In 1830 the State of Delaware, with an area of 2,120 square miles, had a population of 76,748, which in 1860 had increased to 112,216. In 1850 there were 71,169 white persons, 18,073 free negroes, and 2,290 slaves; a total population of 91,532 in the State. The slave population was steadily declining and the free colored increasing up to the outbreak of the civil war. Newcastle County, including the city of Wilmington, and Sussex County, at the opposite end of the State, were in many ways as far removed from each other as one of the new Western States from Kentucky. In 1850 there were in the State 18,841 white persons of school age, 5 to 20.

The little State had followed up its honorable record as the first to adopt the Constitution of the United States by placing in its fundamental law the provision (art. 8, sec. 2): "The legislature shall, as soon as conveniently may be, provide by law for establishing schools and promoting arts and sciences." This provision, capable of great latitude of interpretation for the educational blessing or bane of the Commonwealth, was repeated in the revised constitution of 1831, and is still in force.

The attempt to apply this provision by the establishment of a State school fund through at least three acts of the legislature before 1807, with an effort to divert the fund to the support of the courts, with promise of future restitution, had the result that not until 1817 was \$1,000 appropriated to each of the three counties "to furnish instruction to the children of poor parents in reading, writing, and arithmetic." The contemptuous reception of this plan by the parents of the "children of the poor" was so marked from the first that in 1821 a resort was had to the original British method of using the Sunday school as a primary school of elementary instruction, and a small bonus was annually voted which, we believe, is still paid to each of the three counties for secular instruction in Sunday schools. An interesting document relating to this early period is an elaborate pamphlet published in 1803 by Robert Corson, of Delaware, entitled *Political Inquiries*, in which the author strongly advocates the most advanced ideas of universal education through the length and breadth of the new Republic.

The history of common-school education in Delaware, as in several of the States of the Union, from 1822 to 1829 is chiefly to be read in the appeals of the successive governors of the State for a general scheme of public instruction. One of the most notable features of the growth of a proper educational public in the South during the long conflict until 1870 is the fact that the governors of all these States were almost unanimously on the side of the common people in their demand for better schooling. The chief magistrates of Delaware were conspicuous examples of this fact. The statesman, with his broad outlook over the entire field of public necessities, if a real statesman and not a partisan politician masquerading under that name, in our country is far more inclined to favor reforms in public-school affairs than the average educator or ecclesiastic, each bound by the comparatively narrow view of a religious sect or a special type of school. In 1829 the State school fund amounted to \$151,643 and its income, \$9,255, was a meager capital with which to lay the foundation of a proper system of common schooling for the 10,000 white children and youth then sorely in need of "the great American chance."

It was a man of this sort in public life, of New England extraction, a classmate of Justice Joseph Story at Harvard, and from 1811 till the day of his death, 1875, a prominent character in the political and judicial affairs of the State, Judge Willard Hall, secretary of state in 1811-1814, 1821, member of State senate in 1822, compiler of State laws till 1829, and for forty-eight years United States district judge, who for a long generation was the undisputed leader of the public-school movement in Delaware. The educational writings of this eminent friend of popular education, though highly conservative, cautious, and at times almost timid in their conclusions, are a complete mirror of the condition of the leading public mind in the State for nearly half a century on this theme, and his elaborate arguments, all in the direction of the improvement of the system at any particular time on the ground, are most instructive to-day for the advocates of universal education in communities in a similar condition. A reference to Chapter VII, volume 2, Report of United States Commissioner of Education for 1894-95, will acquaint the reader with the details of the Delaware school law of 1829, which if heartily adopted and enforced would have placed the State at the beginning of the great educational revival of 1830-1860 in line with the foremost States of the South and West. But here, as elsewhere, it was demonstrated that it is one thing to carry through a legislature an educational statute far in advance of the average public opinion of an American State, especially if fathered and pushed by a concentrated group of influential men, and quite another to obtain the application of the law by the people most in need of its beneficent provisions.

In 1837 a portion of the United States surplus revenue distributed to the States, amounting to \$286,751.49, was added to the public-school fund, which in 1843 had reached the respectable sum of \$183,000, \$32,000 being distributed among 182 schools with 6,148 pupils. But there were now almost 20,000 white children and youth in

the State between the ages of 5 and 20, all in need of good elementary common-school instruction, and the secondary and higher education lagged far behind the supply in the neighboring Southern States. The great cities of Philadelphia and Baltimore, at that period prominent educational centers, were largely influential with Wilmington and the more advanced portions of the State. Newark College up to 1850 had graduated only 77 students, and was not recognized as a State institution until 1869.

Indeed, up to the period of the civil war the most notable agency in behalf of a proper system of general elementary education in Delaware was the educational convention, founded in 1836 at Wilmington, with Judge Willard Hall as president, a position held by him for twenty years, till 1856. The influence of this convention, which was rather an annual assembly of the educational common-school public than a gathering of teachers, can hardly be overestimated. By its suggestion the addition from the surplus revenue was made to the "State public-school fund." A law of 1837 favored the little school districts by requiring only a local tax of \$25 per annum to entitle them to State aid. The Newark University was aided by the common resort to several lotteries and some local taxes, and Judge Willard Hall was one of its trustees.

But it must be admitted that even this important agency of common-school reform was weighted by the highly conservative ideas of its majority of members, to a certain extent indorsed by Judge Hall, its long time leader and president.

The radical weakness of the school law of 1829 was its foundation on the idea of "local option," exaggerated to its utmost limits. Judge Hall says: "The design of the system is not to make schools by its operations, but to enable and assist the people to make schools by their own exertions." The people of any district, after it was laid out with sufficient population under the law, was endowed with "the power and responsibility of determining whether it would have a good school, an inferior one, or no school." Although the provision for a tuition bill was incorporated in the system, it was yet left to the decision of a majority in a community opposed or indifferent to general education to indefinitely deprive any child of the bounty of the State and the opportunity of schooling. The obstinate resistance of the districts most in need to any degree of taxation for years abolished the system which, neglecting the warnings and appeals of the general convention, "lingered shivering on the brink" of failure, till even the faithful leader of the educational public gave his sanction to the plan of school keeping adopted at the close of the civil war.

In 1843 the first State educational convention met at Dover. At the outset it "spiked its own guns" by a declaration antagonizing the Massachusetts idea that "all the children of the State shall be educated by the State," in favor of the position "that the people must educate their own children, and all the State should do, or can do, for any useful effect is to organize them into communities, so as to act together for set purpose, and help and encourage them to act efficiently by fair distribution among all the school districts of the income of the school fund. The school of every district is thus in the power of its school voters; they can have as good a school as they please, or an inferior school, or no school. The whole responsibility rests on them, and the measure of that responsibility is the welfare or calamity of all the children of the district."

This position includes the fatal weakness of the old-time idea of exclusive State rights reduced to its lowest terms, of a city, town, county, and neighborhood right to veto the will of a majority of the people, organized as a republican State. The American system of common schools is founded on the idea that every organized Commonwealth is responsible for the capacity of its people for good citizenship. No little district, city, township, or neighborhood is recognized as having any right, natural or acquired, to resolve itself into a social pesthouse of illiteracy, where law and order and all the elements of republican civilization are paralyzed, because of the capricious will of an ignorant and obstinate majority. The idea of the State

applied in this town is simply the old-time European notion that prevailed during the long despotic government of the people by privileged classes, who appropriated the wealth and opportunities of the nation, and doled out to the multitudes below such "crumbs of comfort" as seemed best in their own eyes. No democratic State ever provided for the education of its people under a theory so incomplete. Indeed, no semicivilized people has ever yet reformed itself—but only by a power that is embodied in law has it been lifted out of the slough of ignorance, superstition, shiftlessness, vulgarity, and vice included in the dictionary word "illiteracy." The State of Delaware for more than fifty years from the day when it placed in its constitution the provision for the education of the people was held back from its proper right to the American common school by this policy of holding the public welfare at the dictate of a personal and local independence.

In another most unfortunate respect did the State convention antagonize the ideas of the educational public of the State, resisting the forward movement of the people. In 1838 a movement in favor of normal schools and the general training of teachers was side tracked by a report which Judge Hall was understood to have prepared. The idea of this committee concerning this important subject was incorporated in the statement that "the teacher should be formed in connection with the spirit of the times and under the influences of public opinion, and not educated in normal schools as a distinct professional character." This proposition contains one-half the truth—that the teacher should be educated in sympathy with the people and adapted to his environment. But the proposition that an ignorant, illiterate, and semibarbarous community can be safely intrusted with the fundamental duty of training its own teachers "in connection with the spirit and under the influences of public opinion" within its own borders, if applied to professional life in general, would scuttle human civilization in any age or land. The appointment of boards of examiners of teachers representing districts where any scheme of popular education was established was a failure from the lack of opportunities to prepare for the profession of instruction, which is the first condition of success.

In 1849 the second "cold shoulder" was given by the convention to the proposition to establish a State superintendency of public instruction. In 1846 it gave the valuable advice to the 20,000 free colored people of Delaware "to confer upon their children the advantages of education," a position maintained by the Commonwealth even as late as 1875, when the law, afterwards held to be unconstitutional by the courts, was passed taxing the colored people for the support of their own schools. In 1891 the legislature appropriated \$9,000 as an addition to the small sum that could be supplied by the repeal of the law of 1875.

The utmost effort of the educational public of the State, working through this series of conventions, could only achieve the measure of success shown in the fact that in 1855, in 236 districts of the State, the same number of free schools was in operation, with 10,230 pupils enrolled. There is no information concerning the average daily attendance, length of the school terms, or value of the instruction. The public-school fund then amounted to \$425,525, of which \$49,469.30 was expended for the free schooling of the white children of the State. The outcome of the familiar idea was stated in convention by Judge Willard Hall in the declaration, "the stream rises no higher than its source, and so in every neighborhood where the improving influence of a good district free school is most needed there it is never found."

In 1861 the popular discontent with the slow progress of elementary education in the State reached the legislature, with the result that an act was passed compelling each school district to raise by tax the sum of \$75 in New Castle, \$100 in Kent, and \$30 in Sussex County, to be applied to the support of the schools of the district, with power to increase this sum to the extent of \$400 additional to that designated by law; also authorizing the raising by tax any sum less than \$500 for school buildings.

Thus after a fair trial of more than half a century the mischievous principle of local option in public education was repudiated and the fundamental principle of the common school asserted, that "all the children of the State shall be educated by the State."

The office of county superintendent of schools, created by the law of 1829, was filled by a succession of occupants during the period now under consideration. But as it did not entitle the holder to any special exercise of authority or the enjoyment of any emolument, it was a practical nonentity. An attempt in 1853-54 to lift this office into official respectability and influence failed. But for New Castle, and probably at times for other counties, this official did of his own accord contribute a great deal of valuable service to the people. Especially did Judge Hall and Dr. Gresham labor in season and out of season with the people of New Castle County to this end, and the city of Wilmington and the adjacent districts were largely indebted to this service for their early reputation in education.

Indeed, the discouraging feature of the slow progress of the idea of elementary education in Delaware for more than fifty years of the first century of the national life is relieved, from the period of the great national revival of the common school in 1830, by the record of the public-school life of the city of Wilmington. In the year 1829, under the authority of the school law of that date, the public-school system of the county was established by a division of the territory into ten districts. Teachers for boys and girls were employed, at \$100 and \$75 a quarter. In 1834 eight of the ten districts were reorganized as the "united school districts of New Castle County" and the first public schoolhouse erected. In 1836 the entire number of children at school was 716. Two days of each week in the summer schools were devoted to instruction in needlework.

In 1852 a final step was taken by the passage of the act establishing the present excellent system of common schools for Wilmington. The plan was in no essential respect different from that adopted in all the considerable cities of the country. In 1861 there were 8 schoolhouses in the city, 6 being the property of the board, with 2,052 pupils and 32 teachers, supported at a cost of \$24,930. The development of the system after the close of the civil war, under the faithful charge of its one superintendent, Mr. David W. Harlan, with the addition of the schooling of colored youth as a part of the general system, belongs to the record of the second great revival of common-school education in the United States from 1865 to the present time.

In his interesting and concise history of common-school education in Delaware, by Supt. J. H. Grove, in 1881, we read an instructive comparison of the schools of 1830 with those of that date. He writes: "Fifty years ago there were not more than twenty schoolhouses in the State, and those owned by private individuals. Children were taught mostly in private houses, and none but the wealthier class could afford to any great extent the expense of tuition. The number of children of school age was about 15,000 in a population of 58,000. The branches taught were only primary; the books were of the crudest kind, and school furniture of the rudest material and structure. The teachers themselves were of inferior education, and candidates for college classes were few.

"In contrast to this picture, which might be enlarged to any extent by the most picturesque representations of the early school life of many of the States at that period, especially those in which the common-school system had not then been developed, sufficient for us that the people now own 361 schoolhouses, which, with grounds and furniture, are worth \$440,000, which, in addition to the present school fund, makes an entire investment of \$889,787 for school purposes."

Such is the revelation of the American system of republican society, which, in the last result, culminates in the establishment of a great system for the education of the people sooner or later in every State. And such must always be the outcome of

a genuine form of republican government, which proposes nothing less than the obligation of every Commonwealth and the nation to train every succeeding generation for that sovereign citizenship which is the highest earthly position; the organization of a self-governed manhood and womanhood into a nationality that is in itself the noblest result of a Christian civilization.

NORTH CAROLINA.

In no State of the group of the fifteen Commonwealths known as Southern, in 1860, was the experiment of the people's common school of the American type more persistently tried, with results on the whole more encouraging, than in North Carolina. In all the colonies dominated by the aristocratic British ideals of society during the seventeenth and eighteenth centuries, until a period long subsequent to the establishment of the Union, the English idea that the well-to-do people should educate their own children, leaving to the State an intermittent and inefficient regard for the most elementary instruction of the children of the poor, was the greatest obstacle to the success of their various schemes for public education. Especially in Virginia and South Carolina this idea was so deeply rooted in the mind of the prosperous classes that, notwithstanding the persistent agitation by an educational public representing many of the most eminent personages of the time, this obstacle was only swept away by the great deluge of the civil war.

But the State of North Carolina, by its settlement, its long colonial revolutionary experience, and its history through the first fifty years of the national life, was in many significant ways prepared for the movement of 1840, which placed on the ground a common-school system of a type hitherto unfamiliar to the people of the southern Atlantic Commonwealths. The local historians of this State are fond of dilating on the notable facts that both Sir Walter Raleigh, who first brought a colony to Roanoke Island, in 1584—from which the first American child, Virginia Dare, was born—and Sir Henry Drummond, the first governor, lost their lives for resistance to the home and colonial despotism of that period; that the first blood of the Revolutionary war was shed and the first declaration of continental independence was made in North Carolina; that the intense loyalty of its people during that war was in marked contrast to the indifference and disloyalty which existed elsewhere; that in 1790 the new State—the last to enter the Union—was third in population, only surpassed by Virginia and Pennsylvania, and that from 1795 to 1827 North Carolina produced all the gold mined in the United States. When to this auspicious beginning are added the matchless natural resources of the State; an area of not less than 60,000 square miles; its seaboard a mine of prospective wealth from its timber, its fisheries, and the facilities for agricultural development; its central region—itsself practically a large State—adapted to every variety of farming and watered by great rivers, inviting to manufactures; its western “land of the sky,” a mighty mountain realm, with the possibilities of half a dozen States like New Hampshire and Vermont, the great expectations of its people for an illustrious future can be well appreciated.

But perhaps in no respect was the old north colony so favored as in the peculiar character of its population. The German, Swedish, and Huguenot colonists mingled with a vigorous sprinkling from New England and the central settlements that first came in possession of the seacoast; the good English stock of the interior; and the powerful Scotch-Irish immigration that, in its movement from Pennsylvania to Georgia, largely occupied the beautiful Piedmont section, had one element in common. Like the 40,000 original settlers of New England, they all sought the New World as a refuge from religious persecution at home. They well knew by bitter experience in their native land the meaning of civil and religious despotism, and however differing in other ways from their Puritan neighbors, cherished deep in their hearts the spirit of revolt against the tyranny of priests and kings.

The spreading of populations over a country so vast, and the prodigious difficulty of overcoming the natural obstacles to civilization of their new home for two centuries after the first occupation by Raleigh, kept this body of emigrants a retired and lonely people, isolated from each other and from the other colonies; perhaps even in some ways more out of touch with their nearest neighbors, Virginia and South Carolina, than with several of the old thirteen. The narrow policy of the colonial government and the home rule which resisted all attempts at education outside the pale of the established church of England practically denied the right of any public schooling to the masses until the close of the war of independence.

The deeply interesting story of the early movement in central and northwestern North Carolina at the close of the war of the Revolution to build up the higher and academical education has been told in the circulars of information of the United States Bureau of Education. The first constitution of the State contained an educational clause so broad and elastic that the whole American common-school system could maneuver its forces within its ample space. The State university was one of the earliest founded under the inspiration of the new national life. The family, private, and denominational elementary and academical schools, founded especially by the Presbyterian clergy, were the best of their sort in the South, and by their very excellence doubtless postponed the decisive movement for the people's common school to a later period. David Caldwell, the foremost leader of this Presbyterian type of education of the day, greatly influenced the early development of schooling in the State. His own home academy in Guilford County was a proper nursery of able men. It graduated five governors, fifty clergymen, and numbers of leading characters. Among these was Judge Archibald D. Murphy, the author of the first serious attempt in the North Carolina legislature in 1817 for a complete system of State education. He was at once member of the legislature, judge of the courts, doctor of medicine, man of all good work in the first great movement for the mental and moral uplift of the new Commonwealth, and the real father of the State university, of which he declined the presidency.

But he labored in vain to awaken a prevailing interest in popular education, and in his old age in a published letter written 1831-32 says: "It is apparent that popular education can not be efficient when left to the insignificance into which it sinks with no other security for its prosecution than the accidental and voluntary action which is now left. The plan of popular schools, hitherto the only one we know, is so haggard and meager and deformed in its features and so rickety in its constitution that it prevents many from the use of it who have no doubt that education is of the utmost importance to the young, to families, and to the people of a free State." These words of warning were written five years after the beginning of the movement to establish a State school system, in 1825, and fifteen years after the report made by Judge Murphy, as chairman of the committee on education, in the general assembly of the State. His report outlined a system of public education complete from the base to the summit of society; controlled by an effective board of education, representing all portions of the State, invested with ample "power to act."

But already the forward movement of the committees in these reports had been arrested by the remarkable emigration ("exodus," as named by Supt. C. H. Wiley) across the overhanging mountain region of the higher Appalachian summits in western North Carolina and east Tennessee toward "the West," as the present State of Tennessee was known to that generation in North Carolina. Why the ambitious and enterprising young men of a State so endowed by nature as North Carolina should have been smitten with this strange epidemic of discouragement regarding their own Commonwealth as rather a roosting than a fit abiding place; at best a sort of "tar-heelia;" as Stephen A. Douglas used to say of his native State, Vermont, "a good State to immigrate from," is accounted for by the native historians in various ways, among which the sparse population, lack of central towns, great difficulties.

of travel, and consequent ignorance and poverty of the people, largely figure. Eighty years ago 400,000 population were scattered through a region as extended as England. These characteristics of the situation made a condition that hung like a black cloud of desolation over the more progressive youth of the State. Meanwhile the strong religious sentiment of the more intelligent classes of the middle and western counties favored the establishment of classical academies, to which even the small tuition fee was a fatal barrier to the majority of youth. The plantation class of the central region, as in Virginia, did not favor the people's common school.

The consequence was the overwhelming "break" of the young men who should have developed a new civilization on the lines of its proper, democratic life, for the new State of Tennessee. The very early settlement of this splendid domain beyond the mountains and its development into a rival Commonwealth, and the strange insensibility of the home government to the giving away of the magnificent landed estate which, from its own income, might have built up the largest common-school fund of the Union of that day, acted as a virtual paralysis to the legitimate growth of the Commonwealth in its original direction and, with other reasons, postponed for half a century the first effective movement for common schools for the masses of its people.

But, even despite this drain of two generations of youth, who should have held North Carolina in the front rank of the great Republic, the longing for general education was in the blood and bones of the State. In 1825 a State fund for education was established and a "literary board" put in charge of it. By 1840 the annual income of this fund was \$100,000. In 1840 the rising public opinion invaded the statehouse and resulted in the establishment of a system of common schools for white youth, which through various reverses and hindrances, with the exception of the few terrible years of the civil war, has held its ground.

One of the most efficient friends of this movement was Hon. Willie C. Mangum, afterwards United States Senator, at this time a member of the State senate. The great obligations for the immediate success of this laudable enterprise are due to Dr. Calvin Henderson Wiley, who was then appointed to the first State superintendency of education in North Carolina, which office he held to the close of the civil war in 1865. In his interesting sketch of the history of education in his State he makes a strong point of the fact that the New England States at that time, 1840, alive with the enthusiasm of the great revival that lifted their entire educational system above a temporary arrest, owed their present success to their previous centuries of educational experimenting. But North Carolina in no previous experience of popular education attempted to place on the ground the same complete system. The people of Massachusetts and Connecticut were, from the first, homogeneous in their origin, ideas, and opinions, while the 600,000 people of North Carolina, from their diversified origin and previous isolated life, were almost incapable of a vigorous united policy on any save the most elementary interests. "The common school," he says, "was an entire novelty to our people—a people tenacious of old habits and greatly suspicious of innovations." The great expectation that it would at once strike its roots into the soil and spring up a majestic forest was, of course, disappointed. "The system of common schools, to be successful in the highest sense, implied a moral revolution; it imposed new duties on the entire mass of our population; it was based on new ideas that had to become thoroughly rooted in every mind, and it opposed and sought to remove old prejudices and old habits." Again, though in one sense "educated," the masses of the people in this, as in the majority of the original States, was still an "unlettered people," and in no State was the illiteracy, for several causes, at this time so all-pervading as in North Carolina. "One-sixth part of our people in 1840 could not read, and of those classed among the readers how many could write a plain note off hand or read so as to be understood? This ignorance of the State was the misfortune, not the fault or disgrace, of the people, but it was ignorance, nevertheless, and, in its nature, presented a strong resisting medium to the

whole machinery of common schools, to their principles of action, to their working and their end." The more favored classes were infected with the Virginia, still largely the British, idea of education—that the common school was, at best, a charitable arrangement for "the children of the poor," and had no reliable interest in its expansion or even its success on its own narrow field. It was also supposed, according to Dr. Wiley, to be not only a public but a self-acting labor-saving machine to remove the cost and trouble of educating the children from their parents and their local community. And the chronic misery of the common school all the way up, even more keenly felt to-day, in the hour of its triumph, by its wisest friends than ever before in the day of small things, in North Carolina almost a deadly defect, the inefficiency of the average teacher was, perhaps, the most discouraging feature of the case.

The schools rapidly increased and quite outgrew, both in numbers and efficiency, the old-field school-teachers, who, as far as possible, were drafted into the service. In 1852 there were 3,000 schools in the State, and according to the superintendent there were not 1,000 teachers fit to do well even the elementary work of instruction in the "three R's." And all these defects were intensified and magnified by the radical mistake of 1840, leaving the new system practically with no directing head. Judge Murphy had long ago seen this imperative necessity of any effective scheme of popular instruction and had placed his projected system under the control of an efficient and fairly representative board of education, at one remove from popular election. But this was too great an innovation on the boundless independence of the average Southern society and the almost insane dread of concentration of power which was the real cause of all the previous failures in this section to establish a working system of public schools. The literary board, a body intrusted with the growing school fund of the State, was only an apology for a proper board of directors during the first twelve years of the schools, from 1840 to 1852. The school fund established in 1825 was placed under the direction of this "board of literature," consisting of the president and directors of the literary fund of North Carolina. There were then no public schools, and the board was simply a body of private trustees, with no power of supervision of the system of 1840, of which it was the nominal head. The board was itself conscious of its own impotence and besought the legislature for twelve years to place the system under efficient management.

The result was that until 1852 the legislature of the State had practically no knowledge of what was actually going on in the educational affairs of the Commonwealth. The income of the State fund, \$100,000, was distributed, and that was the end. Every little district was "running on its own hook," without knowledge of what was done elsewhere and with no sense of responsibility to any higher power.

It was not a system in any accepted sense of that word, but a large number of schools, distributed over an area of almost national extent, each doing or not doing its own work. The only wonder was that the experiment survived at all and that it did not go down in a spasm of popular disappointment and disgust. That it did outlive this period of crude shiftlessness and in itself take account of its deficiencies in the legislation of 1850 is a powerful testimonial to the general demand for education among the better classes of the people and the energy and wisdom of the legislation of 1850, that gave to the disorganized system an efficient head.

The right man in the right place was found in Calvin Henderson Wiley, a young lawyer and member of the State legislature who, with a group of progressive associates, aided by the powerful influence of Senator Mangum, succeeded in placing on the statute book a second school law, the most important feature of which was the provision for a State superintendency of public instruction. This gentleman was made the first superintendent of public schools in North Carolina, and, even more the father of the present school system of the State than Horace Mann or Henry Barnard, was, like both these great leaders of the educational revival of the period, a young

lawyer and a rising politician. Calvin Henderson Wiley was born February 3, 1819, in Guilford County, N. C. At the age of 21 he was graduated from the State university, studied law, and was admitted to the bar soon after graduating. In 1850, at the age of 31, he was elected to the State legislature and again in 1852. Here by the same good Providence that arrested Mann and Barnard in their early legislative career, he was selected as most fit to occupy the responsible position of State superintendent of public instruction. For six terms of two years each he was chosen, by almost unanimous consent, to this office, which he only left at the suspension of the common-school system during the closing year of the civil war and by the destruction of the school fund. His last public appearance was, as one of two members of a board in 1867, as the author of an able pamphlet setting forth the attractions of North Carolina and especially of the coast region to settlers, still in the interest of the schools, as in the development of this vast area of unreclaimed wilderness was then the only hope of a rehabilitation of the State school fund and a reconstruction of the system of free public education.

The advent of the reconstruction government of the State having removed Dr. Wiley from active participation in public affairs, he entered the ministry of the Presbyterian Church in 1865. In 1869 he was appointed as general agent for the American Bible Society, first in middle and eastern Tennessee; afterwards, in 1874-1876, for North and South Carolina. Besides his labors in the cause of public education, he was active in various departments. He compiled a series of school readers and published several works of fiction and an answer to Mrs. Harriet Beecher Stowe's *Uncle Tom's Cabin*. He was a constant contributor to religious periodicals and an editor of secular and educational journals. He died at the age of 68 at Winston, N. C.

For the twelve years from 1852 until 1864 Superintendent Wiley was not only the able and industrious official superintendent, but the foremost representative of the idea of popular education in its broadest American aspect in the State of North Carolina. So persistent and laborious were his services, and so broad his conception of the education needed for his State and his time, that no adequate sketch of the history of the common schools of North Carolina during these years could be made apart from a description of his plans and a statement of his personal efforts, relieved against the conditions of that Commonwealth in respect to the entire methods of the training of the masses of its white population for American citizenship.

In the United States census of 1840, the first that seriously attempted to report the educational status of the country, North Carolina appears with a record of 2 colleges and universities, 140 academies and grammar schools, 632 primary and common (country) schools—776 in all. There were in attendance in the colleges 158; in the academies, 4,388, and in all elementary schools, 14,937 students; total, 19,488. The number of illiterate white persons was reported as 56,609. From 632 primary and common schools in 1840, the superintendent reports 2,600 common schools in 1854, with 95,000 pupils, against 14,900, a gain in fourteen years of over 500 per cent, and in the colleges 250 students, an addition of 60 per cent.

In 1852 there were reported 13 seminaries, schools that assumed the title "college," with 600 boys and 1,000 girls as students; 300 academies, with 7,000 pupils, and 100,591 children in 2,100 primary and common schools. In 1850 the whole number of white people in North Carolina was 553,028, a small increase during ten years; free negroes, 27,463; slaves, 288,548; total population, 869,039. The number of white illiterates had either largely increased, or probably was not correctly reported in 1840—71,150. The show of pauperism was in pleasant contrast, and equally favorable for the deaf, dumb, blind, and insane. But we are constantly reminded by the expert statisticians of to-day that the figures of the United States census half a century ago were unreliable and that we must take these, with all local estimates of such matters, as direction posts toward an unexplored realm rather than

a veritable record of facts. But there is, evidently, a great deal more than exaggeration in the cheering report given by Superintendent Wiley of the gain in educational opportunity for the masses during the nine years in which the common-school system had been in actual operation.

At the time of Dr. Wiley's first report, 1854, the number of children in common schools was estimated at 95,000, as stated above. He mentions that the unexampled increase in the numbers of the common schools has not been at the expense of the secondary instruction. He says: "For every two good subscription schools broken down by the common schools we have at least three equally good common schools and an academy somewhere else; or three good schools for one, because there are four other schools not so good for every one thus interfered with." The average term of the common schools in 1852 was "about four months," and the whole number of white children between 5 and 21, 195,000. "There are 150,000 children attending school at some time during the year in the State and 165,000 who ought to be at school."

The superintendent ventures the prediction that "the average ignorance among the generation now coming on will be at least 50 per cent less than among that now in active life." Although the common schools for the nine years since 1842 had walked in silence and darkness and without a voice to encourage or a report or statistics to furnish light, they had made an advance which destroyed the ignorance of the State one-half in ten years. But still "fully one-sixth of the free, grown-up people of North Carolina can not read the Word of God, and 200,000 children, for good or evil, are growing up in the State."

But when we turn from this remarkable sketch of progress to the vivid description of the local management of the common schools of the State during the entire twelve years of the superintendent's administration, we find ourselves wandering through a maze of uncertainty concerning the actual condition of educational affairs. From the beginning he pronounces it almost an impossibility to obtain reliable information of the condition of the 3,000 schools, almost entirely in the rural districts, which he believes to be in operation. There is no attempt here, as there was then little in other States, to find out the average daily attendance on the schools; indeed, it is distinctly stated that the superintendent's estimate included all who at any time had been in attendance. A full account of the pecuniary support of these schools, as drawn from the literary fund distributed according to the reports of school attendance by the local commissioners of the schools, has been a temptation to gross exaggeration in the counts to all States for generations accustomed to the working of the common-school system. On the other hand, the increasing complaint from all quarters of the incompetency of teachers and the increasing difficulties of their support, and the labors and trials of the commissioners to resist the rush of ignorant and useless people upon this new source of income, create a reasonable doubt of the quality of instruction offered to those who regularly attended. The fearful strength of the obstacles to the success of any proper system of common schools through the alarming illiteracy of great masses of the people and other equally potent causes leaves one suspicious concerning the amazing results claimed by the superintendent, such as have never been witnessed in any other State in the Union.

In short, the eloquent and elaborate reports of Superintendent Wiley, crowded with practical and broad suggestions and admirable plans for meeting the peculiar difficulties of the situation, like those of Dr. Henry Barnard in Connecticut, can hardly be taken as a thoroughly reliable record of what was actually being done in this vast region of the North Carolina of forty-five years ago. A full half of this immense area would be regarded to-day as a wilderness; and large numbers of the people were quite out of touch with the whole system, as is reported on every page of this body of school literature. During the first year of his superintendency Dr. Wiley made a heroic effort to visit the entire State, and did actually travel,

largely by private conveyance, through many counties, some of them in the remoter and sparsely populated regions. But he soon concluded that this was a waste of energy. Outside of ten counties he found no reliable means of public conveyance. He had to go by private carriage or on horseback, and two-thirds of his time was spent on the way. The illiterate class was not attracted by his lectures. The time given to any single district was all too short to admit of any very effective work. Thereafter he seems to have wisely remained more at home and concentrated his energies on the endeavor to reach the active school public of all localities by the pen, printed circulars, and consultation with people situated at centers of influence.

Hence we shall be on the safe side if we read the statement with some reservation that a larger majority—nine-tenths of the children of North Carolina, from 1852 to 1865—were in attendance on common schools than in any other State of the Union, or than even to-day in some of the most active educational Commonwealths. From 1852 to 1865 there was nowhere a proper system of gathering school statistics; even the reports of New York, Pennsylvania, and the new Western States were in many ways misleading; and all educational statistics of a State in the condition represented by Dr. Wiley are to be taken with an abundant discount.

But this is evident, that during the twenty-five years from 1840 to 1865 there certainly was in North Carolina such an uprising of the masses of the people in behalf of general education and, in comparison with some other portions of the South, such a generous outpouring of funds for its support, with a persistence in its movement, as plainly sets the Old North State at the head in popular education of all the Commonwealths now under consideration; and there can be no reasonable doubt that had it not been for the interruption of the civil war, whose closing scenes were enacted within its boundaries and whose aftermath for more than one troubled decade was as disorganizing as in any of the Confederate Commonwealths, the system would have steadily grown, gradually clearing itself of its own infirmities, and lifted up the State to an educational level so far above its previous condition that North Carolina would not be, as at present, still one of the lowest in the scale of white illiteracy in the Union.

The several more serious obstacles to the success of the movement are noted in the statement of the first superintendent, which itself bears eloquent testimony to the courage and persistency of the masses of the people of North Carolina at a day so early in the history of the common-school movement in that section. It certainly justifies all he tells us of the deep and unquenchable desire for progress by the classes that labored under the greatest deprivation in social, civic, and educational affairs.

We must therefore, in our general statement of the progress of popular education in North Carolina from 1852 to 1865, leave the details of local operation to be wrought out by those most interested in the record of the times and give our attention largely to the work of the faithful State superintendent of common schools.

The first report of Dr. Wiley, made in January, 1854, reveals his own plan of the educational campaign which he fought out through the twelve memorable years before the outbreak of and practically during the civil war. In reading these profoundly interesting documents we are impressed with the central purpose of the writer. To his view the common school of the type that had been evolved up to that date was the only efficient agency by which the people of North Carolina would be awakened to the fit appreciation of the magnificent resources and grand opportunities of their native State, and through the training of their 200,000 children and youth move upward and onward along the highway of intelligence, virtue, and a lofty patriotism to the rightful position in the Republic indicated by the origin and history of the Commonwealth. It is the education of the whole white population, through the common schooling of all classes of the dominant race, that is always apparent in his view. He plainly sets before the legislature and people the discouraging facts

of the present ignorance, isolation, and the lack of knowledge of the geography, resources, and history of their own State, and consequent absence of public spirit that have steadily reduced the third Commonwealth of the revolutionary period to one of the least prosperous, enterprising, and progressive of all. He would arrest the rushing torrent of emigration that was draining the State of so much of its best young blood by a full publication of the resources of a Commonwealth so favored by nature and opportunity that this valuable population could be kept at home. We find in these pages, and all his subsequent writings concerning these and similar defects in society in the State, no trace of the boastful "booming" of local affairs that is the chronic weakness of the provincial American mind. He thrusts the unwelcome story of the imperious needs of the State in the face of the fathers in the statehouse and points to the one infallible remedy.

Hitherto the natural desire of the masses of the white people of the State for the education of their children had been diverted too much from its proper channel by the endeavor of the more favored and cultivated class to monopolize this precious privilege and draw a hard and fast line between the instructed few and the unlettered "plain people." But the superintendent sees in this tendency an exaggeration of the difficulties that affect the State—the widening of the chasm between the superior class and the "common people," on whom the State must depend for its future advancement. The narrow notion of a poor school for poor children, which even at this period was in favor in all the school States west of New York, seems never to have been tolerated in his mind, and he never mentions it except to cover it with ridicule and scorn. His ideal school was the common school of Massachusetts, Connecticut, New York, and the progressive States of the new West, adapted to the needs of a people practically unacquainted with and prejudiced against it as a characteristic feature of Northern society foisted upon the South. It was to be supported by, for that time, a generous common-school fund of \$2,000,000, with an annual income of more than \$100,000, increased by the taxation of counties sometimes to the extent of the sum received from the State. He was well acquainted with the condition of educational affairs at home and abroad, but was not impelled by any superficial pride of rivalry by his new constituency to force upon public attention methods and practices not adapted to the end proposed.

First came the inveterate trouble that exasperated the patience of Horace Mann and Henry Barnard in their own States—that of obtaining any reliable returns from the schools then in existence. While a majority of the 80 counties of the State did send a pretense of a return, through the school commissioners of the 3,000 different districts, their communications were of such a quality that it was a sheer impossibility to learn from them that which was the one thing needful to be known—what was actually going on in the common schools of their localities. Through every report, during all the years of his laborious service, the afflicted superintendent was seeking, always in a kind and appreciative spirit, to impress on the commissioners the necessity of a more intelligent and consecrated zeal and a faithful performance of their important duties. He favored the passage of the law which transferred the responsibility of their appointment from the courts to the people, perhaps not always to the advantage of the schools. His first experiment of trying to visit the entire area of such a State as the North Carolina of 1850 with but 800 miles of railroad and only 10 of the 80 counties supplied with any fit provision for public conveyance was a discouragement. He succeeded better with his repeated attempts at issuing circulars. Every year saw elaborate communications directed to this class of public officials, both commissioners and examiners, printed in all the newspapers of the State and placed in the hands of every school trustee.

No less vigorous was his campaign of "heading off" the veritable rabble of mental and moral incompetents who tramped over the field of the new occupation of school-keeping thrown open by the rapid multiplication of the schools. The average wages

of teachers were only inferior to those paid by the State of Massachusetts, and greater than in the majority of the Northern States. Indeed, as the superintendent was constantly saying, the lack of money was not the greatest obstacle to the success of the schools. We do not learn to what extent this payment of wages included the board of the teachers. He saw that the State was in no fit condition for the establishment of the State normal school or the teachers' institute, already doing their work elsewhere. The teachers were too isolated and generally too short of money to be gathered in considerable groups for any extended course of instruction. But with great practical wisdom he struck at the root of the evil by proposing a strict system of examination of teachers, with graded certificates of proficiency, given for short terms, taking care all the time that the examiners themselves should be "toned up" to a higher appreciation of their duties. He orders that the record of these examinations shall be posted on the doors of the county court-houses, that the people may know "who is who." He sends out a pithy handbill, addressed to both commissioners and teachers, setting forth the responsible duties of each, and orders that it be posted in every schoolhouse, that the pupils reading it may have an ideal before them by which to test their teachers as well as remind them of their own duties. He urges the establishment of model schools at many educational centers, to which the superior scholars of a wide district may be sent with a view to their training for the work of instruction, and purposes that these schools shall receive an additional subsidy. He calls attention to the fact that large numbers, especially of young women, living in poverty or even working in the fields for a pittance, may be lifted up by the common school and prepared by a system of county, model, and normal schools for the position of teacher. He suggests an admirable arrangement—the teachers' library association—by which the school-teachers of a district may unite in a club, with a suitable library, and frequent meetings for mutual improvement, lectures, etc. He advocated a State journal of education, and at a later day a State teachers' association, both of which were finally subsidized by public funds.

He finally came to the conclusion that a system of popular normal schools, established in different portions of the State, could be profitably organized except in one or two localities. But it was then too near the opening of the great war for the project to attract attention. He also urged upon the university, the colleges, and the leading academies of the State the establishment of a department of pedagogics. In order to promote the union of teachers, school officials, and the educational public in general, he urged upon the counties the building of a "school hall" in every county town, a respectable building, dedicated to education, ever standing as a representative of the people's great interest and consecrated to constant service for the cause.

Even more zealous and untiring was his effort to use the schools for the general improvement and development of an active public spirit through the agency of the schoolbooks. He compiled an excellent North Carolina reader for advanced classes of scholars, directed to this especial purpose. It contained an industrial and historical account of the State, its resources and opportunities, a selection of quotations from the works of its eminent personages, several pages of well-selected and original poetry, and useful tables of various sorts. The subsequent numbers of this series prepared by other hands seem to us far inferior to this, one of the best schoolbooks of the day. He prepared a school catechism for oral instruction, containing a full account of the common school for beginners. He caused the republication of one of Mitchell's series of geographies, with an appendix containing a good map of North Carolina and presenting the cardinal features of the area of the State, one of the first of this sort of publications.

While urging the importance of this series of publications, the superintendent seems never to have been drawn into the habit of the wholesale abuse of Northern school books and teachers which, during this decade, became a prominent feature of the increasing spirit of sectional animosity. He saw clearly the fact that the com-

mon school could only succeed in the State by the development of a competent body of native teachers and must be used as an agency for enabling great numbers of worthy young people to rise in the world. He appeals to an honorable State pride, not to fill the people with an inflated sense of their own superiority, but to awaken a noble ambition to emulate the foremost communities abroad and at home in all that makes a State truly memorable.

As the work went on, the superintendent urges the establishment of the graded school in all important villages and towns; of which there were perhaps fewer in North Carolina in 1850 than in the majority even of the Southern States. His eyes were open to the great material resources of North Carolina, and he labored to make them known to the masses of the people, by the publication of all available information, especially concerning the facilities for a large development of manufacturing industry. And he realized that the growth of villages and cities is an indispensable condition of progress in modern civilization.

The undeveloped swamp lands of the State—1,500,000 acres in extent, a mine of undeveloped wealth, chiefly on the seacoast—were then in litigation between the State University and the literary board. The superintendent deprecated the effort of the university to divert this valuable property from the State common school fund and read an eloquent lecture to the influential and educated class to come down from their offensive assumption of superiority and unite to lift up the masses for the common good. These lands finally passed into the possession of the common school fund, and in 1867, when the fund itself had been wrecked in the war, Superintendent Wiley published a pamphlet as a member of the literary board, setting forth the advantages of this portion of the State and urging white immigration thereto.

On the outbreak of the war in 1860-61, although in full sympathy with the party of secession, Dr. Wiley, through his reports, breathes a spirit of conservative wisdom and deep concern for the people. He realized the fact that the mass of the people who most needed the common school were slow to enter on the great conflict which so wasted their substance that even to-day the State has not recovered from the awful drain. He also appreciated the fact that whatever might be the issue of the contest the State would feel the increasing need of education. If North Carolina was to be brought back to her old allegiance to the Union, then all the more would she need the uttermost enlightenment of her entire population to retain her rightful position in the reunited Republic, and if the confederacy was to become an accomplished fact, then especially would the people of North Carolina need all the training of an educated State to meet the demands of her position in a new nationality. So he urges, with great earnestness and discretion, the continued effort to sustain the schools in spite of the war.

Thus, through twelve long and laborious years, did this faithful servant of the children and youth survey his native State, like a thorough engineer of education "prospecting" the wilderness in view of the years that are now upon us. Whatever may be said of the educators of the South before the war period, it is certain that no one of them had been able, under circumstances in any way so discouraging, to accomplish so much as Dr. Wiley in North Carolina; and probably in no one of the States that gave in its adherence to the Confederacy, were so large a number of children in school attendance up to the closing year of the conflict, as in the old North State. Despite his constitutional optimism, Dr. Wiley was deeply sensible of the actual results accomplished by the campaign of twenty-five years, from the passage of the improved school law of 1840. But he puts the case after a fashion that will not only be accepted by every practical educator as a reasonable explanation of affairs in North Carolina, but may be accepted as an answer to that "indictment of a whole people" nowadays so often drawn up by educational "reformers" against the American system of general universal education.

In 1861 he writes to the boards of examiners: "The common school system of

North Carolina has now arrived at this critical point in its career. It has furnished us with light sufficient to enable us to comprehend our imperfections and to fill us with the desire for better things." This circular is crowded with practical suggestions for the improvement of the teaching force, especially through the larger employment of women. In the general report of these years, 1860-61, he declares that "the State of North Carolina, by distribution from the literary fund and local taxation, distributes the sum of \$278,000 for the schooling of 150,000 children four months in the year, with an average of \$26 per month for teachers' wages. The people of the State have also invested outside the common schools \$2,500,000 in colleges and academies, a small proportion of it in buildings. The academical and higher seminaries bring to the State an annual income from students from abroad of \$750,000, an amount equal to the expenditure for the common school system, and 20 per cent beside, on the whole higher school instruction."

In 1863 the superintendent, even out of the wreck of the war, frames an argument for the establishment of graded and high schools. He says: "In addition to the annual distribution of the literary fund for common school purposes, an additional amount shall be appropriated to such communities as shall raise a like or greater sum by taxes; the amount to be employed in support of graded or higher schools for the education of disabled soldiers and the indigent children of those who have entered the army, or teachers and other useful and honorable occupations. If the schools are not filled with this class they will be open to all others, and all will be entitled to send their children on the payment of tuition." This plan was indorsed by the State Teachers' Association; but the collapse of the State fund in the closing year of the war, 1865, suspended the public school system and relieved the superintendent from further labors in its behalf.

In 1854, only two years after his entrance on his great work of thirteen years, he writes:

I admit that a considerable number of those who now attend school go but a few days in the year, and learn but little; but it must be borne in mind, as a very important consideration, that many of these are the children of those who never went a day to school themselves. Into a mind wholly ignorant, it is hard for the light to penetrate; and the man who does not know the alphabet is not sufficiently enlightened to feel his ignorance, or to appreciate a higher state of improvement. He is not open to the leadership of knowledge at all, and can, therefore, see no one above him. But as soon as he makes a start he can begin to understand his relative position. Hence the children of ignorant parents, who get a little smattering of knowledge at our common schools, will feel their wants when they take their position in life, and their children, if the same facilities remain, will be much better educated. The majority of the children of that large part of the population who can not read at all are learning a little at our common schools. We may boldly assert that in the second generation the dark cloud that covers the sixth of our moral surface will nearly or wholly disappear, leaving only a dim outline to indicate its former existence. There are 3,000 schoolhouses accessible to more than ninety-nine one-hundredths of all our population, reaching to the shores of every lake and river, to the heart of every swamp, and to the top of every mountain. The temple is erected and its lights are burning, feeble and dim, I admit, in many places; but the lights of an inextinguishable fire are burning in every dark valley, in every deep cave, in every marsh and bog and fen. Lo, these 3,000 lamps! To one situated, as many of our people are, within view of only one of these tapers, shedding, perhaps, a dim and flickering light, the prospect may not appear very bright or encouraging; but to behold them, as it has been my business and pleasure to behold these 3,000 lights, suspended in one grand chandelier, and from the ocean to the Smoky Mountains penetrating every square foot of 50,000 square miles of a land of shadows, with the cheering beams of knowledge, is well calculated to fill the coldest heart with emotions of enthusiasm and to arrest the hands of the most daring invader of this constellation of hope.

That this great work was a success, even despite all obstacles, in directing the minds of the masses more and more into the channel of a well-organized, improving, and creditable system of general education is beyond question. During this same

period not only the university but several of the denominational colleges of the State—Davidson, Wake Forest, and Trinity—with several female seminaries of note and numbers of academical schools came up and flourished. Before the outbreak of the civil war the amount of money paid to the State by students from abroad exceeded the \$300,000 expended for the common schools and the interest on the original financial plant, and the State of North Carolina was becoming an important center of the secondary and higher education, especially for the entire region of the southwest.

In 1859 the school population of North Carolina was estimated by Dr. Wiley as 200,850, of whom 105,000 (59,500 males and 45,500 females) were reported as attending school. The sum distributed for common schools was \$255,641, with \$51,108 remaining on hand. The whole amount of school taxation for the State was \$100,450. The average length of the school term was three and two-thirds months. There were 3,488 school districts, and nearly that number of licensed teachers. The superintendent writes:

The common school system and much of our other educational interest is not over twenty-one years old. Six hundred miles of railroad, several hundred miles of plank road, and a very important ship canal, besides other improvements, have been initiated and completed within thirteen years, while much of the territory of the State is yet covered with original and invaluable forests of pine, oak, and chestnut. A large portion of the best land in the State is yet to be put under cultivation, while that now under tillage is capable of vast improvement. Our water power does not yet drive the one-hundredth part of the machinery it can propel, and our inexhaustible mineral wealth has not yet been tapped. North Carolina is larger than New England, twice as large as Scotland, half as large as Great Britain, twice the size of Holland and Belgium combined, half as large as Prussia, and one-third the size of France.

It is with these inspiring views of the resources and opportunities of this great State that the brave superintendent, at the outbreak of the civil war, urges on his people the absolute necessity of supporting the public schools of the State. The fact that amid the tremendous exertions, sacrifices, and sufferings of the people, over 50,000 pupils were kept in the public schools of North Carolina almost in hearing of the noise of war in the neighboring State of Virginia—reaching to its very borders—testifies to the deep root the system had already struck into the soil of the old Commonwealth. During this year Dr. Wiley established a publishing house at Greensboro, to supply his own and adjoining States with school books, and helped to organize, at Columbia, S. C., an educational association for the Confederacy, to which North Carolina teachers owe their *Journal of Education*. During the year 1862 nearly 90,000 children were reported in attendance, and \$81,000 was disbursed.

The present record, from the lack of space, can only include the salient facts of the organization of the common school idea in North Carolina, and the policy and wise and vigorous administration of its superintendent. But it will have accomplished its purpose if it shall invite some one of the many zealous and able young common school men of North Carolina to prepare a fit biography of Dr. Wiley. No volume more interesting and practically useful to the common school public of the Southern States to-day could be published than this, especially if followed by a republication of the educational writings of Dr. Wiley—at least, by a volume of eloquent and instructive extracts from these valuable contributions to the literature of public school education. This work has been admirably done by Dr. Weeks, of the U. S. Bureau of Education.¹ Many of the expedients struck out for the adaptation of the American system of common schools to the peculiar needs of his State during this period are still capable of extensive practical adoption in every one of the 16 Commonwealths once known as the South, for all concentrate on one central purpose—the awakening, informing, and directing the attention of the masses of the Southern people to the wonderful resources and opportunities of an imperial realm; setting forth its own peculiar advantages and the obligation to use the American

¹ See Report of the U. S. Commissioner of Education, 1896-97, Vol. 2, Chap. XXIX (pp. 1379-1474).

common school in all its departments as the motive power of a revival of public spirit, intelligence, and skilled industry, public, social, and political development, and national patriotism.

The educational records of this State during the period from 1840 to 1860—even before the final effort to establish the common school over any extended district in the Southland—are one of the most valuable legacies of the old to the new order of affairs, and should be collected, thoroughly edited, and widely consulted for the encouragement and instruction of those who now have in hand the mighty experiment of educating the 6,000,000 children and youth now coming forward to face the splendid opportunities and confront the great difficulties that still make this portion of the United States the most interesting field of educational observation in our own or any land.

SOUTH CAROLINA.

From the year 1830 to 1860, the period indicated in this essay as a great revival in the American common school, under the leadership of Horace Mann, Henry Barnard, and a brilliant group of educators and publicists identified with this reform, the three notable factors in the educational life of South Carolina bearing on the development of popular education were as follows:

(1) The continued improvement of the State college of South Carolina, with a corresponding growth in the denominational colleges and academies.

(2) The establishment of the graded common-school system in place of the old-time free school for the children of the poor in the city of Charleston.

(3) The steady purpose of the educational public in demanding a radical reformation in the inefficient provisions for the schooling of the masses of white children and youth, favored by the majority of the foremost public men of the State and aided by more than one of the most distinguished members of the State college faculty.

A glance at these movements, all the result of the rising demand for general education of the American type, will be the best preparation for understanding the complete establishment of the common school system in all its departments for all classes and both races in South Carolina within the ten years after the close of the civil war, 1866-1876.

The resignation of Dr. Thomas Cooper from the presidency of the South Carolina State College in 1834 left that institution greatly depleted in the attendance of students, with a growing disfavor among the religious public of the Commonwealth, owing to the "advanced opinions" of the retiring president on matters theological and educational. In 1835 the number of students was reduced to 20. This state of affairs was the opportunity for the establishment of several denominational colleges, among which were Erskine, in 1834; Furman, Baptist, in 1852; Wofford, Methodist, 1851; Newberry, Evangelical-Lutheran, 1858; while a number of influential academical seminaries, several for young women, assumed their present organized form before 1860. An interesting account of these, all of which have greatly contributed to the educational upbuilding of the old Commonwealth, will be found in the History of Higher Education in South Carolina, by Mr. Colyer Meriwether, U. S. Bureau of Education, Circular of Information No. 3, 1888.

At this crisis in the history of the South Carolina College the cause of sound education in South Carolina was greatly discredited in the majority of the schools of the higher and secondary education by the disorderly habits of the students. The views of the severe critics of the present conditions of our college life will be largely modified by a glance at the records of the doings of young America in pursuit of knowledge from the earliest colonial periods, even beyond the close of the first half century of the national life. In no State was this boyish conceit of the "glorious liberty" of student life, including a widespread intemperance and a spirit of chronic rebellion against the authority of a college faculty, more manifest than in the South

Carolina College at the period named. Prof. Robert Henry, who was president as temporary supply in the year 1834, following the retirement of President Cooper, until the accession of Mr. Robert Barnwell, seems to have been especially a victim of this type of civilized semibarbarism; even to-day disguised in "good society" under the various learned and polite apologies for the change of a young gentleman to a defiant rebel against good manners, respectable morals, and the ordinary obedience to law.

Bishop Stephen Elliott was elected to a new chair, "Evidences of Christianity and sacred literature," and a strong effort was made to regain the favor of the religious public of the State by a new departure in college prayers. One decided feature of the labors of President Cooper was the establishment of a thorough study of history and political economy in the South Carolina College in advance of any school of the higher education in the country.

In 1836, Hon. Robert W. Barnwell was elected president of the South Carolina College as the successor of President Cooper. This gentleman had voluntarily retired from a successful career of public life in the State legislature and Congress. He was a good type of the old-time South Carolina gentleman of wealth, scholarly tastes, and general cultivation, of which the late Governor Aiken, of South Carolina, was a conspicuous example. His high social reputation, personal dignity, and courtesy of manner were a mollifying influence upon the excitable student temperament that had become the terror of president and professor and the alternate amusement and indignation of the outward world.

He resigned the presidency in 1841, having restored the attendance upon the College to its usual number, in the neighborhood of 200. After a brief term of service by Prof. Robert Hay came the brilliant administration of Hon. William C. Preston, who, for six years, held up the institution to the highest degree of general prosperity during its entire history.

The administration of Hon. William C. Preston from 1845 to 1851 was a notable event in the history of the South Carolina College. During these years the attendance of students rose to its highest figures, 237, the average attendance being 191. The whole number of graduates during the fifty-five years, from 1806 to 1861, was 1,740, an annual average of less than 32. President W. C. Preston was by all odds the most conspicuous personage yet placed at the head of the college. His brilliant career in the Senate of the United States, where he ranked among the foremost of the distinguished orators who then dominated that body, first attracted national attention to this institution. Under his popular administration the college, in the language of its historian, became "a school of politics." President Cooper had already inducted his classes into the British theory of free trade and awakened an unusual interest in historical and political studies. No college in the United States has probably sent forth so large a proportion of its students to eminent political position as this, from an average attendance of less than 200 and a total graduation of 1,740 up to 1861. Out of a political list of 156, we find 80 lawyers, 32 members of the State house of representatives, and 17 of the State senate. The whole number of graduates, 1,740, furnished 22 governors of States, 4 outside of South Carolina; 8 lieutenant-governors; 14 United States Senators; 39 members of the United States House of Representatives, 28 from South Carolina; 33 judges and chancellors of South Carolina, 3 of them chief justices and 3 associate judges of the supreme court of the State; 15 presidents and 39 professors of colleges; 5 bishops of the Methodist and Episcopal churches, and 14 members of other important positions in the State government. Among its graduates are the names of two men eminent in science: Dr. James Marion Sims and W. H. Bardwell. The brothers Leconte, Thomas Cooper, Francis Lieber, Dr. J. H. Thornwell, Charles S. Venable, President McBryde, with Prof. Edward S. Joynes, all distinguished in their time, have been conspicuous members of its faculty.

The successor of President W. C. Preston was Dr. James H. Thornwell. This

gentleman, estimated by the foremost men of his own State as among the most eminent of South Carolinians, was born in poverty in 1812. By the aid of appreciative friends he was able to study in the Chowan Academy, enter the junior class of South Carolina College, and graduate with the highest honors in 1831 at the age of 19. At 25, after six years of service as tutor and clergyman in the Presbyterian Church, he returned to his alma mater and for twenty years was occupied as professor and president. He retired to accept a professorship in the Presbyterian Theological School at Columbia, S. C. He preached in Columbia, was editor of the Southern Theological Review, and a voluminous writer, especially for the denominational theological publications of the day. He died in 1862 soon after the outbreak of the great revolt against the National Government of which he had been one of the most zealous advocates.

Dr. Thornwell was an excellent specimen of a peculiar type of able Americans, apparently gifted with a special aptitude for large success in a public career, but directed by circumstances to education, the Christian ministry, and literature. It was only later in life that he seems to have found his natural place. It is possible that if he had followed exclusively either of the three avenues to distinction—education, the ministry, or statesmanship—he might have been, as John C. Calhoun was inclined to believe, his own successor in politics, the most conspicuous leader in the old school Presbyterian Church, or the greatest of Southern college presidents. That the outcome of his life was a disappointment at home may be accounted for by the altered relations between the character of education and the college; while a constant and intense interest in popular affairs made him even more than either—a public character. His death at the age of 50, in 1862, may have prevented him from becoming a conspicuous figure during the stormy period of the civil war, and from representing South Carolina in her subsequent career in the reconstructed Union.

But certainly the educator who looks to the common school as the most vital center of American civilization, at the most critical point of the national development, will not question the good Providence that evidently kept him in his own true place during the most fruitful period of his life, from the age of 25 to 45, as the most celebrated schoolmaster of his Commonwealth. We first meet him as associated with Professor Elliott in the interest of popular education in 1839, at the age of 27, in a report to the legislature on the condition of the free schools of the State, made in obedience to a request to the College of South Carolina for suggestions on educational reform by Governor Patrick Noble. In this brief statement he adheres to what he regarded the original idea of the law of 1811; that the free-school system of the State is intended mainly for the use of the children of the poor; rejects the Prussian system for its concentration of power in the Government, and the common-school system as too expensive and unnecessary for the use of the well-to-do class in the South. But he plainly sees the two main barriers to the success of the South Carolina free school: The sparseness of population in the rural districts and the indifference and "false pride of the common people," that prevents its hearty support. In his recommendation for reform he proposes a change that could not fail to reconstruct the existing system into something so near the Northern common school that it could not be easily distinguished therefrom. He urges the establishment of a State superintendency as the only security for the effective working of any scheme; the extension of a State contribution to popular education to \$50,000 only, and its distribution by the State and local commissioners on the basis of school population; a State normal school and the use of the Bible as a text-book in reading.

Late in 1853, at the call of Governor Morey, Dr. Thornwell prepared the remarkable letter on the schools of South Carolina which placed him among the foremost Southern advocates of popular education. Apparently holding still to the idea of a common school for the poor, his "great argument" soars far above and beyond all local and pedagogic limits into one of the most convincing pleas for general educa-

tion ever made to the people of his State. Especially does he join issue with the idea of the sectarian support and control of the secondary and higher education, which had come to the front as a protest against the "infidelity" of President Cooper during his administration in the South Carolina College. He clearly sees that the American common school in every department must cut loose from ecclesiastical control and be relieved from all allegiance to sectarian or church domination. Although profoundly impressed with the importance of religion and morality as the basis of all sound education, he declares that the churches, by their zealous and faithful charge of religious affairs, can be trusted to educate a public opinion that will restrain the common schools and State universities from any permanent lapse into irreligion or immorality. The high character of the faculty and their personal influence can be relied on for the preservation of due reverence for the sanctities of life within the college confines.

This view, now practically the policy of the majority of the leading colleges and universities of the country, was all the more remarkable in Dr. Thornwell, as combined with an almost fanatical championship of the extreme creed of the old-school Presbyterian Church of the State. Indeed, the public men of the State believe his devotion to the Christian ministry induced him at one time to resign his presidency of the college, and his subsequent absorption in theological and denominational life was the cause of his failure to achieve political distinction. But Dr. Thornwell was always a statesman, in whatever position. His famous letter on education in South Carolina was republished by Mayor Courtenay, of the city of Charleston, in 1888, and widely copied by the Southern press. It was one of the most conspicuous documents called forth by the great revival of the common schools, even in its partial influence on the Southern States. It stands midway in this revival period like a great searchlight, illuminating the entire field of public instruction in every department at this interesting and critical period in the history of the State.¹

Under the long administration of President Thornwell the South Carolina college maintained the position in numbers it had reached under the presidency of Hon. William C. Preston, while it was constantly advancing in the quality of its instruction and the eminence of its faculty.

During this period of the reorganization of the college, after the retirement of President Cooper, appears the most eminent scholar and author ever connected with the institution—Prof. Francis Lieber. This justly celebrated scholar and author was born in Berlin, Prussia, in the year 1800. At the age of 25, after a variable experience at the universities of Jena and Halle, suspected of revolutionary liberal views, thrown into prison and expelled to France, and for a time fighting with the Greeks against the Turkish power, he was enabled by the good offices of Niebuhr, the historian, to leave his native country for England. After a year of hardship in London he came to the United States, where he spent the remaining years of a long life, crowded with the most valuable service in the cause of the higher education.

For nine years he lived in the cities of Boston, New York, and Philadelphia engaged in miscellaneous writing, among other things editing an encyclopedia and planning a course of education for Girard College. His friends were among the most eminent, especially of the American historians of the period. Through the influence of Judge Story, Nicholas Biddle, and Governors Hamilton and Hayne of South Carolina he was invited to a professorship of history, political economy, and political philosophy in the South Carolina college in 1835.

Although disinclined to a residence in the South, and never really at home in South Carolina, an opponent of slavery and out of touch with many of his social and political surroundings, he remained at the college as professor for twenty-one

¹ Dr. Thornwell's letter will be found reprinted at length in a preceding chapter of this Report (Chapter VI).

years. His extreme views on public affairs and ill-concealed discontent with his environment doubtless prevented him from reaching the office of president. He almost considered himself in a state of exile, though compelled to remain by the necessities of his family. Two of his sons served in the civil war and one lost his life in the Confederate service. In 1856 he returned to New York and as a professor in Columbia College remained there till his death, at the age of 72, in 1892.

But his service of twenty years in South Carolina College was doubtless the most valuable educational discipline of his life, for here he was left free to put forth his own ideas of the study of history and sociology, and his powerful instruction probably raised this institution to the high reputation it obtained among the universities of the country. In this department he became the same inspiring leader in the higher education of the republic as Agassiz at a later period in science. His original method of instruction, vast and varied learning, and contagious enthusiasm for his favorite studies was an inspiration and a stimulant to the intelligent student. His writings, too well known to be enlarged upon here, have become standard authority, as largely suggestive and making an important transition period in the development of this department of the American college curriculum.

Other professors at this time were the brothers Le Conte, born in Georgia and graduates of the university of that State, since become eminent in California; Prof. C. S. Venable, afterward known as the distinguished professor of mathematics in the University of Virginia, and others.

The brief administration of President McCay, which followed the retirement of Dr. Thornwell, seems to have been unusually distinguished by the reign of disorder among the students. He resigned in 1857 and was succeeded by Judge A. B. Longstreet, of Georgia. This gentleman, known as the author of interesting sketches of Southern life, had been president of the college of Emory and Henry in Virginia, the Centenary College of Louisiana, and the State college of Mississippi previous to his elevation to the head of South Carolina College. He remained in office until the college was closed by the outbreak of the civil war. His 200 students were among the most enthusiastic in their aspirations for the new nationality of which South Carolina for many years had been the most zealous and persistent advocate. Almost the entire body of students and members of the faculty entered the military or civil service of the Confederacy. It was not till 1868 that the institution was reopened with 100 students, but under the auspices of the reconstruction government of the State the university, as it was now named, became involved in the "race question" by the admittance of colored students. It was not till 1880 that it was finally reorganized in connection with the College of Agriculture and Mechanic Arts, supported from the income of the national grant of public lands by Congress in 1862.

During the existence of this institution, under its title of College and University, \$90,000 has been expended in the establishment of a library, now containing some 27,000 volumes, increased by the gift of the library of Hon. William C. Preston. During all the tumults of the sectarian educational contests, to which no State has been more exposed than South Carolina, the South Carolina College has honestly retained its original unsectarian position as the highest representative of the common school idea, and all the efforts to enlarge and improve the system of public education in the State have been furthered by its policy and influence.

