter the preparatory class of the French lycée about eight years of age, and complete there the full course of liberal or general education. The course covers nine years, excluding the preparatory class, and is completed by the examination for the bachelor's degree conducted by university professors. Superior or university education, which follows secondary in France, is highly specialized.

*Variations in the attendance upon secondary schools.*—M. Gréard, who in his long service as vice-recteur of the chief académie, that of Paris, covering nearly the entire period of the Republic, has had ample

opportunity for studying the course of events, dwelt particularly upon the variations in the attendance upon the lycées and colleges. Comparing the enrolment in secondary schools for 1896 and 1897, M. Gréard noted in the State lycées a decline of 863 students and an increase of 188 in the local (communal) colleges, or altogether in the State schools a decline of 675 pupils. The private secular schools lost in the same time 786 pupils, while the church schools gained 3,682. He omitted in his consideration the "petits séminaires," which are hardly comparable with the other schools because they are intended especially for students who will ultimately prepare for the priesthood.

It will be observed that the gain for the church schools, 3,682, exceeds the combined loss in the State and private schools (1461) by 2,221. It is not probable that all the students who were lost to the State and private schools entered those of the church, but in any case there is the gain of 2,221 to be accounted for. The chief explanation, according to M. Gréard, appears to be this: A certain number of the superior primary (high) schools belonging to the church have been transformed into secondary schools of the modern type. In preparation for the change their principals have passed the necessary examinations and secured the sanctions required by the State. These schools have attracted a large part of the students who have withdrawn from the State schools in which the classical course predominates.

In Paris the decline in attendance upon the lycées and colleges from 1896 to 1897 was very slight; in the following year, 1897-98, it was greater, the loss being altogether 299 pupils. On the other hand, the lycées and colleges of the departments of the Academy of Paris (excluding the capital) gained 251 students; many of these it is known have been drawn from the schools of the city. This leaves a total loss of 48 pupils from the State schools of this academy on a total of 17,550.

The opinion expressed by M. Gréard that the decline in attendance upon the lycées is due to the preference for courses of instruction more closely related to the needs of modern industry is reiterated also by Catholic educators. Brother Justinus, general secretary of the institute of the Christian Brothers, discusses the movement toward modern or practical courses in his evidence which is given in full, farther on. The Abbé Batiffol, rector of the Catholic Institute of Toulouse, shows that in his district, which includes sixteen dioceses of the middle region of France, there has been a great falling off in the attendance upon the church secondary schools. This change he attributes to the following causes:

- (1) The tendency of parents to keep their children in day schools or under private teachers until the age of confirmation; that is, 11 or 12 years.

(2) The diminishing birth rate in families in comfortable circumstances.

(3) The economic crisis in the middle region of France caused by the destruction of the vine, a series of poor harvests, etc.

(4) The tendency of rural proprietors to withdraw their children from the secondary schools and place them in boarding schools maintained by the religious orders that devote themselves especially to the work of preparing their pupils for commerce, agriculture, and manufactures.

The statistics cited by M. Gréard are taken from tables submitted to the Chamber of Deputies by the chairman of the financial committee, 1897 and 1898.<sup>1</sup> They have been already published in previous Reports of the Commissioner of Education,<sup>2</sup> and are here reproduced for convenience of reference, together with statistics for 1887.

a Statistique de l'enseignement secondaire des garçons, 1887, p. lvi.

b Ibid, p. lxxviii.

c Ibid, p. xxviii.

The transfer of pupils from one to the other class of schools is not wholly a movement of the last half decade. M. Lévasscur, the eminent statistician of France, cited in his deposition before the commission the data given in the *Annuaire Statistique de la France*, 1898, which show the movement of students in the lycées and colleges since 1831. According to this information, the attendance upon these schools rose rapidly from 1831 to 1880, being 37,000 at the former date and 85,000 at the latter. Since 1880 it has remained nearly stationary. The lycées, it appears, continued to increase their enrollment from 1840 to 1891, since which time it has fluctuated a little, the number of their students ranging between 52,000 and 53,000 (52,630 in November, 1897).

The local colleges (*collèges communaux*) reached their maximum attendance in 1880 (40,000 pupils) and declined from that time till

<sup>1</sup> Rapport fait au nom de la commission du budget, etc. Service de l'instruction publique par M. Bouge, député, 1897, pp. 124, 125; Le même 1898, pp. 32, 33.

<sup>2</sup> Report 1896-97, vol. 1, p. 39; 1897-98, vol. 1, p. 703.

1890, since which their attendance has varied but little (in 1897 it is given as 32,740). The latest statistics of private establishments cited by M. Levasseur (viz, for 1897) give their total attendance as 70,136, nearly the same as the number tabulated above.

The discrepancies in the statistics from different sources are not great and would hardly excite attention but for the political interests which seem to depend upon the relative influence of the state and church schools. One measure of this influence is the actual attendance upon the two classes of schools; hence the commission has undertaken to secure the latest and fullest statistics under this head, which will be published in their later report.

[From deposition of M. Berthelot, permanent secretary of the Academy of Sciences; professor in the College of France; former minister of public instruction.]

*Defects of the lycées.*—As to the lycées and colleges, there are certain questions in respect to which I do not agree with many other eminent members of the teaching profession, and I have repeatedly expressed my opinion in the superior council of public instruction. I consider that our lycées are much too large, they have too many pupils, and this is one of the chief reasons why the principals and directors can not exercise a personal influence either upon the pupils or the professors. I mean that twofold influence, moral and intellectual, which should be the first and the most important of their duties. They are absorbed in the control of the administrative machine. We have constructed lycées to accommodate as many as 1,200 boarders. This is a moral and financial monstrosity.

When a lycée has 1,200 boarders, in addition to hundreds of day pupils, it is encumbered. To maintain order it is necessary to adopt narrow, rigorous rules, as in a barrack. In such a case it is impossible to do anything except to follow blind tradition, keeping at every point close to precedent. Whatever be the ability of the directors, they are powerless to effect any reform or make any real innovation, or to transform the general organization of their establishments.

These evils have been still further aggravated by the institution of the modern course side by side with the classical in the same lycée. This course really required an independent and distinct direction. It is almost impossible to practice in the same establishment several methods of instruction. The result could easily be foreseen: It was simply a similar organization for the classical course and for the modern course. This at once rendered it impossible to do anything for the reform of the classical instruction or for the introduction of new systems which should have been adopted for the modern instruction.

I would insist at the outset that the "effectif" of a secondary school, especially of a lycée, should not exceed 400 or 500 pupils, boarders and day pupils both included. Further, I should desire that each lycée should have a definite purpose; that a lycée intended for classical instruction should have nothing to do with the modern course; otherwise classical instruction is paralyzed and the modern struck with sterility.

[From deposition of M. Lavissee, member of the French Academy; professor of the Faculty of Letters; leader in university reforms.]

*Defective administrative system.*—If our secondary instruction is not in the midst of a real crisis (the word is perhaps too strong), it suffers from evils of which the causes are, on the one hand, political and administrative, on the other pedagogical.

The political causes are these: Secondary education is no longer governed from above, or, to speak plainly, the minister of public instruction is absent. The ministerial influence is not felt, first because the minister does not retain the office long,

and, further, because that, with the exception of two or three ministers to whom we are greatly indebted, he is wholly occupied with other affairs. The hand that works the springs slips away; the springs work badly and unbend.

Let us illustrate: The general inspectors are agents of transmission and information. It seems that at the moment when they are about to go to their circuits the minister ought to call them together to give them instructions, and to assemble them again on their return to question them and receive their information. I was for twenty years attached to the cabinet of M. Duruy, and he always called the general inspectors together in this way. To-day the general inspectors start out without any general understanding as to the directions they should give. It may happen, and it does happen, that general inspectors of the same order of studies succeeding each other in the same class at the interval of a year give directions absolutely contradictory to each other.

The defects of the general inspection are serious. The inspection is hastily made and rarely extends to an entire institution. When an establishment works either well or ill it is necessary to know the reasons. But the inspectors report only their individual observations, which are just sufficient to discuss the question of giving promotion or the academic palm to this or that person.

The influence of the local authorities, rectors, academic inspectors, is no longer felt in secondary instruction. Since the constitution of the universities the rectors are greatly occupied with higher education; the academic inspectors are almost entirely absorbed in primary education. For my part I should not regret this weakening of authority if we had organized liberty. Now, we have the appearance of this organization—a complete hierarchy of councils; councils of professors in the lycées, academic councils in the chief towns of the academies, and near the minister the superior council of public instruction. But the councils of professors, for reasons to be hereafter considered, have no real life; they are nearly useless. I know, moreover, nothing more useless than the academic councils; these are assemblies before which reports are read. The superior council has many defects. It is too strictly professional. The sessions are too crowded, particularly with disputed and disciplinary matters. They are short; it is necessary to drive, to hurry. Often the council simply records what has been prepared and determined by the administration. Rarely does a member have the satisfaction of feeling that good work has been accomplished. In short, this council has not fulfilled the hopes that it excited at the beginning.

We are, then, afflicted in the University of France with a false parliamentarism. Thus there is neither on the one hand authority, nor on the other liberty. This is a system altogether peculiar, mixed, spurious, and which is of itself sufficient to account for all the evils from which we are suffering.

For these evils what would be the remedies? Greater stability in the ministry; more attention on the part of the minister to our affairs which well deserve this consideration; the reorganization of the councils. I do not insist upon the last point, because propositions for the reform of the councils are to be submitted to Parliament.

[From deposition of M. Michel Bréal, professor in the College of France and member of the Institute.]

One of the first questions in your inquiry is that of the fluctuations in the number of pupils (secondary) and the diminution of the number in the State lycées. I am not sure that there has been a diminution, but it is certain that there has been no such increase as might be expected considering the importance given to education during the last fifteen years and the money spent in the interest of pupils.

I believe that the administration (university) has reason to inquire if it is not itself in part to blame for this condition, if errors have not been committed although in good faith and with the most sincere desire to do the best thing.

The first mistake has been the want of permanence in the programmes.

Upon this point I will dwell for a moment, because I have studied the matter very closely. For sixteen years I was a member of the superior council and of the permanent section of the council. I have seen the different programmes succeed each other and have known the reasons given for each of the changes. In the light of this history it is easy to understand the present conditions.

In education a degree of stability is essential; a bad programme maintained a certain time improves itself, but if changes are too frequent there is not time for improvement. Good programmes may spoil each other by too rapid succession.

This history commences in 1879 with the ministry of Jules Ferry, for whose name I desire to say I cherish great respect. In 1880, at the time the programmes were adopted, M. Ferry and the ministry were advocates of a uniform education—that is to say, of the same single course for all students, or at least for the proportion of students.

This had become a difficult matter, above all for an era like ours, when secondary education is no longer the privilege of a particular class of the people; but it was rendered still more difficult from the fact that the programmes necessarily had to be prepared, discussed, and adopted by the superior council.

The superior council is composed of men all distinguished in their specialty and all moved by the best intentions; but that occurred which was to have been expected; everyone tried his hand at the programmes, each wished to include what he thought best.

In this superior council all ideas were represented from those of members who, like M. Boissier and myself, held that the classical studies (as conducted in the lycées) were too superficial, especially in comparison with Germany, and that they should be made more thorough to those who believed that Latin and Greek had had their day and that it was necessary to replace them by more modern subjects.

The superior council naturally endeavored to please everyone; it adopted a mean; it tried to put into the plan of studies everything that was recommended. In this way the programmes of 1880 were made. These resulted in what has been called surcharge of the programmes and the overpressure of students. The surcharge of the programmes is a reality. As to the overpressure of the students, I do not much believe in it, because the students do not overexert themselves. The subjects have greatly increased, but the pupil finds the way (and, on the whole, this is well) to take only what he is able to master. Here I may mention a circumstance that has greatly increased the overcrowding. I refer to the suppression of two years of Latin. Latin had been commenced in the eighth class, the superior council decided that it should be deferred to the sixth. As a consequence, of the eight years of Latin, two were suppressed. This was a great deal.

As the exercises of the different classes were kept very nearly at the same level as before the suppression, the students who reached the fifth class after one year of Latin were expected to know as much as was formerly acquired in three years. Then they suddenly began the study of Greek. This suppression of two years of classical study is mainly the cause of the overpressure. To this cause also is due the decline in the number of students—for many parents regarded the lycées as the school for Latin—hence the children were entered one or two years later.

I opposed this measure; but, nevertheless, I have been reproached with having supported the very proposal that I resisted with all my force. Such is the curious course of popular justice.

This measure wrought disorder in the classes. Professors of the sixth class found themselves suddenly professors of the former eighth, and so it was through all the classes.

The professors accepted the reform with regret. They saw in it the decline of education. This was beyond doubt one cause of the failure of the reform of 1880.

After the lapse of several years, about 1886-87, the discontent echoed everywhere, by the press, became so evident that changes were demanded. The superior council yielded to the new demand and began the search for another plan.

It was then recalled that during the Empire, under the ministry of M. Duruy, a special course had been created (*enseignement spécial*) which was intended for a particular class of pupils. This special course still existed nominally, but it had been nearly forgotten, or at least was not mentioned; it had even been said in 1880 that it was destined to disappear.

The discussions that had taken place in 1865 were then recalled and this special instruction examined more carefully.

It must be said that it was admirably planned by M. Duruy. This able minister comprehended that a new course would require a special personnel and he created a special normal school at Cluny. The programmes were excellent. They were arranged for a short term of years, since the pupils intended for commercial and industrial careers could not stay forever at their studies. The course was terminated by a simple examination within the schools which entitled the successful candidate to a certificate. A word should be said respecting the name—special course (*enseignement spécial*) which has been much criticised. The real name was special course for commerce, industry, and agriculture, but as this title was long common usage shortened it.

So long as the original purpose was kept in view the school of Cluny was maintained, though poorly. But other ideas prevailed in the ministry. Instead of strengthening the special course, they changed its nature. They sought to make a second classical course equal to the first, with the omission of Latin and Greek. To this end the title was changed from special course to modern course (*enseignement moderne*).

I regret to say that this was not a fortunate endeavor. The result was foreseen because the motive of this reform was not to create a distinct course with its own appropriate character, but rather to set up a rival course to the Latin, drawing off a portion of its students by the hope of an easier course leading to the same end. It was no longer like the course created by M. Duruy, a course intended to form a class of pupils having different habits of mind and a different view of the world; on the contrary it was intended to prepare pupils for the same careers as the classical course. This view is confirmed by the character of the programmes; these have been made to conform as closely as possible to those of the classical course. As there were two languages in the classical course, Latin and Greek, two living languages, German and English were included in the modern course. In the little time allowed in the lycée, who can master two difficult living languages? If one is really acquired it is a great deal. The classes are also named the same as those of the classical course; there is the sixth classical and the sixth modern, and so on. They are made as nearly alike as possible. The school at Cluny has been abolished and professors appointed for both courses who have had the same preparation. It would seem that a professor of classical studies would naturally regard students of the modern course as a little inferior. Moreover, a bachelor's degree was instituted as the crown of the modern course, requiring only one year less of study than that given in the classical course. Thus the character of the special course was completely changed. The modern course, although the younger brother of the classical, very soon assumed to equal, perhaps even to replace it.

You will readily see, Mr. President, from my presentation of the case that I am not in favor of the equality of the diplomas. I believe it was a mistake to create two roads leading to the same end. It does not seem to me that we have too few officeholders. To create a second baccalaureate, less difficult in appearance at least than the others, is merely to open a new road to public office, to double the number of candidates. For what is there to prevent pupils of superior primary (public high)

schools from obtaining this diploma. They also learn the living languages, the best of them know enough of science, so in a few years the flood of candidates will be more than doubled. For young men of ability, who would have no difficulty in learning the little Latin and Greek that is required for the classical diploma, it was not necessary to open a new course which, being shorter by one year and in appearance easier, would naturally attract toward the public service a class of persons who heretofore had no thought of entering it.

On the other hand, the special course suffered a disadvantage which affects the modern course also. In order that any course should develop and prosper, it must have a building of its own, and its own principal, whose ambition and self-interest it absorbs and whose entire time and effort are given to it. M. Duruy wished to establish new schools for the special instruction, but as you well know the Chambers were at that time niggardly in their support of public instruction. It was useless to think of asking them to make sacrifices for the creation of new schools. This was fatal to the new course; it will doubtless be the same in the future. A principal can not devote himself at one and the same time to students who are destined for classical studies and those who have in view agriculture, the sciences, or colonial careers. It was financial difficulties that caused the juxtaposition of the two courses. But there were also two other causes which you well know, but which it is necessary to recall, because they will be felt equally in the future. The first was the boarding department (internat); the cost of this diminishes as the number of scholars increases. It is in the interests of this department that the new courses which have been created from time to time have always been placed in the old establishments. Thus the system of boarding has prevented the development of education in France. The second reason is political. The desire has been to unite all young students, in order that the different classes of the population should know and be associated with each other. This was the idea in the creation of the lycées. Napoleon wished that all the youth, whatever their origin, should be brought in contact with each other in the lycées. The idea could be realized with little difficulty, so long as all received the same instruction. But in proportion as new courses were created, and the population of the lycées became more varied, union became more difficult, and the political end was defeated.

These causes are not strictly educational, but they should be considered by those who have the care and responsibility of the future. To dwell a little longer on this subject, I will say a word on this question. Can the course of the superior primary school be made the vestibule to the modern course? Certainly; if we consider the programmes, the difference between the two seems slight. Both include German, English, and the sciences. But there is a difference in the class of pupils; the superior primary course is gratuitous; in the modern course fees are paid. It follows that different classes of the population follow these two different courses. The difference is found here and not in the programmes. In the ministry of public instruction the tendency is to work upon the programmes; but back of these are to be considered the classes of the population to whom they must be applied.

Still another word on this point. The future of the colonies is much discussed. Very well; if the purpose is to train young people disposed to go to the colonies to promote their prosperity, the effort must be made with those who frequent the lycées. This is evident, since to be a colonist with some chance of success, a certain capital is necessary. The pupils of the superior primary schools will indeed go to the colonies, but they will go as laborers. Hence we see why it was a mistake to give to the special course the literary character which it now has under the name of modern.

\* \* \* \* \*

*Remedies suggested.*—When a mistake has been committed it is not easy to go back and correct it. I believe, however, that something can be done. It would be possi-

ble, for example, to give up a second living language. Then the programme of the sciences should be increased. Although I am not a man of science, but a literary man, I believe that in this modern course it is above all things necessary to develop the sciences. It would be difficult to suppress the baccalaureate of the modern course, since it has been established, but it should have a very practical character, so practical that the thought of making it preparatory to the schools of law and of medicine would never arise. It is necessary to insist upon that knowledge of geography, of chemistry, of natural history, of mechanics, which every good agriculturist, trader, or navigator ought to possess.

Question. (By the PRESIDENT.) You would then return to the original conception of M. Duruy?

M. BRÉAL. Yes, so far as possible, considering that formerly this was a course limited to two or three years, and that to-day it is a longer course, terminated by a bachelor's degree.

Question. You would advise that Latin and Greek should both be retained in the classical course?

M. BRÉAL. Yes; as does M. Boissier.

Question. You would not allow Latin for only a portion of the students, as is done in Germany?

M. BRÉAL. This is the modern course.

The PRESIDENT. Plus Latin.

M. BRÉAL. Our classical course deprived of Greek would become the equivalent of the inferior course in Germany. Once eliminated from certain lycées, Greek would soon disappear everywhere and we should fall to the level of Spain. For one of the peculiarities of Spanish education is this, that while in that country they retain Latin they have dropped Greek. This is not a model for us. We should be careful not to impair our classical studies any further; they have already lost so much that this would be the sign of their final ruin.

The PRESIDENT. But some persons, M. Gréard for example, think that the best means of saving the classics is to reserve them for a small number of students and limit them to certain designated schools. At the same time they would open public careers more freely to students who do not pursue the classics; relieve them of the dead weight which hampers them to-day. This is a view that has been set before us.

M. BRÉAL. This is an illusion that for sixteen years has deceived us in the superior council. Every time that something has been taken out of classical education it has been said that it would be the better for the change.

The PRESIDENT. But it is not proposed to take away subjects, but pupils.

M. BRÉAL. This is what was said when the modern course was created.

\* \* \* \* \*

The PRESIDENT. In your books you have discussed the régime of the lycées. You have complained that the principals had too little freedom, even in respect to petty details, and that this was fatal to their initiative. You have said that in Germany the directors of the gymnasiums had much more authority; they determine the books to be used, the hours of work; they may even change the programmes to a certain degree. What should we do in this respect?

M. BRÉAL. We should give more liberty to the principals; but liberty is merely a word. We should allow them the control of a certain part of their funds. Otherwise their best ideas are simply set forth in letters to the ministry where nothing is done beyond classifying them. The principals should be allowed to put the ideas that come to them into practice without waiting for an impulse from the central administration. We ought not to proceed by general measures as we always do. If everything is done by general measures, an innovation is reported immediately. This is the defect of the university; it is a great machine thoroughly organized,

in which all the parts are firmly bound together, but in which it is very difficult to make any reform.

THE PRESIDENT. You complain of the uniformity and also the abuse of specialization in the case of the professors. Do you consider this to be a consequence of the excessive centralization?

M. BRÉAL. The examinations are the cause. We have an *agrégation* (special examination for the diploma of *agrégé*, a special professor) of letters, those of grammar, of philosophy, of history; to-day one is demanded for geography. Once specialization is introduced, it tends to spread more and more. I think that a professor of history should be allowed to give lessons in literature. I see no reason for confining him to his specialty. This, indeed, is easier for the administration; when a vacancy occurs in a class of history in a *lycée* an *agrégé* in history is sent there. The professors are moved like pieces on a checkerboard. A true principal would prefer to select part of his professors in another way. If he discovers a professor of history having a taste for letters he will, when occasion offers, give him the charge of a class in literature for one or two hours.

\* \* \* \* \*

THE PRESIDENT. With respect to the baccalaureate, did you not think several years ago that it would be possible and even desirable to adopt gradually the German system, at least at Paris, transferring the final examination to the secondary establishments?

M. BRÉAL. I have always doubted the possibility of introducing this system into France. The actual conditions of the country make me doubt it more than ever. We must consider how the examinations of maturity (*abiturienten examen* or *maturitäts prüfung*) have been established in Germany; they arose in Prussia. They were established at a time when the nation, it may be said, had no political life, and the control of the State in this matter excited no opposition. The representatives of the Government were received everywhere with deference; no one objected to their decisions. Their presence was even regarded as a favor. It was then easy to institute examinations of this kind. But France, as you know, is actually divided into two camps. Would it be possible to make the students of private schools pass their examinations in the *lycées*? Endless complaints would arise. If the examinations were conducted by professors of the *lycées*, the students from the private schools would believe, or would pretend to believe, that they were in the hands of prejudiced judges. In my opinion, it is not to be thought of.

THE PRESIDENT. You would be less inclined to try this experiment now than some years ago?

M. BRÉAL. The different parties are too much opposed to each other. The professors of secondary instruction do not wish to attempt it at any price. They do not feel strong enough—*independent enough*. The professors of higher education can do it, because they are immovable and because that the system has been established for fifty years; but the professors of the *lycées* are not strong enough to resist the opposition and the criticisms that would be excited. The only thing that might be done would be to include a few professors of secondary education, a number carefully proportioned, in the examining body; but the direction of the examination should be left to the professors of higher education. As to giving every establishment, whether State or private, the right to confer the bachelor's degree, this is a course which, under the circumstances, I can not conceive to be possible. It would be the same as if a country that had a currency received everywhere without opposition should suddenly give it up and permit every district, every city, even every individual to stamp coin on his own account. The pieces would not be taken anywhere. Very soon it would be necessary to find something else to replace the old money of the State.

The PRESIDENT. You were formerly of the opinion, also, that the professors had not adequate preparation. Would it be necessary, as you claimed, to give more attention to this matter, and allow greater freedom to the professors that are better prepared?

M. BRÉAL. There is an institution in Germany which is excellent and which might be established among us. Our professors are weak on the side of pedagogy—the method of teaching. At first they do not know how to adapt their instruction to the age and comprehension of their pupils. In Germany, for the first year the young professor has no class of his own, but he follows the whole series of classes in company with the regular professors; he learns thus by comparing methods, what to follow and what to avoid, since it is true that one may profit as much by the faults of others as by the view of their excellencies.

The PRESIDENT. You have compared the German and French methods with respect to their effectiveness. Do you find that the German methods are more forceful, that they excite the pupils to greater self-activity?

Mr. BRÉAL. In respect to the pupils, the Germans have a special talent which they derive from their primary instruction, for it is in the primary schools that this talent is carried to the highest perfection. The master of a German school knows exactly how to speak to children; this talent is extended then to secondary instruction. In France we do not have this power, and it is difficult for us to have it. This is due to several causes which can not here be considered, but one of which I will indicate. It is this: The intimate relation between the German professor and his pupil is not possible among us; the actual condition of our population forbids it. \* \* \* The German professor is like a member of the family; they receive him in the most familiar way. In France such relations would be impossible.

[Session of Friday, March 24, 1899; M. Ribot, chairman; deposition of Brother Justinus.]

The CHAIRMAN. Are you not the assistant of the superior-general of the order of Christian Brothers (Frères des Ecoles chrétiennes)?

Brother JUSTINUS. I am the secretary-general of the brotherhood, at Paris.

The CHAIRMAN. You are, therefore, well informed as to the regulations and conduct of your establishments. Have you not for some time past, and especially within the last few years, extended the scope of your instruction? Did you not formerly devote yourselves principally to primary instruction?

Brother JUSTINUS. Mr. Chairman, there are certain prejudices upon this subject which I will ask your permission to dispel, because the character of the education given by the brotherhood is not, in some respects at least, sufficiently understood. The following statement which I have the honor to submit to you, I ought to say, is based upon official documents:

#### I.

To M. Duruy almost exclusively has been attributed the honor of originating and organizing our special secondary instruction, the organic law of which was passed June 21, 1865. It was only by a decree, however, that special secondary instruction was converted into modern secondary instruction. Undoubtedly M. Duruy had a large share in the pedagogical work which was thereby accomplished, but it will by no means diminish his merit to recall the labors of his predecessors in this direction, and the examples which inspired him.

In his various reports to the Chamber of Deputies M. Duruy has himself described with impartiality the genesis of special secondary instruction, which is now called modern secondary instruction. Jean-Baptiste de la Salle, the founder of the order of the Christian Brothers, was the first to create the type of this sort of instruction. I will say, at the outset, to avoid all misunderstanding, that the founder of this order

had in mind principally the primary school. This school was the real *raison d'être* of the order, afforded it a field of action, and has remained its first and preferred mission ever since. The original character of our brotherhood has never been changed.

Jean-Baptiste de la Salle was the organizer of the public instruction of his time. All masters of pedagogical science have been willing to accord him that merit. In the pedagogical museum, organized by the ministry of public instruction, the bust of our founder occupies a place among those of the most illustrious pedagogues. The city of Rouen erected a statue to him in one of its public squares, thus honoring our saintly founder as one of the purest glories of the Norman city. Echoing the general opinion the *Dictionnaire de Pédagogie*, published under the direction of M. Buisson, now a professor at the Sorbonne, declares that "the name of Jean-Baptiste de la Salle ought to be placed at the head of the organizers of primary instruction in France and Europe."

But, if the primary school was the principal and master work of Jean-Baptiste de la Salle, there was yet another field of labor which, no less than the first, revealed his creative genius. He had been struck with the serious hiatus in the instruction reserved for children of well-to-do families who were not destined for the liberal professions, so, while organizing the primary school, he also created a special establishment, until then unknown, which should respond to the new needs which his rare sagacity had discerned, and this establishment became the type of those in which modern secondary instruction is given to-day. This establishment became the seat of the administration of his order. M. Duruy remarked in his report upon technical education that France is indebted to the Abbé de la Salle for the practical installation and popularizing of that form of instruction. "From this first experiment," he declared, "there soon sprang a system of instruction which, if it had become general, would have established a century earlier the organization of adult schools, and even that of special secondary instruction. The programme of instruction for the *pensionnats* [boarding schools] of the brethren before 1789 included the catechism, \* \* \* literature, the drawing up of the principal actions in civil law, \* \* \* geometry, natural history, \* \* \* hydrography, and several modern languages. In the *pensionnat* of the brethren at St. Yon, says an old description of Rouen (*Tableau de Rouen*, 1774), the inmates are taught everything relating to commerce, finance, military affairs, architecture, and mathematics." The *Dictionnaire de Pédagogie* of M. Buisson adds: "Here is undoubtedly (why not confess it?) the first point of departure of superior primary instruction and the first sketch of special secondary instruction."

Among the letters patent granted to our *pensionnats* in the last century it is sufficient to note those of February, 1757, in favor of our institution at Marseilles. In that document mention is made of the character of the institution, its object, the success of the studies carried on in it, and the social grade of its students. "The Christian Brothers of Marseilles," it says, "have declared that they were called to this city in 1727 by the late *Sieur de Belzunce*, bishop of Marseilles, and the general council of the said city in consequence of its unanimous desire to receive them as one of the religious communities of the city; that the aldermen urged them to receive as inmates (*pensionnaires*) many of their own sons, as well as those of the principal merchants, in order to give those youths a proper and Christian education and teach them whatever is necessary for entering upon business pursuits; that those youths, having derived great profit by their instruction, the brethren were led to receive the youth of the entire city and its environs. \* \* \* Wherefore, by the advice of our council, and after due report to us made by the first president, intendant, and provincial superintendent of the usefulness of the said brethren, and after exhibiting to us the certificates given in their behalf by the aldermen of the said city of Marseilles, we do permit the said brethren \* \* \* to receive inmates into

their establishment in the same way as at Rouen without annoyance or hindrance of any sort whatsoever."

In 1792 we had eleven pensionnats modeled after the St. Yon establishment at Rouen. To-day the lycée of the university at Angers occupies our former pensionnats at that place. That at Rouen is occupied by the normal school, and others in different places have been turned into public institutions. The revolution ruined our institutions temporarily, but they speedily revived. Such is the case with all works which are in real harmony with social needs, because they carry in themselves a vital principle which enables them to triumph over all reverses. After the decree of August 18, 1792, which suppressed the religious orders, the brothers were obliged to scatter. When Chaptal, minister of the interior from 1800 to 1803, undertook to raise education out of its ruins, he presented to the council of state a bill (projet de loi) in which he proposed to recall the brothers, that admirable institution, as he expressed it, whose members have always combined the art of teaching with the most austere morals. The Dictionnaire de Pédagogie adds that in one of the sessions of the council of state when a discussion of the constitution of the university was going on, the dangers which might result from the adoption of the brothers by the public authority were pointed out. "I do not understand," said Napoleon I, "the kind of fanaticism with which some persons are animated against the brothers. It is a veritable prejudice. Everywhere people are for their reestablishment. This general call is a sufficient demonstration of their usefulness." (Session of May 11, 1806.) This is the origin of article 109 of the decree of March 17, 1808, organizing the University of France, which runs as follows: "The Christian Brothers shall be licensed and encouraged by the grand master, who will affix his signature to their regulations, administer oaths to them, and see that their schools are inspected. The superiors of this body may be members of the university." From which it appears that relations exist between our order and the university of such a special character that we earnestly desire to keep the remembrance of them alive.

The first care of our brothers, after the reconstruction of our order, was directed entirely to our principal work, the primary school (école populaire), but in 1810 the pensionnat system was revived according to the traditional plan. The pensionnat of Toulouse was already flourishing, and soon other establishments of the same kind were opened with the approbation of the public authorities. The original character of special instruction, inaugurated before the revolution, was retained; this was an intermediate or secondary instruction of general culture, but without Greek or Latin, with special attention to commercial, industrial, and agricultural careers.

From the first there was a constant adaptation of our programmes to the needs created by the social transformations which were taking place. This flexibility, which contrasted with the fixedness of the university programmes, excited surprise and a little umbrage in the representatives of the academic authority. The university, in fact, had no establishments analogous to our pensionnats, and the inspectors found it difficult to find a place for our institutions in the ordinary classification. Our instruction did not correspond to the programmes of the classical course because the ancient languages were excluded from it. Neither did it correspond to the course of superior primary instruction because it exceeded the limits of that grade in all points. It was an instruction *sui generis*, adapted to the needs of a very interesting class of young men. Explanations were requested. We answered that by the terms of article 5' of the imperial decree of March 17, 1808, instruction in the ancient languages constituted the very essence of classical education, while in our system instruction in those languages was interdicted, and we could not, therefore, be properly charged with trespassing upon the domain of classical instruction. This liberal interpretation was accepted by the university after some hesitation. In 1840 the complete programme of instruction in our institutions was published. M. Cournot,

rector of the académie of Dijon, declared his approval of it on January 19, 1861. Before that date a ministerial decision of October 22, 1841, had authorized the opening of the pensionnat at Passy, and some years afterwards, in consequence of the results obtained by our method, we were honored by a high testimonial of good will on the part of the minister of public instruction, who, by a decree of January 3, 1856, established scholarships at our pensionnat at Passy with funds taken annually from the appropriation for public instruction, in order, as the official document declares, to give encouragement to the institution of the brothers and test the method followed in it. From 1856 until 1879, when M. Jules Ferry was minister, we always had beneficiaries of the scholarships of the ministry of public instruction. The initiative taken by our order in the direction of special or modern instruction was, therefore, manifestly approved and encouraged by the public authority itself.

In 1862 M. Rouland, minister of public instruction, appointed "a commission to study the questions regarding commercial, industrial, and agricultural instruction in the institutions of public and private instruction." His successor, M. Duruy, continued and even enlarged the scope of the inquiry. In the course of a journey which he made through France he soon became convinced of the necessity of satisfying the wishes which were expressed to him on this subject and which seemed to him as thoroughly justified as they were universal. Thence arose the thought of organizing special secondary instruction within the university. With this object in view M. Duruy wished to make a direct and personal study of the practical question. Three inspectors-general, with M. Danton at their head, were sent to the brothers' pensionnat at Passy, which had more than 700 pupils. This was on March 18, 1864, and on the same day M. Duruy visited the school and was received by Brother Philip, the superior-general, and by the head of the school. Accompanied by his inspectors-general, the minister visited all the classes and complimented the brothers in the most flattering terms upon the appearance and tendency of the pensionnat. Another ministerial visit took place on the 12th of May following. It was caused by the resistance to the projet de loi for special instruction which was manifested in the parliamentary commission which had been appointed to examine the subject. To overcome this opposition M. Duruy invited the members of the commission to accompany him to Passy, in order to demonstrate to them, as he expressed it, the successful realization of his project by the Christian Brothers. The commission accepted the invitation and went to Passy, where the members visited the different classes, inquired into the programmes, examined the students, and inspected their work. In mathematics the examination was upon the eighth book of Legendre. In another class two literary compositions were read which were highly approved; and M. Duruy, turning to the deputies, said: "You see, gentlemen, that it is not necessary to study the ancient languages in order to write good French. I have been of that opinion for a long time." This opinion seemed to meet with a general assent. Finally, in the class in modern languages, a conversation in English was carried on among the students, and one of the deputies took occasion to remark how the utilitarian character of the Anglo-Saxon race is reflected even in its language. This visit, which was at once an investigation and a testimonial, as the biographer of Brother Philip put it, had a greater effect upon the deputies than arguments or speeches could have produced.

The following statement was included in the preamble to the bill upon special instruction: "The superior primary schools have turned out a body of young men well fitted to enter business or industries. \* \* \* The two municipal schools which the city of Paris has established are entirely of that character, as well as the pensionnats of the Christian Brothers. The instruction given in these schools is a response to a real and general necessity. One religious congregation alone (the order of the Christian Brothers) can count 7,900 pupils who are receiving this kind of instruction in 32 schools." (Journal Officiel, Sunday, April 17, 1864, p. 516.) On

December 3, 1864, M. Duruy, after having received many requests for the authorization of programmes of instruction, answered the director of the pensionnat of the Christian Brothers at St. Etienne as follows: "I have read your letter to me requesting permission to add the study of modern languages and elementary geometry and algebra to your programme of superior instruction. When I visited the schools of the Christian Brothers at Passy, Bordeaux, and Nîmes, I expressed my satisfaction at the order which prevailed in those institutions. I granted nothing, but I also withdrew nothing. I respected the status quo as far as the programmes of instruction were concerned. Indeed, before the matter can be settled we shall have to wait for the vote (soon to be taken no doubt) on the bill now pending before the Corps Législatif, when this question will be discussed. I must preserve the same noncommittal attitude in regard to the institution under your charge." There, gentlemen, is the recognition of the priority of the organization and operation of modern secondary instruction by our order, signed by the hand of M. Duruy himself, and the foregoing is the accurate account of the origin of this kind of instruction, drawn from official documents and the archives of our order, which I thought it my duty to lay before you. I draw from it the conclusion that the order of Christian Brothers has in no sense departed from its original rôle and its pedagogical mission by giving modern secondary instruction in some of its large pensionnats. It has simply remained faithful to the traditions, two centuries old, of its founder, of whom the immortal Leo XIII said that he had merited well both from religion and civil society. He bequeathed to us this particular type of instruction among his educational methods and his successors have applied themselves to continuing his work and giving it a national development in conformity with its purpose.

"The Christian Brothers," says Mgr. Dupanloup, "perceived the deep injury which the lack of all good industrial training causes the industrial or commercial classes, and they determined to establish at Passy a pensionnat in which an intellectual, religious, and moral education should be given which should be adapted to the needs of children who are destined for commercial, industrial, and artistic callings. Foreign countries envy us this excellent work and entreat the brothers to come and found similar institutions for their youth. The largest cities of France likewise express the same desire, while such cities as Rouen, Reims, St. Omer, Nancy, Carcassonne, Montpellier, and others enjoyed the benefit of the establishments of the brothers before the revolution. I hope that these invaluable institutions may increase in our land."

## II.

The marked favor which is accorded at the present day to the pedagogical ideas of our founder in regard to modern education was preceded in the first half of the century by a memorable contest in the domain of primary instruction between two systems of instruction, one, of foreign origin, known as the mutual method, and the other, of pure French origin, called the simultaneous method, which was bequeathed to the brothers by the founder of their order. The present is not the only time, gentlemen, when the exaggerated taste for what is foreign has been manifested in our country. It is a singular fact, and difficult to explain, that all the favors of the administration were reserved for the mutual schools and their principal representatives, and private associations were formed to aid them. Pedagogical protection even extended so far in this respect that the order of the brothers, which had always remained invariably attached to the system of its founder, was for a time threatened with the loss of its legal existence. But the defense of the Christian schools lay in their success. The conspicuous superiority of their results finally convinced their most determined adversaries, and to-day the method inaugurated by the founder of the Christian Brothers is adopted in all schools, both public and private.

"The order of the brothers," says the *Dictionnaire de Pédagogie*, "might well

congratulate itself on having remained persistently faithful to the injunctions of J. B. de la Salle when M. Cousin, in his account of primary education in Holland in 1836, reported the following opinion of the school authorities in Amsterdam: "We regard," they declared, "the mutual system of instruction as an absolutely insufficient method." "It is quite curious," remarked M. Cousin, "to hear a Protestant minister, a Quaker, and a philosopher at Amsterdam, unite in praising those poor brothers who are doing so much good and whom a new kind of fanaticism is vainly endeavoring to dishonor." In his account of primary instruction from 1867 to 1877 M. Gréard has clearly and precisely described the conversion (of which he was the promoter) of the mutual schools of Paris into simultaneous schools, and he attributes the success of the schools of the brothers to the excellence of their methods. In a period of thirty years, from 1848 to 1878, out of 1,445 scholarships placed in competition for the primary schools of superior instruction by the city of Paris, 1,148 places (about 80 per cent) were given to the pupils of the brothers. In 1878, the year of the last competition in which they could take part, out of 339 competitors declared eligible, 242 came from the schools of the brothers, and out of 50 first places the brothers obtained 34. In 23 competitive examinations from 1848 to 1870 the ten highest numbers, classified in the order of merit, have been granted to pupils of the schools of the brothers as follows: No. 1, 20 times; No. 2, 22 times; No. 3, 20 times; No. 4, 18 times; No. 5, 19 times; No. 6, 23 times; No. 7, 17 times; No. 8, 18 times; No. 9, 18 times; No. 10, 22 times. The number of boys' schools of the order, however, was only 48 per cent of the total number of primary schools of the same nature.

### III.

If we pass to the grade of modern secondary instruction we can affirm that under the influence of the same methods the results are likewise very satisfactory. No one will be surprised at this when it is remarked that we already had the tradition of this instruction in our order.

The CHAIRMAN. How many bachelors' degrees have you granted?