In 1861 the terms of admittance to the South Carolina College were equal to those of Harvard and in advance of other colleges and universities in the country. Under the influence of Cooper and Lieber the departments of history, political economy, and civics were developed, as before stated. For a detailed account of the South Carolina College the reader is referred to Circular of Information, No. 3, 1888, of the United States Bureau of Education, to which the author of the present sketch acknowledges especial obligations.

The free school law of 1811 was passed by the hearty cooperation of the members

of the legislature from Charleston and an attempt for its repeal in 1813 was successfully antagonized under the leadership of William Crafts, jr., one of the representatives from that city. In commemoration of the services of Mr. Crafts the city government of Charleston named one of the public school buildings the Crafts School. Under this law the city had organized a group of five free schools for white-pupils, with teachers paid \$900 per annum. On this salary these masters were expected to supply and furnish their own schoolrooms, and five houses were built or hired for that purpose. In 1812 there were 260; in 1818, 300; in 1823, 320; in 1829, 467, and in 1834, 525 pupils. The intent of the movement was only the elementary schooling of the white children of "indigent parents," and for thirty years the city did not seriously face the obligation of attempting to educate the entire youthful population, even of the superior race.

In 1842 Governor Patrick Noble stirred up the legislature to ask for a general report of the workings of the free-school system, which was pronounced a failure by the more zealous friends of popular education, and asked for reports from the commissioners of the leading communities. The result was a mass of returns, systems, and propositions, the substance of which appeared in a published pamphlet of 80 pages. The school commissioners of the parishes which included the city of Charleston report that at this time there were three teachers employed at a salary of \$1,200 each, the highest rate allowed by the law, with some 350 to 400 pupils in charge. Each master was compelled to pay for his own school \$300 for an assistant, \$150 to \$200 for a school building, besides additional expenses, leaving his actual compensation from \$700 to \$750. In schools that required but one teacher the salary was \$600, burdened with the same liabilities. There appeared to be among the commissioners little unanimity on the subject of school reform. All agreed in the suggestion for a State superintendent, but did not favor the division of supervisory power between the commissioners and local trustees. Two of them propose a sort of manual-labor system by which the poor parents of children shall be compelled by law, when they send their children to other schools, to place them in charge of the State, in families in the country and at boarding houses in cities. They also urge the city to provide schoolrooms. They suggest a uniform system of teaching, and especially more attention to religious instruction. One of the commissioners, Rev. Dr. Gadsden, drew up an elaborate system of religious instruction by the clergy of the several Christian denominations in school hours, in school buildings, with provision for regulating immoral and disorderly character in children, reminding one forcibly of the ancient régime of colonial days in portions of New England. Nobody seems to have considered the possibility of attempting to school all the white children by the State.

In 1852 permission was obtained from the legislature to impose a tax upon the people of Charleston for providing school houses and other matters relating to the welfare of the schools; the amount in no year to exceed the sum of the annual State appropriation to the city for education. In 1853 the annual appropriation was \$5,400. In this way the general amount was doubled and, until 1856, continued at \$10,500. Up to this date, by a moderate exercise of the taxing power, from \$3,300 to \$5,800 had been annually raised, with which one schoolhouse was built and furnished and another school lot purchased.

Under a legislative act of 1855, the whole sum contributed by the State to the free schools amounted to \$74,400, appropriated in the ratio of \$600 to each representative in the legislature. Under this law, Charleston and all the lower counties were greatly favored, as members of the legislature were elected on a representation of property.

Under the stimulant of the gradual improvement of the free-school system the people of Charleston were finally persuaded to adopt a radical new departure. In 1837 the city practically assumed control of the College of Charleston. The trustees

were elected by the city council and the running expenses were guaranteed by the city. For many years this arrangement held, and the institution was virtually a public school. The college always obtained its students chiefly from the low country of South Carolina, and up to 1885 had sent forth 368 with its full diploma—42 lawyers, 32 physicians, 23 clergymen, and many teachers, including such public characters as Paul H. Hayne, the editor of the great Southern magazine; Hugh S. Legaré, William Lowndes, and William H. Trescott. In 1845 the Citadel Academy was established in the city by the State, and has been retained to the present day, with a provision from an early period of its history that indigent students educated there should teach two years in the public schools of the State after graduation. During the first twenty years of its existence this school had received some 1,800 and graduated 240 students.

In 1848 the city was visited by Dr. Henry Barnard, of Connecticut, on invitation by Governor Ailston, and its foremost people thoroughly aroused by his eloquent and practical representation of the American school system of the North, which had already been wholly or partially adopted by New Orleans, La., Nashville and Memphis, Tenn., Mobile, Ala., Savannah, Ga., and the large cities of the border Southern States, including Washington, D. C. In 1849 Prof. Louis Agassiz came to Charleston, and for two successive years lectured in his own inimitable style on subjects connected with natural history. Through his influence the little museum of the College of Charleston was expanded to its present condition as one of the most reliable scientific collections in the Southern States.

All this was telling on the thoughtful people of the city, who were deeply discontented with the inefficiency of their own school arrangements. Among the friends of the American school system were the school commissioners of 1854, C. G. Memminger, A. G. Magrath, and W. Jefferson Bennett. They petitioned the legislature for the establishment of a proper common-school system, and the bill was reported favorably and passed by that body. The report of the commissioners, prepared by Hon. C. G. Memminger, the father of the present common-school system of Charleston, states that a new schoolhouse had been erected with accommodations for 800 children, under the authority of the free-school law of 1811, which offered the benefits of a public school to all children, with special reference to those of indigent parents. This special provision up to that date held everywhere in the State. Boys and girls from the age of 8 or 9 were provided for in this great building in separate rooms under distinct supervision. The commissioners state that this was done with a view to the establishment of a system of common schools, although it was a more effective way of carrying out the provisions of the old system. Five of the original schools were transferred to this building and the old hardship of compelling the teachers to furnish their own schoolrooms was abolished. The commissioners enumerate the special advantages of this arrangement under eight heads: (1) Better grading; (2) lowering of expenses, the schooling of the 800 at a cost of \$12 per capita; (3) bringing together children of all classes; (4) accustoming the people to taxation for educating their children in the schools they support; (5) increased popular interest, which will raise the character of the teaching; (6) improvement of the spirit of the teachers and the pupils; (7) the employment of Americans as teachers; (8) the adoption of this system in Europe and in the Northern States of the Union.

The heart of the new bill was the power given to the commissioners to impose a tax for "a sum not exceeding 15 per cent upon the general school taxable property as an addition to the fund received from the State."

Under this law the commissioners proceeded to organize, for the first time, the proper American common-school system in this, perhaps, the most thoroughly representative city of the South in 1856. The inauguration ceremonies were largely

attended on July 4, and the address of Dr. S. H. Dickson, the remarkable speech of Commissioner Memminger, and others, were published. But the new system was not allowed to go into operation without a vigorous protest. The friends of the old system asserted that all this was a violation of the original law of 1811, which, although on its face authorizing an extension of the system, really contemplated only the elementary schooling of the poor. Sectional prejudice was also invoked against the importing of teachers from the North. The commissioners had visited the cities of Boston, Hartford, and New York, and had become so thoroughly convinced of the superiority of their educational system that this reconstruction had taken place. A new school house had been built at a cost of \$25,000, and a male teacher employed at \$2,000, and two women at \$900 each had been called from the North. Several of the old teachers had been dropped or placed in subordinate positions, at a salary of \$200.

But it has been proved that the people of any large American city or State have generally accepted improved arrangements for the education of their children and remained deaf to the doleful warnings of the enemies of the common school. The schools of Charleston prospered under the new system and teachers, one of whom was Miss Anna Brackett, afterwards principal of the city normal school of St. Louis, Mo., under the superintendency of Dr. Wm. T. Harris.

The girls' high school was established in 1858 and placed in a spacious new building in 1860. The intention, as stated by Mr. Memminger, was "to establish a school which must be without a rival in the country, in furnishing that education which cultivated parents desire for their daughters. A second purpose is the education of young ladies for teachers." The same arrangement that for many years was adopted in the cities of New York and Philadelphia, a normal school department of the girls' high school, in which pedagogic instruction could be given, was adopted, which has continued until the present day.

The address of Mr. Memminger at the inauguration of the common-school system, July 4, 1856, is a masterly exposition of the intent and action of the new departure. It dismisses the school system of 1811 to its real position as a "pauper school" system, with all implied by that degrading title. While the "middling class" was repelled, the organization was under the contempt "of the poor." "It is useless," he says, "to look for improvement while at the entrance of the school a confession of pauperism must be made." For, although the fund for the support of the free schools had been considerably increased, the schools were steadily sinking in popular estimation. An examination of the system had revealed the fact that "the boys themselves, as well as the community, held the schools in disrepute, and the grade of education was so low that the most inferior private schools stood higher in public estimation." Seldom have the peculiar advantages of the common-school system been more clearly stated, with a broader view of social needs and a more inspiring outlook for the children of the entire white population, than in this admirable address.

In 1860 the school children of Charleston numbered about 4,000. It should be noted that this movement, which achieved such results in this city, had extended to New Orleans, La., Nashville and Memphis, Tenn., Mobile, Ala., Norfolk, Va., and Savannah, Ga. It was the same great popular uprising that had swept like a "celestial breeze" through the old northeastern and central and the new northwestern States, the great revival of the American common school.

The complete development of the new system in Charleston, S. C., was only prevented by the breaking out of the civil war. At the close of the great conflict Mr. Memminger, who had served as secretary of the Confederate States' treasury, returned to Charleston to resume the work dropped in 1862. Under his wise and progressive leadership the common-school system of that city, with the Charleston College, Citadel Academy, Orphan House, and high schools, by 1880 had given to Charleston the educational distinction it now holds among the larger cities of the Southern

States. The grateful people of Charleston, in the year 1888, testified their grateful remembrance of the father of their public-school system by placing a bust of Mr. Memminger in the public hall of the city, amid the portraits of their most eminent citizens.

The history of the free-school system of South Carolina from its establishment in 1811 to its overthrow by the issue of the civil war in 1865 is little more than an illustration of the remark of one of the most distinguished educators of that Commonwealth concerning its record during these fifty years: "In no country or Commonwealth has there been witnessed so remarkable a spectacle of unanimity of purpose among the leaders of public opinion on the subject of popular education, with the almost utter failure of results, as in South Carolina."

In 1838 a committee, consisting of Rev. Stephen Elliott and James H. Thornwell, was instructed to report to the legislature after having conferred with the various commissioners. They incorporated in their report communications from the commissioners, the whole making a very interesting paper. A large part of it consists of a paper by Hon. Edmund Bellinger, of Barnwell, a graduate of South Carolina College in 1826, containing a great deal of information, historical, statistical, and otherwise. Mr. Bellinger quotes the series of special enactments by the colony and State during the one hundred years from 1710 to 1811 (among which may be mentioned, in 1734, the incorporation of the Dorchester South Carolina Academy, established by a colony from Dorchester, near Boston, Mass., afterwards removed to St. John's Parish, later Liberty County, Ga.), referring to the private-school acts at various times. The schools of Charleston at that period, 1734, are reported as having been "insufficient."

Mr. Stephen Elliott, as there declared, was the father of the first public school system, in 1811. The act incorporating this system provided for a system of local education, the quality and extent to be decided by the local commissioners. Every white citizen could send his children to school, free of expense, although in case of an overflow the children of "indigent parents" or "poor orphans" shall be preferred. Three hundred dollars per annum was allowed for each school out of the public treasury, appropriated according to the number of representatives to the general assembly from the district; but never more than thirteen commissioners for each district were to be appointed by the legislature, with power of complete supervision of the schools, and required to make annual returns. No school should be established until the neighborhood should build and furnish a schoolhouse. The commissioners could unite the funds with those of other public schools.

Here was an arrangement sufficiently elastic to admit of a development into an effective system of common schools. In 1812 the law went into practical effect in several counties, but was at once beset with unexpected difficulties. In 1813 the public skepticism concerning the schools was shown by a serious attempt to repeal the law, but the representatives from Charleston prevented this action. At once appeared the chronic difficulty of obtaining reports from the different school commissioners appointed by the legislature. The subsequent acts of 1812-1814 were called for by this neglect. In these the comptroller of the State was authorized to furnish each board of commissioners with a printed copy of the return demanded. In 1816 the returns from 18 districts and parishes show that 3,328 pupils had been enrolled in schools opened "from six to twelve months," at an expense of \$8 per capita. The commissioners are complimented for their labors in the cause of education, "without emolument and influenced by the purest benevolence." Complaints already appear concerning the unequal distribution of the State funds, caused by the system of representation in the legislature on the basis of property instead of population. In 1817 the defects of the system were so apparent that the legislature requested the commissioners to send in their opinions on the changes needed to

adapt the system to the varying conditions that existed in the different sections of the State.

Not one-third of the different schools in the district had made the required returns. In 1818 the same difficulty of scanty returns prevented the educational committee of the legislature from forming any decided opinion of the success of the enterprise, although indulging a fond anticipation that the time was not far distant when all the people would be sufficiently instructed for "intelligent and independent citizenship." The committee prudently refrains from expressing its deliberate opinion of the condition of the system, concerning which information is so hard to be obtained. In 1819 the legislative committee retreated from any action under cover of the same "regret at the apathy of the commissioners toward this noble institution." The commissioners of Charleston are required to examine the merits of the Lancasterian system of instruction and report at the next session. The "works of John Waldo" were circulated at public expense through the district. In 1820 the committee recommend a continuance of the system, and express a hope that the "advantages of the free schools will be commensurate with expense incurred."

In 1822 an act was passed to correct the irregularities in the financial affairs of the schools; among other things providing that the distribution of State funds shall only be made to commissioners that furnish returns. It is reported that the system is growing in general approbation. A penalty of \$50 and removal from office was imposed upon every member of the school commissioners failing to make a report to the legislature. In 1824 it was stated that the school commissioners are furnished with a copy of the law of 1811 and its amendments, and 50 copies of the statute with 25 quires of blank returns are to be furnished to each of the parishes. In 1825 the legislature required the faculty of South Carolina College "to prepare a detailed system for the better regulation of the public schools and other seminaries of learning in the State." In 1826 it is said that the "returns of the commissioners are all favorable to the beneficent operations of the system." In 1828 the State comptroller was instructed to "keep regular accounts with the commissioners of the free schools" and report at each session to the legislature.

In 1836 the growing dissatisfaction with the schools moved the legislative committee to recommend the appointment of a "literary board" to obtain information and report to the next legislature such reforms of the system as may be expedient. An organization, the American Literary Company, appeared offering improved textbooks. No notice seems to have been taken of this report. A fine of \$20 is imposed by law on any person refusing to serve as commissioner of schools, and \$5 for not attending a meeting of the board. Districts and parishes can be subdivided into school "divisions," one commissioner to supervise each. The board shall examine teachers. Trustees are to be appointed to act with the commissioners of every district. We note that the commissioners of Charleston regarded this provision for "trustees" as a shirking of duty by the commissioners.

Mr. Bellinger concludes that "In the facts we see much to encourage, much to warn, and much to instruct. Up to 1811 no general and uniform system of free schools had been in operation through the State." The committee of the legislature complains "not so much of the defects of the system as the non-execution. From the returns of the legislature we find painful evidence that the present free-school system has not been successful. Through a period of twenty-seven years the legislature has been solemnly impressed [as have we of the present day] with the deep, unshaken conviction that the bounty of the State must not be withdrawn and that the schools must be sustained."

He then makes "statements almost incredible, but, unfortunately, not to be denied." From these it appears that from 1812 to 1838 the number of schools and pupils was increased from 4,299 pupils under instruction, at an expenditure of \$4,939,

to 604 schools, with 7,905 pupils and \$39,776 expended. Great inequalities prevailed in spite of resolution after resolution. During twenty-seven years returns were made in five years only. The amount expended bears no proportion to the scholars educated. The small districts and parishes receive no regular sum, and the amount each received bore no proportion to the schools of the district or parish or to the population. These assertions are all borne out by published tables of figures. Since 1815 \$37,000 has been annually appropriated, nearly \$500,000 in all, of which \$109,740 was accounted for. Of the 6,762 scholars, the average number attending the schools, not 1 in 7 were children of necessitous parents. The defects of the system were: (1) Insufficiency of funds. (2) Lack of method, the money not distributed according to any reliable system. (3) After twenty-seven years it was impossible to obtain reliable returns of the use of the school money for results of the system. (4) Teachers generally incompetent; not one examined. (5) No uniform system of instruction. (6) The whole system withdrawn from the public eye. (7) State effort too diffuse, not concentrated. (8) Want of good school books and of a course of instruction. (9) Officials not paid. (10) No vigor in the execution of the system. (11) Disregard of the original purpose; the poor are not benefited, the State is not enlightened.

The commissioner comes to the final conclusion:

“First. That none but poor orphans and children of indigent and necessitous parents should be educated at the expense of the State.

“Second. That the State moneys should be distributed according to the population, not the representation in the legislature.

“Third. A body of executive officials of more efficiency. At present it is a paper system and a very expensive system.”

He makes several suggestions for the reform of the present system, including the reduction of a majority of the commissioners; the appointment of a state superintendent of schools, paid a good salary, with “power to act”; the schoolmasters should be examined; schoolhouses should be erected; a course of study should be made for the use of the schools; the establishment of a female seminary; that every parish be empowered to send one poor scholar gratis to college; that the State furnish necessary training for teachers; that every parish should establish a society to diffuse useful knowledge among the poor.

The same fatal delusion with which Mr. Bellinger was possessed runs through the reports of all the commissioners, that the free school is an arrangement exclusively for the poor.

Meanwhile the governors and foremost public men of the State, as a class, looked far beyond this provincial notion. A succession of these men from the earliest period continued to remind the legislature of its duties.

The original school law of 1811 was a response to the repeated and earnest appeals of Governor Henry Middleton, and adopted with only 15 “nays” in the legislature. In 1815-16, Governor Williams; in 1817, Governor Andrew Pickens; in 1822, Governor Thomas Bennett; in 1823, Governor J. L. Wilson; in 1826, Governor Richard J. Massey; in 1829, Governor Stephen D. Miller; in 1831-32, Governor James Hamilton; in 1833, Governor Robert Y. Hayne; in 1835, through an important portion of his message, Governor George McDuffie, who returned to the subject in 1836; in 1837-38, Governor Pierce M. Butler; in 1839, Governor Patrick Noble, in response to whom the before-mentioned returns from the school commissioners had been made in 1840; an extended review of the system by Governor B. R. Henningsen in 1842; all enforced attention to the subject. In 1847, R. F. W. Allston made a report to the State agricultural society, in which he treated the entire school system in a broader way than hitherto, prophetic of his future action as the chief executive of the State, when the Hon. Henry Barnard, of Connecticut, was invited to South Carolina.

In 1847 Mr. Henry Summer published Suggestions Relative to the Free School

System, in which the defects of the present system were attributed largely to the lack of local government and a habit of dependence on the initiative of the superior class that had less interest in popular education than any in the State. He says, at this date, after thirty-six years of experience: "It was declared on the floor of the legislature that the free school system is a failure, and no one contradicted it. It seemed to be conceded by all." The reports of Mr. Bellinger and others, he says, have attracted little attention. Nothing was done before the movement of 1839, and that he characterizes as "a splendid nothing." He urges a State superintendency, a normal school, and the moral instruction of pupils, and a more extensive course of study, including grammar, arithmetic, history, astronomy, the elementary principles of government, and philosophy. Mr. Summer "takes the bull by the horns" and declares that there should be an adequate system of public schooling "for all the children of the State." He denounces the inequality of the present distribution of the State school funds. Spartanburg has but 5 members of the legislature and Charleston 17, the former with a larger number of voters. He concludes by the solemn warning: "If the State does not waken from this torpor she will see men as trees walking."

In 1853 Gov. John L. Massey takes the old Carolina system to task for its educational failure. "The State has provided only for the education of its wealthy class. For the middle and lower classes it has done nothing, since no organized system has been adopted for this purpose." "Seventy-five thousand dollars had annually been appropriated for free schools, the income of the free school fund, but that liberality is rather a profusion of the prodigal, the judicious generosity which confers no real benefit." He demands an effective system of education for all the children of the State. "Five years ago 20,000 adults, besides children, were unable to read and write. Are there not reasonable fears to be entertained that the number has increased." He recommends the establishment of a State board of education, with a State superintending commissioner. Along with this message the governor sent to the legislature the memorable letter of President Thornwell, of the South Carolina College. (See Chapter VI of this Report.)

In 1858 Hon. R. F. W. Allston, governor of the State, calls attention to the condition of the free school system, and commends the new experiment of the graded schools of Charleston. The teachers of the State were invited by the governor to assemble in Charleston in June, 1858, and examine the practical operation of the school system. A normal school had been attempted in Charleston, and the governor urges the establishment of another in the upper or middle portion of the State. He says: "There is nothing which contributes so much to the elevation of the American character; nothing which proves to strangers the superiority claimed for our personal and social condition, as the unanimity with which the cause of education is everywhere embraced by all descriptions of our people." He defends the cause of the State college and the Citadel Academy, while he discourses in eloquent terms on the absolute necessity of general education to the welfare of the Republic.

In 1850 it was reported that there were in South Carolina 8 "colleges" with 43 teachers and 720 students, expending \$104,790; 202 academies with 332 teachers and 7,467 pupils, expending \$205,489; and 724 public schools with 739 teachers and 17,836 scholars. The population of the State was 274,563 whites, 8,960 free negroes, and 384,984 negro slaves; total, 668,507. Since 1830 the white population had increased but 20,000—15,000 since 1840. There were 40,577 children in the State from 5 to 10 years of age; 36,974 from 10 to 15, and 30,262 from 15 to 20; 107,813 below 20. In 1854 \$75,000 was expended on the free schools, and many times that sum on the superior education. In 1860 the population was 291,388 whites; 9,914 free negroes, and 402,406 slaves; total, 703,708. Since 1790 the white population had increased at about half the ratio of the colored population. That a commonwealth whose white population in 1860 was but 300,000, one-half the population of Boston in 1898, could

lead in a secession movement, carry after it eleven great States, and precipitate a civil war of four years, which destroyed or disabled half a million men, and dissipated the national earnings of a generation, only to be closed by the abolition of slavery and the destruction of a social order that had endured for two centuries, is another proof that the educational system of the old South did train people of great power and resource in public affairs. And in no American State was the peculiar influence of this educational scheme centered upon the training of a superior class for the direction of a middle and the absolute control of a servile class better illustrated than in South Carolina. But on the other hand, there is no American State in which the broader view of the education of the whole people found more earnest and distinguished advocacy, or where, through the half century before the outbreak of the civil war, the experiment of a free school system was more persistently tried in the face of greater obstacles than in this commonwealth. There can be no doubt that the persistent agitation of the leaders in public affairs in behalf of secession during the years from 1830 to 1860 was a great obstacle to the development of the public school during the great revival period of thirty years. Yet, notwithstanding this obstacle, the city of Charleston at the breaking out of the civil war was just entering on the enjoyment of the well organized school system now on the ground.

Of course, what there was of the free school system, including the Charleston schools, went to the wall during the terrible years from 1861 to 1865. But it was a new evidence of the vitality of the educational spirit that the first effort on a large scale in behalf of the education of the freedmen was made in the very heart of the old aristocratic realm of the Sea Islands, including Beaufort, under the direction of Gen. Rufus Saxton. Immediately on the restoration of National authority the old free school system, broadened into the American common school for all classes and both races, appeared on the scene, and, through the ten years of the fierce conflicts of reconstruction, increased so steadily that by 1880 the State was living under a well-digested law by which the masses of the white population were better schooled than ever before, and the largest of the northern seminaries for the negroes, Claflin University, was included in the corporation with the old South Carolina College and the military institute at Charleston, under the general title, "The University of South Carolina." From such a treasury of personal and public vitality there is no risk in predicting a rehabilitation within the coming century that may give to this proud old commonwealth a name and fame in the future that will eclipse the cherished glories of the long and stormy past.

GEORGIA.

No State known in 1788 as Southern began its career in the new Union with brighter prospects for general education than Georgia. The settlement of its almost illimitable area, extending from the Atlantic coast to the Mississippi River, under the romantic administration of Oglethorpe, by the distribution of the different bodies of immigrants, each practically to a new country—including the poor debtors relieved from English prisons; the German "Salzburgers;" a substantial New England population in St. Johns Parish, afterwards the celebrated Liberty County; the Hebrews; a group of Catholics and the Highland Scotchman in Darien—was a prophecy of the cosmopolitan and enterprising order of society that half a century ago won for that commonwealth the proud title, "Empire State of the South." The first constitution of the State was made in 1777, a few months after the Declaration of Independence, by a people numbering scarcely 20,000 whites, with only a militia force of 2,800 muskets scattered over a territory several hundred miles in extent, threatened by an army of 10,000 Indian warriors, flanked on the south by the Tory province of Florida, with a long coast line inviting to naval assault, and a population divided in allegiance between what was probably the most tolerable of the colonial governments, under a governor universally esteemed, and the uncertain probability of a Continental Congress 1,000 miles away.

But these people did not forget to put into their constitution the provision, "Schools should be erected in each county and supported at the general expense of the State." In 1783 the legislature was empowered to grant 1,000 acres of wild land for a free school in each county.

Under this provision one of the earliest schools of the State, the Richmond Academy, was established at Augusta, then the seat of government. This seminary still exists in connection with the public school system of that city and county. The year 1788 was memorable in the early annals of education by the founding of Chatham Academy, now the public high school of Savannah, and the famous Sunbury Academy of Liberty County, for a long time one of the most celebrated schools in the Gulf region of the Union. Although the second constitution of the State in 1789 contained no provision for education, the good work still went on, and by the opening of the present century each of the considerable towns in the new State had its free academy of the old English type, chartered and subsidized by the legislature of the commonwealth, at Augusta, Waynesboro, Savannah, Sunbury, and other points.

In 1798 the third constitution of Georgia contained the provision, "The arts and sciences shall be promoted in one or more seminaries of learning, and the legislature shall, as soon as conveniently may be, give such farther donations and privileges to those already established as may be necessary to serve the objects of their institution; and it shall be the duty of the general assembly at the next session to provide effective measures for the improvement and permanent security of the funds and endowments of such institutions." President Church, of the University of Georgia, himself a native New England educator, declared of this original State educational policy that, had it been fully carried out, Georgia would have had "a system of education equal if not superior to that of any State of the Union."

In 1783-84 the legislature appropriated 1,000 acres of wild land to each county for "free schools," and 40,000 acres for a university. This constitutional provision, combined with the early legislation of the State for the charter of a university in 1785, evidently contemplated the establishment of a system of general education, with a protest against the Southern colonial habit of sending boys of good family abroad for schooling, a practice which Washington sought to abolish by his plan of a national university, but which continued for several generations in all the older Southern States.

Why the generous idea of the fathers of Georgia was not followed to its logical conclusion by an ample provision for the common schooling of the entire white population is not a difficult problem. In 1790 the entire white population of Georgia was but 52,000. Even in 1850 there were in the State only 500,000 white people—less than the present population of Boston, Mass.—burdened with 400,000 negro slaves. The white school population in 1850, 5 to 15, could not have exceeded 150,000 at the largest estimate. In 1830, the beginning of the period covered by this essay, there were but 300,000 white people, with a school population less than 50,000. It must also be borne in mind that the enumeration of a "school population" on paper in this essentially border and pioneer country, as every section of Georgia was even to 1830, is by no means an accurate enumeration of the children and youth that could be relied upon for attending school. What with the poverty of great numbers of the settlers, their isolated settlements and rude means of transportation, the necessity among the nonslaveholding population everywhere for child labor, the terrible unhealthiness of the country, the illiteracy of parents and the lack of suitable accommodations for the housing of pupils, the number that could reasonably be expected inside the schoolhouse would be greatly reduced. The entire area of Georgia is 58,000 square miles—more than seven times the size of Massachusetts, the foremost New England school State. At the opening of the war of the Revolution the hostile Indians were in possession of three-fourths of the territory of the colony,

and not till 1838, after a persistent condition of war for sixty years, was the last tribe of savages removed from its soil. These were conditions so unfavorable that we need not wonder that the most enthusiastic zeal for education should have cooled off.

A secondary reason for the change of the early policy, that in 1840 had brought the State to a point of repealing all its laws favoring the common schooling of the masses and substituting a provision for the meager educating of the children of the poor, largely by subsidizing private schools already on the ground, was the logical result of the inauguration of the academical system through the churches, in opposition to the county academies. This policy, inaugurated during the Revolutionary war and continued through the opening of the nineteenth century, was further promoted by devoting confiscated lands, of which the loyalist class in the State had furnished a large supply, to the founding of this class of schools. Thus favored, the habit grew apace. By 1829 there were 64 academies for a school population of not over 50,000, and in 1840, 176 seminaries, with an attendance of 8,000 pupils. By 1860 there must have been an institution of this sort in every county, and probably in every considerable village of the State.

Of course, these academies would include among their patrons practically all the children of the well-to-do classes. And even in a State with such original democratic predilections as Georgia, the colony under Oglethorpe being the only "anti-slavery" and "prohibition" one of the original thirteen, the rapid development of the sway of slave society, which held no less than a third of its entire population in bondage, would more and more alienate the influential class from the common school.

Meanwhile, the State University of Georgia, chartered in 1785, but only opened to students in 1801 as Franklin College, was for a generation in no condition to be to any considerable degree a power on the side of the general education of the people. The institution was at first only a feeble academy, struggling for funds, and not till 1821 was it apparently recognized by the State by an act establishing a university and the arrangement for the payment of \$8,000 annually, the interest at 8 per cent. of the \$100,000 which was its only endowment. Under the successive vigorous years of the administration of President Waddell it gained a firmer position. The long period of the presidency of Dr. Alonzo Church, of Vermont, was weighted by the destruction of one of the three college buildings by fire, and for ten years the State made an allowance of \$6,000 annually for rebuilding and current expenses, regarded as a tardy acknowledgment of the appropriation of \$75,000 and more of the university land fund retained by the State at the final settlement. From 1841 till 1875 the state contributed nothing. It was stated by President, now Bishop, Candler, of Emory College, in 1889, that "no alumnus of the University of Georgia, many of whom have grown rich by means of the culture acquired therein, has ever made a gift to the university notable enough to get into history." Still the university evidently had enough to do to maintain itself against the persistent opposition of the rising denominational colleges and superior academies. As in other States, its graduates have seldom been found among the teachers in the schools for the poor; and at one period of its history its president and faculty were not regarded as especially favorable to the building up of an effective system of public education.

However this may have been, Governor Milledge originally gave the land on which the university was built. In 1854 another donation of \$20,000 was made. Governor Gilmer donated \$15,000 for the training of teachers. In 1873 the city of Athens gave \$25,000 for "Moore Hall," now the seat of the agricultural department of the university, and Gov. Joseph E. Brown, in 1861, contributed \$50,000 "to aid worthy young men of the State in the effort to get an education."

The administration of President Church continued thirty-five years, until 1860, the year before the opening of the civil war. It was after this that the amount of the national agricultural and mechanical land fund of the State was added to the resources of the university. While the agricultural department remains at Athens,

the mechanical State institute of technology is located at Atlanta. There are also four branches of the university—at Thomasville, Cathcart, Milledgeville, and Dah-longega. The medical college remains at Augusta.

Rev. A. A. Lipscomb succeeded President Church as chancellor in 1860, holding the office until 1874. The old college connection was maintained until 1869. During the seventy-five years of its existence "the university has given to the State 100 ministers, 26 Congressmen, 9 supreme and 50 superior court judges, 30 presidents and professors of colleges, 200 legislators and 4 governors, having, inclusive of its undergraduates, been instrumental in the educating of 6,000 persons." In 1888 1,177 students were in attendance upon all its departments.

Meanwhile, during the generation included in the thirty-five years from 1830 to 1865, the academical system of Georgia, under both its "college" and "academical" titles, was developed to the extent that, while it gave to the prosperous families perhaps the largest opportunity for the secondary and higher education enjoyed at that time by any Southern State, it more closely than ever shut the door against the final growth of the old-time elementary school for the "poor" into a proper system of common school education. The colony of Oglethorpe, almost alone in the Atlantic South, had never been brought under the domination of the Church of England. It was composed from the first of separate groups of people, representing "every sort and condition" of religious creed and polity from the Catholic and Hebrew to the Dorchester, Massachusetts, emigrants to St. John's Parish, who, true to the old-time, rural, New England habit, at once built a log church on the Congregational foundation, established the famous Sunbury Academy, and planted their houses on the edge of the malarial swamps, with the result that during the long period of their occupation the children were so demoralized by sickness and death that scarcely enough were left to be gathered into a good-sized school.

The conclusion of the whole matter was, that, in Georgia, the State University did not have, at first, the right of way accorded to that institution at the beginning in both the Carolinas and afterwards to the University of Virginia. The different denominations appear to have been concentrated in their respective localities, and for a long time separated from each other by difficulties of transportation and the extended area of the State. But at an early period, while the State University was still embarrassed by many hindrances, the religious organizations placed on the ground a series of university, collegiate, and academical foundations that, till the present day, have stoutly contested the field of student patronage, and, by their influence, greatly held back the State from the full development of the final plan by which all public education is still administered under the inclusive title, "The University of Georgia."

An early movement was made to occupy this open field by the great Baptist denomination through the establishment of a school as a manual-labor seminary for the training of the clergy, in 1833, in "two double log cabins with a garret to each, for dwelling, for dining, and for study, for both teachers and students" in Oglethorpe County. Out of this inauspicious beginning came the Mercer University of to-day. It was organized as a college in 1837 and at the close of the civil war removed to Macon by the attraction of a good situation for buildings and a gratuity of \$125,000 from that enterprising city. Besides Mercer, there are four institutions of the higher education in Georgia, representing the Baptist fraternity: The Southern Female College at La Grange; Monroe Female College at Forsyth, Monroe County, founded in 1849; Shorter College at Rome, developed from a previous school by the munificence of Dr. Shorter, who, since 1877, has expended \$175,000 thereon; the Georgia Seminary for young ladies, in Gainesville, Hall County, projected in 1877, and the Georgia Female College, now discontinued, as chartered in 1850. In 1854 it advertised the formation of a normal class for the training of teachers, with 156 members.

The first movement in the denominational direction, however, was made, as usual

in the South, by the Presbyterian body, so renowned in the history of this section from the date of its appearance in the Valley of Virginia, as moving along the highway surveyed and graded by its numerous seminaries of the secondary and higher education. In 1823 the "Georgia Educational Society" was organized, at a session of the Hopewell Presbytery, at Thyatira Church, from which it is claimed "arose the whole movement of denominational education in the State." The result was the charter of Oglethorpe University, which was opened in 1837, and housed in buildings in 1840, with an endowment of \$120,000. In 1842 it numbered 142 students. At the close of the civil war it was removed to Atlanta. At present it is suspended, pending arrangements for its rehabilitation. The Rome Female College, at Rome, was established in 1845, and is now in a flourishing condition.

But it was reserved for the powerful and progressive Methodist body to achieve the most distinguished success in the development of denominational education in Georgia. In 1836 Emory College was established at Oxford, Newton County. It has enjoyed the able presidency of several of the best-known educational dignitaries of that church, including Bishops Pierce and Haygood, Judge A. B. Longstreet, Dr. I. S. Hopkins, and the Hon. Bishop W. A. Candler. This institution has graduated 53 college presidents and professors, 15 circuit judges, 2 judges of the supreme court of the State, 15 Congressmen, 2 bishops, and 11 foreign missionaries. Under the presidency of Dr. Hopkins a department of technology was added to it in 1885, the first in the history of the South. It has been one of the beneficiaries of the liberality of Mr. George J. Seney, of Brooklyn, N. Y., who gave the college a hall with \$80,000 for an endowment and payment of debts.

The Wesleyan Female College, at Macon, claims the somewhat doubtful honor of being the first in the world to confer college degrees on women, a claim disputed by several institutions in the North. But this noble institution does not need this somewhat equivocal distinction to sustain its rightful claim, not only as the earliest, but one of the most successful of this large class of American schools, combining the secondary and higher education under the general term "college," or "university." It was the result of a growing sentiment in the State in favor of the superior education of young women, in 1836, although the preliminary action was taken in 1825. Although the legislature refused a charter to this somewhat radical new departure, a remarkable address before the University of Georgia in 1834, by Daniel Chandler, jr., on "Female Education," revived the waning interest in this movement. The Methodist body in 1836 selected the city of Macon as the field of a seminary of the higher sort for young women, and Dr. Lovick Pierce, father of Bishop Pierce, acted as its financial agent. The present college was opened in 1839 with a president and faculty of 5 professors, several associate teachers, and 90 students. The first class graduated in 1840. During fifty years of its existence, 1840-1890, 1,106 students have received its degree of A. B., and 70 the degree of A. M. It was one of the few important educational foundations in the Confederate States of the South that kept open doors through the civil war, only being closed for two or three weeks by the occupation of the city of Macon by the Union Army. In 1850 its present name, Wesleyan Female College, was substituted for its original title, the Georgia Female College. Mr. Seney also favored this institution by a contribution of \$125,000.

The La Grange Female College, at La Grange, was founded in 1833, and in 1847 received a college charter. Its alumni number more than 400 graduates, and it now enjoys a fair degree of prosperity. Madison Female College, incorporated in 1850, was one of the institutions that perished during the civil war. The Georgia Methodist Female College, founded in 1851, at Covington, Newton County, after being transferred for a time, finally returned to its old allegiance in 1882. Andrew Female College was established in 1854 at Cuthbert; Dalton Female College in 1872, and the Methodist College at Gainesville, and others of a more recent date. The Pio Nono College, established at Macon in 1873, is now a training school of the Jesuit Order.

Besides this development of the higher education under denominational control, there are in the State the Griffin Female College, at Griffin, chartered in 1850; the Georgia Military Institute, chartered in 1851, which did not survive the destruction of its buildings during the civil war; College Temple, now transferred to public school purposes, and Brandon College, founded in 1856, one of the first coeducational schools of this grade in the State.

Among the most notable schools for the secondary and higher education of girls in the Southern States is the Lucy Cobb Institute, at Athens, Ga. This admirable school owes its foundation to Gen. Thomas R. R. Cobb, and its name to his daughter, Lucy, who died at the age of 14, near the time of its establishment. It was opened in 1856 under the principalship of Mr. Wright, from the North. Until 1872 it suffered from the trials and reactions of the civil war. Since the year 1880, under the presidency of the accomplished Miss Nellie Rutherford, daughter of a professor of the University of Georgia, which is situated in the same city, it has risen to its present eminence among the superior schools for young women, not only in Georgia, but in the Southern States. It includes among its teachers several of the professors of the university. Mr. Seney gave it a beautiful stone chapel, with additional aid toward an endowment, and at present it is one of the most prosperous of this type of seminaries in the State.

Martin Institute, a college for boys, first opened in 1818, but chartered under its present name in 1859; the Home College, for young ladies, at Atlanta; Young Female College, at Thomasville; Butler and Gainesville Colleges; West Georgia Agricultural and Mechanical College; Southern Georgia Male and Female College, at Dawson; a number of business schools, including Macon Commercial College, and others at Augusta, are maintained. Our space forbids the mention of the great number of seminaries for both sexes and races which, according to the universal custom west of the Hudson River, assume the name and functions of the whole field of education, from the primary class to the few engaged in college studies.

The Georgia Historical Society, at Savannah, established in 1839, is one of the most flourishing and useful of its class in the South. Its roll of membership contains the names of many of the most eminent men in the State, and its historical contributions are well known. It includes the Telfair Academy of Arts and Sciences, the gift of Mrs. Mary Telfair, which supports a flourishing school of art.

It would exceed the limits of this essay even to mention the private and denominational institutions of the secondary and higher education now in Georgia; for an account of which the reader is referred to Circular of Information No. 4, 1888, of the United States Bureau of Education entitled "Education in Georgia, by Charles Edgeworth Jones," to which we make due acknowledgments; much more to attempt even the enumeration of the great number of academies and private schools of local importance, mostly thrown open during the thirty-five years between 1830 and 1865. Our chief intention in this reference is at once to account for the slow growth of a substantial public-school system, in which the State, until a recent period, has lagged behind several of the Southern Commonwealths less favored with wealth, population, and general prosperity; and the remarkable development of ability, especially in the regions of industrial and public life, among the superior class, which has given to this Commonwealth its proud title—"The Empire State of the South." In no Southern State during the thirty-five years previous to 1865 was the opportunity of acquiring what was regarded anywhere in the United States "a good education," so extended and so accessible to large numbers of the ambitious youth of the more favored class as in Georgia.

But while the State was thus, from its earliest history, cognizant of the needs of its prosperous class, which included a much larger proportion of its white population than any other of the original Southern States, it became to a great extent unmindful of the imperious need of its numerous poor white contingent for the elements of knowledge. The original plan for the endowment of the county academy by

generous gifts of wild lands indicates a lively sense of public responsibility for general education. But these endowed seminaries—to that extent public schools—were chiefly situated in the centers of population, or brought around them a considerable section of the more intelligent class, and were always lifted above the average means of the people most in want of what an American State should be first to give. As early as 1792, 1,000 acres of land were voted as the endowment for an academy in each county. In 1817 an appropriation of \$250,000 was made by the legislature as a fund for the support of free schools through the State. In 1821, \$500,000 was appropriated as a fund to be equally divided among the academies and free schools. In 1823 the interest of this free school moiety, some \$20,000 to \$30,000, was distributed among the counties in proportion to their white population for the education of the children of the poor. Of course, this sum, even with the precarious addition of private benevolence, would only be a revelation and aggravation of the peoples' want, suggesting what was needed rather than what could be done.

Its practical effect was to discourage the establishment of a separate school system as a proper foundation for the improving of the academical and collegiate education, and to bring in the mischievous habit of subsidizing private and denominational, elementary, or academical seminaries, by the payment of tuition fees for such of the poorer class as were not too proud to accept a stigma so offensive as "pauper" in return for a gratuity so inadequate. No child or youth under 8 or over 18 years of age could avail himself of this provision for free tuition, and none for more than three years. A child neglected until 8 years of age is far more inclined to run with the crowd of ignorant and ungoverned youngsters than to go to school; and after 14, in a new country, there would be many things to which he could be put by an illiterate family rather than exposed as a pauper to the ridicule of a set of well-off academical boys and girls. A subsequent change of the law in 1843, limiting the ages to 6 and 16, did not mend matters. The whole number of children of this class, as late as 1860, was estimated at 40,000 to 50,000; nearly one-third of all in the State between 6 and 16.

The history of the endeavors of the legislature of Georgia to wrestle with the question of the suitable schooling of the masses, in the face of the indifference and hostility of the friends of the college and academical system, is a record of several heroic attempts, which came to a general collapse in 1840-1843. In these years all the laws aiming at a common-school system were consolidated into a poor school code, under which the Commonwealth staggered on until several years after the close of the civil war. In 1836 one third of the United States surplus revenue distribution of \$350,000 was set apart as "a permanent free school and education fund," and a committee of observation was sent North to inspect and draw up a suitable scheme for an improved common-school organization. This committee reported a plan for an arrangement not unlike the American common school of that day. They also informed the fathers of the State that "out of 83,000 school children in the State, only 25,000 were in attendance at any school."

This report was published in an edition of 300 copies and contained the draft of an act for the establishment of a general system of common-school education. This committee seems to have been composed of men of expanded ideas. They rejected both the Lancasterian and the manual labor systems, which had a brief but disastrous career, although favored by many of the foremost educators and statesmen of the country, and struck the keynote of the American common school in the demand that the "rich and poor shall be educated together." The committee proposed to divide the State into "school divisions," chiefly by counties; appointing commissioners as superintendents for each division, laying off divisions into school districts, building schoolhouses, and supporting schools. The legislature responded in 1837 by a law establishing a system of common schools on an amended system modified to take effect in 1839. By this act all the funds for the secondary and elementary education were consolidated into "a general fund for common schools." In 1838 it

was also provided that a county tax could be levied at the discretion of the courts, on the recommendation of the grand jury, never exceeding one-half the general tax, for the enlargement of the common-school fund.

But here the legislators of Georgia, as of many other States, had forged ahead of their constituents. The prospect of mixing the academical and elementary departments of education in a school common to rich and poor woke up an opposition which, in 1840, repealed both the laws of 1837 and 1838, and set apart a permanent free school fund. In 1843 the counties were authorized to raise, by local tax, an amount sufficient, with the State distribution, to educate the poor children. The recipients of this bounty of \$20,000 to 40,000 candidates annually for the whole State were called to run the gauntlet of an examination and estimate by the inferior courts as the warrant for the reception of 7 cents a day, accounted in these regulations as a fair compensation for teaching the three Rs; a very clever device for keeping this contingent reasonably small.

This act of the legislature of 1840 touched the low-water mark of legislation in Georgia for one-third the children of the State and accounts for all the obstacles that have hindered the development of the common-school system, some of them not removed even until the present day. Of course, under such a no-system, the education of the poor languished in a chronic neglect; the returns of the number of poor children were grossly neglected and, when made, were unreliable, not including three-fourths of the number who were willing to report. Hardly one-half of these went to school at all, and then only for four months in the year during three years. As late as 1849, and in 1850, 15 counties made no returns at all, and others had never made a return. In 1845 Governor George W. Crawford declared in his message that in 1844 only 53 of the 93 counties made application for the benefit of the free school fund, although this neglect exposed the county to the penalty of losing the right to apply. As usual, this law bore hardly on the poor counties, where the majority of this class were found.

This policy was characterized by one of the leading educators of the State in these decided terms:

We have made the schools mere charities. We have been living under the impression that the children of our State belong to two classes; one rich and the other poor families. We have declared the schools to be the very embodiment of discrimination, with an extreme measure of the disorganizing element. The poor schools of the State, by reason of the law which creates them, are robbed of the influence for good they might otherwise wield. Their low scholarship is a premium on pauperism.

It is unnecessary to portray the condition of popular education in the State for the ensuing thirty years, until 1870, when the present common-school organization was effected and Col. J. R. Lewis was appointed commissioner under Governor Bullock. He was followed in 1872 by Dr. Gustavus J. Orr, the Horace Mann of Georgia, whose devoted and illuminating administration went on until terminated by his death in 1887. The picture of this old type of Georgia schools has been so well drawn by the late Mr. Richard Malcolm Johnston in his recent monographs on the "old-field schools" of the early time,¹ illustrated by the racy sketches of Judge Longstreet, afterwards president of South Carolina College, and the characterization of Superintendent Orr, that it is not necessary that the description should be repeated. Still, the characteristic of any American community is, somehow, to remove by personal and local effort the defects of any imperfection of law or failure of administration. Doubtless, in hundreds of communities the inevitable demoralizing results of such a no-system of schooling were somewhat averted by the efforts of public-spirited and enlightened individuals, churches, and families.

And, as we have invariably seen in all our previous record of Southern educational life, the foremost public men of the commonwealth spared no words in their con-

¹See Report of the Commissioner of Education, 1894-95, Vol. 2, pp. 1699-1733; 1895-96, Vol. 1, pp. 839-886.

stant appeal to the people in behalf of the masses of their constituents. As early as 1837 Governor Schley protested against the popular delusion that the poor should be discriminated against in education, and declared the pittance of \$40,000 given to the schools "a system ridiculously defective," and the social discrimination "invidious and insulting." In 1845, Governor Crawford returned to the subject with words of weight and solemn warning. In 1851 the then governor spoke out with fervid eloquence in behalf of a system of education "common to all." In the same year a committee including President Church, of the State university, and Bishop George F. Pierce, of the Methodist denomination, appointed by an educational convention held in Marietta, presided over by Hon. E. A. Nesbit, issued an address to the people of Georgia, probably written by Bishop Pierce. It was declared that "the present system has not and can not assure the objects of general education or the education of the poor, and should be superseded by another." Hon. Thomas R. R. Cobb, of Atlanta, the founder of the Lucy Cobb Institute for Girls, as chairman of a committee of distinguished gentlemen, prepared a memorial to the legislature from the State Central Agricultural Society to the effect that "we must have public schools in every school district in Georgia," which was circulated and widely read through the State. Governor Joseph E. Brown, afterwards United States Senator, who demonstrated his interest in the higher education for the "poor boys" by a gift of \$50,000 to the University of Georgia, and also in the common-school system later, as chairman of the public school board of Atlanta in 1858, in his message to the legislature spoke out in his own vigorous style, urging the draft of a common-school system for the children and youth of the State. He says: "Many of the noblest intellects in Georgia, now bedimmed by poverty and not developed for want of an education, may be made to shine forth in all their splendor, lighting up both church and state by their worthy deeds." Governor Herschel V. Johnson, candidate for the Vice-Presidency of the United States on the Stephen A. Douglas (Union) ticket of 1860, as governor at even a later period, 1886, "laid his finger on the pulse of the coming century" and protested against the "narrow stinginess" that is so often more conspicuous in statesmen than in individuals. He says: "Let the broadest and most practical education of the children be an object of universal concern."

The results of this long neglect of the common schooling of the masses before 1860 was even more evident during the ten years from 1865, even as late as 1880. Hon. Alexander H. Stephens declared to the author of this essay in 1880 that great numbers of the white people in his own Congressional district in Georgia were not able to obtain clothing for their children sufficient to risk the exposure of attending school during the comparative mildness of even a Georgia winter. In 1880 it was declared that 128,000 white and 320,000 colored persons over ten years of age in the State were wholly illiterate. Happily this great commonwealth at last is rising to a competent view of the necessities of its people and making creditable exertions to realize the declaration of its recent governor, "Education is the foundation of the State."

It was only on the eve of the outbreak of the civil war that, under the stimulant of the stirring message of Governor Joseph E. Brown, the legislature laid the foundation of a proper system of common schools. On December 11, 1858, \$100,000 was set apart from the earnings of the Western and Atlanta Railroad, a State property, for educational purposes, and it was provided that, as the State debt should be paid by the school fund, a like amount of the bonds of the State should be deposited in its place. The people were authorized by this law to establish free schools by their share of this fund, and one county led the educational movement which now includes the 93 counties of the State. The collapse of this experiment during the war was followed by the stagnation of an educational interregnum of 12 years before the commonwealth took up the final work of the establishment of the American common school for all classes and both races in 1872.

ALABAMA.

Like all the Southern States of the Union, Alabama began the establishment of the common-school system at the summit, and through a generation of agitation worked in an intermittent and experimental way downward toward the base, the elementary schooling of all classes, through the initiative of the commonwealth, for good American citizenship grounded on fit intelligence and sound character. The State was able, at an early period, to utilize the national endowment of university lands, and, after four years of preparation, on April 18, 1831, the State University of Alabama was opened to students.

Few of the Southern States have been able to invite their young men to the feast of the higher education under more flattering auspices. The university was founded in a pleasant site in the suburban portion of the original capital, Tuscaloosa. Its outfit of buildings was far in advance of any in the old thirteen States, consisting of a spacious "rotunda," the finest auditorium in the State; Washington and Jefferson "colleges;" "the lyceum," a building containing the university cabinets and lecture rooms; four residences for the professors, and a "hotel," the general refectory for the students. The first president was Dr. Alva Woods, a native of Vermont and a graduate of Phillips Academy and Harvard University, Mass., numbering among his classmates George Bancroft, George B. Emerson, and Dr. Stephen H. Tyng. After two years spent in European travel and study, he served as professor of mathematics and natural history in Brown University, R. I., and, from 1828 to 1831, as president of Transylvania University, Kentucky.

For seven years President Woods presided over the new institution—years of constant anxiety, closed by a disastrous financial collapse which threatened the existence of the university. Added to this was the usual outbreak of disorderly conduct among the students, who were largely composed, as must have been inevitable, of boys with meager additional preparation in letters or discipline for proper college life.

The resignation of the president and the entire faculty in 1837 closed this somewhat inauspicious period of the university beginnings. Among the professors were three gentlemen who afterwards rose to distinction: Henry Tutwiler, Henry W. Hilliard, and Richard T. Brumby. The university opened with 94 students in attendance during the first year, and from the classes of the first seven years went forth several men afterwards well known in the political and professional life of the State.

The second venture of the university on the troubled sea of the higher education in the Southern States began in 1837, under the presidency of Dr. Basil Manly, born in 1795, and graduated with the first honors of South Carolina College in 1821.

For the coming sixteen years he was engaged in the ministry of the Baptist Church, eleven years in Charleston, S. C. Here began his labors as a friend of education by his interest in the foundation of the Baptist Theological School, at Louisville, Ky., and Furman University, at Greenville, S. C. In 1837 he was called to the presidency of the University of Alabama, which he held until 1855, when failing health enforced his resignation after eighteen years of a successful administration. During the following thirteen years he wrought in his profession, as Baptist clergyman, and died in 1868.

For the details of his long and successful presidency of the university the reader is referred to the excellent History of Education in Alabama, Circular of Information of the United States Bureau of Education, No. 3, 1889, by Mr. Willis G. Clark. The most notable incidents of this period of the development of the institution are, first, the heroic attempt to reform the status of college discipline and advance the respectability of college life in general. The students were clothed in an attractive uniform and required to appear in "black silk gowns made after a prescribed pattern," while the faculty were expected to wear "an appropriate black silk gown" at all public exercises.

The new departure in the line of discipline was an attempt to do by force of law what Horace Mann twenty years later really accomplished at Antioch College, Ohio, by the force of a matchless personality and the law of love. It attempted to hold every student in a way responsible for the good behavior of the entire body of its fellows. On the commission of any serious misdoing the students suspected of complicity were "severally called up" and each put upon his own "exculpation." If any student testified to his own innocence his plea was accepted, liable to rejection in case he was detected in falsehood. But if, according to the unwritten law of the average American college boy, he declined to "exculpate himself," he was regarded as taking on himself the guilt of the criminal and compelled to leave the university.

For more than ten years the trustees and faculty labored to carry this impracticable scheme of college government into effect. During this brief period there were not less than four general demonstrations reaching the dignity of a college "riot," requiring the temporary suspension of large numbers of students, once suspending the sessions of the institution. Finally both the uniforms and the exculpatory system of discipline were wisely abandoned, and the university went on with the usual ups and downs of student behavior. The experiment was a useful object-lesson on the folly of a college faculty, a body of learned gentlemen, drawn together largely from the clerical profession, endeavoring to force a scholastic and ultrareligious idea of youthful manners and morals upon a crowd of young fellows gathered in from every class and condition with every variety of previous social and personal training.

Alabama, in 1831, was virtually a frontier State, its young people including the usual amount of excellent material for good, with a fair proportion of distinguished citizenship. It was not so much a reflection on the character and manner of the boys as on the impracticability of their educational guides that this experiment, both in dress and behavior, went finally to the limbo of so much experimenting on the raw material of young America. Better than this was the effort to enforce a higher test of scholarship for entrance, and a more severe type of examination. At a period somewhat later than this, a trial was made of the University of Virginia system of "electives;" practically a permission to every boy, with an outfit little above an elementary school, to enter the university and attach himself to as many or as few chairs as permitted by the faculty, remain as long as he would, and leave with such "certificate of progress" as he had earned; the full honors of the university, of course, only given to the very few who had gone through a severe examination in the several departments required for a complete graduation.

It was, in fact, an effort to transport the university system of central Europe into the backwoods of the new American Republic. It is an evidence of wisdom that a faculty containing men like President Manly and Professor Barnard, after a fair trial made at the instance of the trustees, rejected the scheme as impracticable and proceeded to the more practical organization of a fit curriculum with several departments, largely under the control of the teaching force of the university.

In 1845 the university was favored by the building of an astronomical observatory, well supplied with instruments of investigation, under the direction of Prof. Frederick A. P. Barnard, who first appears here in his distinguished career as an educator in the South, terminating in his long and celebrated presidency of Columbia College, New York. During the eighteen years of President Manly's administration the university enjoyed, in turn, the services of several teachers, afterwards among the most distinguished in the annals of both the Southern and Northern higher education: Dr. F. A. P. Barnard, afterwards president of Columbia College, New York; Prof. R. T. Brumby, who was a noted pioneer in the study of the natural sciences in the South; A. V. Bush, in mathematics; Michael Tuomey, professor of geology; Dr. Landon C. Garland, Henry Tutwiler, and Dr. John W. Mallet. It seems to have been a constant habit of the professors and presidents of the Southern universities and colleges, during their early years of development, to circulate from one institu-

tion to another, thus giving to all by turns the opportunity of superior instruction. And as many of these men were among the more prominent educators of their States and several from Europe, there was more than the usual amount of good teaching and valuable administration in this department of Southern education from 1840 to 1870.

The number of students in the university increased slowly. The States of South Carolina, Georgia, and Tennessee were already in the field and the University of Virginia, with the great name and fame of Thomas Jefferson behind it, was twenty years ahead; while the older Northern foundations, Harvard, Yale, Princeton, and Columbia, still drew their proportion of students. But the growth of the university during these eighteen years seems to have been healthy, as far as possible in a State so poorly supplied with the secondary education, and unsuccessful experiments were usually discarded as soon as their failure was recognized. One of the most important events in its history was the organization of the State geological survey, which, begun under the direction of Professors Brumby and Tuomey, with the aid of distinguished experts from other States, first revealed to the country the great mineral wealth of the commonwealth. The attempt to establish a law school at first failed, and the medical department, located at Mobile, was a later annex.

In 1850-51 an important forward step in instruction was made in the establishment of written examinations. In 1846 the number of students had not reached 100; in 1848, 102; in 1851-52, 126, and in 1855, at the resignation of President Manly, 112. During the eighteen years of President Manly's presidency, 252 had graduated with the usual dispensation of college honors. The financial affairs of the university had been rehabilitated, to the extent that there remained a permanent fund of somewhat less than \$300,000; the annual expense being \$25,000. Several new buildings had been erected.

The resignation of President Manly in 1855 was followed by the appointment of Dr. Landon C. Garland as his successor; a position held for ten years, until the destruction of the university buildings by fire during the closing days of the civil war. The services of Professor Barnard had been lost by his call to the new University of Mississippi, and Prof. R. T. Brumby, who rendered valuable services to South Carolina in his investigations into the extensive phosphate deposits of the coast that have so greatly enriched that State, had resigned. Prof. Henry Tutwiler also had retired, to establish his unique private classical academy at Greene Springs. In place of these came, as a permanent resident, Prof. J. W. Mallett, afterwards of the universities of Virginia, Texas, and Pennsylvania, and Robert K. Hargrove, afterwards bishop of the Methodist Church South and head of Vanderbilt University, Nashville, Tenn., and Prof. Crawford H. Toy, afterwards in the Baptist Theological School at Louisville, at present connected with the divinity school of Harvard University. Three new houses for the professors, a new college hall, and an increase of the endowment fund by the State to the amount of \$300,000 were among the outward gains of the institution.

The establishment of a military department, suggested by the threatening of sectional war, increased the attendance of students to the largest number hitherto matriculated, 137, and appeared to solve the vexed problem of discipline. The educational status of the university was somewhat distracted during these years by the experiment of the University of Virginia system forced upon the reluctant faculty by the trustees. It was tried for several years and finally rejected. The institution was also greatly agitated by the increasing spirit of political discontent in the States over the progress of the antislavery movement in the nation. The year of the acceptance of the presidency by Dr. Garland was also notable from the appearance of the Republican party in the field of national politics, with the great agitation of national political complications; the whole movement closing with the election of Abraham Lincoln to the Presidency of the United States in 1860.

The State of Alabama seceded from the Union on January 11, 1861, and the city of Montgomery became the capital of the new Southern Confederacy. All this raged like a fire in the blood of the student portion of the university. A large number of those in attendance at the breaking out of the war entered the Confederate Army, and during the four years of conflict, although the area of the State was not the theater of actual strife, it was impossible to keep the university in operation in any other form than as a military training school for cadets. "The conclusion of the whole matter" was the destruction of the university buildings by fire on April 3, 1865. The cause seems to have been a skirmish with the advance of the Union army of cavalry under General Wilson, brought on by the student guard of cadets, including some loss of life, for which the military commander was not responsible. Under this provocation the entire group of the university buildings was given to destruction by the order of the Union commander. This great loss has, however, been more than redeemed through a subsequent grant by Congress of valuable mineral lands in the northern portion of the State, from the income of which the new university has emerged with more ample accommodations than before. For additional particulars of the history of this interesting foundation the reader is referred to Circular of Information of the United States Bureau of Education, No. 3, 1889, already quoted.

Meanwhile, during the thirty-five years between 1830 and 1865, the usual development of the secondary and higher education in the Southern States, on the lines of the denominational and private academy, had taken place in Alabama—La Grange College and the Southern University, by the Methodists; Howard College, by the Baptists, and St. Joseph's, by the Catholics, with several academies of wide reputation. The Judson, at Marion, the Alabama Conference Female College, and others, received a large development before 1860. These seminaries also had the advantage at different times of numbering among their presidents and faculties several of the ablest educators in the State and section—Robert Paine, afterwards bishop of the Methodist Church South; Professor Tutwiler; Prof. C. G. Smith, afterwards president of the University of Alabama; Dr. J. L. M. Curry, at present agent for the Peabody and State education funds; Prof. C. C. Calloway, Professor Lupton, Prof. A. A. Lipscomb, and others. The Catholic college of St. Joseph's near Mobile has been well known at home and abroad, and numbers among its graduates a great company of distinguished men—100 lawyers, teachers, artists, Congressmen—among whom were a large number of clergy, and men distinguished in every department of Southern public life.

Perhaps the most unique and justly celebrated educator of Alabama during this period was one who has more than once appeared in the present sketch of educational affairs in the State, from 1830 to 1865, in the person of Henry Tutwiler. This remarkable man was a native of Virginia, born in 1807. He was one of the earliest students and an A. M. of the University of Virginia, with Hon. R. M. T. Hunter, Robert Toombs of Georgia, Edgar Allan Poe, and Alexander H. H. Stuart. He knew Jefferson in his retirement at Monticello. In 1831 he was called to the professorship of ancient languages in the new University of Alabama, where, although but twenty-four years old, he at once became a marked man in the educational affairs of the institution. In 1837 he resigned, with the entire faculty, and was afterward engaged at Marion and La Grange colleges. His broad scholarship and progressive ideas of the higher education had already been manifested. Indeed, it was doubtless from his growing experience with the secondary and higher education of the day that, after thirteen years spent in the regulation service of the college professor of half a century ago, he resigned, and established at Greene Springs, Ala., the celebrated school in which he wrought for the thirty-seven years before his death, at the age of 77. He was twice chosen to the presidency of Alabama University, and was the recipient of distinguished honors at home and abroad. He left a family of eleven children, of whom the best-known daughter, Miss Julia Tutwiler, is still at the head of the State Normal School at Livingston, Ala. The Greene Springs School was founded in

1847, at a local watering place in a remote part of the hill country in Hall County. He found in the sanitarium the building for the use of his school. He shared in the old-time idea that a school for boys should be built up in a natural or artificial wilderness, where the work of education could go on in almost complete isolation from the great world. But, in other respects, he was far in advance of his day—certainly in his own State—in his views concerning the mental training, moral discipline, and general culture of the secondary and higher sort. “To prepare young men for the business of life or for the higher class in the college and university,” was the object proposed and adhered to through the thirty-seven years of his able and successful mastership. The classification of studies was made possible in his school. The curriculum was expanded to include much that is now acknowledged as essential to a good seminary and college training. A well-selected library and apparatus, by which the isolation of the school was made endurable, were a vital part of the seminary. In his own isolated field he should be classed with Dr. Arnold, Horace Mann, Dr. Barnard, George B. Emerson, and President Kingsbury as a pioneer in that view of the higher education wherein many of its modern excellences are found and its greatest achievements at present made manifest.