Brother JUSTINUS. I have not the figures with me, but I can point out that for the institution at Passy alone, from 1892 to 1898—that is to say, from the first application of the present regulations until the last session—we find 365 baccalaureate degrees granted, or a mean of 52 a year for seven years for one establishment only. During the same period the level of the studies was raised sufficiently to allow 48 students of Passy to obtain a double baccalaureate in the same year. Similar results, proportional to the number of scholars, were obtained in our establishment of the *Francs-Bourgeois*, rue St. Antoine, Paris, as well as in our large provincial institutions at Lyons, Bordeaux, Toulouse, Dijon, Clermont, Reims, etc. As the crowning piece of the studies in these schools, a preparatory course was organized at the *école centrale* at Passy, forming a continuous suite with the modern secondary classes. From 1887 to 1898 the *pensionnat* of Passy had the "major" of the promotion four times, the "sous-major" twice, and a certain number of pupils in the ten firsts. Out of 134 pupils presented during this period 119, or 89 per cent, were admitted.

The CHAIRMAN. Of all those who presented themselves?

Brother JUSTINUS. Yes, Mr. Chairman, of all those who were presented by us. Besides, nearly all these scholars finally graduated from the *école centrale* with the diplomas of engineers, and several among the highest numbers.

In order to respond to the requirements of different parts of the country, while our institution at Passy prepares for the *école centrale*, that at St. Etienne prepares with equal success for the school of mines at that place. If we look at the rating at entrance and on leaving the school during the last ten years, it will be found that the scholars of the brothers have gained the place of "major" eleven out of twenty times. Out of the ten firsts, in these ten years, on admission to the school, or  $10 \times 10$ ,

our students got 51 places out of 100. On leaving, their rating shows 53 per cent. From which it can be seen that these young men did not confine themselves to maintaining their rank, but won higher places. As to the practical results of this education, both to the young men themselves and as indicating the profit which the country has derived from their services, it gives me pleasure to inform you, Mr. Chairman, that the Société amicale des anciens élèves du pensionnat de Passy alone has a great number of members who occupy important positions, principally in commercial and industrial careers, and that the list of its friends and patrons (adherents) contains the names of 31 chevaliers of the Legion of Honor.

The CHAIRMAN. These details are interesting, but are a little aside from the purpose of our inquiry.

Brother JUSTINUS. It seemed to me, Mr. Chairman, that these diverse questions were closely allied. Moreover, the exact information which I have just had the honor to submit to you will enable the commission to appreciate better the whole of the results obtained.

#### IV.

Statistics recently prepared give the following as the occupations followed by our graduates:

	Per cent.		Per cent.
Commerce.....	35	Administration.....	7
Agriculture.....	33	Army and the colonies.....	5
Industry.....	15	Students.....	5

The great majority, therefore, follows commerce, agriculture, and industry.

The CHAIRMAN. How did you prepare these statistics?

Brother JUSTINUS. We requested each school to furnish the percentages of its graduates, and then we reduced the mean—

The CHAIRMAN. What schools do you mean?

Brother JUSTINUS. Our 30 schools which give secondary instruction.

The CHAIRMAN. What do you mean by that? Are these the schools that give baccalaureate degrees?

Brother JUSTINUS. Yes, Mr. Chairman. These are institutions organized in conformity with the law and the decrees concerning modern secondary instruction, and classed as institutions of that grade by the academic administration, in consequence of declarations made by the directors who hold university diplomas.

The CHAIRMAN. How many institutions have you where anything besides primary instruction is given?

Brother JUSTINUS. We have 30 in France which are secondary schools and 15 abroad.

M. MARC SAUZET. Are they primary schools at the same time?

Brother JUSTINUS. All these establishments have primary classes. We think that good primary studies are an excellent preparation for secondary instruction.

The CHAIRMAN. Then you have 30 institutions which you classify as secondary.

Brother JUSTINUS. Yes, Mr. Chairman, these establishments have the organization of modern secondary instruction, and the university authority so regards them. This is why in many academies, upon the proposal of the recteurs, ministerial decrees have designated the directors of some of our pensionnats to represent modern secondary instruction in the academic councils. On this point, Mr. Chairman, permit me to correct an error which arose in Parliament in the discussion upon the last budget but one, and which has been repeated, I believe, in the depositions laid before your commission. According to statistics furnished by the *Annuaire de l'instruction libre*, it has been stated that the Christian Brothers had about 500 secondary establishments, and that they had consequently declared their intention to participate in the exposition of 1900. This is an absolute error. Our order only

possesses 30 secondary establishments in France and about 15 abroad, but there is an Alliance des maisons d'éducation chrétienne which has in France, Belgium, and Switzerland about 500 ecclesiastical colleges of classical secondary instruction, or small seminaries. This alliance did declare its intention to participate in the exposition. This is doubtless what gave rise to the mistake I have pointed out. The *Annuaire de l'instruction libre*, I will add, is merely a bookseller's publication, and has no official authority. It has provoked numerous complaints, which have been taken into account in the edition of 1899. My figures, on the contrary, are in perfect accord with those of the *Annuaire de l'instruction publique et des Beaux-Arts* for 1899.

The CHAIRMAN. Then you place under secondary instruction establishments in which something besides simple primary instruction is given, while the majority of the students do not follow the course leading to the baccalaureate?

Brother JUSTINUS. The lycées themselves, Mr. Chairman, have primary classes with a special corps of teachers; many, besides, have joined to them infant classes under female teachers. As far as we are concerned, the part given to secondary instruction, properly so called, is relatively limited. Thus we are at present teaching 350,000 pupils, of which 100,000 are in foreign countries and 250,000 are in France. Of this latter number there are hardly more than 11,000 in our modern secondary establishments.

The CHAIRMAN. Now of these 11,000 distributed among 30 establishments, all do not take what may be called secondary studies, do they? They do not complete those studies?

Brother JUSTINUS. No; certainly not.

The CHAIRMAN. How many stop short?

Brother JUSTINUS. About half.

The CHAIRMAN. You yourself do not regard them as prosecuting secondary studies, but superior primary studies?

Brother JUSTINUS. For a certain number of scholars there are classes in which the programmes of secondary instruction are not rigorously followed. The main object is to prepare those young men for commercial, industrial and agricultural pursuits.

The CHAIRMAN. Let us take, for example, the establishment that I am familiar with, that of St. Omer. Some years ago it passed into the grade of secondary instruction. I believe that the majority of the pupils are the sons of farmers who have no idea of finishing the studies called secondary.

Brother JUSTINUS. Yes, Mr. Chairman, and for that reason we organized, in that establishment, alongside of modern secondary instruction, a more practical instruction, one of general culture, with a special industrial tendency.

The CHAIRMAN. That is true, but the majority of the pupils probably take the industrial classes. Have you any statistics on this dual instruction?

Brother JUSTINUS. At St. Omer the two contingents are nearly equal. There are 68 pupils in the primary classes, 112 students in the industrial, and 157 in those of modern instruction.

The CHAIRMAN. And how about the total of your school population?

Brother JUSTINUS. The three elements of the inmates of our pensionnats are in the following proportion: About 4,000 are in the primary division, 2,000 in the commercial or industrial classes, and 5,000 in those of modern instruction. This shows that the commercial or industrial classes are in a minority in the total of our establishments of modern instruction. I call your attention, Mr. Chairman, to the fact that our industrial establishments are not classed among those of modern instruction. Thus, at Paris, we have important establishments, notably that of St. Nicolas, and several commercial schools, which are not included in the 30 which form a part of the group of modern instruction.

The CHAIRMAN. And in these 30 institutions you think, without being able to give

us the exact figures, that the majority of the scholars do not finish the course of secondary instruction?

BROTHER JUSTINUS. The classes of the ninth, eighth, and seventh grades are primary. Beginning with the sixth, the programme followed is that of modern instruction with modifications required by local needs, but the majority of the pupils do not reach the first grade.

THE CHAIRMAN. I have requested the inspectors of the académies to render an exact account—and you can supply the information—of the number of pupils leaving after the sixth, fifth, etc., grades. You of course understand that the lack of exact figures falsifies our statistics of secondary instruction, so that we carry, en bloc, as a part of secondary instruction, the total population of your 30 establishments.

BROTHER JUSTINUS. The same is true of public secondary instruction, which includes, as I said just now, primary and even infant classes. According to the *Annuaire de l'Instruction publique et des Beaux-Arts* for 1899, there are now 1,168 primary classes in the lycées and State colleges, of which 209 are infant classes, and 268 of these primary classes are in charge of women. In the Académie of Paris alone there are 53 women teachers in the public secondary institutions. Thirty of these are in charge of infant classes, and these figures do not include teachers in the lycées for girls. In one official institution of the city of Paris a system was recently introduced which it would be well to extend to all institutions of the same kind. I allude to the collège chaptal. There is an organization very much like our pensionnats, having classes of superior primary instruction and those of modern secondary instruction, combined with a classical section. By the decrees of July 26, 1895, and January 26, 1896, the official sanction was given to this mixed system, at once primary and secondary, comprising under one management two different degrees of instruction.

THE CHAIRMAN. That is true, but you have no statistics showing the number in each grade; you have only estimates.

BROTHER JUSTINUS. Very close approximations. In some of our institutions the distinction was made long ago in accordance with the requirements of the authorities of the académies. We would regard it as good administration, Mr. Chairman, if this distinction could be made everywhere. The real facts would be brought out in this way and certain statistical enigmas could then be easily explained. For my own part, from the knowledge I have of certain elements of general statistics, I am convinced that sufficient account has not been taken in these latter days of the movement of the French school population. There is a greater crisis in the primary than in the secondary grade of instruction. In eleven years, from 1885 to 1896, the last year of the publication by the ministry of public instruction of the *résumés des états de situation*, the general school attendance has undergone a considerable decrease. The diminution of attendance of children between 6 and 13 is especially noteworthy. In 1885 there were 3,701,540 children in the public primary schools, while in 1895 there were only 3,381,161, showing a diminution of 320,379. But at the same time with this decrease a lively impulse was given to the complementary primary courses, to the superior primary schools, and to the public professional [industrial] schools. These received an increase of 16,672 pupils, a scanty compensation, to be sure, but nevertheless worthy of note. The State lycées and the colleges of the communes must certainly have received a portion of the pupils over 13 years of age who have been retained by the superior primary or the industrial schools.

THE CHAIRMAN. That explains how it is that the figures for the lycées and collèges have remained stationary for a number of years.

BROTHER JUSTINUS. As far as national interests are concerned there is nothing to regret in the new direction given to the studies of this class of students. They are certainly more in place in industrial schools than in the lycées, and my opinion consequently is that what is called the crisis in secondary instruction has been exaggerated.

The CHAIRMAN. There is no doubt of it. To come back to your institution, do you give really modern instruction leading to the baccalaureate in different institutions, and, besides, do you prepare for different schools, notably, the *École centrale*?

Brother JUSTINUS. The preparation for that school is made only at Passy.

The CHAIRMAN. How many pupils have you there?

Brother JUSTINUS. About 900.

The CHAIRMAN. All of them do not follow that instruction to the end?

Brother JUSTINUS. No, Mr. Chairman, but the classes in our establishments are organized on the plan of modern instruction, a certain number being especially commercial. In recent years there have been 230 primary pupils, 110 in the commercial classes, about 500 in the classes of modern instruction, and some 30 or 40 in the course preparatory to the *École centrale*.

The CHAIRMAN. When does the separation take place?

Brother JUSTINUS. After the fifth grade.

The CHAIRMAN. Then you have a commercial section?

Brother JUSTINUS. Yes, Mr. Chairman; the commercial section comprises three classes at the *pensionnat* of Passy, and the industrial section includes four at St. Omer, and about the same distribution exists in the other institutions.

The CHAIRMAN. Do you think that the programme of modern instruction is not sufficient for commercial needs?

Brother JUSTINUS. It is a little too much like that of classical instruction.

The CHAIRMAN. You have been obliged to change it for the benefit of those who want to go into business?

Brother JUSTINUS. Our aim has always been to adapt our programmes to the needs of the different neighborhoods.

The CHAIRMAN. You have been at complete liberty to do so since there is no baccalaureate degree for those studies.

Brother JUSTINUS. It is by an express and well-considered understanding with the families that we determine the delicate question of the direction to be given to the studies of our pupils. We offer to the families the choice between the regular programme of modern instruction and the industrial courses. Many parents say to us: "Make our boy a well-informed, well-bred young man, with strong Christian convictions and of good morals, and that is all we want."

## V.

The CHAIRMAN. So you have classes organized completely upon the model created in 1890? You have what I shall call superior primary instruction, flexible enough to be adapted to the needs of the different neighborhoods. Does this kind of instruction operate on a large scale in many of your establishments?

Brother JUSTINUS. We give this instruction in those of our establishments which do not give modern instruction and in a few special classes of our principal schools.

The CHAIRMAN. Do many of your scholars graduate from the department of superior primary instruction?

Brother JUSTINUS. Although many of our scholars do not take a complete course in superior primary instruction, they do take very useful developments of elementary primary instruction. Industrial drawing, accounts, and agriculture are courses which are highly appreciated by their families.

The CHAIRMAN. Is not this instruction like the public superior [primary] instruction except the adaptation to local needs which you endeavor to bring about?

Brother JUSTINUS. We do not prepare our pupils for the diplomas of the official superior primary instruction, because those diplomas have hardly any weight. Besides, many merchants and manufacturers tell us that the recommendations of our directors are as good to them as all the certificates in the world.

The CHAIRMAN. How old are these scholars on graduating?

Brother JUSTINUS. About 15 or 16 years old.

The CHAIRMAN. There are those whom business necessities oblige to leave school; do you endeavor to give them as complete an education as possible while they are in school?

Brother JUSTINUS. We strive to prepare them for industrial, commercial, or agricultural pursuits while giving them a general culture.

The CHAIRMAN. Do your establishments give different kinds of instruction according to the localities in which they are situated?

Brother JUSTINUS. They all have points in common, but they differ in particulars. For some years, for example, in order to satisfy the requirements of the present situation we have increased the number of courses in agriculture in different places.

The CHAIRMAN. How many of them have you?

Brother JUSTINUS. The simple courses annexed to the establishments of regular instruction are very numerous; most of our pensionnats have them. Some establishments have a special agricultural course. I do not include in this class our agricultural institute at Beauvais, which was founded more than fifty years ago, and has a place apart, on account of its importance. Young men are trained there for agriculture on the large scale for vast agricultural enterprises.

The CHAIRMAN. That is an agricultural school, but in your primary schools with agricultural tendencies do you teach agriculture properly so called?

Brother JUSTINUS. The courses have both a theoretical and practical character, although the organizations are different. Let us take an example. Here is an extract from the "Report to the members of the bureau of the société des agriculteurs de France, section of education, upon the examination of the students in agriculture of the pensionnat Ste. Marie at Quimper, July 11, 12, and 13, 1898, before the special committee of the society." The report states that 150 of the 700 pupils of the pensionnat took the course in agriculture that year. "This course is divided into three years, each having a distinct programme. The programme has been submitted to us, and we have found it perfectly adapted to the intellectual dispositions of the pupils. It is divided into monthly programmes, which are completed by a strict examination at the end of each month. We have examined the questions put in the different monthly examinations, and they seem to sum up the work of the month in a satisfactory manner. At Easter there is a half-yearly examination, both written and oral, which sums up and concludes the studies of the preceding six months. The annual examinations last three days. We divided ourselves into three bureaus, one correcting the examination papers in agriculture, another those in zootechnics, and the third, those in the natural sciences. After the written compositions were corrected, we questioned the pupils, each in turn, on the whole programme in each branch of instruction, and we are happy to express our gratification at the results. The pupils of the first year are familiar with the technical terms of agriculture and the natural sciences; those of the second year show a facility in discussing the quite complicated questions of their programme; while those of the third year could give a dissertation of forty minutes upon such a subject as the management of a farm, and interest us for another twenty-five minutes by their intelligent answers to questions which were sometimes difficult. In a word, the ensemble of this examination was perfect, and the three days your committee spent at the school were full of charming interest."

Now these results, Mr. Chairman, are not new; they are only repetitions of what has been known before in the history of this establishment, for, in 1866, the prefect of Finistère used the following words in his annual report to the general council: "The agricultural instruction of the pensionnat of the Christian Brothers, which is intended for the sons of farmers in easy circumstances, continues to exert the happiest influence in the way of propagating new methods. A large number of former pupils of this school are now members of municipal councils, several are

mayors, and all contribute by the example of their culture and their works to give a powerful impetus to agricultural improvements. The 1,800 graduates who have attended the course of Mt. Olive have all returned to their homes, where they reflect honor upon themselves by improving the useful and noble profession of their fathers. All the energies of the able professors of this school tend to inspire their pupils with a taste for agriculture and a love of country life, and if this useful institution had no other effect than to retain in the country a body of intelligent and enlightened young farmers, it would still merit all our encouragement."

If we consult the *Annuaire du département du Finistère* for 1899, Mr. Chairman, we shall find the names of 74 mayors, 97 deputy mayors, 10 conseillers d'arrondissement, and 2 general councilors, all formerly pupils in the agricultural section of the pensionnat. From 1846, the year it was founded, until the present year (1899), 27,337 pupils have received the education of the Christian Brothers in this institution.

The CHAIRMAN. This institution is not a school of agriculture?

Brother JUSTINUS. No, Mr. Chairman, it is a superior primary pensionnat with an agricultural course added. A farm of 35 hectares serves as a field for experiment, and the pupils are regularly taken there for the season's work. The annual examinations have often included an exercise in practical farm work. The pupils thus have both theoretical and practical training. In all our primary schools equal attention is given to agriculture. The first person to receive honors from the Société des Agriculteurs de France in 1899 for instruction in agriculture was one of our directors. The *prix d'honneur* of the same society was also given to us in 1898, as well as the gold medal for the publication of a course in agriculture for the use of schools.

## VI.

The CHAIRMAN. Do you do the same thing for industrial instruction? Have you workshops connected with certain schools?

Brother JUSTINUS. Yes, Mr. Chairman, we have organized practical courses for industrial pursuits analogous to those of agriculture. At the last examination for admission to the school of naval pupil-mechanic apprentices, 27 pupils of our schools at Brest, Quimper, and Lambézellec were admitted. Of these the school at Brest had No. 1 in the line of promotion, the pensionnat of Quimper No. 2, and that of Lambézellec No. 3. At the other end of France 30 of our pupils from the single school of St. Eloi at Aix were admitted to the *École Nationale d'Arts et Métiers* at the examination at the end of June, 1898.

Our modern secondary pensionnat at Rodez also has a very prosperous industrial section. From 1890 to 1898, 88 of its pupils were admitted to the *École Nationale d'Arts et Métiers* to the navy or the school of foremen at Cluny. Similar organizations exist in a certain number of our establishments. Several, as at St. Malo, Paimpol, and Dunkirk, have special courses in the sciences, nautical arithmetic, etc., for the benefit of students in the schools of hydrography. Only a few weeks ago 24 of these young men, prepared in this way at St. Malo and Paimpol, were appointed sea captains.

As to the industrial courses, properly so called, the most generally known type is illustrated by the St. Nicholas school at Paris. The Academy of Moral and Political Science, in its session of June 12, 1897, allotted the Audéoud prize for this work of this school, the usefulness of which had become acknowledged. M. Léon Aucoer in his report used the following language on this subject: "The principal institution (at Paris) numbers 1,030 pupils, that at Issy, 1,050, and that at Igny, 830. Every year the administration is obliged to turn children away for want of room. According to the request of the parents the children receive either only primary instruction in its different grades, or a special course which fits them for either industry or horticulture. The workshops of the Paris school are one of the characteristic features of

the St. Nicholas work. The institution deals with the proprietors of works who pay all the expenses of the work done in the shops and take the profits, the work being under the direction of a foreman chosen by them. Apprenticeship lasts three or four years, according to the trade. No time is wasted in these shops, and the apprentices are not exposed from their thirteenth year to evil influences. Generally speaking the pupils are trained for trades which require good intelligence and taste, such as printing, geographical engraving, lithography, bookbinding, making of mathematical instruments, machinery, wood carving, bronze founding, and metal carving. Every day the apprentices receive from the Christian Brothers, who give them instruction, special lectures on drawing and modeling suited to their work. The foremen are well pleased with their apprentices, and the head of the establishment receives at the time of the yearly vacation a great many applications to hire the young men.

"The results of our primary instruction, properly so called, have received flattering attentions at all the universal expositions, at Chicago as well as at Paris. What we particularly like to emphasize is the daily work. In the year 1895-1896 there were 346 certificates of studies, 36 brevets of elementary primary instruction, and 5 of superior primary. At Igny, in agricultural and horticultural instruction, the young apprentices gained 44 prizes, viz, 19 at Reims, 13 at Paris, and 12 at Versailles, one of which was a *prix d'honneur* and one a first grand prize. All this work is maintained under a gentle and affectionate discipline which produces the best results. The St. Nicholas school was the first institution of manual work at Paris. It has remained one of the models."

At Lyons, the school De La Salle was organized by the brothers for the benefit of the best scholars of their schools. The founders offer a complement of primary and industrial instruction with a religious and moral training to those families who wish it. For admission the pupil must be 13 years old, at least; he must have a certificate (second degree) of primary studies, from the committee of Catholic schools, and he must pass an examination in orthography, arithmetic (metric system, fractions, interest), French composition, the elements of geometry, and linear drawing. This programme is followed in the schools of the *arrondissement* conducted by the brothers. At De La Salle the course is three years, and the instruction is at once industrial and commercial. It embraces industrial drawing and the mathematics required for that study, French correspondence, common law, bookkeeping, social economy, history and geography, English, and physics and chemistry applied to industries.

Shops or laboratories for forge work, weaving, carpentering, modeling, chemical manipulations, typography, and engraving enable the students to discover their special aptitudes and prepare a sure future. All the students are *externes*. Respectable families are designated to the parents who do not live at Lyons but wish their sons to attend the school. A special arrangement allows students who live at a distance from the school to take their midday meal there.

The object of the direction of this school is threefold, viz, by manual labor, first to show the pupils the necessity of industrial drawing and of the mathematical studies which that drawing demands; second to disclose to them the intelligent side of workshop labor and invite them to prepare for it; and third to give the pupils a general education and enable them to acquire dexterity of hand and sureness of eye.

The industrial courses of St. Étienne offer us a rare example of that diversity of organization of which I have already had occasion to speak. The subject is described as follows in a report of the committee on private schools.

When the committee applied to the principal manufacturers and tradesmen of St. Étienne for their opinion on the expediency of the Christian industrial school, there was but one unanimous approbation, and the committee received only the most sympathetic and lively encouragements. It forthwith set to work and first asked itself this question: Is it indispensable to create workshops at the school, which will evidently

be very expensive? Glancing around the numerous and diverse shops of the laborious city, it soon found its answer. St. Étienne is peculiar in possessing so many and varied industries and trades which sometimes seem to conflict with each other. Thus, there are the coal mines and works where great quantities of coal are consumed, foundries, iron works, arms factories, etc. There are also ribbon and velvet factories, with their attendant industries of dyeing, silk weaving, etc. As in other prosperous cities, we find here building actively going on with its attendant masonry, carpentry, interior and exterior decoration and the like, so that business, notwithstanding many crises, is very active there. In a word, St. Étienne possesses the most diverse kinds of works and the best equipped, and may be regarded, in a sense, as a vast workshop. On the other hand, shops established in an industrial school are necessarily generally incomplete, and insufficient to form real workmen. Would it not be better to use the shops of the city, various and well organized as they are, especially as their proprietors are willing to give free access to them? Is it not better for the apprentice to work in the place where he will have to work as a workman and under the direction of the same proprietor or foreman to whom he will be subordinate in the future?

The system of workshops outside the school, in charge of real foremen and superintendents in which the students remain under the direct supervision of the school, seemed to the committee to be the real solution of the apprenticeship question. This was also the opinion of the leading manufacturers of the neighborhood. Experience has shown that the judgment was sound, for the system adopted has given the best results. The experience of other countries is also in favor of it. In the great industrial cities of Holland, Germany, Belgium, and Switzerland, which countries are our rivals, the industrial schools are generally private foundations aided by appropriations by the cities or the Government. The manufacturers of the neighborhood lend their aid also, which is a guarantee of continual progress.

*Admission and programmes.*—The courses, four in number, are called years. Scholars are not admitted to a superior course until they have passed a rigid examination upon the studies of the lower course.

*First year.*—The pupils of the first year are recruited from the best pupils of the Christian schools of St. Étienne, who are invited to compete for admission to the industrial school. Candidates must have, first, certificate of primary studies; second, a certificate of good conduct; and, third, must not be over 12 years of age on the 1st of January of the year of admission. The scholars of the first year form two classes, but follow the same programme comprising the catechism, sacred history, writing, orthography, style, arithmetic, geometry, French history, linear and ornamental drawing.

*Second year.*—In this course the subjects of the programme of the preceding year are continued, and physics, chemistry, and drawing from nature are added. In the second semester the pupils are taken by sections, in charge of their teachers, into different workshops in the city whose proprietors take pleasure in admitting them and explaining or having explained to them the different operations. At the end of each visit each scholar is required to write a report in which he records his personal observations. In this way an idea of different industries is gained from among which he will have to make a selection. This selection is made in the first fortnight of the vacation. Each second-year pupil who is admitted to the third year is required to inform the brother director in writing the trade he intends to follow. His letter must be countersigned by his parents.

*Third year.*—This year's programme gives a further extension to the subjects previously studied, and adds mechanics, trigonometry, industrial and color drawing, and elements of descriptive geometry. Twice a week the students attend at the workshops of the trades they have chosen and work there under the proprietor, or foreman, or some good workman. The brother director also visits the shops once a

week to ascertain how his students have behaved. Every quarter a committee appointed by the conseil de perfectionnement requires them to do some original piece of manual labor. The apprenticeship of students of the third year is paid by the committee.

In this class room each group receives instruction by special instructors in scientific or artistic principles belonging to the trade it has chosen. Thus, a mining engineer teaches metallurgy; a pattern maker from the manufactory teaches weaving, etc.

*Fourth year.*—The pupils who have completed successfully the third year are admitted to the fourth, which is called the year of apprenticeship. They are assigned to the workshops of the trades they have chosen in the city, and work there under the ultimate superintendence of the brother director and the conseil de perfectionnement. Every evening they return to the school to attend the lessons especially arranged for them. They also attend the school on Sundays and holidays and take part with the rest of the school in parish duties. The brother director keeps himself informed of their conduct and technical work and gives them every month a memorandum of their marks in the class room and workshop. This memorandum is signed by the proprietors and parents.

At the end of the fourth year, which is essentially a year of practice, the young men, after a rigorous examination, receive a diploma of industrial instruction which bears the signatures, first, of the chairman of the committee of private brotherhood schools; second, of the members of the council of administration and of the conseil de perfectionnement; third, of the proprietors under whom they have worked, and, fourth, of the brother director.

This diploma, which has a real moral value, assures the young men the patronage of all persons who favor the industrial school.

Analogous statements might be made of the industrial courses at Reims, Marseilles, Douai, Toulon, Nantes, etc.

## VII.

The CHAIRMAN. Do you find that your practical instruction responds to the needs and the increasing desires of the public?

Brother JUSTINUS. The families of the young men are, as a matter of fact, well satisfied with the organization of these different courses which run parallel to the regular instruction, which preserves, nevertheless, its superiority in numbers.

The CHAIRMAN. Are you not creating a strong competition, not only with the public institutions, but with the ecclesiastical, too? It is so asserted everywhere.

Brother JUSTINUS. We do not compete, in the true sense of the word, with anyone, Mr. Chairman. We desire the welfare of all, including ourselves. However, I have not with me the statistics of the institutions in question, but it will be easily understood that many Christian families, having to choose between the classical and the modern instruction and deciding in favor of the latter, would naturally turn to those religious teachers who have been giving this kind of instruction, handed down by tradition, for two hundred years.

As far as the ecclesiastical colleges are especially concerned, Mr. Chairman, I will remark that we have always restrained ourselves from trespassing upon the domain of the clergy. We have often been urged, in proportion as our pedagogical success has increased, to introduce a course of Latin into our pensionnats, but we have always refused to do so, and among the many reasons which have determined our conduct has been our determination not to lessen the prosperity of the ecclesiastical colleges.

One other consideration should be noted here. The special instruction which the founder of our order introduced two hundred years ago met the needs, at first, of only a minority of the young men of the community. The activity of the young

men of the better classes was directed to liberal pursuits. The conditions of family and fortune in those days enabled the intellectual élite of the country to devote itself disinterestedly to the cultivation of letters or the arts, or to scientific researches. Since then an economic and social transformation has taken place. The number of young men who are compelled to struggle to obtain the necessaries of life has greatly increased, so that our instruction to-day meets requirements which are more widely diffused than formerly, and hence its popularity.

The CHAIRMAN. The expenses at your establishments are somewhat less than at others, are they not?

Brother JUSTINUS. There is little difference, although we are not in such an exceptionally favorable condition as some ecclesiastical colleges—not all—which have free quarters given them by the diocesan authority. Many of our schools have to pay a good rent to the civil societies which own the quarters we occupy.

The CHAIRMAN. Are these societies the real owners, or do they only appear as such in order to cover the acquisitions of your order?

Brother JUSTINUS. These societies are real and have fulfilled all the requirements of the law in their incorporation. You can judge of this, Mr. Chairman, by the following fact: All the civil societies which own the buildings where we have organized our pensionnats have always paid their annual dividends; not one has ever, so far as I know, been an exception to this rule.

M. JACQUES PIOUS. That is a good business. I wish we could all say as much.

Brother JUSTINUS. We have deemed it our duty not to disappoint the friends who have helped us in our work of education of the interest upon their capital. Therefore the directors of our pensionnats scrupulously satisfy all their obligations to the proprietary civil societies. This is their first financial duty.

#### VIII.

M. MARC SAUZET. Do you consider that the passing of pupils from superior primary instruction to modern secondary instruction is an easy one? This idea has been suggested, and it might, perhaps, be possible not only to unite those two classes of instruction, but to make one an introduction to the other. As you have both superior primary and modern secondary establishments, you have perhaps had occasion to make the experiment of the passing of the pupils of superior primary instruction into the higher classes of modern instruction.

Brother JUSTINUS. In order to answer that question I ask your permission to cite the opinion of an authority in education, Mgr. Dupanloup, who had a long experience on this point in classical education. He expresses himself as follows in his remarkable book on education: "I never consented," he says, "to admit boys to the Petit Séminaire at Paris who had not been properly prepared for secondary instruction by a thorough training in the primary grade. Such pupils I sent to the schools of the Christian brothers at Passy, for example. \* \* \* From 8 to 10 or 11 years of age they had received a thorough primary education. From 10 or 11 to 16 or 17 they went freely through the whole of the humanities. With an exception or two, I never knew them rejected at the examinations."

What Mgr. Dupanloup stated of the relation of primary instruction, carefully given, to secondary in the classical, we affirm of modern secondary instruction. The boys in the elementary classes of our institutions have the benefit of what might be called a superior pedagogical supervision, because the masters of the primary classes, being constantly in contact with those of the secondary, are thereby better qualified to open wider horizons before the eyes of their pupils.

M. MARC SAUZET. Do you not prepare boys for classical studies in your establishment at Paris, rue de Gréville No. 44?

Brother JUSTINUS. That is a preparatory school for secondary instruction. In

order to make a distinction between it and the parochial primary school, St. Thomas Aquinas, we have recently placed it under a special head.

M. MARC SAUZET. I asked the question particularly with a view to ascertaining the results of that instruction and as a conclusion to my previous question.

Brother JUSTINUS. To this special inquiry I will answer that the graduates of that school furnish nearly equal contingents to the Collège Stanislas, the lycée Montaigne, and to the day school in the rue de Madrid, in all of which their success has been remarkable. M. de Cabanoux speaks as follows of this school in his report of June 19, 1898, at a meeting at which M. Paul Lerolle, deputy from Paris, presided: "Since its foundation this school has had 643 pupils, of whom many have gained good positions in the liberal professions, in the corps of government engineers, or in the army and navy. Many more are preparing for these professions at the École Normale Supérieure, at St. Cyr, at the polytechnic school, or at Borda. Many others who are younger are pursuing the same end in the establishments of Stanislas, the Jesuit Fathers, the Petit Séminaire, or even in the best State lycées. We can affirm from the testimony of the directors of these institutions that our pupils place themselves at the heads of their classes. One day a professor in a well-known college in Paris received one of our pupils who had just been presented as a newcomer with these words: "Young man, be worthy of your predecessors." These testimonies corroborate in the most explicit manner the opinion of Mgr. Dupanloup already cited.

The CHAIRMAN. Do you think that the type of modern instruction, as it was completed in 1891, is susceptible of great extension and responds to the needs of the country? Or do you think, on the contrary, that it would have been better to adhere to the type of M. Duruy, which your order had inaugurated, as you say?

Brother JUSTINUS. I think, Mr. Chairman, that certain friends of modern instruction have imagined for it a too ambitious part—that of supplanting classical instruction.

The CHAIRMAN. Is that your impression from the experiments you have been able to make?

Brother JUSTINUS. A good general culture can be obtained through the modern instruction without copying the classical instruction out and out. I will add, since I have the opportunity, that neither our founder nor his successors ever intended to make the modern system a rival of the classical; each of these kinds of instruction has its own character, which it is desirable to keep distinct and unaltered.

The CHAIRMAN. You think it would have been better to remain in the plan prescribed for instruction in 1865?

Brother JUSTINUS. I do not regard the limits then prescribed as absolutely unchangeable. That régime might have been modified, and some elasticity or flexibility might have been given the programmes, which they sadly needed; this would have been an improvement which we have tried, in a modest way, to realize.

The CHAIRMAN. But could this be done without so extending the duration of the studies so as to make the modern system the equal of the classical?

Brother JUSTINUS. I will speak of the duration of the studies later. As to the general economy of the programmes, there would be much to say. What objection is there to introducing a diversion into the general programme which should take account of local needs. Without going into specialities too far, and while giving our main attention to the general culture of the mind, why not familiarize our young men with the principal questions concerning business, industries, and trades, agriculture, and the colonies. As to the extension of the modern instruction and the weight to be accorded its diplomas, I will add that if it is understood that this instruction answers the needs of a large class of young men, it is for the interest of the country to guide these young men to it, and, consequently, it would be unwise to deprive the graduation certificates of the prestige they now possess. To diminish their authority would amount to disqualifying the instruction itself.

The CHAIRMAN. What do you mean by that?

Brother JUSTINUS. I mean, Mr. Chairman, that the baccalaureate degree which is now given to graduates from the modern instruction should be retained in the interest of that instruction.

The CHAIRMAN. You seemed to think a short time ago that a special instruction, limited to four or five years, satisfied the needs which you had discovered in the public. You seemed to think that it would not be necessary to extend this cycle of studies to a modern baccalaureate.

Brother JUSTINUS. We must distinguish two classes of scholars in modern instruction. Some do not pursue their studies to the first class, and a more restricted course is sufficient for them. Others demand a complete education from this instruction, differing in character from the classical, but offering an equivalent guaranty of thoroughness as far as the duration of the studies is concerned. The increasing number of bachelors in modern instruction is a proof of this. If this satisfaction is denied them there is danger of throwing them out of their natural path, or at least of sterilizing, with no advantage to anyone, valuable faculties which only need development.

The CHAIRMAN. You are then inclined to maintain the reform of 1891; that is to say, you are in favor of a complete cycle of studies leading to a baccalaureate in modern instruction?

Brother JUSTINUS. Yes, Mr. Chairman; but on condition always of lightening the programmes and giving them greater elasticity.

The CHAIRMAN. Do you think that the law school and the medical school should be opened to those who have followed the complete cycle?

Brother JUSTINUS. That question is so delicate, Mr. Chairman, that I must ask your permission not to answer it. We should not care to make you believe in ambitions that do not exist.

The CHAIRMAN. Perhaps you would fear that superior primary instruction might slip by that door into the faculties of law and medicine.

Brother JUSTINUS. We have not asked that privilege, and do not ask it now. However, to be thoroughly sincere, it would be difficult to insist that a bachelor in modern instruction having, as some do, a real literary culture, and having acquired distinction in natural history, physics, and chemistry, could not be a good pharmacist or even an able physician.

The CHAIRMAN. Do you think that, if access to those faculties was given to young men under such conditions, you would have an increased clientèle?

Brother JUSTINUS. I am not certain of that. Besides, we do not want to receive a different clientèle from that for which our institutions were opened. We stand upon our traditional ground and have no greater ambition.

## IX.

M. JACQUES PLOU. I would like to ask Brother Justinus the average age of the students in modern instruction on graduating?

Brother JUSTINUS. The average age is about 16.

M. JACQUES PLOU. Are the graduates of the modern instruction younger than those of the classical?

Brother JUSTINUS. Both are of about the same age.

The CHAIRMAN. In fact, the moderns are a little behind.

M. JACQUES PLOU. My second question is this: It is said that the scholars from the schools under the religious orders, after entering the State schools, lose the rank they have on entering. Does not this fact indicate that they have received a forced education or instruction and that they can not profit by their acquired knowledge in the State institutions?

Brother JUSTINUS. It would be unjust to base a judgment upon incomplete data.

Individual failures are, of course, possible, and no class of persons is privileged to preserve its members from failure. I have already given statistics upon this point for the scholars from Passy, who were admitted to the École Centrale in the proportion of 119 to 134, or 89 per cent, and who obtained six times the rank of "major" and twice that of "sous-major" from 1887 to 1898, and then graduated with excellent numbers as engineers. At the School of Mines at St. Étienne during the last ten years we have had 11 "majors" out of 20. Out of a total of the first 10 of each year, or  $10 \times 10 = 100$  in all, we had 51 of our scholars on admission and 53 on leaving. There has not, therefore, been a falling off, but an advance. I will close with some statistics which are quite recent and absolutely demonstrative. The entrance examination at the School of Mines at St. Étienne in July-August, 1898, gave the following classification for our 19 students who were admitted: 1, 2, 3, 8, \* \* \* and 37, or a total of 382 for the total of the places obtained. Now, at the classing of 1899 within the school, these same scholars obtained the following rating: 1, 2, 4, 5, 6, 8, \* \* \* and 30, or a total of only 283 for all the places. There was, therefore, an advance of 99 points ( $382 - 283$ ) upon the brilliant results of the entrance examination. Forty-nine of our scholars are now in the School of Mines, and 287 have already the engineer's diploma. Many are holding honorable positions (engineers in chief or directors) in the districts of the Loire, Aveyron, Gard, Nord, and of Pas de Calais.

In closing this communication, Mr. Chairman, I wish to assure you most sincerely that you will always find us ready to give you a patriotic cooperation in everything concerning the important work of national education.

The CHAIRMAN. Mr. Secretary-General, we thank you for your very interesting deposition.

## CHAPTER XXII.

### CONFEDERATE TEXT-BOOKS (1861-1865):

#### A PRELIMINARY BIBLIOGRAPHY.

By STEPHEN B. WEEKS, Ph. D., *Santa Fe, N. Mex.*

[Additions to this list are respectfully solicited.]

- I. Primers.
- II. Spellers.
- III. Readers.
- IV. Arithmetics.
- V. Grammars.
- VI. Geographies.
- VII. Dictionaries.
- VIII. Books on foreign languages.
- IX. Sunday-school and other religious books.
- X. Miscellaneous.

Under each of these divisions the arrangement is first by years, then alphabetically by States in which publication was made, beginning with Alabama.

Capitals have been used: (1) When they appear on the title page as such, and followed either by lower-case letters or small capitals; (2) for proper names and adjectives; (3) at the beginning of a sentence.

Designs, pictures, or other emblems are indicated.

The title page has been copied rather than the cover title, if it is to be had; differences between the two are indicated.

Size is marked in inches by actual measurement of the bound book on outside, over binding.

1. When the book has been seen the title page is given in full and uprights are used to indicate division of lines. 2. When the title of a published book is quoted from another source it is given as there found, with the source. 3. When the title has been made up from advertisements or other sources which are not conclusive as to publication, it has been put in [ ]. In such cases the writer has no further information whether the book in question was actually published or not.

He will be thankful for additions or corrections.

#### I.—PRIMERS.

1861.

[Primer, by Mrs. S. A. Poindexter. Nashville: Southwestern Baptist Publishing House. 1861.]

Mentioned in De Bow's Review, Aug., 1861, p. 207.

[The Confederate Primer. Nashville, Tenn. 1861.]

Published by an association of Southern teachers. Mentioned by So. Lit. Messenger, Oct., 1861

## 1862.

Our Own Primer, by Richard Sterling and J. D. Campbell. Greensboro: Sterling, Campbell & Albright. 186[2?]. 12 mo. pp. 34.

Announced on the cover to Our Own Third Reader, published in 1862. Mentioned in Raleigh Register, July 2, 1862, as published.

Copy in Harvard University Library.

## 1863.

[The Child's Primer. Atlanta, Ga.: J. J. Toon & Co. About 1863.].

Announced on the back of the Revised Elementary Speller as "already issued" in a large edition.

Dixie | primer. | For the little folks. | By Mrs. M. B. Moore. | [Cut of lute, music, urn, etc.] | Second edition. | Raleigh, N. C.: | Branson, Farrar & Co., | Hillsborough street. 1863.

*Collation:* Title, 1 l., preface on verso; alphabet and text, 3-26+ [2]. 9 ill. Size, 5¼x4½ in.

*Copies seen:* Congress.

"Third edition, contains numerous engravings," and was published in 1864. Precedes the First Dixie Reader.

First edition, 10,000 copies.

Illustrated Alphabet. | [Cut of boy and girl]. | Lith: & Published by B. Duncan & Co., Columbia, S. C. [1863?]

Size, 6½x4¼ in. Eight unnumbered leaves illustrating the alphabet, and figures, with stag, horse, boys, dog, bowl, fruits, flowers, and fox, in colors, mostly blue.

*Copies seen:* Congress.

Primer, in German. Richmond, 1863. 24°.

Bound in wall paper. Title from Wynne's Sales Catalogue, 1875, p. 20.

The Confederate Rhyming Primer. Richmond, Va.: George L. Bidgood. 1863. pp. 24.

Designed as an "introduction to the Confederate spelling book" and announced on the cover of Smith's English grammar as "now ready." See also Sabín No. 15254 and So. Lit. Mess., April, 1864.

Southern Pictorial Primer; combining instruction with amusement, and designed for use in schools and families. Richmond: West & Johnston. 1863.

Announced in the "list of new publications" on the cover to Marius, published in 1863.

Mentioned in So. Lit. Mess., June, 1863. "This popular little work has been improved by the addition of several spelling lessons, and a number of new engravings."

Third edition of 10,000 advertised by West & Johnston, Richmond Whig, May 3, 1864.

## 1864.

Burke's | picture primer; | or | spelling and reading | taught in an easy and familiar manner. | With numerous cuts. | [Twentieth thousand.] | [Cut of stores.] | Macon, Georgia: | Burke, Boykin & Co. | 1864.

*Cover title:* Burke's | picture primer; | or, | spelling and reading | taught in an easy and familiar manner. | With numerous cuts. | Altered from an English primer. | [Twentieth thousand.] | Macon, Georgia.: | Burke, Boykin & Co. | 1864.

*Collation:* Title, 1 l., cut of ship on verso; text, 3-64; 106 ill. Size, 5¼x4 in.

*Copies seen:* Weeks.

Some of these pictures had no doubt seen service already as advertisements.

Illustrated Primer. Richmond: Geo. L. Bidgood. 1864 (?)

"Beautifully colored."

Announced as ready on the cover to the Confederate First Reader, published in 1864.

The Confederate primer. [Cut of William and Mary College before the fire of 1859.] [2-line quotation.] Fourth edition. Richmond: George L. Bidgood, Bookseller and Publisher, 121 Main st. 1864.

*Collation:* Title 1 l.; text, 3-32. Size, 5x3 $\frac{3}{4}$  in. 47 ill.

*Copies seen:* Congress.

A MS. note in the copy in the Congressional Library says that the work is by R. M. Smith. [Richard M. Smith, professor of ancient and modern languages and natural sciences in Randolph Macon College.]

The paper cover in which the booklet is bound is wall paper, the title being put on the reverse or wall side.

There are 47 pictures, some of which had evidently been made to do service in illustrating advertisements.

Fourth edition announced as ready on the cover to Confederate First Reader, published in 1864.

The child's first book. By Campbell and Dunn. Approved by the Educational Association of Virginia through their committee. Richmond: Ayres & Wade. 1864.

*Collation:* Title, 1 l.; preface, 1 l., with ill. on verso; text, 5-48; ill. Size, 7 $\frac{1}{4}$ x4 $\frac{1}{4}$  in.

*Copies seen:* Education.

By Rev. William A. Campbell and William R. J. Dunn, esq.

The Virginia Primer. Richmond. 1864. 24°. Cuts.

Title from Wynne's Sales Catalogue, p. 28.

The Southern Primer, for schools and families: illustrated. Thirtieth thousand.

Advertised in Whig, June 24, 1864.

The New Texas Primer. Houston: E. H. Cushing. [1863-1865.] pp. 24.

Mentioned in Raines's Bibliography of Texas, p. 59; date of publication not clear; belonged to the New Texas Series of schoolbooks.

## II. SPELLERS.

### 1861.

[Elementary Speller and Reader, by Mrs. S. A. Poindexter. Nashville: South-western Baptist Publishing House. 1861.]

Mentioned in De Bow's Review, August, 1861, p. 207.

First Confederate Speller. Nashville, Tenn. 1861.

Published by Association of Southern Teachers.

Mentioned in So. Lit. Mess., October, 1861.

Second Confederate Speller. Nashville, Tenn. 1861.

Published by Association of Southern Teachers.

Mentioned in So. Lit. Mess., October, 1861.

Our own spelling book; for the use of schools and families. By Richard Sterling, A. M., principal of Edgeworth Female Seminary, and J. D. Campbell, A. M., prof. of mathematics and rhetoric. Third edition. Greensboro, N. C.: published by Sterling, Campbell & Albright. Richmond, Va.: W. Hargrave White. 186- [year erased in copy used].

*Collation:* Title, 1 l.; preface, iii-iv; text, 5-112. Size, 6 $\frac{1}{2}$ x4 $\frac{1}{4}$  in.

*Copies seen:* Weeks.

The Revised Elementary Spelling Book. The elementary spelling book, revised and adapted to the youth of the Southern Confederacy, interspersed with Bible readings on domestic slavery. By Rev. Robert Fleming. [Vignette of Holy Bible] Twenty-ninth thousand. Atlanta, Georgia: J. J. Toon & co., publishers. Franklin steam printing house. Edition 1863. [40,000.]

*Collation:* Cover title: The revised elementary spelling-book. A picture of Washington is added, size, 6 $\frac{3}{4}$ x4 in.; 12 mo. Title 1 l.; dedication on verso; preface, analysis of sounds, etc., 3-13; text, 14-168. An adaptation of Webster's Spelling Book, with a dedication "to the parents and their children, and to the teachers and their pupils," and "to all the lovers of learning and Bible truth" in the Confederate States, and a warlike preface of 3 pages by Rev. Robert Fleming, dated at Thomasville, Ga.

*Copies seen:* Education.

1864.

Confederate Spelling Book, by Dr. Baird. Macon, Ga.: Burke, Boykin & Co., 186[4?].  
Announced as ready on the cover to Burke's Picture Primer, published in 1864.

The | Dixie speller. | To follow the | first Dixie reader. | [Out of books.] | By Mrs. M. B. Moore, | author of the Dixie series. | Raleigh, N. C.: | Branson & Farrar. | 1864.

*Cover title:* The | Dixie | elementary | spelling book. | For the use | of | common schools. | By | M. B. Moore. | Raleigh, N. C.: Branson & Farrar, | Fayetteville street. | 1864.

*Collation:* Title, 1 l.; preface, iii-iv; text, 5-120. Size, 7x4½ in. Ills.

*Copies seen:* Congress; Weeks.

This book is "revised from Webster and adapted to Southern schools. Webster's Elementary, leaving out all the Yankee phrases and illusions, is still a very good speller for Southern children. Such revisions and improvements have been made as seem necessary to make it fully Southern."

Edition, 10,000 copies.

A second edition of 500 copies was published after the war from stereotype plates, with illustrations.

The Virginia Spelling and Reading Book, arranged after the plan of John Comly, published by A. Morris, Richmond.

Mentioned in the Whig, August 12, 1864, also advertised as "just published."

Copy in Harvard Univ. Library. Richmond, 1864.

Chaudron's | spelling book, | carefully prepared for | family and school use, | [wood cut of Justice] | by | A. De V. Chaudron. | Mobile: | S. H. Goetzel. | 1865.

*Collation:* Two cuts fill up pp. 1 and 2; title, 1 l., 2 ill. on verso; to the public, p. [5]; text 6-48. Size: 7x4½ in.

*Copies seen:* Congress, Education.

The Library of Congress copy is the fifth edition and fortieth thousand.

The Bureau of Education copy dated 1865 is fourth edition, thirtieth thousand.

Another edition, Mobile, 1864, 16 mo., pp. 48, is mentioned in Clarke's Bibliotheca Americana, 1893.

Note "to the public" dated December 1, 1863, year of first publication.

The New Texas Primary Speller. Houston: E. H. Cushing. [1863-65.]

Mentioned in Raines's Bibliography of Texas, p. 59; date of publication not clear; belonged to the New Texas Series of School Books.

The New Texas Spelling Book. Houston: E. H. Cushing. [1863-65.] pp. 96.

Mentioned in Raines's Bibliography of Texas, p. 59; date of publication not clear; belonged to the New Texas Series of School Books.

The New Texas Spelling Book. Revised and enlarged by the addition of a Speller and Definer upon a New Plan. For the use of schools and academies. Houston: E. H. Cushing. 1865. 16°. pp. 145.

Mentioned in Raines's Bibliography of Texas. No doubt a revised and enlarged edition of previous one.

The | Confederate | spelling book, | with | reading lessons for the young, | adapted to the | use of schools | or for | private instruction. | Fifth edition. | Richmond, Va.: | Published by George L. Bidgood. | 1865.

*Collation:* Title, 1 l.; preface, 3-4; text, 5-162. Size, 7½x4½ in. Ills.

*Copies seen:* Education; Congress.

The third edition, published in 1863, had pp. 168.

Based on Webster.

A MS. note in the Congressional Library copy says this was prepared by R. M. Smith, professor in Randolph-Macon College.

The fourth edition was announced on the cover to the fourth edition of the Confederate primer (published 1864) as "in press, and will be ready next month."

Three editions were published between May and December, 1863. Advertisement in North Carolina Christian Advocate, December 9, 1863.

The Virginia Speller and Reader. Richmond. 1865. 24°.

Title from Wynne's Sales Catalogue, 1875; p. 25.

Copy in 8° in Harvard University Library.

### III.—READERS.

#### 1861.

[Philological Reader, Second Book, by Mrs. S. A. Poindexter. Nashville: South-western Baptist Publishing House. 1861.]

Mentioned in De Bows' Review, August, 1861; p. 207.

[Philological Reader, Third Book, by Mrs. S. A. Poindexter. Nashville: South-western Baptist Publishing House. 1861.]

Mentioned in De Bows' Review. August, 1861; p. 207.

[Philological Reader, Fourth Book, by Mrs. S. A. Poindexter. Nashville: South-western Baptist Publishing House. 1861.]

Mentioned in De Bow's Review, August, 1861; p. 207, which adds that the series had received the approval of "a large number of practical teachers and scholars."

#### 1862.

Our Own First Reader. For the use of schools and families, by R. Sterling and J. D. Campbell. Greensboro, N. C. 1862. 12 mo.

Mentioned in Clarke's Bibliotheca Americana, 1873.

Our own | second reader; | for the use of | schools and families. | By | Richard Sterling, A. M., | Principal of Edgeworth Female Seminary, | and | J. D. Campbell, A. M., | Prof. of Mathematics and Rhetoric. | Greensboro, N. C.: | published by Sterling, Campbell & Albright. | Richmond, Va., W. Hargrave White. | 1862.

*Collation:* Title, 1 l.; preface and suggestions to teachers, iii-vi; contents, vii-viii; text 9-168. Size, 7¼x4½ in.

*Copies seen:* Weeks.

Our own | third reader; | for the use of | schools and families. | By | Richard Sterling, A. M., | principal of Edgeworth Female Seminary | and | J. D. Campbell, A. M., | prof. of mathematics and rhetoric. | [Design.] | Greensboro, N. C.: | published by Sterling, Campbell & Albright. | Richmond, Va., W. Hargrave White. | 1862.

*Collation:* Title, 1 l.; preface, p. iii; punctuation, iv-vi; contents, vii-viii; text, 9-208. Size, 6¾x4½ in.

*Copies seen:* Weeks.

Same as the stereotyped edition following, save that the latter has a few more selections.

#### 1863.

The First Reader, by A. De V. Chaudron, Mobile. 1863.

Mentioned by So. Lit. Mess., November-December, 1863.

Our own | first reader; | for the use of | schools and families. | By | Richard Sterling, A. M., | principal of Edgeworth Female Seminary, | and | J. D. Campbell, A. M., | prof. of mathematics and rhetoric. | Second edition. | [Design.] | Greensboro, N. C.: | published by Sterling, Campbell & Albright | Richmond, Va., W. Hargrave White. | 1863.

*Collation:* Title, 1 l.; preface, iii-iv; text, 5-72. Size, 6½x4½ in.

*Copies seen:* Education.

Not illustrated for the reason that such engravings as were proper "could not be furnished in the Confederate States."

Our own | first reader; | for the use of | schools and families. | By | Richard Sterling, A. M., | principal Edgeworth Female Seminary, | and | J. D. Campbell, A. M., | professor of mathematics and rhetoric. | Stereotype edition. | Greensboro, N. C.: | Published by Sterling, Campbell & Albright. | Richmond, Va.: W. Hargrave White.

*Collation:* Title, 1 l.; preface, v-vi; text, 7-96. Ills. size, 7x4½ in.

*Copies seen:* Education; Weeks.

Copyrighted in 1862 and probably first issued in that year. The present edition is from new plates and contains a few more lessons than that of the preceding title.

Our own | third reader: | for the use of | schools and families. | By | Richard Sterling, A. M., | principal of Edgeworth Female Seminary, | and | J. D. Campbell, A. M., | professor of mathematics and rhetoric. | Stereotype edition. | Greensboro, N. C.: | published by Sterling, Campbell & Albright. | Richmond, Va.: W. Hargrave White.

*Collation:* Title, 1 l.; preface, 3-4; on punctuation, 5-10; contents, 11-12; text, 13-224; ill. size, 7x4½ in.

*Copies seen:* Education.

Copyrighted in 1862.

These are said to have been the first books stereotyped in the Confederate States. As a matter of fact the stereotyping was done in Edinburgh, and the first edition printed there.—Third Reader, p. 224.

The | First Dixie Reader; | designed to follow | the | Dixie primer. | By | Mrs. M. B. Moore. | Raleigh: | Branson, Farrar & Co. | 1863.

*Cover title:* The | First Dixie Reader; | to follow | the | Dixie primer. | By | Mrs. M. B. Moore, | Author of the Dixie Series. | [Farm Scene.] | Raleigh: Branson, Farrar & Co. | 1863.

*Collation:* Title, 1 l.; preface, 1 l.; note to teachers, 1 l.; text, 7-62 + 1 l.; size, 5½x4½.

*Copies seen:* Education; Weeks.

Another cover title (Weeks's copy): The | First Dixie Reader, | to follow | the | Dixie primer. | By | Mrs. M. B. Moore, | author | of | the Dixie series. | Raleigh: | Branson, Farrar & Co. | 1863.

First Edition, 10,000 copies.

The | First Dixie Reader; | designed to follow | the | Dixie primer. | By | Mrs. M. B. Moore. | Raleigh: | Branson, Farrar & Co. | 1863.

*Cover title:* The | first Dixie reader; | to succeed | the | Dixie primer. | By | Mrs. M. B. Moore. | Second Edition. | [Cut of train of ears. Some copies have a sheaf of wheat instead.] | Raleigh, N. C.: | Branson & Farrar, | Fayetteville street. | 1864.

*Collation:* Title, 1 l.; preface, 1 l.; note to teachers, 1 l.; text, 7-62 + [1]; size, 5½x4½.

*Copies seen:* Congress; Weeks.

Confederate Publication. New Texas Series. The New Texas Primary Reader. Houston: E. H. Cushing. 1863. 12°. pp. 96.

Mentioned in Raines's Bibliography of Texas, p. 59; copyrighted in 1863; reentered in 1865.

Chaudron's series. | The | first reader, | designed | for the use of primary schools. | Second edition. | Adapted for use in the Public Schools of Mobile. | By A. De V. Chaudron. | Mobile, Ala.: | W. G. Clark & Co., publishers. | 1864.

*Collation:* Title, 1 l.; publishers' notice to first and second editions, 3-4; preface, 5-6; text, 7-57 + [1] + 1 l. (cover); size, 7x4½ in.; 1 ill.

*Copies seen:* Congress.

Publishers' note to first edition is dated October, 1863, and to second edition, June 1, 1864.

Chaudron's series. | The second reader, | designed | for the use of primary schools. | Second edition. | Adapted for use in the Public Schools of Mobile. | By A. De V. Chaudron. | Mobile, Ala.: | W. G. Clark & Co., publishers. | 1864.

*Collation:* Cover title as above; size, 7x4½ in. Title, 1 l.; publishers' notice, 1 l.; prefaces, 5-6; text, 7-96.

*Copies seen:* Education.

Publishers' notice is dated October, 1863.

Chaudron's Series. Chaudron's Third Reader. Mobile, Ala.: W. G. Clark & Co. 1863 or 1864.

Title from advertisement on cover of second reader.

A second edition was published.

By Mme. A. De V. C. She was a native of Mobile.

The | first reader, | for | Southern schools. | Raleigh: | published by the N. C. Christian Advocate | Publishing Company. | 1864.

*Collation:* Title, 1 l.; to teachers, p. 3; text, 4-24. Size, 7½ x 4¼ in.

*Copies seen:* Congress; Weeks.

Readers:

The N. C. Christian Advocate Publishing Company announced in 1864 that "the company has in course of publication a series of readers for Southern schools."—(Cover to the "First reader for Southern Schools.") It does not appear that any other numbers were printed.

The New Texas School Reader, designed and dedicated to the Children of Texas. Houston: E. H. Cushing. 1864. 12°. pp. 184.

Mentioned in Raines's Bibliography of Texas, p. 59. Belonged to the New Texas Series of School books. Deals almost entirely with Texas subjects.

The | Confederate first reader: | containing | selections in prose and poetry. | As reading exercises | for the younger children | in the | schools and families | of the Confederate States. | Richmond, Va. | published by G. L. Bidgood, | No. 121, Main Street. | 1864.

*Collation:* Title, 1 l.; preface, p. iii; to teachers, p. iv; contents, v-viii; text, 9-123. Size 7½ x 4¼ in.

*Copies seen:* Education; Congress.

Designed as a successor to the Confederate spelling book.

A MS. note in the Congressional Library copy says this was prepared by R. M. Smith, professor in Randolph Macon College.

The Confederate Reader, Part I. Richmond: George L. Bidgood. 1864. (?)

Announced as ready on cover to the Confederate first reader, published in 1864.

The Confederate Reader was announced on the cover to the fourth edition of the Confederate primer (published in 1864) as "in press and will be ready next month."

A "series of Confederate Readers" was announced by Bidgood as "nearly ready" in So. Lit. Mess., March, 1864.

The Confederate Reader. Richmond. 1864. 8°.

Copy in Harvard Univer. Library.

The Virginia Series of Readers. The First Reader. 1864. 12°.

Copy in Harvard Univer. Library.

The First Reader, edited by a distinguished Southern teacher. Published by A. Morris, Richmond.

Mentioned in the Whig, Aug. 12, 1864; also advertised as "just published."

## 1865.

[Chaudron's Series. Chaudron's Fourth Reader. Mobile, Ala.: W. G. Clark & Co.]

Title from advertisement on cover to second reader, where it is announced on Dec. 1, 1864, that it "will be published at an early date."

[Chaudron's Series. Chaudron's Fifth Reader. Mobile, Ala.: W. G. Clark & Co.]

Title from advertisement on cover to second reader, where it is announced on Dec. 1, 1864, that it "will be published at an early date."

Our own | fourth reader: | for the use of | schools and families. | By | Richard Sterling, A. M., ↓ Principal of Edgeworth Female Seminary. | Greensboro, N. C.: | published by Sterling & Albright. | New York: Owens & Agar.

*Collation:* Title, 1 l.; preface, iii; contents, iv-vi; introduction, vii-xvi; text, 17-319. ills. Size,  $7\frac{1}{2} \times 5$  in.

*Copies seen:* Education; Weeks.

Prepared for use in Confederate schools but not published until 1865, and copyrighted in the United States instead of Confederate States.

Gives 103 selections.

The original idea of the publishers (see cover to N. C. Journal of Education for Feb., 1862) was that this volume should consist of "historical and descriptive sketches of North Carolina, prepared by Rev. C. H. Wiley." Had this program been carried out, they would no doubt have made use of his North Carolina Reader, first published in 1851. It was the further purpose of the publishers to secure "similar sketches of other States, to be used as the fourth reader of our series in those States." Why this program was abandoned I do not know.

[Our Own Fifth Reader, by Richard Sterling and J. D. Campbell.]

Announced by Sterling, Campbell & Albright, of Greensboro, on the cover to stereotype edition of Our Own Third reader (published in 1863?), as "in preparation;" but as the fourth reader was not published until the end of the war, it probably never appeared. It was to be "a rhetorical reader for the more advanced classes in academies and high schools," and to consist chiefly "of selections from the writings of authors of the highest literary attainments in the Confederate States."

The | first Dixie reader: | designed to follow the | Dixie primer. | By Mrs. M. B. Moore. | Third edition. | Raleigh, N. C.: | Branson and Farrar, | Fayetteville street. | 1866.

*Collation:* Title, 1 l.; preface on verso; note to teachers, p. 3; text, 4-48. Size,  $7\frac{1}{2} \times 4\frac{1}{4}$  in., ills.

*Copies seen:* Education; Weeks.

A post bellum edition of a Confederate book.

#### IV.—ARITHMETICS.

##### 1861.

[Arithmetic, by Prof. M. H. Allis.]

Announced in De Bow's Review, June, 1861, as to be issued "in July next."

Arithmetic, by M. P. Caldwell [Macon, Ga., J. W. Burke & Co.?]. 1861. pp. 178.

A stereotyped edition was printed in 1867 by J. W. Burke & Co., Macon, Ga.

Mentioned in Greenwood & Martin's Notes on the History of American Text-books on Arithmetics.

Our own | primary arithmetic. | By | S. Lander, A. M., | Greensboro, N. C.: | published by Sterling, Campbell & Albright | Richmond, Va., W. Hargrave White. | 1863.

*Collation:* Title, 1 l., preface on verso; text, 3-95. Size,  $6\frac{1}{2} \times 4\frac{1}{2}$  in.

*Copies seen:* Congress.

This was the first edition; there were not many changes in the second; a little new matter was added.

Our own | primary arithmetic. | By | Rev. S. Lander, A. M., | principal of Lincolnton Female Seminary. | Second edition. | Greensboro, N. C.: published by Sterling, Campbell & Albright. | Richmond, Va.: W. Hargrave White. | Columbia, S. C.: Townsend and North. [Copyright, 1863.]

*Collation:* Title, 1 l., preface and copyright notice on verso; text, 3-96. Size,  $6\frac{1}{2} \times 4\frac{1}{2}$  in.

Cover title same as above, with illustration of train of cars.

*Copies seen:* Education; Congress.

Our own | school arithmetic. | By | S. Lander, A. M. | Greensboro, N. C.: | published by Sterling, Campbell & Albright. | Richmond, Va., W. Hargrave White. | 1863.

Title, 1 l.; preface, iii-iv; contents, v-vi; text, 7-223+[1]. Size,  $6\frac{1}{2} \times 4\frac{1}{2}$  in.

*Copies seen:* Education; Congress; Weeks.

This is said to be "perhaps the first Arithmetic whose authorship and publication belong exclusively to the Confederate States." Preface dated Lincolnton, N. C., Aug. 1, 1863.

The Southern Confederacy Arithmetic. By Rev. Charles E. Leverett, A. M., Columbia, S. C. Augusta, Ga., 1864. pp. 218.

The last 12 pp. are devoted to single-entry bookkeeping.

Title from Greenwood & Martin's Notes on the History of American Text-books on Arithmetics.

An | elementary | arithmetic, | designed | for beginners: | embracing | the first principles | of | the science. | By L. Johnson, A. M., | professor of mathematics in Trinity College. | Raleigh, N. C., | Branson & Farrar, | Fayetteville street. | 1864.

*Collation:* Title, 1 l.; preface, 1 l.; text, 5-154. Size, 6¼ x 4½.

*Copies seen:* Weeks.

"The great demand at this time for books of an elementary character in the Southern Confederacy has called forth this little volume. \* \* \*

"Should these pages be deemed suitable, by an intelligent and discriminating public, for an introduction into our primary schools, we promise shortly a work of higher grade, embracing all the modern improvements in the science of arithmetic."—*Preface.*

The other volumes thus promised were never published.

Edition of Johnson's Arithmetic, 10,000 copies, of which nearly all were destroyed by Sherman's army.

Some of the examples are warlike:

"If one Confederate soldier can whip 7 Yankees, how many soldiers can whip 49 Yankees?"—p. 44.

The Southern School Arithmetic; or, Youth's Assistant. By A. & J. Fowler. Revised by M. Gibson, Richmond, 1864. 12 mo.

Noticed in Clarke's Bibliotheca Americana, 1893.

Announced in Whig, Aug. 9, 1864. Copy sent them by West & Johnston.

Stereotyped edition.

Ayers & Wade, the advertisers of Campbell & Dunn's Child's First Book, say that the publication of an arithmetic, offered by the committee of the Virginia Educational Convention, which met in Petersburg, December, 1863, "has been delayed, owing to the want of suitable type. It may be expected before long."—"The arithmetic presents peculiarly strong claims to the public confidence. As compared with similar works already before the public, its superiority is evident in the combined simplicity and perspicuity of its explanations, and the conciseness and completeness of the rules."

[Colburn's Mental Arithmetic. Mobile, Ala.: W. G. Clark & Co.]

An advertisement on the cover to Chaudron's Second Reader, dated December 1, 1864, announces that "a new and revised edition," "prepared expressly for use in Southern schools," was in press.

Browne's | Arithmetical Tables, | combined with | easy lessons | in | mental arithmetic | for beginners. | By rev. Geo. Y. Browne, A. M. | Tuscaloosa, Ala. | Atlanta, Ga.: | Franklin Printing House. | J. J. Toon, publisher and proprietor. | 1865.

*Collation,* Title, 1 l.; preface, 1 l.; introduction, v-viii; text, 9-32. Size, 6¼x3¾ in.

*Copies seen:* Education.

[Our Own Mental Arithmetic, by S. Lander, A. M.]

Announced by Sterling, Campbell & Albright, Greensboro, on cover to the stereotype edition of Our Own Third Reader (published in 1863?) as "in course of preparation."

#### V.—GRAMMARS.

1861.

Our Own Primary Grammar. By C. W. Smythe, Greensboro: Sterling, Campbell & Albright.

D. pp. 72. 25 cents per copy.

Advertised in Raleigh Register, December 11, 1861, as "just published."

## 1862.

An | Analytical, Illustrative, and Constructive | grammar | of | the English language | accompanied by several original diagrams, exhibiting an occu- | lar illustration of some of the most difficult principles | of the science of language; also, an extensive glos- | sary of the derivation of the principal scien- | tific terms used in this work, | in two parts, | for the use of every one who may wish to adopt it. | By | rev. prof. Brantley York. | Third edition. | Multum in parvo. | [Two lines quotation] | Raleigh: W. L. Pomeroy, publisher. 1862.

*Collation:* Cover title same as above. Size, 8½x5½ in. Title, 1 l.; dedication, 1 l.; testimonials, v-viii; prefaces, ix-xii; contents, xiii-xv; text, 21-219.

*Copies seen:* Weeks.

The first edition of this work was published before the war.

## 1863.

First book | in | composition, | applying the principles of grammar | to the art of | composing: | also, | giving full directions for punctuation; | [cut of book] | especially designed for the use of | Southern schools, | by L. Branson, A. M. | Raleigh: Branson, Farrar & co. | 1863.

*Collation:* Title, 1 l.; preface, 1 l.; contents, v-vi; 1 l blank; text, 9-139+ [1]. Size, 7½x5 in.

*Copies seen:* Congress; Education; Weeks.

Edition, 5,000 copies.

Our own | elementary grammar, | intermediate between | the primary and high school grammars, | and especially adapted to the wants of | the common schools. | By Charles W. Smythe, A. M., | author of a series of English grammars, and principal | of the Lexington English and classical school. | Greensboro, N. C., | published by Sterling, Campbell & Albright. | Richmond, Va.: W. Hargrave White. | Columbia, S. C.: Townsend & North. | 1863.

*Collation:* Title, 1 l.; preface, 1 l.; text, 5-148; size, 7x4½ in.

*Copies seen:* Congress; Weeks.

Designed as a sequel to the primary grammar and "embracing a complete elementary statement of the subject."

Smith's English grammar, | on the | productive system. | Revised and improved, and adapted to | the use of schools | in the | Confederate States. | Richmond, Va.: | published by George L. Bidgood. | 1863.

*Collation:* Title, 1 l.; preface, 1 l.; text, 7-200. Size, 7½x4½.

*Copies seen:* Education. Copy in Harvard University Library is dated 1864.

The twentieth thousand was announced on the cover to the fourth edition of the Confederate Primer (published in 1864) as "in press, and will be ready next month."

F. P. Harper's catalogue No. 62, mentions a copy printed in 1864.

The North Carolina Journal of Education for March, 1864, has a scathing article on the inaccuracy of this book and on reprinting it for the Confederate States.

Our own | primary grammar, | for the use of beginners. | By Charles W. Smythe, A. M., | author of "a series of English grammars," and | principal of the Lexington English | and classical school. | Third edition. | Greensboro, N. C.: | Sterling, Campbell & Albright. | Richmond, Va.: W. Hargrave White. | Columbia, S. C.: Townsend & North. | 1863.

*Collation:* Title, 1 l.; preface, p. 3, suggestions to teachers, p. 4, text, 5-72. Size, 7½x4½ inches.

*Copies seen:* Congress.

Announced in North Carolina Journal of Education, October, 1861, and said by that journal to be the "first North Carolina school book that has made its appearance since commencement of the war."

New English Grammar, by Dr. Dagg, Macon, Ga.: Burke, Boykin & Co. 186[4?]

Announced as ready on the cover to Burke's Picture Primer, published in 1864.

[Our Own High School Grammar, by C. W. Smythe, A. M. Greensboro: Sterling, Campbell & Albright. 186[4?]. 12 mo.]

Announced as "in press" on cover to stereotype edition of Our Own Third Reader (published in 1863[?]).

In a letter to Dr. Wiley, dated July 27, 1864, Mr. Smythe says that the Spirit of the Times at Raleigh then had his High School Grammar in press.

\*An | analytical and practical | grammar | of the | English language. | By Rev. Peter Bullis, D. D. | revised by | Rev. B. Craven, D. D. | Raleigh, N. C.: | published by the N. C. Christian Advocate | Publishing Company. | 1864.

*Collation:* Title, 1 l.; preface, 1 l.; text, 5-192. Size, 7x4½ in.

*Copies seen:* Weeks.

Edition, 5,000 copies.

The editorial changes were evidently slight, as "This edition can be used without difficulty in connection with those books by the same author now in the country."

York's | English grammar, | revised and adapted | to | Southern schools. | By | rev. Brantley York. | Third edition. | Raleigh, N. C.: | Branson, Farrar & co., | Fayetteville street. | 1864.

*Collation:* Cover title same, save that 1863 appears in place of 1864 as date of publication. Size, 8x5½ in. Title, 1 l.; preface, iii-iv; 1 l. blank; contents, vii-ix; text, 1-120 + 1 l. errata (on verso).

*Copies seen:* Education.

This book is an introduction to the Illustrative and Constructive Grammar.

The preface is dated "York Collegiate Institute, North Carolina, October, 1860," and we may presume that this was about the date of publication of the first edition.

Advertised in the Standard for January 6, 1863, as one of the firm's "new publications."

The New Texas Grammar. Houston: E. H. Cushing. [1863-65.]

Mentioned in Raines's Bibliography of Texas; date of publication not clear; belonged to the New Texas Series of school books.

Louisiana | English grammar. | Published by order of | his excellency | Henry W. Allen, | governor of Louisiana. | Shreveport, La. | Printed at the Office of the South-Western. | 1865.

Size, 7½x5½ inches, pp. 100.

"This grammar is compiled from the 'New English Grammar' of Roswell C. Smith, whose elementary school books have become so deservedly popular. The style of instruction herein taught, is called the 'Productive system,' and is eminently adapted to beginners and children of tender years. It is published by order of His Excellency the Governor of Louisiana.

"SHREVEPORT, LA., 1865."—*Preface.*

Title furnished by William Beer, esq., Howard Memorial Library, New Orleans.

## VI.—GEOGRAPHIES.

### 1863.

The | geographical reader, | for the | Dixie children. | By Mrs. M. B. Moore. | Raleigh: | Branson, Farrar & co., Publishers. | Biblical Recorder print. | 1863.

*Collation:* Title, 1 l.; preface, p. 3; note to teachers, p. 4; text, 5-48 (last six pages advertisements). Size, 8x7 in. Six maps, uncolored. Cover title same, with vignette.

*Copies seen:* Education; Weeks.

"The first part of this work is intended to be used as a reader. The second is to be studied as usual. The object of this arrangement is to make the child familiar with geographical terms before he begins to study geography."—Note to teachers. Edition, 10,000 copies.

### 1864.

Primary geography, | arranged as a | reading book | for † common schools, | with | Questions and Answers Attached. | By M. B. Moore. | (Second edition.) | Raleigh, N. C., | Branson & Farrar. | Fayetteville street. | 1864.

*Collation:* Title, 1 l.; preface, p. 3; note to teachers, p. 4; text, 5-47+[1]. no advertisements, as in 1863 edition.

Cover title: Primary geography. | arranged as a | reading book, | with | questions and answers attached. | [Vignette.] | By Mrs. M. B. Moore. | Second edition. | Raleigh, N. C., Branson & Farrar, | Fayetteville street. | 1864.

*Copies seen:* Education; Weeks; Congress.

Edition, 10,000 copies.

## EXTRACTS.

## THE UNITED STATES.

"This was once the most prosperous country in the world. \* \* \* In the meantime both English and American ships went to Africa and brought away many of those poor heathen negroes and sold them for slaves. Some people said it was wrong and asked the King of England to stop it. He replied that 'he knew it was wrong; but that slave trade brought much money into his treasury, and it should continue.' But both countries afterwards did pass laws to stop this trade. In a few years, the Northern States finding their climate too cold for the negro to be profitable, sold them to the people living farther south. Then the Northern States passed laws to forbid any person owning slaves in their borders.

"Then the Northern people began to preach, to lecture, and to write about the sin of slavery. The money for which they had sold their slaves was now partly spent in trying to persuade the Southern States to send their slaves back to Africa. And when the Territories were settled they were not willing for any of them to become slaveholding. \* \* \*

"In the year 1860 the Abolitionists became strong enough to elect one of their men for President. \* \* \* So the Southern States seceded. \* \* \*

"This country possesses many ships, has fine cities and towns, many railroads, steamboats, canals, manufactures, etc. The people are ingenious and enterprising, and are noted for their tact in 'driving a bargain.' They are refined and intelligent on all subjects but that of negro slavery; on this they are mad" (pp. 13, 14).

## SOUTHERN CONFEDERACY.

"This is a great country! The Yankees thought to starve us out when they sent their ships to guard our seaport towns. But we have learned to make many things; to do without others. \* \* \* The Southern people are noted for being high-minded and courteous" (p. 14).

The trust of the Southern people in the Almighty is brought out in the following questions and answers, which were to serve as a review of the reading selections of the book:

"Q. What kind of men should we elect to govern our country?

"A. Good and wise men.

"Q. Why?

"A. 'When the righteous are in authority, the people rejoice, but when the wicked beareth rule the people mourn.'

"Q. Where do you learn this?

"A. From the Bible.

"Q. Will God curse a nation because of wicked rulers?

"A. He says he will."

The first edition, 1863, stopped with review lesson No. 10 (pp. 38-39). In the 1864 edition 18 additional lessons were added, making 28 in all. That the tone of the first edition had not been warlike enough to give general satisfaction is shown by the following extract from the second:

"Q. Has the Confederate States any commerce?

"A. A fine inland commerce, and bids fair, sometime, to have a grand commerce on the high seas.

"Q. What is the present drawback to our trade?

"A. An unlawful Blockade by the miserable and hellish Yankee Nation" (p. 47).

It is believed that the two editions of this work represent the only geographies prepared, printed, and published in the Confederate States.

The history of the maps has been told me by Rev. Dr. L. Branson, the surviving publisher, as follows:

He says that he succeeded in finding, in one of the printing offices of the city, an old plate of a map of the United States. This plate was cut into sections and those illustrating the Southern States were used. In the first edition (1863) these maps appear in black only. In the 1864 edition the State boundaries are colored. This was done by hand after the maps had been printed.

A | geography for beginners. | By the | rev. K. J. Stewart | [cut of palmetto tree] | palmetto series. | Illustrated with maps and engravings. | Richmond, Va.: J. W. Randolph. | M.DCCC.LXIV.

*Collation:* Bastard title, 1 l.; folding map; text, 1 l.; preface, v-vi; contents, vii-viii; text, 1-223. Size, 7½x4½. Maps and many illustrations.

*Copies seen:* Education.

This book is announced as the "forerunner" of a series. It seems to have been prepared in the Confederate States. Two sections are devoted to these States, pp. 40-53 and 180-197, the first being more historical and descriptive, the latter more economic in character. The intimate knowledge displayed in these sections would indicate the work of a native. It is evident, however, that the printing was done abroad. The maps have the name of George Philip & Son, London and Liverpool.

[A book of geographical questions.]

W. G. Clark & Co., Mobile, Ala., announce on Dec. 1, 1864, on the cover to Chaudron's second reader that a work of this character "adapted to any Atlas, and taking the place of the primary and intermediate geographies" was "in preparation."

## VII. DICTIONARIES.

1864.

The | palmetto dictionary; | in which | the meaning of every word is clearly explained and | the sound of every syllable distinctly shown; | exhibiting the principles of | a pure and correct pronunciation. | [Cut of palmetto tree.] | A new edition, | carefully revised, corrected and enlarged. | Richmond, Va.: J. W. Randolph | 1864.

*Collation:* Title, 1 l.; preface, 1 l., with errata on verso; advertisement, dated Aug. 25, 1831, and advertisement to present edition, dated Jan. 1847, 1 l., pp. iii-iv; introduction, v-xx; text, 1-730 + 1 l.; port. of John Walker as frontispiece. Size: 6½x4½.

*Copies seen:* Education.

Although this book bears a Richmond imprint, it is evident from its size, from the paper and type employed, that it was not printed there. If such had been the case, it would not have been necessary to call attention to the difference between English and Southern pronunciation; no rules would have been given to the Irish and Scotch "in order to obtain a just pronunciation of English," and the reference to Walker, the author, would have been different.

The work is unmistakably English. The copy used shows that the English title-page was cut out, and a new one, together with the preface inserted in its place. It is probable that this title-page and preface, as well as the binding, was all done in England.

The preface is as follows:

"This Dictionary is presented to the people of the Southern States as the basis of a future one, which may embody the words, pronunciation, and meanings that are adopted and used by our best speakers and writers. And whereas no one person is competent to determine these things for the whole nation, the attention of teachers, professors, and all who desire to promote elegance and accuracy in the use of language among the rising generation, is respectfully invited to this book, and they are requested to mark down its errors, omissions, and redundancies, and send their notes and emendations to the Publisher, who will not only gladly avail himself of them, but cheerfully remunerate any whose labors may be productive of considerable advantage to the work.

"If this request is generally heeded, materials may be collected for a National Dictionary."

## VIII. BOOKS ON FOREIGN LANGUAGES.

1862.

Prose specimens | for | translations into German, | with | copious vocabularies and explanations, | by | H. Apel. | London: | Trübner & Co., 60, Paternoster Row. | David Nutt; 270, Strand. | 1862.

*Collation:* Title 1 l.; dedication to Jefferson Davis, inserted, 1 l., with names of persons helping in the series, etc., on verso; preface, iii-vi (with errata on p. vi); contents, vii-viii; text 1-246. Size: 7½x4½ in.

*Copies seen:* Education.

This book was not originally a Confederate work. Its connection with the Confederacy was brought about by the dedication which was inserted after the publication and intended to increase its circulation in the Southern States:

"To his Excellency Jefferson Davis, President of C. S. A. This series of school books, selected from the best and most approved texts and authorities of modern usage, and prepared and adapted to the wants and institutions of the Southern States, is respectfully dedicated by yours, etc., K. J. Stewart, London, June 15th, 1863."

The verso of this dedication has:

"To the Hon. John Perkins, M. C., La. G. W. Randolph, late Sec. of War, Dr. John Prosser Tabb, Va. Prof. W. Gilham, Va. Mil. Institute, Rev. D. Lee Powel, and others, who have aided in originating and prosecuting this work, this series of school books is respectfully dedicated.

"WILMINGTON, N. C. Trübner & Co., 60, Paternoster Row, London. J. W. Randolph, Richmond, Va."

Deutches A. B. C., und Erstes Lesebuch, Richmond, 1863.

16°. Wall paper cover.

Henkel's Auction Catalogue, No. 825, April 19, 1899.

[Lefebvre's French Grammar.]