Up to the year 1854, no satisfactory arrangement had been made in Alabama for the elementary schooling of the masses of the white population, who were practically excluded by lack of means from the enjoyment of the academic and collegiate opportunities provided for the more favored class. It is probable that the “old field school,” which was almost the sole recourse of this portion of the people in the older Southern States, was here in operation, besides the variety of home instruction by which a considerable number of the better-off sort of families supplied their own educational necessities. There had been efforts in various counties and townships to utilize the United States school land grant for local convenience. But, with all these spasmodic undertakings, the real problem of the education of the responsible masses of an American commonwealth for good American citizenship had not yet been faced during the thirty-five years of the existence of Alabama as a State.

The condition of affairs resulting from this neglect had been suggested as usual in the messages of several governors to the State legislature. But it was not until 1852 that the city of Mobile, then the most important in the State, made the first advance in the direction of a proper common school system for its white population. Previous to this, for twenty-six years from 1826, the city had gone through an experience similar to that of the city of New York in the attempt to support a system of public schools virtually under the control of a close corporation. By several acts of the legislature a board of commissioners had been empowered to erect a school building by the aid of a lottery, and distribute the small income from the county school fund and a special tax at their own discretion. In 1851-52 some \$5,500 was annually parceled out among a number of city and private institutions; the commissioners not pretending to exert any control over either teachers or schools. It was declared that “about one-half of the children in this favored land and wealthy community are growing up without a knowledge of the simple rudiments of learning.” The price of tuition for one scholar in a private school would exceed the ordinary income of a laboring man.

The crisis was precipitated by the movement of the commissioners to sell the Barton Academy building, a fine structure, built in 1835 on land donated at a reduced value to the city for educational purposes by the aid of a lottery and private subscription. It was claimed that from the sale of the school building a sum could be realized whose investment would increase the annual distribution among the private and parochial schools. On this issue the friends of a new order of things took the field, and by a strong popular majority it was voted to attempt the organization of a more extended school system.

Notwithstanding the almost utter lack of funds, the new board of commissioners proceeded to put the great schoolhouse in fit condition for occupancy. The school opened with 400 pupils in November, 1852.

In three months the number increased to 850, with primary, grammar, and high-school departments. A deputation of the commissioners visited the public schools of New York, Boston, and other Northern cities in 1853, and such new features as were adaptable to the locality were introduced. The people approved this action by a substantial majority, and in 1854 the city and county were districted, a superintendent of schools was appointed, and the foundations laid for the upbuilding of the common schools in Mobile, then the city of second importance in the entire Gulf region of the Republic. The whole expenditure for the first two years was \$32,428.68—one-third from tuition fees at a lower rate than in the private seminaries of the city.

In 1854 the legislature passed the act that finally established the public-school system of Mobile, separating it in all essential respects from the general educational system of the State, with only the connection of the annual reception of its quota of the school funds of the commonwealth. By a wise provision of the charter the school authorities were prohibited from subsidizing sectarian schools, a policy which lingered long in at least one of the neighboring States and retarded the proper development of the common school, especially in the rural districts. In 1856 the cost of the schools of Mobile was \$21,890, one-half from tuition. There were 5,920 children and youth of school age. In 1857 the receipts amounted to \$37,000 and the expenditure to \$38,000. The office of superintendent of schools in 1859 was transferred to the principal of the boys' high school. At the outbreak of the war the city of Mobile was paying \$46,600 for the schooling of more than 6,000 pupils.

One important feature of the girls' high school was the teachers' class, which, as in the similar case of Charleston, S. C., became a normal-school department for the supply of the teaching force of the city. The opening of the war greatly crippled the resources of the school authorities, although some of the schools were held in session to some extent until the occupation of the city by the national forces in 1865. The closing of the schools by the deposing of the Confederate authorities was followed by a vexatious conflict of administration during the period of reconstruction, the details of which belong properly to a history of the common schools of Alabama subsequent to the close of the civil war.

This important movement in the chief city of the State was followed, in 1853, by legislative action in response to the urgent suggestions of the governor for the improvement of the very unsatisfactory educational affairs of the State. The report of the legislative committee in 1853 seems to have been the first revelation to the people of Alabama concerning their actual situation in respect to the education of the masses of white children. It was shown that the bountiful national gift of school lands, valued at \$2,000,000, had, during the past thirty-five years, been so embarrassed by differences in the policy concerning its administration and great inequalities of distribution in different localities that, outside the establishment of the university, it had been of small benefit to the children. "From the original character and value of the soil in different portions of the State, it happened that, in several counties, the lands thus set apart for common-school purposes were very valuable; in others comparatively worthless, in some entirely so." In thirteen counties the lands exceeded half the value of the entire school grant, with little more than one-fourth the population. In one county a white population of 6,981 enjoyed an annual fund of \$4,830, while Mobile, with a white population of 17,500, had no land fund whatever. Cane County, with 10,900 population, had less than \$600, and Pike County, with 12,700 people, but \$449. Sometimes a whole township would be owned by one man or a few families living on large plantations, who, out of the public-school money, would send their boys to the

university and their girls to expensive academies. There were few public schools in the State, the number of scholars being 35,000 to 40,000 of a population of 130,000 white children between the ages of 5 and 15. The great obstacle to the development of education had been hitherto the interminable disputes in and out of the legislature concerning the proper use and consolidation of the public-school funds. An attempt to take the sense of the people on the consolidation of the funds for general use failed from the neglect of a majority of the districts to vote under a doubt of the constitutionality of the measure. Under these circumstances the committee recommended the appointment of a superintendent of education for the State, with the exception of the Mobile district, with some improvement of the existing laws, leaving to subsequent investigations such action as would lead to the establishment of an effective system for the schooling of the entire white youthful population. There were 52 counties and 1,512 school townships in the State.

This report of the committee of the legislature, Charles P. Robinson, chairman, was accompanied by a draft of an educational bill and tables, showing the organization and conditions of local school affairs. It appeared that, in 1851, 89 of these townships received from the taxation of the State \$32,736, while the remaining townships received but \$31,912. The latter amount was distributed in sums ranging from 50 cents to \$150; "so much money thrown away by the State, for all practical purposes of education." This report was submitted to the legislature on September 30, 1853.

But there seems to have been no decisive action on the subject until January 24, 1854. The legislative committee, of which Judge A. B. Meek, of Mobile, was chairman, contained as a member Mr. J. L. M. Curry, a young representative of the Talladega district, henceforth to become a commanding figure in the educational affairs of his own and adopted State and the nation. The report of the committee, January 18, 1854, enlarges upon the revelations of the last year. An eloquent and condensed statement of the whole subject is contained in these sentences: "It is not only the highest interest but the clear right and imperative duty of a State, such as ours, to provide a system of common-school education. The property of the State is dependent for protection and safety upon such a suggestion, and should therefore pay for its establishment and maintenance." Hitherto the location of the national grant of lands for the use of the separate townships of the State had been the chief cause of the obstacles to the establishment of such a system. "The means of education were furnished most liberally where they were not wanted, while the needy sections were left almost or entirely without them." In 873 of the 1,572 townships the sum realized from 558,720 acres had reached the amount of \$1,575,598. The remaining townships, nearly one-half the whole number, had received less than one-third that sum. "The fund, as now administered, is an unsatisfactory mass of misapplied bounty, producing inequalities inconsistent with the spirit of our institutions, establishing a class of accidental and not meritorious beneficiaries, and presenting aristocratic features prejudicial alike to social and educational excellence." The committee proposed an arrangement similar to that adopted by several of the new Northwestern States; that the legislature should supply by general tax an annual sum that would reduce these inequalities and provide for an effective system of education for the entire State. Of the 140,000 children of school age 100,000 were receiving no school instruction. "So great mental destitution is apparent in no other State." The example of other States is quoted. Notably, Louisiana is cited, which annually spent \$450,000 in the support of a free-school system. At \$2 per capita \$280,000 would be required in Alabama, which could be raised in addition to the \$80,000 income of the sixteenth section fund; a sum only one-fifth of the revenue of the State, and requiring no additional taxation. The chairman of the legislative committee reminds the legislature that the demand for this great advance in educational facilities is "clamorous," coming from "the great body of the people who are the chief support of the State in peace and war, its

rightful rulers in all legislation, and their voice should be heard and obeyed." He urges that "the elementary branches of learning at least should be free to all pupils, without money and without price." The report closes with a vivid picture of the industrial capabilities of the State, prophetic of what has come to pass during the last twenty-five years of new life in this great Commonwealth.

The bill reported by the committee was an elaborate document. It provided for an "educational fund," consisting of (1) interest on a portion of the surplus revenue fund of 1836; (2) the income, at 8 per cent, of the proceeds of the sales of public lands, added to the national gratuity to Alabama in place of the valueless school lands of certain portions of the State in 1848; (3) the income, at 6 per cent, of funds coming from the sales of the sixteenth section lands in the several townships; (4) the sum of \$100,000 paid by the State; (5) several appropriations of minor importance.

The administration of the system was provided for by a State superintendent of education, three commissioners of free schools chosen in every county, and three trustees of schools for each township. The State superintendent was to be appointed for two years, by the general assembly, with a salary of \$2,500, and the duties generally assigned to this official. Two persons, elected for a year by popular vote, with the judge of probate, constituted a board of county school commissioners, with power to district the county, by consent of the local trustees, distribute the general funds, examine teachers, exercise a general supervision, and manage all general funds for building and furnishing schoolhouses. Every two years three trustees from the citizens of any township should be elected by general vote, to whom should be intrusted the duty of employing teachers, administering the local funds, and reporting to the county commissioners once in three months on the general condition of the schools. Five thousand dollars was appropriated for the support of the State superintendency. The general income should be distributed with a view to equalize, as far as possible, the previous inequalities of the small townships. All white children and youth from 5 to 18 years of age should be admitted to the free public schools, which should be properly graded, a moderate tuition fee being collected in cases where the salaries of teachers were too meager. The city of Mobile was exempted from the provisions of this law.

General W. F. Perry was elected as first superintendent of public instruction under this law in 1855, and with a financial backing of \$237,500 and a school population of 145,588 the State launched forth in the great experiment of educating all its white children and youth. In 1856 the number of children of school age was reported as 171,000 and the funds were increased to \$267,690. The number of schools in 1856 was 2,260, with 89,000 pupils, which, added to the number in Mobile and the students in colleges and academies, made 100,000 under instruction in some form; one-fourth the white population of the State. In 1857 the fund had risen to \$281,800, with 90,000 in school and 178,000 of school age. The excess of expenditure above the general fund was made up by contributions in the local districts, and private schools were subsidized for an extension of term. In this way a term of six school months in the year was said to have been provided. The board of county commissioners gave place in 1856 to a county superintendency. In 1858 Superintendent Perry was succeeded by Mr. G. B. Duval, who reports 2,597 schools with 98,000 registered pupils, with the average daily attendance of 42,274, six and one-half months of school term, and an expenditure of \$564,210; more than one-half the entire cost paid by the parents of children in attendance.

But this grand avenue of popular education thus surveyed and laid open on paper by the people of Alabama, proved, from the first, no advance along a well-defined highway, but the common road of a new country, obstructed by forests, strewn with rocks and sloughs, almost impervious to travel. The superintendent reported, at the end of the first year, that from the difficulty of handling the embarrassed State funds,

the inefficiency and delays of local officials, and the indifference of that portion of the people most in need, the work had proceeded slowly. It was not till December, 1855, that this official was able to get in motion. The immense difficulties besetting a population spread over an area so vast, made it almost impossible to concentrate popular attention on a new and strange organization of public schools. The establishment of a county superintendency was a step forward, and, from the first, there was a steady tendency among the masses toward the idea of popular education.

But the rising tide of political agitation in 1858 appears to have submerged the movement, as for a number of years there are no published reports. Of course, under such a condition of affairs as prevailed from the first, it is impossible to estimate the actual value of the schools, the efficiency of the teachers, the regularity of attendance, the courses of study, the methods of instruction and discipline, and the general results of a school system beset by so many and serious hindrances. But the State had at last undertaken the great good work of schooling its white children, and has pursued it with varied success during the past forty years.

The report of Supt. John Ryan in 1866 is a melancholy rehearsal of the calamities that had befallen the State since the opening of the civil war. There had been no reports from the educational department since October, 1859. Yet the public schools were, after a sort, kept open by the appointment of a provisional superintendent in July, 1865. The records, books, papers, etc., of this office were carted about the country in boxes to keep them from the hands of the spoilers during most of the time after 1863. Hon. J.B. Taylor, the predecessor of Superintendent Ryan, is credited with this almost romantic official devotion. No schools were opened in 1865, yet the superintendent believes that all classes of schools through the State were sustained to some extent by private enterprise. The public system was continued in Mobile until April, 1865, the date of the occupation of the city by the Federal forces, and during the year following, by order of the commanding general of the military department, with an average daily attendance of 1,500 in the city and some 200 in the county. The superintendent issued an appeal to the people of the State to rally to the support of education. Although the schools had been depleted of their attendance by the terrible scourge of war, yet he recognized that the coming in of a new order of affairs would demand even greater efforts for the people's instruction than of old. He notes the great desire of the people to avail themselves of such opportunities as remained, and congratulates the schools on the fact that large numbers of the better educated persons of the State are ready to take up the work of teaching.

The city of Huntsville, in the extreme northeast of the State, as early as 1833 had established an academy for boys and girls, the female department with an attendance of 100, under the direction of three teachers educated in Miss Catharine Beecher's school, in Hartford, Conn., engaged at a salary of \$500 a year, with board. This school was among the first in the public-school system of the State and, like numbers of the old-time Southern academies established by the people or private corporations for public use, it is now included in the general common-school system of that, one of the most beautiful and flourishing of the cities of the State.

In 1830 the population of Alabama was 309,527; in 1840, 590,756; in 1850, 771,623; in 1860, 964,201. From 1850 to 1860 nearly half the population were negro slaves. With the report of Superintendent Ryan, in 1866, the original system of public schools established in 1854 came to an end. By the constitution of 1867 the entire educational affairs of the Commonwealth were placed in charge of a State board and the schools were declared free from tuition fees. The history of the rise of the present scheme of public instruction dates from the year 1868, when the new system went into practical operation amid the discouragements and exasperations of the years immediately following the close of the civil war.

FLORIDA.

The vast territory upon which, after its purchase from Spain by the United States in 1819, the general name of Florida was conferred, includes 58,680 square miles; 37,555,200 acres; as large as Great Britain and Ireland. No Southern State is so diversified in its opportunities for sustaining a dense population, and no semi-tropical State can boast a greater variety of products. One million acres of its area are still designated as "swamp lands," a title that here, as in the Northwest, originally signified an unexplored area, sometimes of untold fertility. In 1830, the opening date of this essay, the population was 18,385 white, 844 free colored, 15,501 negro slaves; total 34,730. In 1840, the population had increased to 27,943 whites, 817 free colored, and 25,717 slaves; total 54,477. In 1850 there were 47,203 white, 932 free colored, and 39,310 slaves; total 87,445; of whom less than 20,000 are reported as under 20 and some 14,000 of proper school age—5 to 15.

The educational statistics of 1850, of doubtful accuracy, report 34 academies, with 49 teachers, 1,251 pupils, and \$22,700 estimated income; 69 public schools, with 73 teachers and 1,878 pupils, costing the State and their patrons \$32,000; a total of 4,812, however, were returned by families as attending school, with 4,000 persons above the age of 20 unable to read and write. These statistics of early Southern schools are known to be greatly misleading by the neglect to give the "daily average attendance," the only reliable test of the real schooling of a people. Otherwise, the new State, then only five years old as a community, admitted to the Union in 1845, might congratulate itself on having more than one-tenth of its entire white population under instruction. As it was, the unreliability of educational statistics at this period in our country was such that this and similar estimates can only be received as suggestions.

It is an easier task to follow the slow rise of the common school in Florida during the twenty years of its life as a State of the Union, from 1845 to 1865, the close of the civil war. This story is so well told in the Circular of Information of the national Bureau of Education (No. 7, 1888), that there is little need, for the general purpose of the present essay, of doing more than furnishing a summary sketch of what was attempted and what was done up to 1860, when the report of the United States Census is that 2,032 pupils were instructed in the "public schools" at an expense of \$20,099, in addition to the 4,486 pupils in "academies and other schools."

The present common-school system of Florida was spread on the statute books in 1868-69 and set to run its race from its humble beginning of 250 common schools with 7,500 pupils of both races in 1870; a school population, 5 to 21, of probably 75,000, 1 in 10 of whom attended school.

The story to be told of Florida is essentially the same as in all the States of the South before the civil war. Here, as in Virginia, the Carolinas, Georgia, and Alabama, there was, from the first, a well-defined common-school public, occasionally coming to the front and against almost insurmountable difficulties attempting to stir up the ruling class to a sense of the importance of educating the masses of the white people. In Florida the ordinary difficulties were increased by the fact that, as late as 1870, the majority of the population of the State was confined to 7 counties in the northern portion of this all-out-of-doors empire. In 1831, fourteen years before the admission of the Territory to the Union, the Florida Educational Society was formed in Tallahassee. It proposed nothing less than a system of general education for, probably, some 5,000 white youth in the Territory. The governor of the Territory was authorized to appoint three commissioners to obtain all information necessary for founding an efficient system of education. An education fund was provided to support this movement and an attempt made to incorporate the manual-labor system of schools, then running its brief career of experiment in the country. But the effort was, from the very circumstances of the case, abortive.

The oldest settled city in the Territory reports that but half of the 341 children between 5 and 15 in the place, were in any school.

Four years later, in 1835, an attempt was made by the territorial authorities to secure the national Congressional land grant, and in 1839 three school trustees were authorized to be chosen in each township to lease the school lands and apply the revenue to the instruction of the children. By subsequent amendment there was authorized a sort of supervision of the action of the trustees by the judge of probate of each county, who, as later in Texas, was named as superintendent of schools for his district. There seems to have been little to report as the result of this, the first attempt to plant the common school in what was then perhaps the least known physical area of the Union, with an Indian war on hand and nine-tenths of its territory practically an unexplored wilderness.

In 1849, four years after the admission of Florida to the Union, an appropriation was made by a legislative act to provide for the establishment of common schools for white pupils, of whom there were, between 5 and 15 years of age, more than 15,000 in the entire State. The sixteenth section of national school lands was consolidated, by 1852-1854, and the interest of the school fund established from this and some other sources was apportioned among the counties; a sum not exceeding 30 cents per capita to every child of school age. Although the counties were authorized to tax not exceeding \$4 per capita for every child of school age, only two of them seem to have acted at all towards raising any addition to the sum received from the State. In 1853 the screw was turned somewhat tighter by a provision that the county commissioners might take from the county treasury such sums as were deemed necessary to the support of schools. But as there was no obligation to account to anybody for this operation there was little result, and such funds as were provided for many of the counties were passed over to the support of favorite private schools. By the influence of Hon. D. S. Walker the citizens of Tallahassee were permitted to establish a public school, supported by a tax levied on the people of the city, in 1852; placing this on the roll of southern cities that entered on the good work of public schooling before 1860.

In 1858 the result of all these efforts was stated in the report of a school population of 20,855, with only \$6,542.60 appropriated to all the counties from the interest of the very moderate school fund, and that a few counties were trying the experiment of schools in session three months in the year. All this had been done in the attempt to put into actual operation the provision of the first constitution of the State, formed in 1838, but adopted in 1845, which contained these provisions:

"SEC. 1. The proceeds of all lands that have been, or may hereafter be, granted by the United States for the use of schools and a seminary or seminaries of learning shall be and remain a perpetual fund, the interest of which, together with all moneys derived from any other source applicable to the same object, shall be annually appropriated to the use of schools and seminaries of learning respectively and for no other purpose.

"SEC. 2. The general assembly shall take such measures as may be necessary to preserve from waste and danger all lands so granted and appropriated to the purposes of education."

The extent of these lands was 704,692 acres for common schools, with 400,000 acres additional, and 85,714 acres for the support of two seminaries, of which only 115,000 acres of the common-school lands had been sold and 47,000 acres of the seminary lands had been disposed of previous to 1873. Although the State fund was involved in the general collapse of 1865, yet the State assumed the annual payment of interest, which, in 1872, amounted to \$15,000 from the common-school fund; not twice the \$8,000 appropriated by the Peabody education fund for the support of common schools in Florida during that year.

This record confirms the remark of the author of the History of Education in

Florida, made in 1889: "The old order was well-nigh void of any system, and until a very recent period there were no studies pursued in the schools that would be classed under the higher education." In 1840-1845, years before the admission of the State to the Union, there were reported 18 academies with 735 pupils, with 51 common schools and 925 scholars. The census of 1850 gives 47,000 white inhabitants, for whom were provided 34 academies and 69 common schools with 3,129 students. In 1860 we read of 97 public schools with 2,032 pupils, and 133 academies and other schools with 4,486 students, with an income of \$20,000 from all sources for public schools.

The result of the attempt to organize the secondary and higher education by the State before 1860 was even less a success. In 1823 Congress granted an entire township, both in east and west Florida, for "a seminary of learning," to be located by the Secretary of the Treasury; and this was increased, in 1845, on the admission of Florida as a State, by the addition of two entire townships of land. In 1851 the legislature enacted that "two seminaries of learning shall be established, one on the east and the other on the west of the Suwanee River, first for the purpose of instructing male and female persons in the art of teaching in the common schools, and next to instruct in mechanic arts, geometry, chemistry, husbandry, and the fundamental laws on which depend the rights and duties of citizenship."

Here was a programme, then, well up to the ideal of any State in the Union in respect to normal schools, industrial education, and instruction in civics. This act was followed by another, bearing on the organization and conduct of these schools; one established at Tallahassee and the other at Ocala. In 1862 each of these seminaries was placed, by law, in charge of a board of education, appointed by the governor, composed of six members with the county superintendent of education, to whom were intrusted the appointment of teachers, the establishment of an experimental school, the erection and furnishing of buildings, and appointments for the industrial department, with the charge and distribution of all State funds appropriated thereto. Each county was entitled to as many free students as it had members in the lower house of the legislature; all others were expected to pay "reasonable tuition."

In 1848 the East Florida Seminary was located at Ocala, where it remained until 1866, when it was removed to Gainesville. Until its removal and even until a later period, 1877, it seems to have been little more than a local high school, the counties included in the organization rarely sending free students. The West Florida Seminary, at Tallahassee, was established in 1856, by the offer of \$10,000 from the city and the donation, in 1857, of a valuable academical school property rated at \$10,000 and a grant of \$2,000 annually for the teaching of the children of the city. In 1858 another seminary property was donated for a girls' "annex." In 1882 these two departments were merged in a consolidated organization. Before the war the college served an excellent purpose as a superior local school for the State capital.

In 1850 there were in Florida no college libraries reported, and only one public-school library of 200 volumes, with the State library of 4,000 volumes. This deficiency was made good during the subsequent twenty years by 75 public and 178 private-school libraries, containing more than 100,000 volumes.

The new era of education in Florida began after the close of the civil war, under the act of 1868-69, and the appointment by the "reconstruction" governor of Mr. C. Thurston Chase as superintendent of common schools. Mr. Chase for four years labored at the pioneer work of commending the system of general education for all sorts and conditions of children and youth to the public mind. From the small beginning of 250 schools and 7,500 pupils, in a State then containing 188,000 people—96,000 white and 92,000 colored, the bulk of the population in 9 counties—the work has gone on to its present condition, where Florida aspires to a superior position among the common-school States of the South.

MISSISSIPPI.

The State of Mississippi has an area of 47,156 square miles, 30,179,840 acres. The first settlers in 1763 occupied a strip of territory along the Mississippi River, 20 miles wide at the north and 60 at the south. The remainder of this immense realm was largely a wilderness, an appendage to Alabama, originally known as western Georgia, which in 1802 ceded to the United States all territory outside its present limits. In 1803 the vast territory of Louisiana was acquired by purchase from France. Until 1795 Mississippi was alternately under the French, English, and Spanish dominion. The Louisiana purchase, in 1803, gave actual possession of this realm of fighting savages. Only in 1817 was this portion of the United States territory admitted as a State to the Union. In 1820 the new State of Mississippi had a population of 42,000 white and 33,000 colored; total, 75,000. By 1830 a considerable portion of the State had been reclaimed from the savages, and the population during the ensuing ten years—by 1840—had leaped to 375,000, in 1850 to 607,000, and in 1860 to 791,000. At each enumeration after 1830 the negro, as now the freedman, shows a majority.

The educational clause in the first constitution of the State, in 1817, is a repetition of the good old deliverance of the ordinance of the Northwest Territory: "Religion, morality, and knowledge being necessary to good government and the happiness of mankind, schools and the means of education shall forever be encouraged." But, up to 1820, nothing had been done save the establishment of a dozen academies, one of which, at Washington, the original capital of the Territory, assumed the complimentary title, Jefferson College. The institution was subsidized by a periodical gift of Congressional lands and "fought a good fight" against discouraging odds until it was cut down to the rank of a village academy by the removal of the capital to Jackson. Apart from the charter and subsidy, the State had nothing to do with these academical schools, they all being either private, corporate, or denominational seminaries.

In 1821 the people of the village of Columbus, on the extreme eastern border of the State, the whole country north, west, and south being largely a wilderness, took their own educational affairs in hand and, from their portion of the sixteenth section school lands, built up the Franklin Academy, which for two generations held up the banner as the "first free school of note and promise in the State." It still exists as the higher department of the common-school system in that pleasant little city, which also contains the State Normal and Industrial College for white girls, one of the most characteristic new departures in the later development of Southern education.

In the same year an attempt was made to establish a literary fund for the education of poor white children and the general support of schools. The bountiful gift of 800,000 acres of school lands by the National Government was largely squandered through the same craze for a rapid increase of population that in so many States has wasted this patrimony of the children. In Mississippi a system of leasing the lands for ninety-nine years on personal security was established, which, by 1845, had reduced the \$2,000,000 reasonably expected for their future value to a dreary waste of "promises to pay," too often not worth the paper on which they were written. The little that was gathered together from the wreck in the establishment of the literary fund was lost in the collapse of the Planters' Bank, through which this and other public funds were manipulated out of existence.

Nevertheless the work of establishing academies, with or without college names, went on apace. During the twenty years from 1830 to 1850, seventy-six of these institutions of various degrees of merit and demerit were established. The majority had only a brief history, although several of them became the foundations of schools now regarded as the leading seminaries in the State. On them and the habit of sending the sons of the superior families abroad and to the North for college training the State for more than a quarter of a century after its admission to the Union

chiefly depended for everything above the ordinary elementary and a partial supply of the secondary education, until the year 1846. Several of these secondary schools had before this assumed the name of college and doubtless did, like all the original seminaries of the country, give instruction in the classics. Yet Governor A. G. Brown, the father of the only genuine early attempt to establish a system of public schools in the State, declared: "During the twenty years from 1820 to 1840 no less than 110 colleges and academies, male and female, had been inaugurated in Mississippi. Most of these had a fitful existence and then went down to the great receptacle of old and useless things—the tomb of the Capulets. The children of Mississippi were largely educated in private schools."

Probably, there was in this new State which, as late as 1830, had only a population of 75,000 white people, with not over 15,000 of proper school age, 5 to 15, scattered over a Commonwealth still two-thirds in the woods, with such a lack of large public spirit that each little settlement might well set up its claim of neighborhood "rights," a more effective description of family, township, and neighborhood schooling than in any other away from the great world. For, after the first miscellaneous immigration to the "shore" of the great river, the State was largely settled by the better class of planters, coming from all the old Atlantic Southern States in patriarchal fashion, bringing their household goods with a long train of the servile class. There was neither an isolated mountain region nor an almost uninhabitable coast country in Mississippi as a huge propagating district of an illiterate multitude, as in some of the original Southern Atlantic commonwealths. At an early period there came to the State an unusually large number of Northern immigrants, of whom many of its superior people, like Walker, Prentiss, Gholson, and others, were illustrious representatives. These people, many of them college graduates and men of local influence at home, would not neglect the education of their families. And as the fertility of this new paradise made the acquirement of what was there regarded wealth a comparatively easy matter, they would not be interested in the second-rate plantation "academy," or even the so-called "college" in a far-off village, but would send their boys back to the old home schools, northward, or even abroad, and give the girls such opportunities as could be brought to their own families through the tutor, the governess, and the neighborhood school. This accounts, on the one hand, for the fact that in the matter of white illiteracy Mississippi has always, as to-day, remained far ahead of the majority of the Southern States, 11.9 per cent over 10 years of age; and, on the other, the less creditable fact that, for all practical purposes, there was no effective system of public schooling for the masses of the white people until the period of reconstruction at the close of the civil war.

But Mississippi, like every State of the South, was never misled into hostility to popular education by her foremost public men. Her roll of educational governors will bear comparison with that of any State of the Union at that early day. As early as 1821, when the State was but 4 years old, Governor George Poindexter declared in his message to the legislature: "The education of our youth is the main pillar of the temple of liberty, without which the superstructure can not be supported; and it is equally true that ignorance is the footstool of tyranny and the irrevocable precursor of the downfall of the Republic." In 1825 Governor Walter Leake said: "Without knowledge, republican virtue must dwindle to a shadow; in such a state of things liberty is only a misnomer for licentiousness." In 1832 Governor David Holmes wrote: "It is an acknowledged truth that the facility of obtaining an education is a subject of primary importance, and ought to claim the unremitting attention of those to whom the high functions of legislation are committed." In 1836 Governor Charles Lynch said: "Primary schools are regarded as deserving in an especial manner from legislative action that fostering care necessary to impart to them the life and vigor for the diffusion of knowledge." He declares the revenues of this State for this work "abundant and ample, requiring only a judicious appropriation to effect the purpose." This was

before the wreck of the national school land fund, which, if properly handled, would have enabled the State, with its limited population, to have surpassed all in the South in the support of common schools. In 1839 Governor A. G. McNutt told the legislature that "it is essential to the preservation of our liberty to provide sufficient means and proper inducements to insure the enlightenment of every child in the State. Common schools should be established in every township having a sufficient number of electors to authorize the employment of a teacher. The children of the rich and the poor could thus acquire learning sufficient to qualify them for the ordinary avocations of life, free of charge." Governor T. M. Tucker, in 1843-44, reminds the people who pay a school tax without children to be educated in common schools that "the whole community would thus be benefited, education diffused, extra protection of life, liberty, and the property of the citizens, by imparting peace, quiet, and stability to the government."

Greatest of all these was Governor A. G. Brown, in 1844-1846. He boldly asserts that "for universal education we are to look to common schools, and not to those great seminaries where the more elevated studies of polite literature are taught. My advice would be given to a good system of common schools which should be open to all, and at which the poor should be educated gratis. There could be no greater or more fatal error than for the rich to say 'we have no interest in the education of the poor.' The man who brings forward and carries successfully through a well-digested plan of common schools will erect for himself in the hearts of his countrymen a monument more lasting than marble—as enduring as time itself." This brave and able chief magistrate, taking advantage of the rapid increase of population and wealth in the State during the years from 1830 to 1840 that followed the clearing out of the Indians, with the securing of the school lands obtained from the Chickasaw reservation, 174,550 acres, valued at \$6 per acre, all save 37,000 acres of which had been sold, from which the State had realized a school fund of \$100,000, was able to open the batteries upon the legislature in a way more vigorous and practical than any of his predecessors.

In 1843 the legislature, anticipating the loss that befell the school fund from the loose and shiftless legislation of their predecessors, made a partial reparation by providing that the State treasury should issue bonds for the seminary fund, with interest at 5 per cent per annum, representing all moneys previously paid into the State treasury on account of the fund, from the time when the sum was so paid up to the date of the passage of the act, January 26, 1843; therefore the governor was directed to establish this fund with annual interest at the rate of 8 per cent upon all moneys due from the State. The university lands had been sold in 1833 for \$277,000, of which \$200,000 had been lost in the downfall of the Planters' Bank. But, with the legislature not interested in the movement for a home university, the governor dilates with especial energy on the habit of the leading people of the State of sending their boys to the North and abroad for the higher schooling. Already had the antislavery agitation in the Northern States assumed a phase especially alarming to a State so poorly acquainted as Mississippi with both the mining and manufacturing industries of her more fortunate neighbors, in which the resources of the Appalachian Mountain realm hold the making of a new empire, and with a colored contingent reaching 197,000 of the 376,000 of its entire population, the governor shrewdly avails himself of the rising discontent in the State to discuss the necessity of the great work of the home schooling of the boys. He fell into the mistake of favoring a division of the funds of the higher education by the scheme of a central university and auxiliary branches, by which the State of Georgia is still embarrassed.

In 1840 Governor McNutt declared that "the discordant views of the members of the legislature in regard to the location of the State university have heretofore prevented the passage of a law providing for the final disposition of the fund," and again urged prompt action on the subject. The result was that "a law was passed

providing that seven possible sites for a university should be selected by the legislature, and three commissioners elected to secure a location." The question of the selection of the sites woke up the slumbering element of the quarrel between the northern and southern portions of the State, which had more than once come in sight of the issue of a threatened secession of the "old south," as that section of the State was called. The real contest was finally narrowed down to the question between Oxford in the north, and Mississippi City on the gulf in the south. The final choice of Oxford by the legislature by a majority of only 1 did not leave the defeated portion of the commonwealth in a very enthusiastic mood to send their sons to what they regarded the headquarters of political corruption and heresy. Indeed, the proposition in 1846 to put the university in operation, precipitated a violent discussion, and the appropriations were only voted by a sectional majority. By this act the trustees were authorized to expend \$25,000. The power of full control over the seminary fund given by the act of 1844 was repealed. On January 14, 1846, the corner stone of the principal edifice was laid.

By 1848 the buildings were so far advanced that the legislature voted an income of \$11,000 per annum—\$6,200 by direct appropriation, and the remainder the interest of some \$90,000, all that remained of the exploited seminary fund. At a subsequent meeting of the trustees it was decided that the president should receive an annual salary of \$2,000, and the professors of \$1,500. A notable act of the legislature in 1848 provided that no intoxicating drinks should be sold within 5 miles of the college grounds, and the thirsty student was remanded to the good nature of his temporary host or to a raid on the shelves of the apothecary for relief. The faculty was elected in 1848. In this appointment the board of trustees had an illustration of the embarrassment of riches that confronts a new administration at Washington, there being 17 candidates for the presidency, 60 for the professorship of mathematics and astronomy, 67 for the ancient languages, and more than 30 for natural philosophy and chemistry; 180 in all. From this multitude, Gov. G. F. Holmes was chosen first president, with a faculty of three professors of mathematics, natural philosophy and chemistry, and the classical languages. The university was opened in 1848, with two classes and 60 students. In 1849 an addition to this number was made by the appointment of Judge A. B. Longstreet who, in 1856, resigned to accept the presidency of the South Carolina College at Columbia. The Mississippi institution suffered a great loss by the resignation of Dr. Frederick Barnard, after the beginning of the civil war. In 1854 the chair of political science and laws was established.

None of the members of the original faculty of the university were natives, and but one was a resident of the State; Mr. George F. Holmes was by birth an Englishman, called from William and Mary College, Virginia; another, a native of Kentucky and a graduate of the United States Military Academy at West Point; the last, a South Carolinian by birth and a graduate of the University of Georgia. The peculiar difficulties of an isolated situation, deficiency of income, scarcity of text-books, etc., were at an early day appreciated. The first set of students appears to have been even more unruly than even the regulation life of that department of a Southern college would warrant; it being said that "never was an institution of learning attended by a body of students so disorderly and turbulent." Under all these drawbacks, it was not remarkable that the university "made haste slowly," the attendance for only two of the first ten years ever exceeding 178.

In 1849 the vacant presidential chair was filled by the election of Rev. (afterwards Judge) A. B. Longstreet, LL. D., whose administration continued until 1856. Although the attendance was reduced to 76 during the first year of his administration, it reached the highest figure previous to 1860 on the eve of his departure to assume the position of president of the South Carolina College at Columbia. It is declared that the presidency of Dr. Longstreet was a great success in establishing discipline among the somewhat crude and youthful student body, through the exer-

cise of the fine executive capacity afterwards displayed in his success in the South Carolina College. The loss to Mississippi by the departure of President Longstreet was more than repaid by the appointment of Dr. Frederick A. P. Barnard, who left the University of Alabama for a professorship in the University of Mississippi. His appointment at Oxford was confirmed in 1859 by the title of "chancellor."

It may almost be said that the proper educational history of the State University of Mississippi began with the appointment of Dr. Barnard to the chief position of direction. This eminent educator, perhaps the most eminent of the numerous personal contributors of the old Northeast to the higher education of the South, was born in Sheffield, Mass., in 1809. He came of excellent New England stock, his paternal ancestors both in Connecticut and Massachusetts being of the most valuable type of citizenship, while, through his mother, he traced his ancestry up to Roger Williams. His early school life, in which he was put to the regulation task of committing school books to memory, including the English and Latin grammar, at once stimulated this useful faculty and filled him with a profound disgust for the mechanical methods which then held sway in all dealings with the humanities. He soon found his way out of this mental prison house into the open highway of literature, mathematics, and the study of modern languages. He graduated at the age of 19 from Yale College, not only with the highest class honors but with a reputation already gained for scholarship in more than one line of acquisition.

After two years engaged in teaching in Hartford, Conn., he was appointed to a tutorship in Yale at the age of 21, where he remained a year. Meanwhile he had published a number of school books on arithmetic, edited a treatise on conic sections, and valuable writings upon the languages of Europe, with all of which, except the Slavonic, he became familiar. He was for a time connected with the asylum for the deaf and dumb in Hartford, Conn., and afterwards in New York, and there pursued with great interest his investigations on the line of the natural methods of instruction and metaphysics. He had also developed a talent for journalism, which he followed all his life, and became a skillful, practical printer by working at off hours in school and college. A treatise on grammar was a part of his versatile authorship.

In 1837, at the age of 28, Dr. Barnard had the call to "go South," which at this early period came to so many of the superior young men from the Northern States, to positions in the rising colleges of that section. His first service was in the University of Alabama, in the city of Tuscaloosa. He appeared before the legislature of Virginia, at Richmond, on his way southward and, largely through his efforts, the establishment of the present asylum for the deaf and dumb at Staunton, Va., was greatly furthered. At the new University of Alabama his teaching soon became conspicuous. He published the Alabama Almanac in 1839, and for several years edited a series of journals and periodicals. He became widely known as a popular lecturer on subjects connected with the higher educational institutions, and showed his growing appreciation of the superior schooling of young women by inviting the pupils of the Tuscaloosa Female Seminary and the ladies of the city to his lectures in the university.

In 1846 Dr. Barnard was placed on the commission to run the boundary line between Alabama and Florida. In 1848 he occupied the chair of chemistry in the university and reconstructed the scheme of instruction in that department. One of his most conspicuous services to the university was his appointment to examine and report on the proposition to substitute the system of elective studies pursued in the University of Virginia for that already in operation in his own university. His arguments against this scheme, which has captured so many of the higher institutions of the South, although they did not prevent a three-years' experiment with the method in the University of Alabama, were fully justified by the result. In a series of letters to Hon. A. B. Meek, of Mobile, Professor Barnard outlined in full the advanced ideas of college discipline which are now being adopted by many of the leading institutions in the country. His idea was that the troubles in college disci-

pline are chiefly owing to the artificial separation of the students, in distinction from the ordinary notions of good breeding, and the making of college life a charmed preserve within which the crudeness of youth can be vaunted in grand contempt of the outside world. As a vital part of this condition was the notion that an institution of learning should be established in a wilderness, or isolated from the general life of the community in a town. His final service to Alabama was in connection with the first geological survey of the State—to point out the great value of the enormous mineral deposits and urge the importance of railroad connections for their development.

So it was not as a tyro, but as a coming man at home and abroad, that Dr. Barnard came to the new University of Mississippi in the eighth year from its establishment. The vigorous administration of President Longstreet had overcome the difficulty of student insubordination, and the institution was ready for his great executive power in the proper development of the higher education. He first came in 1854 as professor of mathematics and natural philosophy. At the outset he was confronted by a deficiency in the means for the prosecution of scientific and mathematical studies which had already prevented the acceptance of a call to this position by other eminent men. He prepared a memorial to the legislature setting forth the importance to the university of this department, followed by an address to the fathers of the State, which secured an appropriation of \$20,000 a year for five years.

So well was this sum applied that, on assuming the chair of the presidency in 1856, the university in general respects was fully abreast of the better sort of colleges in the Union. His address to the graduating class of 1856 on "the relation which exists between the education of the university and the common schools" was one of the most notable deliverances by any high university official in the Southern States in behalf of the struggling cause of general education as applied to the necessities of the white people of the Commonwealth, and especially was it valuable in connection with the effort to make a success of the new common-school system in Mississippi, already under fire from the hostility of its enemies and the general apathy—still everywhere the deadliest foe of the people's common school. He also developed at length, in a pamphlet widely read, his idea of the organization of a proper university; on the one hand providing for a college course as the foundation of specialties in the direction of practical industries, and showing that the schooling of a "business" or trade seminary could not fill the place of a proper post-graduate course, which would furnish the country with the captains of industry to lead the grand army of intelligent workmen, armed with the mighty forces of labor-saving machinery of the new age.

In connection with these valuable labors President Barnard instituted important reforms in the conduct of college affairs, to relieve the overwork of the professors by the appointment of four tutors, and generally to introduce methods in the administration. All this time the institution was running the gauntlet of a perpetual assault on the soundness of its religious faith by leaders of the different churches. The president himself had been consecrated by a bishop of the Protestant Episcopal Church and during his presidency with great acceptance had served as rector and pastor in the village church of that denomination. But this did not lessen the force of the violent attacks on his religious and moral character, especially by certain incompetent professors displaced by his influence. The governor of the State was made the chairman of the board of trustees of the university, and in 1859 the title of the chief executive official was changed from president to chancellor. A proposition that the university should be included in the plan of a series of observations connected with meteorology of capital importance was favorably received and the preparations already made; as was also a contract for the building of a great astronomical telescope by Alvan Clark, of Cambridge, Mass. All these plans were suspended by the breaking out of the civil war.

The development of this broad policy of Chancellor Barnard, under favorable con-

ditions, promised to lift the University of Mississippi to the front of the State universities of the South. But all went down in defeat at the coming on of the great civil war. The news of the fall of Fort Sumter found a military company, "The University Greys," organized and drilled and demanding from the governor of the State the opportunity to be mustered into the Confederate service. Contrary to the advice of Professor (afterwards Senator and United States Justice) Lamar and Confederate President Jefferson Davis, who wisely demurred to this early destruction of "the seed corn of the Confederacy," the permission was given. After satisfying himself that the parents of the students generally approved of this conduct, Chancellor Barnard resigned himself to the inevitable course of events. The student company was ordered to Virginia and saw active service in the first battle of Manassas, and Professor Lamar was elected a lieutenant-colonel in the Confederate army. The university, practically dissolved by the departure of the majority of the students, was finally suspended by the resignation of Chancellor Barnard and the faculty, save two of the professors, who remained on the ground and conducted a high school during the war. The buildings and estate were used for hospital purposes by the Confederate, and at the close of the war passed into the charge of the Union forces. By the faithful efforts of Professor Hilgard, State geologist, the majority of the valuable instruments and the library were saved. The trustees, in their report to the legislature, declared that at no period had the university been in a condition of such prosperity with the most flattering expectations for the future as when it was submerged by the rising flood of civil war.

The subsequent history of the university and the distinguished career of its great chancellor, Dr. Barnard, especially as president of Columbia College and University, New York, which, under his powerful administration rose to its present eminence, belongs to the educational record of the country after the return of peace in 1865. The war also swept down the majority of the academical and collegiate schools then existing in the State, including the already discarded experiment of the State common schools, not to be renewed until 1868-1870.

For the establishment and support of the University of Mississippi, from 1846 until its suspension at the outbreak of the civil war in 1862, the State had expended the sum of \$480,000. In 1854 a chair of "governmental science and law" had been established with Dr. William F. Stearns, and afterwards Hon. L. Q. C. Lamar, as professors, and a class was formed of 7 in 1854 and 28 in 1859.

In 1848 the seminary fund in the control of the State was \$200,000, on which the legislature returned an annual interest of 6 per cent, with the addition of \$2,000 for the support of the department of law. Another annual appropriation of \$20,000 for a period of five years for improvements and deficiencies was made in 1856; of which \$80,000 was used for the library, observatory, chemistry, and apparatus, the latter being declared by experts "the most perfect in its arrangements and appointments then existing in the Union," and the library containing 4,000 volumes. The cabinet of minerals was also declared one of the best in the country. For all these superiorities the university was greatly indebted to the administration of Chancellor Barnard. In all that pertained to the study of the natural sciences at that period in American colleges the furnishing of the university seems to have been well up to the highest standard. But the State held back in the reparation of the great losses brought upon the seminary fund from the inexperience and mismanagement of its legislature. Governor McRae, in 1856, declared that the sum due the university from its original fund by the State was \$874,000 instead of \$200,000. The latter sum, made up from the fragments saved from the general wreck, was paid into the treasury in cash. In 1880 the legislature of the State by formal act assumed the lost seminary fund as a State obligation to the extent of \$544,000, and ordered the payment of 6 per cent interest. This arrangement first gave the university a permanent reliable working fund of \$32,643 annually. Every senatorial district in the State was allowed to send

a student free to the university and all young men preparing for the Christian ministry and all students unable to pay tuition were received without charge, with a pledge that the name of the beneficiary should be held in profound secrecy. During the ten years previous to 1859, 241 in the department of liberal arts and 34 in the department of law had been graduated. The attendance had risen from 80 in 1849 to 168 in 1859. The years 1856 and 1857 had seen 233 and 264 in attendance, the subsequent falling off being attributed to the establishment of two denominational colleges, in 1857, within 50 miles of the university and the withdrawal of students representing the religious bodies to which those colleges belonged from the State institution.

The State feeling that prompted this movement had been rudely strained by an acrimonious debate on the choice of the first faculty, on a motion by two trustees that no clergyman should be eligible to a position as teacher, and no department of instruction including the subject of religion should be established. Although the motion did not prevail, it did awaken the activity of the different religious bodies in the State to push the work of building up, each, a rival college to the State University.

Among the faculty and teachers of the University of Mississippi at this period were several gentlemen afterwards of local and national distinction, among whom were Judge Alexander M. Clayton; Hon. Joseph Thompson; President A. B. Longstreet, of native parentage, though born in Augusta, Ga.; Chancellor Frederick A. P. Barnard, and Prof. (afterwards United States Senator and Justice of the Supreme Court of the United States) L. Q. C. Lamar. Subsequent to the reorganization in 1865 it enjoyed the presidency of John N. Waddel, Gen. Alexander P. Stewart, and Edward Mayes, the accomplished author of the valuable circular of information of the United States Bureau of Education, the *History of Education in Mississippi*, to which acknowledgment is here made for essential aid in the preparation of the present essay.

Some ten years after the establishment of the State University the first movement was made in favor of a similar opportunity for the higher education of the young women of Mississippi. Miss Reneau, a native of Mississippi and a resident of Grenada, in 1856 caused to be presented to the legislature a memorial praying for the establishment of a chartered State college for girls. The indorsement of Governor McRae and the importance of the subject carried a bill through the legislature in 1856, with a selection of Yalabusha County as its site. The scheme failed for lack of any endowment. Three times afterwards did this enthusiastic lady renew the effort, once in the form of a bill for a Congressional endowment of the college by 500,000 acres of land. No action being secured for the scheme, the persistent Miss Reneau again attempted to revive it, in the form of a female department of the University of Mississippi, in 1872. In this form it again passed the legislature, but with the fatal provision that all action of the State should be conditional on the favorable action of Congress. This not being secured, the scheme again fell to the ground, to be finally resumed by the passage of another bill, in 1873, incorporating "The Reneau University of Mississippi." This college, on paper, was never born into the world of mortal existence, for lack of funds. The persistent pioneer removed to the State of Tennessee, where she spent her life.

But her idea lived and in 1879 was taken up by Mrs. Annie Coleman Peyton. After a protracted campaign of five years the present industrial institute and college for white girls was established at Columbus, in 1884. This institution, which aims at concentrating in one great school the academical, industrial, and normal training of girls, at the expense and under the supervision of the State, was one of the most notable results of the great revival of popular education in the South since the close of the civil war. It has succeeded under great difficulties in Mississippi, and has already been adopted on a larger scale by the States of Georgia, Alabama, South and North Carolina, and will doubtless become a permanent feature in the educa-

tional life of the State. In 1890 the State and the city of Columbus had expended upon this institution the sum of \$245,000. The attendance had been as large from the first as the capacity of the buildings and the town would justify, from 341 in 1885-86 to 312 in 1889-90.

A few sporadic schools in Mississippi, from the year 1803, had been supported by the sixteenth section national gifts of land and, from the year 1821, to some extent, schools had existed by provision of the literary fund. But the State owed its first serious attempt to provide for the general schooling of its white children and youth to the same indefatigable friend of the people's education as had initiated the movement in 1844 for the State University. Governor A. G. Brown was one of the rare class of public men who do not content themselves with the intermittent or even eloquent patronage of popular education in an official document, whose chief value lies in its adaptation for use on the stump or by the press in the engineering of a hotly contested election. He spoke out and spoke again. Previous to his first election as governor of the State he issued an address to the people of Mississippi urging the necessity of a good system of schools which should "give to every white child, free of charge, the advantages of a liberal education." In his inaugural address, in 1844, he dilated at length on the same necessity. Not discouraged by the indifference of the legislature, he issued to the presidents of the boards of police in different counties a letter of inquiry concerning the use made of the sixteenth section school lands. He was supported by Judge Thatcher, a native of Boston., Mass., who addressed a letter to the governor on the same topic. He forced the scheme of general education into the platform of both political parties and was elected a second time on the Democratic ticket, with a full understanding of his great interest in the cause. The result was the act of 1846, which, for the first time, attempted the establishment of a uniform system of common schools in Mississippi.

The law provided that a board of five commissioners for each county should be appointed by the board of county police, one for each police district. This board had power to designate certain schools as "common", with a general supervision over them, and to license teachers whose salaries were to be paid from the county school fund. The boards of police could also lay a special tax for common schools, by the consent of a majority of the resident heads of families given in writing. The county school fund was to consist of several taxes received from a variety of sources, among which were liquor saloons, peddlers, etc. The school commissioners were intrusted with the general management of the sixteenth section school lands in behalf of the different townships and were required to make an annual report to the secretary of state, who was, *ex officio*, State commissioner of common schools.

But the scheme was weighted by the fatal defect of so much of the original Southern public-school legislation; its permissive character. Any township that had a larger portion of the school lands than its neighbor would refuse to go into a general county union of funds. The heads of families could control the taxing power of the county, if disposed. The governor, in his last term of office, recognized the partial failure of the law and proposed its repeal, with the substitution of a more vigorous statute and the addition of a State normal school for the training of teachers of both sexes. He was taken away to Washington as a member of Congress, and the legislature "ran wild" in the passage of four additional laws, fashioned to meet the special wants of different portions of the State, represented by 5, 6, 7, and 17 counties, the remaining 35 counties going on under the law of 1846. In 1849 the auditor of the State made a report to the legislature to the effect that already in some counties schools were established. The State was in a fever of excitement over the rapid immigration that had increased the population to 600,000. In 1848 there were 2,540 children between 6 and 20 attending the common schools, 1,300 of them in the city of Columbus, 47 denominational and 11 private academies reporting. The secretary, in 1851, reports that owing to the lack of special and local statistics the law pro-

viding for a general system of common schools was virtually repealed. "Indeed it is difficult to tell what the law is." He was able to report only for 13 counties. He concludes by saying: "It is not so much my purpose to make a report upon schools as to show why I have not done it."

From this date to 1859-60 the legislative tables groaned under the succession of educational bills for the benefit of different localities of the State, the legislature of 1859 and 1860 having passed more than 26 statutes of this sort. The result of the movement from 1846 to 1860 was practically the building up of academies in several quarters of the State and a miscellaneous "keeping the movement before the people." But for all "aid and comfort" to popular education, it was little but a noisy and confusing "thundering in the index" preparatory to a rational scheme for the education of the children and youth. All this was going on in connection with a good deal of private, parochial, and neighborhood schooling. Between the years 1850 and 1860 35 academies and colleges were chartered in the State.

The governors still kept up their urgent plea for better things. Governor Matthews in 1850 declared that the common school system adopted in 1846, "if not a total failure, has fallen short of the expectation of its friends." He recommends, "after ascertaining what available revenues we possess, to supply any deficit that may be required to carry out a general system of common school education by a tax upon the persons and property of all the citizens of the State."

Gov. John A. Quitman in 1851 returned to the subject and urges "the adoption as early as possible of an effectual common school system." In 1858 Governor McWillie proposes that "a State superintendent of schools be appointed to traverse the State and find out what is being done, and that all appropriations be suspended until this information can be obtained." He reminds the people that "we have expended hundreds of thousands of dollars for the benefit of thieves and murderers in the management of a penitentiary. Let the money of the State be expended in the education of the people, and it will be a better appropriation and prevent more crime than such institutions."

The only reply to these earnest reminders of neglected duty was the increased scattering fire of local statutes, passed evidently at the instigation of any representative of a locality which desired some peculiar and charitable arrangement for deciding on some plan for "not doing it." Much, however, should be attributed to the growing excitement in the field of national politics. The leading public men of the State were dominated by this absorbing question, every year, like a threatening cloud, drifting nearer and nearer. The majority of the legislature were in no state of mind to attempt the construction of a complete system of universal education in the face of a wasted school fund and the general opposition to taxation for any purpose. Thus, while the families of the upper class in this way—by home, private, and denominational schools—supplied their own educational wants, and the lower class of illiterate white people did not care for more than their own supply of learning for their children, the burning zeal of every religious sect to gather its own share of public patronage for its own system of academies and colleges, with the exasperation of a class of agitators against the use of all Northern schoolbooks and the employment of Northern teachers, and a state of society in which every man and every neighborhood seemed to be living independently, and all concerted action of a community gave place to a morbid and implacable assertion of personal and local independence, it was impossible that the American common school could find its home in the Mississippi of a generation ago.

It was not until 1867, at the end of this bitter experience of school life, that the educational public lifted its head and began, amid the tumults and exacerbations of the period of reconstruction, to lay the foundations of what at present—thirty years later—is at last assuming the form and substance of an effective system of public instruction for all orders and conditions of people in this Commonwealth.

KENTUCKY.

The history of education in Kentucky, from its first recognized existence as the great "all-out-of-doors" west of old Virginia, in 1780, to the full establishment of a system of common school education founded on a permanent school fund in 1850, is the record of a prolonged conflict between the friends of popular education and the scholastic ideals of the mother State, which held on a full quarter of a century at home after the lusty daughter of the Old Dominion had given in her adherence to the common school, in 1840. The upshot of this prolonged warfare, with its occasional triumphs and discouraging reverses, was the establishment, in 1837-38, of a common school fund, by appropriation of \$850,000 of the \$1,433,750 which was Kentucky's portion of the United States surplus revenue distributed to the States in 1836. The school law of Kentucky in 1838 proposed to establish a common school in every district of the Commonwealth subsidized from the income of the school fund, conditioned on the building of a schoolhouse and the imposing of a local tax for its support. Rev. Joseph J. Bullock, as superintendent of public instruction, opened the campaign of the children's war, which was only closed by the decisive victory for the cause of public instruction in 1850.

In this memorable "campaign of education," extending through a generation, from 1821 to 1850, one of the most notable results was the production of an educational literature not inferior to any that had appeared at that period in the Southern States, and entitled to an honorable mention in the history of the great movement, with its splendid development of leadership, in the older Commonwealth.

The messages of Gov. Gabriel Slaughter for 1816-17 were a veritable "Gabriel's trump," to summon the friends of the children and youth to the assault upon the illiteracy that was already invading the masses of the people in Kentucky. He advocated a scheme of popular education which would "shoot" the light of knowledge in at the door of every log cabin among the mountains and every plantation mansion of the blue grass country or city home in Lexington, then the literary center of the new West.

In the debates concerning the appropriation of the new literary fund to the two colleges of the State, Mr. Robert B. McAfee distinguished himself by an eloquent testimonial to the series of educated men in the history of the new Commonwealth, that might to-day be used with profit as a theme of declamation by the school boys and girls of Kentucky.

Gov. Thomas Metcalf urged, with great force, a public provision for the education of the girls and young women of the State; especially appropriate in a Commonwealth which had been honored by the services of Mrs. Jane Coombs, its first teacher, at Harrodsburg, in 1775. Under his administration a strong legislative report was made on the subject of an additional distribution of public school lands to other than the new States of the Northwest; responded to by Maryland and New Hampshire and Georgia, but with no immediate result.

Among these legislative documents on the subject of popular education, one of the most interesting was the report of a committee appointed to examine the systems of common schooling in the different States of the Union, with the view of recommending a suitable plan for home use in 1821. The chairman of the committee was Mr. W. T. Barry, then at the beginning of an eminent public career as judge of the highest courts of his own State, United States Senator, and a member of the Cabinet. This document has been justly named, by a historian of Kentucky, "one of the greatest State papers of the Commonwealth." Judge Barry is perhaps the most distinguished of the long list of the public men of Kentucky during the entire generation before the civil war who gave his influence to the unpopular cause of a system of common school education worthy of a rising Commonwealth always noted for its lofty claim of national distinction; an example, unfortunately, not imitated by too

many of the most noted leaders of political parties, whose embittered personal and public contests have been one of the chief misfortunes of the State.

The committee had, with great pains, obtained information of the public school systems of the leading States of the Union, and their description of them is among the most valuable portions of the report. But the plain and powerful manner in which the whole question of the people's right to education was put in this admirable paper leaves the reader to marvel that the system proposed by the writer did not at once conquer prejudice, awaken indifference, and move the legislature to immediate action. Undoubtedly it produced its effect, but, like many a great public deliverance, it was an educational projectile that woke the echoes above the head of the generation at which it was aimed, only to strike with powerful impact upon the children of the fathers who had underrated its proper significance.

One of the most interesting features of this report is a series of letters received from eminent gentlemen of other States, including ex-Presidents Adams, Madison, and Jefferson; Gov. Robert Y. Hayne, of South Carolina; Mr. William Duane, of Philadelphia, and others. In his communication to Judge Barry, James Madison made the oft-quoted remark, "A popular government without popular information or the means of acquiring it is but a prologue to a farce or a tragedy, or probably both. Knowledge will ever govern ignorance; and a people who mean to be their own governors must arm themselves with the power that knowledge gives."

John Adams, although "at present blind and paralytic," wakes from his lethargy to compliment "the wisdom and generosity of your legislature in making liberal appropriations in money for the benefit of schools, academies, colleges, and the university; an equal honor to them and their constituents; a proof of their veneration for literature and science, and a portent of great and lasting good to North and South America, and to the world—great is truth; great is liberty, and great is humanity, and they must and will prevail."

Col. F. W. Parker, the well-known school man, formerly of Quincy, Mass., will be happy to recognize his beloved constituency in this letter of John Adams, written in 1822: "In this small town of Quincy, consisting of not more than 1,400 inhabitants, I think they voted this year \$1,700 for the support of schools—more than one dollar a head for every man, woman and child in the place. The central public school pours out of its doors at 12 o'clock every day from 100 to 200 boys and girls, as happy as Scott or Shenstone has described them and their masters in their works. There are not less than four or five schools kept by women in different parts of the town for children of both sexes too young to be able to travel to the central school." The Adams family has kept its hand on the old town, now the city of Quincy, even till this day; and until a very recent date the Adams Academy, established by a fund by both the ex-Presidents of that name, was taught by the son of Edward Everett.

Thomas Jefferson also, "bending under the weight of age, debility, and on account of a dislocated, lame, and stiffened wrist, making writing slow and painful," replies not in as happy a frame of mind as his old friend and opponent, Adams. He sits up at Monticello, evidently smarting under the rebuff from his own State, which rewards a generation of labor lasting through his official life by a beggarly pittance of \$45,000 per year for general education. He writes of this Virginia plan: "After costing us to this day \$180,000, if a single boy has received the elements of a common education, it must be in some part of the State unknown to me."

William Johnson, Henry W. De Saussure, and Robert Y. Hayne reply for South Carolina. All seem ill at ease at what they feel compelled to communicate concerning the public schools of their State costing twice as much per capita as those of Massachusetts, while "exclusively confined to the poorer class of citizens."

The longest reply is from the pen of Mr. William Duane, a distinguished lawyer and friend of education in Philadelphia, who drew the will that established Girard College in that city. This is the only communication that attempts to discuss the

prevailing methods of education. Mr. Duane, after giving the most favorable account possible of the imperfect system of public education in Pennsylvania, is outspoken, first, in his contempt for the Lancasterian or the Monitor system of instruction that was running its course as the most conspicuous educational "fad" of that generation. He says: "The public schools of Pennsylvania are inefficient and not worthy of your attention." He scorns the popular method of instruction as one that confines its impressions to the mere accumulation of words and appears to leave out of view the only important part of education, that of arranging and comprehending ideas or discriminating among facts. "Its chief recommendation," he declares, "is its cheapness." He sums up the whole case by the declaration, "In my own opinion the prevailing systems of education are all wrong from the first to the last stage. There is only one system of education in existence fit for a country that is free or for a people to whose institutions knowledge is essential in an age when knowledge is power and ignorance is weakness." That system he indicates as the natural method of Pestalozzi. After giving a brief description of the great reformer he says: "There is one school for girls taught in Philadelphia by Madam Fitegeat, a disciple of Pestalozzi." He also informs the committee that Joseph Neff, a Swiss educator and a coadjutor of Pestalozzi, was then living on a small farm near Frankfort, Ky. He urges the friends of educational reform to send their sons to him as a sort of normal or model school for the State. He also speaks of West Point and the military academy of Captain Partridge in Vermont as worthy of notice. Says Mr. Duane: "In presenting this system to your attention I am offering to you an opportunity to do honor to your State, your country, and human nature." The natural method of instruction thus commended in the day of its obscurity is now the basis of all successful teaching in this and every civilized land. The fact that a circular sent by the same committee to numerous distinguished people in their own State, soliciting information concerning the condition of education in their neighborhood, was treated with almost absolute neglect, explains somewhat the indifference of the legislature to the powerful appeal of this, one of the most notable documents connected with the history of education ever issued in Kentucky or the South.

Nearly ten years had passed before the people of Kentucky were again addressed by a report of the committee on education of the House of Representatives, in response to a governor's message in relation to schools and seminaries of learning. The well-worn copy of this document before us is one of its second edition of 2,000 copies. The committee, through Mr. Charles S. Morehead, its chairman, makes an earnest and pertinent appeal to the legislature. It refers to the report of the auditor of the State, concerning the educational situation; that from more than half the counties there had been no returns concerning educational affairs. From 8 counties there were reports only of the number of the children. From 34 there is also a statement of the number at school, pronounced "unreliable." Such as it is, the record shows that in 34 counties there were 51,000 children, with 11,000 at school. The committee state that "not more than one-third of the aggregate number of children are in school." Whether this refers to one-third of all between 5 or 6 and 21 we are not informed. The reluctance to move in popular education is ascribed, among other causes common to all new States, especially to the fact that "much the larger portion of the population of Kentucky is derived from Virginia, where the efforts in behalf of this subject have been signally unsuccessful." The literary fund, established in 1821, had increased to \$141,000, with an annual income of only \$8,450. In the lack of any effective support for the system, the committee recommend a permissive scheme of local taxation for schools, and with feeble logic attempt to persuade the legislature of the superior economy of a common-school system. Transylvania University was just then in want, and the plea for State aid by a loan from the literary fund is well put.

But the most inviting portion of this report is a letter from Rev. Benjamin O.