The Whig, Dec. 5, 1862, announced that Mr. Lefebvre, who had long had a female school in Richmond, was to undertake a "series" of schoolbooks. The first was to be a French Grammar. The other works, "such as Mr. L.'s experience as a teacher may suggest to him to be needed in our primary schools."

A | complete grammar | of the | French language; | with | exercises and dialogues, | for the use of schools and private students. | By | John Christison, | teacher of modern languages in the Dundee | public seminaries. | First C. S. A. from Fifteenth Edinburgh Edition. | Carefully revised by F. W. Rosier. | Richmond: | Geo. Dunn & co., publishers. | 1863.

*Collation:* Title, 1 l., with advertisement on verso; text, 3-143.

*Size:* 5½ by 3¼ in.

*Copies seen:* Education; Congress; Weeks.

Cover title: A | grammar | of the | French language: | by John Christison, | of Dundee college. | First C. S. A. Edition. | Richmond: | Geo. Dunn & com'y. | 1864.—Congressional Library copy.

First Latin book. Greensboro: Sterling, Campbell & Albright. 186[3?].

Announced on cover to Smythe's elementary grammar, published in 1863.

"Containing grammatical introduction, with exercises for translation and composition."

A grammar | of the | Latin language: | for the use of | schools, | with | exercises and vocabularies. | By Wm. Bingham, A. M., | of the Bingham School. | Greensboro, N. C.: | published by Sterling, Campbell & Albright. | Richmond, Va., W. Hargrave White. | 1863.

*Collation:* Errata, 1 l.; title, 1 l.; preface, iii-iv; text, 5-304.

*Size:* 6¼ by 4¼ in.

*Copies seen:* Weeks.

Copyrighted in 1862, but preface dated May 10, 1863.

The preface says that the object of the work was to supply "a practical first book in Latin, suited to the capacity of beginners, and yet full enough for a book of reference throughout a course of preparation for college. \* \* \* The almost insuperable difficulties in the way of publication render it impossible to present the work in the most desirable style of binding and typography; but the author is assured that such defects as result from the terrible struggle through which our nation is passing will be readily overlooked. \* \* \*

"The work, imperfect as the author is conscious that it is, is commended to the teachers of the Confederate States as an auxiliary, however feeble, in establishing Southern literary and intellectual independence."

Cæsar's commentaries on the Gallic war, with a vocabulary and notes. By Wm. Bingham, A. M., of the Bingham School. Greensboro, N. C.: Sterling, Campbell & Albright. 1864.

Reviewed in *Land We Love*, III, p. 178 (June, 1867). No copy seen.

Announced on cover to stereotype edition of Our Own Third Reader. Prof. C. L. Raper, in his *The Church and Private Schools in North Carolina*, says this was actually published in December, 1863, "with explanatory notes and a complete vocabulary."

First Latin book. By C. W. Smythe. [Raleigh?: 1864?.]

In a letter to Dr. Wiley, dated July 27, 1864, Mr. Smythe says that the printing of this work was then being carried on by "Hufham," of the *Biblical Recorder*, in Raleigh.

## IX. SUNDAY SCHOOL AND OTHER RELIGIOUS BOOKS.

1861.

[Pocket edition of the New Testament. Nashville: Graves, Marks &amp; Co. 1861.]

Mentioned in De Bow, December, 1861, p. 559.

The Whig, March 4, 1862, says that the Bible had been printed in the South, presumably during the war period.

A Confederate edition of the New Testament was printed in Atlanta, Ga., by J. J. Toon; the stitching, binding, etc., done in Raleigh, N. C., under the superintendence of Rev. W. J. W. Crowder.—Whig, September 9, 1862.

Copies of these editions bear the dates of 1862 and 1863.

1862.

Calvary catechism. Macon, Ga.: John W. Burke, agent. 1862.

Announced on verso of title-page to Child's Scripture Question Book as "just published."

Sunday-school bell. Macon, Ga.: J. W. Burke, agent. 1862.

Announced as "just published" on the verso of title-page of Child's Scripture Question Book, 1862.

Child's | Scripture question book. | Southern edition. | Macon, Ga.: | John W. Burke, agent. | 1862.

*Collation:* Title, 1 l., with announcement on verso; text, 3-194.*Size:* 5½ by 3½ in.*Copies seen:* Weeks.

The | Westminster | Shorter Catechism, | ratified by the | general assembly | of the | Presbyterian church | in the | United States, | at Augusta, Georgia, December 4, 1861. | Richmond: | Presbyterian committee of publication. | [n. d. 1862?.]

*Collation:* Cover title as above, 1 l.; no separate title; text, 3-32.*Size:* 4½ by 3½ in.*Copies seen:* Congress.

Catechism of the Wesleyan Methodists. Compiled and published by order of the British conference. Greensboro, N. C.: 1863. 16mo.

Mentioned in Clarke's Bibliotheca Americana, 1873.

Historical Scripture questions. Raleigh: Branson, Farrar &amp; Co. 186[3?].

Announced on cover to First Dixie Reader, published in 1863.

A "book for Sabbath schools and for the camp; is pronounced by W. J. W. Crowder, tract agent, 'the best work of the sort within his knowledge.'"

The Biblical Catechism. Designed for Sabbath schools. By Rev. J. J. Lansdell. Raleigh: 1863. 16mo.

Mentioned in Clarke's Bibliotheca Americana, 1873.

Catechism for Little Children. Compiled and published by the Sunday school and publication board of the Baptist State convention of North Carolina. Raleigh: 1864. 32mo.

Mentioned in Clarke's Bibliotheca Americana, 1873.

Curious and useful questions on the Bible. Published by the North Carolina Board of Missions. Goldsboro, N. C.: 1864. 16mo.

Mentioned in Clarke's Bibliotheca Americana, 1873.

Southern Zion's Songster; Hymns Designed for Sabbath School, Prayer and Social Meetings, and the Camps. Compiled by the Editor of the North Carolina Christian Advocate. Raleigh: 1864. 32mo.

Mentioned in Clarke's Bibliotheca Americana, 1873.

Sunday school questions | on the | four Gospels, | together with a | condensed harmony. | By | Basil Manly, Jr., | Greenville, South Carolina. | Volume 1. | Sabbath School Board of the So. Bapt. Con., | Greenville, S. C. | Baptist Sabbath S. Board of North Carolina, | Raleigh, N. C. | Raleigh: | printed at the Biblical Recorder office. | 1864.

*Collation:* Errata, 1 l.; title, 1 l.; preface, 1 l.; suggestions to teachers, v-viii; text, 9-150, with 1 page of advertisements on inside of cover.

*Copies seen:* Weeks.

The Child's Question Book, by B. Manly, jr., was probably the same as the preceding. It is announced on cover to Manly's Sunday School Questions on the Four Gospels (published 1864), by the S. S. Board of So. Bapt. Convention, Greenville, S. C., as to be published "in a few weeks."

This was a book of "questions and answers on a portion of the Gospels, designed for primary classes."

A brief catechism of Bible doctrine. By James P. Boyce. Greenville, S. C.: 1864. 16 mo.

Mentioned in Clarke's *Bibliotheca Americana*, 1873. Mentioned also in Riley's *History of the Baptists in the Southern States east of the Mississippi*.

[Confederate S. S. hymn book. By C. J. Elford.]

Announced on cover to Manly's Sunday School Questions on the Four Gospels (published 1864), by the S. S. Board of the So. Bapt. Convention; Greenville, S. C., as to be published "in a few weeks."

Little Sunday school hymn book. Furnished by S. S. Board of the So. Bapt. Convention. Greenville, S. C.

Announced on cover of Manly's Sunday School Questions on the Four Gospels, published in 1864.

Mentioned in Riley's *History of the Baptists in the Southern States east of the Mississippi*, p. 279.

First edition, 14,000; 2d edition, 70,000.

Sunday School Primer.

Announced on cover to Manly's Sunday School Questions on the Four Gospels (pub. 1864) by Sunday School Board of Southern Baptist Convention, Greenville, S. C., as to be published "in a few weeks."

"Ten thousand Sunday School primers were soon exhausted, and a second edition was issued."—Riley's *History of the Baptists in the Southern States east of the Mississippi*, p. 279.

Confederate Sunday School Hymn Book. Greenville, S. C.: S. S. Board of the Southern Baptist Convention.

Mentioned in Riley's *History of the Baptists in the Southern States east of the Mississippi*, p. 279.

1st edition, 3,000; 2d edition, 10,000.

Little Lessons for Little People, by B. Manly, Jr. Greenville, S. C.: S. S. Board of Southern Baptist Convention.

Mentioned in Riley's *History of the Baptists in the Southern States east of the Mississippi*, p. 279.

Infant Class Question Book, by L. H. Shuck. Greenville, S. C.: S. S. Board of the Southern Baptist Convention.

Mentioned in Riley's *History of the Baptists in the Southern States east of the Mississippi*, p. 279.

The Sabbath School Wreath: | a collection of hymns, | compiled by a Sabbath School teacher. | [1 line quotation] | Raleigh: | Sunday School & Publication Board. | 1866.

*Collation:* Title 1 l, preface on verso; text, 3-104. *Size:* 5½ x 4 in.

*Copies seen:* Weeks.

"The great need for a suitable collection of Sabbath School hymns first led to the compilation of this little volume about three years ago. The favorable manner in which it has been received calls for the publication of this, the fourth edition."—Preface.

## X. MISCELLANEOUS.

1861.

Map of the Confederate States of America. Published by A. Morris, Richmond, Va., 1861. Size 28 x 30 inches.

Mentioned in N. C. Journal of Education, July, 1861, p. 224.

Hunten's Scales and Exercises for the Pianoforte. Richmond: George Dunn & Co., 1864.

Noticed in So. Lit. Mess. for Nov., Dec., 1863, Apr., 1864. In 2 parts of 16 pp. each.

Hunten's Instructions for the Pianoforte, in 2 parts. Richmond: Geo. Dunn & Co. 1864(?).

Announced on the cover of Christison's French Grammar. Same as previous title?

Burrowes' | pianoforte | primer, | containing the | rudiments of music, | calculated | either for private tuition, | or, | teaching in classes. | Revised and enlarged, with additions | and alterations, | by W. C. Peters, | Richmond, Va.: | J. W. Randolph, publisher. | 1864.

*Collation:* Title, 1 l.; preface, iii-iv; text, 5-47+[1]. *Size:* 7½ x 4½ in.

*Copies seen:* Congress.

This was a second edition.—Preface.

The | boys and girls | stories of the war | contents: | General Stonewall Jackson | Commodore Foot and Colonel | Small, etc., etc. | West & Johnston, Richmond.

*Collation:* Cover t. as above, the whole in a border, except place and publishers; n. d.; no separate t. p.; text, 1-32. *Size:* 4½ x 3 in. ills.

*Copies seen:* Congress; Weeks.

## [General Physics.]

Dr. John LeContes' MSS. treatise on General Physics, nearly completed, was destroyed when Columbia was burned, and was never rewritten.—White's Cyclopædia of American Biography.

## [Natural Philosophy.]

On works of this character Branson, Farrar & Co., Raleigh, N. C., say on the cover to Branson's First Book in Composition (published in 1863): "There is great difficulty in preparing a book of this kind at present, on account of the numerous cuts needed. Steady energy, however, can overcome all these things and give to our children all the books necessary."

## [Elementary School Books.]

Mrs. S. A. Vaughan, of Atlanta, announced in the So. Lit. Messenger for December, 1861, that she was preparing an elementary series of school books.

## Bowen's Works.

The Whig for Dec. 4, 1863, says:

"Among the patients in the Lunatic Asylum at Milledgeville, Ga., is the celebrated African missionary and writer, Dr. Bowen. Since he has been a patient he has written a spelling book and grammar which have been published, and is now engaged on a work on chemistry and philosophy."

## Burke's Publications.

J. W. Burke, agent, Macon, Ga., announces in his edition of the Confederate Almanac for 1865: Smith's Grammar, Dagg's Grammar, Child's Scripture Question book, School of the Guides (military), Burke's Picture Primer, Confederate Spelling Book.

## CHAPTER XXIII.

### LIST OF EDUCATIONAL PERIODICALS IN THE UNITED STATES.

(1) ARRANGED BY STATES.

- | <i>Alabama.</i>   | <i>Illinois.</i>  |
|---|---|
| Birmingham, Educational Exchange, M., 1899, vol. 14.            | Aurora, Modern Education, M., 1899, vol. 1.                         |
| Normal, Normal Index, W., 1899, vol. 13.                        | Bloomington, School and Home Education, M., 1899, vol. 18.          |
| <i>Arkansas.</i>  | Chicago, Biblical World, M., 1899, vol. 13.                         |
| Little Rock, Arkansas School Journal, M., 1899, vol. 4.         | Chicago, Chicago Teacher, M., 1899, vol. 1.                         |
| <i>California.</i>  | Chicago, Child Garden, M., 1899, vol. 7.                            |
| Berkeley, University Chronicle, Bi-m., 1899, vol. 2.            | Chicago, Child Study Monthly, M., 1899, vol. 5.                     |
| San Francisco, Western Journal of Education, M., 1899, vol. 14. | Chicago, Dial (The), M., 1899, vol. 27.                             |

	Cheyenne, Wyo. ....	State superintendent of public instruction.

<sup>1</sup> Corrected to May, 1900, in so far as changes have been reported to the Bureau.

## II.—CITY SUPERINTENDENTS.

## ALABAMA.

Anniston, H. C. Gunnels.  
 Bessemer, G. M. Lovejoy.  
 Birmingham, J. H. Phillips.  
 Eufaula, F. S. McCoy.  
 Florence, Henry Clay Gilbert.  
 Huntsville, S. R. Butler.  
 Mobile, John D. Yerby.  
 Montgomery, Charles L. Floyd.  
 New Decatur, W. B. Gibson.  
 Opelika, T. C. Pinckard.  
 Selma, R. E. Hardaway.  
 Tuscaloosa, James H. Foster.

## ARIZONA.

Tucson, Samuel P. McCrea.

## ARKANSAS.

Fort Smith, J. L. Holloway.  
 Helena, W. W. Rivers.  
 Hot Springs, George B. Cook.  
 Little Rock, J. R. Rightsell.  
 Pine Bluff, J. H. Hinemom.

## CALIFORNIA.

Alameda, Charles C. Hughes.  
 Berkeley, Franklin E. Perham.  
 Eureka, A. C. Barker.  
 Fresno, Morris Elmer Dailey.  
 Los Angeles, J. A. Foshay.  
 Napa City, J. L. Shearer.<sup>1</sup>  
 Oakland, John W. McClymonds.  
 Pasadena, James D. Graham.<sup>2</sup>  
 Pomona, Frank H. Hyatt.<sup>2</sup>  
 Riverside, Charles E. Keyes.  
 Sacramento, O. W. Erlewine.  
 San Bernardino, Howard L. Lunt.  
 San Diego, F. P. Davidson.  
 San Francisco, Reginald H. Webster.  
 San Jose, Frank P. Russell.  
 Santa Ana, Lyman Gregory.  
 Santa Barbara, William A. Wilson.  
 Santa Cruz, D. C. Clark.  
 Santa Rosa, E. M. Cox.<sup>2</sup>  
 Stockton, James A. Barr.  
 Vallejo, Charles A. Fulton.

## COLORADO.

Aspen, F. J. Browncombe.  
 Colorado Springs, John Dietrich.  
 Cripple Creek, Ezra W. Palmer.  
 Denver:  
 District No. 1, Aaron Gove.  
 District No. 2, L. C. Greenlee.  
 District No. 7, W. J. Wise.  
 District No. 17, ———.

## COLORADO—Continued.

Leadville, Edward C. Elliott.  
 Pueblo:  
 District No. 1, James S. McClung.  
 District No. 20, John F. Keating.  
 Trinidad, Charles V. Parker.

## CONNECTICUT.

Ansonia, Wm. Alexander Smith.  
 Branford, Henry C. Moore,<sup>3</sup> T. S. Devitt.<sup>4</sup>  
 Bridgeport, Charles W. Deane.  
 Bristol, C. L. Wooding.  
 Danbury, A. C. Hubbard.<sup>5</sup>  
 Derby, J. W. Peck.  
 East Hartford, Joseph O. Goodwin,<sup>5</sup> George A. Bowman.<sup>4</sup>  
 Enfield, Samuel A. Booth.<sup>6</sup>  
 Greenwich, Newton B. Hobart,<sup>3</sup> Thomas F. Howley.<sup>5</sup>  
 Hartford, Herbert S. Bullard.  
 Manchester:  
 Town Schools, Herbert O. Bowers.  
 Ninth District (south), F. A. Verplanck.  
 Meriden, Albert B. Mather.  
 Middletown, Walter B. Ferguson.  
 Milford, H. I. Mathewson.<sup>2</sup>  
 Naugatuck, Andrew D. Meloy.  
 New Britain, Giles A. Stuart.  
 New Haven, ———.  
 New London, Charles B. Jennings.  
 New Milford, Charles H. Soule.  
 Norwalk, A. Blanchard.<sup>5</sup>  
 Norwich, Frank T. Maples;<sup>5</sup> Nathan Lee Bishop  
 Supt. Central Dist.; John B. Stanton Supt. West  
 Chelsea Dist.  
 Rockville, Isaac M. Agard.<sup>7</sup>  
 Stamford, Everett C. Willard.  
 Torrington, Edwin H. Forbes.  
 Wallingford, Malcolm Booth.  
 Waterbury, B. W. Tinker.  
 West Haven, Edgar C. Stiles.  
 Westport, L. T. Day.<sup>5</sup>  
 Willimantic, George E. Hinman.<sup>8</sup>  
 Winsted, H. Hungerford Drake.<sup>5</sup>

## DELAWARE.

New Castle, George W. Andrew  
 Wilmington, David W. Harlan.

## DISTRICT OF COLUMBIA.

Washington:  
 William B. Powell, Supt. of Public Schools.  
 G. F. T. Cook, Supt. of Colored Schools.

<sup>1</sup> Principal grammar school.

<sup>2</sup> Supervising principal.

<sup>3</sup> Principal.

<sup>4</sup> Acting visitor.

<sup>5</sup> Secretary of the Board of School Visitors.

<sup>6</sup> Chairman of the School Committee.

<sup>7</sup> Superintendent of the East District Schools of Vernon Town.

<sup>8</sup> Secretary of the School Committee.

## FLORIDA.

Jacksonville, George P. Glenn.  
 Key West, C. F. Kemp.<sup>1</sup>  
 Pensacola, N. B. Cook.<sup>1</sup>  
 St. Augustine, J. W. McCluny.  
 Tampa, L. W. Bucholz.<sup>1</sup>

## GEORGIA.

Albany, S. R. De Jarnette.<sup>2</sup>  
 Americus, J. E. Mathis.  
 Athens, G. G. Bond.  
 Atlanta, W. F. Slaton.  
 Augusta, Lawton B. Evans.  
 Brunswick, Gustavus J. Orr, jr.  
 Columbus, Carleton B. Gibson.  
 Griffin, J. Henry Walker.  
 Macon, D. Q. Abbott.  
 Rome, James C. Harris.  
 Savannah, Otis Ashmore.  
 Thomasville, K. T. Maclean.<sup>1</sup>

## ILLINOIS.

Alton, Robert A. Haight.  
 Aurora:  
   District No. 5 (East Side), C. M. Bardwell.  
   District No. 4 (West Side), A. V. Greenman.  
 Beardstown, S. Sterrett Beggs.  
 Belleville, H. D. Updike.  
 Belvidere:

Scott Shipp, LL. D., supt.	Agricultural College of Utah	Logan, Utah.
E. A. Bryan, A. M.	Virginia Agricultural and Mechanical College	Blacksburg, Va.
	Virginia Military Institute	Lexington, Va.
	Washington Agricultural College and School of Science	Pullman, Wash.

## IV.—PRINCIPALS OF NORMAL SCHOOLS.

*Public normal schools.*

Location.	Name of institution.	Principal.
ALABAMA.		
Florence .....	State Normal College.....	Marshall C. Wilson.
Jacksonville .....	do .....	Jacob Forney.
Livingston .....	Alabama Normal College for Girls .....	Miss Julia S. Tutwiler.
Montgomery .....	Montgomery Normal School .....	
Normal .....	State Colored Normal and Industrial School.	W. H. Council.
Troy .....	State Normal College.....	Edwin R. Eldridge.
ARIZONA.		
Tempe .....	Territorial Normal School of Arizona..	James McNaughton.
ARKANSAS.		
Pine Bluff.....	Branch Normal College .....	J. C. Corbin.
CALIFORNIA.		
Chico .....	California State Normal School .....	Carlton M. Ritter.
Los Angeles.....	State Normal School.....	Edward T. Pierce.
San Diego.....	do .....	Samuel T. Black.
San Jose .....	do .....	A. H. Randall.
COLORADO.		
Greeley .....	Colorado State Normal School.....	Z. X. Snyder.
CONNECTICUT.		
Bridgeport .....	Bridgeport Training School .....	Besse E. Howes.
New Britain .....	Normal Training School.....	Marcus White.
New Haven.....	State Normal Training School.....	Arthur B. Morrill.
Willimantic.....	do .....	George P. Phenix.
DELAWARE.		
Wilmington.....	Wollaston School.....	Clara Mendenhall.
DISTRICT OF COLUMBIA.		
Washington.....	Washington Normal School .....	Mrs. Idaliah G. Meyers.
Do .....	Washington Normal School, seventh and eighth divisions.	Lucy E. Moten.
FLORIDA.		
De Funiak Springs.....	Florida State Normal School .....	C. L. Hayes.
Tallahassee .....	Florida State Normal and Industrial College.	T. De S. Tucker.
GEORGIA.		
Athens .....	State Normal School .....	S. D. Bradwell.
Milledgeville .....	Georgia Normal and Industrial College	J. Harris Chappell.
IDAHO.		
Albion .....	Albion State Normal School.....	J. C. Black.
Lewiston .....	Lewiston State Normal School .....	Geo. E. Knepper.
ILLINOIS.		
Carbondale .....	Southern Illinois State Normal University.	D. B. Parkinson.
Chicago, Station O .....	Chicago Normal School .....	Francis W. Parker.
Normal .....	Illinois State Normal University .....	John W. Cook.
INDIANA.		
Indianapolis .....	Indianapolis Normal School.....	M. E. Nicholson.
Terre Haute .....	Indiana State Normal School.....	William W. Parsons.
IOWA.		
Boonesboro .....	Boone County Normal Institute.....	B. P. Holst.
Cedarfalls .....	Iowa State Normal School.....	Homer H. Seerley.
Dexter .....	Dexter Normal School.....	D. P. Repass.
Rockwell City .....	Calhoun County Normal School.....	D. K. Bond.
Woodbine .....	Woodbine Normal School .....	M. A. Reed.
KANSAS.		
Emporia .....	State Normal School.....	A. R. Taylor.

## IV.—PRINCIPALS OF NORMAL SCHOOLS—Continued.

*Public normal schools—Continued.*

## CHAPTER XXV.

### APPLIED (OR ECONOMIC) GEOGRAPHY.

#### INTRODUCTION.

The enormous expansion of American, English, and German international trade; the acquisition of vast transoceanic possessions, especially on the part of Great Britain; the sleepless instinct of gain that opens up markets in the most remote countries for the products of labor in farm and factory, quickened by ever increasing speed through the aid of mechanical power; the annihilation of distance by contrivances never dreamed of a few generations ago, all these factors have combined to change both matter and methods of the study of geography in the schools, and to give this study a new character.

Time was when a mere description of the earth's surface, and memorizing of names of States, cities, mountains, lakes, and rivers constituted the sum total of what the child of the elementary school derived from the study of geography. In secondary schools the study was rarely more than a mere foil to history.

Then followed the wonderful development of the natural sciences during the middle of the nineteenth century, which gave a new impetus to geography. It became the common focus of many of the natural sciences, and under the name of "nature study" the subject of geography almost lost its identity, at least its former vassalage to history changed to servitude to the new trend of thought. Physical geography, or rather topography, was considered the only part of geography worthy of study, and to some extent it is so still.

But recent historical events have called for a change louder than the wise counsel of farseeing men, who had from time to time urged the advisability of emphasizing the human element more than was done. To-day it is made clear to us that geography deserves to be more than a handmaid of history on the one hand, or a mere drudge in the service of nature study on the other hand. It demands a place and dignity of its own, combining the objects of the two methods, the historical and the scientific, and besides, offering to the student a useful agency in bringing him in contact with commercial elements. Advocates in Europe and America eloquently press the claims of geography to a separate and independent position in the curricula of schools of every kind. But among the educational institutions which call for a new departure in the teaching of geography, the commercial and other technical schools in Europe are the most insistent, as will be seen from a report of Prof. A. J. Herbertson, of Edinburgh, Scotland, reprinted in this chapter.

Before the paper of this eminent authority is presented, it seems proper to show that in the United States the necessity of a change has also been foreseen.

#### OPINIONS OF EDUCATORS IN THE UNITED STATES.

The three special reports issued by authority of the National Educational Association: The report of the committee of ten on secondary school studies, dated 1893; the report of the committee of fifteen on elementary studies, dated 1895; and the report

of the committee of twelve on rural schools, dated 1897, may be quoted as clearly setting forth the attitude of teachers in this country on the subject. Of course, it is well understood that there have been isolated expressions from time to time pointing out the faulty methods in teaching geography, but the general awakening to the need of a change in the character and aims of that study is of rather recent occurrence. While as yet few chairs for the study of geography have been established in higher institutions of learning in this country and in England, the universities, and the polytechnic and commercial schools of college and university rank in France, Germany, Austria, and Switzerland have fostered the study most assiduously, so that when a new departure for the study of geography was necessitated by historical events and the awakened commercial spirit of the times, German and French scholars aided the movement generously.<sup>1</sup> In continental Europe the commercial schools have special atlases differing from those of other schools in paying particular attention to facts of commercial importance.

The committee on secondary school studies, mentioned before, discussed geography in a subcommittee, the report of which contains the following statement regarding the order of treatment based on the students' mental processes. It will be seen that this document emphasizes chiefly physical geography.

The conference offer, by way of suggestion, the following scheme. The appended remarks bear in part upon the educational philosophy entertained, in part upon the purpose of the work, and part upon the methods of execution. Reduced to a sentence the scheme is, first, see; next, reproduce; then study the productions of others; and, meanwhile, ponder and reason on all.

1. *Observational geography.*—In the judgment of the conference, observation should go before all other forms of geographical study and prepare the way for them; its object being (1) to develop the power and habit of geographic observation, (2) to give the pupils true and vivid basal ideas, and (3) to arouse a spirit of inquiry and a thirst for geographical knowledge. This work of observation should begin with those features that lie immediately about the pupils and so fall easily within the reach of their direct study and ready comprehension. In rural districts, the natural features of the surface will obviously form a large part of the study; while in cities, the artificial features must largely take the place of these. In the one instance, natural geography, as seen in the forms of the land, the hills, valleys, plains, meadows, divides, streams, lakes, etc., will predominate; while in the other artificial or humanistic geography will receive leading attention, as streets, railways, wharves, harbors, parks, plats, wards, etc.; but something of both these groups of subjects may be found and utilized in both localities. Neither should be neglected, for the pupils need not only to acquire clear ideas of the things by which they are chiefly surrounded but type ideas of the things which characterize other localities and of which they need to form correct ideas without being able to see them. Observation, however, should not be confined simply to the passive fixed features by which pupils are surrounded. They should observe the agencies that produce surface changes, such as winds, rains, floods, thawing, freezing, cultivation, etc. The temporary streams that follow heavy rains represent on a small scale many of the natural processes by which surface features are produced. From these immediate agencies, the observations should extend to the phenomena of the weather and the climate, such as temperature, winds, clouds, seasons, etc. As a step toward the understanding of mathematical geography, so called, the children should be led to observe the shifting of the sun north and south with the seasons and to measure the amount of this by the length of shadows at noonday in the different months of the year. They should compare these by means of a record kept for the purpose. In like manner, they should observe the movements of the stars and other heavenly bodies. As a step toward the study of the distribution of plants and animals and an insight into their dependence upon temperature, soil, food, etc., the pupils should be encouraged to observe the differences of plants on uplands, lowlands, marshes, etc., and upon sandy, clayey, gravelly, or stony ground, and to note the habitual dispersal of animals and insects in the neighborhood, and also their relations to each other, as in forming or frequenting forests, prairies, meadows, etc. As a step toward the study of the human elements in geography, observations should be made upon the population and its distribution; upon home occupations and productions; upon local political boundaries, as

<sup>1</sup> See also Chapter XXX of the Annual Report of the Commissioner of Education for 1896-97.

wards, school districts, city or town limits, etc.; and upon the location of cities, villages, railways, canals, etc. Thus, by a little ingenuity and industry, a large part of the features that make up the substance of geography in the large sense may be found illustrated close at home, and, if suitably studied, the basis may be laid for clear conceptions of those features which lie beyond the range of the child's observation.

Observation should not only begin the work in geography but should continue throughout the entire course and beyond. If scholars are not educated so as to continually observe geographic features and note their significance whenever they are brought in contact with them, whether during school days or afterwards, the school work fails of its most important possibilities. The pupils' first observational work is necessarily of the simpler and more superficial kind. As knowledge and insight increase, they should see more and more of the geographic phenomena that come before them and see deeper and deeper into their significance and receive increasing pleasure and profit from them. To this end, every opportunity for observational work in geography should be eagerly embraced. Excursions for the special purpose should be made as frequently as practicable, formally or informally, in school hours and out of school hours, by classes and by individuals. Advantage should be taken of incidental excursions in which the class or any of its members participate. The little trips and longer travels of members of the class should be taken advantage of. Late in the course, special studies of certain geographic features may be taken up with success and profit.

2. *Representative geography.*—Immediately after the making of observations should come their reproduction in the form of descriptions, sketches, maps, models, etc. The instruction of the teacher falls far short of its highest efficiency if the early work is merely observational and receptive. The great end of education is to create productive ability. One important form of this is representative production. Besides having value in itself, the description of features that have been seen and their representation by sketches, maps, or models reacts upon the observational work and induces a clearness, sharpness, and definiteness that it would not otherwise be likely to take. Not only this, but it leads the scholars to realize what maps, descriptions, etc., really mean. By this means pupils are lead up naturally to an ability to read with vividness, ease, and full understanding the maps and descriptions which constitute the medium of the larger part of their later studies, and such ability to read is of supreme importance in all subsequent work.

3. *Derivative or descriptive geography.*—When pupils have gained true and vivid basal ideas by observation and have by reproducing these acquired a realistic sense of the meaning of maps and an ability to read them in the full and proper sense of the term, they are prepared to pass on to a formal study of descriptive geography. In this the observational and representative work of others than themselves is made the basis of study. The pupils are not now studying the earth's surface, but "a description of the earth's surface." The work is not direct and immediate, but derivative and secondary. The pupils can not carry their own observations over more than a very small fraction of the earth's surface, and their work upon even this small portion must in the nature of the case be very imperfect. Their great dependence must therefore be upon the work of others, the work of geographical experts, and hence descriptive geography must embrace much the largest portion of their attention. The common mistake is that it embraces too nearly all of it, and the observational and reproductive efforts which are necessary to give the study of descriptions its greatest serviceability are neglected. These should be continued throughout the course running parallel with the descriptive study and supplementing and vivifying it.

4. *Rational geography.*—It has already been urged that the pupils should be induced to observe changes and processes as well as the simple passive facts of geography, and that there should thereby be laid the foundation for an understanding of the origin, the development, and the future history of geographic features. This is the introduction of rational geography as distinguished from the mere noting and memorizing of facts. This phase of the subject, which leads the pupils into the reason of things, should be assiduously cultivated, for it is the soul of the science. It should, however, be carefully adapted to the capabilities of the pupils, particularly in the earlier stages of the study. They should not be forced beyond their capacity to comprehend the nature of the agencies that have rendered geography what it is. On the other hand, there is an equal danger of underestimating the capacities of pupils to see into the reasons for natural operations. It is as dangerous to allow their capacities to lie undeveloped as it is to overload them with reasonings they can not understand and to force them to carry these in a mere verbal form by an effort of memory. The reasonings should be such as they can follow understandingly if not work out themselves. If they merely commit them to memory they

are as dead as other things simply memorized and lose entirely the rational element. It may not be wholly without value in some cases to give to children a statement of the causes of phenomena even though they are unable to understand the methods of their operation, but it should be clearly understood that this is not teaching the scholars to reason concerning phenomena, or even to follow reasonings concerning phenomena, but merely to memorize the reasons of phenomena.

It is not recommended that rational geography be dissociated from observational and descriptive geography, but rather, on the contrary, that it be intimately connected with these and that it be introduced so as to give them life and significance. To do this skill and discretion must be used respecting the way in which the rational element is introduced and the extent to which it is carried.

It will be noticed that the committee proposing the foregoing mode of treatment does not lay the chief stress on the political, ethnographical, and commercial features, but mainly on physical geography as the groundwork of the study. President Charles W. Eliot, the chairman of the committee of ten, thus concludes his comments upon the report of the subcommittee:

Their conception of physiography is a very comprehensive one. In short, they recommend a study of physical geography which would embrace in its scope the elements of half a dozen natural sciences, and would bind together in one sheaf the various gleanings which the pupils would have gathered from widely separated fields. There can be no doubt that the study would be interesting, informing, and developing, or that it would be difficult and in every sense substantial.

The committee of fifteen on elementary studies, appointed by the same association in 1894, and reporting in 1895, evidently viewed the subject from a different standpoint as will be seen from the following quotation of the report on correlation of studies:

Geography has preserved the comprehensiveness of meaning [it had in the Middle Ages] as a branch of the study in the elementary schools down to the present day. After arithmetic, which treats of the abstract or general conditions of material existence, comes geography with a practical study of man's material habitat and its relations to him. It is not a simple science by itself, like botany or geology or astronomy, but a collection of sciences levied upon to describe the earth as the dwelling place of man and to explain something of its more prominent features. About one-fourth of the material relates strictly to the geography, about one-half to the inhabitants, their manners, customs, institutions, industries, productions, and the remaining one-fourth to items drawn from the sciences of mineralogy, meteorology, botany, zoology, and astronomy. This predominance of the human feature in a study ostensibly relating to physical nature your committee considers necessary and entirely justifiable. The child commences with what is nearest to his interests, and proceeds gradually toward what is remote and to be studied for its own sake. It is, therefore, a mistake to suppose that the first phase of geography presented to the child should be the process of continent formation. He must begin with the natural differences of climate and lands and waters and obstacles that separate peoples, and study the methods by which man strives to equalize or overcome these differences by industry and commerce, to unite all places and all people, and make it possible for each to share in the productions of all. The industrial and commercial idea is, therefore, the first central idea in the study of geography in the elementary schools. It leads directly to the natural elements of difference in climate, soil, and productions, and also to those in race, religion, political status, and occupations of the inhabitants, with a view to explain the grounds and reasons for this counter process of civilization, which struggles to overcome the differences. Next comes the deeper inquiry into the process of continent formation, the physical struggle between the process of upheaving or upbuilding of continents and that of their obliteration by air and water; the explanation of the mountains, valleys, and plains, the islands, volcanic action, the winds, the rain distribution. But the study of cities, their location, the purposes they serve as collecting, manufacturing, and distributing centers, leads most directly to the immediate purpose of geography in the elementary school. From this beginning, and holding to it as a permanent interest, the inquiry into causes and conditions proceeds concentrically to the sources of the raw materials, the methods of their production and the climatic, geologic, and other reasons that explain their location and their growth.

In recent years, especially through the scientific study of physical geography, the processes that go to the formation of climate, soil, and general configuration of land

masses have been accurately determined, and the methods of teaching so simplified that it is possible to lead out from the central idea mentioned to the physical explanations of the elements of geographical difference quite early in the course of study. Setting out from the idea of the use made of the earth by civilization, the pupil in the fifth and sixth years of his schooling (at the age of eleven or twelve) may extend his inquiries quite profitably as far as the physical explanations of landscapes and climates. In the seventh and eighth years of school much more may be done in this direction. But it is believed that the distinctively human interest connected with geography in the first years of its study should not yield to the purely scientific one of physical processes until the pupil has taken up the study of history.

The educational value of geography, as it is and has been in elementary schools, is obviously very great. It makes possible something like accuracy in the picturing of distant places and events and removes a large tract of mere superstition from the mind. In the days of newspaper reading one's stock of geographical information is in constant requisition. A war on the opposite side of the globe is followed with more interest in this year than a war near our own borders before the era of the telegraph. The general knowledge of the locations and boundaries of nations, of their status in civilization and their natural advantages for contributing to the world market, is of great use to the citizen in forming correct ideas from his daily reading.

The educational value of geography is even more apparent if we admit the claims of those who argue that the present epoch is the beginning of an era in which public opinion is organized into a ruling force by the agency of periodicals and books. Certainly neither the newspaper nor the book can influence an illiterate people; they can do little to form opinions where the readers have no knowledge of geography.

As to the psychological value of geography little need be said. It exercises in manifold ways the memory of forms and the imagination; it brings into exercise the thinking power in tracing back toward unity the various series of causes. What educative value there is in geology, meteorology, zoology, ethnology, economics, history, and politics is to be found in the more profound study of geography, and, to a proportionate extent, in the study of its merest elements.

Your committee is of the opinion that there has been a vast improvement in the methods of instruction in this branch in recent years, due in large measure to the geographical societies of this and other countries. At first there prevailed what might be named sailor geography. The pupil was compelled to memorize all the capes and headlands, bays and harbors, mouths of rivers, islands, sounds, and straits around the world. He enlivened this to some extent by brief mention of the curiosities and oddities in the way of cataracts, water gaps, caves, strange animals, public buildings, picturesque costumes, national exaggerations, and such matters as would furnish good themes for sailors' yarns. Little or nothing was taught to give unity to the isolated details furnished in endless number. It was an improvement on this when the method of memorizing capital cities and political boundaries succeeded. With this came the era of map drawing. The study of watersheds and commercial routes, of industrial productions and centers of manufacture and commerce, has been adopted in the better class of schools. Instruction in geography is growing better by the constant introduction of new devices to make plain and intelligible the determining influence of physical causes in producing the elements of difference and the counter process of industry and commerce by which each difference is rendered of use to the whole world and each locality made a participator in the productions of all.

Prof. Geo. P. Brown, of Bloomington, Ill., commenting on this utterance, makes the following remarks, which clearly set forth the distinction between the two former methods of treatment of the subject:

The doctrine of this section upon the educative value of geography and its relation to human life will be accepted by most teachers. The elementary school must study the earth as the home of man. This gives emphasis to the industrial and commercial features of the study. The teachings of the report are in substantial accord with those of the Herbartians. We study physical geography that we may know better our fellow-men and our relations to them. The relation of this branch to history on the one side and to science on the other is a notable example of that idea of correlation which would teach each subject in the light of the knowledge of all others to which it is naturally related. The social order combines geography, history, natural science, the industries, and the characteristics of the people into a very close unity. The Herbartians and all good teachers demand that this unity shall be recognized in the school. The demands that some are making to have the emphasis placed upon the nature element rather than upon the human element are not sanctioned by this report. Geography is in part a natural-science study and in part a sociological study.

Sociology and nature are so intimately related in it that much of the latter must be known in order to understand the former. The time has certainly come for expunging much of the "sailor geography" from our course of instruction.

The report of the committee of twelve on rural schools also comments on the study of geography as follows:

The committee of fifteen has already advanced the opinion that the industrial and commercial idea is the central idea in the study of geography in the elementary schools. It leads directly to the natural elements of difference in climate, soil, productions, races of men, religion, political status, and occupation of the inhabitants, and it explains how these differences have arisen in some measure through cosmic and geological influences. It should be the teacher's object to make the pupil understand, just as early as his growing capacity admits, the peculiarities of his habitat, leading him to study the land and water formations in his neighborhood, and giving him power to recognize in the visible landscape about him the invisible forces that worked in the past and still are at work in the present, molding these shapes and forms. On the basis of this knowledge of the elements of difference produced by nature in soil, climate, and configuration of the landscape, he should explain the grounds and reasons for the counter process of civilization which struggles to overcome these differences by bridging the rivers and tunneling the mountains, by using steamboat and railroad so as to unite each particular habitat with the rest of the world. He should see how man adapts to his needs the climate of each place by creating for himself a comfortable temperature, using for this purpose clothing and shelter, as well as fuels of wood and coal or derived from oils and gases to protect from cold; and, on the other hand, utilizing ice or power fans, and creating easy access to summer dwellings on the heights of mountains or at the seashore to mitigate the heat. He turns the soil into a laboratory, correcting its lacks and deficiencies by adding what is necessary to produce the crop which he desires. He naturalizes the useful plants and animals of all climes in his own habitat. It is evident that the details of the process by which differences of soil, climate, and production arise, important as these are, should not be allowed to occupy so much of the pupil's time that he neglects to study the counter process of industry and commerce by which man unites all parts of the earth to his habitat, and progressively overcomes the obstacles to civilization by making climate and soil to suit himself wherever he wishes.

To restate this important point in a word, it is true that the deeper inquiry into the process of continent formation, the physical struggle between the process of the upheaving or upbuilding of continents, and that of their obliteration by air and water; the explanation of the mountains, valleys and plains, islands, volcanic action, the winds, the rain distribution, is indispensable to a comprehension of the physical environment. But the study of the cities, their location, the purposes they serve as collecting, manufacturing, and distributing centers, leads most directly to the immediate purpose of geography in the elementary school, for it is the study of that civilization in which the pupil lives and moves and has his being.

Keeping this human standpoint in view all the time as a permanent interest, the inquiry into causes and conditions should proceed concentrically from the pupil's use of food and clothing to the sources of the raw materials, the methods of their production, and the climatic, geologic, and other reasons that explain their location and their growth. It is important in this as in all matters of school instruction to avoid one-sidedness. Although the human factor should receive the most emphasis, special care should be exercised lest the nature factor should be neglected.

A very instructive essay on the subject was recently submitted to the Manchester Geographical Society, and published in its journal. The author is Dr. A. J. Herbertson, lecturer on industrial and commercial geography, Heriot-Watts College, Edinburgh, Scotland. The following is the paper:

#### THE POSITION OF ECONOMIC GEOGRAPHY IN EDUCATION.

The movement for improved commercial education is part of a great change which, during the present century, has profoundly modified, in a greater or less degree, almost every civilized nation of the world. The nineteenth century has been marked by an extraordinary development of commercialism, an unprecedented acceleration of production, an enormous development of facilities of transport, and, consequently, of distribution, the constant opening of new markets, and the rapid exploitation of new lands. The consequent increase of population has led to the keenest competition both in production and distribution, and to a growing sense of the importance of the scientific study of both. Attention was at first chiefly paid to the scientific study

of production, or technical education, and is now being directed to the organization of a similar scientific study of distribution, or commercial education. To no country is this of more importance than our own. At the beginning of the present century Britain possessed a variety of advantages, many of them accidental and temporary, which appeared to ensure to it the commercial supremacy of the world. It was then impossible to foresee the rapid acceleration of mechanical invention and material progress which has done so much to equalize the nations of the world in the struggle for existence. At the beginning of the twentieth century we are starting little, if at all, ahead of our competitors, and this is the more serious, inasmuch as we have all been brought up to believe in the commercial superiority of Britain as part of the world's foreordained and unchanging order. Fortunately it is now becoming recognized that the day of lucky accidents is practically over, and that the time has come to organize commercial progress. Our competitors know this at least as well as ourselves, and have recognized, on the whole, perhaps earlier than we, that the successful merchant or trader requires, no less than the teacher or doctor, a strictly professional training. It is not, of course, denied that life supplies an empirical training by rough methods of its own. The battle between scientific and empirical methods has already been hotly fought on the question of the training of teachers, and it is not necessary here to recapitulate the arguments. It is now generally agreed that the empirical method is long, laborious, and wasteful. This most people will be willing to admit in the case of commercial education also, and the problem is therefore narrowed to that of suggesting, so far as our present experience admits, of various practical steps which should, and could, be taken at the present time.

#### ECONOMIC GEOGRAPHY IN SCHOOLS.

The object of school is not to train the young for special professions, but to educate them—that is, so to draw out the whole of their latent faculties, not forgetting the sense training, that at the end of the school years they are well qualified to begin, and to profit by, a more specialized professional training. The great task is not to impart information about isolated branches of knowledge, but to help pupils to realize that they are dealing with the actual problems of a living world, and that their success in any department of life will depend on their understanding of the problems it presents and their solution of them. Teachers protest against any further subdivision of subjects as detrimental to the true educational well-being of their pupils, and rightly maintain that too early specialization merely results in leaving the pupil stultified—neither well educated, nor even well instructed. It can not be too clearly understood that in the matter of geographical education we are entirely with them. Nothing could be more mischievous, or more useless, than premature specialization in certain aspects of geography, which can only be taken with advantage after a thorough and sound general education. The best service the school, whether primary or secondary, can be asked to render to the cause of commercial education is to improve and widen its general geographical teaching, laying stress on principles, on relations of cause and effect, on the influence exercised by geographical conditions on all the activities of man, and therefore, incidentally on his commercial and economic ones, in which many lessons will also be suggested by the events of the day. If this were done, the task of our various commercial institutions, at a later stage, would be a comparatively easy one, and it is precisely the absence of this preliminary geographical training which renders it so difficult for the specialist teacher of economic and commercial geography to do any but the most elementary work with his pupils.

The writer's experience, both as a teacher and as an examiner correcting papers from all parts of the United Kingdom is, that while there has been progress in the methods of geographic teaching in recent years, much remains to be done; that too little attention is paid to principles, and that the physical basis of political and economic geography is too much neglected. Before any great improvement can be looked for, teachers must themselves receive special geographical training. The programme for the new science schools which the Scottish Education Department have proposed may be taken as an indication of what will soon be required in all schools. The need for trained teachers to carry out such a programme is obvious, and it is all the more necessary as more time must be given to geography in most schools, which can be done without damaging other subjects only by a judicious use of the geographical aspects of those subjects. For instance, much elementary physics can be grouped with physical geography, applied mathematics with map making, and a free combination of history with physical geography as well as political geography may well be attempted. This will become increasingly possible as the codes grow less rigid and teachers are permitted to draw up their own syllabuses subject to the depart-

mental criticism. In this matter the Scottish department has again made a great step forward in their new code.

Such improvement in general education at school is a necessary preliminary to improvement in special education in commercial colleges. Without a proper grounding at the day school nothing but the most elementary work can be done at the commercial school and college, and this elementary work is practically all that is done at present. A great advance in the quality of work in commercial colleges will take place when the quality of that done in our primary, but more particularly our secondary, schools is improved.

IN THE COMMERCIAL SCHOOL AND COLLEGE AND AT THE UNIVERSITY.

Geography is at once a necessary part of the business man's stock of knowledge, and one of the best educative elements in his training.

The scope of geography as a tool will vary from place to place. In a great commercial seaport the leading routes, ports, and markets of the world would be more fully treated than in a manufacturing center, where only special ports, routes, and markets would require this detailed consideration. In one region some parts of the world are of more importance than others; the geography of these would require to be known in detail.

We may consider the needs of three different classes, each demanding a different scheme of education. (1) There are those going into business immediately on leaving school and who wish to supplement their knowledge by attending evening classes. (2) There are those who can afford to give more of their time to study, and take one or two years in a commercial college, or continue their studies in such a college combined with their daily work. (3) There are those who wish to specialize in the study of commercial subjects, and devote three or four years to this. These we may distinguish as elementary, intermediate, and advanced commercial training.

*Elementary commercial education: The commercial evening school.*—In the commercial evening school the geography course should be continued for at least two, and, if possible, for three years. In each year the student should gain a greater grasp of the principles of economic geography, as well as a more extensive knowledge of the distribution of economic products, and of trade centers and routes. In these two or three years a thorough knowledge of the economic conditions of the British Isles, of the principal British colonies, and of the leading commercial countries of the world should be gained, as well as of the economic aspects of general geography. This is not so impossible if the preliminary training has been satisfactory. At present most teachers of economic geography find they have to spend much time in imparting to their pupils an elementary knowledge, more particularly of the principles of geography. Hard and fast syllabuses issued by a central department, and applying to all schools, are very undesirable; but carefully considered suggestions would be useful to the teacher in making up his programme, more particularly at present, when no very definite tradition as to the content of economic geography exists.

Each teacher should be at liberty to draw up his own programme, which should depend on the economic conditions of the center, and also on the interests of the teacher himself. Any examinations should be conducted—as far as this is possible—on the teacher's syllabus and not on those of a central body. While no definite syllabus should be prescribed, a few suggestions may be found useful.

There are several ways in which such a class may be profitably conducted:

(1) For instance, a detailed study of the economic products of the home region, and of the regions with which it trades, might be made the means of imparting the most important detailed information that is required by the business man, and at the same time form the basis for a study of the main principles of economic geography.

(2) The British Isles may be taken as the area for detailed study, and the principles deduced from the facts learned in connection with them, such as the climatic control of wheat farming, the coal control of industry, and so on.

(3) Another useful method of beginning the study of commercial geography is to revise the facts of general geography from an economic point of view; to study the circulation of the atmosphere, for instance, and its relationship and effect on navigation, or the distribution of heat and its relationship to different types of plants.

Each of these methods has been adopted by one or other of the teachers at present active in our evening commercial schools. In a few years the experience gained will allow each teacher to find out what is really best for his pupils. At the same time an occasional meeting of teachers of geography to discuss methods would be a useful means of hastening this.

What is required most at present is an extension of commercial schools and a

better coordinated curriculum for the pupils who wish to obtain a commercial certificate at them. For this certificate economic geography ought to be one of the compulsory subjects, and each student should have at least two sessions in the classes in this subject before entering for examination.

*Intermediate commercial geography: The commercial college for day students.*—Many parents who feel that they can not afford to send their boys to a university or to a commercial college for full training desire to continue the education of their sons for at least one or two years after leaving school in some higher institution. In commercial colleges provision should be made for the training of such pupils, and also for another type of pupils such as we find among the law students of the Scottish universities. In Edinburgh and elsewhere law apprentices are permitted to attend university classes one or two hours a day during their apprenticeship. This might well be extended to youths beginning business who would devote part of the day to acquiring a knowledge of practical business, and during another part be continuing their general education, specialized along economic lines. Commercial colleges and the faculties of commerce in our universities should provide for the needs of such students. The courses for such students should be more advanced and thorough than those of the commercial evening school. The main difference from the training in the evening school should be the greater insistence on the principles of economic geography combined with a study of the history of commerce, more particularly in the nineteenth century, thus giving the pupils a sound knowledge of the causes bringing about the great economic development of present times. Such a training for those who will become the managers or principals of great businesses is of the utmost consequence. At present practically no systematic provision is made in this country for this education. Both in technical and commercial matters the country has become thoroughly alive to the necessity for proper education, and steps to insure it are gradually being taken. Already our technical schools may be called satisfactory, and it is hoped that in a very few years our commercial departments will be equally advanced. Both in technical and in commercial matters, however, there is a great lack of opportunity for higher education. This higher education is quite as essential as the more elementary.

*Higher economic education: The faculty of economics in the university.*—Those who are going to lead in the economic world need as thorough a training as those who lead our navies and armies. It may be said that the most valuable training will be in the actual world, and of course this is quite true; but to make this experience of the actual world of greatest service it is necessary to put our leaders in possession of a thorough knowledge of economic facts and principles, and, above all, to give them the power of applying the principles to the facts, to train their power of judgment and of prompt and efficient action. Economic geography from this point of view is no mere collection of statistical data, either of distribution of commodities or of the means of distributing commodities. It is not even confined to a study of the movement of commodities from place to place. An economic leader must be capable not merely of surveying the world with an economic eye and seeing all the economic movements that are taking place, but he must have a vision of the economic possibilities of regions and markets still undeveloped. He must be able to realize possibilities as well as actualities. Only in this way can we train men who will organize the victories of peace.

The task of training such leaders in the world of industry, trade, and finance is one which should fire the imagination of all our university authorities, more particularly those situated in great industrial and commercial cities, such as London, Birmingham, Manchester, Liverpool, Leeds, and Glasgow.

The economic, however, is not the only aspect of applied geography which should be dealt with in a modern university. A geographical training should be given to men of affairs, civil servants, consuls, explorers, and missionaries, as well as to business men. Provision should be made for special courses which would be useful to engineers, physicians, soldiers, and, in the maritime cities, also to sailors.

In all universities the application of geography to teaching should form one of the most important features of the work of the department. Just as the training of the business man is a natural interest of the universities of our great cities, so the training of the teachers for the economic schools fits in well with the plans of the older universities.

In the economic side of every university a very thorough training must be given to the students. In addition to the theory and history of economics and other subjects taught in the economic schools of such universities as Pennsylvania, although not yet in this country, economic geography should be an essential subject. This should include not merely an intimate knowledge of the descriptive geography of the different countries of the world, from an economic point of view, but should deal

with such facts as their weights and measures, their customs regulations, and the nature of their ports and their facilities of communication by land and sea. It should include a study of the different races of the world from an economic point of view, considering their customs and prejudices, the nature of their clothing and utensils and their wants, more particularly those which can be supplied by our manufacturers. The student should have practical acquaintance with the produce of different parts of the world (Waarenkunde), although this need not necessarily be taught by the geographer.

The student should be accustomed to deal with statistics of all kinds and should know the principal publications of our own and foreign countries where economic information can be obtained. Reports issued by the boards of trade, agriculture, and other Government departments, reports by our consuls, and other official publications should be perfectly familiar to him, and he should be trained not merely to consult, but to interpret, such documents; in other words, he must learn the way to handle geographic tools. A knowledge of the use of tools alone is not sufficient. The power to direct the using of tools is even more important. The habit of interpreting statistical and other reports, as well as of acquiring the information they contain, is essential in a successful merchant or financier. In the economic geography course, therefore, great stress should be laid on a thorough understanding of the principles of economic development, and as far as possible this should be applied not merely to the interpretation of the present economic conditions, but also to a forecast of those of the near future. The economic possibilities of many parts of our empire, the possibility of making new or of extending old markets, should be constantly studied.

The economic section of a geographical department must, therefore, be equipped not merely with highly skilled teachers, but with adequate apparatus. The geographical department should be as extensive, and would probably prove as expensive, as any other department in the university. It requires its special institute as much as physics or chemistry or any other subject which has at once an academic and an economic interest.

The geographer has to know his types; he has to accumulate his samples as the biologist does; he needs more books and maps, more photographs and specimens, than any other teacher in a university, and these usually of a more expensive kind. The staff must be that of experts. Not merely one geographer is wanted in a modern university, but at least half a dozen, each of whom is a specialist in some section of the subject. Each teacher should be an expert in either one great region or in one aspect of geography. The specialist in one continent or country should every now and then be afforded facilities for visiting it. He should correspond with and as far as possible know personally the other leading authorities on his own region. All the important publications relating to that country should be systematically added to the departmental library under his charge. Each expert should be responsible for the up-to-date character of the books, maps, specimens of his own special area. He should keep a card catalogue of published matter dealing with his special region, and should be able to give information to the business man as well as to the student on any subject connected with his particular region. While teaching should form part of his duties, general research and the direction of research should take up a large proportion of his time.

In the library, map, photographic, and museum departments it is desirable that there should be the closest possible cooperation between the geographical department of the university, the local chamber of commerce, and the geographical society. All of these bodies are constantly accumulating literature, etc., of economic interest, which it would be well to unite into one collection arranged in a uniform manner. The collections should be so arranged that they are always easily studied, and they should be housed near enough the business center of the town, as well as the university, that both the business men and the university students would find it easy to make constant use of them. This institute might well be the center from which the loan collections of all kinds might be sent out to the towns round about, in the manner which Mr. Sowerbutts has suggested for his proposed commercial museum. In this way the closest connection would be maintained between the academic and the commercial world. The work of the geographical department would be given not merely the theoretic completeness of the university department in the matter of research and of teaching, but both of these would be so determined by the practical needs of the community that the pupils trained by the geographical department would possess a thorough knowledge and practical power of dealing with concrete economic problems, and by it the research work published would have a completeness and a practical utility whose importance it would be difficult to exaggerate.

Dr. Herbertson, the author of the preceding paper, presented also a report of what is being done in some other countries in regard to the study of applied geography, and this report contains a number of statements of facts that will be welcome to educational authorities everywhere. It is therefore reproduced in full. The following is the report:

#### REPORT ON THE TEACHING OF APPLIED GEOGRAPHY.

[Prepared at the request of the council of the Manchester Geographical Society. By Dr. A. J. Herbertson, F. R. S. E., F. R. G. S., lecturer on Industrial and Commercial Geography, Heriott-Watt College, Edinburgh.]

#### INTRODUCTORY.

Just as geography may be defined as a special way of looking at the greater organisms that make up the world—its mountain and river systems, its plant and animal associations, its races of men and their organizations—so applied geography may be defined as a special way of looking at geography, a limitation and a specialization of the study of it from one point of view. For the business man this point of view is an economic one, for the medical man a climatic and demographic one, for the missionary an ethnic and ethical one.

There is one aspect of applied geography which is not dealt with at all in this report—the educational one. The educational aspect has been too much neglected both by schoolmasters and by geographers. It is not sufficiently realized that all departments of geography should not necessarily be taught in school, but that a good teacher must make a selection. The limitations he will put on geography will vary with the locality wherein he lives, and the future work of the pupils he teaches. The choice of the most educative elements of geography is a difficult one, and requires considerable knowledge and great judgment. \* \* \*

The applications of geography to military, medical, and missionary purposes can be very briefly dealt with, as, at present, the subject is practically not included in the curricula of most colleges and schools training for these professions.

In addition to the very elementary geography required for entrance to the military school, geography is studied in connection with history, and military topography is another subject taught.

The following letter, from one of the leading missionary societies, summarizes the customs of most:

“In reply to your questions concerning the instruction of missionaries in geography, I am afraid that I have not much information to give.

“(1) Our committee have not thought it necessary to require any more special knowledge of geography from missionary candidates than is represented by an ordinary English education.

“(2) Owing to the extent of the society's operations, and to the impossibility of foreseeing special vacancies in the mission field, we are not able, as a rule, to assign candidates to any particular mission until near the time for them to sail, and hence we can not do much in the way of giving instruction to individual new missionaries concerning the special geography of the country to which they go. As soon as we do know to what particular mission a particular candidate is going, we do what we can to help him obtain, before he sails, such knowledge of the country as is likely to be of use to him. This would have more to do with the people and their history, customs, and religions, than with the physical features and productions of the country; and we seek to do this by lending him books and by putting him in touch with retired missionaries or those at home on furlough.

“I ought, perhaps, to add that our medical advisers make a special study of the climates of the different countries to which our missionaries are sent, in order to be able to advise us as to the suitability of individual candidates for this or that field, and that we, of course, also keep ourselves informed as to the kind of food to be obtained in any country, so as to be able to advise recruits what supplies to take with them. Beyond this we do not make any special study of the products of the different countries, as our missions are not in any sense commercial.”

It would certainly add to the admirable work already done by so many missionaries, both as missionaries and geographers, if a more careful training, more particularly in human geography, could be given to them than the slight elementary knowledge they gain at school and the special information they obtain from experts and standard works in the hurried weeks immediately before their departure for the mission field.

A certain amount of geography is no doubt taught in the public health depart-

ments of the leading medical schools, but as far as can be learned no systematic study of medical climatology or demography is given in any of our medical schools.

At the present time the idea of applied geography is perhaps limited in most minds to that of economic geography, or even to purely commercial geography. There are many reasons for this, the pressing practical need for the recognition of this aspect of geography being the most important. Technical education has recently been organized throughout the country, and may be said to be developing in a satisfactory way. Having turned our attention to the practical scientific study of production, we must now do the same for distribution. The school for the practical scientific study of the means of distribution—the commercial college—has not yet had the attention paid to it that it ought to have and that it will have. In such a college the commercial side of geography should have a very important place. Commercial geography is the study of the alteration of existing distributions of commodities and of the means by which these changes are effected. It corresponds to the study of circulation in the human subject. It is not a statical, morphological study of a dead world, but a dynamic, physiological study of a living one. Hence it is at once a most attractive and a most difficult subject—one requiring careful preparation of the pupil and still more careful and thorough training, combined with a wide experience of the world, of men and of their economic activities on the part of the teacher.

It is to this aspect of applied geography that this report is almost exclusively confined, and it contains a summary of the results of an inquiry into the existing state of affairs in this and other countries, such as can be gained from correspondence and perusal of documents, a selection of which is given in an appendix.

#### THE PRESENT POSITION OF ECONOMIC GEOGRAPHY IN OUR EDUCATIONAL SYSTEM.

To ascertain the present position economic geography holds in our educational system many teachers of commercial geography were approached in person or by letter, and a correspondence was entered into with the managers or directors of technical and commercial colleges and others interested in the subject. In addition, a circular letter was sent out by the society to all the chambers of commerce in this country, asking for information about the teaching of commercial geography in their district, and what steps, if any, each chamber had taken to promote its study. Answers were received to this letter from 31 chambers, and in a number of cases led to a correspondence with other local authorities.

A large number of the chambers of commerce replying, while stating that they had done nothing directly to found courses in commercial geography, expressed sympathy with the idea of having them, and some urged the great need there was for them. One secretary in the north of England wrote: "Boys leaving any kind of school in this country are not acquainted with an elementary knowledge as to the location of the chief towns of their own and other countries. I have known an intelligent boy state Rotterdam was in Belgium and ask if a letter to Pontypridd required a foreign stamp."

The following letters are typical of another set of answers:

"In reply to your inquiry respecting the teaching of commercial geography in this district, I regret to say that we as a chamber consider that instruction in this important matter does not receive the attention it deserves.

"Outside the ordinary school curriculum there are few opportunities for its study, and a special committee of the chamber is now engaged in striving to find the means for encouraging an interest in this and kindred subjects.

"The chamber is not making any special efforts to promote the teaching of commercial geography, although we have been endeavoring for some years to give special prominence to commercial education generally, but owing to the lack of cooperation of the educational authorities we have been unable to effect our purpose at present.

"I have made inquiries of the scholastic authorities in the neighborhood, and am informed that all the teaching in the higher grade schools on this subject is in this direction, the masters giving prominence in their lessons to matters connected with productions, industries, and trades of various countries."

One chamber, which reports that commercial geography is taught in secondary schools, adds: "An evening class was opened some years ago in commercial geography, but the attendance was so very small that the governors were obliged to close it."

A number of chambers try to promote the teaching of commercial geography by giving certificates and prizes on the results of examinations on the subjects, and the London chamber has organized special commercial examinations (see later). Some chambers have succeeded in getting commercial geography made a course in the local technical school, and others are making arrangements for such a step next session. Some chambers have a list of firms giving preference to candidates for situa-

tions who possess a commercial certificate, but in a few cases commercial geography has no place among the subjects necessary for this certificate.

The agencies at present engaged in directly spreading a knowledge of commercial geography are: Secondary schools, some of which have special classes in the subject for advanced pupils; evening continuation schools, technical and commercial schools and colleges, the university colleges and the university extension societies, and the geographical societies.

It is not possible to discover how many secondary schools have special classes for commercial geography. Those which do usually prepare their pupils for examination in the subject by one or other of the authorities noted below. It is a debated subject whether commercial geography should be taught as a special subject in our secondary schools, and the writer of this report, while admitting it may be desirable in special circumstances, is strongly of opinion that as a rule it ought not to be attempted, and that the time would be much better spent in giving pupils the thorough grounding in the facts and principles of geography, which they so rarely get at present. No good teacher of geography, however, will ever omit to point out to pupils who can appreciate the points the economic applications of the geography lesson.

For the continuation schools a very satisfactory syllabus has been prepared by the educational department for the guidance of teachers, and it has the great advantage of being a syllabus the teacher is not bound to follow, but one which he can modify to suit local needs. (See Appendix A.) The number of continuation schools teaching commercial geography in England and Wales in 1897-98 was 495, and payment was claimed for 12,460 pupils.

In Scotland in 1897-98 geography was taught to 18,191 pupils in 237 departments of continuation schools.

Many of our technical colleges have a commercial department, and in most of them which have this department commercial geography is taught. The syllabuses vary very much, depending partly on local conditions, partly on different conceptions of the content of commercial geography. In some cases the syllabus is peculiar to the institution, in others it is that of one of the chief examining bodies.

Special attention must be called to the efforts to promote sound teaching of commercial geography in the West Riding of Yorkshire. The county council have arranged for a special set of Saturday lectures on commercial geography for teachers. These are given by Mr. E. R. Wethey, M. A., F. R. G. S., whose syllabus is appended. A special set of slides is prepared for each lecture. The lectures have been very successful, and the secretary of the Heckmondwike Chamber of Commerce reports: "Commercial geography is taught here at the higher schools both in day and evening classes. The school teachers attend the county council classes at Leeds on Saturdays and reproduce the lectures here with the use of the lantern slides."

The training of commercial geography teachers is of the utmost importance, and it is satisfactory to be able to report that it has been undertaken in several other centers, making use of the University Extension organization.

During the winter of 1898-99 University Extension courses in economic geography were given in different parts of England, but mainly in London, and are well attended. The examinations have not yet been held, but last year the results in cases coming under the writer's personal observation were very satisfactory.

In 1898-99 four courses, each of 25 lectures, dealing with different branches of economic geography, attended by 358 pupils, were given in connection with the London University Extension Society, one of the courses with the cooperation of the London school board. Other courses in geography were given by University Extension lecturers of Oxford (2), Cambridge (3), London (3), and Victoria (1), which had only an indirect connection with economic geography or none at all.

Hitherto the universities have paid no attention to economic geography as a special subject for students of geography or of economics. This winter Liverpool University College, in conjunction with the chamber of commerce and the technical instruction committee of the county council, founded a school of commerce. Commercial geography is one of the subjects. The school of commerce is, however, at present only an evening one, and corresponds to that of Nottingham University College and to the technical evening colleges elsewhere, and not to the faculty of commerce that now exists in several foreign universities. The importance of such a faculty of commerce has been ably urged by Mr. Chamberlain for Birmingham, and should become part of the universities in all our large cities.

One institution in this country, however, can be compared with some of the best foreign ones—the London School of Economics, where lectures are given in economic geography.

So far as the writer can learn the University Extension lectures, those in Leeds to

West Riding teachers, and those in the London School of Economics, are the only means of gaining instruction in aught but the rudiments of economic geography at present available in this country.

The various geographical societies, by their lectures and journals, do much to promote an extension of our knowledge of commercial geography, and none more than the Manchester society. The museum proposed by the society will prove of great service to those who have access to it; and it is an essential part of the new scheme that arrangements be made for lending small sample collections of economic interest to the schools and colleges which affiliate themselves with the society. This will facilitate the carrying out of one of the recommendations of the education department in the north of England. (See Appendix A.) The unique work of the "Victorian" lecturers of the Manchester Geographical Society must be mentioned in this report. In 1898-99 many lecturers dealt with various parts of the British Empire and other lands, from an economic as well as a geographic point of view.

Several organizations exist for examining the pupils trained in commercial geography. Commercial geography is not a subject necessary for the College of Preceptors' commercial certificate, but it is part of commercial English for the intermediate education board for Ireland, and commercial history and geography form one compulsory subject for the commercial certificate of the local examinations of Edinburgh University. In England several bodies are specially concerned with the examination of students of commercial geography—the London Chamber of Commerce (examinations in London, Southampton, and Jersey); the Society of Arts (Birmingham and elsewhere); the Union of Lancashire and Cheshire Institutes, and several county councils, which give commercial scholarships and exhibitions and conduct special examinations for candidates, like the Lancashire County Council.

What is needed at the present time in this country seems to the writer to be:

(1) A clearer idea of what should be taught as economic geography; for the impression his experience leaves is that far too many of the faults of the old methods of teaching geography are still retained. Wearisome and useless lists of capes, islands, rivers, and mountains may not be given, but they are too often replaced by equally objectionable lists of exports and imports.

(2) Means for training teachers of geography and business men who wish to learn more than the most elementary facts and desire to become experts. The universities and university colleges are the bodies on which the duty of doing this should fall.

(3) At the same time an expansion of University Extension lectures and the formation of advanced classes in the subject in our technical and commercial colleges are much needed. The writer's experience is that the first year at a commercial geography class only suffices to prepare a pupil to begin a thorough study of the subject, and that much good work is lost both to pupil and teacher through there being no opportunity for continuing the work together.

#### ECONOMIC GEOGRAPHY IN FOREIGN EDUCATIONAL SYSTEMS.

Without personal inspection of the different kinds of commercial schools and colleges at home and abroad it is very difficult to form a very decided opinion on the question whether other countries are more advanced than our own in the teaching of economic geography. In all countries special attention is now being directed to commercial education, and every year new schools are being started, and the scope of those already existing greatly enlarged. Probably the facilities at present available for learning elementary commercial geography are almost as good in this as in other countries; but the British teacher labors under the disadvantage that his pupils are not so well prepared to profit by his teaching as those of Continental countries such as France, Switzerland, and Germany; and he himself can not find the means of obtaining a geographical training such as most foreign teachers possess.

There can be no hesitation, however, in pointing out that greater facilities for higher training in economic geography exist in some foreign countries than at home, and it is necessary to emphasize the need for adequate provision of higher economic education in this country.

A summary of the information received from various foreign correspondents is given here, and extracts from some of the syllabuses sent are printed in the appendix.

*France.*—The director of secondary education in France has kindly drawn up the following valuable statement on the position of economic geography and the history of commerce in the commercial schools of France:

"The teaching of geography and the history of commerce has an important place in the syllabuses of the higher commercial schools and the commercial colleges of France. The final examinations of these institutions give the successful pupils a

coveted dispensation in the matter of military service, and this attests their importance.

"In the commercial schools, as in the lycées, the study of economic geography is based on an exact knowledge of the physical structure and the political conditions of a country. The French programmes have never encouraged the introduction into the lessons of lists of agricultural products, of manufactured articles, of means of communication, and of commercial statistics under the pretext of adapting geography to the needs of practical education. It is made a means of giving the pupils a true education; that is to say, of developing their powers of reasoning and of initiative. For this purpose the section of physical geography is in no ways limited. The masters, however, are recommended to avoid the faults of useless erudition, and to adapt the physical geography to the end in view. For instance, if they have to touch on the domain of geology, it ought to be to furnish general notions about the composition of the most fertile soils, and to indicate the distribution and the importance of the common minerals. In studying climates they ought to teach what is of importance for agriculture, and how climate affects ocean navigation. In describing the mountains they ought to insist upon the distribution of valleys, passes, and slopes. In dealing with rivers they ought to show how their length, depth, and variations make them suitable for navigation. The same precautions are enjoined in studying the conditions of animal and vegetable life.

"This essential discipline is easier in our commercial high schools owing to the custom of associating history and geography in education. It appears to our educational authorities, or at least to the greater number of them, that a real adaptation of the geographical studies, such as their limitation to the social facts of the diffusion of wealth, has its foundation in the historical method. Our pupils seem to be trained by this discipline to direct their interests toward the ideas which explain the relationship of the human societies to the regions in which they are settled, or are commencing to be settled, by commerce and by colonization. We have tried to orient our commercial education like our classical education, by the philosophy which is necessary to it. Hence it is that the history of commerce is a subject intimately allied in its educative work with the study of history properly so called, and of geography. Formerly the history of commerce was confined to an account of the mere general facts of exchange, and an explanation of economic doctrines; now our instruction in the history of commerce tends to become explanatory and evolutionary. The descriptive lessons are always combined with an examination of the geographical conditions of each people and of each epoch. In short, the programmes of history, commercial or other, and of geography are harmoniously and strictly bound together. At any rate, we attempted by the formal instruction and by the tendency given to the final examinations to arrive at this result.

"It is probable that an approaching modification of the entrance examination to the higher commercial schools will give a powerful and efficacious sanction to the reforms of which we have just sketched the spirit. At present the entrance examinations are entirely oral as far as regards geography. In future a written examination in the form of questions, of problems, and of a dissertation will be compulsory. Consequently the candidates will hereafter be trained, not merely in an exact knowledge of descriptive geography, but also to coordinate their information, and to deduce well-reasoned conclusions. Alongside the course in theory there will be a course in applications. The power of judgment will be developed, and that of pure memory minimized. We consider that geographical education will not bear fruits except under such conditions.

"In the examination for our professorat commercial there will be the same endeavor to associate the geographical teaching with the greatest possible number of other studies. In the higher examinations geography is not allied to the history of commerce nor to the political economy, which are treated by themselves, for we are guaranteed against an abuse of specialism by the age and maturity of the student. We ask the candidates, however, after a brief preparation, to discuss a question in economic geography in a foreign language. This ingenious examination has given us the greatest satisfaction. Owing to the complex character of this text we are assured that the future professors, sent on a mission to a foreign country, are not merely trained in the current language, but have lived among the people of the country in which they have visited, have heard the discussions in different kinds of societies, and have read much. In this respect we are fully satisfied with the results.

"In general outline such are the principles which dominate our teaching of economic geography. They are of the same nature as those which inspire all our secondary education."

Economic geography has an important place in the curriculum of the *L'Ecole des Hautes Etudes Commerciales*, which is supported by the Paris Chamber of Commerce.

This school prepares students intended for business or industrial life for positions in banks or in railways, for the consular and the civil service, and for commercial teaching. The pupils are those who have passed through the Lycée or other secondary schools, and must be over 16 years of age. An entrance examination is required. A special preparatory school has been formed for preparation for this examination.

*Belgium.*—Twelve special commercial schools exist in Belgium. The most important are those connected with the Universities of Brussels and Liège and the Higher Institute of Commerce in Antwerp.

At these institutions the course extends over two years, but for those entering the consular service a third year is required.

The pupils at the Antwerp Higher Institute of Commerce have to pass an entrance examination on the general subjects of instruction in the Athénées, Colleges and Gymnasias, and a preparatory course is also given at the institute for this examination, in which physical geography forms a part. A commercial museum, library, and laboratory form part of the institute.

*German Empire.*—The following quotation from an interesting and valuable report on Commercial Education in Germany, by Mr. Consul Powell (Diplomatic and Consular Reports, Miscellaneous Series, No. 483, 1898), summarizes the present condition in Germany:

"There existed in 1891 in the German Empire 165 commercial continuation schools, of which 65 had been started since 1885. In Prussia there were 77; in the other States, particularly Saxony and Baden, 88, only one of which was founded by the Imperial Government. Town councils founded 23; chambers of commerce, 11; merchants' guilds, 20, and others by associations and private munificence. The State granted a subvention to 54, and town councils to 68.

"A higher order of commercial education is found in the secondary commercial schools, sometimes improperly styled commercial academies, and are either independent establishments, as those of Leipsic, Dresden, Chemnitz, and others, or only special branches attached to the higher public schools, as at Munich, Zittau, Frankfort-on-the-Main, Flensburg, and a few other places.

"The intention of these commercial academies is to benefit those young men who, before entering business, wish to devote a few more years to the further cultivation of higher branches of commercial knowledge, and to perfecting themselves in modern languages. On the other hand, the 'Handelsschulen,' which are based upon or joined to the national school or secondary school system, teach German, foreign languages (always English and French, oftentimes Italian and Spanish), history, geography, mathematics, natural science, drawing, commercial history, banking, exchange, commercial law, bookkeeping, political economy, knowledge of merchandise, and technology.

"It is now stated that the Prussian Government are next session going to introduce a bill in the Landtag to provide a considerable sum of money for the support of commercial education, not only with reference to the education of clerks, but also as a new department in University Extension, and it has been deemed advisable to imitate the example of Leipsic with its recently opened commercial university, and to attach to a number of universities a special branch for the teaching of commercial knowledge in its more advanced and scientific regions, similar to the polytechnica at Karlsruhe and Darmstadt, which, so far as I am able to ascertain, were the first to adopt the Leipsic method.

"At Aix-la-Chapelle, Berlin, Hanover, and other places possessing polytechnic institutes, special departments for commercial instruction are to be added, the efficiency and success of which can hardly be doubted. In short, the great interest in commercial education which has now been aroused in the various governments of Germany is sure to produce very considerable results before long."

Dr. Sigismund Günther, professor of geography in the Polytechnicum at Munich, has sent an account, of which the following is a summary:

"Our school gives a complete course in commercial and economic geography every year, two hours per week being devoted to it. In winter extra-European countries, and in summer Europe, are dealt with. The course is compulsory for all who aspire to become custom-house officers. Except this school, there is no other in Bavaria dealing with this subject from an academic point of view, but a proposal has been made to organize a course in this branch of applied geography at our industrial metropolis—Nüremberg. Except for this, there is no advanced instruction in economic geography, although it is naturally a subject taught in the elementary commercial school."

In Leipsic, the Public Commercial School (Oeffentliche Handelslehranstalt) is nearly seventy years old, and is now under the charge of the chamber of commerce. In the division preparing youths who have finished their school course for business geography is taught two hours a week in each of the three classes.

Dr. Kurt Hassert is giving a course of lectures of three hours per week in the University of Leipsic, and also in the Commercial University (Handels-Hochschule) on the geography of the world, transport, and trade.

Dr. T. Delius, lecturer in English and in economic geography in the newly formed commercial department of the Royal Polytechnicum, at Aix-la-Chapelle, has kindly supplied the following information:

"For some time past there has been a movement on foot for a higher commercial education on the plan of our university system, but it has not as yet resulted in the establishment of a new institution except in Leipsic. Last year they tried the experiment at Leipsic of admitting young business men to the university lectures on the same footing as the other students, and the experiment seems to be successful. We are trying here a different arrangement, viz, the addition of a commercial department to the technical one already in existence. There will be lectures on all the principal subjects that interest business men: Political economy in all its branches, commercial law, commercial arithmetic, 'waarenkunde' (knowledge of merchandise), modern languages, commercial geography, etc., so as to provide for the needs of a higher education for business men.

"For economic geography only two lectures a week are provided at present, but I hope to obtain more before long. In the winter session I intend to lecture on America, Australia, Africa, and Asia, while my colleague, Dr. Lehmann, is going to lecture two hours a week next summer on general economic geography and Europe. This arrangement will probably be modified at no distant date, but at present the whole thing is in an embryonic state. The funds for the new department are not provided by the State, but by the chamber of commerce and other commercial corporations. We are going to establish a commercial museum in connection with our department. We have funds for 'Waarenkunde' and for a collection of coins—the latter of which is under my charge in the summer session. I lecture on measures, coinage, etc. Besides, I intend to establish a geographical collection—especially literature—monographs, etc., referring to economic geography."

*Netherlands.*—Mr. W. R. Bischof, honorary secretary of the Netherland Chamber of Commerce in London, has kindly obtained the following information from Mr. J. Yzerman, of Amsterdam, lecturer in geography at the Commercial High School at Amsterdam, through the intermediary of Dr. J. H. H. Hülsman, head master of the same school:

"In all Dutch schools the pupils go through an elementary course of geography. There is no special training in commercial geography, except in those schools which are specially devoted to the education of pupils in commercial matters.

These schools are: (1) The Commercial High School at Amsterdam, where a course of lectures is delivered twice a week, extending over two years. This school is organized by the municipality of Amsterdam.

"*Syllabus.*—The Netherlands, and its colonies and possessions, is the special subject treated in these lectures, but the most important European countries—e. g., England, Germany, France, Belgium—and the most important non-European countries—e. g., the British colonies, Egypt, China, Japan, United States of America—also receive careful attention. The industries, commerce, connections by sea and railway and telegraph, the transport arrangements, the ports and markets of those countries, are studied. The physical condition, climate, the food, etc., are described. Full statistics are given. These are mostly derived from consular reports. The statistics for the Netherlands and its colonies and possessions receive most consideration.

"In former years 'Zehden's Commercial Geography' was used, but as it gives most particulars about other countries than the Netherlands, and very little about the Netherlands, the pupils have had to rely on the lectures delivered by the teacher.

"(2) The private Commercial High School at Amsterdam. We know commercial geography is taught at this school, but we have no particulars of the course of instruction.

"(3) Twentsche Commercial and Industrial School at Enschede. The manufacturing district in Holland, in the province of Overysel, is called Twente; it is the Dutch Lancashire. The curriculum lasts one year. The programme includes the Netherlands, its colonies and possessions, and the countries which have most commerce with it. The highways of the world's commerce are also treated.

"(4) The Commercial Class at Rotterdam. The curriculum lasts a year, two lectures a week. The programme includes the principal countries of Europe. The special subjects are: The centers of industry, the commercial highways by land and water, the condition of the agriculture, and the principal commercial towns. Plants—cotton, flax, poppy, etc.—which have importance in commerce and industry are dealt with, and special attention is given to their cultivation, their peculiarities, their transport, etc. The chief markets for the raw products and for manufactured goods are described.

"In connection with the schools or classes numbered (1) and (4) a public high school exists, where the pupils are, more than at the other public high schools in the Netherlands, taught with a view to a subsequent special commercial training. The education at those two public high schools lasts three years. Pupils enter generally when they are 12 years of age.

"Only pupils who have successfully passed through the three years' curriculum at these public high schools, or their equivalent elsewhere, can follow the whole course of lectures delivered at these commercial high schools. Such training, however, is not necessary for pupils who want only to attend to the lectures on one or two special subjects.

"At the Commercial High School at Amsterdam lectures are delivered like those at Rotterdam with regard to the raw products of industry and commerce (wares and merchandise). This forms a special subject, and is not treated in connection with commercial geography.

"The above are the chief points of the report which has been sent to me.

"Commercial geography is taught in the Netherlands in the two principal commercial towns, and in the principal seat of industry.