Peers, a clergyman of the Protestant Episcopal Church, principal of a classical school in Lexington, and afterwards for two years president of Transylvania University, who was requested by the legislature to communicate any information in his power on the general subject of common schools. Mr. Peers had not only read and reflected upon, but, probably beyond any man then in Kentucky, had actually seen the common-school systems then in operation in the different States. The committee of the legislature had included in the invitation Rev. Alva Woods, late president of Transylvania University. Mr. Peers had visited the schools of all the New England and Middle States, including Maryland, Virginia, and Ohio. Several of these States he finds stand for the fundamental idea of the common school; that the property of the State should educate the children of the State for good citizenship. The methods of applying this common idea are reduced to three. First, of Massachusetts; second, of Connecticut; third, of New York. In all these the State only attempts to support the teachers; the school books, school-houses, fuel, and incidental expenses are matters of local or private concern. In Connecticut the means of school support are derived from a large fund, in Massachusetts exclusively by taxation, in New York from a fund and taxation united.

The writer proceeds to give a clear and interesting résumé of the different systems of public schools in these three States, preferring for the use of Kentucky that of New York, in which the Commonwealth, through the distribution of a moderate school fund, stimulates the people of every school district to local taxation. He touches on the radical features of the case by showing the willingness of the people to submit to taxation for education, as noted in the State of Massachusetts, which seems to be a satisfactory arrangement to the people of that State.

He sees clearly the defects from the undue multiplication of schools in New England and New York, and the consequent cheapening of the occupation of teaching. But he does injustice to the schools by forgetting that the same popular reverence for learning that has built up and supported a system of general education for 150 years in New England has attached to the office of teacher a respect similar to that of the clergyman. Teaching, certainly in its higher grades, was always regarded in New England as one of the "liberal professions," whose compensation is found not so much in the money received as the regard of the people for the instructors of their children. The rate of compensation in Connecticut, New York, and Massachusetts, as to the average wages of the country teacher, was generally supplemented by board, and was not especially different from the salaries of other professional men; the country parson, even when minister of the entire population, being regarded as "passing rich" on \$400 a year. He rightly declares this cheapening the common school destructive to the one object of educating the rich and poor children together, since the former will invariably abandon the public schools. He represents the public schools of Boston as "the pride of that literary capital and the acknowledged models for the Union." Another defect is the great variety of school books tolerated in the majority of the schools. All these points are well taken, and with the exception noted above concerning the teachers, were in 1830 a warning to all States proposing for the first time to "create" a system of public instruction.

The four conclusions drawn from this examination were:

- (1) The necessity of legislative action.
- (2) The division of the State into school districts.
- (3) The danger of relying on a large school fund, as demonstrated in the State of Connecticut, and the great advantage of stimulating local taxation by the distribution of a moderate State subsidy, dependent on the corresponding action of the district.
- (4) "That nothing whatever can be advanced by legislation unless the people be personally and permanently interested." Here the report touches the vital point in the educational habit of this great State; the slow development through half a century, of the disposition to raise funds sufficient for the education of the children and youth

among the masses even of the white people of the State. The public sentiment underlying the common schools of New England was truly named "An inheritance from the past. It was started and cherished by the religion of the Puritans." The funds appropriated by the State for education did not seem oppressive; "not being exacted from the people, the schools were established, sustained, and supervised by the people." The report also exposes the mistake of intrusting the administration of "the paper system" to the ordinary executive officials of the State and locality, with no regard to their interest in the cause. It notes the fact that the town of Northampton, Mass., furnished not one pupil to the celebrated Round Hill School, established by George Bancroft, then known through the Union. It urges a system of training competent teachers. It suggests the publication by the State of a well-selected set of schoolbooks and a "public library placed in every log schoolhouse," and adds, "Would to heaven we had in Kentucky, or even in the Union some Brougham who would give to that mighty agency—the press—its appropriate use." May it not have been in response to such petitions going up to the God of Light all over the Republic seventy years ago that a Horace Mann, a Henry Barnard, and the glorious company of educational reformers, led by these great captains of the grand army of the children and youth, appeared even while the petitioners were "lifting their eyes up to the hills" for hope and strength? The report also dilates on the advantage of teaching the children the facts of civil government.

A collection of letters from distinguished literary and public men of the North and East shows with what eager interest this movement for universal education in Kentucky was watched by the foremost people of the Union.

The immediate result of this report—one of the ablest and most instructive as a document for public distribution ever presented to the people of a new American State—was the passage of one of those permissive school laws which, for half a century, were the despair of Southern educational progress. The State was arbitrarily divided into school districts, by the carving of the counties into irregular tracts of the open country containing a sufficient population, and each of these artificial communities was permitted to decide for itself whether it would be taxed for a system of common schools, with the almost imperceptible stimulant of the pittance received from a literary fund, whose entire sum for the Commonwealth did not amount to \$10,000. The result was exactly discounted by the enemies of the cause from the beginning. Not a school district acted under this permission, and the "system" fell from the press like a scrap of official waste paper.

But the spirit that animated such declarations as have been noted was not to be daunted by another failure. It was six years before the opportunity came of striking for a new effort. It appeared in the distribution of the national surplus revenue, in 1836, among the different States. The historians of Kentucky appear to think that the previous agitation, inaugurated by Maryland and especially favored by Kentucky, for a more equable distribution of the national domain for education, especially among the original thirteen and the additional States of Kentucky and Tennessee, was responsible for this action by Congress. However this may be, that the indirect appropriation of the only two distributions ever made to the establishment of a common school fund in many of the States was in some way connected with this movement can not be doubted. The common-school public in Kentucky at once "took time by the forelock," and evidently before the hostile element was organized for action pushed through the legislature the school law of 1838. This law was approved February 16, 1838, and on the 20th of March Rev. Joseph J. Bullock, a brother of Judge William Bullock, who was an influential actor in the passage of the statute, was appointed first superintendent of public schools in Kentucky.

The law thus presented to the people was an elaborate statute, containing nine provisions. The first appropriated the interest of \$850,000 of the \$1,114,000 already

received from the surplus revenue distribution, and all additional sums that might be specified, as a common school fund, with a provision that \$150,000 more should be so applied, if the fourth installment of the national distribution should be received. Here was scored the first victory of the opposition—in cutting away more than a quarter of a million of dollars from the entire amount.

A State board of education was established, consisting of the secretary of state, the attorney-general, and the superintendent of public instruction, who should be nominated by the governor and approved by the senate. To this board was intrusted the management of all the public-school funds of the State, and it was a corporation subject only to the legislative power of alteration and amendment. The superintendent of schools was to be appointed for two years, at a salary of \$1,000 per annum. He was intrusted with all matters generally assigned to that official in the public-school States of the Union. Besides the general supervision of the school system, he was also, "with the advice and consent" of the board of education, empowered to make the proper distribution of the State fund to the counties and the different school districts.

The board of education was also authorized to appoint five commissioners of schools in each county, who were intrusted with the entire supervision of public education. By their direction, the county courts were to attend to the proper division of the counties into school districts, each district to contain not less than 30 nor more than 100 school children between the ages of 7 and 17. Also to make arrangements for the legal voters in all the school districts to vote on the question of accepting the new system, which included the duty of providing a schoolhouse, with incidentals, and supplementing the small public gift by a tax sufficient to support the common school. In case the district accepted, the commissioners of each county were burdened with several obligations, to see that the voters of each district were charged to elect five school trustees, and to raise a tax for the support of the schools. These five trustees were required to furnish a proper school building or room, to hire teachers, fix their salaries and pay their wages; in fact, to assume the legal supervision of the schools and make yearly reports to the county commissioners.

This board of five county commissioners was weighted with a great burden, being, indeed, the motive power of the entire system. Appointed by the State board and working without salary, it was expected to perform an amount of labor which, in the condition of public opinion among its constituents, was little less than placing upon each member, during his official year, a work demanding all his time and requiring the service of an expert in public affairs. The commissioners were expected to supervise the division of the county into school districts and the election of teachers in each of them; to receive, be responsible for and appropriate all the State school moneys among the districts; to make full reports to the State board, based upon the reports of the local trustees, including a large amount of detailed inspection; to be responsible for all loss of public-school funds attributable to their own neglect or maladministration; and to examine all teachers. The persons chosen as trustees were compelled to accept and act, on penalty of a fine of \$5 or \$10, and could not resign except by permission of their own board. One of the provisions of the law, possibly the first in the school legislation of the Republic, was the privilege of voting granted to every widow or maiden assessed for taxation, and every minor possessed of property could vote by himself or his guardian. All lands belonging to bank corporations were subject to the school tax, and the corporation could vote by its agents in school elections. A clause in favor of those districts in a county which adopted the system provided that, in case of a refusal to act for five years, the portion of the school money not used should be passed over to them. The cities of Louisville and Lexington, having already established systems of schools, were excluded from the general provisions of the act.

It is easy to see at a glance that, although this school law might become a valuable agency for educating the people of the State into a proper school public, it contained in itself the possibilities of the conflict that involved the Commonwealth through the ensuing eighteen years in one of the most intense and bitter wars through which the American common school has achieved a final triumph in any American commonwealth. It attempted at once the New England system of dividing the State into school districts; in Kentucky and the South a purely artificial division of territory, based on the number of children, in one case including the area of half a dozen towns in Connecticut or Massachusetts, and impossible in any populous village or city. It required such a mass of local legislation and political responsibility as had never before been known in the States where the county is the unit of government. So, while doubtless valuable as an education into the habit of the local administration of public affairs, it ran counter to all the public habits of the people and at once aroused the jealousy and opposition of the "court-house ring" that was always the center of public affairs in the county.

The appointment of the county school commissioners by the State board of education removed the county and State boards from popular sympathy and gave the appearance more of a law imposed upon the "free and independent" people of the county, with very large powers of manipulation and direction in the most important matters concerning the schooling of the children. The commissioners were compelled to work without pay and to perform an amount of labor and complicated public business in the face of an unsympathetic constituency that might challenge the courage and patience even of a friend and would appall any man inexperienced in or hostile to the common school.

It was inevitable that such an arrangement would be, except under especial conditions, an unwieldy and ineffectual machine. The fatal weakness of the permissive system was, in itself, a sufficient cause of its destruction. In view of the great amount of public indifference and opposition, it left any district of a county at liberty to reject the proffered gift of public money and continue in its old situation of public illiteracy. Besides the defect of the New England system noted by Mr. Peers, the endless subdivision of the State into little districts would open the way for mischievous personal influences, especially in a country where such influences were dominant and too often interested to avoid taxation. In this, as in the law of 1830, we may almost charge the opponents of the system with the policy of secretly leaving the overenthusiastic friends of the public school to pass a law that could not be enforced, anticipating the opportunity of destroying it by a series of attacks on every vital point, as was certainly attempted, with almost complete success, during the ensuing fifteen years.

The first State superintendent of public instruction, Mr. Joseph J. Bullock, assumed this important position on February 20, 1838, and was compelled, by failing health, to decline a further appointment at the end of his term of two years. In January, 1839, he made his only report, which covered a year's administration. This, like the previous reports of Barry and Peers, is a document of permanent value in the able and suggestive public-school literature of Kentucky, than which that of no American State more richly deserves a proper collection, edited and annotated, in a library of education, for the study of every teacher, school official, and intelligent voter in the country. Superintendent Bullock was no visionary educational enthusiast, who supposed that a "paper law" could establish a system of common schools in a State perhaps, in 1838, more under the influence of violent ecclesiastical and political partisanship than any in the Union. He fortified himself by extended reading of the best educational literature at home and abroad.

His first check was the difficulty of obtaining information concerning the work of the county commissioners. In many instances his letters were unanswered, and, except in the limited space that could be covered by a personal visit, it was

difficult to obtain any important information. At the end of the first year there were still ten counties where there had been no appointment of school commissioners. The correspondence of the office had already become a great burden. The superintendent touches the heart of the difficulty in the pregnant sentence: "It soon became evident to my mind that there was need for a public sentiment to be created in order to the success of the system." In the heroic attempt to "stump" the State in the cause he visited 20 counties and made numerous addresses, but was arrested by ill health. He comes to the conclusion that "great changes can not be effected at once." At the end of the first year only 13 of the counties had even reported the number of children between the ages of 7 and 17. In only one county had the commissioners complied with the request for information of the number of children of this age unable to read. But from a general understanding of the subject, the superintendent estimates that "at least one-third of the children of this, the school age, in the State, were unable to read, and had no means of common-school education, and unless something is done to remedy that evil this deficiency will soon be greater." In one of the most intelligent counties of the State not more than half the children were going to school, and it was not probable that two-thirds could read. The general verdict of all classes of public men in the State was to the effect that "one-third of our white population is entirely uneducated."

The fund set apart for common schools was \$850,000, with an income of \$65,978.27. During the first year only \$1,005.27 had been expended, the schools really not yet being in operation. The superintendent believes that the small sums thus distributed to the districts will not "act as an incentive to the people to tax themselves with a degree of energy which promises at present a movement for general education." He proposes a tax of one-third of a mill on the dollar of all the property in the State, and argues forcibly in favor of this policy, quoting the words of Edmund Burke: "Taxes for education are like vapors, which rise only to descend again to beautify and fertilize the earth." He suggests that for two or three years the annual income of the State school fund shall be paid to those districts which have accepted the system. The law should require the schools to be kept at least four months in the year. One dollar, instead of 50 cents, should be assessed as a poll tax.

In view of the great defects of ordinary teaching, the superintendent speaks of the normal school, and, under the conditions existing, proposes the utilizing of the colleges and academies of the State for the work. He urges that the State superintendent receive a salary sufficient to enable him to visit the different portions of the State and take counsel with the people on the great cause. He presses home, with irresistible logic, the economy of the public-school system to the State. In New England, New York, and Pennsylvania the average cost of educating a child is \$4, while in Kentucky it is \$20 per annum in private schools. In Boston \$10 furnishes better instruction for the children in public than \$20 in private schools. In New York the cost was \$6.50 in public and \$25 for private schools; in Cincinnati, \$6.40 for public and \$16 to \$36 for private schools, the average cost of private tuition in Ohio being in the city \$25 and in the country \$16. The entire white population in Kentucky in 1839 was 600,000, with 150,500 of school age (5 to 17). Half of these, 75,000, at private schools, at \$16 per capita, would cost \$1,000,000 per year. Thus the entire school population of Kentucky could be educated with no additional expense, simply by distributing the burden from individual caprice to the imposition of a tax on property. Only by such a policy could the office of teacher be made respectable. He contrasts the condition of the great European nations, England, Prussia, and France with Spain and Italy; summons the states of antiquity to the bar of investigation; notes the State of Massachusetts, which "expends to the amount of \$1,000,000 per annum in the shape of direct taxation for her common schools." He touches on the importance of public education as a prevention of pauperism and crime. "England expends more in prisons and charity than Prussia

for her common schools," in ten years expending in the transportation of criminals to Australia more than \$40,000,000.

The argument from sparseness of population was met by the fact that the 600,000 white people of Kentucky occupied an area of 40,500 square miles and were distributed in a way that every district of 16 square miles would contain 60 persons of school age, and the majority could have schools accessible to their homes. "If it is true that negro slavery is an enemy to popular education, let slavery be abolished." He quotes from the fathers of the country in favor of the right and duty of the State to educate. Chief Justice Marshall says: "I can not be more profoundly convinced than I am that virtue and intelligence are the basis of our independence, and the fundamental principle of national and individual happiness." He appeals to the State pride of Kentucky. "The whole civilized world seems to have been awakened from its slumbers, and the nations are combining in one mighty effort to spread light and knowledge among the people; and sad indeed will be the condition of the State that stands still and leaves the education of its people to chance and caprice." The present movement for internal improvements already in operation in the State, without corresponding enlightenment of the people, "will only expose our nakedness and degradation to the scorn and comment of visitors from all countries under the face of heaven."

Nothing but the limitation of space in this essay prevents the entire republication of this magnificent plea for the common schools to the people of Kentucky by Dr. Bullock, its first State superintendent of public instruction. It is significant that in this State the battle for the children was not to any considerable extent fought by its great public men; but rather by clergymen and laymen who spoke and worked for the masses of the white people, then but half converted to the gospel of universal education. There can be little doubt that the very absorption of the foremost public men of Kentucky in national politics, a natural result of the great political interest and influence of Virginia, emphasized by its position as the first new State of the Union beyond the Appalachian Mountain world, was largely responsible for this. And the dominating class of this period in the history of the State, the leading public men, the clergy, and the wealthy planters, took excellent care of that department of education in which their own sons were trained for the continued mastery of the commonwealth. At the time when, according to the statements of its great educational reformers, one-half the children of the State, 100,000, were out of school, there were 6 colleges in operation with 800 students, 100 additional receiving similar education out of the State, and 5,000 pupils in academical and private grammar schools. The State has paid dearly for its long discrimination of educational opportunity between the different classes of its people, as shown by the great number of men of high order of ability who left Kentucky in their youth, not only for the distant Southwest, but especially for all the great free States north of the Ohio and west of the Mississippi rivers.

The second State educational report, January, 1840, by Supt. H. H. Kavanaugh, afterward bishop in the Methodist Episcopal Church, emphasizes the urgent appeals of Superintendent Bullock. But the difficulties apprehended by the first head of the system now appeared in all their formidable proportions. Superintendent Kavanaugh is compelled to state that, two years after the passage of the school law of 1838, "the schools have nowhere, as yet, been put into operation under the sanction of the law. All the efforts of the Board of Education to ascertain the number of children in the several counties between the ages of 7 and 17 have hitherto proved abortive. Hence the superintendent has never been able to make an apportionment of the funds to the counties and the counties are not authorized by the law to go into operation until the apportionment is made." For this state of affairs the superintendent declares the people are not responsible. The question of public education has never been submitted to them. His experience, during a tour extending through a

year of his administration, demonstrated that when the masses of the people were properly informed concerning the subject their approval was practically unanimous, although want of organization and lack of familiarity with the subject generally left them almost helpless to carry out their desire. He states that the counties have often been prevented from the districting of the territory by the expense of making a complete survey, and because the agreement of two of the three judges is necessary to the accomplishment of the preliminary work.

The neglect of the commissioners was the most dangerous element in the failure. While 20 or 30 counties were ready to accept the law, the people really had no opportunity to vote, by the strange indifference or hostility of the official body to whom they looked for the action which should place them in communication with the State superintendent. The superintendent again brings forward the "astounding fact" of the great illiteracy in the State. At the end of ten years, after repeated efforts to obtain the facts on this subject from the commissioners, only three of the counties have responded; two of which report—one that not one-half and the other that not one-fourth of the children from 7 to 17 can read. So the entire machinery of the common school of the State still awaited the movement of the commissioners appointed by the State board before the public school could be more than "a system on paper."

Meanwhile a financial panic had swept over the Commonwealth from 1839 to 1842. The legislature had pledged the State to an extended system of internal improvements. In 1840 "the school funds of the State were seized upon and applied to the liquidation of the internal improvement debt." The peculiar method was, by investing the school fund in the bonds of the internal improvement scheme, leaving the support of the schools to come from the interest of these bonds, which was practically nothing. Whatever may have been the intention of this movement (upon which the historians of the State differ), its practical application was to prevent the public-school system from going into any general efficient operation for the coming six years. In 1840 it was announced that, outside a pittance of a few thousand dollars, there were no funds to meet the demands of the common schools. In 1843 the State was in debt to the school fund, by the failure to meet its legal demands, to the extent of \$116,000, the entire principal of the school fund having been spent in the building of "new turnpike roads" and the "improvement" of the rivers of the State. This was, in fact, a virtual declaration of war against the common-school system by its enemies, as represented by a majority in several legislative sessions of the State. The first attempt to abolish the office of State superintendent of education had failed. In 1843 an effort was made to abolish the public-school system altogether. While this did not succeed, a vital wound was inflicted by an amendment of the school laws, providing that no district could be taxed for the support of common schools without a vote of two-thirds of the people, and the office of special district collector of school taxes was abolished.

The result of this was that, in the legal complications that at once sprang up around the exciting question of taxation, this, the most vital feature of the statute, without which a State school system was impossible, fell to the ground. The end was not far off. In 1845 the board of education surrendered the State school bonds, representing the fund of \$917,500, and they were burned in the presence of witnesses. The explanations of this act were, (1) "That the State held the original bonds, which were on separate pieces of paper and could, without difficulty, be recorded in the books of the secretary of State and the second auditor, to have the same force and effect and bear the same rate of interest as the original bonds; and that this was an act of commendable prudence for the protection of the State and preservation of the bonds." (2) Another eminent Kentucky statesman declares that the legislature, "in order to reduce, on paper, the State debt, ordered the school bonds to be canceled, and thus was blotted out the school fund." (3) Mr. Cassius

M. Clay, then the leader of the antislavery party of the State, asserted that this was "a gigantic effort on the part of the slaveholders of the State to prevent the people from being educated, as being incompatible with the interests of slavery."

Whatever may have been the original intention of any or all three parties, the result was never disputed. During the period when this policy prevailed at the statehouse the cause of popular education in Kentucky was practically stranded.

The third and fourth reports, by Supt. B. B. Smith, afterwards bishop of the Protestant Episcopal Church of Kentucky, cover the period for 1840-41. During this time this indefatigable official had personally visited 70 of the 90 counties of the State; a journey of eight months through 2,500 miles of territory; equivalent, sixty years ago, to a corresponding tour to-day through the entire 16 Southern States. His administration was concentrated on "the effort by the pen and press to extend information and awake the people from their strange apathy upon one of their vital interests." He had endeavored to enlist the influence of the clergy of the leading religious denominations in the good cause; and the public assemblies of the Methodist and united Baptist churches had passed forcible resolutions. But he is compelled to report that "of the main results of the exertion there can be no actual measurement." Twenty of the ninety counties had been districted in 1840; but in only one of these eighty districts had the voters been called together. The first common schools in the State, under the law of 1838, had been organized in the town of Versailles in 1840. The meager reports from a few counties show that the rates of assessment for local taxation varied from 5, 8, 10, 20 to 30 cents in \$100. The number of children between seven and seventeen (the public school age), as computed by imperfect returns, was 170,000, while the number in attendance in common schools was in the neighborhood of 42,000. In all the counties 1,100 male and 200 female teachers were employed. One appropriation from the school fund had been made. The failure of the commissioners as examiners of teachers is noted, and the suggestion made for the appointment of a special examining board. The superintendent's first report calls attention to the announcement of "the astounding fact" that "the commissioners of the school fund have failed of being able to make arrangements for meeting the semiannual payment of the interest accruing from the State bonds held by the board of education, leaving this department entirely without the means for meeting the engagements to pay any drafts upon them for common-school purposes on the 10th of January, 1841." The report of the next year shows that while an increasing number of the counties had gone through the motions of being districted, 33 in all, "in whole or in part," 81 districts have adopted the law entire, 15 only in part, and 10 have for the first time obtained State aid. These districts have received but \$3,500, of which \$1,250 was paid to the superintendents of schools and \$2,000 to the schools. The number of county commissioners had been reduced from 5 to 3, and it is suggested that a similar reduction of trustees in the district would be advisable.

One bright spot appears in this almost total eclipse of the school system—the renewed prosperity of Transylvania University. The city of Lexington and Fayette County had rallied and contributed \$100,000 to the erection of a new college building. Members of the Transylvania Institute had aided, and private benefactions had also been made. The medical and law departments of the university numbered, respectively, 250 and 71 students. The academical department lingered behind, through having no president, with only 90 students and a low state of funds. The trustees report that "the institution has been left for the most part to struggle for itself, and has for many years enjoyed the empty honor, without reaping any of the solid advantages of being a State university. All the real estate and funds belonging to the university have been derived from the liberality and culture of private individuals in the city of Lexington. "Col. James Morrison had left the university the residuary legatee of his estate. The city of Lexington had been granted repre-

sentation on the board of trustees." The superintendent urges the legislature to come to the rescue and give the institution "funds equal to the control which they exercise in its management." It is earnestly desired that a department of pedagogics should be established in the university, and that it be rendered efficient and brought in connection with the common-school system of the State.

The school law of 1838 had been amended in 1839 by reducing the number of county commissioners to three and providing for a compensation of \$1 per day; excepting the lands of free negroes from school taxation; declaring that the property of nonresidents in school districts should be taxed, and that the distribution of the school fund should be confined to the districts accepting the system. In 1842 the commissioners were relieved from the dependence upon the county courts in the arrangement of districts. A board of three professional school examiners might be appointed by any county commissioner's board. Where a district failed to impose a tax, the communities raising a subscription may claim the distribution of the State fund. The poll tax may be raised to \$1.50, but can not be less than 50 cents, per capita. The consent of three districts in any county shall bring the State distribution. The State superintendent shall spend eight months of each year in traveling and lecturing. When any county fails to adopt the common-school system, the amount due shall be paid over for the education of the indigent class. In 1842 the superintendent was instructed to report on the possibility of undertaking the preparation of teachers and on the expediency of placing the State in communication with other States of the South by a conference on matters of educational policy.

In January, 1843, Supt. G. W. Brush made a brief report, the substance of which was that, in several instances, cities and towns have adopted the school system and are supporting it by their own exertions, but all agree that the restoration of the school fund shall be demanded. There were now due five installments of interest, amounting to \$116,375, with a prospect of a deficit of \$125,000, of which only less than \$1,000 had been recovered. The county commissioners advised that this state of affairs should be remedied. A new law provided for the taking of a school census in each city and a more careful examination of teachers; also providing that the State University shall establish a department of pedagogy for the training of common-school teachers.

A private letter addressed to Hon. Henry Barnard, in February, 1843, by Bishop B. B. Smith, concerning his State, is skeptical concerning education; revealing the great illiteracy of certain portions of the State, stating its results, and declaring that these statements were made with no motive save "the broadest one of bringing all the sons and daughters of Kentucky very speedily into the best possible common school."

In response to the petition of a convention of the friends of education, addressed to the legislature at this period, a majority of the legislative committee on education recommended the abolition of the office of State superintendent, on the ground that the legislature is perfectly competent to receive and act directly upon the reports of the different school districts and save the expense of \$1,000 a year to the school fund. They also recommend the resumption of the use of the school fund for the benefit of the schools.

The history of Kentucky, by ex-Supt. Z. F. Smith, in view of this period of the educational record of the State, says: "The administration of three governors had come and gone in Kentucky with no substantial practical results for our common-school system. The entire outcome of ten years' legislating (1838-1848) upon the subject of education in Kentucky was that we only had a law upon the statute book that had not taken root in the affections and life of the people. The system had a precarious existence, and fears were entertained of the repeal of the school law." One of the superintendents (Dillard) had suggested that "while a majority of the

substantial citizens were not opposed to education, they needed more a sense of equality and less of distinction and exclusiveness."

But the day of the turning of the tide had now come. The legislators that had yielded to the persuasions and commands of the enemies of the common school were gradually learning that as fast as the people actually gave their minds to the subject of universal education they were firm in utter disapproval of this disastrous policy that had well-nigh accomplished the destruction of the only system of popular instruction ever seriously attempted in the Commonwealth. While portions of the State were bravely toiling, almost against hope, the State itself seemed more and more averse to aid in building its own foundations on the schooling of even the children of its ruling class. In 1847 Rev. Robert J. Breckenridge was appointed State superintendent of education, and, according to the spirit and manhood which afterwards made him one of the most distinguished of the Presbyterian divines of the country, he gathered himself together in twenty pages of the most decisive talk and most illuminating tables of statistics with which the fathers at the State house had been confronted for many a long day. In this work he was supported by Gov. C. C. Crittenden, afterwards colleague of Henry Clay in the Senate of the United States.

Superintendent Breckenridge very plainly informed the legislature that, owing to a persistent violation of the intent of the school law of 1845, the condition of the schools was "far from satisfactory." The school fund of the State ought to produce a yearly income of \$65,000; but "in point of fact not the fifth part of the sum is yearly appropriated to that object." While the county commissioners were required to forward their reports before December 1 of each year, in order that by the February 1 succeeding the usual distribution of funds might be made, he had received, at the close of December, reports from only one-fourth of the counties and only one of the cities. The result was, "to deprive the remaining counties of the State of all the benefit of the law for the present year." In the larger part of the counties reporting the system had only been partially adopted, three or four of the twenty or thirty districts only reporting; and barely one-third the children in them attending school at all, or at best but half the year. The entire income of the State school fund divided among the children would give only the fraction of a dollar to each child between 5 and 16 years of age. At present the people were relying on private contributions and tuition fees to eke out nine-tenths the cost of the schools. He points to a great outrage: that while the appropriation is yearly made to every child in the State, a great proportion of it, not being used, is covered back into the State treasury for ordinary purposes of expenditure, thus depriving the children of \$50,000 of the \$65,000 secured to them by the statute. He suggests that the entire sum should be given to the districts in actual operation, thus making numbers of good schools, which would be the most powerful argument to the people for their multiplication.

From these suggestions the superintendent branches off into a dissertation on the practical impossibility of offering the Northern system of common schools to a State like Kentucky, and, presumably, to every State of the South. Only a portion of the State is fairly suited for this experiment. The artificial division of the counties into school districts is an innovation on the system that makes the county the political unit. He suggests that the sums assigned to each county should be divided among all schools that act under the law, located according to the public convenience. He also makes a suggestion that all private schools should be included in this subsidizing, and the distribution be extended to the higher institutions of learning. The system which he had in view resembled somewhat the present public-school organization of England, in which all varieties of private and church schools in cooperation with the provisions of the law are subsidized, while systems of board schools for the cities and destitute districts furnish the resources for the school population. To a practical man, like Dr. Breckenridge, it is difficult to see how it could seem possible that a

State or section of the country, in which the aristocratic order of society was even so thoroughly developed as in the States of the South in 1848-1860, could be brought under a system of education that fitted a region as different in its social arrangements as Great Britain from the United States.

But all these speculations were secondary to the intention of the new superintendent, which was to rescue the State school fund from the spoilers of the legislature, or from the condition into which it had been permitted to fall by the strange apathy and neglect of education among the people. He says that in 1847-48 the fund amounted to \$717,500. In addition to this there was an interest account, the result of several years of the diversion of the proper income of the fund to other purposes, of \$294,000. In short, the entire school fund amounted to \$1,288,500, with \$65,000 income for the use of the schools. He therefore boldly challenges the legislators at once, as "an act of simple good faith," to draw up a State bond to be executed to the board of education for this appropriated income in the past, amounting to some \$300,000, and that the entire sums should be secured to the children.

The yearly loss to the school fund from the neglect of the interest account was more than was applied to the schools. He "strikes out from the shoulder" in this defiant sentence: "I charge upon your honorable body that it has so managed as to divert the larger part of the annual interest of the school fund from the sacred cause to which it was devoted; so managed that nearly \$300,000 of interest thus devoted are now due this fund; and that all the interest upon interest thus devoted has been totally lost to this fund; so managed that the schools of the State have received less, year by year, than the fund thus lost by not receiving interest even upon the interest." He demands in imperious style the immediate issue of the interest account of \$300,000, and that the interest of this be annually used or added to the entire fund. Until this is done, he declines to discuss further the interior condition of the schools, but feels under the necessity of demanding for the superintendent of schools such an office in the statehouse as befits the dignity of his position. Of the 90 counties of the State, 27 had reported. In them, with the exception of three which had kept school the year round, the trustees had reported school terms of three to five and then six and seven months. He publishes a list of the 72 derelict counties of 1847, 55 of which did not report in 1846, and asks the commissioners of the same to comply with the law and submit their reports. Thirty-four counties had not received anything from the State since 1840, and had not reported at all. In the 27 counties reported there were 12,330 children entitled to receive \$3,786.70, and 4 counties, with 8,072 children entitled to \$2,481.69. The full account is posted in a short table:

Children of the State between 5 and 16.....	173, 968
Reported in the common schools	20, 402
The more than seven-eighths not reported and not benefited by the school system	153, 566
The cost of schooling all the children in attendance in four cities	\$8, 072. 00
In the remaining portions of the State less than one-thirteenth of the children receive any benefit from the system, to wit.....	12, 230
If the fund were all invested the sum to be distributed among the counties would be.....	\$65, 000. 00
The interest of the fund actually invested would amount to	\$50, 000. 00
As it is, the board of education will receive, under the acts of 1844-45...	\$6, 268. 30

The State faced this charge and, by the act of 1848, February 20, six weeks from the reading of this tremendous report, the governor was authorized to draw a new bond for the arrears of interest due the board of education. This was issued for \$368,768.43. An additional act provided for a tax of 2 cents on the \$100 for the benefit of the school fund, thus insuring the payment of the interest of the entire sum. Next followed an act securing the sole use of the school fund for the schools, and stopping the ruinous habit of diverting the sacred patrimony of the children to ordi-

nary State expenses. Then followed the final step that virtually replaced the school fund and placed in the revised constitution of the State, in 1849, a provision by which it was held irrevocable, as sacred from invasion or spoliation under any pretext. The last ditch of the opposition to the common schools was found in the contention of Governor Helm, in 1850, that the school fund was not a part of the State debt payable at the State treasury. But the plain people of the State did not listen to this counsel, and that portion of the constitution which confirmed their judgment concerning the common schools was firmly established.

The courageous superintendent, in his report for 1848, congratulates the people on taking the two first steps of this reform, and declares the passage of the new tax law for the common schools "under all the conditions of the case one of the most remarkable exhibitions of popular sagacity and wisdom ever made in a free government." The tax thus voted would reach the sum of \$50,000 or \$60,000 annually. The fund, in 1848, before this addition was \$1,299,268.42. Independent of the new tax, the income was \$65,000, but as yet there was no provision for raising this amount beyond a few thousand dollars. The superintendent declares that the State, at the risk of repudiation and dishonor, is still drifting under a policy careless and treacherous to the sacred cause; and, emboldened by his recent victory, his language becomes more pointed and significant than before. He sets plainly before the legislature the past condition in respect to the schools, and then declares that until further provision is made for the payment of the interest on the whole school fund "the entire character of the State must continue to suffer, and the school system of the State continue to retrograde, a prey to all the inroads attending a small provision and entirely insufficient supplies in the ordinary annual income of the State."

Having delivered himself of this weighty matter, the superintendent proceeds again to the discussion of his own idea of the system of education proper for the State. The income of the consolidated school fund would be possibly \$120,000 per year. His previous suggestion of subsidizing private schools is dropped, and he proposes a system of high schools, one in each county, in which a few of the best pupils of the district schools should be educated, free of tuition, for a few years. These high schools should also be open to all on the payment of a moderate fee. A central university should also receive students from every county under conditions that would make it a proper State university.

The superintendent reports an increasing interest in education and warns the fathers of the State that their policy of meeting the demands of the school men will test the capacity of the entire system to secure the confidence of the people. The Transylvania University appears to be passing again into an eclipse. The law of 1839 created a board of overseers bound to report to the legislature the management of the institution by the trustees, of which the State superintendent was a member. This board had never reported and in the meantime important changes had taken place in the university, and its condition was not satisfactory as a State institution. The superintendent urges other matters essential to his station as superintendent of education. He suggests the use of the Bible as the best and cheapest reading book. He closes this interesting document with this impressive paragraph: "I should consider the destiny of Kentucky placed far beyond the reach of chance if the means of education were brought within the reach of all the people, and that education based on the only sure foundations—of morality and intelligence."

Fifty-six of the counties did not report in 1848, and the superintendent gave notice to their commissioners to report or resign. Thirty counties still remained outside, having never reported or received anything from the school fund since 1840, if ever. Forty-three counties, a gain of 16 from the previous year, had reported. There was now an attendance of 24,026 children, with an expenditure of \$8,409.10. There were three cities with 7,475 children, expending \$2,616.15; together making the whole number 31,501 children, and \$11,025.25 expended. There were 183,458 children of school age in the State, of whom 151,957 were not found in the common schools. It

was estimated that of the 67,220 parents of the children 7,436 had no property for taxation, 12,964 less than \$100 of taxable property, 12,344 from \$100 to \$400, 5,685 from \$400 to \$600, and 28,791 with more than \$600, so that 102,436 of the 183,458 of the school population of the State were dependent on the more favored class for the means of education. On the question of the school tax of 2 cents on the \$100 74,628 voted in the affirmative and 37,746 in the negative, a majority in 70 of the counties of 36,882.

In 1849, thanks to the administration of Dr. Breckenridge, as superintendent of education, the constitutional convention inserted in the fundamental law of the land a provision whereby the sum of \$1,225,768.42 of the common-school fund, plus \$73,500 in stocks in the Bank of Kentucky and \$51,223.29, the balance of unexpended interest of the fund for 1848, with whatever future additions might be made, "should be held irreversible for the purpose of sustaining a system of common schools." The interest and dividends of the school fund, besides any sum obtained by taxation or otherwise, should be appropriated in aid of common schools alone, and the general assembly should make provisions for the payment of the interest of the school fund. Each county should receive its due proportion of the distribution, and if not used it should be preserved for the future use of the county. The State superintendent of public instruction should be elected for four years by the people. The people by a large majority had voted a tax of 2 cents on \$100 for payment of the annual interest of the school fund.

In 1852 the school code was revised, with several important changes. The school age was changed to 6 to 18 years. The public money should be expended for common schools alone. The State board of education should adopt rules and regulations for the government of the common schools, and recommend the tax bonds to be issued. The superintendent should visit and lecture in at least twenty-five counties a year until the entire area of the State was covered; afterwards visit schools one week in each month. His office should be in the city of Frankfort, or within 60 miles of the capital of the State. The number of county commissioners was reduced to three, and their term of office fixed at two years, their compensation being \$1 per day for not exceeding twenty days in the year. No school district should contain more than 100 or less than 20 free white children. The three district trustees should visit their school at least at the rate of one visit a week. The common schools must be in session at least three months in each year and be free to all white children from 6 to 18. A private school or seminary may be regarded a common school for a portion of a year. The regular bounty of the State was thus withdrawn from all seminaries and colleges outside the district common schools and such private and other seminaries as for a time came under the regulations of the State and local authorities.

Dr. Breckenridge held the office of superintendant until 1853, longer than any of his predecessors. The result of his invaluable administration was seen in the first report of his successor, Hon. John D. Matthews, in December, 1853. In that year the average attendance in the schools had become 72,000; the entire enrollment 101,300. The sum of \$140,856 had been appropriated for the schools, and the State tax had given \$69,258. The school fund had mounted to \$1,409,270. Each child in the State was entitled to a stipend of 70 cents for the 230,000 of school age.

As a supplement to this report Dr. Breckenridge retires with a "general statement," in which he reviews the field of conflict for the past six years, recounts the victories gained, and protests against several changes in the school laws, especially the provision for entirely free education, which he declares is an impossibility in the present condition of the State, the method of distributing the school fund, etc. His closing words are worthy of preservation:

A vast work has been done for popular education in this State; but it has been done under vast opposition and against vast obstructions. * * * An immense fund has been created, organized, and secured; and when in a moment of political frenzy it was destroyed it has been by a glorious series of legislative and popular

acts redeemed, restored, augmented, and made sacred. The whole State has been organized into school districts, and a complete and general system of popular education in its lowest stage been firmly and wisely established. Many thousands of comfortable schoolhouses have been erected, and many thousands of additional teachers have found honorable and remunerative employment. Many tens of thousands of the sons and daughters of the State have received in those schools the first elements of education, great multitudes of whom if not for these schools would never have received any education at all. And, perhaps, more than all, a public sentiment, and what is better and deeper, a public principle, fixed, general, and earnest, has been lodged in the minds and established in the hearts of our people that the work is a good work, that it can be done, and shall be done.

He disclaims honor for all this, save as the successor of his predecessors, and thanks the press, many statesmen and philanthropists, and many private citizens, "not a few in the humbler walks of life." "As for myself," he says, "I count it one of the most fortunate events of my life, as it will always be one of its most precious reminiscences, that I also have had my share in a period so full of good, and good only." "There is a glory greater than the glory of wealth, and power, and arms, and conquest; the glory of learning, gathering, cherishing, diffusing, promulgating knowledge, whereby men may adorn their lot in this life whatever that lot may be, and whereby, as far as knowledge can, they may be led to know a better life to come."

But this work, great as it was, did not satisfy the greatest of school men and administrators of education yet produced by the State. He saw clearly the weakness of limiting the support of education to the elementary, and pleaded with great eloquence for the public support of the secondary and higher departments. He also perceived clearly that the State was in no condition in 1852 to make the common schools entirely free, since an income of \$500,000 at least would be required for the annual support of even the system on the ground for six months in the year. He seems at times inclined to favor the present British system of subsidizing all varieties of schools, so that a larger number could be educated. The subsequent history of common schools in Kentucky, nearly half a century later than the time when these predictions and warnings were put forth, shows his remarkable knowledge of the people of the State and the practical insight into the condition under which the people's children could be trained for citizenship.

Robert Jefferson Breckenridge was born in Kentucky in 1800, and died at Danville, Ky., in 1871. He studied at Princeton and Yale and graduated at Union College, New York, in 1819; was admitted to the bar in 1823, and practiced as a lawyer eight years. For four successive years he was a member of the Kentucky legislature. As a public man he advocated the emancipation of the slaves; and his disappointment at the failure of that policy induced him to abandon politics and study theology at the age of 29. In 1832 he became the pastor of a Presbyterian church in Bethlehem, where he remained thirteen years. In 1845 he was elected president of Jefferson College, Pennsylvania. Two years later, he returned to Lexington, Ky., as pastor of the First Presbyterian Church. At the same time he was appointed State superintendent of instruction, in 1847. His great labor as State superintendent was carried on in connection with the pastorship of his church, without an office in Frankfort, on a salary of \$1,000 a year. After his retirement from this office he was appointed professor of theology in the divinity school at Danville, Ky., where he spent the remainder of his life. He became a great power in what was known as the old-school division of the American Presbyterian Church, and was widely known as a prominent writer on religious and other topics. At the breaking out of the civil war in 1861 he became at once prominent as one of the most important and courageous supporters of the Union cause in the South, although a son and a nephew, then Vice-President of the United States, united with the Confederacy. His last public service was the presidency of the National convention that nominated Abraham Lincoln for a second time to the Presidency of the United States, at Baltimore, in 1864.

It is doubtful if the annals of American education furnish a more conspicuous instance of a public service more decisive, rendered against greater obstacles and conducted with greater courage and wisdom, than the six years of the administration of Dr. Breckenridge as State superintendent of public instruction in Kentucky. He understood the people of his own State as few of the most distinguished statesmen of Kentucky have known them. He appeared at the crisis of the conflict that was not, as in New England and New York, a battle for important reforms with the continued support of the common school, but a war to the death against anything that by any figure of speech could be denominated a system of public instruction. And although from the first he was followed by an intelligent and right-minded "middle class," in no State of the Union has the dominant class in church, state, and society been more fully set against the uplifting of the masses by an effective system of public instruction than in Kentucky. It was an emergency where but one policy could have prevailed; the policy of a courage that faced popular defeat and persisted to the end. If the masses of the white people, one-third of whom could not read in 1838, could be aroused to the necessity of education; could be persuaded, against all their prejudices, to submit to taxation and stand firm against the leadership that so far had withholden the great boon of common schooling from the children, all would go well. That it did go well and that this great State was finally brought to an enduring fidelity to the common-school system, as later, in even a greater peril, it stood fast against the deluge of disunion, was more due to the splendid leadership of Dr. Breckenridge than to any single cause. His reports and addresses on popular education form perhaps the most conspicuous section of a valuable school literature, to which the friends of the common school will revert as to a living spring of inspiration in the still troubled conflict for the reformation and expansion of the system. His analysis of the obstacles that prevented the complete success of the American common school in a slave State was the most correct ever made and has been vindicated by the history of every Commonwealth of the sixteen that favored that type of labor until the close of the civil war.

The tables of statistics annexed to the first report of Superintendent Matthews in 1853 revealed the progress of the common schools of Kentucky during the twelve years from their first establishment in 1841. In that year only 4,950 children were reported as the school population of the entire State; in 1853, 201,225. In 1841 but 2,160 were attending the common schools, in 1853 72,000 were in regular attendance. In 1847, when Dr. Breckenridge assumed the State superintendency, there were reported only 20,000 of school age and 10,220 in average attendance. Under his administration of six years not only had the State fund been secured from destruction, the State constitution revised in favor of public instruction, new school laws been placed on the statute book, and the annual income for public schooling raised to \$150,000, but the attendance on schools had increased sevenfold, and the people of the State for the first time been awakened to the support of the system of public instruction to a far greater degree than by the repeated efforts of the previous forty years.

The report of Superintendent Matthews for 1854 contains a fervent plea for the establishment by a tax of 3 cents on every \$100 of property in the State as a perpetual income for education. The taxable property of Kentucky in 1854 was estimated at \$405,830,168. Of the 80,218 parents of the 227,123 children between 6 and 18, 11,578 were reported as without property; 8,530 with less than \$100; 13,391 from \$100 to \$400; and only 39,895, representing 116,846 children, with more than \$600 of taxable possessions. Only 30,000 parents in a white population of 800,000 confessed to \$1,000 of taxable property, on which was paid \$3 as a school tax. The average attendance on the schools for 1853 was 76,420, the highest enrollment being 116,243 and the number of school age 207,210, a gain of 4,000 from the previous year. There were 3,257 districts in which schools were kept and 102 of the 103 counties had reported.

In 1855 the good work was still going on. There were 229,424 children recorded as of school age, of whom 113,763 had been registered as enrolled, with 73,000 in average attendance. One hundred and fifty thousand dollars was expended in 3,371 districts, with some 5,000 teachers employed. The people had voted the 3-cent tax on \$100 by a majority of 3 to 1, only 5 of the 103 counties voting "no." The largest majority vote ever given in the State was this for education—82,765 to 57,526—and the wealthy citizens vied with their poor neighbors in the support of schools common to all. The new tax raised the income of the common-school system to \$121,749. Superintendent Matthews recommends a system by which the Morrison College of the Transylvania University could be improved by the appointment of two additional professors for political science and English literature, including a department of pedagogy. To this school a certain number of pupils should be admitted with free tuition and \$1 per week, paid during forty-eight weeks, with the obligation to teach in the common schools from three to five years, according to the time of receiving instruction. The trustees of Transylvania University had offered the State the use of their buildings and the service of the entire faculty for this purpose. The property was estimated at \$100,000, and \$10,000 from the State fund would be required for the experiment.

The report of Superintendent Matthews made in 1857 covers the school years of 1855-56. It opens with a laudable "flourish of trumpets" over the condition of the common schools. "The system of State instruction never presented a more prosperous or gratifying condition." In 1855 the number of children of school age was 229,424; for 1856, 245,181. The income applicable for the public school was limited to \$1.20 per capita, from the increasing numbers. The largest number at school in 1856 was 139,805; the average attendance, 92,367, an increase in sixteen years from an average attendance of 2,160, was a cause of thanksgiving. There were 3,888 school districts in 104 counties. A change of the law making the minimum school term five instead of three months is urged. The income of the common-school funds in 1856 was \$291,630; the amount disbursed the previous year was \$149,016; in 1856, \$142,603. The 3-cent school tax, with certain other sources of income, had furnished \$286,265. The general condition of the school fund is reported as favorable.

There had been several important amendments to the school laws in 1855-56. The most valuable in its direct effect on the schools was the reduction of the county school commissioners from 3 to 1—appointed for two years by the county court—practically the system of county supervision adopted in several of the Northern States. The compensation—\$2 a day for fifty days' work—was a practical notice to this official to visit every school in his county at least once a year. The superintendent contrasts the condition of the common schools of Kentucky with other slave States with great satisfaction to his own Commonwealth, and emphasizes the additional opportunity of education afforded by "numerous high schools and superior boarding schools for both sexes, and five or six colleges with able faculties, and all of them fairly endowed. "Every facility and all the advantages of other and older States, in every branch of science and in every department of learning, may be obtained by the youth of our State on his native soil." How far the good superintendent's estimate of the quality of all departments of education in Kentucky in 1856 was stimulated by his almost violent reference to the growing crusade in the nation against the institution of slavery—a point in which he differed from all the previous occupants of his office—must be judged by a careful reading of the returns and the growing factor of sectional interest connected with the first political campaign in 1856, on an issue distinctly based upon the restriction of the extension of the "peculiar institution" into the new Territories.

But on one point there could be no discussion. The State of Kentucky certainly had a sufficient wealth of young manhood and womanhood to supply a native teaching force for the new common-school system. Every State superintendent had

urged the necessity of making some competent provision for the training of teachers. The most vulnerable point in the new schools was the incapacity of their corps of instructors, and the bitterest taunts of their enemies were directed against the average country schoolmaster. Half the teachers in many of the northern border counties were drawn from the northwest and Pennsylvania. The distinguished statesman, James G. Blaine, and a long line of less celebrated public men and well-known women, began their career as master or mistress in a Kentucky schoolhouse. At this juncture the old State Transylvania University made the advance which rallied the legislature to provide for what, on paper, seemed the most favorable arrangement for a great normal college yet adopted in the country. In 1855 the trustees of the university made a full offer of the institution and all its effects, \$200,000 in value, to the State, including its entire reorganization under a new board, for the especial object of establishing what would now be called a State normal college. The history of this noted institution had been, from the first, a record of varied success and depression, with but scant consideration from the Commonwealth, which gave it the name—with few of the advantages—of a State university.

Transylvania University was founded in the territorial period of Kentucky by a grant of 20,000 acres of the escheated lands of loyalists of the Revolution, then in Virginia, in 1783. In 1794 the new State established the Kentucky University. In 1798 the two rival institutions were united under the name of Transylvania University. The general endowment of the former college was cut down by a Kentucky State law, excepting certain of these lands from escheat, and of the \$30,000 obtained from the remaining 8,000 acres, \$20,000 were lost by the failure of the Bank of Kentucky. Another gift from Virginia, 1787, of similar nature was refused by the State in 1802. In 1815-1820 the State gave to the University some \$3,000 and in 1821 two gifts of \$10,000 and \$2,500. This finished the account of the State with its university until 1829, when the buildings were destroyed by fire. They were restored by the gifts of Col. James Morrison, the city of Lexington and other contributors assisting, with \$20,000 from the same hands for a professorship, certain scholarships also being founded by the city of Lexington. These benefactions had raised the institution from its ashes, and, with renewed fortunes, it had come up to the year 1856.

The eloquent plea for a normal school by Superintendent Matthews had its effect, and in 1856 a law was passed for the complete reorganization of Transylvania University under a board of trustees, consisting of the governor, lieutenant-governor, secretary of state, the chief justice of the court of appeals, the attorney-general, the speaker of the house of representatives, and the superintendent of public schools, in addition to the seven permanent trustees, the administration to be divided equally between the two classes of officials, which would be a close corporation. The new board was intrusted with all the privileges and duties of the original university. The fit organization of a proper college course would be completed, "with especial reference to the fact that the effort of said university thus reorganized was to furnish the Commonwealth of Kentucky with a sufficient and constant supply of good teachers, who were to be citizens of this State, while it should indirectly afford the means of instruction to pupils who may not have in view the profession of teaching." There was to be a president and four professors in the academical department, each professor presiding over a special chair. "All branches of learning commonly taught in the district schools, together with the training and practice of teachers, shall be included in one or the other of the professorships."

The trustees had direct power over all the operations. Every county had the right to send one pupil constantly, free of charge, for instruction, and there was a bonus of \$1.50 per week for board, and each county and city should send a pupil for every representative in the legislature, to be chosen by the county commissioner of schools by competitive examination, to the number of 116. The university gave two full

years of instruction, which the pupil was to reimburse by teaching for a similar term in the common schools. The recipients of this bounty were to be young men, not under 16 nor over 30 years of age, for the two previous years residents in the State. A post-graduate course of one year was opened on the same conditions as the regular course, and every normal pupil of requisite capacity could receive additional instruction. Other students could be admitted to a college course by paying tuition. The legislature voted \$10,000 per annum for the support of the normal department.

The reorganized university was opened in 1856. The inaugural address was an eloquent and popular presentation of the proper use of a normal school, with the environment of a department of moral science, physical science, mathematics, and ancient languages. The professors had charge of the several departments, assisted by those of the other classes. The president warmly dilates on the advantage to the university from this addition of a fine body of young men of mature age and fixed habits brought there by a special purpose, and urges the indirect influence of the improved common-school system in preparing the future material of the college departments and their influence upon the entire sphere of the higher education in the State. "The total want of accurate instruction and thorough discipline in the early stages of education is an utterly unmitigated evil, a crack in the foundations which now threatens the whole superstructure and endangering all. * * * The very attempt to hide the defect recoils upon the moral nature, strikes in upon the inner man, and slowly fashions him for inevitable moral turpitude." He looks to the normal school always to lead in this great reform. "Its method not only the best, but the only possible good method. * * * This habit, formed in the normal school and transferred to every department of the university, would of itself suffice to revolutionize our system of education and raise up a new race of statesmen and citizens."

The law reorganizing the university was passed by a vote of 56 to 37. The trustees elected a president and five professors and the State Normal School was opened in Lexington, September 1, 1856, with 80 pupils. "No school of similar character in this country ever commenced with that number of pupils, or under such favorable auspices, or with so full a corps of instructors." One hundred and nineteen students were received during the first year from 90 counties. But with all this triumphant beginning, the superintendent regarded it important to devote nearly a half of his report of 29 pages to an elaborate defense of the necessity of normal training in general and the new normal university in particular.

The physical condition of the office of State superintendent remained unchanged. With the exception of a brief period during the administration of Dr. Bullock, it had been migrating between Louisville and Lexington, and the occupant had performed its burdensome duties in connection with the cares of a church pastorate. All the incumbents of the office had been clergymen. Drs. Bullock and Breckenridge were ministers of the Presbyterian; Dr. (afterwards Bishop) Kavanaugh of the Methodist; Dr. (afterwards Bishop) Smith of the Protestant Episcopal; Dr. Brush of the Methodist, and Dr. Diller of the Baptist Church. Up to this date, 1856, there had been a zealous avoidance of the subject of the common-school reforms by the leading politicians and statesmen of the Commonwealth, with the exception of several of the governors, who honestly cooperated with the growing educational public in the work. This was in singular contrast with New England and New York, neither having, with the exception of Dr. Sears, placed a clergyman at the head of the common-school department.

The report of Superintendent Mattlews, in 1858, covering the school year of 1857, opens with a discussion of the important office of county commissioner of schools. An attempt to make this office elective, with a salary, was frustrated, on the ground that it would drag the entire department down into the maelstrom of county partisan politics. The superintendent advocates the election of the school commissioners by

the people with an adequate salary, and giving them the appointment of the local trustees. Two hundred and fifty-four thousand children had been reported as of school age, with an average school attendance of 88,931, the largest number attending being 138,522. The number of district schools was 4,221. The superintendent urges the distribution of the school funds on the basis of actual attendance of the children. The income of the school fund for 1858 was estimated at \$304,466, and the entire amount of the State fund at \$1,455,332.03.

But these preparations for the constant growth of the elementary education were rudely dashed by the repeal of the law of 1855-56 establishing the State Normal University and the consequent abandonment of that institution by its transfer to the original board of trustees by a large majority of the legislature. The reports of the trustees and the State superintendent dwell with almost pathetic pride upon the immediate success of the experiment. During the first year there were 203 students in the university, 80 of whom were in the normal department. It was claimed that this body was carefully selected by the county commissioners, had done themselves credit in the school, and had faithfully labored in the common schools in return. The somewhat boastful proclamation that this the first institution of the kind in the South had surpassed all similar schools in the older States was based on the ideals and expectations of its professors. The public treatment of this truly broad and practical agency was due to the fact that while the masses of the people of Kentucky were coming up to the support of the elementary common district school to a greater extent than in any State of the South, the six colleges and numerous private and sectarian academies still to a great extent represented the determination of the "superior class" and a large division of the religious public to hold fast to the secondary and higher education as their rightful possession. The reorganization of the Transylvania University as a proper State college, with the free training of a considerable body of young men as teachers, was a menace to this idea that could not be endured. By an adroit play on popular prejudice it was not difficult to swing a legislature so largely representative of the rural population of the State over to the extreme action of 1858. The afflicted Superintendent Matthews, who thus saw the offspring of his hopes so relentlessly stricken down, sets forth the indignity so evidently directed against the education of teachers. With this destruction of his plan Transylvania University was relegated to a history of bitter contention from which it has only within the past twenty years been delivered.

The report rendered to the legislature in April, 1860, by Supt. R. Richardson opens with a clear and forcible history of education in Kentucky through its entire historic period. It is a convincing demonstration of the determination of the mass of people in the State to stand by, at least, the elementary department of a free-school system and pay reasonably for its support, notwithstanding the revolutionary and disastrous happenings of the past fifty years. The late State auditor, Mr. S. Page, is credited with a great service to the State through many years. The superintendent urges a movement to increase the rate of interest for the State school fund from 5 to 6 per cent.

Having thus set forth the great cause of congratulation for the rapid development of the common school in the State, the new superintendent turns to a consideration of the defects that still encumber the system and to a large extent contributed to the strong opposition which still cripples it. He complains that of the 10,000 local officials of the system "many are so ignorant of the matters included in school supervision as to be incompetent to be qualified for any statement of facts touching their respective districts."

Another and more serious defect was the unwillingness of the majority of the citizens to contribute, by local aid, to the improvement of the schools. Four of the larger counties of the State did contribute to the extent of \$100,000. Thirty additional

counties gave from \$250 to \$5,000 each. Outside these 34 the remaining 70 counties were relying chiefly on the State fund, which maintained a poor school, under an incompetent teacher, for barely four months. The State of Delaware was supporting a common school of seven and one-half, and Alabama of six or seven months. The superintendent speaks of a reactionary policy that would cut down the school system of every State and reduce it to the condition of a degradation of the entire system "to a petty scheme of hire and salary and compel it to be what its enemies desired." The policy of school directors here, as in other States, is deplored. Only 5,000 are reported and the work of destruction still goes on. The necessity of a uniform system of schoolbooks and of better schoolhouses is urged. The State association of teachers was organized in 1857-58, and county associations were being formed as tributaries. The Educational Monthly Teacher was published under its auspices. The subject of school libraries is mooted, the cities of Louisville and Lexington having already moved in this direction. The gradual falling off of the average attendance from the schools is attributed to the lack of competent teachers, and to this cause are traced nearly all the defects of the system. He suggests a general plan for some method of training teachers for the State.

The reports of 1860-61 are filled with the evidence of the calamities that have already befallen the common-school system from the outbreak of the civil war. After a brief period the attempt at neutrality by the State in the great conflict had made the Commonwealth the proper seat of war. In no State were the inevitable results of secession more painfully realized—the estrangement of families; "the father against the son and the daughter against the mother;" the entire tragedy of internal disorder concentrated within the State. Although the Commonwealth had remained devoted to the Union, and, after the first year of the war, was generally free from dangerous invasion, yet it was impossible to prevent the disastrous effects of a widespread discontent. In the year 1861 the attendance of the children at school fell off from the average number of 107,000 to 61,000. The deficit in the collection of taxes from the unsettled condition of the State reduced the income of the schools from \$481,900 in 1860 to \$201,000 in 1861, and the number of districts in which schools were supported to 201. In place of a discussion on the condition of the schools and methods of reform, as in former years, Superintendent Richardson devotes the report of 1861, printed June, 1862, to an eloquent declaration of the results of the great conflict, up to date, in the diversion of school funds from their legitimate use to the support of the war; the scattering of school children, and the general loss of confidence in the work of popular education in the South. While the entire North had gone on in its school system, even in the face of the greatest exertions and sacrifices of treasure and blood, the superintendent maintained that every State that seceded from the Union had lost its hold on the common-school work, so well begun, and only in the border Commonwealths that remained true to the Union had the children been cared for at all. The superintendent insists that the present attitude of Kentucky on the great question of the preservation of the Union was due to what had been done during the past ten years in the interest of the education of the masses of the people, and declares that the counties most conspicuous in the support of the common schools had been uniformly most loyal in their devotion to the Union cause.

By 1863 the reports of Superintendent Richardson had a still more melancholy tale to rehearse. The occupation of the State by the military forces of the Union and the repeated alarms of invasion by the Confederate armies had so disturbed communication that it had become difficult to gather the report for 1862. The average number of pupils attending the schools had been reduced to 43,654. A law passed August 30, 1862, which required every teacher and official of any school, established or chartered by the State, to take a solemn oath of loyalty to the Union, had worked a fur-

ther disintegration of the common school, causing the loss of probably 10,000 children in attendance on the common schools alone. The money expended from a reduced income was \$271,000. The voluntary contributions for education had largely fallen away.

With the passing of the year 1862 the storm of war drifted far southward, leaving the people of the State measurably free from the deplorable effects of the civil strife. The two years of conflict had cut down the attendance on the common schools more than 50 per cent, one half the districts in the State having ceased to support the schools or failed to report, and the average attendance of 1862 was 63,000 less than in 1860. In 1863 the tide again began to take an upward turn. Public confidence was in a measure restored and the new State superintendent of education reports an average attendance of 73,306 in 3,212 districts. But as this essay has already been prolonged beyond its legitimate limit—1860—the future of the common-school system in Kentucky must be studied further in the history of the thirty-five years since the close of the civil war.

The history of the effort of the State of Kentucky to deal with the higher and secondary education is, far beyond the record of the elementary common school, the story of great aspirations and well-meant endeavors, hopeful at first, but thenceforth so embarrassed by private and sectarian interference that there is little to record until the period subsequent to the civil war. The first movement to endow the county academy under the name of college or institute, in 1798, by the gift of 6,000 acres to each county, was postponed until 1821, when its utter failure arrested further action. The failure came from the habit of appropriating money for education with no responsibility for its use. Each of these schools was practically a private or sectarian corporation, entirely removed in its administration from any concern of the State. And, worst of all, the school funds thus given in a liberal spirit, by loose legislation were apt to be squandered by careless, probably sometimes by dishonest, handling. It is asserted that some of these gifts, if properly managed, would have amounted to a fund of \$5,000,000, and that an average income of \$60,000 was not an extravagant estimate of their value. The downfall of this scheme of public subsidizing this type of schools woke up the ambition and rivalry of all the religious bodies of the State, of private friends of the secondary and higher education, and even of the secret societies, like the Masonic order, sometimes of an entire town or city.

From this time on until the breaking out of the civil war this work of establishing this class of seminaries, generally with names and pretensions too high for their actual accomplishment, went on apace. Almost every village of any proportions had one, and the larger places often more than one, of these. The presence of a popular president or the influence of a clergyman of a powerful church for a longer or shorter time would divert a train of pupils in one direction. Of these, a few of the most worthy and best supported survive to-day. A history of this side of the education of the State, which for all practical purposes was the only method of conducting the secondary education for the half century before 1860, would be a great assistance in the estimate of the education of the foremost people of that day, which made the name of Kentucky of national import, and in 1860-1865 attracted the eager attention of the Republic to the battle of giants in this now "dark and bloody ground" of the civil war. Probably a score of seminaries of greater or less worth have at different times obtained the name of college. Several of these, by right, may claim this title, and for half a century past have to a certain extent done the work of the old-time rural or village American college in a way often more efficient than is sometimes done in schools of greater pretensions, with the courses of study more ample and resources corresponding. As far as concerns the support of the higher education by the State the educational bounty of the Commonwealth has had no other object outside this early arrangement than Transylvania University.

The history of Transylvania University may be regarded a century-long romance of the early educational life of the great West. The original institution from which it was born was established, on paper, by a grant of the legislature of Virginia in 1780 of 8,000 acres of escheated lands belonging to parties unfriendly to the country during the war of independence. The founder of the school, Col. John Todd, obtained the appropriation and was probably responsible for the high-sounding preamble of the legislative act. After a little skirmishing, under the presidency of Rev. Thomas Rice, a native of Virginia and a graduate of what is now Princeton University, it was transferred to Lexington in 1793 and located in a building on a vacant private lot until housed in a home of its own, raised by private contribution. From the first hour of its existence it seems to have been regarded as a prize of sectarian contention. In 1795 the State endowed and chartered the Kentucky (Presbyterian) Academy with 6,000 acres of land. In 1798 the two institutions were united under the name Transylvania University, which began its existence with a princely endowment of 20,000 acres of land contributed by Virginia and 6,000 acres by the State to the Kentucky Academy.

The first proof of the waning affection of the new State for its first-born educational child was the release of the escheated lands of its Tory citizens. This, at "one fell swoop," deprived the university of its main support, leaving only some 8,000 acres of land, sold for \$30,000. The second act was "like unto it," abolishing the charter of the University of Kentucky, in which this university fund was included, and leaving it minus two-thirds of its endowment. The third movement was to repeal the law by which Virginia had granted to the university one-sixth of the lands in the district of Kentucky, finally given to William and Mary College.

But, nothing daunted, the first university beyond the mountains began its career at Lexington, Ky., in 1798, with a tuition fee of £5 a year—one-half cash, one-half in "property"—with boarding £9 per year in "property," pork, corn, etc. John Filson, the first historian of Kentucky, was its friend, and began the great work of introducing the scholars of the nation to the Southwest—the advanced guard of the mighty army of pedagogues of both sexes that has so ministered to the educational aid and comfort of this vast section. The lot upon which the two-story brick building stood was donated by the citizens, and Professor Filson was a teacher. The appointment of a Baptist clergyman as teacher in 1794 precipitated the quarrel which resulted in the secession of the Kentucky Academy in 1798, and left the academical department, under Rev. John Moore, as first president. In 1799 the departments of law and medicine were added. The professor in the law department was Col. George Nicholas, followed by Henry Clay, William T. Barry, the author of the admirable educational legislative report of 1821, and others. A donation of a building from the city of Lexington and a succession of able legal professors gave this law school a national reputation. The professor of the medical department was Dr. Samuel Brown, a native of Pennsylvania and a student of Edinburgh. This department of the university was said to have been the first arrangement for reliable medical instruction in the West.

In 1804 President Moore was succeeded by Dr. James Blythe, a native of North Carolina, a graduate of Hampden Sidney College, promoted from the professorship of mathematics and philosophy. He held the position fifteen years, and afterwards was professor of chemistry in a medical college in Indiana. The first university degree was given by Transylvania in 1802, and in 1804 Indian students were admitted. The medical department grew steadily, and its first degree was granted in 1818.

In 1817 a determined effort was made in behalf of the university. A new college building was contributed by the city of Lexington, and Dr. Horace Holley, of Boston, was invited to the presidency. This gentleman, a member of one of the most brilliant of the Connecticut families of that day, was born in Salisbury, Conn., in 1781; as usual, taught in the common schools, and graduated at Yale in 1803 with distinc-

tion. Beginning the study of law in New York, he attached himself soon to Dr. Timothy Dwight as his teacher in theology, and in 1805 was ordained to the Congregational Christian ministry at the age of 24. In 1809 he was found in the pulpit in one of the most popular churches of Boston—Hollis street—afterwards known through the pastorate of John Pierpont and Thomas Starr King. His personal qualities, popular manners, splendid oratory, and versatility of faculty attracted immediate attention. He soon became to the New England Christianity of that early day the forerunner and prophet of the notable separation of the "liberal" from the "evangelical" sections of the Congregational Church, under the leadership of Dr. William Ellery Channing, about the year 1820, in connection with Buckminster and others, one of the most important representatives of the "advanced" religious movement in New England. His occasional preaching at New York and Washington attracted great attention from prominent public men, and suggested his name as a fit person to undertake the pioneer university work of the new State of Kentucky.

Under the administration of Professor Holley the university was reorganized, and the medical school rose to special importance. In 1819-20 the State made the small contribution of \$8,000, and in 1821 increased its appropriation by the gift of one-half of the profits of the Lexington Branch of the Bank of the Commonwealth for two years, amounting to the small sum of \$10,000. In 1824 a further contribution was made of \$20,000. In 1825 it was asserted that Transylvania University possessed the best college library in the Union, having received donations from private individuals, including Edward Everett, and also from the British Government. The medical library was said to be excellent. The institution became known in the East, and attracted the attention of many distinguished people, including Lafayette and the Earl of Derby, Judge William T. Barry, known as judge of the State courts, afterwards United States Senator and a member of the President's Cabinet. In 1826 the medical school had 281 students, with 53 graduates, the largest then in existence in the United States. In 1823 Col. James Morrison, one of the new wealthy men of the State, endowed the academical department with a gift of \$20,000. The power of President Holley to carry out his broad and liberal policy was one of the questions always debated by the educational public in the estimate of the distinguished head of a growing university.

It is unnecessary, especially since the recent publication by the Filson Club of Louisville, Ky., of a thorough review of the causes of the separation of President Holley from Transylvania University, to enlarge on this unhappy incident in the history of the higher education of that State. Doubtless, his free and popular manners, possibly somewhat his want of tact, more evidently his growing dissent from the dominating type of theology in the Southwest, had each its part in kindling the flame among his opponents which finally drove him from his great position and broke his heart. After a brief attempt to establish a new college in New Orleans, he fell sick, and on the home voyage to the North died on shipboard. His wife migrated to Texas, and after a residence there returned to New Orleans, where she died. His brilliant administration had raised Transylvania from the obscurity of a provincial academy to the fame of a university known at home and abroad. Only 22 students had graduated from it during the sixteen years of its existence previous to his coming. During the nine years of his presidency 666 had been sent forth. Among his professors and pupils was Benjamin O. Peers, author of the famous report on common schools of 1830. The dedication of a new medical building was another of the fruits of his labors.

In 1828 Rev. Alva Woods, D. D., was chosen to the presidency of Transylvania from Brown University, Rhode Island. After a residence of two years he entered upon the presidency of the University of Alabama. In 1829 the new buildings of the university, with the law and college libraries, were destroyed by fire. Dr. Woods was succeeded by Rev. Benjamin O. Peers, a graduate of Transylvania, a clergyman

of the Protestant Episcopal Church, and at one time president of an academy. He served for two years. In addition to the Morrison College department, founded by Col. James Morrison from his gift of \$20,000, now the center of the university, a theological department was opened in 1835. In 1838-39 the city of Lexington donated \$70,000. Seventy people incorporated a Transylvania institute with \$35,000, and the pupils of the medical department furnished a lot for the new medical building costing \$15,000. But from the continual neglect of the State and the persistent rivalry of the different religious bodies, each of whom was building up its own college while carrying on the war against the State institution, Transylvania had steadily declined until 1842. The control was then given to the Methodist Church, and Bishop Henry B. Bascom was chosen as president. The institution at once rallied and for seven years the prospects of the university assumed their old aspect. The resignation of Bishop Bascom in 1849 threw the university back upon the hands of the State. Prof. J. B. Dodd was his successor until another reorganization in 1856. In that year came the attempt to establish the most important and broadest normal college in the Union, in connection with the faculty of Morrison College herein already described. The failure of this movement by the reaction in the legislature in 1858 has already been noted.

Dr. L. W. Green was president during this experiment, called from the presidency of Hampden-Sidney College in Virginia. He retired to the presidency of Center College, Danville, Ky. The medical school went on until the opening of the civil war. This department had held its own during all the vicissitudes of the Academical College, and up to 1861 had graduated 2,000 students. After the failure of the normal school experiment, the academical department sunk to the dimensions of a grammar school, under the principalship of Dr. J. K. Patterson, now the able president of the State College of Kentucky. In 1865 the university was united with the Kentucky University of the Christian denomination, and its history from that period illustrates the attempt of a denominational school in education to represent a growing American State. Its final separation from State relations has resulted in its present position as one of the most useful institutions of learning in Kentucky, under the direction of the important religious body known as the Christians or Disciples.

The graduates of Transylvania University during the period of sixty years from its foundation in 1798 included great numbers of men distinguished in State and national affairs. Its downfall was one more proof that the American system of common-school instruction in its higher no less than its elementary department can not safely form a connection with the denominational or any other system of public instruction save one over which the people, through their representatives, have complete control. The few States that still persist, and the National Government in its dealing with the Indian tribes, are certain to abandon a policy so antagonistic to American ideas. The State of Kentucky, by the aid of the Agricultural and Mechanical College land grant of the United States in 1862, was able in 1867 to attempt the establishment of a proper State university, coeducative and already of established reputation, with a valuable normal school department, under the presidency of Dr. Patterson, who stood by the deathbed of old Transylvania during the stormy period of the civil war.

The history of the secondary education in Kentucky, under the auspices of the State, subsequent to the decay of the original system of the subsidized academy of each county, about the year 1820, is substantially confined to a record of a few of the larger towns, still the principal cities of the State. The rapid development of the denominational religious academy during the forty years before the civil war was the chief hindrance to the growth of the free secondary public school. The same influence that finally broke down the effort of the Commonwealth to establish a State university and left Transylvania to be fought over by a succession of ardent combatants, forced into the school laws a provision which, until subsequent to 1865, restricted

the State practically to the support of the country district school. At the same time the larger towns, which chose to establish and support the nearest approach to the modern graded school system then in the West, were exempted by the statute from the control of the county school authorities, each municipality being rated as one district, with no connection with the State save the receipt of its own quota of the school fund. The original towns thus favored were Maysville, Lexington, and at a later period Covington. Indeed, until 1856 the modern free high school, open to the entire white population, was not established in Louisville, the most flourishing city of the State. Before that period several of the towns had aided in the establishment of a grammar or classical school, established, partially supported, and to a certain extent governed by a municipal law under a special provision of the charter. But the history of the common school of Kentucky, until after the civil war, does not include what is now known as the free high school outside the few municipalities where it was the exception in the movement that for thirty years so agitated the Commonwealth.

Of these larger towns, the city of Lexington, Fayette County, is the earliest to which attention was attracted for its interest in education and as the first center of culture and literary and political interest in what was then one of the most remote portions of the civilized earth. As soon as the place was occupied as a fort, about the time of the breaking out of the Revolutionary war, a private school was set up by John McRay, who at once demonstrated his capacity to attend to the then important department for thrashing by slaying an impertinent wild-cat who dared to attack the master on his throne—the schoolhouse desk. Land was given for a "Latin and English school" at an early day. In 1787 Mrs. Jane Woolman, of Philadelphia, established the Lexington Girls' School, with tuition of £4 a year, payable in cash or "truck." Another school followed, and in 1788 Transylvania University, under its final name, was set up, probably the first attempt beyond the Alleghenies under the United States Government to establish the higher education.

The fact that Lexington, Ky., for that early period was regarded as the center of the cultivated society and foremost professional life of the new Western world, and the early union of the denominational schools of the different religious bodies with Transylvania University, and the attempt to dispense with ecclesiastical interference by the appointment of a new board of management, "not one a professor of religion;" the administration of President Horace Holley, a minister of the "liberal" type from Boston, extending over a period of nine years, from 1818 to 1827, by all odds the most notable period in the history of the institution; the union of all the opposing forces which forced his retirement; the renewal of the fierce war of the sects, resulting in the capture of the institution in 1842 by the Methodists, which brought in a brief period of success; the failure of the effort to reorganize in 1854 as a State normal college, and the final union with the important Christian denomination in 1856, which made a prodigious struggle to maintain it in connection with the Commonwealth, and, failing in this, has at last come into full possession of the college; all this, which has already been told, was a great obstacle to the full development of the common school system in Lexington. What with the great influence of the central institution which according to the custom really included every type of schooling, the numerous schools—private and public—that rose and fell for the training of children and youth of all ages, the high aristocratic tone of society in this and the adjacent blue-grass region, the strange indifference of the majority of leading public men, several of national reputation, in the city to the great movement that was agitating the masses of the people for general education, the common school interest, save at one or two brief periods, was not conspicuous.

In 1840 the city of Lexington reported a voting population of 2,571, with 2,622 children; a total valuation of \$18,399,621, the second in the State. The city had a population of 27,756 and received \$1,055 from the State school fund, with 1,325 chil-

dren at school; 256 white persons unable to read. There were 39 male and 5 female teachers. But in the report of the first two State superintendents, 1839 and 1840, the failure of the fund reduced the allowance of the city to \$583.20 for 1,458 children between 7 and 17. In 1842 the city government reports \$1,524.42 expended for "city school." A private fund of \$7,000 was being gathered for a "free school." At this time the condition of Transylvania University was absorbing the interest of the educational public of Lexington, and, for the time and place, large contributions were given to its rehabilitation from destruction by fire and the depression of the years that followed the retirement of President Holley.

Meanwhile Lexington had long since become the first of the notable new places beyond the mountains. In 1789 the first horse race is reported, the precursor of the great reputation of the city and region for fine-blooded stock and the development of the race track, so noted that the chief historian of the State pauses in his narrative of interesting events to record the doings of the most celebrated horses, while the public vocabulary has been adapted to the popular habit by speaking of almost every industrial, political, social, or educational movement as "a race." The town claims the publication of one of the first newspapers west of the Alleghenies, in 1787. In 1811 John Reynolds, then governor of Illinois, passing through Lexington, speaks of it as a "handsome town." It was the place of meeting of the first legislature and became the residence of several men of national eminence of the period. Among these were several of the contestants of the claim of Robert Fulton as the first steamboat inventor in the Republic. Its roll of distinguished men, including the celebrated name of Henry Clay, was hardly exceeded by any town in the Republic previous to 1840. In 1800 the population was 2,400, Cincinnati, Ohio, being spoken of as an adjacent village of 750. A great "revival of religion" in that year may have saved the rising town from the bad reputation that clung to several of the original cities of the Ohio Valley, and its sanitary character was in strong contrast to what was called "the graveyard of Louisville." In education it boasted among its citizens the names of Barry and Peers, whose educational reports to the legislature in 1830 and 1840 were among the most powerful influences that contributed to the final establishment of the common-school system in 1849-50.

The historians declare that in 1816 "Lexington is known as the most elegant and cultivated city of the West." High-toned social entertainment was the order of the day. It was still as large as Cincinnati and kept with as good care as the oldest town of the Union. The lunatic asylum was the first of the kind established west of the Alleghenies, and the largest in the United States. It was established as a local charity in 1816 and dedicated by the eloquence of "Kentucky's favorite son"—Henry Clay, of Ashland. The price of young male negroes in 1817 was from \$500 to \$700. A great event was the visit of Lafayette in 1825. During the reign of President Holley the little city bore the title, "The Athens of the West." Its leaders in society, education, and the professions were well known. The university had a national reputation. The public press abounded in literary articles, and its reputation for authorship was the best in the West. A liberal social atmosphere added to the interest, and with the charming rural surroundings of the fertile countryside, Lexington became a favorite resort for strangers and visitors from abroad. A Bible society was formed in 1822, and in 1823 the first religious journal founded in the Southwest opened its batteries on what was described by the popular theology as "the rising infidel tendency of the country," represented by the liberal teaching in the person of President Holley. The record of the political performances of rival politicians, in which the discussion of national affairs was liberally mixed with bitter personal rivalries, even to the extreme verge of the "free fight" or the more formal duel, was one of the chief entertainments of their constituents. Mary Todd, the wife of Abraham Lincoln, was born in Lexington. The best speech of Henry Clay at home was made before the "Lexington Junto," the predecessor of a larger asso-

ciation, in 1798. The learned naturalist, C. S. Rafinesque, was a professor of Transylvania University in 1824. Jefferson Davis was a student in Transylvania University, and the stranger to-day is shown the window in the o'd mansion where the young student was to be seen at his books. Lexington early became the headquarters of ecclesiastical and theological interest. Rev. Barton A. Stone was the leader of the little group of people called "Christians," since known by the name of the rival sect of "Disciples," an offshoot from the original body, now become one of the most powerful of the religious bodies of the Southwest, numbering among its followers Henry Clay and large numbers of the public men of the State. Among its clergy Rev. Alexander Campbell was best known in this sect, having been the founder of Bethany College, West Virginia.

In 1843 occurred the famous theological discussion between Alexander Campbell and Rev. N. L. Rice, with Henry Clay—a distinguished judge and a prominent colonel being selected as directors. The first macadamized road, the successor of the plank road, that lifted the inhabitants of the great Southwest above the abysmal mud for half the year, appeared under the patronage of leading citizens as a new highway from Lexington to Maysville. The first railroad in the West also took its departure from this famous little city in 1830, \$7,000 being contributed by its citizens. One million dollars was regarded sufficient capital for a connection with Portsmouth on the Ohio River.

In 1832 Lexington became an incorporated city, its first mayor, Chancellor Hunt, a graduate of Transylvania University. Mr. Timothy Flint, in his "Mississippi Valley," breaks forth into ecstasies over the beauties of the adjacent country, the loveliness of the city, the hospitality of its people, and its progress in all the arts of life. Gen. Andrew Jackson, a candidate for the Presidency of the United States, was greeted at a mammoth "barbecue" about the same time. An orphan asylum was established in 1833. In 1834 the Catholic Church founded one of its many institutions for education and charity in Lexington—St. Catherine's Academy.

With all this stir of life and the gathering testimony of so many of the public and superior people of the Southwest to this favored place, we need hardly be surprised that the attention of the people was for a long time detained from the establishment of the common school. In 1834, moved by the growing numbers of children, the city established a school in a discarded church building with 107 pupils under Master Gayle, assisted by his daughter. A committee of three, appointed by the city council, had charge of the movement. In 1836 a private fund of \$10,000 was given for its use. For that day the gift was regarded generous. During the years of depression, previous to the administration of Superintendent Breckenridge in 1848, the State appropriation had fallen below \$1,000 per annum for nearly "200 (?) children of school age." In 1848 Fayette County contained 1,056 white children between 5 and 16, while Maysville had 1,000, Covington 1,230, and Louisville 4,982. Fayette County was put off with the pittance of \$70 from the depleted State fund, while Lexington with 1,121 children received \$392.35 of State aid.

In 1853 the powerful hand of Superintendent Breckenridge had arrested the common school in its downward trend, and increased the amount of State aid to all the cities. Lexington reports in this year 1,378 of its 1,484 children in the common schools, with an average attendance of 910, with \$943.75 from the State distribution. The historian of the city, writing in 1872, remarks: "In this year [1853] the public school had attained a prosperity greater than it ever acquired before or since. Not a single private school for the education of boys was in existence in the city; everybody sent his children to the city schools, and the ceremonies that attended their closing exercises indicated the interest and pride that was taken in them by the citizens." Mr. James O. Harrison, chairman of the school board, had devoted himself to the upbuilding of the schools. As usual in the Southern States, the improve-

ment of the citizenship of the place was associated with the success of the common-school system. In 1854 the number of children is reported at 1,500, with an average attendance of 1,000 and State aid of \$1,000. In 1856, the increasing number of children, 1,683 the highest number in school, with an average attendance of 1,500, and \$2,000 received for their support from the school funds, seemed to predict a beginning of the decline, as there appears to have been no State tax, and the support was from local funds and private contributions. This was the year of the existence of the normal class connected with Transylvania University, and the uplift of the hopes of the common-school public were soon to be dispelled by the act of the legislature in repealing the law. In 1856-57 the receipts from the State were \$1,718 and \$2,082, with an increase of pupils—1,432 and 1,735. In 1858, with a State aid of \$1,890 and a school population of 1,575, the average attendance had fallen to 640, less than two-thirds being found at any time in the common schools, the city having about one-half the school population of the county. In 1860, 479 was the average attendance, less than half the full number attending, with 1,459 reported of school age, and an income from the fund of \$1,081. Only 781 were in average attendance (about half the population of school age) in 1861. Rising again to 1,089 in average attendance, with an income of \$1,755.60, in 1862, it fell to 600 (one-third the school population) in 1863. The State was involved in the great war, and the attendance on the common school was but one-half that of 1860. Lexington, in an exposed position, the center of the frightful political agitation of the Commonwealth, especially suffered with the remainder of the State. A rally in 1864 to an average attendance of 1,079, and a distribution of \$2,174, suggested the coming of better days; but in 1865, the year of the collapse of the Confederacy, the average attendance sunk to 485—one-fifth the school population—898 the highest and 390 the lowest number attending. The situation was not materially improved in 1866—2,000 school population, 600 average attendance, with no receipts from the State.

It is evident from this statement that from the year 1853, in comparison with the condition of the city, the interest in the common school in Lexington had declined. The close of the war found the system in peril. The increase of pupils of the private and denominational schools from the class able to attend and pay for this type of instruction was marked, and this form of education was largely relied on by the major portion of the well-to-do people of the city. The sudden influx into Lexington of crowds of the colored people from the adjacent country involved the educational public in a new situation.

There were three cities somewhat exempted from the effect of the general school statute of Kentucky in 1838, under the following provisions: "That the provisions of this act, so far as it relates to Jefferson, Fayette, and Mason counties, shall not apply to the cities of Louisville, Lexington, and Maysville. And these cities shall be considered as having adopted the system of public schools by taxation, and be entitled to all the benefits of the act, on the report of the government of their public schools of the number of children within said cities of the ages named in this act; and that part of the school fund which these cities shall be entitled to shall be paid to the mayor and council for the use of the public schools of said city."

The city of Covington on the Ohio River was afterwards added to these three places and the special history of these, of which Maysville was still among the first in population and wealth in the State, will now briefly be treated. But of all, perhaps the least of the group in this respect, Maysville, for more than a generation, was a conspicuous leader in the educational life of the new time. The latest historian of Kentucky, Professor Shaler, of Harvard University, says: "Mason county became the best school county in the State, and from it came an unusually large number of teachers, editors, and other literary men." This he ascribes to the original settlement of the county by immigrants in large number from Pennsylvania,

New Jersey, and New England, especially to the immigration from Connecticut. "In the beginning the New England people probably did not amount to over fifty families, but it was an important contribution to the life of the colony."

Mason County was the eighth of the nine counties already formed in Kentucky in 1792, when the State was admitted to the Union. It then included a large territory on and adjacent to the Ohio River which has been subdivided into nineteen counties and portions of counties. In 1790 the entire county contained 2,722 people, the least in population of the nine; Fayette, with 10,419, being the first, and Jefferson, including the village of Louisville, but 4,765. In 1870 the population of Mason County was 18,126—the fourth of the original nine. Its first county town was Washington, now a small village, a few miles inland from the Ohio River, and Maysville, now the chief and most populous city of the county, was only a landing on the river bank. The first settlement was in 1784, by a party of Virginians. It was "established" by act of the Virginia legislature under the name of Limestone. It grew steadily, overshadowed by its steep "bluffs," the little county town of Washington, in 1805, boasting 100, while Limestone contained but 50 houses. In 1810 Maysville contained 335 people and 100 houses. The Baptist Church building was the first erected in northern Kentucky, at Washington, Mason County, in 1785. Those famous pioneers, Simon Kenton and Daniel Boone, and later others of the same sort, were connected with the settlement of the county and its chief city. The Methodist brethren were in due time on hand, and the family that brought the good tidings to the western wilderness was connected with the second Methodist Church founded on the continent. In 1790 a young Master Davidson, concerning whose doings as a schoolmaster we should be interested to hear more, as in so many other cases, was called to display his talents in battles with the wild-cats and the wilder men of the woods, with which the historians of the early West so encumber their narratives.

The quality of the original stock that occupied the land in old Mason County was proved by the great number of eminent citizens, some of national reputation and others possibly more useful in their day and generation in their own common life than the more conspicuous brethren who were sent to the State and national capital cities. It was only by gradual growth that the county mounted to the population of 18,000 during the eighty years ending with 1870. In 1840 its school population was one-fourth of its entire population, a ratio which declined to one-fifth in 1870. The fertile uplands in the rear of the river were a great attraction to the settlers from the North, of whom Pennsylvania supplied a large proportion, while the class most distinguished in public affairs was largely of New England origin.

But while never one of the great cities of the Ohio Valley, and for half a century past steadily declining in the ratio of population and wealth, Maysville had so wrought in the cause of education that in 1838 we find it among the three cities exempted from the general operation of the new State school law by reason of having a special school of its own, supported partly by the bounty of the State. In 1840 Mason County had not adopted the school system of 1838, while Maysville had 578 children of school age. In 1842 there were 510 children in the town with 100 in a school, taught twelve months in a year, with \$250 State aid and \$650 assessed. In 1847, at the appearance of Dr. Breckenridge as State superintendent of schools, Mason was still among the more destitute counties, while Maysville had 1,000 children and received but \$300 from the State. In 1856 Mason County is credited with a taxable property valuation of \$9,534,209, and a school population of 3,382, of whom 1,260 were in average attendance. Maysville had 702 children, with 175 in average attendance, with a ten months' term, \$562.80 of State aid, and an expenditure of \$950. Up to 1859 the public school record is still unfavorable, of 910 children of school age but 227 having attended at any time, and the average attendance only 173 ten months in the year. Throughout the war the decline went on. In 1861, 995 of school age, 150 in average attendance eight months in the year, with \$627 from the

State and \$950 distributed. And, as late as 1869, the record is 1,071 of school age and only 317 in attendance for ten months.

The conclusion from this is that while in general sympathy with the common-school system of the State, Maysville at an early period established common schools for a portion of her children, subsidized in addition to the distribution of the State fund; yet the educated class of the city during the years before the civil war was more in favor of private and academical schools than otherwise. In 1870 the city was credited with a free high and three district schools, while five seminaries, two for male and three for female students, and several other private and parochial schools, declared Maysville, for a city of its description, still an educational center of the old-time sort. Mason County at present is, however, regarded one of the most advanced in the State in its support of the common school for the rural districts.

Another of the cities that were at a later date exempt from the general operation of the school law of 1838 was Frankfort, after 1793 the capital city of the new Commonwealth. When Lexington became the first capital in 1792 it was the most populous town in the State, the entire population being over 70,000 and that of Frankfort 1,000. Why the seat of government was removed to Frankfort, a place still under fire from the savages, and for many years a village of moderate proportions, is one of the mysteries of the involved and intense public life of Kentucky. In 1840 the town was organized under the new school law, with 230 children in four schools, taught by two men and two women, with the, for the day, generous salaries of \$750 and \$550; although the course of study in the schools, afterwards largely extended, then included Latin, geography, and grammar. Their support, in addition to the limited State fund, came from a tax of 25 cents on each \$100, from which \$775 was obtained. Notwithstanding the fight of the opposition against laying the tax, the good work went on, and the progress was more than could be expected. At the end of the first year it was proposed to submit the question of the continuance of the schools to a second vote of the people. The attendance increased the second year, which reduced the per capita cost of education from \$27.38 to \$14.20. In 1856 the number of children of school age was reported as 456; in average attendance, 145; in 1859, 659 children, with 90 in average attendance six and one-half months. The city had no school in 1863, the middle year of the civil war. By 1869 the common school had taken a "fresh start" toward the new order of affairs, there being 320 of the 815 children of school age in average attendance three months in the year at \$4.50 per capita, the entire amount received from the State \$684, with the usual addition of local funds.

In 1810 Frankfort is described as a village of 140 houses. The city claims the honor of the establishment of the first full sectarian school in Kentucky, in 1819, with 30 scholars, whose instruction seems to have been centered upon committing the verses of the Bible to memory. The entire school had committed 36,640 verses. One class in two and one-half years had read the Bible entirely through, from 5,000 to 7,000 verses each, and were perfect in the Assembly's Catechism, from which these industrious pupils had committed 600 separate proof texts. The population in 1840 was 1,917; in 1860, 3,702, only 200 greater than that of Maysville, 3,499. It is to be regretted that the interest of the historians of Kentucky is so largely confined to the Indian fighting of the early, and the career of the "distinguished citizen" of the later, period that such commonplace matters as the education of the masses of the people, even in the most important towns, is only to be dug out of obscurity by a laborious research through historical material often confused and rarely altogether reliable.

The city of Covington, Kenton County, appears in the list of excepted cities before Frankfort. The county was organized as late as 1840, and its first county seat, Independence, was situated 11 miles south of Covington. But the city of Covington is now second in importance in the State, opposite Cincinnati, Ohio. Until 1815 it was a small settlement, known only as a "ferry." It was named from General Coving-

ton, a distinguished public character in the State, and in 1834 received a city charter. In 1840 it had a population of 2,000, which twenty years later (1860) had increased to 16,471. Covington is now a growing city of 60,000 people, and with its neighboring city, Newport, and several large villages adjacent, represents a population of 150,000 opposite Cincinnati, still the great city of the lower Ohio Valley. In 1854 the number of school children was reported at 3,000, and in 1860 at 3,782. In 1842 Covington first appears in the record of Kentucky city schools, with a school population of 2,609 and \$243.60 of the disbursed State school fund. In 1848 Kenton County appeared as one of the districted counties, with a small school population outside the city and no report for the time. In 1859, with a city population of 16,000, 3,439 children of school age were returned, with 1,031 in average common school attendance.

These villages, that were the incipient cities of Kentucky during the period covered by this essay, are fair representatives of what was going on in what were then the centers of the secondary and higher schooling of the State. In the subsequent development of education during the past thirty years a large number of county towns and old-time "college villages" have taken up the complete organization of the common school, in many cases absorbing the local academy as a free high school, and, in a measure, bringing the denominational colleges in elbow-touch with these new "seminaries of learning." But as the real common-school life of these places has been almost entirely developed since the close of the civil war, the record of their often remarkable work does not fall within the time limits of this paper, which exclude by far the most interesting chapter in the history of the common school in Kentucky. For although the city of Louisville had moved at a comparatively early date in the direction of the public schooling of its white population, yet it was only during or soon after the close of the war that its present excellent system of secondary academical and industrial training was fully organized. There is a great advantage in presenting the record of a city of this importance as a whole. Long before the outbreak of the civil war, the two cities, Cincinnati, Ohio, and Louisville, Ky., had in all ways outgrown the inland and border towns of Kentucky, of which Lexington, the chief, for a time could justly claim to represent the beginnings of cultivated and influential municipal life in the vast region of the new West.

Thenceforth Louisville rapidly came to the front as the foremost representative in Kentucky of the new American life of a united country.

The recent publication of the admirable volume containing the record of the growth and present status of this, one of the most beautiful and characteristic of our Western American cities, with the contributions of the Filson Club and the group of scholars gathered about what is probably the most valuable collection of early historical documents beyond the Alleghenies, will furnish ample material for the sketch of this closing epoch, the culmination of the long-drawn conflict of the common school public of Kentucky to bring the educational opportunities of their State in line with the great commonwealths, more than ever now their neighbors, on the northern shore of the Ohio.

It will be seen from this account of common-school education in these the more advanced county towns, and even the chief cities of Kentucky, previous to 1860, that the progress of the proper graded-school system—the most conspicuous product of the great educational revival from 1830 to 1860—had been slow. While probably almost every branch of knowledge included in the common-school curriculum of the day was in one way or another taught in these schools, yet neither the free high school nor any very effective system of the free grammar school had been extensively organized. Up to a very recent date the county academy for general instruction and the private or denominational female seminary had retained their hold on the more favored classes as the only method of securing an education above the elementary common school of the country and the mixed schools of the towns. Almost every considerable village in the State had its seminary, of which it was proud and

which its leading citizens supported for the schooling of their families. In no State of the Union is it more important that a complete history of the numerous academical schools with the large number of "colleges" should be studied in order to obtain a fair estimate of the general culture of the influential class and such pupils as could press upward into the higher regions of school life than in Kentucky. As late as 1877 the Report of the United States Commissioner of Education published the names of 13 "colleges," 20 "female colleges," and more than 50 seminaries and academies for the secondary and higher education. The proportion of this class of schools, mostly of a denominational character, to the population of the State was much larger during the period from 1830 to 1860. The common-school system at this late period had converted very many village and city supporters of the old idea, and the common school public, trained by a fifty years' "campaign of education," from 1820 to 1870, was pushing forward toward the triumph of the past ten years. No State is now more alive with enthusiasm for the great good cause of universal education, whose corner-stone is the American common school, than this Commonwealth, whose educational public has so long and so bravely fought and so nobly won in this the grandest movement, including the most notable reforms, in the history of the modern world.

TENNESSEE.

The author of the chapter on "The public-school system of Tennessee," Thaddeus P. Thomas, M. A., in the able Circular of Information of the National Bureau of Education, No. 196, Higher Education in Tennessee, writes: "One cause of the slow development of the system of public schools in Tennessee and throughout the entire South has been the failure to recognize the importance of laying a good educational foundation. There has been a tendency to forget the fact that the effectiveness of the higher education depends largely upon the vitality of the common schools. * * * It is largely due to this," and other causes, "that the public-school system of Tennessee, as a vigorous and effective system, has no real history before 1873."

Hon. James Phelan, in his History of Tennessee, writes: "The history of the common school of Tennessee is in the main a history of the public lands of Tennessee, and the history of the public lands of the State is the history of confusion. This confusion, which is much too intricate to unravel in a short space, originated in the act of cession, and more than 300 acts have been passed on subjects growing out of the relation between the public schools and the school lands of the State."

The Hon. W. R. Garrett, of Nashville, Tenn., in an elaborate address delivered before the department of superintendence of the National Educational Association, at Washington, March 6-8, 1889, gives the key to this failure of Tennessee to profit by one of the most munificent educational land grants of the Union, in these forcible sentences: "In Ohio and in the other States carved out of the Northwest Territory the sixteenth section in each township was designated and conveyed direct to the inhabitants of the township. The admirable system of United States surveys definitely located the grant, and the title was vested. Tennessee, which had been admitted ten years before its land cession, had not been reached by this system of surveys. The township and the section could not therefore be designated, and Congress did not vest title in the inhabitants of a township or district. The provision was in the following words: 'And the State of Tennessee shall moreover, in issuing grants and perfecting titles, locate 640 acres to every 6 miles square in the territory hereby ceded, where existing claims will allow the same, which shall be appropriated for the use of schools for the instruction of children forever.' This provision imposed a duty on the State, but failed to vest the title in the subordinate civil division. Tennessee had no series of civil divisions of 6 miles square corresponding to the township. The grant was not then definitely located and vested. In the meantime much of the land had been taken up by valid claims, and, with the rapid stream of immigration which poured in, the squatter preceded the surveyor. Many acts were passed

by the legislature to protect the school lands; but from the vague nature of the grant, and possibly from the failure to appreciate its value, the opportunity to utilize it was lost." The corresponding provision, which required the legislature to appropriate 100,000 acres for the use of two colleges and 100,000 for the use of academies, one for each county, the land not to be sold for less than \$2 per acre, and the proceeds to be vested in funds for the secondary and higher education, failed to be largely useful from similar causes.

It was to this very "embarrassment of riches" in the presence of an empire of fertile and attractive wild lands, and its natural result upon the population of the old thirteen colonies, impoverished at the close of the Revolutionary war, that the long period of indifference and conflict which postponed the children's day in Tennessee for almost a century was largely due. The body of the early settlers of Tennessee contained the usual proportion of men educated according to the idea of culture for the man of affairs in the Southern Atlantic States a hundred years ago. The majority of the early settlers were people of more than ordinary intelligence, possibly in an Anglo-Saxon state the best material for the founding of a great republican commonwealth. Theodore Roosevelt, in his "Winning of the West," declares that among the early settlers of Tennessee and Kentucky not over 3 or 4 per cent were obliged to make their mark in the signature to the ordinary business and public duties of the day.

Of course the presence of negro slavery, which created a strong aristocratic order of society, and the earnestness, not to say violence, of the sectarian religious spirit in this early generation, with their inevitable results in a sparsely settled country, would tell against the formation of a public opinion favorable to the American common school, then little more than a school of the New England States. In addition to this, the first settlers of those two original Territories were at once confronted by the terrible war with the Indians, which only ceased with the close of the war of 1812-1814. When we recall with what a strange lack of practical business sagacity and foresight the people of Ohio, despite their great advantages of a township organization, wasted their own splendid land grant for education, we can not wonder that the people of Kentucky and Tennessee, who had literally watered their homes and landed possessions with their own blood in almost perpetual warfare, should have protested against giving up their own land titles to secure what seemed but a distant good—the building up of a system of common schools, with which they had but little practical acquaintance in the older Southern States from which they came.

But the original settlers in 1789, in convention at Jonesboro, East Tennessee, adopted a constitution for the revolting State, Franklin, placed therein a provision for the "encouragement of all kinds of useful learning," and provided specifically for a university at the center and public grammar schools in each county, to be endowed by public lands and supported by local taxation. In 1790 the State of North Carolina finally ceded to the United States the entire area now known as the State of Tennessee. Congress soon after created a Territorial government and President Washington appointed William Blount as Territorial governor. In 1794 the Territorial assembly first met in regular session at Knoxville, then in the second year of its settlement. One of its first acts was the creation of a school, which exists at the present day as Greeneville and Tusculum College. The next day another institution was launched by the legislative act which created Blount College, in the vicinity of the little village that had been the Territorial capital. This new seat of learning "struck twelve" at the beginning by declaring itself undenominational in religion. Its board of 17 trustees included the governor; the first two United States Senators and the first two judges; Governor John Sevier, first governor of the State and first Representative in the Congress of the United States from the Mississippi Valley; four subsequent United States Senators; three governors of the State, and the proprietor of the first newspaper pub-

lished in Tennessee. Nine of these gentlemen bore the title of "esquire," "all honorable men." A little two-story wooden building, erected by subscription on a square donated by Colonel White, the father of the town, was the outward beginning of the college. Knoxville was then a settlement in the wilderness, on the outskirts of civilization, a cluster of log and frame houses surrounding a palisaded and loopholed block-house. The first president of Blount College was Rev. Samuel Carrick. The president, one professor, and teachers were occasionally "granted leave of absence" to go off to an Indian fight. There was no provision for the support of the school by public taxation, and it received nothing during its existence from the Territorial or State government. Its support was from small tuition fees and voluntary subscriptions. The two rival "colleges" at Washington and Greeneville obtained the mass of the academical student material of the new Territory; and its larger tuition fee and higher collegiate pretensions made it especially the school for the more favored class. The first and only graduate was William E. Parker, in 1806, and before another appeared the institution was merged in the larger arrangement of East Tennessee College, now known as the State University, at Knoxville. But even then Blount College had anticipated the educational demand by almost a century through the admission of young women. Five names of Tennessee maidens appear in its calendar. Of these Barbara Blount remained foremost in "honorable mention," being named as "attentive, diligent, untiring, and ingenuous." The name of "Barbara Hill" was given in honor of her to the beautiful eminence to which the institution was removed from what is now a crowded district of the city.

It is not to report what has already been written elsewhere concerning the history of the university at Knoxville until 1830 that this present record is made, but to fix the impression that the failure to utilize the splendid landed endowment for a full State system of education in Tennessee was not owing so much to the indifference of the people as to the endless complications that involved the administration of the public lands for more than an entire generation, and which have made even a passing reference to this topic almost an offense to the educational public of that State to-day. We shall not waste time and patience in any new attempt to unravel the "ins and outs" of this terrible entanglement, with its 300 statutes bearing on the one subject of the common school. It is not remarkable that the people of Tennessee, weary of this never-ending strife, which almost seemed a part of the public collegiate and common-school interest, should fly to the old-time refuge of local private and denominational schools. For nearly three-fourths of a century, like the European peoples of the past, they educated their children in the numerous colleges, academies, and private schools that sprang up in every considerable community.

In 1840 Tennessee is reported as having an outfit of 8 "universities and colleges," with 492 students; 152 academies and grammar schools, with 5,539 pupils, and 983 primary schools, with 25,090 scholars; 6,907 children "schooled at public charge," with 58,521 illiterate white persons over the age of 20. At that date the population of the State was 829,210, of whom 640,627 were white. In 1850 the population had increased to 1,002,717, of whom 756,836 were white. There were then 18 colleges, with 83 teachers and 1,705 students, with an annual income of \$67,689; 264 academies, with 404 teachers and 9,928 pupils, with annual receipts of \$175,926; 2,680 public schools, with 2,819 teachers, 104,107 scholars, and \$200,000 expended. Seventy-eight thousand one hundred and fourteen white people over 21 years of age could not read or write. Only 21 libraries were reported, with less than 50,000 volumes, all save 8,000 of the State library in institutions of learning. In 1860 the number of mature white illiterates was 67,000. In regard to popular illiteracy there is no reasonable doubt that before 1860 the number of illiterates, especially in the South and Southwest, was greater than represented by the figures of the national census, while the scarcity of books is proof that other thousands of people, able after a poor fashion to read, never did use books to any appreciable extent in their educa-

tion for the duties of private and public life. A discouraging feature of this record is the great preponderance of white female illiteracy. In Tennessee, in 1860, the excess was 16,000—27,000 men and 43,000 women—which, with a small contingent of “free colored,” raised the army of ignorance to 72,000 illiterates, all past the age of legal citizenship. In 1850 North Carolina and her daughter Tennessee, with the exception of the new State of Arkansas, represented the two highest percentages of white illiteracy in the Union—North Carolina 32 and Tennessee 26 per cent. This had been reduced, in 1860, in North Carolina to 25 per cent, probably by the public school system inaugurated by Dr. Wiley, and in Tennessee to 20.36 per cent. Virginia reported, in 1850, 21.54; in 1860, 17.59 per cent; Maryland, at the same dates, 18.56 and 13.86; Louisiana, 18.87 and 11.55; Kentucky, 22.20 and 18.01; Georgia, 20.17 and 18.08; Delaware, 26.05 and 25.09; Arkansas, 27.84 and 18.94; Alabama, 20.36 and 17.24. But meanwhile Nashville, Knoxville, and several of the lesser cities of Tennessee had already become notable seats of learning.

It would be a profitless and ungenerous task to reproduce, in the present historical record, the details of the long struggle of the powerful State of Tennessee, a Commonwealth that before 1860 had given to the Republic two Presidents of the United States and a notable body of eminent public men in national and local affairs, with its original land endowment and the wreck they finally became. The lesson of this conflict is, however, not that which two of its three senators in Congress implied in their opposition to the Blair bill for national aid to education in 1880–1890. For it was not inevitable, seventy-five years ago, or at any subsequent date, that a generous national grant for popular education should demoralize an American Commonwealth. On the contrary, the history of the common school in almost every State of the great west and on the Pacific coast is a protest against this assumption. But with the loose habits of local organization and government that prevailed in the eight Southern States that received the National Government grant of school lands, coupled with the opposition of the more influential and the indifference of the lower white class for a whole generation to the American system of common schools, it was not strange that several of the ablest of the Southern representatives in Congress should shrink from an experience like that which had accompanied the management of educational funds in the time past.

It will, in this essay, only be necessary to take up the record of the State University at Knoxville and the University of Nashville, the only considerable institutions that ever claimed a State representative character during the period from 1830 to 1860; to attempt to set forth the varied fortunes of the public-school system inaugurated in 1834, through its numerous changes up to its partial collapse at the outbreak of the civil war; and especially to call attention again to the services of the great representative of universal education who for twenty-six years, at the capital of Tennessee, held up the banner and marshaled the people in words that now thrill the reader like the blast of a trumpet—Philip Lindsley.

THE UNIVERSITY OF TENNESSEE.

In 1807 Blount College, which, during the thirteen years from its establishment in 1794, had been a respectable academical institution of the grade then denominated “college,” and had sent forth a number of students, afterwards distinguished in the annals of Tennessee and the neighboring States, was merged in the East Tennessee College.

The history of this event is so interwoven with the early management of the public land grants, first by North Carolina to the United States, second by the Congress of the United States to Tennessee, and third by the State of Tennessee, as represented by its legislature, that it would be almost vain for an “outsider” even to venture an opinion concerning the practical wisdom of what was done, or the possibility, under the peculiar conditions of the case, that anything radically different could have taken

place. This question has been discussed again and again by the ablest advocates of the differing theories of public obligation. We have only to refer to writers like Phelan, Garrett, Sanford, and Merriam for the best of the later explanations of the conflicting and almost exasperating political policy by which the people of the great State of Tennessee have, even to the present day, been withheld from any effective direct support of their own State university system.

But one suggestion may be made which seems to have often escaped the attention of many of these disputants. It is simply "a delusion and a snare" to attempt to discuss the policy of dealing with the Indian tribes, and the final question which is so involved with the Indian policy which was adopted by many of the States of this Union, either the thirteen colonial or subsequent territorial Commonwealths, on the assumption that their people ever recognized as valid and obligatory the moral, civic, and social ideals and duties, acknowledged as binding on States and communities in our own day. The original settlers of the American colonies, except those of Pennsylvania, who, according to the historian Parkman, treated with Indians who had already been conquered by the Iroquois, and were compelled to bear the degrading name of "old women," never regarded the Indian as the same kind of human being as he figures to-day in the Hampton and Carlisle schools and the recent Mohonk annual conventions of his friends. Neither the American Indian nor the African negro a hundred years ago was held by any civilized people to be a man entitled to the rights or regards of Christendom in the affairs of this world, however eminent may have been the zeal of the clergy and pious laity of the churches to convert him to the Christian religion as a security against the awful pains and penalties of heathenism in the world to come. The whole circle of ideas and practices by which a new territory of the United States is now governed and the claims of the original settlers adjusted is the result of three hundred years of turbulent and painful national experience, and was not even conceived, and much less recognized, by the multitude of impoverished immigrants who, at the close of the long and terribly exhausting Revolutionary struggle and the discouraging period of the confederation, thronged the wild mountain passes of Appalachian America and settled in what appeared to their longing eyes the paradise of a splendid new world in States like Kentucky and Tennessee. The method of survey and occupation of land, as fixed by the slaveholding colonial order of society in the southern Atlantic States, was hostile to the system of accuracy in determining boundaries, establishing townships, and allotting farms and great estates brought to the Northwest from New England. The settlers of the new Southwest, brave, religious according to the ideas of the day, honest and patriotic, believed that the nation gave them new homes, which were to be made habitable by incessant toil and hardship, and defended by themselves at the daily risk of life, through the almost incredible labors and sacrifices of more than one generation. It is simply idle to talk of what the new State of Tennessee should have done concerning the management of their school lands when there was no State of Tennessee apart from the very people who had made it, the vast majority acknowledging no especial natural right of occupation by the pagan savage, or any duty to turn themselves out of house and home to build up what they generally regarded as a college for the education of a small professional class.

So when the settlers of these Southwestern States were compelled to face the situation, to educate in the limited sense in which it was then regarded, as a personal, social, and civic necessity, they had no realization of what we now call the American system of universal education at the public expense—a scheme, as far as they knew it, under general disapproval in every State from which they had come. All the educational methods they had known were in the old-time field schools or, at best, in the private seminary established by a church or kept as a means of living by a master, supported by tuition fees and private subscriptions. There was no special difficulty of getting as much of this as any community cared

for by any of the common expedients then in use; and a good deal more of that was obtained in some communities, and often of a better quality, than the educational historians acknowledge. To judge harshly the people of Tennessee, or of any of these new Southwestern States, because of their long delay to utilize the public lands for a well-developed scheme of popular education is to assume a condition of public opinion and a theory of public obligation in this matter which only appeared in the ideals of a few of the more advanced States, and appeared in them rather as a longing and prophecy for a far-off future than as a guide to present legislation.

So we turn from the long and wearisome undertaking even to lift this original land and educational policy up into intelligent shape with the simple conclusion that the Tennessee of the first half of the nineteenth century and the Nashville of the twenty-seven years of the campaign for education by Lindsley were not the Tennessee and the Nashville of to-day. Instead of deploring the waste of the great resources and the almost unaccountable and inexplicable opposition to public education during the long period from the settlement of the State to the close of the civil war, it is far more profitable and, on the whole, more fit and fair to seek out the permanent and progressive side of this mixed and conflicting history of popular education; to do justice to the efforts of the academies and colleges, private, church, and corporate, and, above all, to do honor to the labors of a band of teachers, educational leaders, and reformers who during these long and discouraging years toiled for the children and laid the foundations of all of the present great uplifting agencies of to-day.

As we contemplate the present prospect of the University of Tennessee at Knoxville, under the very able administration of the past ten years, we can look with more complacency upon the slow progress and the exasperating trials and hindrances of the early day of its proper establishment as the East Tennessee College in 1806. The able historian of the university characterizes this period in the following expressive language: "From the death of the first president, Rev. Samuel Carrick, who bears the twofold honor of planting the Presbyterian religion in the wilderness of Tennessee, founder and first pastor of the first Presbyterian Church of Knoxville, and the first president of East Tennessee College, to the close of the civil war, the history of the college is a story of struggle and repeated disappointment, of heroic effort on the part of successive presidents, conspicuous among whom were Shannon, Coffin, Estabrook, and Cook, of alternate periods of advance and retreat." "The history of the period before the civil war was largely taken up with the effort to realize the land-grant fund and to overcome the popular prejudice which was engendered against the college on account of this struggle." Indeed, from the year 1807 till 1820 the institution was unable to open its doors. A succession of legislatures recorded the humors of their constituents by a series of postponements of the payment of both principal and interest on the college and academical lands, until it might well appear that the popular expectation was that the lands were to be turned over to the people as a free gift. An attempt to lift the sinking infant from its cradle by that primitive method, a lottery, failed from inability to sell the tickets.

In 1820 the college united with the Hampden-Sidney Academy, which had been chartered under the same expectation of a public subsidy at Knoxville in 1806, and its principal, Rev. D. A. Sherman, became president of the united schools, although each retained its own board of trustees and conducted the business of education on its own empty treasury. In 1821 Governor McMinn forcibly reminded the legislature of the deplorable confusion into which the educational land-grants of the State had fallen, and a similar call for justice was sounded by his successor with no result. But in 1822 relief came indirectly from an agreement with the State of North Carolina which, in consideration of the exemption from taxation of lands donated for the payment of the soldiers of the Revolution, had transferred to the State University of North Carolina a direct gift of 60,000 acres of land; passed this land over to Tennessee—20,000 acres to be given to the East Tennessee and 40,000 to

Cumberland College at Nashville, regarded as the Western State University. In 1825 the college obtained what is estimated as the small sum of \$24,000.

The greatest misfortune of this prolonged warfare between the settlers and occupants of the lands and the educational claimants for their rights was the growth of an almost vindictive popular prejudice against the colleges. This feeling, of course, was nursed by the small political demagogue, and skillfully worked up by leaders of the different religious bodies in the effort to make the people dependent on the church as the legitimate dispenser of both the secondary and the higher education. This long-drawn warfare of thirty years between the college and the people of the districts in which the university lands had been located was closed by a treaty of peace in 1838, whereby the East Tennessee College consented to accept the gift of half a township of land. Out of sale of this it realized the sum of \$34,000, in place of the \$100,000 in land grants, contemplated by Congress in its original gift to the State. This sum, at interest, in thirty years would have amounted to \$300,000. The college realized by all these donations from the State not more than one-fifth of this sum, which would have furnished an ample, even a munificent endowment, according to the ideas and practices of the American college foundation of that period.

It was also a misfortune that, during the first thirty years of the history of the East Tennessee College, there had been no effective public school system in the State. Hence, this institution fell into the usual habit of all the State universities in the South established before the advent of the common-school system. One and all, in their curriculum and methods of instruction and discipline, persisted in the regulation way of the old-time American, which was only an imitation of the British college of the period. Many of their presidents and professors were men of unusual ability and, for the time, of ample scholarship. But the ambition to rival similar institutions in the old States and even the European schools, of which many of their teachers were graduates, lifted them far above sympathy with the ungraded secondary and elementary educational establishments of that day. They became often a refuge for the sons of the wealthier citizens and the nurseries of the social and political theories held by the leading class of Southern society. Even to the present day, the cause of universal education is hindered in some of these States by this singular lack of conciliation, even of sympathy with the State University, which should be the head of the public school system and of the graded high and elementary departments established during the past thirty years. As it was, the East Tennessee College, previous to 1838, had sent forth a small class of graduates, afterwards distinguished in the annals of the State, after a fashion justifying its existence even under the exclusiveness of its educational policy.

An even more destructive result of this experience of thirty years was the fact that, as the East Tennessee and Cumberland colleges were nominally under State support, they received little from private donation. This source of income, often most valuable even at present for the State universities of the country, was monopolized by the multiplication of denominational academies and so-called colleges, of which, as already shown, in 1840, there were a considerable number. Without discussing the question at issue between the advocates of the State and the "Christian" or denominational college and academy, one may say that the multiplication of the latter, until a recent date, has prevented the concentration of educational funds in a leading university similar to Harvard, Yale, Columbia, Princeton, and the University of Virginia in the original States. This has especially been felt as a great hindrance to the cause of a genuine type of academical and collegiate education in those commonwealths. The reckless assumption of the highest names, college and university, by academical schools, even by the institutions for colored youth, up to the present time has confused the public mind and rendered any positive concentration of effort on the highest and broadest provision for university and college training almost an impossibility. The great recent wealth of the old Middle and Western

States has, in a measure, prevented the worst effects of this policy. But in the South, crushed and overwhelmed by the outcome of the civil war, these institutions of the secondary and higher learning found it necessary to adjust themselves to the needs of all classes of students, and only by the slow and painful efforts of its foremost educators has it been able to rise above this grievous disability. In Tennessee and Kentucky and other States it was truly said: "Of the making of colleges there is no end. Every cross-roads hamlet has, not its academy or high school, but its college."

In 1840 the name of the institution was changed from "The East Tennessee College" to "The East Tennessee University." During the period now briefly recorded the presidency of the East Tennessee College was held in succession by Rev. David A. Sherman, who remained in office till 1825, and the Rev. Charles Coffin, D. D., as his successor, who resigned in 1832. He was succeeded by James H. Piper, who resigned after one year, and his place was taken by Dr. Joseph Estabrook. All these gentlemen, save Piper, were natives of New England and graduates of Harvard, Yale, and Dartmouth colleges, as the first president of Blount College was of New England descent. At this time there appeared, first as tutor and afterwards as professor, one of the most eminent of the future publicists of Tennessee—Horace Maynard. His connection as professor in the college terminated in 1843, and he became especially known to the country by his heroic espousal of the Union cause during the civil war. The administration of President Estabrook continued until 1850. During this period the university saw better days. From the sale of a portion of the college lands several new buildings were erected at a cost of \$21,000; literary societies were established and a university magazine published. Regular college classes were formed in 1837, and the first action under the new arrangement was taken in 1837-38. In 1846-47 there were 169 students, and the reputation of the institution had long since extended to the far-off States of the Northwest.

Hon. W. B. Reese succeeded President Estabrook, but resigned in three years. His successor was Rev. George Cook, a native of New Hampshire, and a graduate of Dartmouth College. He had been for several years the principal of the Knoxville Female Academy. The university then fell into one of its periodical fits of depression, succeeding the favorable prospects of the former ten years. The city of Knoxville was visited by the cholera, and President Cook was charged with hostility to the institution of slavery. The university did not open in 1854 until the spring term. After several unsuccessful attempts to establish a medical and an agricultural department and to consolidate the university with other schools, President Cook resigned in 1857.

The university was now suspended for a year, unable to secure a president. In 1858 Rev. W. D. Carnes, a minister of the Christian Church, was elected, having come up to this honor from his graduation and service since 1842 in different subordinate positions. Tuition was placed at \$25 in the college and \$20 in the preparatory departments for five months, and the president received from the endowment fund \$400 and each of the faculty \$250, increased by student fees. A medical department was established, on paper, with five professors, but did not go into practical operation for lack of funds. A similar attempt to establish a military department was made in 1859. In 1860 President Carnes resigned and was succeeded by Rev. J. J. Ridley. His administration opened with favorable promise of success.

The sons of clergymen of all denominations were educated free of tuition. The military department, which had now been successfully established, especially became popular. The number of students was doubled.

But when the deluge of civil war came rolling down the valley of East Tennessee the president resigned, the college work was suspended, and, until 1865, the buildings were used, in succession, as barracks and hospitals for the Confederate and Union forces. The Congress of the United States afterwards appropriated \$15,000

as compensation for this usage. With this untimely close we leave the University of Tennessee, to be welcomed again in the day of its resurrection, at the close of the civil war.

THE UNIVERSITY OF NASHVILLE.

Like the University of Tennessee, at Knoxville, the University of Nashville dates from the earliest period of Southwestern colonial settlement. In 1785 Davidson Academy was founded at Nashville. The State of North Carolina endowed it with 240 acres of land. The Rev. Thomas B. Craighead was elected president, and the school was taught by him for twenty years in his own church building. The tuition fee was \$25 per annum. The institution was as unpartisan in politics and as unsectarian in religion as was possible and remain in accordance with the spirit of the times. Nashville was then a village of 400 people, with no probability of becoming the capital of the future State. Like the corresponding school, Blount College, its board of trustees contained a fair proportion of the foremost men of the Territory, among whom was young Andrew Jackson.

In 1807 Davidson Academy had grown to Cumberland College. The chief reason for this was the hope of support from the new public-land fund granted by Congress. Already the college was to receive one-half of the 100,000 acres, valued at \$2 per acre, given by Congress for a college in the eastern and western sections of the State. Up to this date the only building was a brick structure, not finished until 1808, costing \$12,240. The new college was launched under the presidency of Rev. James Priestley, with himself and the Rev. William Hume as professors and George Martin as tutor in the preparatory department. This arrangement held on for eight years, to 1816, when the college was suspended, and on its reorganization Dr. Priestley continued at its head until his death, in 1821.

Up to 1816 the institution had graduated nineteen students. William Hume was one of that considerable class of foreign-born and educated schoolmen who were oftenest found in the colleges of the South, from their earliest years to the period of the civil war. His broad mantle has fallen on a succession of his descendants, and his family is still represented among the educators of the South.

The reason given for the collapse in 1816 was lack of funds. The institution was involved in the mazes of the great land controversy already noted. Its State patrimony of 240 acres had soon depreciated, as lands could only be sold in Tennessee at a very moderate price. During the period from 1821 to 1824 the search for a new president went on. Dr. Philip Lindsley, a native of New Jersey and a graduate of Princeton, already noted as a successful teacher, on a third invitation accepted the position, and came to Nashville in 1824. He was then 38 years old, for all intents and purposes in the flower of his great ability and high expectations, and numerous regrets followed him from one of the old Central States to his new home in the Southwest.

For the ensuing twenty-five years, till 1859, the history of Cumberland College, or the University of Nashville, as renamed in 1826, was bound up with the educational career of its great president, Philip Lindsley. It is noted that the original presidents and professors of this college were generally drawn from the Presbyterian ministry and the Middle States of New Jersey and Pennsylvania, as the corresponding officials of the University of Tennessee, at Knoxville, were nearly all from New England. But both these institutions were established, from the first, on a nonsectarian religious basis, like Transylvania University, in Kentucky. But in this original diversity of their educational status may be traced some important results to the future of Tennessee. Dr. Lindsley was a powerful and consistent advocate of universal education, as far as it could be advocated in a slave State and confined to the white population. But he held with enthusiastic and even obstinate pertinacity to the idea that the university was the center and soul of all successful education, and an effective secondary and common school were its logical results. The New Eng-

land idea, though outwardly at that period accepting the same statement, placed a much greater emphasis on the people's common school as the true foundation of all that could be built above and upon it. As the years went on this divergence was more noted, and the State University of Tennessee, at Knoxville, after the close of the civil war, became a celebrated headquarters of the movement for the establishment of the graded common school in Southern villages and cities. Perhaps the most brilliant group of superintendents of the graded schools of the Southern Atlantic and Southwestern States dates from this university, several of the most distinguished being natives of Tennessee and graduates of this school.

The character and career of Philip Lindsley has already been treated in one of the previous essays on the common schools of the South. We have already shown with what a broad apprehension and catholic, even prophetic spirit, he entered on the great work of building up, under the most adverse conditions, in the village capital of a new Southwestern State, a rival to the leading universities of the New England and central Commonwealths. That he failed to achieve his splendid idea, and, indeed, never gathered more than 150 students, taught in a few extemporized buildings by a poorly paid faculty, and finally left his work in the hands of his son in 1850, quite worn-out and almost despairing of present success, has been already shown.

The fact was that from 1825 to 1850 the State of Tennessee was in no condition even to comprehend the plans, much less pay for and support by educational college material such an establishment as hovered before the exalted vision of the enthusiastic and consecrated president of Nashville University. One decided hindrance was the lack of an effective common-school system or, at least, a group of preparatory schools to furnish the class of students required for such institutions. Another was the educational crudeness of society in the Southwest. These States for many years were so involved in the struggle to wrest the soil under their feet from the stubborn savages, who contested every mile of territory to the bitter end of barbarism; so embarrassed by the institution of slavery, which divided the agricultural, practically the only social, order into the two classes of the great and the comparatively unimportant landowners; so hampered by the widespread illiteracy of a great number of the white people, and so held in the grip of an ironbound theological and ecclesiastical domination, which has always been at once the strength and the weakness of American Protestantism, that the splendid appeals of Lindsley and the undeniable merits of his powerful school were rather felt in a slow and gradual educational uplift of the country than in the graduates of the university. In 1824, on the accession of President Lindsley, there was not a college within 200 miles of Nashville. In 1850, when he left the city, there were 30 so-called "colleges" within 200 and 9 within 50 miles of the capital of Tennessee.

The story of the university during the quarter of a century of the presidency of Dr. Lindsley has been told. The addresses and plans of the president seem at first to have startled the almost sluggish educational spirit of the State. But this growing influence woke up a denominational zeal which, subsequently, filled the land with rival schools. It can not be denied, also, that the severely classical type of schools like the University of Tennessee cooperated with the prejudice excited by the great conflict over the school lands to drive away the majority of college students. The denominational schools, on the contrary, were nearer the hearts of the people, not involved in the public contention, and probably, with their less thorough curriculum and larger liberty of study, more popular with the mass of their constituents. Philip Lindsley, although in many respects highly conservative in his educational ideas and projects, for twenty-five years appeared before the people of western Tennessee as a visionary and a radical. But his board of trustees included many of the most influential public men of the State, and from its 1,000 students, the entire number from 1825 to 1850, came twenty-eight members of the Congress of the United States and a corresponding number of eminent men in all professions. Sixteen professors were

employed, at different times, in the department of instruction. A medical department was inaugurated in 1850, which has grown into the present celebrated schools of medicine of Nashville. A military department was also added, by consolidation with a school already established, with buildings in the city, which for a time increased the number of students, especially on the approach of the civil war.

In 1850 the university was believed to be on the gain, its possessions increasing from \$116,000 to \$140,000, to a considerable extent due to the operations in its real estate. The original situation of the institution had been changed and new buildings were in the course of erection, though not according to the large plans of the president. His idea of manual training as a proper department of university life was also a half century in advance of the time and place, and came to nothing. The decline of the school was precipitated by the breaking out of the cholera in Nashville in 1848-49, which almost depopulated the city of its students. In 1850 President Lindsley resigned and left Nashville for a professorship in the Presbyterian Theological School in New Albany, Ind. He died in Nashville, on a visit as delegate attending the General Assembly of that church, in 1855.

The career of Dr. Lindsley was, beyond question, the greatest personal educated influence in Tennessee during the quarter of a century of its continuance. His university was the broadest in its scope and the most thorough and progressive in its methods of instruction of any similar institution in the Southwest. Dr. Lindsley was a teacher of rare personal character and power, and the class of students capable of appreciating his superiority were his admirers to the verge of worship. There was no man in the South from 1825 to 1850 whose words reached so far and resounded with such potent effect upon the cause of universal education. In this respect he was well mated with the great educational leaders of the revival epoch, from 1830 to 1860—with Mann, Barnard, and their noble following in the central and Western States, which built up the present organization of the American common school; but, unlike the majority of these great men, Dr. Lindsley seems to have always viewed education from the university point of observation, and to have had wavering and somewhat unformed ideas of the place and functions of a system of popular education. Indeed, at one time he appears to have advised the suspension of the common schools and to have seriously considered the possibility of home and family education among a people too little interested in education itself to support even the country district school of seventy years ago; but his name is still a power through the entire region so long aroused by his appeals and instructed by his ideas, and the name University of Nashville, now best known through its most active department, the Peabody Normal College, perhaps more nearly than any institution of learning in the Southwest, is the response to the prophetic faith of its great president in its day of beginning.

It is not in the purpose of this essay to trace the rapid growth of the private, collegiate, and denominational academies and colleges that during this period limited the growth of the two State universities of Tennessee and largely explained the slow progress of the public common school. These numerous and often excellent schools account for the notable public and professional eminence in the class then in almost supreme control of public affairs. But their lack of suitable arrangement for good elementary instruction was seen in the growth of an illiteracy that at one time left Tennessee far down on the rounds of the educational ladder, and still keeps a considerable portion of the State in this respect in a condition satisfactory to no true friend of universal education.