"The idea of the educational system in the Netherlands is that commercial geography can only be taught successfully if the pupil has a sound knowledge of the general geography of the world. It is not taught to children under the age of 15 years, and only to pupils when they have had such an education as will enable them to follow such a subject intelligently. It is only taught to those intending to follow a commercial career.

"Commercial geography is looked upon in the Netherlands as a special subject of teaching. This is why it is taught in a thorough manner. The better the grounding in general education the pupils have the higher the standard is that the teacher can aim at."

*United States of America.*—The University of California has founded a college of commerce of full academic rank. Prof. George Davidson, who has been over fifty years in the United States Coast and Geodetic Survey, and whose travels are counted by hundreds of thousands of miles, has been appointed to the geography chair. His course this winter deals with the Pacific; its currents and winds and highways of commerce, and countries bordering the Pacific; the nature of these countries and of their peoples; their various products and manufactured articles; their inland transportation; and their relation to the great highways of commerce. A commercial museum is attached to the college.

The University of Chicago has also founded a college of economics and politics; but as yet no provision has been made for the teaching of geography.

The economic schools of several other American universities are very important, but except for lectures upon transport, usually associated with transport law, geography is not a subject dealt with in them.

The Commercial Museum in Philadelphia deserves special mention, although it does not as yet have any systematic courses of instruction in connection with it. Some of its monographs on economic geography are such as should be prepared in the economic section of the geographical department in a modern university. Some of the specimens of its great collection are arranged geographically, and the museum ought to be a great center for teaching economic geography. Commercial museums should form part of the necessary equipment of every geographical department, although not necessarily on the elaborate scale of the great one in Philadelphia.

#### CONCLUSIONS.

1. There is a growing realization of the importance of commercial geography in all commercial countries. In many centers of our own country, more particularly in the industrial regions of England, so much has been done in the way of forming classes on the subject in the evening schools that it is coming to have a more important place in the evening continuation schools everywhere.

2. On the other hand, there is no consensus of opinion as to what commercial geography is, or what should be the successive stages in which it is taught. The diversity of syllabus, however, is a good feature, for every region has its own particular economic conditions, which should largely determine the details of the syllabus.

3. One difficulty most teachers of commercial geography in Britain have to contend with is the lack of geographical training in their pupils, and much time has to be spent in teaching them what they should have learned at school. The syllabus of the entrance examination of the *École des hautes études commerciales* in Paris is an example of the knowledge required abroad before a pupil is admitted into an

advanced commercial school. The need for improving the quantity and the quality of the teaching of geography in our schools, where it is so often neglected, is a very pressing one, and must be attended to if the special training of the evening and day commercial schools and colleges is to be of much value. A thorough and sound commercial education can only be based on a thorough and sound general education.

4. Another difficulty is that teachers have to teach themselves, and at present hardly anything is done to help them to do this. More advanced teaching in economic geography is even more necessary than an extension of elementary teaching. At present practically no provision is made to systematically give advanced instruction in economic geography, and this is not likely to be done until the matter is seriously taken up by the universities. The directors of industry and commerce need this systematic training even more than their subordinates, and it is of vital importance that the universities and the more advanced technical colleges should see to the adequate provision of the means of teaching this subject, as the Germans and Americans are beginning to do.

It would seem, therefore, that the continental nations are ahead of us in the more thorough training given in geography in schools; that, like ourselves, they have become thoroughly alive to the importance of a sound special training for young business men after their school years, for which they are now making provision, and in the matter of advanced economic training they have moved ahead of us.

Some of the writer's views about the economic section of a geographical department are outlined in the accompanying paper. In conclusion, he has to thank the numerous correspondents who have so readily answered his many questions, and, above all, the Manchester Geographical Society and its energetic secretary for the opportunity of making this survey of the present position of the teaching of economic geography.

## APPENDIXES.

### APPENDIX A.

#### SYLLABUS OF EVENING CONTINUATION SCHOOL CODE IN COMMERCIAL GEOGRAPHY, ENGLAND AND WALES, 1898.

A good grounding in the physical features of the earth's crust, the variations in climate and in animal and vegetable life should have been received before a scholar enters upon the study of commercial geography, which deals with the geographical distribution of commercial commodities, chiefly food, with raw and manufactured products and minerals, and with various facilities and hindrances to trade.

The full course is divided into three stages, as follows:

*Elementary stage.*—The British Isles, means of communication and transit by land and by water, the trade routes and facilities for communication with all the more important countries of the world.

*Intermediate stage.*—One British colony, India, and one foreign country; the commercial relations of each with Great Britain and with other countries as affecting the interests of Great Britain.

*Advanced stage.*—Some one branch of British trade to be thoroughly studied, commencing with the cultivation or production of the raw material, its distribution, and conveyance, manufacture, markets for finished products, duties and tariffs (if any), competition of other countries.

It is suggested that each country should be dealt with on lines similar to the following:

(1) Position, configuration, and climate, and their influences on the prosperity of the country. (2) Raw productions: (a) Mineral, (b) vegetable, (c) animal: How and where found, how rendered of commercial value, for what used, and price (fluctuant or otherwise). (3) Manufactures and markets therefor. (4) Means of transport and communication (natural and artificial). (5) Exports: Natural or artificial (tariffs) restrictions to the development of trade. (6) Imports: Natural or artificial (tariffs) restrictions to the development of trade. (7) Seaports, river ports, and other commercial towns. (8) Trade routes traversed by British ships bearing imports and exports. (9) Foreign competition encountered by British merchants and extent thereof.

The course should embrace the study of the localities where and the geographical and local conditions under which the various commodities are produced; the means of transit, and the trade routes available, both for inland and for export, together with the distances and ordinary modes of conveyance to important markets; the quantities available for export, and the actual recent rates of export to various countries;

neutral markets and extent of British trade with them; the quantities in demand as imports, and the extent to which this demand is met by various foreign countries; the capacities of countries for commercial development, including both old and new countries; weights and measures, currencies, tariffs, postal and telegraph arrangements, and social and political characteristics likely to affect trade; ports and harbors, light-houses and light-ships, coaling stations. Maps showing the districts producing the more important natural and manufactured commodities should be made use of.

Special maps, showing rivers, canals, railways, cables, steamship, caravan trade routes, and producing districts should be obtained.

It would be helpful if the students were required to draw a series of charts or maps, each of them illustrating some particular characteristic of the country under revision, and on the following lines, showing: (1) Contour of the land, lines of drainage, and particular localities of the river basins. (2) Distribution of mineral products (details can be obtained and filled in from the text-book). (3) Distribution of vegetable products. (4) Distribution of industries. (5) Canal, railway routes, and trade lines. (6) Steamship routes to nearest countries and trade centers, etc., until each characteristic has been so exhausted.

In order that the students may see and examine the real objects spoken of, it is recommended that a well-chosen museum for practical teaching be provided. Where a commodity is being dealt with, it would be well to show it not only in its natural state, but also in the various stages of manipulation to which it is subjected before the useful article is produced. When the exhibition of the object is only imperfect, pictures of the object, with its native surroundings, should be shown.

#### APPENDIX B.

##### CITY OF LIVERPOOL SCHOOL OF COMMERCE.

[Mr. Clarence G. Dyall.]

**GEOGRAPHY.—Commercial.**—General survey of the trade of the United Kingdom, with particular reference to Liverpool. The imports and exports of the United Kingdom, and the areas in which the imports are used and the exports manufactured. Causes determining trade and locality of manufacture. Geography of great commercial products: Cotton, wheat, petroleum, timber, tobacco, wool, etc.; chief countries of production of these articles and their condition; chief countries of consumption. Trade rivalry of other countries with the United Kingdom. Great trade routes and lines of communication, with particular reference to the cheap and rapid transport of wheat, cotton, petroleum, etc., from the place of production to that of consumption.

## CHAPTER XXVI.

### A REVIEW OF SWEDISH GYMNASTICS.<sup>1</sup>

[By Theodore Hough, Assistant Professor of Biology, Massachusetts Institute of Technology; Instructor in Physiology and Personal Hygiene, Boston Normal School of Gymnastics.]

The term "Swedish Gymnastics" is usually understood to mean, in this country at least, a system of physical training designed to meet certain demands in the education of childhood and youth; and, since the question of its utility is at present largely or chiefly concerned with its use in schools, it will be well to begin our discussion with this phase of the matter.

If it is a function of education to train the growing individual for usefulness in life, physical education must demand attention in any proper scheme of educational work, since the capacity for usefulness is so largely determined by the physical health of the individual. It is perfectly true that we find cases in which, owing to unusual mental power, success has been attained in spite of physical defects and even of moral defects. We see cases where success has similarly been attained because of moral qualities and in spite of very moderate mental power or of physical weakness. But such cases are the exception. If you study great masses of people, you will find that serious defects in physical power are almost certain to hamper life's work. That work may be done, but it involves a severe struggle. In a large percentage of cases it is not done, and life becomes a succession of failures. It is, after all, on the physical man that we build. The leaders in life's activities are almost without exception men of strong physical constitution; a large percentage of the failures are men of weak constitution; and any system of education which impairs physical vigor and leaves men physically unequal to the work of life is unworthy of encouragement,—is, indeed, radically wrong.

The physical condition of health of a human being at any age until growth is completed is the result of a process of physical development. In actual life, Athene does not spring full-fledged from the brow of Jove, nor Venus from the foam of the sea. For 175,200 hours the most varied physiological activities have been at work to make the man or woman of twenty years; and, could we read but deep enough, we could see that the conditions which obtained during each of those hours have contributed their share to the final structure, the health, the possibilities of that living being.

Development, in short, is the result of three factors:

1. *Heredity*.—It is not necessary to attempt a definition of this term. It is the expression of the structure and characters of the fertilized ovum from which all the cells of the body are derived. It gives us the living material upon which we must work in education, and at once determines the possibilities, the limitations, and, to a certain extent, the course of training.

2. *Environments*, both of the body as a whole and of each of its units, the living

---

<sup>1</sup>This paper was given, practically in its present form, in May, 1899, as a lecture before the students of the Boston Normal School of Gymnastics, and subsequently, in June, 1899, before the physical training conference at Springfield, Mass.

cells. This would include the external conditions of life and the chemical and physical character of the blood. Under it we would include the food supply, the surrounding temperature, clothing, the care of the young by the parents, the hygienic conditions of the dwelling, bathing, and so on.

3. *Activity* of each cell and of the body as a whole. By activity I do not mean simply muscular activity; that is merely the activity of one kind of cell—the muscle fibre. The discharge of a nervous impulse from a nerve cell is a case of similar activity in another kind of cell; the process of secretion is similarly another case of activity in a gland-cell; and so with each kind of cell in the body. Now, we have satisfactory evidence in most cases that the growth of the cell is profoundly influenced by its functional activity and can not be complete without this activity. If a growing muscle fiber never contracts, it can not develop into a healthy adult fiber. A growing nerve cell which never sends an impulse over its axon can not become an efficient nerve cell. A growing pancreas which never secretes pancreatic juice can not grow into a perfect gland. The classical example of this is the failure of the motor cells of the cervical cord to develop when the arm has been amputated about the time of birth. Under such circumstances the nerve cells do not send impulses out over their axons, and accordingly take on characteristic degenerated forms. Moreover, within certain limits the efficiency of an adult cell is proportional to the amount of activity it has had during development. The muscle fiber which has been used is capable of doing work which one which has been used but slightly can never be trained to perform. "You can not teach an old dog new tricks," is one way of saying that the greatest possibilities of training belong to the period of growth, and this is especially true of physical development. We can do for the physical man before the age of 21 what it is absolutely impossible to do between 20 and 60.

The three factors, then, at work in development are heredity, environment, activity. Heredity should determine what education is to attempt and the general course which its operations should follow. Environment demands attention to the hygienic conditions of the home and the school, to clothing, feeding, bathing, etc. The greater part of the work of education, however, is directed toward giving such guidance to the activities of the body, and especially to the volitional activities, as shall produce the best physical, mental, and moral results. Now, if what has already been said be true, it is clear that muscular activity is a necessary factor in the development of the physical man. Not only is it necessary to the proper development of the nervous and muscular systems, but over and above this, in subsequent life health is so intimately dependent on muscular activity, and muscular activity is so hard to maintain in a physically defective body that some sort of physical training must go along with study in youth to make our educational scheme complete.

When we examine farther into the matter, we see that not only does muscular activity play an important part in general in the development of the child, but that different neuro-muscular mechanisms develop best at different periods of life. Accordingly, the muscular activity of the child is directed chiefly toward the development of the mechanisms of accustomed movements, such as those of walking, running, and, in general, of movements which involve the use of large masses of muscles and produce coordination of these muscles. Later, activity takes on more distinctively the character of skilled movements, which cultivate manual dexterity, the more perfect use of language, etc. Going along with these, we naturally find the growth of the more complicated mental processes, this mental development generally, though not always, continuing in full force long after the motor mechanisms are acquired.

Nature, however, does not make the adult man as a machinist does a piece of mechanism, by completing one thing before beginning another, and then, when every part is complete, putting all together into a harmonious whole. The curve of work on each mechanism would overlap the curve of work on other mechanisms, but the maximum points of these curves would be different.

A moment's consideration of the previous discussion brings out clearly the fact that the mental education of the child begins at the time when his physical development is still going on, and that the work of the schoolroom is a direct hindrance to normal physical development. The child must give up his play in order to learn his lessons. He must sit still, and that, too, in what are frequently unsuitable desks, made without reference to the proportions of his body. It is, indeed, very doubtful whether the highest physical development is ever consistent with the best mental training; the boy as he leaves our schools can never be capable of the same endurance that we find among more uncultured peoples who live under otherwise favorable surroundings; nor is there any physiological reason why he should reach such a state of physical development, considering the work which he has to do in life. But it is not necessary that he should leave school with impaired health; it is not even necessary that he should be hollow chested, stoop shouldered; it is not necessary that he should have an awkward carriage; it is not necessary that he should be physically lazy, disinclined to take the very moderate amount of exercise which the maintenance of his health demands.

The mental training of youth, in other words, has introduced an unnatural physical environment, which, if not corrected, will in nine cases out of ten tell upon subsequent bodily health, and so in too many cases upon mental and moral health as well. If no attention were paid to mental training, if our children never went to school, physical training would be for the greater part unnecessary. It is, therefore, one of the main functions of physical education to correct the injurious effects of the unnatural environment created by mental education, and to do this without endangering the efficiency of that mental training.

Such is the starting point of the Swedish system, in common with most other systems. Whether it adopts the correct means or not, it goes to work with the right object in view. Its purpose is not to train athletes, although it may be developed in that direction; it is primarily an attempt to conserve the physical man during his mental training, so that, when the period of schooling is over, he shall have a body physiologically capable of sustaining him in the work of his life.

Not only is its purpose correct, but its general attitude in approaching the practical problems is also correct. Its work, in other words, does not run to doing difficult feats on particular pieces of apparatus; the Swedes claim—and with justice—that they do not adapt their work to apparatus, but their apparatus to their work. Far be it from me to claim that this is a virtue found only in this particular system; but in certain other systems this point is not properly guarded; and in any system corrective exercises, to be effective, must be carried out under the guidance of trained teachers. It is a fact not fully appreciated, even among those who believe in exercise in general, that the best physical development comes from the proper use of very many different movements; that the use of one group of muscles going along with the improper use of other groups of muscles, although for the time being serving the general hygienic purposes of exercise, may produce anatomical results which can only be described as deformities; and that this is especially apt to be the case where movements are improperly executed.

Gymnastics, moreover, as developed in Sweden, has kept in view another matter of very considerable practical importance; it is necessary in our schools that comparatively large numbers of students shall receive physical training at the same time; and it is impossible to avoid this condition entirely, even with the most favorable arrangement of the study schedule. Largely for this reason the use of large and cumbersome apparatus, which occupies an amount of floor space entirely out of proportion to the number of students which it can accommodate, is avoided, and the work is done either by using free standing movements alone or else these with the addition of work on apparatus which can be arranged along the walls or ceiling of the room or can readily be removed, leaving the entire floor clear for the class.

drill.<sup>1</sup> The movements chosen at the same time exercise all the muscles of the body and yet can be carried out simultaneously by large classes. Thus we have introduced the gymnastic drill, which is employed not solely for its value as a drill, but because a single instructor can do effective work with a large number of students at the same time. This is a matter of great practical importance. The drill is far superior to individual gymnasium work. This is seen at once if one realizes the fact that if physical training is to accomplish the very desirable end of producing correct proportions, form, and carriage of the body the instructor must be able to observe quickly the work of a large number of students in every movement they make. With ordinary apparatus work, such as is used in most of our gymnasia, this is impossible, because fifty or a hundred different students are each doing a different thing. The drill likewise has the advantage of supplying an incentive to every student to do the movement correctly, in that others are doing the same thing at the same time. For these practical reasons the gymnastic drill, whether with apparatus or without it, is the ideal form of gymnasium work.

We often hear critics sneer at this feature of the system. In a recent article in the *American Physical Education Review* we read of "that nervously exhausting and deadening drill known as the Swedish gymnastics, which, by the name of educational gymnastics, adds fatigue to fatigue by taking the initiative away from the child and forcing him to pay constant and close attention to the orders of the teacher, that he may execute with precision entirely uninteresting and conventional movements." I have no disposition to underrate the value of spontaneous play in the development of the child. By all means encourage the child to play, and make this a part of the school day. Nor do I advocate undue attention to gymnastic work. I advocate giving only so much of this as is necessary to correct the physical or physiological faults resulting from schoolroom work. Nor do I deny that any drill, any gymnastic work, may be "nervously exhausting and deadening," this depending on the teacher, the main factor upon which the success of all gymnasium work depends; but, granting all this, I must insist that gymnastics, when properly used, can produce advantageous physiological results, which can not be produced by play alone. It does not do to forget the fact that while play will do for a savage or a kitten what we try to do for our school children by gymnastics, the material upon which the factor of play works in these cases has not been subjected to conditions which actively produce deformities or deficiencies. Superintendent Seaver well stated the purpose of school gymnastics as the antidote of the school desk. Take the most common example, that of stoop shoulders and contracted chest. Will it be claimed that these can be corrected by spontaneous play alone? Personally I have seen too many cases which could not be brought into agreement with such a theory to allow me to accept it, and even in many cases where play exerts a corrective influence the same results can be more surely and more economically accomplished by gymnastics. And we deny absolutely that gymnastics need be a bore.

The last paragraph indicates the position of Swedish gymnastics in physical training, and this must not be lost sight of by those who would understand it. It will be more fully shown in later parts of this paper that physical training presents two distinct although not mutually exclusive sides—the general hygienic and the corrective. While Swedish work gives to a very considerable extent the general hygienic effects of exercise, it is primarily concerned with the corrective side; and it may be well to define clearly at this point what is meant by corrective gymnastics. The effects of the physically specialized life of the school, and, indeed, of most forms of specialization, manifest themselves in two ways—in anatomical changes and in awkwardness or peculiarity of movement of the body as a whole. Strictly speaking, the

<sup>1</sup> The word drill is always used in this paper in a sense similar to its use in military drill, and never in the sense in which it is frequently employed in the literature of gymnastics, where it means a definite series of movements performed in unison by a class, as, for example, in a "dumb-bell drill."

term "corrective" should be used only with reference to that gymnastic work which attempts to remove anatomical and physiological faults. In point of fact, the exercises which are used to do this are essentially the same as those used to prevent the same faults, and no hard and fast line can be drawn between remedial and preventive gymnastics. It is therefore convenient to include the two under the single term corrective, which is thus used in this paper. It will subsequently be shown how gymnastics can have this corrective effect.

The most distinctive feature of Swedish work is the fact that it never loses sight of the corrective element. This is its primary purpose. Gymnastic movements which, though graceful in themselves, have a marked tendency to produce some anatomical fault are rigorously excluded. Even those which, though not open to this criticism, only result in the ability to do some gymnasium trick of little or no use in practical life are relegated to a subordinate place. The basis of training of its teachers is kinesiology. The anatomy of the skeleton—the joints and the muscles—is studied most carefully, not, as Du Bois-Reymond would have us believe, in order that the pupil may be conscious of what particular muscle he is contracting, but because it furnishes the only means of understanding the effect of a definite movement on the skeletal parts, and so of estimating its corrective value. Such study is for the preparation of the teacher, not for the pupil of the gymnasium floor. It is not even necessary that the teacher should think of the kinesiology of a movement at the time he gives a command, but his use of a certain movement should ultimately, consciously or unconsciously, rest on this basis.

This characteristic of Swedish work is at once its greatest strength and its greatest weakness. It is its greatest strength because no other physical trainers can show such theoretical knowledge of kinesiology or such successful practical application of that knowledge in corrective work. The Swedes have worked out this part of the subject with singleness of purpose, and they have made the field their own. On the other hand, it is its greatest weakness. At times individual teachers have forgotten that corrective work is not the whole of physical training. It has been pushed to a needless extent and at times to the exclusion of outdoor work, which is more attractive and which also produces an amount of endurance which indoor corrective work can not. Nor can there be any doubt that these corrective exercises have at times been given in a manner that strongly suggests an operation in orthopedic surgery without anæsthetics. There is a right way and a wrong way of doing all things, and it would be strange indeed if some teachers had not taken the wrong way and failed to infuse into their work that personal element of interest and enthusiasm upon which its success very largely depends. I will even go farther and say that there are few fields which offer such opportunities for the successful exercise of all the qualities of a bore as does that of Swedish gymnastics. This follows from the fact that it is systematic, and anything systematic is peculiarly liable to such abuse. But this is no valid argument against the use of the system. Is it a valid argument against the study of the English language and literature that so many of its teachers do most fearfully and wonderfully bore their pupils with it?

Having dealt with these more general features of the problem, we may now pass to the consideration of those which have to do with the system itself. And, first, let us say that the Swedes are right in having a system. The "day's order" is the point of most attacks. Some critics seem utterly unable to understand that anything systematic should be anything but monotonous, and so it would be were each day's work like that of each preceding day. The "day's order," however, involves no such idea. Apart from the fact that, as the pupils work more and more in the gymnasium, new exercises are introduced—a thing not easily done, by the way, with large numbers in the ordinary apparatus work—the "order" only affects the general classes of movements, and within each class of span bend, heave, back, abdominal movements a very large amount of variety is possible, and, in point of fact, is util-

ized in the work of different days. There can be no doubt that a poor teacher can make a Swedish drill an insufferable bore; but a poor teacher can make anything a bore, and usually does so.

One of the main points of physiological interest is the matter of progression, as seen from day to day and in the day's order itself. As to the former, all must agree that in any course of training one should begin with simpler work, and as the body improves in physical condition more and more difficult work should be attempted. This is the essence of training. The heart, the vaso-motor system, the respiratory system, the mechanism of heat regulation, and the nervous coordination of the more fundamental positions and movements must all be trained by use to work together. Pupils can do the more difficult exercises properly only as they have become fitted to do them by having experienced the benefits of simpler work. It is not my purpose to show how the Swedish system does this, as I am not aware that anyone has denied that it is capable of any degree of refinement in this kind of progression. I shall linger long enough on the subject only to say that any system of physical instruction should make clear the necessity of this factor of training if the greatest benefits are to be obtained from muscular exercise at any time of life. Many a man loudly, but ignorantly, proclaims that exercise does not benefit him, simply because he began with a 50-mile bicycle ride or a hard bit of mountain climbing.

Coming to the second kind of progression, the day's order itself, let us say again that, even if the particular sequence of movements adopted is not required by the nature of the case, it is better in general that the majority of teachers shall have some system to guide their work. It is putting it very mildly to say that very few teachers of gymnastics will ever have that commanding genius which will enable them to conduct classes upon the basis of general knowledge of muscular exercise; few even have that originality which would enable them to work out for themselves a rational method of work in physical training. Even if there were no system each teacher would inevitably evolve one. In other words, most teachers would soon fall into certain ruts; and it is simply a question whether you are going to have a system which represents the ruts into which the individual mind has more or less unconsciously fallen or a system which is the result of organized effort, both on the theoretical and on the practical side, for many years. In other words, the work of the teacher of gymnastics is the practice of an art, and it is obviously better that accumulated experience should form the basis of work, even though we grant at the same time that every effort should be put forth to encourage independence and originality.

The Swedes insist that their system is based on correct physiological principles. This may or may not be true. Advocates of the system should, however, avoid making the statement that, as a matter of history, it was deduced from the physiology of the human body. The fact is that the Swedish system of gymnastics was for the most part developed to its present form before modern physiology was more than in its infancy. Ling died in 1839, and it was not until 1860 or 1870 that the several discoveries of physiology began to be coordinated into a satisfactory body of scientific knowledge. No doubt Ling and his successors made good use of the physiological knowledge they possessed; no doubt they constantly endeavored to work from physiological knowledge as a starting point; no doubt they subjected their work to the best physiological criticism they could give it, and no doubt a great deal of this was good physiology and produced good results. But, granting all this, it is not wise to claim that the system was deduced from physiology. It is an art; and whatever use may have been made of pure science in its development, yet if it is successful that success is quite sure to be due to practical experience of results—the true test of any art which deals with the human body. A bridge can be built on the basis of scientific knowledge alone, but only because we know all about its parts and can calculate exactly what each one can do. It is quite conceivable that a civil engineer should design a new kind of bridge which introduces entirely new features for sustaining the

weight, and yet know beforehand that the structure will do exactly what he expects of it. That is one of the highest triumphs of exact science. But the science of the workings of the human body, or physiology, has not yet reached such a degree of exactness. Much less had it reached it in Ling's day. It is with gymnastics as it is with medicine. Physiology suggests, and often its suggestions are correct. It aids in interpreting results, and so may be an indispensable aid; but, after all, a physician does a certain thing because he has done it before and found that it produced the effect he desired. And the practical teacher of gymnastics gives certain movements because—although what he knows of physiology may have suggested them, and although he feels more confident in using them—because he believes they are physiologically correct; yet, after all, he uses them because he has tried them in the past and found that they work. And if the Swedish system is worthy of confidence as a practical method it is because it rests ultimately on this basis.

I have spent the time I have in emphasizing this point because I know that incorrect physiological claims have been made in support of certain things done. Various writers present us a body of so-called physiological knowledge which, to say the least, does not commend itself to physiologists; and I may as well tell you frankly that if an uncandid opponent of the system should desire to make fun of it he would find ample occasion for doing so in many of the physiological statements which have been given in explanation of its day's order. I have seen this done myself, and that with most pronounced success.

But anyone who should make this a reason for rejecting the system in part or in whole would only advertise his own lack of common sense. The Swedish system of gymnastics, like every other system, is not what is written in books, but what is practiced on the floor of a gymnasium. As I have said, it is an art which has been developed with a certain end in view, and is built upon practical experience of results. If good results are achieved, the system is sure to rest to that extent on a sound physiological basis.

Now, the Swedish system does achieve good results. Comparison of the entering junior and the graduating senior classes of this school proves this—not a comparison of the two classes during the drill hour in the gymnasium, but more especially off the gymnasium floor; and I have never seen it questioned that the results obtained in Sweden are eminently satisfactory, at least from the point of view of corrective work. What, then, are the strong points of the system which enable it to produce its physiological effects?

1. Every group of muscles in the body is given its appropriate functional activity. We have thus produced the effects of use upon these muscles and upon the nerve cells which innervate them. The various neuro-muscular mechanisms become more perfect machines, capable of doing the work demanded of them at any time. In connection with this, valuable secondary effects are produced upon other organs, such as the aid to peristalsis with abdominal movements, the increased efficiency of the respiratory mechanism, etc.

2. Closely connected with this is the correction of faults of posture by properly chosen contractions of the various groups of muscles in the body. The muscles adapt themselves to the work of the skeleton and the skeleton adapts itself to the work of the muscles. Thus the dorsal muscles of the neck will lengthen and the ventral muscles shorten when the weight of the head is allowed to bend the neck forward. When the pectoral muscles are exclusively used and the pull they exert on the shoulders is not corrected by contractions of the muscles of the back the latter group of muscles lengthen, while origin and insertion of the pectorals come closer together. The result is round shoulders, the skeletal parts accommodating themselves more or less to this condition. When the erect posture is not carefully maintained and improper curvatures of the spine result the antagonistic muscles and ligaments of the spinal column likewise accommodate themselves to the changed condition, those on

the concave side growing shorter and those on the convex side growing longer. Consideration of these deformities show that they are produced in two ways—by improper positions and by the use of one set of muscles with concomitant disuse of their antagonists. In both cases one set of muscles becomes longer—i. e., origin and insertion come to lie farther apart; while the other becomes shorter—i. e., origin and insertion come to lie closer together.

The trouble is corrected, first, by such work as will passively stretch the shortened muscles and ligaments; in response to which stretching they lengthen. Thus the correction of the fault of round shoulders begins with the stretching of the pectoral muscles by contractions of the back muscles or by other means. In addition to this, we must strengthen by use the muscles whose antagonistic play maintains the proper relation of the skeletal parts, the purpose of this obviously being to make such muscles sustain the continuous contraction demanded of them without undue fatigue.<sup>1</sup> Mere difference in the strength of antagonistic muscles will not of itself produce skeletal deformity. Such deformity is apt to result, however, when this difference of strength goes to the extent that one group of muscles is too weak to sustain efficiently the work demanded of them. When they fatigue in this way exactly the same thing happens as in a "tug of war," when the greater fatigue of one side gives the victory to the other. These considerations also make it clear that, where both antagonistic muscles are too weak and consequently relax their support to such skeletal structures as the vertebral column, skeletal deformities may result even when the muscles in question are of equal strength. Undoubtedly many cases of improper curvature of the spine have their origin in this cause.

Whether or not this is the complete physiological explanation, there can be no doubt that such deformities, when not too grave, can be corrected in the manner indicated, and it is in this field that gymnastic work in our schools does what play alone can not do. When, for example, stooped shoulders have been acquired by faulty position, spontaneous play gives no stimulus to bring about that contraction of back muscles which will correct the fault. Indeed, in many cases play only accentuates the fault, because of the natural tendency to use the stronger muscles and to disuse the weaker ones. This must be especially true of unregulated play, and even with supervision attention can not in general be given to the manner in which a movement is made. Play is therefore not a practical method of corrective work.

3. The work not only trains the neuro-muscular mechanisms of isolated movements to a high degree of efficiency, but also trains these mechanisms to work together. In other words, it trains the power of nervous coordination of movements. Just as the separate cells of the body become more efficient by being used, so these cells learn, as it were, to work together by performing as accurately as possible those movements which call for their cooperation. Hence the stress which is laid upon balance movements and also upon the proper execution of movements involving considerable coordination. Awkwardness is for the most part only another name for the bad habits formed by doing things in the wrong way. It is avoided or corrected by doing them in the right way.

Every effort is made, moreover, to facilitate this correct performance of more or less complicated movements, and it is partly for this reason that the element of undue fatigue is avoided. The same rule is insisted upon in one of our most successful methods of language study. The lesson must not exceed fifteen or twenty

<sup>1</sup> Not only does a fatigued muscle exert a less powerful pull than a fresh muscle, but the feeling of effort under these conditions becomes an unreliable indication of the amount of work done. If a dynamometer be arranged so as to record the work done at every moment of the effort and not merely the maximum pull, it is found that toward the last, when every effort is being made, and, to judge from our feelings, with more or less success, to add one pound more to the record, in point of fact the muscle is not doing half the work it did at first; and when we remember what an important part these afferent impulses of the "muscular sense" must play in guiding the work of the antagonistic muscles which maintain proper position it at once becomes clear what a difference it makes whether or not we rely for such work upon muscles which are strong enough to sustain it.

minutes, and must be interrupted as soon as fatigue shows itself. The correct idiomatic use of the language is acquired by the correct repetition of the idioms of the language, i. e., by the acquisition of habits which can be acquired only by correct use. To attempt to speak these idioms when one is fatigued with previous study means that a large percentage of them will be incorrectly given, with the result that, if bad habits are not acquired, the mental path of easiest conduction for the correct habit is no longer the clear and unmistakable one it should be. Precisely the same thing is true of what may be called the grosser movements of the body. To do them correctly is to blaze a clear and unmistakable trail of nervous conduction. To do them incorrectly is to confuse that trail with misleading signs, which must be unlearned.

A very striking feature of the highly coordinated movements used in the Swedish gymnastics is the fact that so many of them are performed with one or both feet on the ground and supporting the weight of the body. Such is the case with all balance movements. The significance of this is at once seen when it is remembered that it is exactly this coordination which is of greatest use in everyday life. An equally great sum total of coordination is required by the more difficult feats on the horizontal or parallel bars or the trapeze, but the skill thus acquired is useful, for the greater part, only in the performance of similar tricks on such pieces of apparatus. I can personally recall cases of men who were most excellent athletes of this kind and yet whose gait was anything but graceful. Now it is a legitimate demand on any gymnastic training in schools that it shall produce not only correct proportions of the body at rest, but also graceful carriage of the body in locomotion; and the principle of training by use shows us clearly that this is to be accomplished chiefly by the use of movements and positions in which, the weight of the body being supported on the feet, equilibrium must be maintained in difficult positions.

4. The need for training to do the more difficult work is kept in view. Students attempt particular movements only as they are provided with the proper physiological agents therefor by previous work. The exercises, in other words, progress from the simpler to the more difficult, and are so chosen that the former directly prepare for the latter. No other work compares with the Swedish in this respect.

5. Full and free respiration is always insisted upon. In many forms of physical exertion there is a tendency to diminish, or even suppress entirely for a time, the respiratory movements. At times, of course, this is absolutely necessary, as when, in lifting heavy weights by the arms, the thorax must be made rigid to assure a firm point of origin for the working muscles. The condition is even then, however, objectionable from the standpoint of the organism as a whole. Probably one of the chief benefits of muscular exercise is brought about through the accompanying increase in the breathing movements. We can not at present positively affirm or deny that this is because of the increased amount of oxygen taken to the tissues,<sup>1</sup> although such an

---

<sup>1</sup>We have good reason to believe that merely increasing the ventilation of the lungs does not increase the percentage of oxygen in the blood, nor the amount taken up by the tissues. The tissues do not take more oxygen because more enters the lungs. On the contrary, their consumption of oxygen is conditioned upon the amount of chemical change taking place in them, and this in turn is largely dependent upon their work. It is almost certainly, moreover, a mistake to assume that during muscular exercise all cells of the body profit by a quickened circulation and a more ready access to oxygen. The percentage of oxygen in arterial blood being practically constant, the amount of oxygen offered any organ will be determined by the amount of blood flowing through it and not by the ventilation of the lungs; indeed, we know that in general the blood supply to internal organs is distinctly diminished during muscular exercise, in order to compensate for the increased supply to the muscles and the skin. Whenever there is an increased amount of blood flowing through an organ, more oxygen will, it is true, be offered to its cells, but it will be taken up by them only as their chemical processes call for it. We have, moreover, good reason to think that the mechanism of respiration, including the heart, provides, under ordinary conditions, far more oxygen than even the working tissue can use. The blood leaving an organ frequently, if not generally, has half the oxygen with which it entered the organ; and this remains true even when the organ is working, the increased blood flow being more than sufficient to compensate for the increased consumption of oxygen.

explanation is frequently given with an assurance which betrays complete ignorance of some well-known physiological literature. It must be remembered, however, that the respiratory movements produce other effects upon the organism than ventilation of the lungs. They aid in the return of blood to the heart and they are an important factor, if not the most important factor, in causing the flow of lymph in the lymphatics. Thus their increase during muscular exercise aids the heart at a time when it is apt to be overworked and increases largely the flow of lymph, not from the working organs alone, but from all organs of the body. This is not the place to describe the physiological importance of the lymph flow. Let it suffice to say that there is good reason to believe that a good, steady lymph flow from an organ is an important condition of its healthy nutrition and that the increase of lymph flow from all organs of the body brought about through the increased respiratory movements is one of the chief agents through which muscular exercise favorably affects the body as a whole.

It is therefore quite conceivable that the breathing movements may be sufficient to supply all the oxygen needed for muscular work and to remove the large amounts of carbon dioxide produced thereby, and yet not be the aid to the circulation of blood nor to the flow of lymph that they should be; and, if this be true, it is a proper function of physical training to train the power of full and free respiration under all possible conditions. It is a matter of common experience that there is a marked tendency to insufficient respiration whenever work presents the least element of effort. I have seen this frequently among bicyclists in going up even slight inclines; they seem to put all their energy into volitional muscular contractions and to have little left for respiration; respiration is, as it were, held in abeyance until the effort is over, and then they must stop to "puff and blow." Now, it is just as easy—nay, easier—to maintain full and deep respiratory movements during the performance of most work, and when this is done there is less of subsequent fatigue. Moreover, as I have attempted to show, the general hygienic effects of the exercise are most probably enhanced by this deep breathing. It would, indeed, seem that all considerations point to the advisability of gymnastic training cultivating the habit of deep breathing; and whether the Swedes give the correct reason for the practice or not, it is a fact that its importance is everywhere recognized in their practical work. The mobility of the ribs is kept at its maximum, the capacity of the thorax is enlarged where that is possible or advisable, while the special respiratory exercises do their part in training the breathing mechanism to the full measure of its working capacity.

6. The carrying out of definite movements with accuracy and precision is a training in volitional control. It increases the efficiency of the mechanism of skilled movements. One who has had such training in carrying out great numbers of movements at the word of command can do with the muscles what it is unlikely that he would be able to do otherwise. The body becomes more "supple," which means largely that the number of its possible movements is largely increased, or, more correctly expressed, the number of its possible movements is not reduced as life advances, and we tend to limit the movements of the body to the few which some sedentary occupation calls for. It prevents the narrowing of the field of volitional control, and it is especially important that the field of volitional control shall not be narrowed during the period of development.

To prevent any misconception, it may be well to state clearly that this increase of volitional control does not mean that a person can at once perform some new kind of work as well as those who have become accustomed to that work by long practice. Almost all special kinds of work involve the more or less constant use of certain groups of muscles, or else, as in swimming or rowing, they involve the acquisition by practice of a coordinated nervous mechanism of accustomed movements. A man with such complete volitional control will have to strengthen still more the muscles

which rowing, for example, involves; he will also have to acquire the nervous mechanism of the movement, but he can learn to row accurately and easily sooner and with less expenditure of effort than can a man without such volitional control.

This effect is of psychological importance. Health depends on exercise, and whether we are inclined to take exercise or not depends partly on the use we can make of our bodies. Exercise is necessarily monotonous to the man who has but few muscles to use, few movements to make. There is an impulse to take the exercise that health demands when the individual has the conscious power which comes from volitional control of many movements. In other words, there is a love of movement, natural to the child, and a priceless possession from the hygienic point of view to the adult, which we should never allow to slip away from us.

7. In a later portion of this paper we shall have occasion to discuss the relations to each other of the two purposes of physical training, corrective work, and the general hygienic effects of exercise, as well as the extent to which the day's order fulfills the latter purpose. We may here anticipate these discussions, however, merely to say that Swedish gymnastics, properly done, produce in a high degree those general effects of exercise which favorably affect the health of the organism as a whole.

I must not be understood as saying that each of the above seven objects is accomplished only by Swedish gymnastics. Some of them are distinctive, while others are not. The essential characteristic of Swedish work is that it aims at and secures in a remarkable degree all these results; and I believe that the secret of its success is to be sought here rather than in minor details of the "day's order," which is simply the practical method adopted of achieving these physiological ends.

The exact form of the "day's order" is not simply the expression of a physiological idea. Certain things are done because they are not the most feasible under given conditions. Moreover, in gymnasium work there is a psychical as well as a purely physiological element; and nothing can be worse than to neglect this in practice. A class is not put directly to executing back or lateral trunk movements; the effect of such a course upon the interest of the class in its work had better be left to the imagination. It is, moreover, only partly for physiological reasons that each movement is given at the time when it can best be performed or least interfere, by introducing the element of fatigue or otherwise, with the proper execution of other movements. Any explanation of the work must therefore take account of other considerations than those which are purely physiological.

The exercises of the day's order may be classified as follows:

1. Introductory movements, which include order movements and movements of the extremities.
2. Span-bending movements.
3. Heave movements.
4. Balance movements.
5. Back movements.
6. Abdominal movements.
7. Lateral trunk movements.
8. Running, jumping, vaulting, and games.
9. Slow-leg and respiratory movements.

The common nomenclature is retained as far as possible, although certain objections may be made to it. Indeed, the names are denotative rather than connotative; and so long as this is understood there is but little objection to the use of the common terms. I have, however, dropped the old term "leg movements" and substituted therefor the more accurate term, "movements of the extremities." The old term is not only misleading, but is associated with certain very questionable physiological explanations, and should be abandoned.

Postponing for the moment the description of these classes of movements and the

reasons for their sequence, we may classify the exercises of the "day's order" from the physiological point of view as follows:

1. Activities of limited motor mechanisms .....	}	Span bending. Heave. Back.
2. Activities involving a high degree of general coordination .....		Abdominal. Lateral trunk. Extremities.
3. General bodily activities of considerable intensity .....		Balance. Vaulting. Jumping. Running. Games.