THE COMMON SCHOOLS OF TENNESSEE.

In the year 1806, ten years after the admission of Tennessee as the sixteenth State of the Union, the Congress of the United States extended to the new Commonwealth the same bounty as had been secured for the rising States of the Southwest, in the generous appropriation of public lands for education. Not only was the ample

domain of 100,000 acres given for the establishment of an academy in each county and a like amount for a college in each section of the State, but the needs of the children were also abundantly recognized in the following provision: "And the State of Tennessee shall moreover, in issuing grants and perfecting titles, locate 640 acres to every six miles square in the territory hereby ceded, where existing claims will allow the same, which shall be appropriated for the use of schools for the instruction of children forever."

But it is one thing to draw up a public document and another thing to enforce its purport in the midst of an army of clamorous claimants ready to talk, vote, and, if need be, to "ride roughshod" over all laws and ordinances that conflict with what they honestly believe to be a substantial right to the contrary. Herein is the original and valid explanation of the fact that until the close of the civil war the history of the common school in Tennessee is virtually the history of an interminable conflict of the State with the population of the large district of the Commonwealth covered by this original cession of school lands. It was not so much a resistance to the education of the children by these people as a conflict of interests, whether it were worth the while to turn themselves "out of house and home" by abandoning their farms, gained and tilled by the most extreme labor and held in constant peril of life, for the remote prospect of schools for their children. In this long-drawn contest the majority of the people were so exasperated at what they regarded the injustice and inhumanity of their legislature that in the end the name of public school, academy, and college was like the flag of a common enemy flaunted in their faces. Doubtless the legislature could have done complete justice to both parties in this controversy by voting compensation for the lands which were already covered by valid claims. But all good things in a new republic are not born in the same year. While the early New England settlers at once acted on the radical democratic idea that the State is bound, at least, to aid substantially in the education of the children, there was no such general conviction of public obligation in the States of the South as was maintained for a lifetime by the great champion of American democracy, Thomas Jefferson, and rejected by Virginia as late as 1820, and never sincerely acted upon, even by that Commonwealth, until 1870, five years after the fall of Richmond and the close of the war of the sections.

We have already set forth the other practical hindrances to the early action of Tennessee on the matter of supreme concern to every new American State, the training of the children and youth for American citizenship. They were the comparatively sparse population of all the Southern States, almost like a colony in a wilderness; the loose survey and allotment of the empire of wild lands that held out an invitation to all mankind to "come and take without money and without price;" the radical weakness of local government in commonwealths ruled so fully by the public opinion of a superior class, responsible for the condition of industry, church, school, society, and politics; the severe spirit of social exclusion which separated the children of the dependent from the dominant class by barriers almost as high and strong as the old-world distinctions of race and caste; the violence of sectarian religious partnership that for two full centuries virtually placed the education of the children of sixteen States in the hands of the clergy and zealous laity of the different Christian sects. All these influences, strong everywhere, were especially powerful in States like Kentucky and Tennessee, settled by an energetic, ambitious, proud, and sensitive people, ever ready to assert what they believed their just individual rights, and easily provoked to reckless and violent outbreaks in what was regarded the interest of the people versus legislature and even law and order itself.

So it is neither just nor necessary to assert that the early people of Tennessee were an ignorant and illiterate class, in the modern educational sense of that term, because they so long failed to get on the ground what all men must admit to be the most effective and democratic agency for training their children up to good citizenship of State and

nation. Even among the thousands of white people who figure in the census tables as unable to read and write would be found many who, in more than one direction, had been educated by the stern teacher, necessity, into the manhood and womanhood which are the best assurance of republican society. The life lived in the making of such a Commonwealth as the present State of Tennessee was itself a university, even with books and schools left out. A people that cleared the boundless wilderness of savages, now occupied by half a dozen of the United States, brought it into a condition fit for occupation by civilized men, governed commonwealths, built cities, and crowded their great rivers with commerce, then hurled back the flower of the English armies, the veterans of Wellington, and later, even under the terrible temptation of secession, gave to the cause of the Union a larger contingent of patriotic soldiery than Washington ever commanded, can be trusted, in due time, to take up the cause of the full and free education of its younger generation, as the State of Tennessee has already done. The city of Nashville may still boast that it is, in some ways, the educational center of the Southwest, and the larger cities and villages of the State can show a record of recent public-school life of which no American community need be ashamed.

In the present essay it will only be necessary to indicate the planting and growth of the common-school idea in Tennessee during the years of the great American educational revival, from 1830 to 1860. Much of this would be included in the history of its leading public-school educator. The career of President Philip Lindsley and his son cover the entire space from 1824 to the close of the civil war. Other names might be mentioned, less prominent, but still cherished in their respective localities. We have already shown how the policy of the university at Knoxville, through a series of able educators from New England, gave to this institution a decided leaning toward popular education, which was manifested by the remarkable group of its graduates during the final movement for the establishment of a common-school system through the Southern States.

The history of education in Tennessee would be like the play of Hamlet without the Prince of Denmark were the names of Samuel Doak and the group of Presbyterian clergymen that appeared in the earliest years of the Territorial life of the State left out. Doak came of North Irish ancestors, who successively lived in Pennsylvania and Virginia, on their way to the new world beyond the mountains. He was schooled for two years at Princeton College, which he entered at the age of 24, in 1773. For two years he did service as tutor in Hampden-Sidney, the Presbyterian college of Virginia, where he studied theology and was licensed, and for a time preached in Virginia. He appeared in Washington County, Tenn., where he occupied a farm, and built the first church and schoolhouse in the State—the schoolhouse declared “the first literary institution that was established in the great valley of the Mississippi;” although in this claim it is probable that the existence of Catholic mission schools and churches, previous to that date, is overlooked. He fought in the war of the Revolution, and was enlisted in the attempt to set up the new state of Frankland in the far-off wilderness of what was then western North Carolina. His associates—Houston, Balch, Carrick, and Craighead—were also a fine representation of that division of the army of the Lord, which regarded the schoolhouse the twin sister of the “church house,” and looked upon ignorance as the chief of staff of Satan in the enslavement of mankind. Indeed, Craighead, the first president of Blount Academy, was so pronounced in his advocacy that he was in perpetual hot water with the denominational authorities in the town, and for a time, suspended from the ministry. But he never was suspected of heresy in the broader communion of the ministry of education, and finally compelled the church in Tennessee to come to his educational views, in 1829.

The first school in Tennessee was founded by Samuel Doak and chartered by the legislature of North Carolina; first as Martin and afterwards as Washington Acad-

emy, at Salem, in 1795. Doak held the presidency of the school until 1816, resigning in favor of his son. In religious faith he was a cast-iron Presbyterian, of the enduring Scotch and Scotch-Irish type. He believed with all his heart and soul and might in the power of knowledge to lift up the souls of men and, with the complete dedication of his powerful manhood, labored to direct the popular mind of the new Territory to the cause of education. His college still remains, a useful school of the academical-college type, and the spirit of its founder still inspires the people of the beautiful region now known as East Tennessee.

Although the new State was given a royal portion of public-school lands by the act of Congress in 1806, they never turned out a very profitable estate. To a people who regarded 50 cents per acre an extreme price for the best wild land and \$1 unbearable, the sum of \$2, fixed by the act of cession as the value of the school lands, was regarded a positive "imposition." The great war of the land "sections" made it a practical impossibility to realize from this source. This war continued through an entire generation and, through its clouds and storms, looms up the possibility, only to disappear, of any permanent educational policy in the State. But, as in the old-time rhymed contest of "the upper and the lower mill," that "fell out for want of water" and "went to law—that is, to war—resolved to give no quarter;" the conflict ending, as told in the record:

One lawyer took the upper mill,
The lower mill the other.

So, when this notable conflict came to a truce, the original purpose of the grant, "the education of the children forever," while appearing in the original deed of cession, was left as dry and parched as the rival mill ponds in the dry time of a Southern summer drought.

Indeed, it was not till 1830, almost twenty-five years after the cession by Congress, that the legislature of Tennessee heeded the perpetual reminder of its governors; who, through the entire history of the common school in the State, enforced the claims of popular education and its imperative necessity for the life of the Commonwealth. In this year, 1830, an attempt was made, that the county court, established by a statute of 1829, should lay out school districts and estimate their population. A body of five trustees was to be elected, and the chairman of these bodies was to name school commissioners for the county. The revised constitution of the State, in 1835, certainly ties up the school fund as fully as the fundamental law can do it.

The constitution of Tennessee—March 5, 6, 1835.

ARTICLE XI.

SEC. 10. Knowledge, learning, and virtue being essential to the preservation of republican institutions, and the diffusion of the opportunities and advantages of education throughout the different portions of the State being highly conducive to the promotion of this end, it shall be the duty of the general assembly, in all future periods of this government, to cherish literature and science. And the fund called "the common-school fund," and all the lands and proceeds thereof, dividends, stocks, and other property of every description whatever, heretofore by law appropriated by the general assembly of this State for the use of common schools, and all such as shall hereafter be appropriated, shall remain a perpetual fund, the principal of which shall never be diminished by legislative appropriation, and the interest thereof shall be inviolably appropriated to the support and encouragement of common schools throughout the State, and for the equal benefit of all the people thereof; and no law shall be made authorizing said fund, or any part thereof, to be diverted to any other use than the support and encouragement of common schools; and it shall be the duty of the general assembly to appoint a board of commissioners, for such term of time as they may think proper, who shall have the general superintendence of said fund, and who shall make a report of the condition of the same, from time to time, under such rules, regulations, and restrictions as may be required by law: *Provided*, That if at any time hereafter a division of the public lands of the United States, or any of the money arising from the sale of such lands, shall be made among the indi-

vidual States, the part of such lands or money coming to this State shall be devoted to the purposes of education and internal improvement, and shall never be applied to any other purpose.

SEC. 11. The above provisions shall not be construed to prevent the legislature from carrying into effect any laws that have been passed in favor of the colleges, universities, or academies, or from authorizing heirs or distributees to receive and enjoy escheated property, under such rules and regulations as from time to time may be prescribed by law.

But a report of the joint committee of the legislature, in 1837, in which appears the name of Washington Barrow as chairman from the house of representatives, shows that no satisfactory condition of educational affairs had yet been arrived at. The committee say:

The subject of education has never yet received in Tennessee that attention which it so richly merits. Appropriation after appropriation, it is true, has been made to the support of common schools; but the system adopted under the name has heretofore proved imperfect and by no means equal to the expectation of those who first established it. While this has been the case with the common-school system, a prejudice has prevailed against the higher institutions of learning, academies and colleges, neither of which has consequently ever received much from the munificence of the State.

This report is written in the broadest spirit of educational policy and urges the establishment of a complete system of education, including the common, academical, and collegiate departments, under public supervision, and supported by the income of the State school fund. It is stated that the school fund, proper, with the addition of the surplus revenue, will amount to nearly \$2,500,000. Of this, the amount of \$2,000,000 should be appropriated to common schools. One hundred thousand dollars could then be realized, which would be ample to found a system—"a partnership between State munificence and individual enterprise and liberality." The report does not favor entirely free instruction. The system of New York is favorably mentioned as a model for the State of Tennessee. A fund of \$50,000 had been secured for the academies, which the committee proposes to increase by \$600,000 from the surplus revenue, from the \$650,000 invested hoping to realize \$40,000 annual interest. This would give \$550 to each of the seventy-two counties of the State as a bonus to an academy; "sufficient to support a first-rate teacher," on condition that the county would erect and furnish buildings, etc. These schools should be accessible to both sexes, "in separate apartments," the tuition to be free to those unable to pay, on condition that the recipients should teach in the common schools and thus supply a greatly needed want. The colleges should be endowed by the remainder of the income of the surplus revenue—\$300,000; \$100,000 to Knoxville, \$100,000 to Nashville, and a third \$100,000 to a new college in the western part of the State. Thirty poor young men should be educated free, on condition of becoming teachers. The committee believe that this arrangement will end the bitter controversy over the disposal of the school lands. The enthusiastic chairman of the committee indulges in a golden dream of the spectacle of 3 colleges, 70 academies, and a system of common schools, "shedding their united light and heat into every corner of the State."

The law of 1838, passed in response to this able and earnest plea for the children, complied with the previous request for a State superintendent of instruction and enlisted the services of a variety of State and local officials. But the efficiency of the system was concentrated on the five school commissioners who were to be elected once in two years by popular vote in each school district. To this body was given a weight of official duty that was in itself a strong argument for the reluctance to accept the office that soon developed itself. This board was required "to take a census of the scholastic population every year; to provide and locate schoolhouses, with the care of the same; to engage, pay, examine, and if necessary, dismiss teachers; to visit and inspect the schools at least once a month; to inspect the teacher's registers, and fix the tuition by a rate bill; and to make a report every year to the clerk of the

county court, including a great variety and amount of information respecting the state of the schools, and in case of failure in discharging certain of these duties considerable penalties are attached." All this service required the attention of more than one man for a county, and was to be rendered to the State as a labor of love. There were 71 counties in the State, containing 987 civil districts, each of which was recognized as a school district. In 911 of these districts commissioners were elected. In 76 none were elected, or those that were chosen refused to serve.

Here was a fatal defect in the organization of the common school. No public interest could survive the imposition of an army of public officials so numerous, so inexperienced, and under such constant temptation to neglect or abuse their official duties. The county commissioner was the next step in this elaborate scheme. He was compelled, with a small compensation and under severe penalties, to become a sort of city superintendent, in his oversight of the performance of his army of crude subordinates. To the county treasurer was given the duty of disbursing the State funds, with a commission of 1 per cent for his services. The system was booked for its beginning in January, 1838, but the State superintendent, Robert McEwen, in his report of October 8, 1839, declares that at the beginning of the year he had no sufficient information to justify the distribution of the funds, and the new districting was not made until July 1. On the last day of June, 1838, it was established that the school population of the State amounted to 185,432 between the ages of 6 and 16. The superintendent announces that "already a very considerable number of schools have been established and under highly flattering auspices," and that a good educational spirit prevails among the people.

But no system of common schools on paper, however elaborate, could safely be cast forth into such a howling wilderness of financial confusion as greeted the appearance of the first public school of Tennessee. One of the frequent cyclones that work a periodical financial destruction on so many new American Commonwealths burst upon Tennessee the very year of the inauguration of the school system. The school funds of all descriptions from lands and surplus revenue were involved in this calamity. The State Planter's Bank, which was the depository of these funds, fell into general disrepute. During this period of an inflated and unreliable paper currency, the superintendent exercised his own personal judgment by loaning large sums of the public school funds to personal friends. The failure of these creditors to come to time plunged the funds of the public schools in a slough of despond. "The superintendent was prosecuted and a receiver appointed, but nothing practically effected." Under these conditions the excellent suggestions of other portions of his report of 1839 failed of any appreciable effect in building for the children and the rescue of the children's patrimony.

In 1839 a committee of seven appointed by the legislature to examine the accounts of State Superintendent McEwen, made a report concerning the transactions of that official from the year of his first election in 1836. It appeared that, in the exercise of what he claimed to have been a necessity forced upon him by the financial collapse of 1837, he had been accustomed from the first to retain in his own hands and loan to private parties large amounts of the school funds. Of the morality of these transactions the committee does not speak, but the outcome of this four years' business was an indebtedness of the superintendent to the State of \$121,169, of which \$11,728.61 was for interest unaccounted for. All this, the committee assert, was in flat disobedience of the law made for the investment of all moneys received in certain banks of the State. The committee adds a statement of the school fund. One million three hundred and thirty-two thousand nine hundred and fifty-six dollars and thirty cents is pronounced "good," and \$66,844.68 "doubtful"; total \$1,399,800.98. The report closes with these expressive words: "The legislature of our State has been long and persistently engaged in the difficult business of administering a valuable fund for the purpose of education. But, in spite of all these efforts, it has been time after

time plundered by a thousand hands. If we desire to preserve and cultivate the ample fund we now have, we should place such restraints upon those through whose hands it must pass that they will not waste it with impunity. It is a duty we owe ourselves, our children, and the Commonwealth to preserve it unimpaired."

A subsequent investigation by a committee of five, involving several members of the former board, revealed an even more serious condition of affairs. According to this, the superintendent of public instruction was a general operator in a variety of "wild cat" schemes, such as banks, insolvent from the beginning; loans to partners in mercantile houses; land companies in Texas and Alabama, with a constant reputation for "note shaving," converting depreciated into more or less reliable funds, all in direct disobedience of the requirements of his office.

The report of State Superintendent R. P. Currin, in October, 1841, with the exception of half a page, is entirely confined to the results of these investigations. The financial affairs of the department of education had been placed in the hands of a receiver, who, in the first six months of his administration, had collected \$17,000 of the \$121,000 in the hands of the late superintendent. An appeal to a higher court on the whole matter was then impending. The new superintendent divides the school funds into two classes: (1) "Many notes and evidences of debt in the hands of county agents." (2) "Judgments in favor of the old State Bank of Tennessee." The latter, amounting to \$77,372.58, seem to have been placed, by common consent, on the wrong side of the public ledger. Of the former debts due for land grants, there was found the large sum of \$127,387.18. But the view in this direction resembled the prospect of a mirage on a Western prairie. It was doubtless true, as the superintendent declares at the close of his report, that "popular education is rapidly rising in popular favor, and it is tested that this form will be universal and final in a consensus of substantial benefits." But it must be confessed that the prospects of a common-school department six months in office were somewhat dubious that had nothing more hopeful to report than that the constant effort to arrest the "thousand plundering hands" stretched forth toward the school funds accounts for "the failure to present to any considerable extent their plans for the improvement of the common school, whatever the engagements of the office and the performance of its ordinary duties might be expected to suggest." There had been distributed through the State, on January, 1841, the sum of \$120,449.99. A revision of the school laws in 1840 tied up the public-school funds with new regulations and reduced the number of commissioners in each district to three. The school population of the State in 1841 was estimated at 186,097, and the amount distributed was \$120,452.06— $64\frac{11}{16}$ cents to each child; an increase in the number of children of 6,000, and of five-sixteenths of a cent to each pupil.

From the year 1840 to the breaking out of the civil war, in 1861, the history of the common schools of Tennessee is largely a record of numerous legislative provisions for the preservation and issue of the State school funds, with small regard to that supervision of public instruction without which the most generous expenditure would only amount to throwing money into a bottomless pit of confused and incompetent administration. The office of State superintendent was abolished in 1843, and the enormous burden of the oversight of the education of the white school population from 6 to 21 cast on the already sufficiently weighted shoulders of the State treasurer, with no additional salary for that official and no special bond required for the protection of the schools. The result was, as described by Gen. John Eaton, first State superintendent of public instruction in Tennessee, after the close of the civil war, in 1869: "The provisions of the former school code related only to schools for whites, and made the treasurer of the State superintendent of public instruction. There had been no superintendent of the State schools under the new law—1867; therefore I turned to the State treasurer for reports, but found none, neither any records, save a bundle of old letters. Seeking of leading men,

prominent in State affairs in the past, I failed to find any one who could tell me, in detail, exactly how the former system operated in its various provisions, from district commissioners to State treasurer. It was apparent that there had been no report exacted from each official to the State of the discharge of his responsibilities. The scholastic population was reported to the State, and the State fund for distribution was apportioned and paid out to the trustees of the counties. The State did not know, and could not tell, whether a dollar was expended as the law required—whether it was used for public or private purposes, or a child taught, or not. The provisions of the code appear to have been a dead letter in all respects during the war, after the reorganization of the State government, till the passage of the new law. Under this statute, nothing was done save some collections of portions of the school tax for the entire year previous to my appointment as superintendent, in October, 1867. Seeking information as I could, I met exceedingly diverse expressions of opinion. The revenue officers of the State assured me that they had no money in the treasury; that there having been no schools in operation to call for the money, it had been, in the State's distress, used, like other revenue, to liquidate the indebtedness of the State." The State system was to be rebuilt, like a ship upon a sea, still rolling and surging under the influence of the recent storm. During the year 1867-68, in a table of educational statistics in the United States, prepared by Hon. Z. F. Smith, State superintendent of Kentucky, the State of Tennessee does not appear. So completely had the organization for popular education existing up to 1860-61 been swept away by the ravages of the great war that, in the words of Superintendent Eaton, "Educational facts in regard to Tennessee, at that date, were not considered worthy of notice."

When we turn to such records of the operations of the public-school system of the Commonwealth from 1840 to 1860, we are at no loss to understand the fact and to locate the responsibility for such an utter wreck of the school system that had been in operation in its own irresponsible way for a period of nearly thirty years. It was not true that the people of Tennessee from the beginning were unfriendly to, for in many cases they were eager for, the education of their children and youth. The original settlers of East Tennessee, as we have seen, proceeded at once to build the schoolhouse, while they were compelled to till the earth and worship God with their loaded muskets at hand to defend themselves and their families from the hostile savages. And although, according to Governor A. V. Brown, it required two entire generations to bring the new lands to a state of cultivation to insure comfort and the rude plenty of the time to the people, yet the College of East Tennessee was graduating well-taught pupils, and other colleges and academies were improving in their course of studies and method of instruction. The early settlement of Nashville, we have already seen, was commemorated by the establishment of the Davidson Academy, and right there was enacted one of the noblest experiments in university life on record in the history of the Southwest.

Tennessee was largely settled by a class of well-to-do planters, who were not wanting in their appreciation of educational facilities for their children. But a strange fatality seemed to hang over the new State for several generations after its settlement, in the lack of cooperation in public affairs, which took the form of an apparent suspension of the public educational interest. This was doubtless somewhat owing to the physical separation of the great territory practically into three commonwealths, each separated from the other by highlands that almost defied population, and of course were unfavorable to unity of interest among the occupants of the different sections. So these three divisions, eastern, middle, and western Tennessee, early contracted a bad habit of working at cross purposes in public affairs. The management of the public school lands from the first was without proper system, and between the people of the rival sections, the previous claims of settlers, and a lack of combination among the friends of popular education, the public-school fund was in a state of siege for sixty

years, to be finally captured and carried into a captivity from which it was only released by the reviving sense of educational obligation among the people at the close of the civil war.

But with the best intentions there could have been little satisfactory schooling with the singular complications in the official management of the schools. Every distribution of the public-school funds during all these years was compelled to run the gauntlet of ten different officials before it reached the district schoolhouse. When it left the hands of the treasurer of the State it virtually disappeared from the view of the Commonwealth. It is not necessary to infer that it was fraudulently appropriated. But there was a score of ways by which it could be "plundered by a thousand hands" on its journey to the children. The different officials seem to have had no power to enforce obedience to such laws as there were for the protection of the school moneys. There was practically no way to find out whether the commissioners who stood nearest the children were competent and faithful; whether the teachers taught or only "kept school." The attendance, the course of study, the grading of scholars—all the conditions of a successful administration of a system of public instruction—were wanting. It is not to be wondered at that the more enlightened portion of the people, who most felt the need of education for their families, were repelled by the vain show that such an arrangement must be, and built up the colleges, academies, and private schools in which they could have some prospect of reasonable training for the young. The records of the legislative enactments from 1840 to 1860 show a constant succession of newly chartered private and denominational schools, until it would seem that in every considerable neighborhood the district common school must have been under the shadow of a powerful prejudice among the well-to-do class, and in many ways regarded as an inferior place of instruction.

This record of legislation continued from 1840 to 1846. In 1840 the general school law of 1833 was revised, with important additions and supplements. In 1839 the State Bank of Tennessee was made the custodian of the school funds and the surplus revenue of the State—a portion of which was included in the school fund—and all debts due from the local school authorities to the State treasurer were called for. In 1840-41 attention was called to the first requirement: to issue the summons for the election of school commissioners; and other matters provided for in their administration. In 1843-44 the powers and duties of school commissioners were enlarged. Several new provisions for the management of school lands were made in 1845-46. Meanwhile the office of State superintendent of instruction had been abolished and his duties thrown on the shoulders of the State treasurer, who, at best, could only keep watch for the outgoings from the State treasury, but had no time to overlook the greater interests of education. In 1848 the president and directors of the State Bank of Tennessee, established to protect the interest of internal improvements and public education, were made a board of commissioners for the charge and distribution of the State school funds, now amounting to \$1,500,000. Several banks and insurance companies were compelled to pay a certain per cent on their capital as a condition of their charter, to enhance the school fund. In 1841 one-half the surplus revenue fund of the State had been added to the school fund. In 1845, by legislative act, the State was divided into school districts, each of which was authorized to lay a school tax by a vote of the people. In 1853 a tax of 25 cents on all polls and 2½ cents on each \$100 of taxable property was levied for the schools. The county judges, by a two-thirds vote, could impose a county school tax, or, in defect of the count, a majority could call for a popular vote on this proposition, and the secretary of state was ordered to pay to each an amount equal to what it raised itself. But in 1847 Governor Neil S. Brown speaks of previous efforts at education in this discouraging way: "The effort for popular education has slumbered and lingered and pined, and exists now rather as a memento of the past than as a living system for practical government and experience." In 1848 the city of Nashville reorganized its system of common schools,

which has done much to give to that beautiful and progressive city its present high reputation as a leading educational center of the Southwest.

Indeed, the statute books of Tennessee during this period fairly bristle with laws passed in favor of an effective system of public education; and from 1839 to the breaking out of the civil war the treasurer of the State made an annual distribution of funds, ranging from \$103,759.46 in 1839 to as low as \$70,154.29 in 1840; \$90,350.47 in 1850; but in 1843, the amount rising to \$163,174.32; in 1847, \$191,241.84; in 1855, \$159,262.83; in 1856, \$178,533; in 1857, \$199,328.29; in 1858, \$240,586. But there went along with this a discouraging column, representing the amount of funds remaining in the hands of the authorities of the counties, ranging from \$11,792 in 1839 to \$57,000, \$65,000, \$90,000, \$86,000, \$139,000 in 1846, an average of more than \$50,000 annually of the children's money unaccounted for in the treasury. In the two years, 1854-55, the State paid \$316,359 for common schools, colleges, and the State library, besides \$106,000 for its new charitable public institutions.

By act of 1850 the State paid \$18,000 annually to the county academies, each county receiving its grant with regard to population. The distribution for these schools had risen from \$17,000 in 1839 to \$28,560 in 1842 and \$23,000 in 1848, thereafter to be limited to \$18,000. The school fund invested in several banks and boards of control, etc., was transferred to the State Bank of Tennessee, as before stated. By 1855 the affairs of this bank were in a condition that demanded investigation. The committee reported that the school funds would have been better invested in State bonds at 6 per cent than in the stock of any corporation offering 2 or 3 per cent more, and especially in one which was subject, from its organization, to all the casualties arising from the change in its officials every four years, as the one or the other political party prevailed in an election, and to the carelessness, negligence, and fraud of those controlling it.

In 1848 it was found that, according to the examiner's report, the bank admitted a "suspended debt" of \$735,581, of which \$388,985 was declared hopelessly bad, and had debts to be paid out of the future profits of the institution amounting to \$211,433. The debts were due from the nine branches and numerous irresponsible individuals and corporations that had gathered, like a flock of buzzards that hover above a graveyard. The legislature, moved by a culpable carelessness in a season of panic, had chartered a great number of new banks, all of which at once fell off to 2 or 3 per cent, and were practically floundering in a hopeless slough of speculation outside their own proper business. The majority of the legislative committee united in a recommendation to suspend the Bank of Tennessee, or give it a power of controlling the actions of its nine subordinates which had wrought so much of the mischief. This idea, however, was not complied with. The bank went to wreck with the consolidated school fund during the civil war, and was finally wound up in the reorganization of the State government after the occupation of Nashville by the Union armies.

But enough has been said to expose the imperfect management of the people's school in Tennessee during this period of twenty years. A school system, like "a government of the people, for the people, by the people," is doubtless the highest achievement of the past, provided the people know what they want and elect to the post of administration men honest, competent, and patriotic. But a government of the people, displayed in a system of popular education without the support of energetic and intelligent supervision, is only an educational quicksand that will swallow up the grandest endowment and cause the efforts of a generation to go for naught. The beginnings of a genuine common-school system in Tennessee were only laid when Supt. John Eaton, afterward the eminent United States Commissioner of Education, who built up this Bureau from a little group of clerks in one room to one of the most effective departments of education in any land, faced the boundless difficulties of his position of first superintendent of public instruction under the reorganized State

government by the appointment of county superintendents and corresponding officials in neighborhoods in November, 1867.

Meanwhile there were not wanting indications that the people of Tennessee were not to be discouraged by the ill success of their public-school system, but were looking elsewhere for relief. It has already been shown to what an extent the better-off class, aided by the church and college, labored to supply their own educational wants by the establishment of great numbers of academies, numerous "colleges," and private schools of every sort. Indeed, the majority of these "colleges" and "academies" contained a preparatory and elementary department, and were open to all who came. Many of the families of the humbler station, unable to pay tuition fees, were more ready to receive aid from friends and neighbors to educate their children in this way than by the more public method of a sort of proclamation of poverty in the common schools.

An important agency of popular enlightenment during these years was offered in the county agricultural fair. These gatherings were attended by the foremost public men of the State. Besides the usual goings on of this style of gathering, the admitted influence on the farming and mechanical industries of the State, and the direction of efforts for revealing the vast natural resources of the Commonwealth, there was a notable feature included in the printed addresses on topics relating to the general uplift of society. In one of these, Governor A. V. Brown, as early as 1851, put forth an ideal of agricultural and mechanical training prophetic of the condition of the admirable organization of these departments in the present University of Tennessee, at Knoxville, under the administration of President Dabney. Dr. Boner, in 1855, prepared an elaborate programme of the grading and arrangement of studies in an institution of this sort. It was by the timely aid of the United States land grant for this purpose, in 1862, that the University of Tennessee, with several other important State universities and colleges of the South, were able to resume operations. Forty-two of these agricultural fairs were chartered in as many counties of the State by 1859-60, and the addresses, often of great importance, by the most distinguished public and professional men, were published in the annual State reports. In this way large numbers of people who had not enjoyed early opportunities of schooling, while listening to addresses of a superior character calling attention to a broader view of social, industrial, and public life than the ordinary political speech of the day, were receiving an education by the "natural method" of contact with superior minds.

Indeed, in all our investigations of educational affairs in the State during the years before 1860, we are constantly brought in view of the great amount of valuable instruction open to all the people, through the popular speaking and preaching of all kinds by which the South has always been distinguished. Leaving out the somewhat exaggerated local estimate of the favorite preachers and public men of the time, as "orators," there was a great amount of sound, instructive, and thoroughly practical public speaking always at the demand of every class. In fact, the slave population, especially in its most intelligent portion, profited by this, as by the conversation and their general intercourse with the superior people, especially the women of the white race, to such an extent that the country and the world were astonished at the number of well-informed colored men who stepped forth into leadership of their people on the emancipation at the close of the civil war.

THE PUBLIC SCHOOLS OF NASHVILLE, TENN.

The present public-school system of Nashville, Tenn., dates from a remarkable address delivered before the municipal authorities and people of the city, on June 7, 1848, by J. H. Ingraham, esq., on "Public schools and the importance of establishing them in this city." In this address Mr. Ingraham stated that there were in Nashville 2,015 children between the ages of 5 and 21; that there was in the city but one free school, carried on at the expense of \$600 a year received from the State

fund, with an attendance ranging from 20 to 70 pupils. The nickname, "Poor School," had made it an object of aversion, even for the poorer class. The lecturer claimed that the 1,400 similar public schools of the State, supported at an annual expense of \$118,000, were under the same imputation. There were also in the city 36 private schools, altogether containing 1,005 scholars. Regarding the number of available school children in the place as 1,500, and deducting 115 of the pupils out of the 1,005, there remained 890 Nashville children actually at school. This left 610 children who were without the means of education, nearly one-third of the entire number in a city of this size. Practically, 1,000 children and more in Nashville, in 1848, were living without the means of education.

In contrast to this, the eloquent speaker presented the condition of affairs in the city of New Orleans, La., where in 1842 the public-school system was inaugurated, with 26 schools and an attendance in 1848 of 2,600 pupils, under 57 teachers, nearly half of them young women, at an expense of \$36,000 annually. The instruction was gratuitous and without charge for books and stationery. As a result of this movement, a public school library of 8,000 volumes had been established.

But the most effective example was the city of Natchez, Miss., whose schools have been referred to in the portions of this essay devoted to that State. In 1845 nearly one-half of the white children in Natchez were living without schools, either through the whole or a greater portion of the year. A gentleman of that city, on his retirement from business, offered to the city a large mercantile building that could be easily converted into a public schoolhouse on condition that his gift should be duplicated by an equal sum from the public treasury. His offer was accepted, and the Natchez Institute, a public school, was established in 1845, under the superintendence of teachers sent from the city of Boston, Mass. The building was divided into eleven school rooms, and a public hall and separate playgrounds for children of both sexes were arranged. The school was graded into primary, grammar, and secondary departments for boys and girls, and the city government took the new system under its complete charge. On the 4th July, 1845, the city honored itself by the inauguration of its new system of public instruction. The schools were supported by a local tax on all taxable property and free to all the white children of Natchez. It opened with 70 pupils, but within a year the attendance reached to 500. The attendance increased so rapidly that the board was obliged to raise the age of admission to 6. In 1848 there were 575 pupils and 80 were graduated. Twelve young men had been sent to college. Numbers had been established in business and 13 girl graduates had already entered the university of matrimony. A board of 7 visitors attended to the oversight of the schools. Of 900 different pupils in two and a half years but 5 had died, and the personal appearance of the school children in morals and manners, both in public and private, had been wonderfully improved. Every Friday evening the new hall was open to the parents and friends for an entertainment by the children, and the schools united in a beautiful rural gathering on May Day, one of the first occasions when all white children of every class and condition were gathered together, the entire town looking on with pleasure and pride.

A course of popular lectures had been established, delivered in the hall, in which the prominent men of all professions and trades addressed the people, with debates and essays interspersed. Previous to this a tornado had laid one-half the city in ruins, and there appeared to be danger of a decline in the industries of the place. The establishment of the schools, as in all similar cases, was a signal for the turning of the tide of affairs. Good people from the whole region roundabout flocked to the city for the enjoyment of its educational facilities. The planter, from his "river-bottom" plantation; the laborer, from the country; the professional man, the mechanic—all came. The city increased steadily in population; real estate appreciated 50 per cent in value; indeed, the rise in real estate alone far more than compensated for the cost of maintaining the schools.

A most effective portion of the argument was a statement of the comparative cost

of education by the private and public system. In New Orleans the annual cost of schooling 2,600 pupils was \$36,500. But Nashville was already paying for 890 pupils, in 36 private schools, \$29,533. At this rate New Orleans would have been paying \$87,278 for her 2,600 scholars, her gain by the public-school system being \$50,778. Natchez paid \$7,000 a year for 570 children; if educated, as in Nashville, by private schools, the cost of the same number would have been \$21,128, saving \$14,128 by the change. Every scholar in the New Orleans schools cost the city \$14.03, a saving of \$19.22 from the private-school method. Each pupil in Natchez cost the public \$12.30, a saving of \$20.95. Nashville was then paying \$33.25 per capita in private schools, and could support public education for \$11.30, a difference of \$21.95 for each pupil, the sum of \$16,935 being sufficient for all, instead of \$50,000, as paid at present. When to this was added the fact that the public-school system in all ways, save the indulgence of social pride, was superior to the present, the argument was closed. A library of 12,000 volumes was established by the Natchez Library Institution, and a cabinet of natural history was donated by Congress. The schools soon outgrew their accommodations and, at the end of the first year, the board called for additional arrangements.

Other considerations were brought in to enforce the conclusion concerning the superiority of the common school. The publication of this able and practical address, which was ordered by the city authorities, was the signal for a strong movement among the people of Nashville. The labors of President Lindsley, although not so pronounced in this direction as in the higher education, found here perhaps their widest and most important local fruition. The plans of a school system, an extract from a report of the State superintendent of public instruction, with extracts from an address of Hon. J. S. B. Thatcher, were published. In addition there was published a statistical survey of the condition of the common-school funds, showing their amount as \$1,346,068.15, with an annual income for distribution of \$117,395, which, divided among the 272,245 children and youth of school age, gave a fraction under 42 cents to each. This valuable document was closed by the publication of a school programme adopted by the Institute of Natchez and adapted to the condition of the proposed system of Nashville. There was also printed an eloquent address delivered at Natchez by Hon. J. S. B. Thatcher, which deserves a place in any collection of the literature of the Southern common school before 1860, and which would be one of the most valuable additions to this department of American literature.

The publication of this manual of universal education in due time bore fruit. In the spring of 1850 Alfred Hume, esq., a teacher of a classical school in Nashville, was commissioned by the city government to visit the public schools of various cities of the Union. In the following August Mr. Hume rendered an elaborate report, of which 2,000 copies were printed. This report has been called the beginning of the public schools of the city.

In 1853 the first school building was erected and named for Mr. Hume. The first board of education was elected, consisting of seven gentlemen, Mr. Hume being a member. The president, F. B. Fogg, esq., presided over the board for eight years. The Hume Building was erected on land donated to the city, and subsequently the Howard Building was placed on a lot donated by Mr. H. Howard and wife.

In 1855 the schools opened under the superintendence of Mr. J. F. Pearl. The first published report of this official, dated August 29, 1857, paints a glowing picture of the beginning of free education in the city. According to this report, there were then in Nashville not less than 3,000 white children and youth between the ages of 6 and 18. Of these, some 500 were found in the private schools of the city. Of the remaining 2,500, 1,202 were cared for in the public schools. There seems to have been an unusual amount of friction at the beginning of the system, in bringing an unruly portion of the children into due subordination. In 1857, the third year of the schools, 1,961 certificates of admission were issued, 1,026 for boys and 935 for girls; of which 759 did not represent pupils remaining in the schools, 149 were

“suspended for irregularity in attendance,” 19 for failure in their studies and insubordination. The remainder fell out into service, work, etc. The superintendent congratulates the people on the success of the school government in dealing with bad boys and insubordination in girls; also on the fact that, during the school months, requests are frequently made by employers to learn the record of pupils, and numbers of the boys stepped from the schoolroom into good positions in many occupations.

A high school for boys and girls had been established during the year 1857, by which the gap between the elementary schools and the university had been closed. By the present of a valuable lot, the city had been enabled to build a commercial schoolhouse, but the rush upon the schools had overflowed the limit. Seven hundred children and youths were still in no school and 100 were out for lack of accommodations. But, on the whole, the experiment was a gratifying success. The superintendent showed his capacity in his earnest movement for a State normal school, and his estimate of the proper qualifications of a teacher. The number of pupils in attendance was 1,263, of whom 382 were in the primary, 340 in the intermediate, 133 in the grammar, and the remainder in the high school. There were 25 teachers, with an average number of 63 pupils in charge of each. The system was under the control of a board of education of seven members and a secretary appointed by the city government. The course of study appears in all respects to have been similar in its requirements to that of other cities of the same size through the country. The high-school course had a sensible arrangement for a classical and an English department, thus avoiding the severe classicism which still closes the doors of the people's high school in so many of our Southern cities to all save pupils who are prepared to face a three or four years' course of Latin.

In 1858 Superintendent Pearl congratulates the people of Nashville on “the pleasing evidence that your schools are growing in influence and establishing character for themselves, thereby gaining the applause of the community. The difficulties that appeared at the beginning are gradually yielding to regular discipline and improved teaching. Attendance is more regular—indeed, the attendance is only limited by the accommodations—an important section of the city still being greatly in need of a new school building. The average whole number is increased by 43 and the average daily attendance by 39, for the year 1857.” The fact that one girl was dismissed from the school for “obstinacy” had found its compensation in the pleasing fact that the highest prize for excellence in scholarship was captured by a girl.

In 1861 the revised school code raised the number of the board to eight. The board of education was required to furnish an estimate of the probable expense of the public-school system at the beginning of every year, and a tax sufficient to cover the expense was levied on the people, the entire school management being under the exclusive control of the board of education.

In 1860 the president of the board of education was able to report that the long-desired Howard school building had been erected at a cost of \$16,000, on a site donated by Mr. Howard in 1839 to the city for public purposes. The entire expense of the city schools, besides the cost of this building, was \$28,133.71. The superintendent included the fifth and sixth years of the public-school system in the report rendered October 1, 1860. In 1860 the attendance had increased to 1,423, with an average daily attendance of 1,224, an increase in one year of 201. Of these, the average death rate was little more than one-half of one per cent. Thirty-one teachers were employed, and the National Spelling Book of Parker and Watson was substituted for the ancient “Blue Back” of Noah Webster. The superintendent again calls attention to the difficulty of finding teachers competent to handle the elementary grades according to the natural methods of instruction, and quotes the practice of the schools of St. Louis, where the primary teachers are selected with great care and paid equal salaries with those of the upper grades. The necessity for crowding the school buildings was overcome in the new Howard schoolhouse, built on a site valued at \$10,000, presented by Mr. and Mrs. P. H. Howard. The superintendent urges the necessity

of a separate building for the high school and the normal-school department for the training of teachers. The high school contained 115 students, with an average attendance of 102. Three boys had been sent to Yale College, Connecticut, from this school in the fourth year of its existence.

This report concludes the history of the public-school system of Nashville previous to the sudden closing in the midst of the session of 1861, by the transfer of the seat of war to Tennessee, only to be reopened in 1866. There is no published report, save a printed course of study in 1869, until the year 1870. At this period begins the administration of that admirable educator, Supt. S. T. Caldwell, under whose able and vigorous direction for more than ten years the public schools of Nashville became probably the best in the Southern States, and with fair comparison among the best in the country. That the system had taken deep root in the public confidence is shown by the fact that, in 1870, only five years from the close of the civil war, the school attendance reached 2,000 white and 500 colored children, with a corps of 80 teachers, supported at the expense of \$92,000.

THE COMMON SCHOOLS OF MEMPHIS.

The city of Memphis also had established a system of city public schools as early as 1852 in three departments, primary, intermediate, and grammar, with a board of visitors and a code of regulations that suggests the presence of the educational spirit. In 1856 we find on the board of seven members the name of Leon Trousdale, afterwards the noted State superintendent of public instruction for Tennessee. Mr. L. Pope was superintendent. The grammar department included high-school studies, the classics, French, etc. The act of incorporation for the schools, passed by the legislature in 1858, provided that the system should be under the exclusive control of a board of visitors, one elected from each ward of the city, the board competent to elect its own officers and chartered with the power of control. The schools were free to white children and youth of the city, although a fee might be imposed for instruction in branches higher than usually taught in the public schools of cities. The board of visitors was empowered to make an approximate estimate of the expense of the schools, and the city government might lay a tax on the people not to exceed \$15 for each white person between the ages of 6 and 16. The board of visitors was authorized to expend \$75,000, and by permission of the city government to raise the money for the cost of suitable school buildings. From a report for the years 1864-65, it appears that while the public schools of Nashville were closed during the entire period of the civil war the Memphis schools were kept open. In 1861-62 there were 17 with only 1,500 pupils and in 1864-65 27 schools with 2,400 in attendance. The city did not own one public schoolhouse at this date and the schools were housed in rented buildings. The committee congratulated themselves and the city on the fact that amid all the fierce excitements of the civil war "the schools are as little affected by party spirit, whether in religion or politics, as any public schools of America." The cost of the system was \$45,473.88, with an average daily attendance of 1,028, costing about \$4.35 per capita. Among the teachers we recognize the name of Miss Jennie M. Higbee as principal of the high school, who, after her retirement from the public service, for many years remained at the head of one of the most important female colleges of the South in Memphis.

With this record, manifestly imperfect and somewhat fragmentary from the lack of so much valuable material in the form of reports, statistics, and the educational documents now supplied by every State of the Union, we leave the deeply interesting subject of public education in the State of Tennessee. Its subsequent development proceeded under the more favorable conditions which have lifted this Commonwealth, so richly endowed by nature, so favored by its central situation in the Union and the vigor and intelligence of its population, to an educational achievement that makes the State of Tennessee, perhaps, chief among the sixteen States once known as the South.

STATUS OF EDUCATION AT THE CLOSE OF THE CENTURY.¹

By NICHOLAS MURRAY BUTLER,
Professor of Philosophy and Education, Columbia University.

Imagination and feeling increasingly bear the brunt of shaping human opinion and human conduct. Intelligence does its organizing work and then disappears below the surface. Much of life goes on without its active cooperation, just as many of our mental reactions, first organized in the brain, come to be carried on through the spinal cord alone. When we stop to think, we realize that a century is of human making, a purely arbitrary division of time. Century might have been the name given to a longer or a shorter period—twenty years or two hundred—without doing violence to anything save present associations. The limits of a century are wholly imaginary. The skies do not change when a century is ushered in, or the thunders roll when it passes out. A century begins and ends as noiselessly and as unperceived as any moment which glides from the future into the past. Imagination, however, gives to the century an objective reality, and feeling welds our thoughts to it. The arbitrary period of time which it covers, and the events which happen in that period, come to have for us a relation of cause and effect or of reciprocal dependence. We can not rid ourselves of that feeling. Fancy, if you can, Attila charging upon the Western Empire in a century called the fifteenth instead of the fifth, or Louis XVI losing his head in the eighth century instead of the eighteenth, or Columbus discovering America in the twentieth!

We do well to resign ourselves to the spell of these mental creations, and to learn, as Macaulay somewhere said, to know our centuries. But who can know the nineteenth century? Development so rapid, changes so startling, inventions so undreamed of, crowd each other in a whirl of confusing images when we try to picture this century and to note its salient facts. It is the century of Napoleon and of Lincoln, of Hegel and of Darwin, of Goethe and of Kipling, of Bessemer and of Rockefeller. More leaders of enterprise and more captains of industry have appeared during this one hundred years than in all previous recorded history. The average of human intelligence and of human efficiency has been raised to a point—in the United States, certainly—which a few hundred years ago would have entailed notoriety and, perhaps, distinction. Prosperity and querulousness, desire and happiness, have all multiplied together. How can all this be interpreted?

¹ Reprinted from the Proceedings of the Department of Superintendence, N. E. A., at Chicago, February 27-March 1, 1900.

The wisest answer seems to me to be this: The nineteenth century is preeminently the period of individual liberty—political, religious, intellectual, industrial; and its manifold triumphs and achievements are due to the large opportunities which have been granted to individual initiative, and to individual expression. The greatness, the shortcomings, and the contradictions of the nineteenth century are alike due to this.

It must be borne in mind that mankind discovered the significance of the individual rather late, and that, when discovered, this significance was variously interpreted. Man's early institutions and his law, based as they were on kinship, took the family, bound together by tie of blood, as the unit. The individual was of very secondary importance. The horde, the tribe, the State were successive aggregations of families, or, perhaps better, a larger family. The interest, the ambition, the vengeance of the group or community controlled each individual's acts, and in large measure, his opinions and his thoughts. Under such circumstances education could only be tribal or ethnic in its aims and in its forms. It sought to reproduce a type, not to develop a capacity.

The journey during the history of civilization from this point of view to one from which the individual is himself of importance is a long and arduous one. Of representative ancient thinkers, the Sophists, the Cynics, and the Stoics alone championed the cause of the individual as such, and their appreciation of the real meaning of individualism was most imperfect. The Sophist hope, that a man could spin a web of successful and useful existence out of the shadowy contents of his own perceptions, was dashed once and for all by Socrates. The Cynic revolt against social order and convention is typified by Diogenes with lantern and with tub. The Stoic outlook was a broader one, but it in turn was shut in by the massive height of an omnipresent, overruling law, before which man could only seek virtue through stern resignation. The clue suggested by the master mind of Aristotle, by which the essential nature and the limitations of individualism might be made known, was not fully followed up for centuries. Yet from the fifth century before Christ, onward, philosophy was increasingly becoming not only the science of human conduct, but the art of human living; and individualism was necessarily the gainer. How shall a man live to attain wisdom and virtue? was the question which the Greek and Roman moralist pressed home upon each individual listener with tremendous force. Then Christianity came, with its teaching of the equality of every human soul before the judgment seat of God. Here, at last, individualism seemed to have found a secure foundation. The Sermon on the Mount was its charter and its moral guide. A man's salvation depended upon himself alone. Speedily, however, a reaction set in, and the old habit of setting hard and fast limits for the individual asserted itself. Christianity grew rapidly into an elaborate system of doctrine to be held in its entirety *semper, ubique, ab omnibus*. On the other hand, the Roman jurists were elaborating a system of personal rights, which was destined to afford individualism a new foothold and to exercise a profound influence upon European society. Superficially, then, individualism was checked by a body of doctrine, uniformly prescribed, which guided faith and practice; under the surface, rights and opportunities for the individual continued to develop slowly. Education took on the form of the superficial appearance of uniformity, and for centuries the Western World continued steadily to uncoil itself in constantly widening circles, but still in circles. At length the inner contradiction between the two great elements of mediæval civilization asserted itself and the crash came. With the mocking jests of Rabelais, the caustic wit of Montaigne, the masculine fervor of Luther, pent-up individualism hurled itself against the bars which confined it. It broke through, now here and now there, and rushed headlessly hither and yon, searching for escape. It tried mysticism in religion as a relief from the clanking chains of dogma, and absolutism in politics as a protection from its nearest foes. Meanwhile, the crushing force of ancient tradition asserted itself with dogged determination. But it was too late; the long-checked desire for a freedom which

was too often interpreted as anarchy, and for a liberty which in its newness appeared to mean license, could not be controlled. In its name the persistent Anglo-Saxon challenged the house of Stuart, and after two centuries worked himself substantially free from the old forms of bondage. The more passionate and quick-moving Celt had to wait longer, but he acted more quickly. In the dramatic horrors and sublimities of the French Revolution he gained his immediate end at the risk of losing every precious possession of the race.

The smoke of the French Revolution hung over Europe when the nineteenth century opened. As it gradually cleared away it became obvious that the successful struggle of individualism for recognition was almost over, but that the results were to be worked out by argument, not by anarchy. The century soon to close records what happened.

Education, as a matter of course, has always borne the impress of the civilization whose product it was. From the fourteenth century to the nineteenth, the demand of individualism for representation in the schools has been heard, now earnest and reasonable, now passionate and incoherent. Politics and religion so far overshadowed education in importance that it was a long time before there was any widespread recognition of the close relation in which education stood to them. On this matter the seventeenth and the eighteenth centuries brought great light, and there was new hope for the schools. False and partial as we must hold much of the French and English philosophy of the eighteenth century to be, it is nevertheless to be credited with having convinced the world that a fundamental principle bound together rational progress in politics, in religion, and in education. To this conviction the nineteenth century has clung most tenaciously. The result has been an unexampled and dazzling expansion of educational endeavor and accomplishment.

When the century opened Rousseau had been dead nearly twenty-three years. Pestalozzi had just left Stanz for Burgdorf, and at the age of 55 was crying ecstatically: "The child is right; he will not have anything come between nature and himself." Froebel, an introspective youth of 19, was at Jena, at that moment the very center of the productive activity of German thought. Reinhold had been expounding the new gospel according to Kant there, and Fichte had only recently been expelled while trying to interpret it. Then and there Froebel, as he himself said, began to know the names of Goethe and Schiller and Wieland. Hegel, too, was at Jena. His *Lehrjahre* were behind him, and at 30 years of age he was nearly ready to measure his strength with the masters. The lecture programmes of the University of Jena, as has been said, at that time fairly "dripped" philosophy. Herbart, who had been one of Fichte's pupils at Jena a few years earlier, was still, at 24, studying and giving private instruction. These five men—Rousseau, Pestalozzi, Froebel, Hegel, and Herbart—were to give to nineteenth-century education most of its philosophical foundation and not a few of its methods. From them have come the main influences which have shaped education for a hundred years.

Each one of the five pleaded in his way for the value of the individual. Rousseau, with no institutional sense and no insight into the meaning of history, exclaimed "O man, concentrate thine existence within thyself, and thou wilt no longer be miserable! Thy liberty, thy power extend only as far as thy natural forces, and no farther. All the rest is but slavery, illusion, prestige." Pestalozzi, whose intellect never quite caught up with his emotions, was really neglecting the individual by his method of trying to care for him. Froebel and Hegel saw far deeper. They knew the meaning of institutions, of thought relations, of development, both inner and outer. They taught the individual as a *Gliedganzes*, a whole and yet a part of a larger whole, and so gave us our truest view of individualism in education. Herbart's individualism was hard and mechanical, though his doctrine of apperception gave promise of something better and more vital.

These men, then, projected individualism into contemporary educational theory. They had hosts of disciples in many lands, and the movement grew apace. It

needed, however, the touch of practice to make it genuinely real. This came after 1848, the line which divides the century into two parts—the earlier part dominated by thought, with spirits like Goethe, Wordsworth, Coleridge, and Emerson as its exponents; the latter dominated by action, with Lincoln, Gladstone, and Bismarck as exemplars. In 1848 the individual gained the foothold which he had struggled for, but lost, in the haste of 1789.

The pressure from practical life followed. The old educational material and the traditional educational methods were attacked with greater frequency and with greater vigor, as not adapted to modern needs. The ancient languages and the civilizations they embalmed were denounced as fetishes. The world's philosophy was nonsense; its art was archaic; its literature pedantic and overlaid with form. Straightway altars were erected to new and unfamiliar gods; before all to that product of the human understanding called science, which Mr. Herbert Spencer, with a humor quite unconscious, defined as partially unified knowledge. The new spirit exulted in its freedom. It accomplished much; it ignored much. In a thousand ways it impressed itself on life, on literature, and on art. Education was shaken to its foundations. Nothing was sacred. No subject of study, no method of teaching was immune. Old institutions of learning were too slow to move and to adapt themselves to these conditions. New ones were invented, created, set in motion. Wealth, public and private, poured out like water to make possible and to sustain these new types of school. The seven liberal arts faded into insignificance beside the endless list of subjects now found to be worthy of study.

This great, world-wide movement justified itself for the time by its results. Commerce, industry, and invention multiplied apace. The forces of nature were commanded through being obeyed. Education had become democratic, and was ready to offer training in preparation for any calling. The traditional list of learned professions was increased by architecture, engineering, and a dozen more. Early and complete adaptation of the individual to his appropriate career was hailed as the new educational ideal before which all else must give way. In consequence, the hasty conclusion was drawn that not only methods of procedure in education, but the sole principles upon which to proceed, could be learned by the study of the infant mind and the infant body. Upon this as a basis a superstructure of educational theory and practice was erected, which would have delighted the heart of that arch Philistine, Rousseau. All that had been was wasteful, misleading, wrong, not on its merits, but simply because it had been. The progress of the race in civilization was explained as having taken place in spite of men's ideals, not because of them; and it was therefore rejected as a source of inspiration and of information. Individualism had not only won a great victory, but apparently its opponents were annihilated.

This new philosophy, however, had not established itself without a protest, and as this type of individualism became more and more extreme in its claims, the protest grew louder and more earnest. Could the crowded centuries of the human past teach us nothing? Were the art of Phidias and of Raphael, the verse of Homer and of Dante, the philosophy of Plato and of Kant, the institutions of the Roman law and of constitutional government all to depend for their educational meaning and value upon the carefully noted actions and preferences of the unformed infant in its cradle? The humor of the situation revealed itself, and the reaction set in.

Individualism had gone too far. In the effort of forming its fullest flower it had torn itself up by the roots. History did mean something after all; and environment was discovered to be a thing of three dimensions, not of two only. Reflection succeeded to controversy. Meanwhile the new sciences of nature had themselves been studying embryology and heredity. These words took on new meanings. The individual was seen to be a product as well as a producer. Product of what? Of all that man had thought and done, and of his own infinitesimal self. But if this were true, then what of education? Obviously, the defenders of the new must shift their

ground and retreat from the untenable position of Rousseau to the impregnable fortress, Gliedganzes, of Froebel, of Hegel, and of all philosophical teachers of evolution. This change has been made, and as the century closes the soundest educational philosophy the world over teaches that the individual alone is nothing, but that the individual as a member of a society and of a race is everything. Selfhood, which can only be attained by entering into the life history and the experience of the race, is now put in the high place which was about to be rashly filled by selfishness. True individualism, which would enrich the life of each with the possessions of all, is well-nigh supreme, and sham individualism, which would set every man's hand against his fellow, is disposed of, let us hope forever. Education rests securely upon the continuous history of man's civilization, and looks to the nature of each individual for guidance in the best methods of conducting him to his inheritance, but not for knowledge of what that inheritance is.

Every conception of this nineteenth century, educational as well as other, has been cross fertilized by the doctrine of evolution. In whichever direction we turn we meet that doctrine or some one of its manifold implications. We have incorporated it into educational theory and have thereby shed a flood of light upon problems hitherto dark. Evolution has assisted mightily in that interpretation of individualism which I have just defended. It has bound the universe together by homogeneous law, and the relations of each to all, both physical and social, have become far clearer and more definite. But much remains to be done in applying the teachings of evolution in actual plans and methods of instruction. The application is going on, however, all around us and without cessation, and is the cause of not a little of the existing educational inquiry and unrest. Our schools have shed one shell and the other is not yet grown. Illustrations of this will be found in the teaching of mathematics, of language, of history, and of the natural sciences. We halt often between the logical and the psychological order, failing to appreciate that evolution gives a place to each. The logical order is the order of proof, of demonstration; the psychological order is the order of discovery, of learning. Children do not learn logically; they come later to see logical relations in what they have learned. The well-equipped teacher knows both logic and psychology. He is prepared to guide the pupil in his natural course of learning, and also to point out to him the structure of relationship of what he has learned. Text-book writers the world over have been slow to see this distinction; but, with only few exceptions, the best American text-books, which control so powerfully all school processes, are in advance of those most in use in Europe. The logical order is so simple, so coherent, and so attractive that it seems a pity to surrender it for the less trim and less precise order of development; but this will have to be done if teaching efficiency according to evolution is to be had.

The course of evolution in the race and in the individual furnishes us also with the clew to the natural order and the real relationships of studies. It warns us against the artificial, the bizarre, and points us to the fundamental and the real. Only educational scholarship can protect the schools against educational dilettantism.

Two lines are needed to determine the position of a point. The two principles of evolution and of an individualism, viewed in the light of the history of civilization, seem to me to determine the status of education at the close of the century. The working of these principles is exemplified in practice in a thousand ways. They lie behind and determine every effort for improvement and for progress. The diverse types of school, higher and lower, with their widely different special ends and yet with a common fund of basic knowledge which they all impart, reveal a purpose to cultivate and to adapt the special powers and talents of the individual, while holding him in touch with the life and the interests of his kind. The existence of the wonder-working elective system in secondary schools and colleges, together with the limitations put upon it, is due to a real as opposed to a sham individualism. The marked emphasis now laid upon the social aspect of education, in Europe as well

as in the United States, and also upon the school as a social institution and a social center, is additional evidence of the dominance of the individualism of Froebel rather than that of Rousseau. The demands for the establishment of a proper system of secondary education in England, for the making over of the secondary-school systems of France and of Germany, for the closer articulation of lower schools and higher schools, of schools and colleges, in the United States, for making elementary school instruction as little wasteful and as full of content as possible, for bringing forward studies which give adequate scope for expression in various forms, and the demand that the community shall relate itself to its educational system simply and effectively—all these are based, consciously or unconsciously, upon the desire to apply the teachings of evolution and to progress toward the ideal of a perfected individualism.

Education, so conceived and so shaped, has made an irresistible appeal to every civilized nation. During the century education has definitely become a state function, not as a dole, but as a duty. Consequently, the public expenditure for education has become enormous. In the United States it amounts annually to \$200,000,000 for the common schools alone, or \$2.67 per capita of population. This sum is about one-tenth of the total wealth of Indiana or of Michigan, as determined by the census of 1890. In Great Britain and Ireland the total public expenditure on account of education is over \$88,000,000, or \$2.20 per capita. In France it is about \$58,000,000, or \$1.60 per capita. In the German Empire it is over \$108,000,000, or more than \$2 per capita. These four great nations, therefore, the leaders of the world's civilization at this time, with a total population of nearly 210,000,000, are spending annually for education a sum considerably greater than \$450,000,000.

The annual expenditure of the United States for common schools is quite equal to the sum total of the expenditures of Great Britain, France, and Germany combined upon their powerful navies. It is nearly four-fifths of the total annual expenditure of the armed camps of France and Germany upon their huge armies. It is a sum greater by many millions than the net ordinary expenditures of the United States Government in 1880. This expenditure for common schools has nearly trebled since 1870, and during that period has grown from \$1.75 to \$2.67 per capita of population and from \$15.20 to \$18.86 for each pupil enrolled.

These imposing and suggestive statistics mark, in the most objective fashion possible, the distance we have traveled from the beginning of the century, when there was literally no such thing in existence anywhere in the civilized world as a state system of education. But pride of achievement should yield to a feeling of responsibility for the future. In the light of the nineteenth century no man dare prophesy what the twentieth century will bring forth. We only know that a democracy shielded by insight into the past and armed with trained minds, disciplined wills, and a scientific method is as ready as man's imperfect wisdom can make it for whatever may come in the future.

Daniel Webster, in his oration at the laying of the corner stone of the Bunker Hill Monument, exulted honestly in the conviction that the example of our country was full of benefit to human freedom and to human happiness everywhere. "We can win no laurels in a war for independence," he said. "Earlier and worthier hands have gathered them all. Nor are there places for us by the side of Solon, and Alfred, and other founders of States. Our fathers have filled them. But there remains to us a great duty of defense and preservation; and there is opened to us, also, a noble pursuit, to which the spirit of the times strongly invites us. Our proper business is improvement." This injunction, laid upon Americans by their great orator three-quarters of a century ago, has lost none of its force. It applies with peculiar directness to teachers and to teaching. The glory of founding educational systems can not be ours; but the effort for improvement, by building wise practice upon sound theory, is within the reach of each one of us.

DISCUSSION.

President CHARLES W. ELIOT, Harvard University.—Mr. President, Ladies and Gentlemen: The scholarly address to which we have just listened has described so clearly and comprehensively the educational progress of this century that I need say nothing about the philosophical and biographical aspects of the subject. It only remains for me, in the few minutes during which I can occupy your attention, to supplement in some particulars, as best one may in extemporaneous speech, Dr. Butler's admirable paper. I will touch on three or four of the leading features of educational progress during the last half of this century. As Dr. Butler has already said, it is during the last half of the century—since 1848—that the chief progress in education has taken place.

The first great movement of reform was the introduction of freedom in choice of studies—first in universities or colleges, and later in schools. Like most other large educational movements, this change proceeded from new conditions entirely outside of the proper realm of education. It proceeded from the wonderful development of new knowledges which took place during the first half of the century, accompanied by the discovery of new principles and methods of scientific investigation. These new knowledges and new methods of inquiry commanded public attention, and created an imperative demand that youth should be instructed in them. The managers of education positively have had no option with regard to the introduction of some sort of elective system. They have been compelled to introduce it. A limited elective system was first introduced into Harvard College in 1826 during the administration of President Josiah Quincy, a layman who came late to an educational post, having previously been a member of Congress and mayor of Boston. His two successors in the presidency did not agree with him as to the importance of an election of studies; so they tried to extinguish the system in Harvard College. The second of these two presidents put on record in his own reports his failure completely to extinguish the system, and gave the true reason for the failure—namely, the incoming of such a number of new sciences and of new philosophical and practical intellectual interests that it was impossible to restrict the programme of studies in the college to the old seven or eight so-called liberal arts. Thus then the great change wrought in the second half of our century in public education was forced on college administrations from without. They had no choice; they must give to the student freedom in choice of study; and they must so specialize the teaching that the professor should have freedom to develop throughout all his career the teaching of a single topic.