The order movements have been omitted from this classification because they are not of physiological importance; likewise the slow-leg and respiratory movements, because of the very special function for which they are used. The purpose of the first group is to correct or prevent deformities; of the second, to give ease and grace of carriage; of the third, to produce as far as possible the general hygienic effects of exercise. Finally, the three groups overlap to a very considerable extent.

The term activity is used to emphasize the fact that it is not simply the muscles which are being trained, but the nervous system as well. Indeed, it is more than this, for still other organs, notably those of the vascular and respiratory systems, take part in such muscular work.

The course of the day's order and the reasons for using each kind of movement at its particular time may then be given as follows:

1. *Introductory exercises.*—Included under this head are a great number of movements which have previously been classified under order movements and leg movements. The term "order movements" really denotes the purpose rather than the character of the movement. They have been described as "intended to attract the minds of the pupils to the approaching gymnastic work; to induce them to assume that fundamental position and carriage best suited to the physiological interests of the body, from which other gymnastic movements start and to which they return before a relaxed position of rest is assured." There can be no question that a large number of exercises do actually serve this purpose, and that the ordinary drill begins with them; and I can see no objection to the continued use of this term to indicate the purpose of many of the introductory commands of the day's order. On the other hand, as has been pointed out, the term does not describe the character of the movement as do the others; nor do order movements constitute a well-defined class of exercises. To the term "leg movements" I have two objections—it gives a false impression of the real character of the work, and it is connected historically with what is quite indefensible physiology. With regard to the latter objection, I have no intention of discussing the point here. The purpose of this paper is not to discuss what has been written about the Swedish system, but to describe what it is in actual practice on the floor of the gymnasium. I shall therefore confine myself to the statement of what is done during this part of the day's order, and the physiological results achieved thereby. As to the former objection, while it is perfectly true that leg movements are used and form a large percentage of the work done, yet it is also true that movements of the neck, shoulder, and arm are used often simultaneously with those of the legs. The former have no doubt been regarded as order movements, and, as used, serve this purpose; but they serve other purposes as well. The stretching of the shoulder muscles, for example, which is the most prominent characteristic of the various "arm extensions," has a very important corrective effect upon the form of the shoulder region; and while it may be claimed that this is included in the statement about order movements that "they are intended to induce the pupils to assume that carriage best suited to the physiological interests of the body," yet

we should then be compelled to include in the same category span-bend, heave, and back movements—in short, all activities of limited mechanisms which correct faults of posture and carriage. Moreover, these leg movements would then not form, as a matter of sequence, a separate class from order movements; and, finally, the movements of the upper extremities play their part—and a very considerable part it is—in the redistribution of blood, which has been improperly attributed to leg movements alone.

It seems to me that we should describe more accurately what is done by grouping both under the head of introductory exercises, which have two objects in view—first, to serve the general purpose of order movements; and, secondly, by calling into use the largest muscular masses of the body, to produce, without undue fatigue, some of the most important results of muscular exercise, among which may be especially noted a marked redistribution of the blood, more going to the working muscles and the skin and less to abdominal organs. Such work is not so specialized as that which immediately follows, and for this reason is most suitable for beginning the lesson. Incidentally it serves corrective purposes, both in the training of simpler motor mechanisms and also to some extent in coordination.

2. *Span-bending movements*, which consist of certain backward flexions of the trunk which have the effect of straightening the thoracic region of the spine, of vaulting the chest forward, and of increasing the chest capacity and mobility of the ribs.

3. *Heave movements*, which consist of various exercises in a hanging position and others which have the effect of expanding the upper part of the chest by lifting it upward. Incidentally, they also develop the arms and upper trunk muscles. Heave movements follow span-bending movements, because they are more vigorous in character; and it is claimed that, as a matter of experience, they are apt to produce a certain amount of soreness in the abdominal muscles, which is for the most part avoided if they are preceded by span-bending movements.

In these first three movements a considerable amount of work has been done, the intensity of the work increasing to a maximum in the heave movements. This work involves—indeed, is the result—of katabolic muscular changes which produce heat and discharge on the lymph and blood large quantities of waste substances. The body reacts to these conditions, and the general physiological results of exercise follow. These are directed primarily to getting rid of waste products; incidentally, they provide food and oxygen for the anabolic processes which at once begin to make good the loss of muscular fuel substance. In order to get rid of the heat, the cutaneous arterioles dilate, and the secretion of perspiration is greatly increased; these agents are aided by the increased volume of air heated in the lungs and the increased evaporation of water from the surfaces of the respiratory tract. The temperature of the blood rises slightly, though perhaps not more than a degree centigrade. In order to get rid of the carbon dioxide, the breathing movements and the rate of the heart beat are increased; the circulation through the lungs is consequently quickened, but it is a mistake to assume that the amount of blood flowing through all organs of the body is increased. In point of fact, the arterioles of the intestine, the kidney, and probably the liver and spleen, constrict, thus diminishing the blood flow through them. It is probable, though not proved, that the blood flow through the brain is usually somewhat increased, though at times it may be unchanged or even diminished. In all these vascular changes the cardiac, the vasoconstrictor, the vasodilator centers work together, so as to maintain the aortic pressure at the normal height or somewhat above it. The pumping action of the contracting muscles aids in the flow of blood and lymph away from them; and the augmented respiratory movements, by increasing the aspiration of the thorax, aids the return of blood and lymph from all organs. Especially important is this effect upon the lymph flow, since an increased lymph flow from an organ means increased circulation of lymph in the tissue spaces around the cells, and hence a more equal and rapid distribution

over the surface of the cell of the food material and oxygen derived from the capillaries, and a more effective return of waste products to the capillary wall for removal. Other organs are thrown into activity to complete the oxidation of certain katabolic products of muscular activity; and the presence of an increased amount of some of these products in the blood changes the chemical character of the blood, and so the environment of all cells of the body. It is, moreover, not improbable that, so long as these are not present in excessive amounts, the changes thus produced may favor the healthy life of other cells; muscular activity would, from this point of view, produce an internal secretion; but the matter needs further experimental study.

These are the general physiological effects of all muscular exercise, and their amount is proportional to the intensity of the exercise taken. It is to them that the "freshening" effects of exercise are due. The movements of the extremities, span-bend movements, and heave movements, therefore, in addition to the special corrective function which each performs, by calling into play large groups of muscles, serve the additional purpose of "freshening up" the class without producing such fatigue as may interfere with the proper execution of subsequent coordinative or corrective movements; and it is only after these are given that the general physiological effects are pushed to their maximum point of intensity in vaulting, jumping, running, and games.

In accordance with this plan we now pass to—

4. *Balance movements*, "which bring about a coordination of muscular contraction in all parts of the body, and by demanding equilibrium in difficult positions train the sense of correct and graceful posture." Movements of the extremities, back and lateral trunk movements, and others involve coordination of muscular contraction in all parts of the body, and hence are to that extent balance movements. The training of the sense of equilibrium, in other words, is not confined to this part of the day's order, but is merely its chief feature and special purpose.

Balance movements are introduced at this time for several reasons. They make an agreeable change in the nature of the work, which in the immediately preceding movements has been confined to activities of limited motor mechanisms; since more of these follow in the various trunk movements, a certain amount of monotony in the general character of the work is avoided. Moreover, no muscles important in maintaining equilibrium on the feet have been worked very hard; and hence, in the absence of local and general fatigue, finer coordinative work can be executed. Finally, balance movements throw most work on the leg muscles, and hence to a certain extent rest the trunk, which, having been concerned in heave movements, has still to perform those movements which involve the various flexions of the spinal column. When the various balance movements have once been learned, they are profitably introduced elsewhere, and especially where fatigue is present; their use in that case trains still more the sense of equilibrium in difficult positions. It is clear, however, that they should first be learned under the most favorable conditions before being used under unfavorable conditions.

The previous corrective movements of limited motor mechanisms have to deal with muscles which act upon the upper ribs or with their immediate antagonists. After balance movements we pass to a group—(5) back, (6) abdominal, and (7) lateral trunk movements, which produce flexions of the spine (dorsal, ventral, and lateral). Such movements not only train the use of the muscles concerned, but are also the chief means of correcting and preventing faults in the growth of the spine. This is especially true of back movements, which also correct the carriage of the shoulder blades. In addition to this, abdominal and lateral trunk movements, "by alternating increase and decrease of abdominal pressure, favorably affect the work of the digestive organs.

The comparatively short space devoted to the description of these three classes of

movements does not indicate their relative importance in the day's order. In point of fact, they are surpassed by no other class in corrective value. Through them we secure correct carriage of the trunk, depending, as this does, upon the proper play of the great groups of antagonistic muscles especially concerned in and strengthened by such movements; and it is the weakening of these muscles through disuse which is the chief cause of the tendency to "slump," against which a recent magazine editorial enters a timely protest, as being all too characteristic of American life.

The order in which they are given is, for the most part, immaterial.

8. *Vaulting, jumping, running, and games.*—These exercises at the same time command a high degree of coordinated muscular action and constitute the most severe work of the day's order. The previous balance movements train the sense of what has been called "statical" equilibrium, or equilibrium of the body at rest. Vaulting and jumping, on the other hand, train the sense of "dynamical" equilibrium, or equilibrium of the body in motion, and in this case of motion which involves considerable muscular work.

It is hardly necessary to add that they are not features peculiar to Swedish gymnastics, and that they serve the same purpose, no matter by whom used. They form, in fact, an indispensable part of all gymnastic training. The greatest stress, however, should be laid on the proper execution of the movements. It is not, for instance, the height of the jump which is of importance, but the way in which it is carried out and the proper landing which follows. In addition to the coordinative value of these movements, they, together with running and games, involve rather intense physical work, and produce in the highest degree the general physiological effects of muscular exercise already described. These effects are allowed to "approach, but never to exceed, the limit where breathlessness in its graver form sets in."

9. *Slow-leg and respiratory movements.*—It is a well-known fact that on stopping suddenly any very vigorous exercise certain disagreeable symptoms are apt to result. These are characterized by a very evident heart beat, at times grave breathlessness, and feelings of fulness about the head, in which the throbbing of the pulse can often be distinctly felt. These symptoms are most pronounced immediately upon stopping—at least it is at that time that they most affect consciousness. For the present it is sufficient to understand that at times symptoms of distress follow exercise, and that in practically all cases which do not involve actual exhaustion the symptoms are much less pronounced—so far, at least, as consciousness is concerned—if we do not stop at once, but gradually pass from the more intense work through less intense forms to rest. This is a recognized practice in the care of horses. No jockey is allowed to stop a horse immediately after the finish of a race, and it is hard to believe that the popular impression that such a course is more or less apt to produce temporary or permanent injury to the animal is entirely without basis in fact. It can not be said that all severe work is sure to be followed by symptoms of distress, nor need we be surprised to find that these symptoms may or may not appear under what seem at first sight identical conditions. In a class of 20 people perhaps not more than half would show marked distress after a given run, for the simple reason that the same work may be severe to one and easy to another; and in the same individual the same work may be severe one day and easy the next. But, granting all this, it would seem a safe course to avoid this distress as far as possible; we do not know that it is always harmful; but it looks suspicious, and we certainly do not know that it is never harmful. The history of many pathological conditions of the heart and the circulation points too clearly to excessive muscular work as having to do with their causation to justify us in ignoring any warning that may accompany such work. It is for this reason that the severe exercises of the day are immediately followed by slow leg movements (such as comparatively rapid marching), accompanied or followed by respiratory movements. The reason usually given for this—

that "the accelerated action of the heart must be normalized" and "free respiration restored"—is unsatisfactory. The accelerated heart action will, in point of fact, come back to the normal if the organism be left to itself, and free respiration will also be restored. It seems much more accurate to say that these movements afford very great assistance to the heart in maintaining an efficient circulation. They thus prevent distress, and hence, no doubt, danger, while the organism is adjusting itself to the changed conditions of rest.

As I have said, it can not be claimed that these movements are necessary in all cases. They are probably unnecessary, for example, in very strong individuals, in whom vigorous work does not produce the cardiac acceleration seen in those not so strong; but they are advisable with the majority of people and probably necessary with a large number. It must not be forgotten that the mission of gymnastics is not primarily to the athlete, nor is its chief purpose the training of athletes. In accomplishing the purposes of physical training outlined in the beginning of this paper we have no reason to believe that the cultivation of great strength is necessary, nor, in view of the conditions of life among people to-day, is it desirable. The athlete is as much a specialist as the student of Sanskrit literature; and the great muscular strength and bodily endurance under physical strain which is his speciality is no more necessary for the health of the business man or student than is a thorough training in astronomy or physics to the athlete as such. I am convinced that it is a mistake to attempt to cultivate a healthy sentiment for rational physical training among people generally by means of the athletic ideal alone. So far from encouraging the rational use of exercise by all, it certainly at times tends to discourage it, simply because the ideal is unattainable to the vast majority of men, and it is entirely out of place among women. The Swedes have avoided this error successfully. Without discouraging athletics they recognize that the athlete is a specialist and that there is a physical training needed by all classes—by people who can never be athletes, the vast majority of whom react less rapidly and less perfectly to sudden changes in the state of the body as regards muscular activity than do those trained to the highest degree of physical endurance. Hence it is advisable with drill work with large classes "to warm up" to the more intense work more or less gradually, and not to pass immediately from this to rest.

Any account of the day's order fails to do it justice which does not emphasize the element of progression so skillfully carried out. In each group of movements the student passes to those requiring greater coordination and greater strength only after he can do simpler movements involving the same general groups of muscles. This is merely the principle of training, but nowhere is more attention given to it than in the system we are considering. Compare it, for example, with the method of giving directions to individual students for the use of apparatus for the next three or four months, and then giving new directions for more difficult work only after that time. The Swedish drill can stand this comparison and should invite it, for it is clear that only in drill work can any proper system of daily progression be carried out successfully in large classes; and daily progression in large classes is a thing which, it seems to me, we have a right to demand of any gymnastic work which professes to be physiologically correct and practically available.

The mere recount of these groups of movements of the day's order certainly sounds uninteresting enough. In point of fact, it is only the skeleton upon which the system is built, and no more describes a day's drill with a good teacher than does the human skeleton betray the life of the human body. I have already said that a poor teacher can make a Swedish drill an insufferable bore. In fact, the ability to make gymnasium work attractive and interesting is absolutely necessary to anyone who is to undertake that work. Swedish gymnastics will not be a success without this. But will any other gymnasium work be a success without it?

Critics of the system have made, it seems to me, two very great mistakes—one class has deluded itself into thinking that it has criticised the system, when it has only criticised certain physiological or other statements which have been made about the system; another class goes no further than the skeleton upon which the whole thing is built, and then pronounces the system itself “as dry as bones.” Neither mistake would have been made had the system been studied on the floor of the gymnasium and with reference to the aims which it seeks to accomplish.

In physical training two aims are preeminently important:

1. The general effects of bodily exercise, including the acquisition of that amount of physical endurance which the special conditions of each individual life demand. I place this first, for it is the chief object of physical training.

2. Correction of physical faults, both deformities of the muscular and skeletal systems and deficiencies in the nervous control of the body. I have tried to show that this is rendered necessary by the specialization of life, and is especially necessary with that specialization which marks the period of development, and which may be summed up in the words, “the school desk.”

The primary purpose of the Swedish system of gymnastics is the second of these objects. Its system of movements is based on a most careful study of kinesiology. It studies the effects of the innumerable possible movements upon the development of the body—that is to say, upon form and carriage—and it makes use of such movements as are known to be fitted to accomplish the corrective effects desired. It gives these movements in that way which will best insure with all members of the class their proper execution and greatest corrective value; that is, in the form of a drill and to the word of command; and it gives them with constant reference to such progression, both in the work of each day and especially in the work of successive days, as to secure the effects of training without undue fatigue or strain.

It does not entirely satisfy the demands of the body for general exercise. No gymnasium work does. The Swedish system is not all of physical training; and if some of its advocates have claimed that it is, such claims are merely the result of overenthusiasm and do not demand serious consideration. It starts with the assumption that corrective work is needed, and that this must be an essential part of all gymnastics, but it endeavors to give this in such a way as shall not sacrifice the more general hygienic effects of muscular activity. To what extent it accomplishes this depends largely on the teacher, partly upon the gymnasium facilities. It is not automatic; it will not succeed in incompetent hands, but unless you are ready to deny the need of all corrective work in physical training it does not demand qualities of its teachers other than those which all physical training requires.

We hear much to-day about the immense superiority of outdoor games to indoor gymnastic work; and there can be no doubt that in most, if not all, our American colleges for men there is a marked tendency away from the gymnasium. Nor need we be surprised at this. When gymnasia were first built at our colleges the entire work of physical training, apart from that of class and college teams, was confined to the gymnasium, which thus came to assume a rank of exclusive importance to which it was not entitled. Moreover, this gymnasium work has rarely, if ever, been under sufficient supervision. It is not too much to say that the American idea of a gymnasium has been an elaborate building with expensive apparatus in which the innocent student in search of health might pull on various weights “with nervously exhausting and deadening monotony.” Such has been the experience of the majority of men who have tried such work, and the tendency to the exclusive use of games is simply the unanswerable proof of the failure of the system. It is not a valid argument against well-directed gymnastics. In fact, both the gymnasium and outdoor games have special functions in physical training, and one can not replace the other. On the contrary, one supplements the work of the other. For producing

the general physiological results of exercise, outdoor work is immeasurably superior. Bicycle riding, canoeing, rowing, tennis, golf, skating, etc., not to mention the games of earlier life, should constitute and, as a practical matter, must constitute the chief means of physical training; but while they well serve these more general and more important purposes, they are not conveniently used at all times of the year, and they have only limited corrective value; they do not remedy faults of posture, of carriage, of gait, and those interested in physical training should see to it that the welcome increase of interest in outdoor exercise does not produce neglect of the corrective work which the gymnasium alone can give.

## CHAPTER XXVII.

### THE FUTURE OF THE COLORED RACE.

---

#### I.

THE OPPORTUNITY AND OBLIGATION OF THE EDUCATED CLASS OF THE COLORED RACE IN THE SOUTHERN STATES. AN ADDRESS DELIVERED BEFORE THE AGRICULTURAL AND MECHANICAL COLLEGE FOR NEGROES, AT NORMAL, ALA., MAY 29, 1899, BY REV. A. D. MAYO, A. M., LL. D.

I do not appear before the faculty and students of the Agricultural and Mechanical College to discuss what the newspapers and politicians call "the race question" in the Southern United States. What is here called the "race problem," under another form, is equally pressing in the Northern States of the Union. It is only one section of the radical problem raised by that new departure in human affairs, the original Declaration of American Independence, fought out through eight terrible years of the war of the Revolution, and finally embodied in the Constitution of a republican government for the United States of America, declared, substantially, by Mr. Gladstone to be the most remarkable achievement of original statesmanship ever struck out by any body of men in the history of mankind.

The motive power of that new government and order of society, now a century old—the great political dynamo that generates the force which moves and illumines the national life—is the radical idea, then for the first time deliberately adopted by any government, that it is possible to construct a nationality in which "all orders and conditions of people" can live together, each man, woman, and child a vital part of the whole, every member protected in all the fundamental rights of human nature, including the sovereign right to strive for his own highest possibility of manhood or womanhood, and all working together for the common good.

That lofty idea of our new American nationality is only the translation into public affairs of the idea of human nature and possibility announced by Jesus Christ in the Sermon on the Mount, the Lord's Prayer, the Beatitudes, the Golden Rule, and the Law of Love. After an eighteen-century struggle upward out of the darkness of a paganism which held to the fundamental heresy of antiquity that every superior man was a brevet deity and all the rest of the world human trash, "in the fullness of time" this great American new departure sent greeting back to Palestine and began the mighty experiment of educating all orders and conditions of people upward toward that American sovereign citizenship, which truly achieved is the loftiest position in the world, made possible to every son and daughter of God.

Of course, it was not to be expected that ideals so lofty could at once be wrought into the actual life of any people. The entire history of this Republic during its first century is only a record of the intermittent progress toward this exalted declaration. It was only after the most terrible civil war of modern times, involving the slaughter of half a million of the flower of American youth, and the disappearance of the earnings of an entire generation of the people in the form of powder and shot, with the complete overthrow of the entire organization of human society through half the national area and its reorganization through the entire extent that we were able to include the whole American people in the world's great roll of honor, Amer-

ican citizenship, and with that the perilous attempt to confer on every man the last and most eminent right of free suffrage. Even this was only another attempt to legislate an ideal into the common life of the nation—an attempt whose realization remains for our children.

But this has been gained. "The past is secure." We begin the twentieth century of our Lord and the second century of the nation with the all-around agreement that hereafter this sovereign obligation to educate all orders and conditions of people toward the high ideal of American society shall proceed by the agencies of peace. "Peace hath her victories no less renowned than war."

From this time onward all the forces of the higher civilization of the twentieth century are to be concentrated and worked to their uttermost to solve the original American problem: How can all these peoples who, since the dawn of history, have lived in a chronic state of active warfare, only broken by more or less brief periods of truce, here, in the world's greatest Republic, be educated up to living together in a government and order of society consecrated to the highest welfare of all? And for the solution of this mighty problem the American people presents to the world the most original of all its many "new inventions," the people's common school. This, the most central and powerful of all our present agencies of American civilization, is practically a little republic, planted in 250,000 schoolhouses, in every State, Territory, county, city, township, and hamlet of this broad land. It is, when truly understood, fitly organized, and well conducted, the most complete and influential representative of the practical religion announced and lived by the great Teacher, Statesman and Savior of mankind.

The American ideal of manhood and womanhood is the same as that announced and lived by Him, so fitly named by the poet, "the first true gentleman that ever lived." The motto of "the first society" in this Republic is simply the old scripture: "Let him who is greatest among you be your servant." The American ideal of personal superiority that overrides every theory of race, class, culture, power, manhood, or womanhood of the past, is that all superiority of the individual is only another opportunity to serve the whole. We shall never reach the impracticable dream of the optimistic philanthropist—a millennium where all people will be equal in all respects. The law of human superiority through its myriad of forms will forever assert itself; it is to-day as relentless and masterful here as in any of the older nationalities or in any period of history. All discussion of this most puerile of fancies is idle breath. The only question left us to discuss, by the Providence that sets limits and bounds to every soul, is what are the opportunities and obligations of every man, every class, every race, in its relations to the mass of mankind? And here we face the everlasting ordinance: The Son of man and Son of God comes into this world "not to be ministered unto, but to minister." The end of all activity in the family, the church, the school, the state, through all the higher agencies of civilization, in every Christian land, is to educate the whole people into the complete possession and use of their own superiorities toward the idea of the law of service. This is all there is in the "race question" of the South, and the larger question of the welfare of all the races and classes now represented in the 75,000,000 American people.

It is doubtless an interesting question, What are the opportunities and obligations of the 65,000,000 American people, made up from the ingathering here of all the European nationalities, toward the 10,000,000 new-made colored citizens in the United States, and the 10,000,000 strangers in the islands of the sea that may be thrown upon us by the providence of the past year of successful war? But I do not discuss this question to-day, although never declining to discuss it, when presented upon proper conditions, as an American and not a local or sectional question, at a fit time and place. To-day I propose to talk, not at long, but at short, range. I propose to inquire, What are the opportunities and obligations of the 100,000 more or less youth of the colored race who, in contrast with the remaining 9,900,000, may be

called educated in respect to this vast multitude, more than twice as numerous as the entire population of the United States under the first Presidency of Washington? For this body of the 100,000 colored people this inquiry transcends all others, just now, in importance. For, according to the way in which this opportunity and obligation are understood, accepted and lived out by this 100,000, will depend, not only the present welfare of the 10,000,000 colored race at home, but in large measure the future policy of the nation in dealing with the coming multitudes that the providence of God may bring, through years to come, within the expanding influence of the national life.

Let us, at first, try to understand the actual condition of affairs among the 10,000,000 of the colored race in the Southern States, as far as relates to their higher development. The air is darkened, and the sunlight of common sense, not to say common humanity, is now obscured by a flock of theories. But we may as well remember that this great problem is finally to be solved by those who best understand the facts of the case, and have the broadest and most profound apprehension of the eternal principles of justice and love, to which all our human affairs must sooner or later adjust themselves.

What is the actual condition of the 10,000,000 of the colored race in these sixteen United States, which creates the opportunity and obligation of the 100,000, more or less, who to-day, by the favor of Providence and largely through the benevolence of friendly people in both sections of the country, are recognized as the educated class?

After twenty years of careful observation in every Southern State, each of which I know geographically and educationally as well as I know my native State (Massachusetts), I see a few evident facts.

1. I see that no people in human history has made such progress out of the underworld of paganism and barbarism, from which we all emerged, in three hundred years, as the colored people of the United States. I certainly do not undertake to defend the institution of negro slavery. But that man must be blind who does not see that the 6,000,000 people who in 1865 stepped over the threshold of the nation's temple of liberty, were in every essential respect another people than their ancestors in the dark continent—perhaps the majority of whom were there not a hundred and fifty years before. In all save the education that comes through schools and books, the colored race, in 1865, at the close of the civil war, had laid the foundations of all education in the three great acquirements that underlie our Christian civilization. They had learned the art of continuous and profitable work. They had learned the English language, the language of the people that leads in the idea of constitutional republican government. They had accepted the Christian religion, according to the creeds and ideals of conduct prevailing among the vast majority of the American people. With all its defects, the American people, at that period, had made the most headway in the organization of Christian ideals of life in their form of society and government, of any people. The whole people was responsible for the condition of these 6,000,000, of whom it could be said that, on the whole, their transition from African barbarism and paganism to American citizenship had been accomplished with less suffering and general demoralization than the similar elevation of any European people during the past thousand years.

How this came about no theologian, sociologist, or statesman has yet been fully able to explain. But practical, everyday men, who are doing the work of this world, have come to the conclusion, after eighteen centuries of a half-paganized and half-Christianized civilization, that God Almighty is the great moral economist of the universe. Whatever may be the status of man as he comes into this world, no man is permitted to get out of this world until, by his own will, or over his will, he has contributed something to the common cause of the uplift of the human race. If there indeed be an eternal hell, no eternal sinner can get there without, at some point in his doleful journey, he pays toll at some gate of heaven. The rela-

tion of the American people to the present 10,000,000 colored American citizens will finally be judged by history, from the fact of the progress of the colored race during its two hundred and fifty years' residence in the country, as revealed by its condition in the year of final emancipation, in 1865.

Indeed, so evident was this fact that the people then representing the Union, in due time after the close of the civil war, was moved to confer upon these 6,000,000 of freedmen the highest earthly distinction—full American citizenship.

This act now certainly appears the most hazardous experiment of the kind in history. But it was only an extension of the established practice of the whole country which, in 1860, had already admitted to full citizenship great multitudes of the lower orders of European immigrants; hundreds of thousands of whom were, in several essential ways, less prepared to use worthily this supreme gift than many corresponding thousands of the more intelligent of the colored folk. In fact, this act was a compliment to the training of the colored people in the South. And no statesman to-day is wise enough to decide with confidence, whether things in the United States would have been, on the whole, better at the beginning of the second century of the national life had not this happened.

But the most grievous result of this experiment has not been to the white, but to the colored man himself. Every European people has been compelled to reach its present condition of political and social emancipation through a thousand years of war, pestilence, and famine. Every step in the rough road has been gained only after a generation, sometimes a century, of conflict that has made Europe the cemetery of the human race. But the American colored man received more than any European people has yet gained, with no conspicuous effort of his own. Still, the everlasting law abides, that nothing worth having in this world is won and held save through the extreme of toil, suffering and sacrifice. Our 10,000,000 colored people in the United States are now passing through their own wilderness on their way to the promised land, which, to-day, to all save a superior class, is like a far-away mountain range on a distant horizon, sighted now and then through clouds and storms and mists by the dwellers in the valley below.

Doubtless there are still some great advantages in the situation. It is such an advantage as no people in history has yet enjoyed, that the final destiny of this people can be wrought out through the agencies of peace. We are certainly approaching that new and blessed era when "Sword, Pestilence, and Famine," the three terrible teachers of the past, are being remanded to ancient history. In their place the colored man is now invited to take his place in the great university of the new American life, whose faculty consists of Professor Free Labor, Professor Free Church, and Professor Free School, with the good will of every wise and benevolent man and woman in Christendom, and such a prize on the gleaming mountain top has never yet allured the hopes and strung the nerves of any race of men. Surely no people on earth, at any time in a similar condition of the colored race in these States, has had so much to encourage it, so many friends, such powerful forces working in its behalf, as these 10,000,000, represented by this institution of learning and civilization in which we are gathered to-day.

2. But another thing I see, just as plainly as what has now been stated. I can not help seeing that more than half the 10,000,000 of these colored people are still weighted with the bottom disability to the use and enjoyment of full American citizenship, an illiteracy that still holds practically in bondage 60 per cent of the entire number. In the six States where what is called the "Race problem" is now the most stringent—Louisiana, Alabama, Georgia, South Carolina, Mississippi, and North Carolina—this illiteracy, during the present decade, has ranged from 60 per cent of all persons over 10 years of age in North Carolina and Mississippi, to 64 per cent in South Carolina, 67 per cent in Georgia, 69 per cent in Alabama, and even to 72 per cent in Louisiana. In the District of Columbia, where the national Government, in connection with the

District, supports the best common school system in the country for the colored race, 35 per cent of these people over 10 years of age are illiterate, largely from the constant drifting in of the poorer classes from the neighboring States.

It is certainly a great tribute to the American people of all sections that during the past thirty-five years this illiteracy of the colored race has been reduced 40 per cent. Especially is it honorable to the Southern people, that \$100,000,000 have been expended, chiefly by the white race, under conditions that we all know, during the past thirty years, for the education of the freedmen in common schools. It is also honorable that the North and the nation, from the beginning of the civil war to the present day, have probably contributed an equal sum. The Christian people of the Northern States are now spending more than \$1,000,000 a year, largely for the superior education of Southern colored youth. But this does not change the stubborn fact that 60 of every 100 colored people in our own 16 Southern States, men, women, and children, above the age of 10, are living to-day in the most unfortunate of all conditions—illiteracy.

We are all the time discussing this question of illiteracy at cross purposes. It is regarded simply as an ignorance of letters; and we are reminded that the use of letters, five hundred years ago, was the luxury of the few, and that within the memory of living men the majority of people in Christendom was in this condition. We are called anew to admire the model virtues of people unable to read and write. An entire literature has sprung up concerning the colored race, in which the moral and social excellencies of the old-time slave population are duly magnified, sometimes to the extent that we suspect the author never heard of a respectable colored man who could read and write. But all conditions of this sort are perilous or harmless, according to their social and civil environment. Illiteracy in these United States to-day is no longer an amiable or, except under conditions rapidly passing away, an excusable weakness. Illiteracy in Alabama to-day means ignorance, superstition, shiftlessness, vulgarity, and vice, rolled together in the person of one illiterate man or woman, and concentrated as the bottom slum and slough of every American community. It is indeed a great black ocean, pestilent, hideous, malarious, under every State, community and family, steaming up death and destruction through all the lowlands of our American semicivilization and drifting in its poisonous moral and social atmosphere through the open door and window of every palace in the land.

The only condition under which ignorance is apparently a harmless element in society is in a social order, organized according to the old-time patriarchal and paternal method, guided by an aristocracy of intelligence and character that protects the masses from their foes without and their own folly and unrighteousness. Doubtless in some of its localities, and everywhere in some of its aspects, the institution of American slavery could be mentioned in this connection. Indeed, even the desire for, not to say the possession of, letters, would not only have been a constant peril to the institution itself, but under ordinary conditions intelligence could scarcely be regarded a blessing to the enslaved. But all this is ancient history.

To-day every ignorant man, woman, or child in this Republic is in a state of siege from the Grand Army that marches under its four generals in chief—Superstition, Shiftlessness, Vulgarity, and Vice. His ignorance is not only his great misfortune, but his deadliest temptation to all varieties of folly, weakness, and transgression, which land their victim in a state more hopeless than any form of "natural depravity."

And even more than this, the illiteracy of any considerable American class is the greatest peril to every grade of people above it. No American community, Anglo-Saxon or otherwise, however exalted by wealth and culture and social refinement and civic power, even by the Christian religion as it is now understood, preached, and practiced, is proof against the terrible temptation from a race in the present condition of 60 per cent of the colored people of these sixteen States. I make no

charge, and have none to make, concerning the moral superiority or inferiority of the Southern people in all that concerns good American manhood and womanhood. They, doubtless, like all portions of the American people, have peculiar superstitions, shadowed by the defects that are the peculiar temptation of every superior or dominant race. But no people in history has been able to resist the perpetual influence of having among it another people, mixed up with everything in its daily life, always accessible, dependent, and always in the way in the hour of temptation, sixty of every hundred in the condition that every illiterate colored man or woman must be; each of them, meanwhile, endowed with all the powers of full American citizenship. As well might a colony expect to avoid the blight of malaria in the great Dismal Swamp, or expect to live in health and comfort with the basement story of its houses under water in a Mississippi River overflow, a turbid ocean 100 miles wide, choked with drift, swarming with all the fearful, loathsome, and malignant creatures driven from their own haunts by the frightful invasion. It is not in the South alone that this terrible scourge of illiteracy is manifest. It is a national breeding place of all manner of moral sickness and mental perversion, touching the most remote outpost of the republic, turning the national mind and conscience upside down, with now and then an explosion, as from the bottomless pit, of wrath, fear, and hatred, that often reveals the best man and the most saintly woman to themselves as a possible rebel against every human sanctity and every ordinance of justice, order, and common humanity, established by the experience of the human race.

Now I am not here to-day to lecture the white people of these States, as I have been talking and writing to and about them for the past twenty years, with the encouragement and general assent and approval of their foremost people in every State, city, and hamlet visited, concerning their duty in this emergency. I am not here to declare that the North should repent of its great failure in Congress ten years ago to put forth the mighty hand of the nation to enable the South to increase the quantity and improve the quality of the schooling it had already established for both races of its people. I am here to-day to call attention to the opportunity and the obligation of the 100,000, more or less, of colored youth below the age of 35, all born under the American flag, all American citizens, concerning the deliverance of one-half the race out of the submerged district, the lowest slough and slum of the nation, which we still choose to cover up by the fine dictionary word—illiteracy.

3. For, at the opposite end of the social plateau of these 10,000,000 we find a body which, in contrast with the illiterates, may be named an educated class. It is only by a sharp contrast that this distinction can be awarded to possibly more than 100,000 young persons of both sexes, who, during the past thirty-five years, have been enrolled for a longer or shorter period in the group of institutions originally established by the churches and benevolent associations of the North, but latterly supplemented by all the States of the South, for the secondary, higher, and industrial training of selected colored youth. Within the past fifteen years every Southern State has established one, or more than one, free school of the secondary, normal, and industrial grade after the type of the famous Hampton Normal and Industrial Institute founded by Gen. S. C. Armstrong, at Hampton, Va., soon after the close of the civil war. In the year 1896-97 there were 169 schools for the secondary and higher education of colored youth in operation in these sixteen States, with 1,795 professors and teachers, 1,008 of whom were women, 45,402 students, 25,159 girls and 20,243 boys; 2,108 of the (1,526 males and 582 females) being in college grades. In the secondary, the high, and academeal grades there were 15,203 students, a majority of 2,000 girls. In the elementary, or what is known as the primary and grammar grades, there were 28,091 pupils—11,773 boys and 16,318 girls.

Apart from the State normal and industrial seminaries, which, as a rule, do not include the classics, and the pupils in attendance on an increasing number of free

high schools in cities, there would seem to be at present some 2,410 students in classical, 974 in scientific, and 11,340 in higher English studies; 14,724 in all above the elementary grades. In the normal classes, but few of which can be regarded as professional other than in name, there were 5,081 students, about equally divided by sex. There were only 295 students in "business courses," of whom 179 were males. There were 1,311 professional students named, the large majority in theology and medicine. Of the 13,581 included in industrial training, 8,611 were girls and 4,970 boys, of whom 1,027 were studying farming, 1,496 carpentry, and a smaller number other mechanical occupations.

These schools report 224,794 volumes in libraries. The entire value of their buildings, grounds, etc., is \$7,714,958. Their annual income is \$1,045,278. All this, save \$141,262 from tuition money, \$271,839 from State or municipal aid, and \$92,080 from permanent funds, comes in the way of a benefaction from the North, whence this entire plant of \$7,700,000 has been derived. Probably \$3,000,000 has been given in permanent funds. Many of these higher schools have been in existence for twenty or more years. More than a dozen of them, established by the Northern churches, have assumed the title "college" or "university," and are organized according to the academical and collegiate methods of the leading denominational seminaries in both sections of the country fifty years ago, with such additions especially in their industrial and normal departments and improved methods of teaching as may have been found expedient.

It is impossible to determine the number of colored youth who, since the year 1870, have been at different times enrolled in these 169 seminaries of the secondary and higher education, and who to a greater or less extent have received a permanent influence from such attendance.

The majority have doubtless profited more in their improved manners and morals than in their scholarship by this experience. Still, it would seem impossible that any save a perverse or utterly careless youth could spend over a year in one of these schools, in contact with these often cultivated and always faithful teachers, really surrounded by a new world, without becoming in some way a member of the educational in contrast with the illiterate class.

It is probably not an overestimate and it may be an underestimate to say that of the 10,000,000 colored people in the United States 100,000, under the age of 30 years, are regarded by the masses of their own people as educated. Certainly more than 500,000, possibly 1,000,000 children and youth of this race during the thirty-five years since emancipation have entered manhood and womanhood with more schooling than George Washington, John Marshall, Benjamin Franklin, Roger Sherman, Andrew Jackson, Abraham Lincoln, Henry Wilson, Horace Greeley, George Peabody, and multitudes of men and women in all sections of the country, who are named in history or cherished in the memory of important communities as leaders in the higher region of American life during the first century of the Republic. This is a great testimonial to the capacity of the race, the last to step over the threshold of civilized life in these modern days. And it should assure the most despondent friend of the negro that the destiny of these 10,000,000 is safe in charge of the American people. It is only necessary that it be itself awakened to the one supreme obligation of every class in the Republic, the duty to learn the great American art of self-help and follow its own noblest and wisest leaders toward the "prize of the high calling," a complete American citizenship—the grandest prize that now tempts the worthy ambition of mankind.

Of this body of the educated 100,000, 27,000 are now reported as teachers of the 1,500,000 children enrolled in the public schools, 900,000 of whom are in "average daily attendance."

The attendance of colored children and youth in public schools is on the whole an encouraging tribute to the demand of this people for education. There were 1,460,084

enrolled in all the public schools for the race in 1896-97. There are 2,816,340 colored children and youth between 5 and 18 years of age in the 16 Southern States, 32.65 per cent of the entire school population of the South. Of this number 51.84 per cent were enrolled in public schools, against 67.79 per cent of the white children of similar grade. The average daily attendance of those enrolled in colored schools was 61.95 per cent, in comparison with 67.58 per cent of the white. In 1897-98 there was one colored teacher to every 33 colored pupils in average attendance at the Southern common schools. The annual cost of the public schooling of these 900,000 children in 1897-98 was \$6,656,000, with probably \$2,000,000 additional for the secondary and higher education. Of the public school expenditure almost the entire sum is obtained by taxation of the white people of the South. But this is simply in accordance with the American common school idea, which is that the property of the State shall educate the children of the State. As the colored laboring class of the South, like the corresponding white class in the North, is in large measure the creator of the wealth of the country, it is no special hardship that the white property owners of the South should largely support the common school for all.

But the historian of education will record to the enduring praise of the Southern people that during the past thirty years, despite the overwhelming destruction of property and demoralization of society by the greatest civil war of modern times, it has invested \$546,600,000 in public schools alone, and several other millions for the secondary and higher education; \$104,000,000 having been invested in the education of children and grandchildren of a people who, in 1860, were held in chattel slavery and declared by the Supreme Court of the United States not citizens of the Republic. And it is a cause of rejoicing to the country that to-day there are more than 1,000,000 colored children in the public schools of the South, everyone of whom was born a freeman, under the American flag, a citizen of the United States.

4. Always and everywhere the most favored class is compelled to deal with the less favored portion of mankind, for its uplifting, through the agency of the great intermediate multitude who walk in the middle of the road, "the plain people," who are the "bone and sinew" of every civilization. It is of this class of which the Good Book says, "the common people heard Jesus gladly." It is to this body, the 40 per cent, of the colored race, above 10 years of age, who have risen out of the almost absolute illiteracy of forty years ago, and the smaller class who, still deprived of letters, are educated (educated by life) above their fellows, that the 1,000,000 of the colored educated youth must turn for the "rank and file" of the grand army of invasion of the dismal realm of ignorance, superstition, shiftlessness, vulgarity and vice that still holds out against all efforts of a republican civilization working for its regeneration since the emancipation of the race. For here, among the better sort of those who have enlisted in the army of intelligence and progress, will be found the most reliable advisers, the fairest counselors, the most faithful allies of the enthusiastic and devoted educated young men and young women, going forth to serve the Master by "preaching the Gospel to every creature." And here, also, will be found the well-to-do in worldly goods, who must be instructed in the Christian idea of using money, saving on the lower to spend on the upper side of life. And, above all, here is a solid, conservative class, which will restrain the pernicious antics of the professional agitator, visionary enthusiast, the chronic impracticable, and the cranks and humbugs of every description, shaping the direction of a sound policy concerning public affairs and discerning the most effective manner of meeting and repelling every assault upon the rights of the masses.