Let me attempt to give you an idea of what has been going on since 1870 in this one institution in regard to the teaching of a single subject—political economy. A few days ago there died in Cambridge, in his seventieth year, Prof. Charles Franklin Dunbar, who, having previously been a man of business and the editor of an influential paper in Boston, was made in 1871 professor of political economy—an immensely important subject, which at that time had no teacher exclusively devoted to it in Harvard University. It merely received a scanty portion of the attention of a professor of “natural religion, moral philosophy, and civil polity.” In his first year of service Professor Dunbar gave instruction in one course prescribed by juniors, and in that same year he offered one elective course to seniors. Such was the modest beginning of the university's department of political economy. When he died there were in Harvard University three full professors of political economy, one assistant professor, and six instructors. There was no prescribed course, but a large number of optional courses; and any youth who wanted to study political economy with thoroughness could begin that study as a freshman, and continue it for four years, that is, through his whole college course; and then he might devote two or three years' time to it in the graduate school. One thoughtful, resolute, clear-headed, just man developed this important department of instruction in one American college, in a little less than thirty years, through freedom for student and teacher alike.

Many persons have a very inadequate conception of the meaning of election of studies. They think of it chiefly as a questionable liberty for a thoughtless student. It is really the sole means of developing thorough, far-reaching university instruction in any subject, or in all subjects, and therefore is an indispensable means of promoting and stimulating American scholarship. It is as essential to the production of great teachers and great authors as it is to the training of well-equipped students.

I pass on to the next fundamental change in American education, a change which is pure, far-reaching gain, and which has been wrought out better in America than in any other country. I refer to the change in school discipline. Again, this is a change brought about not exclusively by professional teachers, but by social forces working through all the community, but especially developed in schools and colleges. Nowadays we realize that the fundamental object in all education is to develop self-control and the power to give an intense mental attention; and we realize that self-

control is not to be cultivated in children under the arbitrary pressure of another's will. As a boy I went to what was considered the best public school in Boston—one famous throughout the country—the Boston Latin School; but I have to testify that the chief disciplinary motive to which I felt myself subjected during my boyhood in that school was fear—fear of the rough tongue of the teacher, fear of the harsh construction put on the childish motive and the childish conduct, and fear of physical pain as an inducement to an unnatural quietness and to mental application. That is a true picture of school discipline before the middle of this century all over the world, the school world, for thousands of years; but here in about the middle of this very century came a great change. It came partly through the church. Fear began to cease to be the prime religious motive. Men began to find out that systematic theology is an exclusively human science. They began to see that it was a marvelously presumptuous thing in one man, though he were a St. Augustine, a Calvin, or a Dr. Hodge, to undertake to state in the forms of human logic God's scheme for the salvation of men, and to describe the nature and the results of God's justice. Men began to emancipate themselves from the terrors of systematic theology. Then, too, we began to learn all over this country that government should not really be what for thousands of years government had been—the work of one arbitrary will, or of a few arbitrary wills—but rather that it should be government by the people for the people. We all began to think that the right conception of government for the citizen might teach us something concerning the government of a child. It occurred to us that if self-government was the whole object of political freedom, then self-control might be the legitimate primary object of a child's development. Again, home discipline began to change for the better. Family government became gentler; and all these changes in society helped wonderfully to the beneficent change in the school. There has not been a more blessed change in the world than this change in home and school discipline from fear to love, from driving to leading. Wonderful has been the fruit of this change on the temper of our people and the happiness of our homes.

I pass on to another immense change, brought about quite outside the schools and colleges, which has nevertheless affected profoundly the public provision of systematic instruction. During the last fifty years, on account of industrial changes, the population in our own country, and in most of the civilized countries of the world, has been rushing into cities and large towns. This rush into urban life has had a very ill effect on schools. It has tended to make schools large machines, and of course it has deprived the children of the natural out-of-door sports of country life. The grading of classes in a large school had to be inflexible, and the product had to be uniform, like that of a flour mill. That meant that the quick children were held back and the slow were driven forward, to the great disadvantage of both sorts. It meant marking time. It meant also bad air, bad light, and crowded rooms, with fifty or seventy pupils to a teacher. These are impossible conditions for good teaching. The condensation of population introduced new risks of health; so that what was the normal rural death rate rose in all large cities and towns to an unnatural height. The children suffered most from these increasing risks. Gradually, but chiefly within the last twenty years, we began to escape from some of these evils. We gave greater attention to good air, proper heat, and proper light; we gave greater flexibility to programmes and options among studies. In short, we attended to the conditions under which the children and the teachers worked, and tried to make them wholesome. But more than that it has been absolutely necessary to do. When a child grows up in the country, it gets a natural training in accurate observation. It wants to find a four-leaf clover; it runs to see where the green snake went to; it tracks the woodchuck to its hole and gets it out; it learns the songs of the birds, and knows when the smelts run up the brooks and when the twilight is just right for finding the partridges. In short, the country child gets naturally a broad training in observation. It also has on the farm an admirable training in manual labor. From an early age it can actually contribute to the care of animals, the successful conduct of the household, and the general welfare of the family. In the city all this natural training is lacking, and substitutes for it have to be artificially provided. This necessity has brought into our schools nature study and manual training, to teach the child to use its eyes and its hands, and to develop its senses and its muscular powers; and these new beneficent agencies in education, already well in play, are in the near future to go far beyond any stage at present reached. We do not yet see how to replace in urban education the training which the farmer's boy or the sea-coast boy gets from his habitual contest with the adverse forces of nature. The Gotts Island boy, on the coast of Maine, goes out with his father in the early winter morning in a half-open sailboat to visit their lobster traps and bring home the entrapped lobsters. They start with a gentle breeze and a quiet sea, though the temperature is low. The boy knows just how to steer the boat 5 or 6 miles to sea, where the traps

are sunk on some rocky spot which the lobsters love. The father is busy pulling the traps. The boy watches the weather, and suddenly he says, "Father, there is a northwester coming. See the clouds driving this way over the hills." The boy knows just as well as the father what that means. It means a fearful beat to windward to get home, facing a savage wind and a falling temperature, the spray dashing over the vessel and freezing to the sails and ropes and loading down the bow with ice. It means a life-and-death struggle for hours, the question being, Shall we get into harbor or not before we sink? Now, that is a magnificent training for a boy, and the sheltered city offers nothing like it. The adverse forces of nature, if not so formidable that men can not cope with them, are strenuous teachers; but in modern cities we hardly know that the wind blows, or that the flood is coming, or that bitter cold is imperiling all animal life.

Lastly—for my time has almost expired—a new motive is presented in our day to the teacher, the parent, and the children; the motive of joy through achievement. The great joy in life for us all, after the domestic affections, is doing something and doing it well, getting where we want to get, and bringing others where they would like to be. Give every child, we say, the joy of achievement. Do not set it to do what you know it can not do well. Set it to do what you think it can do well, and show it how. That is just what goes on in a happy kindergarten, or in a successful university conference or seminary. This is the new and happy aim in modern education—joy and gladness in achievement. I need not say that freedom is necessary to this joy. Schools used to set children doing things they could not do well. That, fellow-teachers, is the unpardonable sin in educational administration. It is not for the happiness of the children only that this new motive—to increase joy—has come to bless us. It brings new happiness to the teacher also. It is means of happiness for everybody throughout life. As a result of the advent of this new policy we are learning not to use with children a motive that will not work when the children are grown up. To be sure, we must admit that this doctrine condemns almost all the school discipline of the past and much of the family discipline; but the future will not mind that if it finds the new doctrine beneficent.

Ladies and gentlemen, I do not know a more sacred occupation than the function of a superintendent of schools in the United States. The more I see of the kind of work a good superintendent does, the more I am impressed with its beneficent character. Let me urge you to mix freedom with all your policies and efforts. It seems to me that nobody's name lives in this world—to be blessed—that has not associated his life work with some kind of human emancipation, physical, mental, or moral. Dr. Butler very justly named Rousseau as a great contributor to educational progress. The main work of that man's life tended and still tends toward human liberty, and that one fact has almost sanctified an execrable wretch. Do you remember what Rousseau did with five of his wife's babies, one after the other, in spite of her prayers and tears? He put every one of them in succession into the public crèche, knowing that in the then condition of foundling hospitals that destination meant all but certain death. Yet we sit here and listen to the praise of that mean and cruel creature. How shall we account for these two judgments of one man, both just? We can only say that he tied the main work of his intellectual life to the great doctrine of human liberty. Verily, to have served liberty will cover a multitude of sins. May you serve freedom and humanity in all your labors, and then have no sins to cover!

THE TRAIL OF THE CITY SUPERINTENDENT.¹

By AARON GOVE,

Superintendent of Schools, District No. 1, Denver, Colo.

To follow the trail of the city superintendent of schools tramping backward is not difficult, but the traces are faint when one reaches the beginning, sixty years ago. A little path has its origin about 1839 at Providence, R. I., upon which traveled Nathan Bishop. Another path that helped to mark the road more plainly started with Prof. S. S. Greene, at Springfield, Mass., in 1840. Later, in 1847, the main trail is joined by one from Columbus, Ohio, where Dr. A. D. Lord was made the first city superintendent of schools in that State. The same year Rickoff, at Portsmouth, and Leggett, at Akron, joined the party.

¹ Reprinted from the Proceedings of the Department of Superintendence, N. E. A., at Chicago, February 27-March 1, 1900.

As the school committee—the name of the body elected to take the direct oversight of common schools in New England—was changed in character, because the people seemed to demand business men as well as ministers for counsel and direction, the duties of the committee became quite too heavy for active business men to perform; besides, the fact that amateurs, chronic reformers, and men of leisure lacked efficiency was apparent then as now. Out of this came the demand for expert supervisors.

The duties of the office were evidently dimly defined in the minds of the people of the time, but the main thought obtained, viz, that able men, willing to give counsel and exercise veto power upon proposed measures, would accept such responsibility and serve on directory boards only when the execution could be placed in an office created for that purpose. Once established, the office of the city superintendent became helpful, and very soon necessary.

The trail of the superintendent, formed by the little paths in New England and Ohio flowing into one, as the brooks join to make the main stream, has become broad and solid, but not straight. Windings, curves, crooked places, right angles, and numerous turnings back upon itself are seen in looking over the road traveled. The embryo germ-thought planted in the heads and hearts of Greene, Philbrick, Wells, Mann, Rickoff, Stephenson, Jones, Hager, and Newell has led these men through devious ways, against tremendous obstacles, and over the trail, by the sacrifice of almost infinite trial with vigorous opposition, in contest and in conflict to the end. One and another languished, fell, died, and are buried by the side of the road. Each traveled his own gait, with rations and blanket only, never knowing, although caring much, where each year's tramping would end.

The deaths of great men in national and political history are commemorated by song, story, and memorial days. Only in secluded family circles, and midst the personal friends, are the works and lives of heroic schoolmasters recorded and remembered.

The trail of the city superintendent has been followed persistently during the sixty years by very few pilgrims; of the hundreds that have struck it, most have left it for another prospect. The roll of names is short. Various callings have contributed to the gang on the trail; commercial, mercantile, professional, and industrial vocations each have sent representatives to join the tramping throng.

The causes for striking the trail and the reasons for leaving it are well in sight. Inadequate preparation has been potent in forcing desertion. Neither scholarship nor executive ability alone has been found ample for permanent occupation. The requisite power and wisdom of the city superintendent is identical with that of the competent man in industrial, commercial, or diplomatic life, with that common necessary attribute in each and all—adequate special preparation. A college senior is poor material for an executive of schools as well as for industrial or mercantile establishments.

Men in middle age, of ability to measure themselves, enter with hesitation and lack of confidence upon an undertaking with which they have not in early manhood been familiar. Superintendents of schools are not born, but made, made exactly as are men in other lines of life, by training, discipline, and experience.

Schools of philosophy and pedagogy can not be seen along the earlier trail. Their establishment and conduct is one of the later improvements upon which we congratulate ourselves. The chairs of pedagogy which the colleges have hastened to endow are occupied by such talent as has never before entered the work of training teachers. The value of the product can scarcely be overrated, and yet we are compelled to recognize that some material is sent to that factory out of which supervisors can never be made. More than experimentation in a pedagogical college is required. One of our eminent philosophers, Professor James, has written: "A knowledge of such psychology as this can no more make a good teacher than a knowledge of the laws of

perspective can make a landscape painter of effective skill." It is an added truth to that other one so hesitatingly learned, that graduation from a normal school is no earnest of a teacher.

Among the 625 city superintendents to-day on the trail, from cities of eight thousand or more people, are men and women of all ages and colors, and of such varied antecedents as to preclude a reference to them as a profession. The practices, expenditures, customs, and environments of the respective cities that they represent compel as varied and various administrations.

But the trail has become broad, even if crooked. Its side lines are becoming more and more evident. The Bureau of Education, embarrassed by its limited appropriation and its humble official position as an adjunct of the Department of the Interior, has been, through its reports, one great factor in unifying the differences in the work of city superintendents. The hindrances imposed upon the Bureau have been overcome to almost a superhuman extent by the one and, as I believe, the only man competent for this great work. When the work of Commissioner Harris shall be comprehended in all its fullness, we shall wonder that we lived during his time without a complete realization of the power of this great man.

A second factor, great in another way, has been and is the department of superintendence of the National Educational Association. The annual three days' meeting, if, according to its traditions, it can be held to business, not picnicking, will accomplish the unifying of the methods and procedure of city superintendents. The trail is to become less and less crooked, the pilgrims are to tramp more regularly, and the forward movement is to be more even. Looking backward, the halts and windings have been many, and while the intense, over-ardent reformers have for a day threatened an upset, this department has contributed largely to prevent serious overthrows.

From the writing school in the forenoon and the reading school of the afternoon in old Boston, with its imported Lancastrian system, has come what we have in this the sixtieth year.

We have fought, bled, and died with the no-recess plan; the formal teaching of moral science in all grades; grammatical diagramming; the monitorial system; departmental instruction (which has lately been lifted from the grave and its ghost rehabilitated); teaching patriotism perfunctorily; self-government (also recently resurrected); concert recitation, and teaching geography by singing (how the latter raged like a roaring whirlwind, while from hundreds of schoolrooms came the doggerel song!); counting in penmanship; individual instruction (which has ever been the chief work of the competent teacher); counting one for a comma, two for a semi-colon, three for a colon, four for a period, etc.

In teaching reading, the battle has been on with the Pollard system, the phonetic system, and large editions of books printed for a great city with Leigh's phonetic type; script before print; the word, sentence, leaflet, and analytic method (the latter taking about six weeks for each page of the reading book).

In arithmetic we have passed through the Grube method; the ratio method by chart (introduced and discarded by Pestalozzi in the last century); the ratio method by scales of weight and yardsticks; a later ratio method by blocks; the lightning method by Webb, and others.

In music we have had the tonic sol-fa method, involving a changed system of writing music; and we have lately introduced the "primary trot," being a mechanical running by primary pupils about the schoolroom; and also object teaching.

May I indulge in a digression here to call attention to that incomparable report to the National Educational Association, read at Harrisburg in 1865? We are fond of our modern committees of five, of ten, of fifteen, because the character of the membership makes their reports so valuable. Let me read the names of that committee of seven, whose report, drawn up by S. S. Greene, together with the remarks of

Principal E. A. Sheldon (he who was the apostle of object teaching), puts into the shadow much of the nature-study and field-work instruction of to-day. They were: Barnas Sears, S. S. Greene, Josiah L. Pickard, J. D. Philbrick, David N. Camp, Richard Edwards, Calvin S. Pennell.

We have had Mr. Charles F. Adams with his Quincy discovery. Some of us were active in those days. And when that old hero, Daniel Hager, wrote to me that he would go from Salem to Quincy and write me all about it, I waited for the report of his visit. Like all of our correspondence, this was helpful and comforting to an ambitious superintendent. He said: "I found nothing new, but I found new combinations, and a genius for work and enthusiasm in the superintendent that was helpful and inspiring." He urged me to go and see, even if I was 2,000 miles away. This conclusion, given at that time by Mr. Hager, has been verified in the years that have followed.

From these innovations and out of these proposals we have, to some extent, accepted the amendments; in some cases we have taken nearly the whole, finding it good; in others, but a little, ever trying and sifting, holding to that which has been practically demonstrated as of value. A large part, as you and I know, has been discarded as the vagaries of overzealous but misguided and imprudent but persistent innovators. These people are good to have about us, and may be encouraged to spend their energies like the inventor in material things who seeks for perpetual motion. Another class, however, outside of school circles are to be condemned and cast out—the iconoclasts, who never plan a proposal for aught new, or for a substitute, but who, through the press, platform, and pulpit are everlastingly tearing down and demolishing and condemning.

The activity of the present is unprecedented. Experiments are proposed, and that superintendent who hesitates in entering upon them is temporarily lost. One of the most pronounced of these experimental movements is the attempt to construct laws that relieve people and boards of education of not only execution, of school laws, but of framing them. In haste to eliminate evils attending school supervision consequent upon interference from incompetent councils, measures are urged placing much power in the office of the superintendent, with few limitations.

In reaching for the desirable, as is the custom of Americans, we are overreaching. It is not likely that any American community will, for a long time, submit to the administration of any public office with limitations such as are repugnant to their antecedents and training. The personal-liberty idea and the government-by-the-people idea are a part of the unwritten as well as the written constitution of Americans. Even though government by the whole people has never been found expedient and has never been the practice, fortunately for our country the minority of the people have ever governed, and for safety must ever govern. A minority of the 75,000,000 make and enforce the laws for the majority.

It is unnecessary to decide whether or not the schools of a city can be most successfully conducted by one man or by a group of men; the former method is impossible, and must continue to be so until the sentiments of the people become less democratic. Were an elected board of experts within reach, the outcome would have good promise. But a board of educational experts in America at present, if called together, would sit in discussion seventy-seven years and then adjourn disagreeing.

There is no authority for us. Each man is bound to trek upon his own domain. The reports of the Bureau do not assume to be authoritative, but to give information only. Hall, Parker, Butler, Soldan, Maxwell, Sabin, and the rest, however much they may deserve it, wear no judicial ermine. We listen to the theories of the doctors, and are compelled to discard very many of them as impracticable or extravagant. The superintendent who accepts too soon the results of an experiment trifles with the children's greatest interests and wrongs the people whom he serves.

The appearance and active participation of scores of young men—some of them brilliant, some scholars, some callow, but all honest—add to the educational ranks such vigor and forcefulness as were never before known. The list of names now in the pedagogical field comprises a kind of men of power and thought that never before looked toward the school and the training of children. This promises an outcome for the product of the elementary schools far better than the country has hitherto known. Because professors of pedagogy are made in a year, out of all sorts of material, by some institutions, and turned loose to prey upon us and preach inchoate doctrines, is no cause for anxiety. If some of them do become earnest over adolescence and the bacteria found under pupils' finger nails, and the curves of the lines of fatigue, and danger from common drinking cups, and common property in pencils and books, they are sure either to learn as they follow the trail, or, what sometimes is better, fall out. Such conditions are a part of all advance movements.

* * * * * *

Without question the greatest problem to-day is how best to administer the public-school interests of a city. The same problem in a field but little different confronts the student of municipal government. The method of the constitution and the selection of a school-governing authority appear as the initial proposition. Shall the people elect, and how—at large or by wards? Shall the directory, as in municipal governments, be changed all at one time? Shall the board be appointed by the executive of the city, as in New York and Chicago, or by the courts, as in Philadelphia, or elected by the people, as in Boston and St. Louis? Shall the board be subservient in financial conduct to the municipal government, as in Boston, or independent of the city officials, as in St. Louis and many smaller Western cities?

The history of the last two years or more leaves no doubt of the interest and even anxiety of the American community as to the direction of public schools. From our great metropolis down through the secondary cities is found an agitation, an unrest, as to the conduct of this quasi-public corporation. Chicago, Detroit, and Indianapolis had their "innings" before their respective legislatures last year with different results. New York had set the pace the preceding winter, with a result that is believed to be an advance in efficiency. The legislatures at Lansing and at Springfield looked with disfavor upon carefully prepared bills for the schools of their chief cities. The press tells us that divided counsel among the promoters was the chief cause of defeat; and yet we can scarcely say that defeat was not for the ultimate good. A prominent and, as before mentioned, objectionable feature of this proposed legislation was the increased and quite unlimited power for the superintendent. This latter was too radical a measure to be readily accepted.

The Indianapolis law deserves more than passing notice; first, because it was conceived and prepared by eminent and experienced schoolmen; second, because, led in a way not to arouse opposition by a united body of schoolmaster and superintendent promoters, the legislature passed and the governor signed the most remarkable school bill yet recorded. So quietly has this been done, and so promptly and quietly has the new régime been initiated, that little public notice outside Indiana seems to have been given to it. At present it promises far better school administration than has yet obtained in the country, and yet, as "the proof of the pudding is in the eating," we must wait and see. It is certain that Indianapolis has improved on Cleveland, the pioneer in special school laws for cities. After some study and review of the three bills for Detroit, for Chicago, and for Indianapolis, one is compelled to believe that the bill for Indianapolis is the best, and the outcome, so far, is a verification of that belief.

The whole matter is an evidence of great activity throughout the country in the determination of the people to place the control and government of schools as far as possible beyond the reach of the baneful practices of the municipal governments of

America. Earnest men, enthusiastic to right a wrong, usually go too far and ask too much. One feature usually presented—absolute government by one man—must be a mistake when carried to its ultimate extent. It is unlikely that any one man is competent to direct, control, and be the complete manager of a city school system. However great his ability, accurate his judgment, quick his apprehension, long his experience, and extensive his general scholarship he is still one, and only one; the wisdom of the one needs to be supplemented by the counsel of others.

On the other hand, it must be conceded that a material difference lies between the practical administration of the affairs of a public and of a private corporation. In the case of the latter, often immense financial considerations, the manipulation of vast machinery, the necessity of effective and prompt action—sometimes approaching the heroic, as in great labor strikes—demand eminent organizing and executive power; while the accountability of the superintendent, as well as his responsibility, is always to a small, intelligent, and interested directory; one constituted only for the single object of financial gain, totally free from political or social issues. Interference by individual stockholders is not tolerated. The efficiency of the administration depends upon the superintendent himself, under such limitations as his board prescribes. Prompt action is always not only possible but obligatory. His forces are all concentrated upon the matter in hand; episodes, side issues, the press, the public, and the owners are impotent to dissipate his powers or hamper his plans.

But the school superintendent who, with competent counsel added to his own expert ability, constructs a course of study, condemns the work of a poor teacher, objects to the engagement of inferior talent, frowns upon the purchase of unnecessary apparatus, or, what is even more threatening, recommends the substitution of a better text-book for a poor one, understands full well that, however unanimous may be the support of his board, many taxpayers, as well as mercantile and commercial interests, are sure to take a hand either to forward or prevent the execution of whatever plans he may devise. The inevitable letter to the press, over the anonymous signature of "Taxpayer," is a reminder that the people propose to allow their representatives on the school board to act their will only when it coincides with that of the individual opinion—a condition, of course, over which the superintendent of private corporations has never to worry.

And so one has a right to assume that, in addition to the power and skill of the superintendent of great industries, the superintendent of schools needs another qualification—that of mollifying and educating a great and not always prudent or well-informed constituency.

The title of the office, "superintendent of schools," is no misnomer, but it is submitted that the term "assistant superintendent of schools" does not sufficiently indicate the duties of that office, and is an unfortunate designation. Our Canadian neighbors have a better name, "inspector." An assistant superintendent of schools is not needed in any administration; one superintendent is enough, and all that can perform the proper duties of the place. The office needs assistants who inspect; in fact, that is what assistant superintendents now do, or ought to do.

I know there is not much in a name, but I would establish a superintendent with a corps of inspectors whose reports would be the basis for changes, appointments, and conduct of the entire system—men appointed for expert ability along different lines, who would do their work along that line, whose office would be in dignity second to none, and whose counsel would be the controlling counsel, while the superintendent would do the directing and executing.

The trail of the city superintendent of schools has been narrow and crooked. To-day it is wide, and is to be fairly straight, so that the recruits need have little doubt by day or by night as to where the trail lies.

The throng on the trail will stay there, and wild-eyed reformers with their, to them original, discoveries, although resurrected from the last century, will fail to decoy

the prudent superintendent. Sticking to what one knows, avoiding experiment, and the chasing of brightly colored will-o'-the-wisps, will make those who stick to the trail carry themselves well to the end, and the monument shall be erected in sight of all who pass thereafter.

OBLIGATIONS AND OPPORTUNITIES OF SCHOLARSHIP.¹

By PRESIDENT EDWIN A. ALDERMAN.

University of North Carolina, Chapel Hill, N. C.

I believe I am speaking to you, ladies and gentlemen, at the moment of the broadest national feeling in the life of the later Republic, and hence I have hesitated in the choice of my theme, "The obligations and opportunities of scholarship in the Southern States," lest I seem to modify the operation of so beautiful and universal a force as scholarship by any sort of restricted geographical label. The land where his fathers lived, idealized by woe and fortitude, and stern adherence to a theory and an idea, is forever dear to the man of the South, and no less to the boy of the South reaching up into manhood; but the great Republic, whose firm foundations his forefathers helped to lay so deep and strong, is very dear to him, too. Its flag, wherever it may be carried, is the symbol to him of the best that he can hope or dream, and prophecies of his undivided country's destiny stir his blood and sing in his brain. The very tragedy of the career of the southern portion of our Union justifies my theme and gives to that section a certain distinctiveness, which it can not quickly change, if it would, in its tendencies and in its duties and needs. That tragedy is bound up in the one stupendous error of slavery for which all sections of the Republic are equally to blame. I shall not retail in any detail this story so often told in assemblies of this nature, but it seems worth while to say this much: By slavery the South was foreordained to spend sixty wonderful years in a period of hurtful stillness and isolation, wherein was developed a rural, patriarchal society with all its virtues and all its defects. It doomed us to a shameful period of chaos and submersion, wherein every atom of our boasted racial strain was put to the test. It hung in the balance the mighty issue whether a section of the English branch of the white race should preserve its standards, its homes, its governmental consciousness, what was good and lovely in its past, or whether, like the less virile races, it should descend to an inferior type. The men of the South, born between 1835 and 1850, as they entered upon maturity and manhood, inherited a fearsome legacy of defeat in war, of political and social and industrial anarchy, of poverty, and of the prejudice of the world. The older men of that group retained, perforce, the habit of mind and the hindering traditions of the patriarchal order. The younger ones lacked education and mental training, save such as could be obtained in the trenches and upon the battlefields, and they lacked, too, the buoyancy of unbeaten youth, and yet there rested upon them the task of maintaining their racial integrity, of establishing new institutions, and of finding such a clew to changed economic systems as would enable them to create wealth enough to educate their own children and the children of their slaves. These men were not fit, nor were the times fit, for calm, philosophic thought or academic view points. The times were rude and unquiet, and afforded small opportunity for any self-development except development of fitness to survive, to endure, and to perfect. It may be said with truth, therefore, that the last thirty years have been a period of crudity, of sternness, and some violence, in Southern life, and of much misunderstanding of Southern men by their fellow-countrymen. At the sacrifice of their own highest ideals of growth Southern white men have given

¹Reprinted from the Proceedings of the Department of Superintendence, N. E. A., at Chicago, February 27-March 1, 1900.

themselves up to the doing of two vital things—the assertion of their right, as proud men acquainted with suffering, to control and direct the course of affairs in the life of their localities, and the creation of wealth and material resources. They have done these two things so well that those of us born since 1861 find ourselves living with some peace of mind in a new world of friendly feeling, of waning intolerance, of increasing wealth in urban life, of industrial power, and educational desire. It may be doubted whether any generation of Americans, save the men who made the Constitution and the pioneers who built the great West, deserve so well of their posterity as these bearers of war's burdens. It is a poor American who is not proud of them, and it is a pale, spiritless Southern man who does not render to them the tribute of his gratitude and his love. It is settled, I believe, that this white man, who has shown himself so full of courage and force, shall rule in the South, because he is fittest to rule. There is a race problem, but it is largely a problem of how the white race shall use its power, in justice, in kindness, and constructive good will, to the white man and to the black man alike. It is tolerably certain, too, that the South shall grow in wealth. The very frenzy of work and accumulation has gotten into its blood. Its citizens have relearned the hang of industrial success which slavery and its consequences robbed their fathers of when the century was young. They have taken to heart the lesson that civilization can express itself in terms of dollars and cents as well as in terms of theories and enthusiasms. When the idea became clear to them that cotton from the looms was worth three times the value of cotton in the fields, they began the establishment of technical schools and the building all along their limits, from the banks of the Roanoke to southern Alabama, 500 cotton mills with 5,000,000 spindles and 1,000,000 looms, and they have just begun. Sleepy little Southern towns that once dozed under the sun and boiled over in hot talk of State's rights and strict construction of the Constitution are now black and busy and happy, sending to the ends of the earth salable things made of iron and steel and cotton and wood. There is some loss of picturesqueness, perhaps, but certain gain of power. It is as if a man had swapped a hobby horse for a steam engine.

But some fundamental things have not been settled. It has not been settled what sort of intellectual and moral civilization shall be the final outcome of all this revolution and new birth. It has not been settled how just our modes of government are to be, whether our highest selves are to be realized in our institutions or our life properly adjusted to the larger life of the world. It has not been fully settled whether we shall start right or wrong in the modern world. That supreme result is for the men and women who have been born since the civil war, and for their children, to achieve. After isolation, war, submersion, awakening, the South is really beginning its probation as a member of the modern world in the twentieth century. Its chief problem is the chief problem of every society passing from simpler social forms into the third and highest stage of society, namely, the realization of its highest self in life and law, not by personal courage or raw individualism, not by patient endurance of disaster, but by intelligent activity, by civic unity, by public spirit, and community effort. Noble and impressive beginnings have been made in the direction of this self-realization. A system of public schools for black and white has been established in all the States and is being improved under stupendous difficulties, not the least of which is a periodic demand by overborne, exasperated men that each race shall support its own schools by its own taxation. But this will never be done. Justice is against it. Self-interest is against it. The black, ugly fact that ignorance is a remedy for nothing and a peril to everything quickly crushes out whatever life there is in the idea, for its triumph would mean the existence of a permanent body of death, and improvement is slow and pitiful enough at the best. The principle of local taxation for other purposes than jails and bridges has been written in the statute books. An attempt is being made to coordinate justly the secondary, technical, and higher education. A movement for public roads and pub-

lic libraries is going forward. The revision of constitutions, the creation of wise systems of public taxation, and the improvement and uplifting of rural life are engaging the attention of the thoughtful. These movements as yet are chaotic or atomistic, characterized by lack of harmony and symmetry and oneness of purpose, and needing to be correlated and fused and welded into one effective agent of social amelioration. The traditions and powers of the old life will not bring these things to pass. There is needed a new social spirit, a new type of man, with a new equipment of power to inform and influence and guide this spirit.

Here, then, is a new intellectual and moral world about to be born. There surrounds it the dignity of a sad and historic past, and there stretches before it an unimagined future, thrilling with impulses of growth. Though hard pressed by new ideas aloose in the world flowing out of its urban growth, this land is still a land of conservatism in religion, in culture, and in politics. If one wants to find out what the old stock thought and what they liked, one must still journey southward. Even Senator Hoar found it necessary to flee from Boston to Charleston of all places to get some comfort in his desire to quench our new, fierce thirst for islands. Yet conservatism can not hush its cry for men to guide it wisely, out of sensitive social self-consciousness, into the broad current of the world's thought, to build its institutions, to remodel its constitutions, to shape its policies, to settle nobly grave questions of suffrage and of race. I do not believe there has been so inspiring a call to youth and strength since Stein and Fichte lifted Germany from under the hoof-prints of Napoleon's army and led her happy and prosperous into the family of nations. The nation has cause to be thankful for one thing. The raw material of citizenship for this upbuilding exists in the South, whether it shall be sought for in the old family stocks, sobered and broadened by poverty and fortitude, or whether it shall issue from the ranks of the plain people, who fought our battles for us, who inherit the English temperament, who may not be able to read, but who are able to remember that their fathers earned liberty as a reward of sacrifice behind the cotton bales at New Orleans, on the fiery crest of Kings Mountain, or in the swift and fateful marches along the valleys of the Dan.

It has been my trade in life, and it still is, to work with the Southern boy. I have some right, therefore, to judge him and to weigh him. He would perhaps have slight patience with any effort of mine to set him up as a wholly different type from the vigorous American boy elsewhere, and to hedge him around with any barrier of sectionalism; and I do not wish to do that. He is an American boy. Yet great historic social forces have been at play upon the Southern boy, as they were at play upon his fathers, and we are to examine the result. He is frank, sunny, and courageous still, though hardships and struggles have added to him a certain toughness of temper and fineness of spirit. Life has generally widened out to him through sacrifice. He has had from his youth the tutelage of self-denial and renunciation. He may be at college, tasting the sweet waters and breathing the clearer air, but he knows that far away in the humble home the father and mother are taking counsel in the still hours of the night how they may scrimp here and save there and work a little harder and rest a little less, and so pay out gladly their life and their strength for his sake; and life looks grander to him by reason of it, and duty seems easier to him and opportunity sweeter and kindlier.

The ethical and the ideal appeal very strongly to the boy of the South. Not because he is any better than his neighbors, but because economic conditions have developed that side of him. He has left off certain vices of his grandfathers, and he is clearly their superior in intellectual curiosity and thoughtfulness about the common good and the needs of the average citizen. Enthusiasms are very likely to possess him, and ideas and principles attract him more potently than machinery or organization. There is a tribal primitive individualism in his blood which is to him both a blessing and a curse. It has been a blessing at times, causing him to take things

in his own hands to preserve his own liberty and the dignity of his person at any cost. Sometimes it has been a curse, shading off into lawlessness, tending to paralyze concerted effort and to leave communities disunited and torn by religious and party differences, and thus unable to achieve high public ends. At the bottom the Southern young man is a political animal, in Aristotle's good sense of the word—impulsive, upright, and patriotic. No weary cynicism or passion for wealth and sports as yet bounds his horizon. His highest idea of great service and great achievement is service to the state, and molding society in social and political forms.

This fine impulse for public service goes to seed sometimes, and we have the frantic, callow voice shouting panaceas and nostrums, and here and there the malign figure of the demagogue creeping about, causing simple men to lend an ear to political and economic sophisms. But the average Southern boy, like the average American boy, has brains, and honesty, and faith, and enthusiasm. His trouble is a sort of dazed timidity. He seems to lack what his fathers had excess of—singleness of purpose and grim earnestness. I believe this will come, for it is in his blood, when his ideals harden into certainty, when he feels more at home in American life, when he learns the trick of concerted action, and when the society immediately about him becomes more critical of itself and tolerant of all shades of thought and opinion.

In the past the South has been charged with setting too much store by wise leaders and neglecting to provide for wise followers. A militant order, with its base resting on slaves and its summit bright with masterful, lovable men, like the Athenian city-state, had very little trouble about its leadership. Men heard the organ voice of Calhoun and heeded it as the men of the tribe heed the strong man, as the Florentines followed the Medici, or as the Irish rallied about O'Connell or Parnell. Jefferson Davis, Judah P. Benjamin, Alexander Stephens, Robert Toombs, Henry A. Wise, and W. A. Graham spoke, and their States or parties recognized their primacy and massed behind them like men at arms on a field of battle.

But the old type of leader has gone by forever, like a lost type in nature, and the leader-ridden South of the past is leaderless now. I hear no commanding voice in the political life of the Southern States. In the field in which for seventy-five years she was preeminent the South is now defective. Her public men are rarely scholars. There are no Madisons and Clays and Calhouns and Lamars. There are some notable names in business, and Lanier and Page and Harris and James Lane Allen and Woodrow Wilson are worthy names in any literature. There are clever men everywhere, but no commanding men. There are reasons for this, and perhaps it is not to be deplored. The coming leader has a harder task than the leader of the olden time, and there must needs be time for him to grow. He can no longer incarnate the dumb, dull aspirations of the people and be a glorified figure to them as Clay and Jackson were. The age of personal loyalty has been succeeded by an age of personal distrust. The mass has been broken up into common, hard-headed, acute, power-loving men armed with the weapons of democracy. These men are going to rule whether they are fit for it or not, and the problem is to make them fit—or better, perhaps, their children fit, for the grown-up folks are past saving—by putting them into a school of ideals, where they shall get uplift of thought, and where the tastelessness and mediocrity and unthinking activity that beset democracies shall be rooted out. The most pervasive school of ideals to which most of the young men in my land have been going for generations is the school of politics, and it has been a dull and sordid school, having for its curriculum a weary trivium of negro, tariff, and currency, and not the highest phase of any one of them. It is just here that the presence of the negro has worked the saddest harm to us. There is a deep feeling that intelligence, character, and wealth must be the real majority, whatever the sum of votes may add up. Political self-preservation, as they see it, has forced ardent, high-spirited young men, able and eager to understand great questions, to stand at the ballot box and beat back a black tide of ignorance, and thus behold without a blush

the sacred conception of suffrage violated, public service cheapened, and, too often, the mere manipulator rewarded. Any force that can change this is a good force. I believe that this school has suspended and another and better one has been founded in which there is a new motive concerning itself about things near at home, and yet conscious of the unity and majesty of American life, a fresher and more inspiring motive which will make for the end of this reign of dullness and danger to character.

It is a common, pat thing to say to Southern young men: "Quit talking about the South; keep out of politics, and go to work." Two-thirds of this advice is very healthy, but the other third is fretful and superficial. To keep out of politics in a republic is to keep out of life, and to keep out of politics in the South is to miss opportunities that come only in splendid creative epochs of national history. For educated men such a course is to demonstrate afresh that mincing, dainty cowardice of scholarship, in the presence of great, rude, human forces, which makes Erasmus seem small to us beside Luther and sets the towering genius of Goethe below the radiant young poet Körner, singing his defiant songs to the bright face of freedom. Politics exists in my thoughts as a form of applied patriotism, seeking, by pleading with the public conscience and by education of the public mind, to bring about good government, to establish schools, to build roads, to spread culture abroad and to make it dynamic, and to win liberty such as free men are fit to have. And let us define patriotism, for in my thought it needs some redefinition, having become a somewhat slippery and elusive term, high and holy thing though it be. There is the unthinking, alcoholic patriotism that shouts: "My country, may she always be right! But right or wrong, my country!" There is the ancestral patriotism that worships the *genius loci* and the fathers. Its devotees can not forget their grandfathers. They have the disease of atavism, and enwrapped in the graveclothes of their forebears they sit deathly still in the busy world and fancy that virtue issues from their garments to the afflicted passers-by. There is the thrifty patriotism that shouts for party and party leaders and votes the ticket. There is the noble rage that inspired Southern boys to climb the slopes of Gettysburg, and that inspired Northern boys to turn their breasts into a stone wall to meet the onset, and that inspired the sons of both, with reunited love and common purpose, to charge together through the hot grass and under the brazen sun about Santiago. And finally there is the patriotism of common sense, which is the very religion of citizenship. This patriotism is a compound of scholarship, of social sympathy, of right reason, trying to teach democracy, "that glorious optimism," how to use its rude devices so that it may justify its right to exist as the ultimate form of government. There are many very unlovely manifestations of this patriotism in the shape of heated, willful men in primaries and at the ballot box, but the thing itself is an academy, a battle ground of ideas which should strive to emancipate tens of thousands of white men in the South and in the North and West from petty local views, from selfishness, from the tyranny of hard creeds, from the philosophy of carelessness and wasteful *laissez-faire*, from false individualism, and teach them largeness of view and the necessity of community effort for community good. Much has been said from a thousand platforms in this country about the scholar in politics, and he has for some decades been the stock figure for academic eloquence. And perhaps not enough has been said about the power of culture and the passion for knowing, to regenerate the individual man by lighting up his mind and disciplining his willfulness, by giving him the fine true sense for beauty and manners and order and reason, and by endowing him, to use Mr. Lowell's noble phrase, "with that good taste which is the conscience of the mind and that conscience which is the good taste of the soul." But the impulse to cry out for scholars and seers to enter into the hurly-burly of life is a just one. The individual is so microscopic and self-government so begirt with the perils of unintelligent strength and vulgar force that there must needs be great movements flowing about guided by the scholar's purpose to be of service to great masses. The theme may be trite enough,

but instinct and reason call for the reality. And the reality is the man who sees things as they are, and hates violence; who has no fear of oppression, because he is strong; who can not be deceived, because he has been trained and knows truth from mania and the fates of nations and the experiences of cities and men; who can not be terrorized, because he is not afraid; who can not be starved, because his hands have skill and his brains have cunning. This real sort of scholar is needed to aid in the transformation of unthinking, careless white men, without tastes or wants or desires, into men with ideals; men who can see the relation of law to society, and what it means to defy law, even to protect innocence; men who can see the beauty and interest of life; men who have some civic sympathy, love their towns, villages, front yards, highways, parks, schools, and libraries, and, thus proceeding upward, grow into a grander conception of the perils and privileges of the heritage left them by the Lord God, now grown so swiftly into an empire, vaster than the empire of Trajan or Justinian. Men of philanthropic impulses are easily moved to helpfulness by the spectacle of the black race striving to fit itself for republican citizenship unwisely thrust upon it. They are not so easily moved by the spectacle of the white race striving to fit itself for the noble discharge of an unparalleled sociological duty. And yet that is the pivot of the whole question. The education of one untaught white man to the point where it is clear to him that knowledge and not prejudice must guide his conduct, and that for the honor of his name and country and his posterity he must deal with these people in justice and kindness and Christian forethought, is worth more to the black man himself than the education of ten of his own race. I believe that any Southern university is doing more to lift up the colored race, through the broad-minded men it is training and sending into life, than nine-tenths of the schools for higher education of the negro, and if these universities had the means to set in operation academic forces to study and investigate and digest the great problem, instead of thrashing out old straw, their power would be increased tenfold. It is wise and just to help the black man, but it would be equally wise and just to recognize that the white man is the dominant force, and that he will act in the light of his knowledge and training. The white man has shown himself to possess courage and fidelity and self-respect and pride. He needs help in the right way, though he is too proud generally to say so. Save among the most ignorant there is no truculence, no passion, but a high desire to do right. Impotency, the frightful difficulties of the situation, and the sheeplike solidarity of the negro himself sometimes beget exasperation. It is substantial, brotherly help that we need, my brethren; not the altruism of the remote, nor the scorn of the doctrinaire, nor the cock-sure criticism of the unaffected. I believe that it should be a high and precious privilege for all Americans to help their Southern countryman work out his problem of orderly, law-abiding social life, and to help him as brothers in loyal affection.

In speaking thus strongly I do not forget that a black man, Booker Washington, has seized the essentials of the negro question more perfectly perhaps than any Southern man of either race, and has pressed his views before the country with a mingling of diplomacy, sympathy, and patriotic scholarship altogether admirable. What I mean is that even Booker Washington, with his undoubted gifts and with the wealth that is coming to him, will become simply a racial phenomenon, without lasting effect upon the great question, if he has not the intelligent sympathy and cooperation of the white men about him.

It is a singular and startling thing that no Southern college attempts the study of social phenomena in any adequate or organized way. Departments of social science, in the modern sense of the word, do not exist among them. They have widened out from the traditional circle of the liberal arts into the study of agriculture, mechanics, textiles, but they have not approached the confused, unrelated human forces about them in a scientific fashion. Their students approach these subjects in

the spirit of the empiric, the dilettante, or the politician. They do not bring to the consideration of such questions the trained habit of mind, the trained orderliness of thought that is needed for their mastery. This is largely due to poverty of equipment.

I have sometimes thought that the National Government, which once thought it wise to help its citizens to a better understanding of their industrial life through the land-grant colleges, might find it equally wise to help them in the same way to an understanding of social problems, whose righteous adjustment means so much to the peace, honor, and prosperity of our whole people.

What is to be the general type of man, may I ask, who is to come out of Southern life able to lead her new forces resolutely and to find the key to the broader life? First of all, he should be an educated man. We have done with the sneer at book learning and the apotheosis of the self-made man. The old leaders were learned men and masterful men, persuasive in speech and swift in action. Their distinguishing traits were strength of will and serenity and confidence of mind and spirit and perfect equipment for their peculiar work. Their times demanded fire and strength. They supplied the demand and to spare. The special demand for this era is knowledge and sound basis of action. We as yet have it not. We need to know about things before we settle them, instead of settling them first and learning about them afterwards. There must come into the thought of the humblest man among us that instinctive Scottish feeling of loyalty and reverence for knowledge as the power alone fit to deal with questions of public welfare that marks off so sharply the man whose mind is set upon the building up of his institutions in righteousness and wisdom, whose strength is upon the power of conduct, from the man who is desirous of working his own will and obtaining the reward of his own smartness. Evidences that this attitude is coming about come often to my knowledge. Mature men come up to college, spending all their little store to sit with boys to get some little learning. Three-fourths of a whole body of five hundred students are in college as a result of money earned or borrowed. One-fourth are earning their way through college by every form of daily labor, from cutting wood to cutting hair; sensitiveness, sentiment, pride, gentle breeding, everything swallowed up in the overmastering desire for the blessed light! The universities and colleges in the South which hear this cry of need and must minister to it are not strong in equipment or endowment. It is a struggle for them to exist. The sum of all their endowments does not equal the endowment of any one of a half dozen Northern and Eastern institutions, and too often as a stunting inheritance from the grinding days of want the people have gotten used to their poverty in matters relating to higher education. What strength they have is internal—the strength of disinterestedness, of moral energy, of faith in the belief that they are the symbols of the benign force that shall work out the good life of their land. What strength they need to accomplish this end is the strength of endowment, of apparatus, of ample and even magnificent surroundings, that they may arise so sharply and clearly out of low levels that they may set new standards and establish new conceptions of college life.

I once stood upon the deck of a great ship whose prow was slipping gently through the waters of the Bosphorus to the Black Sea. As we passed the spot where Robert College stands upon its rocky hill the boys waved flags and sheets and handkerchiefs in salute to the starry flag floating at the masthead. The brave pioneer college moved the imagination strongly, standing there stout and strong upon its hill, while all around it soared the minarets and towers of a stubborn and unyielding faith, and all about it heaved the tides of the yellow people of the unchanging East. The place seemed to my fancy at once a fortress and a dynamo, holding tight and fast to the things that are good, but sending out to the dim, toiling thousands in the shadows at its base the vital currents of light and life. The curving shores of Constantinople faded from my view, and I saw my home land, teeming, too, with tumultuous, untrained youth, but of a different breed and duty, and every college a Robert Col-

lege, charged with power and desire to fit them to guide their people into the larger circle of American life, and American hope, and American destiny.

The mere industrial man, masterful and creative as he is, can not do this supreme service for us. He dazzles us now because he represents the great thought that civilization can not reach its true development in poverty, but he is too much in the grasp of the theory that it is a higher and holier duty for the prosperous man to grow ever more prosperous than it is for him to pester himself about broader and purer social conditions. The mere orator will not do with his silver tongue. There was a time when every little village had its silver-tongued orator, who wielded his scepter from the hustings or the court-house, but his voice will not carry far into the metallic clink and roar of the times. The breezy, aggressive, accumulative imitator will not stand the test. There may be something parochial, but there is also something fine and impressive in the almost Hebraic feeling of the people of the Southern States that their section has something high and precious and distinctive in manhood and leadership to contribute to American civilization. It can not be mere boasting, so runs their dream, that it is the logical right of their land to bring forth out of her travail and agony something fair and good of her own likeness and pattern—the old refined gold, which disaster and defeat could not tarnish, beaten by fiercer, freer, civic forces into finer and subtler form. The spirit of his fathers, brave and steadfast men, who held firm and did not compromise, ought to be in him, and shall be in him. Sordidness and commercialism will not wholly submerge him and wear away his fineness. He will love honor more than life, and loyalty more than gold. A worldly, modern, clear-eyed man breathing the breath of freedom, he will reach men's hearts and he will control men's wills, not by machinery, but by the strength of integrity and sincerity and through faith in his words. And so, when the age of moral warfare shall succeed to the age of passionate gain getting; when blind social forces have wrought some tangle of inequality and injustice, of hatred and suspicion; when calculation and combination can only weave the web more fiercely; when the whole people in some hour of national peril shall seek for the man of heart and faith, who will not falter nor fail, in the sweet justice of God, they shall turn hither for succor as they once turned to a simple Virginia planter to free them from a stupid king and a stubborn Parliament across the seas.

ALCOHOL PHYSIOLOGY AND SUPERINTENDENCE.¹

By PROF. W. O. ATWATER,
Wesleyan University, Middletown, Conn.

In discussing the topic assigned me on your programme, I understand it to be your wish that I consider especially what should be taught in our schools about alcohol in its physiological relations. Allow me a word at the outset regarding the more general scope of instruction in physiology. In planning a course of study in this, as in any other subject, careful consideration must be given to the several parts, in order that the whole may be well considered and well balanced.

One thing I wish to urge is that we should tell our pupils more about the economy of food and nutrition, and since physiology already takes all the space there is for it in the curriculum, I would suggest that some things now found in a good many of the text-books be omitted to make room for what might be taught about the demands of our bodies for nourishment and how to supply them to the best advantage of health and purse. This would make a more substantial foundation for the

¹Reprinted from the Proceedings of the Department of Superintendence, N. E. A., at Chicago, February 27-March 1, 1900. The next following chapter of this Report (Chapter IX) contains a paper treating the question of temperance instruction from a European standpoint.

special instruction about alcohol in itself. To make room for this in the already crowded curriculum, I would suggest that some minor and more technical parts now taught might be omitted.

In illustration of what might be taught about the laws of nutrition, let me call your attention to the leaflets which you will find on the seats you are occupying. These have been furnished by the United States Department of Agriculture, through the kindness of Hon. James Wilson, Secretary of Agriculture, and Dr. A. C. True, director of the office of experiment stations. They will give you a hint of the purpose, plans, and some of the actual results of a series of investigations which are being carried on in different parts of the United States under the authority of Congress for the purpose of learning more about the economy of food. Let me also call your attention to these specimens, which are duplicates of those in the food collection of the United States National Museum. They illustrate the chemical composition of the human body and of the foods which nourish it. From the leaflets you may infer that already a large amount of information has been obtained regarding the chemical composition, digestibility, and nutritive values of our food materials, the ways in which they nourish the body, the dietary habits of people of different classes and regions, the more common errors in our food economy, and the ways in which we may select, prepare, and use our foods so as to make our diet less costly, more palatable, and more healthful. The museum specimens suggest one of the ways in which some of these facts may be explained and thus made most useful. The leaflets and specimens indicate some of the many ways in which our Government, in response to a public demand, a demand which comes especially from teachers, economists, and philanthropists, is gathering and disseminating knowledge of those things which require the most exact research for their discovery, and which, clearly discerned and rightly taught, take hold on life, form the most useful part of education, and can become sources of the truest inspiration.

When we consider that "half the struggle for life is a struggle for food;" that "half or more than half the earnings of the wage-earner is spent for the nourishment of himself and family;" that not only a man's power to work, but also his health, are largely affected by his food; that some of our most skilled hygienists are telling us that a large part of the disease which embitters life and hastens death is due to avoidable errors in diet; that more harm comes to the health of the community from erroneous habits of eating than from the habitual use of alcoholic drink; that economists, philanthropists, and divines are urging more and more earnestly the need of attention to such subjects, are we not justified in asking if a little more room can not be found for it in the school curriculum?

THE PHYSIOLOGICAL ACTION OF ALCOHOL.

I now come to the main division of my subject—the physiological action of alcohol, and what is and should be taught regarding it.

The laws of nearly all our States, I believe, require that the curricula of our public schools shall include physiology, with special reference to the action of alcoholic beverages. Such legislation would be impossible without a public sentiment back of it. Whether or not this legislation has assumed the most rational form, or whether the people at large understand exactly its purpose and to what degree the hopes of its promoters are being fulfilled, it is not my desire to discuss. The facts I desire to urge are two: First, it is the law, and, as such, our duty as teachers is to obey it as long as it stays on the statute books; second, there is a wide difference between the teaching of this subject in many schools and in many text-books on the one hand, and the teaching in the colleges, universities, and medical schools, and by the leading physiologists of the world, on the other. It is this most unfortunate disparity which I ask especially to consider. If the one body of doctrine is correct, and the other to a greater or less extent incorrect, as I personally believe it is, you, as teachers,

as schools superintendents, as the leaders in our education, are interested to know it. Here, as I understand it, is the reason for the title which your secretary has given to my subject, "Alcohol Physiology and Superintendence."

If the alcohol physiology now being taught in our public schools as a branch of science is scientifically correct, then it can not be pedagogically or ethically wrong, and there is little reason for my discussing the subject to-day. But if it does not tally with the most reliable conclusions from scientific observation and experiment; if what is taught as truth is half-truth or partial untruth; if doubtful theories are set forth as settled facts; if a rule of conduct is based upon an unsound theory; if the attempt is made to improve the morals of the men of the future by a wrong teaching of the boys of to-day—that educational policy is pedagogically and ethically wrong and ought to be altered.

OPINIONS OF LEADING AUTHORITIES.

The physiological action of alcohol is very complex, and the views of physiologists generally regarding the different details are naturally divergent. Let us take, for instance, the much discussed question as to whether alcohol is food or poison.

First of all we must have a clear understanding of what we are talking about. A given substance taken into the body may act in a variety of ways. Meat—beefsteak, for instance—which is universally called a food, supplies the body with material to build up its tissues, repair its waste, and furnish it with energy in the form of heat to keep it warm, and muscular power for work. It also has an action upon the nervous system which is not yet fully explained, but may perhaps be called stimulative. Taken in excess it may be injurious; its action is then pathological. Being thus injurious, it might under these circumstances be called poisonous. Arsenic is sometimes taken as a medicine, and as such is believed to be useful, though we do not know exactly how or why it is so. But arsenic has no value whatever as nutriment, and therefore can not be called in any sense a food. In more than minute doses it is deleterious or fatal. It is a true poison. There are certain vegetable products which, fed to animals, supply nourishment, but at the same time are injurious, so that they can not be used for food. Chemists have analyzed some such substances, and found ingredients which are nutritious and others which are injurious. That is to say, some substances are clearly foods, some are clearly poisons, some act in both ways. How, then, shall we class alcohol? What I shall attempt to show you is that the results of the most valuable scientific research and the opinions of the leading physiologists of the world unite in saying that it may be either food or poison, or both, according to circumstances.

Alcohol is not like the meat or the seed, a complex material made up of different ingredients. It is a simple chemical substance. Nevertheless it has very different actions. A chemist can analyze the seed and separate the parts which are nutritious from those which are poisonous. But he can not do this with alcohol. When the physiologist experiments upon its action he has to take it as a whole. This complicates the experimenting and makes the interpretation of the results difficult.

When we come to consider the dietetic use of alcohol, however, we must take into account, not only its direct value for nutriment, but also its indirect action—as, for instance, its effect upon digestion. So likewise, when we consider its pathological effect, we must take into account its indirect action upon the nervous system. Indeed, if we are going to study the subject at all thoroughly, we must recognize many subdivisions. Since we can not go into the details here, let me briefly summarize what appear to be the views of leading physiologists of the world.

What do the authorities say in answer to the question: Is alcohol food? Of course, the answer depends first of all upon the definition of "food." But people may properly differ as to the definition, and it is not worth while to quibble about what may

be left to the dictionaries. Let us then go back of this and ask: What do the specialists say as to its nutritive effect?

If we study the views held by the physiologists and pharmacologists in this country and in Europe who are regarded by their fellow-specialists as best qualified to speak with authority, we may perhaps divide them in three groups. At one extreme would be a small group who take grounds, more or less strongly, against any dietetic use or value of alcohol; but even this group would generally admit, I think, the absence of proof that alcohol does not supply the body with nutriment. There is a second group who are inclined to favor the moderate dietetic use of alcohol, tending to class it with nonproteid food materials, like sugar, starch, and fat, but still maintaining that its classification as a food is not clearly established. And where they are inclined to question its value for directly supplying the body with nourishment, they maintain that it may be valuable as an aid to digestion and otherwise, and find in this another reason for using it as part of the diet. A third group, whether they advocate or oppose its use, regard the evidence as sufficient to pronounce alcohol, in moderate quantities, a food in the sense that it may serve for nutriment, and many urge that there are circumstances in which its nutritive value is very important. Whether alcohol is or is not a poison is likewise a question of definition. Here again wise men may disagree; but back of this lies the important question: Is it injurious? That alcohol may be injurious, that in large enough doses it is unquestionably a poison, and that in smaller quantities, taken habitually, it may be extremely harmful, there is no shadow of doubt. On this point there is no disagreement of authorities. But whether, or under what circumstances, it is injurious when taken in moderate quantities is a very different matter; and here opinions disagree.

The opinion of Professor Fick, that alcohol in small amounts should be called poison, has been often quoted, and is, I believe, made the principal basis of the statement in many of our school text-books that alcohol is called a poison by the highest scientific authorities. But, Professor Fick defines "poison" in a way which, be it right or wrong, gives to the word a meaning quite different from that in which it is popularly used. He is one of the group of physiologists who practically deny any food value to alcohol. So far as I am aware, however, their number is small.

I have looked into many of the standard treatises upon the subject, and have conversed with many eminent physiologists, pharmacologists, and chemists about it. In so doing I have constantly seen and heard alcohol referred to in small quantities as food and in very large quantities as poison. But I have rarely seen or heard alcohol in small quantities called a poison, in the ordinary sense of the word, by any specialist who is generally regarded as an authority. Indeed, as I write this, I do not recall a single instance, but I should not feel warranted in saying that there are no such instances, because there are things which one might forget, and, furthermore, there may be many which I have not happened to see. I have no doubt but that, if I had been looking especially for evidence on this side of the question, I might have found a good deal more than what I have just said implies.

If, then, we leave out of account the question of scientific definition of the terms "food" and "poison," and take the words in the meanings in which they are commonly used, I think we may properly say that alcohol is both food and poison. Only, if we speak of it as food, we must be careful to bear in mind that it is not and can not be a food in the same sense in which bread and meat are foods. Food performs two great functions. One is to build body tissue and keep it in repair; the other is to yield energy in the form of heat to keep the body warm and muscular or other energy for its work.

To bring this out more clearly, let me remind you that our foods contain different classes of nutritive materials or nutrients. One of these classes includes the nitrogenous substances, protein compounds or proteids, as chemists call them. The

myosin which is the basis of lean meat, the albumen or white of egg, the casein which makes the curd of milk, the gluten of wheat, are familiar examples of proteid compounds. They are transformed into blood, muscle, bone, and brain. They are the true tissue formers of the body, the materials which serve for building the bodily machine and keeping it in repair. They also serve the body for fuel, but their use in this respect is limited. The fats, like fat of meat, the butter fat of milk, and the oil of cotton or of olive, make a second, and the carbohydrates, which include the starches and the sugars, a third class of nutrients of food. The fats and carbohydrates lack the chemical element nitrogen which is characteristic of the protein compounds, but they contain large proportions of carbon and are sometimes called the carbonaceous nutrients. By their oxidation, i. e., burning, in the body they yield its principal supply of energy.

Bread, meat, milk, and the like contain both the nitrogenous and the carbonaceous materials. Meat lacks the carbohydrates; to make a well-rounded diet we use bread, potatoes, and other vegetable materials with the meat. Bread and milk may be called complete foods, as they contain all three of these classes, and with them the other ingredients necessary for nutrition. Such complete foods not only build the bodily machine and keep it in repair, but also supply it with fuel.

While proteids serve for building tissue and have a limited value for fuel, we could not well live on proteids alone. They are not complete foods. Fats, starches, and sugars are not complete foods. They can not build tissue; nevertheless, they make the larger part of our food, for the reason that our bodies need more material for fuel than they do for building and repair.

Alcohol can not build tissue; it has no nitrogen. It can not be stored in the body for future use, as is the case with fats, nor can it be transformed into fat and thus stored in the body, as is the case with the sugars and starches. But it is oxidized in the body and does yield energy. In this respect it is analogous to the fats, sugars, and starches. Just how it compares in fuel value with the fats, sugars, and starches, or just how these latter compare with one another in fuel value, are questions as yet unanswered.

Alcohol is, then, at best a partial food. To call it food, in the popular sense of the word, and without qualification, may produce a wrong impression. Furthermore, its action upon the nerves and otherwise in the body is such that only very small quantities can be taken without serious derangement. When taken habitually in excess it is not only injurious to health but ruinous to character. And while its nutritive action may be very important in some cases, especially with aged people or in certain forms of disease, people generally do not take it for the sake of its nutritive value at all.

Taking the word "poison" in the sense in which it is commonly understood, namely, as applying to substances which are deadly in their effect, alcohol in small quantities can not in my judgment properly be called a poison. It may be injurious in one case and not in another. Just where to draw the line between the quantity which may serve only as food and that which acts as poison is impossible. The amount that can be taken without injurious effect differs with different people. And even though there are conditions in which it is not injurious and is even useful, yet there is the danger that it may lead to excess, a danger, which, as teachers of youth, we must not, we dare not, forget. This fact, coupled with the demoralization that comes with its habitual and excessive use, constitutes, in my judgment, the chief argument against its use.

But I have started to give you the opinions of leading physiologists, and have indiscreetly gone out of the way to give you my own, and that, too, when I am only a physiological chemist. Let us go back to the authorities.

At the meeting of the International Physiological Congress, held in Cambridge, England, in September, 1898, an effort was made to obtain an expression of opinion

which might be taken as a consensus of leading physiologists regarding this especial subject. The occasion had brought together some of the best-known authorities from the different countries of Europe, America, and even Africa and Asia. The congress did not include a great many men, but it did include a number of great men. The following statement was drawn up by Prof. Michael Foster, of the University of Cambridge, who was the president of the congress, and was printed and offered for signature:

The physiological effects of alcohol, taken in a diluted form, in small doses, as indicated by the popular phrase "moderate use of alcohol," in spite of the continued study of past years, have not as yet been clearly and completely made out. Very much remains to be done, but, thus far, the results of careful experiments show that alcohol, so taken, is oxidized within the body, and so supplies energy like common articles of food, and that it is physiologically incorrect to designate it as a poison, that is, a substance which can only do harm and never good to the body. Briefly, none of the exact results hitherto gained can be appealed to as contradicting, from a purely physiological point of view, the conclusions which some persons have drawn from their daily common experience that alcohol so used may be beneficial to their health.

I was present at the meeting and conversed with a number of the gentlemen present regarding the statement. Only a very few, so far as I heard, had any hesitation with regard to it. I learned of two or three who were unwilling to sign it without slight change in the phraseology. I was told of one who said he believed it, but did not like to sign it, because it might be employed by liquor sellers as an encouragement to their trade. There may have been a considerable number who disagreed with the statement in one way or another, but if the number had been at all large, I think I should have known it. Certain it is that a very considerable number of the most celebrated men present expressed their decided approval in personal conversation. I have here a list of 62 men who expressed their approval by their signatures. Nearly all are well-known investigators. Among them are professors, teachers, and heads of laboratories of a large number of the most noted universities and medical schools of the world. The list includes many of the most celebrated physiologists of our time.

The following, also by Professor Foster, is interesting, not only as a concise summary of what is definitely known about the physiological action of alcohol, but also as showing how much space should, in the judgment of one of the most reputable of modern physiologists, be devoted to the subject in an elementary text-book. It fills two of the 247 pages of the *Elementary Physiology of Foster and Shore*.

Alcoholic beverages.—Ordinary alcohol is an organic compound of the composition C_2H_6O . It occurs in the following proportions in the following beverages:

	Per cent.
Beer (about).....	5
Light wines (claret, hock) (about).....	10–15
Strong wines (sherry, port) (about).....	20
Spirits (about).....	30–70

When alcohol is taken into the body most of it is oxidized and gives rise to energy. The amount of energy thus supplied, compared with that of the other parts of the food, is insignificant, and the effect of alcohol depends, not on the energy which it supplies, but on the influence it exerts on the changes going on in the several tissues. The value of the various articles of diet does not depend by any means solely on their ability to supply energy; we have seen, for instance, that salts, which supply no energy, are nevertheless of use in directing the changes going on in the body. In a somewhat similar way alcohol and other substances may influence and direct these changes. Whether that influence is beneficial or no will depend upon many circumstances, and certainly upon the quantity taken. We have many illustrations that a substance taken into the body in a certain quantity will produce one effect, and in another quantity it may be quite an opposite effect. There is no doubt that a certain quantity of alcohol is injurious and interferes with all the functions, and ultimately brings about various diseases, but it does not follow from this that in a smaller quantity it may not be harmless or even beneficial.