Happily for the opportunity of the 100,000 of the new generation now called to the leadership of the race, they find in the better sort, the 40 per cent of their people who have seen the light of knowledge, a most efficient ally in their great enterprise, and not only from the most worthy of this class, but from an increasing number

who have not enjoyed the opportunity of schools and letters, will come forth, year by year, new levies of people who have no longer "any use" for the "blind leaders of the blind," in the pulpit, on the platform, in office, or as advisers in any department of common or public life. And, of all the following to be desired by a wise and progressive leader, the most desirable is a people, just in the condition in which several millions of the colored race are now found. Nowhere do you find such a genuine respect and even reverence for true and tried superiority; such a confiding regard in whoever proves himself a reliable, sound, and steadfast friend of the people's cause, as here.

Indeed, one of the most inspiring and pathetic spectacles in American life to-day is the attitude of hundreds of thousands of the better sort of the colored folk before any man or woman, from either race or section, approved as a leader able to lead a friend who is neither a flatterer nor a fool; as ready to declare the defects as to recognize the virtues of his followers; as severe to restrain as courageous to lead the advance. Here is such an opportunity for the highest achievement of good for great numbers of people as has never before, and may never again, be offered to a superior class, called by God to go forth and lead the wandering tribes out of the desert, across Jordan and into the promised land.

For the present is a transitional period. A generation hence, with the larger extension of education, the increase of comfort and a more general prosperity, it will be far more difficult than now for any favored 100,000 to go before and marshal the army of the Lord for a new exodus out of any Egypt. To-day is the golden opportunity for a supreme effort of the class that can honestly call on a generation to set its face toward the future. Every young man or woman now going forth from one of these great schools is accepted by his friends and has a following, as a representative of good education and all the indescribable blessings connected therewith. To every one of these it can be said, as the Master in the Mount said to his new and untried disciples: "Ye are the light of the world. A city set on a hill can not be hid." You will be received with a great expectation and a hearty welcome. And of you it can be said that this attitude of the mind and heart of your constituency is of itself one of the greatest opportunities given to man to do his uttermost for the uplifting of a race.

And it is a part of this great opportunity that even the illiterate, of whom the majority are only in part involved in all the perils of their condition, confide in you for the instruction of their children with a mighty faith that you will send them out from the churches and the schools far better and wiser than themselves, and that they will often become, through their children, your most docile and devoted followers. The greatest following of the noblest reformers of the world has often been from the class that has been cast away as the offscouring of the race by those who sit up in the high places of culture and power. Jesus said to the proud Pharisee, the contemptuous Sadducee and the mocking scribe: "These publicans and harlots will go into the Kingdom of God before you." It was among the slaves, the obscure and afflicted and oppressed lower orders of the Roman Empire that Paul and Peter and the other ten found the materials to build the primitive Christian Church. Even the "upper ten" of old revolutionary Boston "sailed away at break of day" to Halifax when General George Washington marched into town. The true reformer should never despise his audience or turn his back upon any sincere following, for the Word of God often comes to the poor and lowly, and the child who was born in a stable and cradled in a manger became the leader of the centuries and the Savior of mankind.

Permit me, then, to ask the more thoughtful members of this young army of the Lord, "one hundred thousand strong:" "Do you, who by the blessing of God and the favor of your friends, have been able to come up out of the darkness into the twilight of knowledge, where you now abide, realize the grandeur of your

opportunity?" It is to be acknowledged leaders toward the upper region of American life of a people twice as numerous as the entire population of the Republic under the Presidency of Washington.

There is one region of American life, and that the highest—the opportunity of all others, worked and prayed for by the noblest of mankind—that is, yours without rivalry or resistance. Nowhere in this world to-day is a body of 100,000 young men and women called to such a ministry of service and sacrifice for the uplift of 10,000,000 of the human race as you. Any 100,000 young people of any other race who should go to work with such a mission as your own would be smothered in the great multitude who are already engaged in similar work, and only now and then one, a "survivor of the fittest," would obtain a position where he could show himself for what he was. But you stand on this high plateau of opportunity, the observed of all observers, with no jealous or hostile body outside your own race to hinder, and all Christian people, at home or abroad, applauding every success, giving generously to you of all sorts of good gifts, bearing up your work on the wings of prayer, that signifies as much to-day as in any of the days of old. You have not made this great occasion for yourself, and it comes not as any reward of merit, but as an invitation to prove yourself fit "soldiers of the cross." This glorious and unique opportunity was created for you by the providence of God. This standing place where you now are marshaled was gained for you by the sacrifice of half a million patriotic lives and the indescribable suffering of an entire section of our common country. The continued benevolence of the friends of the people for a whole generation has made it possible that you should be lifted up to this high mount of opportunity and obligation. The "gracious favor of Almighty God," invoked by Abraham Lincoln in his proclamation of freedom, has called you, not because you are especially worthy, but that you might be made worthy to answer this summons from on high.

5. Remember this, every young man and woman that hears me: The wisest and best people of every section and community in the United States are always on the watch for the appearance of one more young man and woman worthy of their aid and encouragement. Your end of the social scale is to do the best that lies in you with all your might. If so, each of you will be the friend and beloved disciple of Him who was fitly called by the poet "the first true gentleman that ever lived," with the love of God, "whose favor is life, and whose loving kindness is better than life." You can manage to "worry along" with this sort of social consideration while you are intrusted by Providence with laying the foundation of the new social order for a whole people who, if your life is prolonged to my own age, may number 20,000,000, everyone of whom will speak of you, if you deserve it, as the schoolboys and girls of my youth spoke of the fathers of the Revolution; as they do now of the heroes and statesmen of the war for the Union; and as you speak of your own soldiers, who now, under the blazing sun, in the jungles of the tropical islands, are clearing the way for a new opportunity for your children, perhaps even greater than your own. If you are doing and living up to what God now calls you to be and do, you can well afford to wait upon the coming of all the good things for which you long to-day.

In fact, your present opportunity furnishes the only way by which you can obtain all that belongs to any good American citizen. "There is only one way under heaven known among men" whereby your great hope can be realized for your people, and that is just the way where you now enjoy an opportunity such as is given to no similar class in Christendom—this great labor of love for the uplifting of your people, which you can do with "none to molest or make you afraid."

But someone may reply: "All this is doubtless very fine, but it is somewhat vague and vaporous, and does not seem to fit my own case." Let me, then, "descend to particulars," and call your attention to several ways in which you are able to serve in the great work of training up your people in their present condition of childhood,

"in the way they should go," so that, when they rise to their complete status of manhood and womanhood, "they shall not depart from it."

In 1896-97 there were, in the sixteen Southern States, 6,000 students in schools, classed as normal, theological, and medical, representing the three great liberal professions that touch most closely on the common life of the masses of any people. The statesman, the lawyer, the author, the artist, and the journalist—all move the superior class at second-hand, and the illiterate class directly scarcely at all. But the Christian minister, the teacher, and the physician stand "next of kin" to our own flesh and blood. Often, if the men and women in these professions are worthy, they influence us in a way more personal and radical than is possible for the majority of people in family relations to minister to each other.

There are now probably not less than 50,000 young colored men and women more or less educated and competent, acting in all these sacred relations among the 10,000,000 of the colored people. And there are still only half the colored children and youth of school age in the South at school at all. Perhaps half the colored people are not living in regular church relations; possibly not attending church. And only a small portion of the colored families are living under healthy sanitary conditions, or ever see a doctor or a health inspector until in some "tight places" with a dangerous disease, or warned by a visiting policeman. Now, with the exception of the medical profession, the white professional man or woman is almost banished from this, the most important field of professional service. Your people are no longer gathered, like their fathers and grandfathers, in the gallery of the old church, to hear the preaching of the most distinguished divine, but flock around their own favorite preachers and religious leaders. The teaching in the public schools, outside of a few cities, is all in the hands of 27,000 colored schoolmasters and schoolmistresses.

What an opportunity is here—the bodily and mental training, and the religious ministry to a whole people, covering their entire higher life! Read the testimony of the experts who have recently examined the sanitary conditions of great numbers of colored people now living in the larger Southern cities, and more every year employed in the rapidly increasing manufacturing institutions of the South. What a dismal picture of sickness, death, sorrow, and the demoralization of families is this! Almost twice the ratio of deaths to the white race, with the imminent danger of the entire colored race being involved in the most deadly class of diseases, consumption and its attendant complaints, which the best medical skill in the world has only recently checked among the more careful and protected communities of all the nations. Is not this an opportunity given to the faculties of your schools of medicine, such as to no other body of physicians, the task of dealing with the physical life of a whole people, and in so doing lifting up thousands from destructive habits that are the curse of the race? And when we read that this terrible mortality and disease is not due so much to the physical environment of your people as to their ignorance of the most common laws of health and the reckless indulgence in the animalism that, in every people in similar conditions, is the great, black, underlying slough and slum of every community, is not the opportunity of the colored physician and nurse lifted to a great moral ministry? If the medical profession of this race in one generation could reduce the death rate from an average of 34 to 1,000 in five of the larger cities of the South to some approach to the 20 per thousand of the white race, would it not be an achievement worthy the highest aspiration of the most devoted body of young men and women, doctors and nurses, as especially in doing this so many of these poor children could be saved from the bottomless pit of the animal vices, where all manhood and womanhood sink down into an almost hopeless annihilation?

Think of the 27,000, possibly of all sorts 30,000, teachers of the 1,000,000 children and youth now in school, 33 to each teacher in average daily attendance. What an

opportunity is this, to have in charge all the children, practically all the time during the months allotted to their school life! What a change to multitudes of these children, who come from such homes as we know they have, to such a place as you can easily make your schoolhouse—make it by the cheerful work of your own pupils, at once transforming a bare and thoroughly unsightly school building to a pleasant summer or winter home! Even in doing this you are training every child in the fine art of home making, without which there is no better future than to-day for several millions of your people. And if, besides this, you can yourself be a Christian man or woman in the teacher's chair, as every young man or woman should be in his every-day "walk and conversation," an object lesson of that character, without which your boasted American citizenship is only "a prelude to a tragedy or a comedy, and probably both," you may become a follower of the world's supreme Teacher, who said: "Of all that the Father has given me, I shall lose nothing, and raise them up again at the last day." And if you can only pry open the darkened window of the soul of one of these little ones, so that, as through a little crack, a shaft of golden light may cleave the gloom and remind this child of the infinite firmament that holds the earth in its embrace, you may have made it possible that this prisoner in the abode of ignorance may be aroused to break out of the sleep of mental dullness and range at will through all the glorious spaces of the wisdom, beauty, and love that are the heritage of every soul that comes into the world.

And what can be said that has not been said of the minister of religion? Only this: That a low, sensual, selfish, superstitious, and, in any essential way, incompetent man in this position is a curse more blasting than a pestilence to any youth that comes within the moral malaria of his personality. But if he is in truth a good man of even common ability, really devoted to his sacred calling, trying with "all his heart and soul and strength" to serve the people, to protect the young, to warn the careless, to rebuke the obstinate, to stand like a rock across the way of any man or woman determined to go to the evil one, he is such a blessing as only can be known to them who are privileged to be of his flock. And let it be remembered that even the superior upper class of the colored flock are more accessible to the influence of a worthy Christian ministry than any other sort of our native American people.

The colored clergyman has a range of opportunity far beyond the ordinary minister of religion elsewhere, and an unusual proportion of the larger ability of the race has been attracted to the pulpit. There, too, is the place where woman can do a work possible nowhere else. Remembering all this, we may well realize the height, length, breadth, and depth of this great professional opportunity.

Then remember, you doctor, minister, teacher, that you are by your very position compelled to be a missionary. At best you now have access to only a small portion of your people. Indeed, the majority of these 10,000,000 of your folk are still to a great degree outside your beat. What a call to the good physician to go forth into the dark regions of the country and the submerged district of the city life and give battle to the enemies of the bodies and souls of the people! What a chance for every young man and woman teacher, provided he is not smitten with the personal ambition of opening a little private arrangement which will divert the small means of the few more favored in their worldly goods to his exclusive use and leave the majority to go on in deeper discouragement than before! What an opportunity to go down to the hardpan of the bottom strata of the country, break up the crust of ignorance and indifference, and persuade the whole people to come up towards a new life! In a few years of such work he may change a dull and hopeless to an active, hopeful, and progressive neighborhood. If you can, at any sacrifice, plant yourself in any little countryside, however neglected and deserted, you may show how a good and wise man or woman anywhere by faith and hard work may reclaim even a mental and moral desert and make it "blossom like the rose."

Then, beyond this, remember that it is for you to lift each of these great professions

above the condition in which they have only been known to your people during the first generation of their freedom. It was inevitable that the colored minister, the doctor, and the teacher of thirty years ago should have been a great contrast to those whom the freedmen had known in the old days on the plantation. He was too often not good enough or intelligent enough to be intrusted with any responsibility in connection with the families that he often preyed upon more than he prayed for. We need not be too severe now upon the feeble beginnings of the professional life among your people; but we must remember that, while "the days of their ignorance God winked at, He now calls on all men to repent." It is given to you to lift these, the most sacred and important of all the professional callings, to their real dignity. It is for you to prove that the new minister, doctor, teacher, man or woman, should be "the guide, philosopher, and friend" of every man and woman and child. Just such an elevation of these three professions as you can achieve during the thirty coming years will be in itself a service whose value can only be estimated when it is seen in the improving life of the entire people.

And remember again that your brothers, off in the islands of the sea, are clearing the way for your young men and women to go forth on a mission of peace, bearing the gifts of knowledge, righteousness, and health to other millions even more in need than your own countrymen. I will not enlarge on the great possibilities opening to your people in the inauguration of the new colonial policy of the nation; but I believe I can see in a not distant future such opportunities for the more enterprising of your young people in the way of an honorable success in life, and especially in the great opening for Christian service in the years to come, as in themselves would repay all the blood and treasure expended in the past year, or all the toil and trouble of the future administration of our new possessions.

Then I note with great satisfaction, in the last Report of the United States Commissioner of Education, that 13,581 pupils in the 169 superior schools for your race in 1896-97 were receiving instruction in the different industries, the boys in the various departments of manual training and the girls chiefly in the improved house-keeping, cooking, and the important art of sewing. I am glad to note that nearly twice the number of girls than boys are thus engaged—8,611 girls to 4,970 boys—for the fundamental industry of any people is the art of making a good home, where, on the ordinary income of a few hundred dollars a year, a family can be maintained in health, morality, intelligence, and all the refinement possible to the humblest abode that shelters a truly mated husband and wife and a group of children, like a cluster of roses crowning the altar of a Christian household. Your own good president, Council, and your faithful teachers are all the time telling your people that, until they rise up and leave the one-room cabin, there is no hope for them this side the abode of the blest, even if there is any reasonable chance of getting there at all by this, the purgatory line.

The Queen of England and Empress of India had a habit of giving each of her own girls, at an early age, a little house, with strict instructions to each to become a first-class housekeeper, if nothing else. And when the little woman had learned to cook a good meal, set the table and preside at its head, the Queen accepted an invitation to her daughter's first dinner party. So it came about that everyone of Victoria's girls, besides receiving the scholarly accomplishments of a cultivated lady, became an especially good housekeeper.

An old keeper of a first-class railroad restaurant in Ohio used to reply to the compliments of his customers after a particularly good lunch: "Sir, it requires eternal vigilance to keep a good eating house." The mental and spiritual and physiological responsibility within the next twenty-five years to place the majority of the colored people in a good home is itself a "degree" more significant than any college honor, and the young graduate of any school, who can achieve that in the house given her not by the Queen of England, but by her "king of men," may well be more proud

of her neat morning rig in her own kitchen than of the senior uniform in which the "girl graduates" disguise their good looks on commencement day.

If Victoria of England is not ashamed to look after the housekeeping of her girls, I wonder where the colored American girl anywhere can be found who will set her face against the most womanly of occupations, as if it were a "let down" from her dignity? "I don't want to be a servant," you say. Well, that is just where you differ from the Lord Jesus Christ, who said: "I came not to be ministered unto [i. e., to be served, waited on], but to minister [i. e., to be the servant of all men]; and to give my life a ransom for many." Oh, my dear girls, I entreat you, put out of your heads and hearts this supreme vulgarity and sin of contempt for any necessary labor of the hands, for service and sacrifice are the central law of our human life. The higher education, according to the last American interpretation, is just this: The art of placing an educated mind, a consecrated heart, and a trained will, the whole of a refined manhood and womanhood, right at the ends of the ten fingers of both your hands, so that "whether you eat or drink, or whatsoever you do," you may "do all to the glory of God."

I say I am especially glad that the girls are just now giving more attention to industrial training than the boys. For there is no great danger that every American boy, unless an idiot or a criminal, will not sooner or later be brought down to the grindstone of hard work of some sort, for hard work of body, mind, and soul is the one qualification of the new American gentleman.

Every man, of whatever rank or importance, must do his own part of the drudgery of common life. The American idea of a gentleman is a man who carries master and servant under the same skin. If a gentleman and his servant are two men, under two skins, there is always a chance for periodical friction, not to say of permanent disagreement—a strike, a rebellion, anything. But if a gentleman carries his servant under his own skin "he has him just where he wants him." He has all the service he needs at his hands, and if there is any tussle about it, it concerns nobody but himself.

Industrial education, as understood by the genuine educators of the country, is the art of abolishing drudgery and menial labor through the invention of labor-saving machinery. A labor-saving machine enables every workman to call in the help of God Almighty through his obedient servants, air, water, steam, electricity—all the wondrous powers of nature, which are the habits of the great Creator and the grand dynamo of the universe—to do the work of this world and verify the old prophecy concerning man: "Thou hast made him little lower than the angels and crowned him with glory and honor. Thou hast put all things under his feet." Don't believe any man who tells you that this great movement of industrial education is only a clever device of your enemies to crowd down the colored man to the condition of a European peasantry, only another name for the old-time chattel slavery. So far from this, it is the science of sciences, the supreme art of all the fine arts, the science and art of putting the trained mind and the consecrated manhood and womanhood into the body, so that all labor may be exalted to a mental and moral discipline and the mighty saying of the great apostle be verified: "Know ye not that ye are the temple of God, and the Spirit of God dwelleth in you?"

I am told, but I hope it is not true, for the fact that 40 per cent of all the colored students of the secondary and higher schools of the South is under industrial training contradicts it, that there is a growing disinclination among the educated young men of this race to take up this department of education. If so, a dark day has come to the colored race and to the Southern section of this Republic, for here the opportunity of the 100,000 educated youth of your race is such as has never been offered before to any special class of young men in the United States.

Within the coming thirty years this entire Southland is to be reclaimed to what God made it to be—one of the most productive and attractive portions of the earth

for the occupation and enjoyment of man. As I have gone up and down this marvelous country during the past twenty years, becoming as well acquainted with every one of its sixteen Commonwealths as with my own New England, I have not been surprised that even the prosaic land agent and the hard-headed railroad president should break forth into eloquence in the attempt to prophesy the wonders of its future.

The cause of this is not hard to find. Within the past half century the whole civilized, even the oriental world, has been awakened as by the voice of "a great angel out of heaven" to the fact that the intelligent labor of the masses of mankind, under the leadership of the expert captains of industry, is the new gospel for making this world a fit place for the abode of civilized and Christianized man. The day of the old, slow, stupid drudgery of the toiling millions to keep soul and body together is passing by, and the era of that enlightened industry, which makes every laborer a "coworker with God" and "an active partner" in business with all the great, silent, majestic forces of the universe, is now upon us.

The South finds itself to-day with a heritage of natural resources of which no man has yet compassed the grandeur and possibility, but with a great laboring class, ten millions strong, half of whom are still in the bonds of illiteracy and the other half just waking up to the understanding of what a creature man can become when joined in copartnership with omnipotence in dressing and keeping this Southern garden of God.

You are now directly concerned with the opportunity and obligation connected with the 10,000,000 of your own people, who, for good or ill, are here "to stay." Who, then, is to superintend the mobilization of this grand colored army of industry, that shall march forward, conquering and to conquer, over this wide field, where such honors and prizes are to be gathered as make all the titles, badges and glories of war only as tinsel and sounding brass in the presence of fine gold? If you, young men and women, whom the educational public of the whole nation has put to school for this organizing and leading your people, shirk the studies and the exercises that will train you to go before your own and lead them in this inspiring campaign toward a prosperity such as never before came to the Southern people, who will take your places?

For a little while, if you so will it, you may be able to disport yourselves as superior to your fellows, disdainful to put your own hand to the plow of reform, scorning the great leadership now offered to you. But after that, what? In one generation the entire lower side of Europe will then be let loose upon you. The labor union will inclose you like the iron prison house in the old story, which every day contracted itself upon its victim till he was crushed in its awful embrace. I tell you, young men and women, unless you do get up early in the morning while "for you it is called day," "the hour is coming and now is" when you and your people will be elbowed off into the holes and corners of the industrial world, like the young men whom I very often see with college diplomas in their pockets, waiting on table, watching a hotel bell, doing anything to keep the wolf from the door. And these young women—God help the young colored women, educated or ignorant, thirty years hence who has not learned how to keep the house in which she is permitted to live!

If there be a depth of degradation below the old-time slavery—which was not a degradation, but only the inevitable schooling of bondage through which every race has been compelled to make its way upward to civilization—it is found in that class of young men looking around for a chance to stand up to the crib and be fed, like human live stock, by their mothers, "sisters, and cousins, and aunts;" and worst of all, by their wives, the mothers of their children. A bright young colored girl in Texas said to me: "I don't want to marry. These young men are all such comical creatures that their wives have to support them." Such a life—the life of any young man who expects to live without solid and continuous work—is like the mask of the

old Greek actor, a double face, half tragedy and half comedy. If half a century hence your people are found where their enemies declare they belong, the "hewers of wood and drawers of water" of a superior race, you, the known educated, will figure in the pages of history as another of the failures of the ages—a people that were called and would not come.

Your race will not finally go down with you. For, as in the parable, when those that were called to the feast "begged to be excused," the highways and the hedges were ransacked and the wedding was furnished with guests.

The operative industry of the South should in time be largely in the hands of your people, for your race has an aptitude for it not inferior to that of any other sort or condition. The great mechanical industry of the South, which, during the coming generation, is to reach gigantic proportions, is to-day in every department open to you. What is to prevent you from having your part in the new era of skilled agriculture, fruit raising, the care of animals (dogs left out), in a country where there is land enough and to spare, and where every young colored man and woman should resolve to own at least one square mile of "sacred Southern soil?" There is no reason why the higher departments of textile engineering and architectural industry shall not be open to you.

And do not talk the foolishness that there is no place for you in this new industrial revival of the South. Any man or woman of you who can do as good or a better job of work than others, will be called to do it. The new South is now bent on having the best of everything. If you can give it the best in any department of productive industry, you will find your own place. I am not insensible to the force of prejudice and custom; and above all the power of pretentious inferiority over modest and deserving worth. But this American people of ours believe in fair play; and, in the long run, every man, class, race, will be estimated for just what it is worth in the field, the workshop—in every occupation and art that makes for the building up of the nation. Thomas Carlyle says: "No book was ever written down except by itself." No set of people in the United States of America can permanently be kept below its actual worth to the country. You and yours are left to decide what that position shall finally be.

Yes, if you are indeed able to face this mighty opportunity. Here comes in the obligation which, like a gloomy shadow, so often tempts the best of us to pray to God to be delivered from the greatest opportunities of life, lest in our weakness and wickedness they may become our final condemnation. This fundamental obligation of all to the one hundred thousand educated youth of your race, all born under the flag of the reconstructed Union, comes down to us through eighteen centuries in the stirring words of the great apostle: "When I was a child, I spake as a child, I understood as a child, I thought as a child; but when I became a man, I put away childish things." The most serious peril to this entire body of the educated young manhood and womanhood of the colored race is an inveterate juvenility that views this marvelous opportunity as a child takes all the gifts showered upon it as something belonging of right to itself, until it can not be satisfied by anything, but "claims the earth," and cries for the moon and stars.

There has not been a generation of youth in American history that has been so demoralized or is now in such peril of being demoralized by the greatness of opportunity thrown upon it, the magnitude of the favors it has received, and the intoxication of a mighty sympathy from the best people in the world, as just this one hundred thousand of whom I speak. From out the wilderness of bondage trodden by their fathers it has suddenly been transferred, as by magic, to the mountain heights of human opportunity, a privilege and position only conquered by any other race of men through centuries of conflict, the education which is the greatest gift to any generation. And a mighty opportunity like this is like the great hall of a spacious mansion, full of open doors, broad stairways and swift elevators, that admit to

every chamber of magic in life, even to the lofty roof, from which our American citizenship lies outspread, beneath, around, and above.

It must be from this obstinate and protracted childhood that so much of the apparent inability to recognize even the commonplace obligation to appreciate this opportunity comes. Otherwise I can not understand why so many of those who have been its recipients now seem to be more concerned by the impossibility of getting something else that just now can not be given by anybody than in considering "what manner of men they should be to whom this word of God has come." Why are so many of these young men and women apparently so careless in the use of these, the choicest gifts of Providence to any youthful generation? Why are they so greatly concerned to use these summits of opportunity to which they have been invited, to magnify themselves in the eyes of their less fortunate brothers and sisters, rather than to "remember those yet in bonds as bound with them?" Why are they often so eager to shoot the track of sane and practical duty at the call to any little personal gratification? And above all, why are so many of this class apparently fixed in the idea that they are the especial "wards of the nation," that the friendly people who bought their personal freedom "with a great price," and have continued for a generation to dispense the supreme bounty of education, are hereafter bound to help those who have already been educated to their present opportunity, still to assist in any little personal enterprise that may be chosen, even if a bypath away from the hot and dusty highway up which their people must toil in its long journey for success?

I warn these young men and women that the childish habit of dependence on the communities and people that have already done so much for them is their greatest peril. These friends, who have caused to be spent the \$100,000,000 especially for the superior education during the first generation after emancipation, have not done it because they propose to keep these beneficiaries in perpetual childhood, or even as an attractive and unique spectacle of a precocious development of the race. They have done and are still doing this with the expectation that these persons will in due time come of age, and, with a grateful acknowledgment for past favors, will only ask the future privilege of being the true leaders of their own people to their own place in the Republic.

For if this 100,000 can not attempt this work, who can do it for them? If they fail to come forward as a body, each in his or her best way enlisting for life in the "good fight," on whom are we to rely? Of course the people of the South understand this peculiar weakness. They know all about the defects of the negro character, this self-indulgent and dependent habit that holds itself away from the rough contact with the hard and repulsive features of the situation and work "on the lines of least resistance." Many of the Southern people honestly believe, and are telling us with great emphasis, that this is a fatal lack of native capacity, a chronic "race habit" that will keep this people forever in the rear, not only of the all-dominating Anglo-Saxon, but of all these immigrating European peoples, and that even the educated portion of the race may as well be content to retire into their own little corner of national life and keep quiet.

Here is this great opportunity for industrial training, which is welcomed by the foremost educators of the Union as one of the peculiar contributions of the age to the new life of the Republic. Why do so many of the one hundred thousand educated hold back from the most important work for their people, going down to the common level of the common school and toiling in the low and dark places of the land for the practical schooling of the race? Why can not more of these students wake up out of the childish habit of school life, the habit of becoming the bodyguard of every offender of school order and law, as if the chief honor or dignity of the young man or woman at college was to be a shield for every idle, mischievous, sensual, or selfish boy or girl, who has come in collision with the government of the institution? I would not judge too hardly of this, the bottom weakness

of the class of educated youth, which I summon to-day to such a magnificent opportunity. I do them all honor by holding them up to their loftiest obligation. But after twenty years spent among the schools of the South, I long to discover the signs of a more manly and womanly habit of life among this class I now address. I long to see these young people coming together to make of themselves the new American phalanx that, like the embattled 10,000 of old, shall be placed at the center of the great wavering multitude of the 10,000,000 to assure it of victory during the century that is before us.

Indeed, my young friends, this seems to me about all there is in the great problem that this year again looms up, black and threatening, above the social and political horizon. Can the 100,000 more or less educated colored youth, who, during the first generation of their freedom, have been schooled and sent forth to "spy out the land" and survey the road along which their people may walk up to their own place in our many-sided American life, lift themselves, each for himself or herself, out of the little environment of personal interest in which they are sunk out of sight of their great opportunity, and really open their eyes upon it, stretching like a splendid landscape, rising from the lowlands to the foothills, scaling the different plateaus even to the azure encirclement of the mysterious mountain ranges that block the horizon? Will they take account of stock in their own spiritual condition, and, responding to the call from heaven, "show thyself a man," and like the woman who "hath chosen the better part," build themselves up "after the manner of the perfect man, to the measure of the stature of the fullness in Christ?" In proportion as you can do this, the revelation of your opportunity will be the revelation of your sense of obligation. Children use the gifts of life as playthings. Men and women, after the pattern of the Master, use opportunities as a summons to new obligations and ever new effort to achieve the best given to them to do.

As I have gone over, in the light of my past experience in the Southern States, what I should say to the young men and women who here represent the 100,000 youth of the colored race, my mind has constantly turned to the great original order from headquarters, given by the "Captain of our salvation" to his first twelve obscure and untried disciples, sent forth to preach the gospel of love to God and man to an unbelieving and unrighteous world.

Wonderful as that tenth chapter of Matthew's record is in its profound insight into human nature and perfect comprehension of the conditions of all radical missionary effort, it is no less remarkable for its complete adaptation to the opportunities and obligations of the body of people for whom I have meditated this discourse. How can I find a more fitting climax to all I have said to-day than in reading over again this great order No. 1 from headquarters, delivered eighteen centuries ago?

First—Take courage, all of you, from the fact that such an order should have been given to these twelve obscure young men, absolutely untried in the great work to which they were appointed. Even in the Sermon on the Mount when the disciples were only a little group of people attracted by a new preacher, Jesus had said to them: "Ye are the light of the world. A city that is set on a hill can not be hid. Let your light so shine before men that they may see your good works and glorify your Father which is in heaven." And to the twelve apostles, two of whom were to fall away and all were to "forsake him and flee" in the hour of supreme trial, and later to the eleven who were to be involved in contentions and misunderstandings among themselves and the chief of apostles, Paul, he gave such power and authority to preach, heal and even "cast out unclean spirits" as would indicate a body of men tried and proved as by the fire. He gave them no inspiration that was proof against their own folly, conceit or sin, but simply issued his sublime order, demanding the most exalted courage, persistence and character, even a consecration unto death.

This is just what the Lord Christ now says to each of you. It is not given because

of any special merit in yourself. It is given as an inspiration to the grandest and most unselfish service for God and man of which you are capable. This ministry for God and humanity to which you are invited is in itself the highest "higher education" for every man and woman, strong and sweet and brave, enduring enough to receive it. If you can not live up to it, it will appear, as in many an enthusiastic follower of the Master, who, in the hour of danger, "forsook him and fled." If you are made of the right stuff, the call, with all its overwhelming splendor of opportunity and weight of obligation, will only introduce you to your better self, and as you go on, bring forth qualities in you never suspected by you or by your nearest and dearest friends.

Like the twelve apostles, you are sent, not to deal with the people, friendly or otherwise, among whom your lot is cast. They have their opportunity and their obligation in their connection with you, and a responsibility in no respect less important to them than yours to yourself. But you are sent to "the lost sheep" of your own "house of Israel." First, to the lower strata of your own race, in your own commonwealth, 60 per cent of whom are still in the bonds of an illiteracy that means everything that should be hateful and abhorrent to every friend of mankind. Your order is: "As ye go, preach, saying the kingdom of Heaven is at hand." Now is the time for this people, "sitting in darkness," to be "wakened out of sleep" as by the shining forth of a great light. The kingdom of Heaven to them and all like them is a new birth into the Christian manhood and womanhood that this great Republic, no less than the Master, now demands from every man and woman on whom it has bestowed the eminent degree of American citizenship. The sick, the poor, especially the dead-alive, will all be brought to you. And if you can cast out the legion of devils and the "unclean spirits" that now torment the lower order of these, your unhappy brothers and sisters, great will be your reward long before you go to any other heaven than the one you are called to build up right here in this commonwealth, in this beautiful and bountiful Southland.

Do not waste time prospecting for a favorable situation, or give too much thought to your supply of gold and silver, or to your own rank in the army of the Lord. Shoulder your Bible and go in wherever there is an open door. In any city "those who are worthy" of your ministry will find you out, and "your peace will come upon them." Otherwise "let your peace return to you." Always "keep the peace," for somebody will finally accept it. At the worst "shake the dust from your feet" where there is no place for you, and go your way, leaving God, through his all-directing providence, to deal with the situation. "If they persecute you in one city, flee ye into another," for you will not have gone through even all the cities of Alabama before the kingdom of God will have come. Somewhere will be found somebody who will welcome your coming and "hear the Word with gladness." And the kingdom of God always comes in this world when one soul throws open all doors and windows and bids the everlasting truth, love and beauty come in and there abide.

Do not imagine that your ministry, even if it is confined to living up to the "mark of the high calling" in the most common station in life, is to be a promenade, a reception, a festival, or even a Sunday-school picnic. Read over again the awful words of the Master, prophetic of every sincere endeavor made since He went to the Cross to preach and live a new departure in righteousness, intelligence, social or political uplifting anywhere. Perhaps the most obstinate of all who resist you will be your own people, offended with your call to repentance and newness of life; for "a man's foes shall be they of his own household." There is no hatred, contempt, or malignity like that of a people "half savage and half child" when shown the true picture of themselves. But if you can be "wise as serpents and harmless as doves," falling back on God in the hour of emergency to know "what ye shall speak" and

do, and especially if you can "endure unto the end," you will be saved and your success will be the earthly and spiritual salvation of many of those to whom you come.

Even if you are broken down with only the burden of living up to the best you know, be not disheartened, for what you meditate in darkness will be spoken into the light, and what you hear with the ear and fitly speak and worthily do will be repeated and done over and over again, till it is shouted from every housetop and proclaimed from all the mountain summits around the world. If "the Master of the house was called Beelzebub," who are you "of his household," even if you are "hated of all men for his name's sake?" Your bodily life is only lent you from God to be spent in the service of God for the uplifting of man. Even if taken from you, you will not die. Your "soul will be marching on." Abraham Lincoln in the White House was a man on a mountain top, bracing himself against the tempests and thunders of a nation in the throes of a mighty revolution. Abraham Lincoln, the martyr President, is now the father of the new Republic, honored and everywhere beloved throughout the world.

And finally, never forget that God is the supreme economist in the affairs of this world. "Not a sparrow falls to the ground without the Father," and the very hairs of the head grown gray or bald in the Master's service are all "numbered." Not a word, or act; or thought, or look, if worthy of your high calling, will be lost. And "whosoever shall give to drink unto one of these little ones a cup of cold water in the name of a disciple, verily I say unto you, he shall in nowise lose his reward." God grant that, whether the "time of departure" of any of us is far off or "now at hand," each one may be able to say with the apostle, "I have fought a good fight. I have finished my course. I have kept the faith."

---

## II.

### HOW TO IMPROVE THE CONDITION OF THE NEGRO.<sup>1</sup>

We must admit the stern fact that at present the negro, through no choice of his own, is living among another race which is far ahead of him in education, property, experience, and favorable condition; further, that the negro's present condition makes him dependent upon the white people for most of the things necessary to sustain life, as well as for his common-school education. In all history those who have possessed the property and intelligence have exercised the greatest control in government, regardless of color, race, or geographical location. This being the case, how can the black man in the South improve his present condition? And does the Southern white man want him to improve it?

The negro of the South has it within his power, if he properly utilizes the forces at hand, to make of himself such a valuable factor in the life of the South that he will not have to seek privileges; they will be freely conferred upon him. To bring this about, the negro must begin at the bottom and lay a foundation, and not be lured by any temptation into trying to rise on a false foundation. While the negro is laying this foundation he will need help, sympathy, and simple justice. Progress by any other method will be but temporary and superficial, and the latter end of it will be worse than the beginning. American slavery was a great curse to both races, and I would be the last to apologize for it; but, in the presence of God, I believe that slavery laid the foundation for the solution of the problem that is now before us in the South. During slavery the negro was taught every trade, every industry, that constitutes the foundation for making a living. Now, if on this foundation—

---

<sup>1</sup> From "The future of the American negro," by Booker T. Washington.

laid in a rather crude way, it is true, but a foundation, nevertheless—we can gradually build and improve, the future for us is bright. Let me be more specific. Agriculture is, or has been, the basic industry of nearly every race or nation that has succeeded. The negro got a knowledge of this during slavery. Hence, in a large measure, he is in possession of this industry in the South to-day. The negro can buy land in the South, as a rule, wherever the white man can buy it, and at very low prices. Now, since the bulk of our people already have a foundation in agriculture, they are at their best when living in the country, engaged in agricultural pursuits. Plainly, then, the best thing, the logical thing, is to turn the larger part of our strength in a direction that will make the negro among the most skilled agricultural people in the world. The man who has learned to do something better than anyone else, has learned to do a common thing in an uncommon manner, is the man who has a power and influence that no adverse circumstances can take from him. The negro who can make himself so conspicuous as a successful farmer, a large taxpayer, a wise helper of his fellow-men, as to be placed in a position of trust and honor, whether the position be political or otherwise, by natural selection, is a hundredfold more secure in that position than one placed there by mere outside force or pressure. \* \* \*

What I have said of the opening that awaits the negro in the direction of agriculture is almost equally true of mechanics, manufacturing, and all the domestic arts. The field is before him and right about him. Will he occupy it? Will he "cast down his bucket where he is?" Will his friends North and South encourage him and prepare him to occupy it? Every city in the South, for example, would give support to a first-class architect or housebuilder or contractor of our race. The architect and contractor would not only receive support, but, through his example, numbers of young colored men would learn such trades as carpentry, brickmasonry, plastering, painting, etc., and the race would be put into a position to hold on to many of the industries which it is now in danger of losing, because in too many cases brains, skill, and dignity are not imparted to the common occupations of life that are about his very door. Any individual or race that does not fit itself to occupy in the best manner the field or service that is right about it will sooner or later be asked to move on, and let some one else occupy it.

But, it is asked, would you confine the negro to agriculture, mechanics, and domestic arts, etc.? Not at all; but along the lines that I have mentioned is where the stress should be laid just now and for many years to come. We will need and must have many teachers and ministers, some doctors and lawyers and statesmen; but these professional men will have a constituency or a foundation from which to draw support just in proportion as the race prospers along the economic lines that I have mentioned. During the first fifty or one hundred years of the life of any people are not the economic occupations always given the greater attention? This is not only the historic, but, I think, the common-sense view. If this generation will lay the material foundation, it will be the quickest and surest way for the succeeding generation to succeed in the cultivation of the fine arts, and to surround itself even with some of the luxuries of life, if desired. What the race now most needs, in my opinion, is a whole army of men and women well trained to lead and at the same time infuse themselves into agriculture, mechanics, domestic employment, and business. As to the mental training that these educated leaders should be equipped with, I should say, give them all the mental training and culture that the circumstances of individuals will allow—the more, the better. No race can permanently succeed until its mind is awakened and strengthened by the ripest thought. But I would constantly have it kept in the thoughts of those who are educated in books that a large proportion of those who are educated should be so trained in hand that they can bring this mental strength and knowledge to bear upon the physical conditions in the South which I have tried to emphasize.

Frederick Douglass, of sainted memory, once, in addressing his race, used these words: "We are to prove that we can better our own condition. One way to do this is to accumulate property. This may sound to you like a new gospel. You have been accustomed to hear that money is the root of all evil, etc. On the other hand, property—money, if you please—will purchase for us the only condition by which any people can rise to the dignity of genuine manhood; for without property there can be no leisure, without leisure there can be no thought, without thought there can be no invention, without invention there can be no progress."

The negro should be taught that material development is not an end, but simply a means to an end. As Prof. W. E. B. Du Bois puts it, "The idea should not be simply to make men carpenters, but to make carpenters men." The negro has a highly religious temperament; but what he needs more and more is to be convinced of the importance of weaving his religion and morality into the practical affairs of daily life. Equally as much does he need to be taught to put so much intelligence into his labor that he will see dignity and beauty in the occupation, and love it for its own sake. The negro needs to be taught that more of the religion that manifests itself in his happiness in the prayer-meeting should be made practical in the performance of his daily task. The man who owns a home and is in the possession of the elements by which he is sure of making a daily living has a great aid to a moral and religious life.