Alcohol produces its most marked effects on the vascular and nervous systems. It leads to a dilatation of the small blood vessels of the skin, and so to a larger flow of blood to the surface of the body; this, while it produces a sensation of warmth, leads to an increased loss of heat by radiation and perspiration. If the amount of alcohol taken is excessive, the loss of heat will lead to a definite fall of temperature. Alcohol is then of no service as a preventive against cold.

Alcohol makes the heart beat more quickly and makes it do more work in a given time. In some cases this may be beneficial, but generally it is a wasteful and useless expenditure of energy. Alcohol diminishes the power of doing prolonged muscular work, and large quantities lead to a great diminution in the force of muscular contractions.

The effect of alcohol on digestion is very complex. When taken with food it leads to a diminution in the rate and completeness of digestion, if it is present in any but very small quantities. If some proteid (white of egg or fibrin) is put in a flask with some gastric juice, it is found that, if a very little alcohol (1 part to 500 of the mixture) be added, the digestion will go on a trifle more rapidly, but if the alcohol added much exceeds this amount, a well-marked retardation is produced. It does not follow that such a small amount of alcohol is useful in ordinary digestion, because when it is taken into the stomach we have to consider the influence it has on the secretion of gastric juice, on the movements of the stomach, and on absorption. A small quantity of alcohol appears, however, to encourage the secretion of gastric juice, but large quantities act injuriously on all the processes of digestion.

A small amount of alcohol may promote the action of the central nervous system, and often appears to quicken the rapidity of thought and to excite the imagination, but more usually, and always when taken in any but small quantities, it diminishes the power of connected thought and judgment. It also diminishes the power of receiving sensory impressions, and, at the same time, blunts all the special senses. Since it reduces the sensibility to cold and fatigue, and allays mental pain and worry, it is often resorted to and then with great danger.

The limit up to which any beneficial effects are produced by alcohol is soon reached, and beyond that it only does harm. This limit is not the same for all individuals; a quantity good for one may be injurious for another, and a large number of people find that strictly moderate quantities of alcoholic beverages do them no harm, while others find that similar amounts impede them in their daily work.

The effect of alcoholic beverages does not depend solely on the ordinary alcohol in them, for other substances which they contain often have powerful actions in the body. The habitual use of such beverages to excess greatly shortens life by inducing diseases of many organs. In some cases of disease alcohol may be of great service, but in health it can not be considered a necessity, and is far more potent for evil than for good.

From the evidence at hand regarding the use of alcohol, the following by Dr. E. A. Parkes, the eminent English hygienist, seems to me a fair and judicious statement of the facts, although I should be inclined to lay a little more stress upon the principle that, in health at any rate, it is superfluous or worse, and to insist more strongly upon the importance, in this country especially, of general abstinence from its use:

The facts now stated make it difficult to avoid the conclusion that the dietetic value of alcohol has been much overrated. It does not appear to me possible at present to condemn alcohol altogether as an article of diet in health, or to prove that it is invariably hurtful, as some have attempted to do. It produces effects which are often useful in disease, and sometimes desirable in health; but in health it is certainly not a necessity, and many persons are much better without it. As now used by mankind, it is infinitely more powerful for evil than for good; and though it can hardly be imagined that its dietetic use will cease in our time, yet a clearer view of its effects must surely lead to a lessening of the excessive use which now prevails.

Reference has lately been made in the public prints to some experiments at Wesleyan University which have had for their object the study of the nutritive action of alcohol. One does not like to say a great deal about his own work, and I should rather stop with the references to what other investigators have done and said; but in view of the misstatements and misunderstandings which have received currency regarding these inquiries and the conclusions we have derived from them, it is perhaps fitting that I should refer to them now, as I have been especially requested to do.

The experiments in question have been undertaken on behalf of the committee of

filthy for the investigation of the liquor problem. They are, however, carried out in connection with researches upon nutrition which are made under the auspices of the United States Department of Agriculture, and constitute part of the larger inquiry into the economy of food, of which I have already spoken.

The experiments are made by the use of the respiration calorimeter, by means of which it is possible to measure the income and outgo of the body of a man, as expressed in terms of both matter and energy. The apparatus includes a chamber about 7 feet long, 4 feet wide, and 6½ feet high, in which the man stays for a number of days and nights. It is furnished with folding bed, table, and chair. For some of the experiments—those in which muscular work is to be done—there is provided a stationary bicycle, on which the man may ride the equivalent of a desired number of miles per day. Arrangements are provided for ventilation by a current of carefully purified air. The temperature is kept constantly at a degree which is agreeable to the occupant. In this chamber he reads, writes, works, eats, drinks, and sleeps. So far from being uncomfortable, each of the four gentlemen who have been subjects of the experiments thus far has found himself very little discommoded in any way save for the monotony of confinement in so small a space. The period of each experiment generally varies from four to nine days, though in one case it reached twelve days. Even after this experience not one of the gentlemen has been in the least unwilling to repeat the trial. So far from finding difficulty in securing subjects, we have numerous volunteers, and are able to select men of special fitness for the purpose, as regards both bodily characteristics and, when desired, scientific training.

The general plan of the experiments consists in giving the man a diet adapted to the purposes of the experiment, and measuring, weighing, and analyzing, not only the food and drink, but also the products, solid, liquid, and gaseous, given off from the body. This involves, with the rest, the measurement of the air the man breathes and its analysis, both before it enters and after it leaves the chamber, in order to determine the products of respiration. Not only the chemical elements and compounds, but also the energy of the income and outgo, are measured. The body receives energy in the food, in which it is latent, or so-called potential energy. A small part of the energy leaves the body in the unoxidized excretions, in which it is still latent, but the larger quantity is given off in the heat emitted from the body, and in the external muscular work performed. Especial arrangements are provided for measuring this energy, and since that given off from the body is mostly in the form of heat, the apparatus is practically a calorimeter. It is because the apparatus enables us to determine both the respiration products and the heat that we call it a respiration calorimeter.

One of the most interesting results of the experiments of this kind conducted at Wesleyan University is the close agreement of the income and outgo of energy. They thus indicate what in fact has been generally believed, though the belief has lacked definite experimental proof, that the human body, like any other machine—a steam engine or an electrical dynamo, for instance—obeys the law of the conservation of energy.

By giving men under experiment different kinds and amounts of food, and varying their activity from actual rest to light or severe muscular or mental work, it is possible to learn how the body uses its food, what materials are needed for its support, and how different food materials compare in nutritive value.

The special object of the experiments with alcohol was to study its nutritive effect as compared with that of the fuel ingredients, fat, sugar, and starch—carbonaceous compounds, let us call them—of ordinary food. In most of the experiments pure (ethyl) alcohol was used, though in some the alcohol was given in the form of whisky or brandy. It was administered with water or coffee, and taken with an ordinary diet of meat, bread, butter, milk, sugar, and the like. The amount of alcohol per day has been equal to about 2½ ounces of absolute alcohol—about as much as would

be contained in three average glasses of whisky, or in a bottle of claret or Rhine wine. This is generally divided in six doses, three with meals and three between meals, the object being to avoid any marked influence of the alcohol upon the nerves, and thus to test its action as food under normal bodily conditions. Comparative tests were made by use of rations with and without alcohol. The ration without alcohol consisted in each case of ordinary food materials supplying the nutritive ingredients in amounts more or less nearly sufficient to meet the wants of the body. In the corresponding ration with alcohol, parts of the sugar, starch, and fat of the food, the carbonaceous ingredients which supply the body with fuel for warmth and work, were taken out, enough to be equivalent in potential energy to the $2\frac{1}{2}$ ounces of alcohol, and the latter was used in their place. In the experiments in which the man did not work this alcohol made about one-fifth of the total fuel material in the diet. In the experiments with hard muscular work, in which more food was used, the alcohol furnished about one-seventh of the fuel supply. Ten experiments in which alcohol was used are now completed and ready for publication. These are compared with a somewhat larger number of experiments similar in the main, except that they were without alcohol. The results may be briefly stated as follows:

First, extremely little of the alcohol was given off from the body unconsumed; indeed, it was oxidized, i. e., burned as completely as bread, meat, or any other food. Second, in the oxidation all of the potential energy of the alcohol was transformed into heat or muscular power. In other words, the body transformed the energy of the alcohol as it did that of sugar, starch, and other ordinary food materials. Third, taking the experiments together, the body held its own just as well with the rations consisting partly of alcohol as it did with the others. This was the case whether the men were at rest or at work, and whether the rations were or were not adequate to the needs of their bodies for nourishment. In other words, so far as the figures for income and outgo of chemical elements and compounds in these experiments show, the alcohol protected the nitrogen and carbon, the proteids and fats, of the body from consumption as effectually as the carbonaceous nutrients which it replaced. There were, indeed, variations in the figures from day to day and from experiment to experiment, as must be expected in this kind of physiological inquiry. In some cases, judging by the figures as they stand, the alcohol appeared to be less, in others it appeared to be more, efficient than the sugar, starch, and fat in protecting either the nitrogen or the carbon of the body from consumption. In certain ingredients there were large losses, in others there were gains of either nitrogen or carbon or both. But these gains were in general about as large and frequent with the rations without alcohol as with the corresponding rations with alcohol. Taking the experiments altogether we should not, in my judgment, be warranted in saying that the results established any difference between the two kinds of rations in this respect.

I am very far, however, from regarding the results of these experiments as final. Take, for instance, the question of the relative fuel values of the carbonaceous nutrients, fat, sugar, and starch, on the one hand, and alcohol on the other. These experiments, which are more detailed than any others of the sort of which I have been able to find descriptions, imply, as far as they go, that corresponding, or to use a chemical term, isodynamic, amounts have equal values as fuel. To put it in another way, one ounce of alcohol when burned with oxygen in an apparatus for the purpose, such as we use in the chemical laboratory, will yield about the same amount of heat as, say, three-fourths of an ounce of fat or an ounce and three-quarters of either sugar or starch. But whether the body gets the same benefit from the ounce of alcohol as from the three-quarters of an ounce of fat or the ounce and three-quarters of starch or sugar is another matter. The body uses the sugar, starch, and fat for a variety of purposes. It may be that the isodynamic amounts of these car-

bonaceous nutrients have equal values for some of these purposes and unequal values for others, the value depending upon the kind of service. So, likewise, it may be that the value of alcohol as fuel depends upon the kind of work it is to do. For aught we know to-day there may be forms of service as fuel which it can not render or can render only under certain conditions. Exact answers to these questions will require a large amount of patient and costly research.

As may be seen, these experiments had to do simply with the nutritive action of alcohol. They have very little bearing upon its indirect action, nor do they indicate what are its effects when taken habitually for months or years.

In certain deliberative bodies—in Congress, for instance—personal explanations are sometimes in order. I hope it may not seem unfitting if I venture to say here that some of the statements which purport to have gone out from Middletown regarding these experiments are entirely wrong. Thus it has been said that we are studying the effects of alcohol as brain-food, and for that purpose have been feeding men upon a diet consisting chiefly of alcohol. These reports are entirely without foundation. No such experiments have ever been made or even planned in our laboratory or under my direction. For that matter, I can not see how any physiological chemist could think of alcohol as a material especially fitted to supply nourishment for brain work. I can see how it might sometimes stimulate the action of the brain in certain ways. Indeed, workers in that field, I believe, have tried to explain its action in this as in the opposite direction, but that is a subject for the physiological psychologist, and not the chemist, to investigate and pronounce upon.

An account of these experiments was given at the International Physiological Congress in the summer of 1898 referred to, and also at the meeting of the American Association for the Advancement of Science in Boston the same year. Last June a similar account was given at the meeting of a scientific club in Middletown, Conn., where the experiments were made. Some days in advance of the meeting newspapers in different parts of the country contained announcements purporting to represent what I was going to say. Neither my associates nor myself authorized them or have any knowledge as to how they originated. They contained statements to the effect that the experiments showed that alcohol is a useful food, and that 2 ounces per day made a desirable part of the diet. Some of these totally unauthorized and unwarranted statements, I regret to say, have been utilized by venders of alcoholic beverages as recommendations of their products.

How far the views of leading physiologists and the results of scientific research, as I have thus tried to epitomize them, differ from the teaching of the so-called "authorized" text-books used in our schools you who are so familiar with the books and schools are well able to judge. I will, however, later on give you some illustrations of the teaching to which I object.

WHAT SHOULD AND SHOULD NOT BE TAUGHT ABOUT THIS SUBJECT IN THE SCHOOLS.

Meanwhile, permit me to state some of the things which, as it seems to me, ought and ought not to be taught in the public schools. In so doing I do not attempt to cover the whole ground or enter into the physiological details, but simply indicate what, in my personal view, should be said or not said about some of the more important phases of the subject.

WHAT WE SHOULD NOT TEACH ABOUT ALCOHOL.

1. We should not teach that it is a food, in the sense in which that word is ordinarily used. If we are going to discuss its physiological action at all, we can not well ignore its nutritive value, but we should at the same time emphasize its limitations. When we speak of it as food or nutriment, we should explain to what extent and in what ways it can and can not nourish the body. So, likewise, if we speak of its

effect upon digestion, we should not say simply that it is an aid or that it is a hindrance, but that it may be one or the other, or both, according to circumstances.

2. We should not teach that it is a poison, in the sense in which that word is ordinarily used. We may say, and with truth, that alcohol in large quantities is poisonous, that in large enough doses it is fatal, and that smaller quantities taken day after day will ruin body and mind. But it is wrong to teach our boys that alcohol in small quantities, or in dilute forms in which it occurs in such beverages as wine and beer, is a poison in the ordinary sense of the word. In all that we say on this point we must bear in mind that the intelligent boy knows well, and as a man he will know better, that people have always been accustomed to moderate drinking, as it is commonly called, and yet live in excellent health to good old age. If we tell him that alcohol in small quantities is poisonous in the sense in which he understands the word, he will see that we are exaggerating, that we are teaching for effect, and he will instinctively rebel against the teaching.

We may say, and say truthfully, that the moderate use of alcohol is fraught with danger. But the cases where the occasional glass leads to marked excess are the exceptions. If we present them to the thoughtful boy as the rule, he will detect the fallacy and distrust the whole doctrine.

We may be right in saying that alcohol often does harm to health when people do not realize it, that it prepares the system for inroads of disease, that there is a gradation of injury from forms scarcely perceptible to the utter ruin of body and soul. But to present the "horrible examples" as a common result of drinking is illogical in itself, contrary to right temperance doctrine, and hence injurious to the children whom we teach. For that matter I believe that the picturing of the frightful results of vice to young and innocent children is more harmful than useful.

3. We ought not to teach that alcohol in small quantities is harmless. Still more should we avoid saying that it is commonly beneficial. Some of us as individuals may believe that its use in small quantities is generally desirable, but there is nothing in either the facts of common experience or in the results of scientific inquiry to justify the inference as a general principle. Doubtless many people, especially those in advanced age, or suffering under certain forms of disease, are benefited by alcoholic beverages in moderate amounts. Here it may have a decided medicinal value, and my own belief coincides with that of a great body of physiologists in ascribing to it under some such circumstances an extremely important food value, although the exact ways in which it is useful are not yet demonstrated. But I can see no justification for the claim that moderate drinking is generally useful, and there is no denying the terrible fact that it is often harmful, not only in itself, but because of the excess to which it so often leads.

4. We ought not to teach that alcohol in small quantities is always or necessarily harmful. Some of us as individuals may believe this. Honestly believing that theory we may be justified in arguing for it. But we are not justified in teaching it dogmatically, and in my judgment it is positively wrong to make such a dogma a part of the instruction which is presented to our youth as authoritative, be it in the school, the Sunday school, or the pulpit. It is wrong for two reasons: First, because it presents an unproven theory as an attested fact, and, second, because it leads the trusting child to believe what the thoughtful, and at times skeptical, boy or girl, and the intelligent man or woman, may afterward learn to be wrong.

5. Still worse is it to take the theory that the use of alcohol in small quantities is always or necessarily injurious, and set it up as demonstrated by scientific observation and experiment. This is positive untruth. If we tell it to children, they will believe it until they learn better. They may possibly remain in ignorance of the error until they are grown, or indeed all their lives; but sooner or later many of them will find that they were deceived. It may be in the high school, it may be in the college or medical school, it may be from general reading or conversation; but

when the deception is found out a reaction comes. The good we tried to do is undone. The certain injury is far greater than the hoped for good.

6. To take the theory that alcohol is in no sense a food, but always a poison, that it is never useful, but always harmful, and allege that it is supported by the great bulk of scientific authority, is falsehood. We may look over the literature of the subject and cull out statements which can be used to support it. We may even find writers of more or less repute who attempt to defend it in the light of scientific experiment. In this way we may accumulate statements which the unsuspecting reader may be led to regard as proving that the scientific authority is on this side of the discussion. We may unconsciously go farther and persuade ourselves that there is scientific ground for adopting such theories, so often and so truly is "the wish the father to the thought." In our great anxiety to find every means to work against the evil wrought by alcohol we may gradually come to feel ourselves justified in presenting all the arguments we can against it and in ignoring all we can on the other side. But this does not turn theory into fact or falsehood or misrepresentation into truth.

The following quotations are from so-called "approved" text-books of physiology commonly used in our schools:

Nature apparently makes no effort to appropriate it [alcohol]. It courses everywhere through the circulation, and into the great organs, with all its properties unmodified. Alcohol, then, is not, like bread or beef, taken hold of, broken up by the mysterious process of digestion, and used by the body. "It can not, therefore, be regarded as an aliment."¹

Alcohol is universally ranked among poisons by physiologists, chemists, physicians, toxicologists, and all who have experimented, studied, and written upon the subject, and who, therefore, best understand it.²

Alcohol is not a food or drink. Medical writers, without exception, class alcohol as a poison.³

It must be remembered that in whatever quantity, or wherever alcohol is found, its nature is the same. It is not only a poison, but a narcotic poison.⁴

These statements are misrepresentations. They belong to a kind of doctrine which pervades many of the "approved" text-books and much of the common temperance instruction. They are none the less false or wrong, either scientifically or morally, because the object is to educate our youth away from evil; the misstatements are none the less reprehensible because they occur in school books which have the official indorsement of a great temperance organization, whose membership includes thousands and other thousands of the noblest, the most conscientious, the worthiest of the women of the world. Nor does it help the matter that such statements are repeated and such theories are promulgated with the sanction, and are enforced by the authority, of the church, in the teachings of the Sunday school, and from the sacred desk.

Do not misunderstand me. I am not imputing wrong motives, I bring no railing accusation, I charge no one with intended wrong. I only ask that the men and women who do these things—many of them are my acquaintances, some are my warm personal friends, their standing in the community is so high that no arrow of aspersion can reach them, their characters are so pure that no stain can tarnish them, their names are in my memory and their faces in my vision, as I write this—I ask that they consider the facts as I am sure they have not considered them, that they look into the evidence as I am sure they have not looked into it, and that they remember in their attitude toward these questions the principle I have read in their own writings and heard from their own lips—the foundation of morality is the truth.

WHAT WE SHOULD TEACH ABOUT ALCOHOL.

1. It is, under some circumstances, a valuable nutriment in the sense that it can yield energy to the body, but not in the sense that it can build tissue. It is, under other circumstances, a poison in the sense that it is injurious to health. When taken in large enough quantities and for long enough time it is destructive to life. It is sometimes very useful and sometimes very harmful, but the harm that comes from drinking, in many communities, vastly exceeds the good.

While we can not deny to alcohol a nutritive value, that value is very limited. In yielding energy to the body it resembles sugar, starch, and fat, though just how and to what extent it resembles them experimental inquiry has not yet told us. It differs from them in that it does not require digestion, and is hence believed to be more easily and immediately available to the body. It is not stored in the body for future use like the nutrients of ordinary food material. The quantity that may be advantageously used is small. If large amounts are taken, its influence upon the nerves and brain are such as to counteract its nutritive effect, and it becomes injurious in various ways. And, finally, there are many people who begin by moderate use and are led to disastrous excess.

Alcohol may be useful to one man and harmful to another. One may take considerable without apparent harm, while another may be injured by very little. One may use it habitually without injury, while another may not. In sickness it may be a priceless boon. But it may likewise be the cause of physical, mental, and moral ruin.

2. The boy or the man, as long as he is in good health and does not need alcohol for medicine, is in general better off without it.

3. While some can drink a little without danger of drinking to great excess, others can not. The safest way is to keep out of danger.

4. There are business considerations also as well as those of health that strongly favor temperance. The boy who wants to make his way on a railroad or in a large business establishment has a better chance to get employment and to work up into a profitable position if he is an abstainer than if he is a drinker. Already many such establishments refuse to employ men who drink, and there is reason to expect that more will do so.

5. Temperance is always advisable. This we may emphasize most strongly. But whether or not we shall teach the necessity or even the advisability of abstinence is another matter. About this the best men differ. Two who disagree may be equally honest. Each has the right to express his own convictions and may often feel it his duty to do so. But it is neither just nor wise to teach our youth that the doctrine of total abstinence rests upon undisputed principles of either physiology or morals. It seems to me that the question whether a man should be a total abstainer depends on two considerations. The first is one of policy. Will drinking injure him? If so, he had better abstain; if not, he may drink. But he must be sure of his ground before he begins, and he had better wait until he reaches maturity and understands himself and the subject well before he takes the risk. The other consideration is an ethical one. Remembering that he does not live for himself alone, what will be the effect of his example and what is his duty? The rule of conduct in this respect is a matter for him to decide. You and I may have the right to advise him, but the decision is between himself and his own conscience.

6. An ambitious and right-minded boy wants to be an influential and useful man. I think he should be taught that it would be better for the community at large if there were less drinking; that the community is influenced by the examples of strong and good men; and that his own personal influence will be better if it is on the side of temperance.

7. Great as is the danger of alcohol to purse and health, the moral injury is incom-

parably worse. Its most terrible effect is its demoralization of character. However much good men may do in helping others to save their money and promote their health, a still greater service to their fellow-men is that which helps them to a higher plane of moral living. And here is the strongest argument of all in favor of that self-abnegation which leads us to do those things, and those things only, which will best enable us to render that service to our day and generation. In that way we do our noblest duty to our fellow-men and to our God. All this we may, and I believe we should, teach in the schools.

ERRORS IN THE CURRENT TEMPERANCE TEACHING—ETHICAL CONSIDERATIONS.

The misstatements in the text-books of the type referred to above are of various kinds. Sometimes the error consists in stating doubtful theories as attested facts; in other cases, the principles laid down are partly true and partly false; in still others, the statements are squarely opposed to all of the results of the latest and most accurate scientific research. The statements are enforced by quotations, of which some are by real authorities, but are too often put in such ways as to misrepresent their actual teachings; while others are from men who do not stand for the best research and the highest scholarship, but are quoted as the most reliable authorities.

I do not mean that the approved text-books are all wrong. A great deal of what they say is entirely true. In the parts not bearing upon the action of alcohol there is often little to criticise and much to commend. The trouble is this admixture of error.

In one respect they are all alike. The impression which they give the pupil is that science teaches that alcohol, even in moderate quantities, is always harmful and never useful. This is untrue.

The object is to oppose an enormous evil, to teach our youth to resist that evil. The purpose is most worthy; the trouble is in the method. The evil being clearly defined, a doctrine is formed to meet it, and evidence is sought to sustain the doctrine. Whatever can be found in its favor is exaggerated. Whatever opposes it is ignored or denied. It gradually ceases to be the propagandism of the few and becomes the creed of the many. It is the old story of human dogma, repeated over and over again in politics, in theology, and in morals. And here, as in many other cases, the worthiness of the cause and the earnestness of the advocates are such as often to "deceive the very elect." Indeed, the very best people often become the most sincere and devoted advocates of the doctrine. In this case the scientific expert is not deceived. But the statements are put in such persuasive ways and sustained by such seeming force of scientific authority that the unsuspecting pupil, and, indeed, the teacher who implicitly trusts the text-books, is led to believe that they represent the real teaching of the best physiological science.

I was once talking about this subject with a teacher, and reminded her of Lincoln's saying: "You can fool all the people some of the time, and some of the people all the time, but you can't fool all the people all the time." She replied: "But can't we fool the boys until their characters are formed?" Now, I think that lady was perfectly sincere; I am equally sure that she was wrong. You can not build character on falsehood.

A well-known philanthropist in New York City tells this story: "I happened to be in a school down on the east side when a class of boys from tenement families were reciting in physiology. The teacher asked: 'What is beer?' The answer came in chorus: 'Beer is poison.' Now, those little chaps knew that that was a lie. Their fathers and mothers drank beer every day." Such children were not fooled by any such teaching.

But even if they are deceived for a time, it will not last, nor can you get around the difficulty by falling back on definitions. Tell a boy a thing is poison, and he will suppose that you mean by poison what he means by it, and what people

generally mean by it. He has not access to the particular dictionary or scientific treatise which has a definition that may be stretched to fit your meaning. You may persuade him for a time that it is a poison in the popular sense of the word, but when he grows up he will learn that he was mistaught; indeed, he may do so before he is grown up. The scholar in the higher classes shares the present tendency to skepticism; when he finds that he was deceived, he does not mince matters; he reasons with himself: "That teacher and the text-book lied. If they would lie in one case, they would in another, and I am not going to believe anything they told me." Even if he does not go so far as this, even if his faith is not lost, but is only shaken, the harm is done; the effect is to undo much of the good that the teaching is intended to do. Furthermore, and what is still worse, the result must be to impress upon the pupil, and by the most effective agency, that of example—the example of the school, the Sunday school, and even the pulpit—the idea that deception is allowable in a good cause, that the end justifies the means. This is undermining the very foundations of morality.

One of the most honored members of your association remarked to me yesterday in speaking of this subject: "Teach a boy of 10 that a lie is the truth, and at 20 he is in danger of believing the truth is a lie."

This evil, so intrenched behind the earnest aspirations of our community, and so fortified by legislation, is the one against which I protest and which I urge you, as leaders in education, to unite in your endeavors to oppose.

Perhaps I ought to speak more considerately of things so dear to thousands of the best, the most earnest, the most devoted people, those to whom temperance means so much, who would shrink with horror from intentional deceit, and in the fiber of whose noblest thought this doctrine is so interwoven.

We meet here a very peculiar difficulty. The object of this teaching is a noble one. When we criticise the method we are in danger of seeming to oppose the purpose, and yet the improvement in method is necessary for the attainment of that purpose. It seems to me that one of the great obstacles in the way of the true temperance reform is found in this very exaggeration which makes so large a part of the means used to promote that reform. It is building on sand. The place to build is on the rock of attested truth.

You see, then, that I am not trying to set up a dogma in opposition to "scientific temperance instruction." I earnestly approve of the purpose, but object to part of the method. I protest against the dogmatic teaching of scientific theories which still lack demonstrative proof. More than that, I protest against the teaching of what science shows to be positively erroneous. And I also ask that the teaching of science in our schools shall keep pace with the progress of research.

But what are we to do about it? I hesitate to make positive suggestions to those who have much more experience than I, and on whom rests so much of grave responsibility for deciding what instruction our youth shall receive. I venture, however, these considerations:

The success of such instruction depends very largely upon its spirit. If it is based upon the real desire for truth, if disputed principles are referred to as questions rather than demonstrated facts, if no more is claimed than is proven, and if under these restrictions the evils of alcohol are clearly set forth, and especially if the teacher speaks with the power of accurate knowledge and profound conviction, the instruction can not fail to be incalculably useful.

Still more effective will it be, in my judgment, if less stress is laid upon the material—i. e., the physiological and economic—side of the question and more upon its moral aspects. Our people are keenly alive to ethical ideas; and youth is a time when thought is fresh, the aspiration is for the ideal, and mind and heart are open to the truest ethical impulses.

Let me emphasize most strongly the moral aspects of this question. Temperance

reform is moral reform. I can not see how a thoughtful man, earnestly desirous of rendering his best service to the community, can fail to be interested in that reform.

The harm which alcohol does to health, the economic injury it brings to the individual and to the community, are terrible enough, but it seems to me that the supreme evil which comes from its misuse is its effect upon character, its power of demoralization, the moral ruin which it brings. No exaggeration is needed to paint this picture in the most terrible colors.

As one who has been interested in temperance reform from childhood, I have come to believe that we have been depending too much upon the economic and physiological argument. Statistics of the nation's liquor bill do not appeal very strongly to the ordinary man; still less does the average boy care for them. The men who know most about the physiological effects of alcohol are specialists in physiology and hygiene. I know scores of these men. Total abstainers among them are exceptions; I was about to say rare exceptions. If they are not persuaded by the facts they know so well in theory and in practice, what can we expect from teaching the average boy or girl a little of the theory?

The supreme object of education is the formation of character. Character is shaped by education, but its basis is morality. Again I say, Temperance reform is moral reform. The mind and heart of youth are most strongly influenced by moral thoughts, by ethical ideals. There you can keep within the truth and there make the strongest appeals.

One essential for the success of true temperance reform is that what is taught as science shall be placed upon the basis of demonstrated fact. This means a change of base on the part of a great body of our most earnest temperance reformers, but that change is necessary.

We wish to help the drunkard to reform; but is it necessary to tell him that no man can touch alcohol without danger? To build up the public sentiment upon which the reform of the future must depend, we wish our children to understand about alcohol and its terrible effects; but when we teach them in the name of science, shall we not teach them the simple facts which science attests, and which they can hereafter believe, rather than exaggerated theories, whose errors, when they learn them, will tend to undo the good we strive to do? In short, is not temperance advisable even in the teaching of temperance doctrine?

In the great effort to make men better there is one thing that we must always seek, one thing we need never fear—the truth.

DISCUSSION.

Mrs. MARY H. HUNT, national superintendent of scientific temperance instruction of the Woman's Christian Temperance Union.—The study of hygiene, with physiology enough to make the hygiene intelligible, has been introduced into the public schools of this country. It is difficult to understand why anyone should oppose it. True, this study has been made compulsory for all pupils in all schools, and it includes the nature of alcoholic drinks and other narcotics, but our boys and girls must live in their bodies as long as they stay in this world, and they need to be taught how to take such care of them that these bodies will be strong, beautiful servants of the mind, instead of the mind becoming the servant of weak bodies and debasing appetites. There are no dangers in the ambushed paths of life which the children of this land need more to be warned against than those attending the use of alcoholic drinks and other narcotics. The representatives of 73,000,000 of the American people, in Congress and State legislatures assembled, realizing this, have enacted these temperance physiology laws because they believe that individual and public good demand it, and we should be able to count upon the cooperation of all good men and women as executors of these laws.

We are asked to discuss this morning the paper of Professor Atwater. He would have us teach that alcohol has a food value and is not a poison. If that be true, then we should so teach. At this point let me say that there is no aspersion cast upon those who have been instrumental in securing the study in our schools that is more absolutely unjust than the accusation that for effect we want untruth about alcohol

taught. We are not so idiotic. The man who makes this accusation, if he is candid, thereby shows that he does not understand his times. The educated women of to-day are keeping step with their brothers in knowledge. They have been to college. As students and investigators they know almost as much as you gentlemen. Almost, I say, lest you should deem it disrespectful if full equality in attainment should be claimed. Professor Atwater quoted a woman as asking, "Wouldn't it be right in teaching a boy against alcohol to deceive him until his character is formed?"

That woman and her question must have emanated from the brain fog of some opposer to scientific temperance education who was trying to find out for himself whether three glasses of whisky or a bottle of Rhine wine is isodynamic with certain amounts of sugar, fat, and starch. She does not belong in our ranks.

The advocates of scientific temperance education in our public schools know that their cause has nothing to fear from the truth. They also know that—

Truth alone is strong,
And, albeit she wander outcast now, I see around her throng
Troops of beautiful, tall angels, to enshield her from all wrong.

"The truth shall make you free" is no vain promise. If teaching the children of this country that alcohol has a food value is teaching them truth, then it will eventuate in good to the individual, the home, society, and citizenship. If the crime, misery, poverty, and madness that have heretofore resulted from the use of alcohol as a beverage are only myths, then let them give place to this old new story of alcohol a food. But, Mr. Chairman, we can accept nothing but positive proof at this point; the issue is too great. Assumption and assertion amount to nothing; juggling with definitions to worse than nothing.

"Anything that nourishes the body without injuring it" is what the people understand by a food. It is a good, honest definition, accepted by sincere men, both in and out of scientific ranks. Is alcohol a food and shall we so teach the children? is the question before us.

Professor Atwater, as I understand it, bases his claim of food value in alcohol on his experiments made at Middletown, Conn. The story of these experiments was first given to the public on the 13th of last June. The thoughtful people of this country were startled to receive newspaper reports of his claim that he had proved that alcohol, when taken in the amount usually found in three glasses of whisky or one bottle of Rhine wine per day, is as much food as sugar, fat, and starch, and that therefore the pulpit, platform, Sunday school, and public school are in error in teaching that alcohol is a poison and not a food. These and similar declarations, always accompanied with attacks on scientific temperance teaching, appeared and reappeared with variations in the newspapers of the land of well-nigh five months before a scrap of other evidence was given the public in proof of these remarkable statements which are at variance with some of the best and latest utterances of modern science.

Not until the 6th of last November was Professor Atwater's Bulletin No. 69, containing his first official report of these much-vaunted experiments, given to the public. Accompanying this bulletin his Circular No. 357 was sent to the press of the country for publication. The last sentence of this circular says: "The bulletin is very technical and not for general distribution." With all due respect to the culture of Middletown, happily there are in the United States, outside of that city, some other people able to understand technicalities and therefore to study this bulletin with its tables. Its accompanying Circular No. 357 contains the deductions drawn from the experiments described in the bulletin. These deductions are exactly what I understood Professor Atwater to state from this platform yesterday, viz:

1. In the case of the man experimented upon the alcohol was almost completely oxidized in the body.
2. The potential energy of the alcohol burned was transformed into heat or muscular energy.
3. The alcohol protected the material of the body from consumption just as effectively as corresponding amounts of sugar, starch, and fats.

In the first place, it is a fact that other well-known and violent poisons, as muscarine, morphia, etc., are also oxidized in the body, liberating heat and energy, but their bad effects show that such oxidation proves nothing in their favor; neither does it in the case of alcohol. It would be ridiculous to call morphia or muscarine foods because when taken they are oxidized in the body. It is equally so to make a like claim for alcohol. It is the sum total of the effects of a substance that must be considered in deciding whether it is a food or a poison.

To state the fact that alcohol liberates in the body heat and energy, and to say in that connection no more of its heat and energy producing power, is to state half-truths. An increased number of heat units are evolved by alcohol, but at the same time it so paralyzes the nerves in the walls of the blood vessels that an unnatural amount of blood rushing to the surface is cooled, and more heat is radiated from the

body of the drinker than the alcohol liberates. These easily demonstrated facts leave alcohol no place whatever as a fuel food. The energy that the oxidation of alcohol in the body liberates is of brief duration, and is under such poor nerve control that working ability as a whole is so much impaired by alcohol that business to-day demands total abstinence of its employees. Therefore both science and experience deny to alcohol any food value as a supporter of energy.

On page 73 of the bulletin is Table No. 7, where are recorded the effects day by day as the man in the calorimeter took alcohol for six successive days. If the material of the body had been protected during that time, as Professor Atwater states in his third deduction, there should have been a plus sign before the column of nitrogen, showing that the man did not lose protein, but we find the contrary, showing that the man lost the most valuable of all body material each day he took the alcohol. Turn to the other table, No. 10, and we find there was a slight gain in protein for one day only, but a decline the other days. These tables were submitted to experts in four of our great medical colleges, quite as well qualified to do original work as our friends at Middletown. I read here from the report of Prof. C. A. Herter, who is not simply a chemist, but a physician and professor of pathological chemistry in Bellevue Hospital Medical School, New York City:

One fails to find any support for the view that alcohol protected the material of the body like sugar, fats, or starch, in the report of Professor Atwater, according to his own figures. Those in experiment No. 7, where 417 grams of protein were given in four days, show that there was a loss of nitrogen equivalent to 48.2 grams of protein. In the other alcoholic experiment, No. 10, there is a similar, though somewhat smaller, loss of nitrogen. One is, therefore, compelled to admit that these experiments do not support the third conclusion of Professor Atwater.

Please remember that it is on that third conclusion that Professor Atwater's argument mainly rests that alcohol acts as a food.

This view of Professor Herter is supported by Prof. Seneca Egbert, M. D., professor of physiology in one of the great medical colleges in Philadelphia, and also by Prof. Frank Woodbury, M. D., a well-known writer on therapeutics, who is connected with another medical college of Philadelphia. This pamphlet which I hold in my hand, entitled "An Appeal to Truth," contains like testimony from Winfield S. Hall, M. D., a professor of physiology in one of the medical colleges in this city, Chicago.

You will recall that the ten experiments described in Bulletin 69 are Professor Atwater's only published data upon which rests his claim of a food value for alcohol. In only two of these experiments was the man given alcohol, and in both of these he lost most valuable body material; therefore, Mr. Chairman and friends, inasmuch as this testimony is not contradicted by the experience of centuries, we can not conscientiously recommend that the children of this country be taught that alcohol is a food.

Honest opposition to temperance teaching is based on misapprehension. Critics have widely published the false charge that our requirements are ridiculous or unpedagogical. These absurdities are what you are opposed to and not our true position. For instance, it was said on this platform yesterday that we claim that "alcohol in the smallest quantity always does harm." I challenge anyone to find such a statement in any of the indorsed physiologies. What we do say is that because alcohol is a narcotic a little has the power to create an uncontrollable and destructive appetite for more, and, therefore, a little is always dangerous. No one can deny that statement. It is as undeniable as the law of gravitation, and nobody has ever brought a scrap of proof that controverts it. Two facts—first, that alcohol is a narcotic, and, second, that it has, like other narcotics, a cumulative attraction for itself—are the fundamental scientific reasons for total abstinence. I thank God and take courage for the Republic as I remember the millions of children in our land who are being taught these reasons.

And now with regard to that English assertion about alcohol not being a poison, quoted here yesterday, and said to have been signed by certain physiologists. To the best of my recollection it was that, "when taken in quantities and ways that cause no injurious effect, alcohol can not be called a poison."

There is probably not a brain worker in this presence who has not had strychnine prescribed for him by the doctor. If it acted upon you as it does upon me, you took it "in quantities and ways that cause no injurious effects." But you would not, therefore, say that strychnine is not a poison. It is special pleading to attempt such a claim in the case of alcohol.

Out of the thirty indorsed text-books on temperance physiology in our list there are three, written some sixteen years ago, that make statements which can be distorted. Please note I say can be distorted into meaning that alcohol is not oxidized in the system. Two of those books are being revised; the third is practically out of use. Of the other indorsed books which Professor Atwater attacked it can in all truthfulness be said that they are as accurate in statement and pedagogical in con-

struction as are any other school text-books now in use. They have been again and again submitted to the best scientific authorities with the request that any inaccuracies be pointed out, and every suggestion that truth warrants has been and ever will be incorporated in them.

In closing, please allow me to say you have criticised our methods in securing the legislation that makes this study compulsory. They have been to carry the case to the final tribunal, the source of power under our Government, the people. The people have instructed their lawmakers to pass these laws. You think we should have withdrawn our endeavors when we saw that any schoolmen objected. We would gladly have done so if you could have assured us that the temptations our children will meet in life will be so withdrawn as to leave no call for this warning education. You complain of our persistence. There is nothing more persistent than mother love when the child is in peril. As to the personal allusions, I will only say that I have long since ceased trying to defend my coworkers and myself in this cause. Whoever attempts to advocate an unwelcome truth that rebukes a popular evil will find he is treading the paths martyrs have trod. Such a one will be battle-scarred. I make no apology in this presence for having been somewhat instrumental in placing 16,000,000 of our school children under temperance education laws. No one could do that without meeting opposition of the kind that will turn and strike back. To this I make no reply, but a nation saved from the thralldom of strong drink through its schools and school children will be abundant reward.

CHAPTER IX.

THE RÔLE OF THE SCHOOL-TEACHER IN THE STRUGGLE AGAINST ALCOHOLISM.¹

By A. SLUYS,

Director of the Brussels (Belgium) Normal School.

I.

* * * The school-teacher has, as a matter of course, an important rôle to play in the conflict with alcoholism. He is charged with the instruction and education of children from 6 to 12 or 14 years of age. He meets again in the adult classes certain of these former pupils of his, also others who have not been able to attend at all the elementary schools. He may make known to all these the injurious effects of alcohol; he may urge them not to give themselves up to the vice. But it must not be kept from view that the elementary school can not accomplish everything; that its rôle and its field of action are necessarily limited; and that, on leaving school, the young man is thrown among social surroundings where he is often subject to promptings directly the opposite of those he received at school. A socialist newspaper, the *Vooruit*, recently gave an account of the detestable customs prevalent in the workshops, where the apprentices are systematically demoralized by the workmen. The article is worthy of being quoted in full for the light it throws upon certain aspects of the problem of alcoholism:

The fatherly counsel of the schoolmaster gives place to the curt and sometimes brutal commands of the employer. The frail limbs of the scholar of yesterday are weighed down under the burdens imposed upon him.

How often his heart must swell, the poor urchin, when, going to the mill at 6 in the morning, his coffee pail under his arm, he thinks of his playmates who, happier than he, can live the joyous life of the schoolboy in vacation!

The grown-up workmen all know by experience how we would have liked, in the first days of our apprenticeship, to fling away our tools and resume our bocks.

The transition from one way of life to the other is indisputably too abrupt and too brutal.

The half-time system, the half day of study succeeding to the half day of work, has been extolled. This system is excellent, but it exists neither in practice nor in law, and the children of poor people continue to pass from five hours of lessons to ten and eleven hours of work.

The great question is to ascertain in what degree the workmen, leaving the employers out of consideration, can aid in rendering the lot of the apprentices more tolerable, and in diminishing the effects of the transition.

The workmen of themselves can effect much, and yet, let us bear witness to it with regret, too often their efforts are directed much more to doing harm than good.

¹ A report to the Sixth International Congress against the Abuse of Alcoholic Drinks, held at Brussels. Translated from a reprint made (1899) with the permission of the author by the committee on antialcoholic instruction of the Canton of Neuchâtel, Switzerland.

The chapter of this Report immediately preceding (Chapter VIII) contains an address by Professor Atwater on the teaching of alcohol physiology in the public schools.

The new apprentice serves too often as the butt of the older workmen; he is a laughingstock for them; they make fun of him, his trousers are too short, his hair badly combed, etc.

Absurd tasks are imposed upon the youth in order to make him ridiculous. There are even those who go so far as to treat him brutally and strike him, under the pretext of frolicking with him.

Ill-advised jesters nail his slices of bread and butter to his bench, or slip between them a thin leaflet of wood in order to augment his dinner bill of fare.

Have we not seen some of them who led these youths into drinking gin and chewing tobacco, or who indulged in filthy talk in their presence?

These imbeciles succeed in eradicating in a few weeks what required years of effort on the part of the schoolmaster to implant.

It is simply criminal.

The worst of the matter is that the apprentices are so treated under the pretext of rendering them more intelligent and completing their education.

We have heard more than once old workmen say, "People did the same with us, therefore—"

The excuse is a fine one, and the retaliation noble indeed! It is a smart thing to pay back upon the children the brutalities of which one has been the victim himself. The result is not slow in appearing. After a few weeks of practical jokes and persecutions the young apprentice makes it a point of honor to signalize the change that has been working in him; he swears like an old salt, indulges in broad talk to the women, smokes like a Turk, learns to exact "pourboires," is initiated into artful dodges ("trucs"), and sometimes drinks alcohol like a lord.

The delicacy of feeling of the scholar has vanished; he has become of more rough exterior, the evening school is deserted, the way to the industrial school forgotten, but, after the example of the great folks, he raises pigeons for the coming match, reckons up the chances of the favorite horse winning, etc.

The work of the school then suffers a serious check through the demoralizing agency of the workshops, the factories, the mills. Other untoward influences conspire to the same end. How many parents addicted to drunkenness carry their lack of conscience so far as to subject to the influence of alcohol ("alcoholiser") their children of the tenderest age!

We felt constrained to point out these drawbacks before undertaking to answer the question relative to the rôle of the school-teacher in the fight against alcoholism.

It must not be imagined that the school can do everything in the matter of moral education. It is only one factor working in conjunction with a great number of others, such as heredity, the family, the workshop, the office, the social surroundings. The school-teacher can not realize through his own efforts the ideal which he has in view; his agency is too often neutralized by surrounding influences beyond his power to modify.

Appeal must be made to school-teachers to contend against alcoholism, for they should cooperate in the moral education of the children whom it is their business to fit for life; but it must be borne in mind that the school is not the only educative medium, that the impossible must not be expected of it, nor a regenerative influence attributed to it which it does not possess. Let us add that the struggle against alcohol in the domain of the school is especially difficult and delicate, and that it demands of teachers special knowledge and abundance of tact.

II.—ABNORMALLY ALCOHOLIC CHILDREN.

There exists a class of children who have suffered in a greater or less degree alcoholic degeneration. In our country [i. e., Belgium] these unfortunates, if they do not happen to be altogether idiots, are sent to the ordinary schools and mingle with the normal pupils. They are in general distinguishable by certain characteristics; the majority are impulsive, irritable, undisciplined, uneducable, bad, dangerous even. The ordinary disciplinary agencies have no hold upon them. Far from improving in the class room, they grow worse as they grow older; to the ancestral influence which weighs heavy upon them is added that of the family surroundings, which perverts them still further; their alcoholized parents furnish them with only wretched

examples; often beaten, almost always poorly fed, these children revolt and become vagabonds. There are some of them who do not lack intelligence, who learn easily, and become good pupils in so far as the school instruction properly so called is concerned; but from the moral point of view they are thoroughly bad, and they have unfortunately often a baneful influence upon their fellow pupils, whom they entice and corrupt. Others are mostly wanting in intelligence, have dull minds, unreliable memories, and drag along in the lower grades; at the most they exhibit a certain aptitude for branches of a mechanical character, as writing, drawing from a copy, reading; but when they have learned to read, to draw, to write, they do it without intelligence, after the manner of a reflex action and not thoughtfully. These abnormalities are almost always vicious. They have an unfortunate propensity for liquor, tobacco, vagabondage; they try their hand at divers trades, and as they have no perseverance, no moral energy, but depraved tastes, they do not succeed in any kind of apprenticeship, but become bad workmen, idle and unfaithful employees, give occasion to their employers to discharge them, and finally bring up in the police court. It is in great part from among these bad characters that the always increasing youthful criminal population is recruited.

All children who present themselves at the public schools are admitted, and none are examined from a psycho-physiological point of view. The depraved, the vicious, are intermingled with natures free from any hereditary taint. A pedagogical system adapted to normal pupils is applied indifferently to all. Under these conditions the educative work of the teacher is secretly undermined by the neutralizing influence of the bad elements, which exercise upon the others an unobserved pernicious influence.

We have been able to establish the fact, during a career extending over more than thirty years, that the ordinary school education, while good for the normal pupils, is ineffective for the abnormal, for the alcoholic degenerates. These are a pest in the schools; their example is pernicious; they can corrupt the best of their fellow pupils, and by constantly inciting to disorder they cause the teachers to lose valuable time. Calls to order, admonitions, warnings, counsel, encouragement, all the disciplinary agencies which are operative with normal pupils have no effect upon the abnormal, who are a plague spot in the class and often do irreparable injury.

In order to organize scientifically the schools, a rigorous selection would have to be made among the pupils, the abnormal separated from the normal and placed in special institutions where they would be subject to an educative régime adapted to their nature. A certain number might in this way be redeemed and the contagion of vice among the normal pupils avoided. Rigorous measures have been taken, at least in the great centers of population, to keep out of school pupils having infectious diseases, such as smallpox, scarlet fever, measles, typhus fever, diphtheria, etc., and with good reason; but it should not be lost from view that moral maladies are just as contagious as physical ones. One unbalanced and vicious child in a class room is enough to cause grave disorders. A close examination of the antecedents of young persons who fall into vicious ways, especially of those who are sent to charity schools (*écoles de bienfaisance*), and of those who are going to bring up in the police court or court of assizes, would demonstrate that the major part of the contingent of unruly and criminal children is made up of the sons and daughters of alcoholized parents, debauchees, profligates, criminals, and that a certain number also are the victims of suspicious associates. We have been able to observe more than one case of the latter kind. Moreover, who has not heard of children brought up in respectable families, who have had only good examples before their eyes, and who for all that have fallen into disorder and vice as the result of frequenting certain kinds of company.

The ordinary teacher does not possess the proper means for improving abnormal pupils. If there are in his class children vicious through alcoholic degeneration or as the result of badly directed previous education, his educative influence may be

greatly lessened or altogether nullified. The best schools under the existing system of organization may send out criminals and blockheads without our being able to place the responsibility on either the teacher, the programmes, or the methods. The educational systems with a religious basis are no more free from this result than the unsectarian or rationalistic, since the cause of these pathological and moral aberrations is not a pedagogic one. One of the most urgent reforms, then, would be to institute everywhere a medical examination, to the end that the tares might be separated from the good grain—that is, the vicious children from those who are neither tainted nor corrupted.

To attain this end a twofold supervision must be exercised—that of the teacher and that of the physician. The former would report to the latter the incorrigible, bad, vicious pupils, upon whom the ordinary agencies exercise no ameliorating influence; the latter would examine them from an anthropological and physiological point of view. As a result of this twofold examination, the condition of these pupils would be ascertained, and those requiring a reformatory educational régime would be placed in institutions especially adapted to them. So long as this course is not adopted the public school can not be accused, as it has been recently by some either through ignorance or design, of having been lacking in the matter of moral education and of furnishing to society a portion of its juvenile delinquents. The public school can not be held responsible for the existing and future morality of its pupils. It has no effect upon physiological and psychical heredity, and it receives indifferently as pupils good natures and perverse natures. It submits all children without distinction to the same régime of instruction and education; it itself feels the influence of the family surroundings [of its pupils], which may be good, indifferent, or bad. Moreover, after the pupil quits school at the age of 12 or 14 years, he is modified more or less by the associations of the workshop and by his social surroundings, where the process of his evolution is continued without interruption. The influence of the teacher can not in any case be the preponderating one, and it is a piece of good luck when it is not strongly antagonized by the other educative influences.

Heredity, to be sure, is not inevitable nor unavoidable. As Dr. Ladame well says, “degeneracy in all its different phases may be combated by social or individual measures, preservative or even curative, which will lessen or entirely neutralize its effects.” But the measures must be actually applied all the same, and this can not be done by the elementary teacher.

Our conclusion is then as follows: If it is desired that moral education in general, and antialcoholic education in particular, should succeed in the schools, the pupils must undergo a rigorous selection; the abnormal, unbalanced, degenerate, incorrigible, etc., pupils must be removed from the ordinary schools, kindergartens, primary schools, etc., and placed in institutions especially organized for them.

The city of Brussels has already made a start in this direction. It has recently established a special school for dullards, among whom are found victims of alcoholism of parents. The system should be extended so as to embrace all classes of abnormals. In Sweden there are schools for incorrigibles who can not be retained in the ordinary schools. In Belgium charity [bienfaisance] schools receive children who require special care. But the separation of alcoholic and other degenerates from normal children has not yet been effected in the public and private schools, and it is for this that we insist upon the necessity of studying the question, to which attention has already been called in the congress of criminal anthropology.

III.—METHODS OF THE ANTIALCOHOLIC SCHOOL PROPAGANDA.

In the first place, the teacher should enlighten his pupils as to the physiological effects of the use and the abuse of alcoholic liquors. In point of fact, the majority of drinkers are biased in favor of alcohol; they attribute astonishing properties to it; it is warming, they say, and they drink when it is cold and damp; alcohol is the water

of life (*eau de vie*), the liquid of fire which imparts energy, and they drink before going to work in order to increase their strength; they drink also during and after work in order to get renewed vigor and resist fatigue.

Alcohol inspires cheerfulness and joyfulness, as they pretend, and they drink when they are sad or are crossed. But they drink also to celebrate the joyous occurrences of life. They attribute to alcohol the property of curing all sorts of diseases and indispositions; it drives away stomach aches and headaches; it protects from cholera, from typhus fever, from all epidemics; it is the universal panacea.

Certain women of the common class, country nurses, drink during the nursing period under the pretext that it makes the milk richer (*plus fort*) and gives vigor to the nursling; and they congratulate themselves upon this system, which plunges the little ones into a stupefying sleep, and if they die in convulsions the occurrence is attributed, not to the alcohol, but rather to bad luck or to some imaginary cause.

Drinkers, then, ignore the injurious effects of alcohol, and discover in it salutary properties which it does not possess. Everything conspires to keep them in this ignorance and this fatal error.

In 200,000 drinking shops in Belgium are sold alcoholic liquors, many of which are of doubtful origin. The poison is displayed everywhere in the most inviting ways; the glass maker's art produces vessels of the most varied forms and colors for containing it, and for giving it a seductive aspect; artists design beautiful colored posters, which are displayed on the walls of cities and villages, hotels and wine shops, and which commend this or that alcoholic liquor, pointing out its extraordinary aperient, stomachic, and curative properties; and in this field all parties are patriotically united, for there are numerous monasteries which put on the market alcoholic liquors which are extolled in resounding and suggestive advertisements.

The cafés, the wine shops, the taverns take on an attractive and artistic aspect, often of unheard-of richness; the walls are covered with frescos that glorify beer, wine, alcohol, and tobacco; singers are installed, orchestras, piano and guitar players, etc., and if the music they make is rarely of an elevated character, it none the less furnishes a powerful attraction, fascination even.

Everything conspires, then, in actual society to keep people imbued with this notion that alcoholic liquors are endowed with wonderful virtues. In the majority of families, among the middle class as well as among the workingmen, no occasion of festivity is permitted to pass without bottles of liquor on the table; large bumpers of alcohol are drunk to the health of newly married couples, or of new-born infants, or of persons celebrating their jubilee; at a funeral repast people drink to assuage their grief at the death of a relative or friend. The children are present at these feasts, and the adults make them swallow several gulps of the delicious liquor. Sundays and holidays the parents take the children to walk, in the course of which several glasses of beer are drunk "*en famille*," and in addition a few swallows of gin, anisette, punch, or elixir. At the season of the "*kermesses*" and "*ducasses*"¹ the libations take on colossal proportions; the schools are closed. Are the children not to take part in the alcoholic festivities of the adults! And everywhere the small glasses of gin and brandy alternate with the mugs of beer, without cease, day and night.

The Flemish *kermesses* as depicted by Teniers are reproduced yearly in all the villages and in those quarters of cities where the more common people dwell. They have withstood the edicts of Charles V and the ordinances of Joseph II.

A public official in the Walloon country, who had solicited us for a lecture against alcoholism, wrote to us: "The date you mention will not do; it is the first day of the *ducasse*; for three weeks all the village—men, women, and children—will be unable to hear any lecture whatever; all will be drunk every day; the '*péquet*' will flow to

¹ *Kermesses* are, in the Low Countries, parish fairs, held annually and celebrated with processions, dances, masquerades, etc. *Ducasses* are patron saints' festivals in Belgium and the north of France.—*Translator*.

the brim in all the wine shops of the locality, and it is the same at every ducasse in the whole arrondissement, in the whole province."

Let us add, in the whole country.

Saturdays and Sundays, often also Mondays, many workmen squander in tap-rooms the available part of their wages, and for a long time it is not beer they have preferred but gin. Country workmen do the same. The dwellings of manual laborers are in general small, gloomy, and dismal; the furniture is insufficient; not the least comfort is found there; the children are often dirty and ill clothed; the wife, who is ignorant of the principles of hygiene and domestic economy, does not know how to manage the housekeeping or provide appropriate food for the family. The economical education of women has been everywhere lamentably neglected; she has been taught rules of syntax she will never have use for, and historical dates and occurrences without educational value, but she has been left in ignorance of maternal pedagogy, hygiene, and domestic economy; she has never been prepared for her essential mission, the management of a home. Many of them are obliged to work in the shops, and when they marry they have not the slightest notion of the duties, so difficult and so delicate, of a family mother. So the workman is little disposed to return to his dwelling, where nothing attracts him, and he proceeds to make a sot of himself at the wine shop.

The common people are driven into alcoholism, (1) by their ignorance; they think that strong liquors are beneficial to the health, and do not know that they are injurious; (2) by the fact that their houses are badly kept, that no comfort is found there; (3) by their incapacity to make proper use of their leisure time. Laborers who have toiled long hours in the fields, shops, mills, factories, mines, or quarries, have absolute need of recreation; now, how may they spend their leisure time when they are poor, ignorant, and the family hearth offers no attraction? It is to the wine shop that the man of the people goes to meet again his comrades; there he finds recreation, chats, discusses, plays at cards, bowls, skittles, archery; or perhaps he is a member of a brass band or choral society, and practices for the next festival. The wine shop answers, in our day and in the present state of our morals, to a need of human nature; it is the medium, in lack of a more appropriate one, where the masses go to satisfy instincts which are universal, the instinct of social companionship, the need of recreation. The working class may not be blamed if the pleasures of the wine shop are not more elevated; they have been kept until to-day in a very great relative ignorance, they have not received sufficient education; at 10 or 12 years of age the majority of the children of manual laborers must quit the school for the workshop, where the prolonged and excessively specialized labor is unfavorable both to their physical development and their intellectual and moral improvement.

These then are the three great causes of alcoholism in our country.

There are others, such as alcoholic heredity, of which we have already spoken, whose victims require special treatment.

We do not mention insufficiency of wages, for it has been proven that increase of wages is not always accompanied by decrease of alcoholism. We do not think that workmen drink solely because they are insufficiently nourished; it has been during periods of great economic prosperity that the consumption of alcohol has increased the most. Increase of salaries, which is on other accounts highly desirable, can not of itself solve the problem of alcoholism. The solution is of an educative and moral character, and at the same time of an economic.

How shall the teacher go to work to check the evil? It must be attacked on the three sides we have pointed out.

In the first place, as to ignorance, and prepossession in favor of alcohol; this is the easiest part of his task.

He will make known to his pupils the physiological effects of alcohol; he will endeavor to combat the popular prepossessions, and will point out the deplorable results of alcoholism for the individual, for the family, and for society.

Shall he give this instruction after the didactic method, that is to say, through the medium of lessons at stated times, according to a given programme, or shall he rest satisfied with merely occasional remarks?

We think it fitting for him to make use of both methods.

Occasional lessons may indeed be useful and efficacious to a certain degree, but they are insufficient; they permit important facts to slip from the memory too easily; they are desultory and disconnected; have no unity.

Direct teaching according to an established programme does not have these defects, and if the teacher can make skillful use of the procedures of modern pedagogy they are of uncommon efficacy. For the upper classes of elementary and intermediate schools at least, as well as for adult classes, we think an antialcoholic propaganda programme should be drawn up comprising the following topics:

1. Alcohol, its origin; its properties; its uses.
2. Alcoholic liquors; their manufacture; their adulterations.
3. The physiological effects of alcohol; the diseases of the drinker of it.
4. The influence of alcohol upon the nervous system, and especially upon the brain.
5. The demoralization produced by alcohol.
6. Alcoholic heredity.
7. How people alcoholize themselves; how they are cured of alcoholism.
8. Statement of the income and expenses (budget) of the temperate and the intemperate man.
9. What the Belgian people lose through alcoholism; direct and indirect losses.
10. The fight against alcoholism is a duty.

This programme may be lengthened or shortened, and carried out with more or less detail, according to the degree of advancement of the pupils. The essential point is not to overload their memories with scientific terms borrowed from chemistry, physiology, and pathology, but to enlighten them by means of facts tersely put, so as to implant in them firm antialcoholic convictions. If, on the one hand, the teacher must shun all pedantic and repelling phraseology, on the other he must keep aloof from all puerile sentimentalism; children and young people are fond of neither the one nor the other. In antialcoholic teaching, the intuitive method must be employed in order to obtain results. Recourse should be had particularly to pictures and diagrams, to permit the truths to be firmly grasped. We have been able to substantiate, on the one hand, the radical inefficacy of formal antialcoholic lectures, and, on the other hand, the considerable influence exercised upon children and the common people by short lessons illustrated by well-executed pictures and diagrams. To cite an apt example: Since 1875 we have taken regularly our pupils, large and small, to the museums of art; now we have always observed that De Groux's beautiful painting, *The Drunkard*, made a vivid impression upon them. The distressing scene which the great artist has depicted with so much truthfulness moves them deeply; they see there, as in real life, the sad consequences of alcoholism, and they never forget the sight, which has so elevating and so wholesome an influence. A few words of explanation, a few questions deftly put, are all a teacher possessing tact needs in order to draw from the painting the best of antialcoholic lessons. These are the kinds of scenes that should be reproduced by engraving, by chromolithography, so that the schools and antialcoholic propaganda societies may be supplied with them. The Patriotic League displays at the Universal Exposition a series of paintings, which, without possessing the artistic value of the work of De Groux, are nevertheless almost all pitched in the right key. It must not be forgotten that every picture shown to the children or to working people should fulfill two essential conditions:

- (1) The subject must be simple and true to life, and devoid of intentional exaggeration.
- (2) It should be artistically reproduced.

Coarsely designed engravings, which offend or deprave the esthetic sense, should be banished from the schools; just as little are wanted those exaggerations or those

caricatures which present the victims of alcohol under a grotesque or ridiculous aspect; these unfortunates should be represented to the pupils as diseased persons to be restored to health, not as wretches to be made fun of. We should combat that popular sentiment which makes of the drunkard an object of derision and jest. The painting of De Groux strikes the right note. It excites pity at the lot of the drunkard who, returning to his wretched dwelling, finds his wife dead of misery and her children in a mournful desolation.

Too complicated symbolical pictures, which it is impossible to make understood without long explanations, should also be excluded. We would not have it understood, however, that we reject all symbolism. On the contrary, we are of the opinion that certain compositions are very suggestive, of which may be taken as a type the beautiful painting of Michel, showing the demon of alcohol followed by Madness, Crime, and Suicide. It is a work to be reproduced and distributed among the schools.

Besides the distressing scenes which alcoholic mania presents to us, alas! in such great numbers, it seems to us advantageous to exhibit others of a humorous character. The English are particularly successful with these. We remember the effect produced in a class room one day by an exhibition of lantern slides from an English collection. One of them was a diptych: To the right, a pretty house with a garden; the happy mother and children spring forth to meet the father returning from work; to the left, an intemperate and idle workman comes to a stand before a pile of hogsheads which represents what he has drunk in twenty years; he has nothing left, his pockets are empty, his clothing in rags, his health ruined. The other workman, who has abstained from drink, has saved enough to insure himself a modest competence. A skillful teacher can draw an excellent lesson from a slide of this character.

The League against Alcoholism would do an eminently useful service in recommending for the use of the school and the popular propaganda a good selection of pictures and slides, presenting the alcoholic question under its manifold aspects, physiological, pathological, economical, etc. There should be a series of chromolithographs to exhibit in the sessions of the class, and a series of slides for lectures with lantern projections. These series should be accompanied by a book with explanations ("guide"), which would enable the teacher to give rigorously accurate lessons without being obliged himself to make toilsome researches in books and in a multitude of documents often difficult to procure. In point of fact, the teacher has already many absorbing occupations, and additional labor can hardly be required of him. His work must therefore be facilitated. He may incorporate the antialcoholic lessons in the general programme as object lessons, or make them the subject of exercises in declamation or themes for composition. But he must have a reliable "guide" and appropriate apparatus. As there are a great number of communes and schools too poor to be able to buy this apparatus, consisting of wall pictures, a magic lantern and slides, and an explanatory catalogue, the League with the aid of the Government, or the Government aided and advised by the League, could organize a system of loan collections. The apparatus would be placed gratis at the disposition of teachers for their antialcoholic lessons and lectures. It might even be very advisable, at the start, to organize a body of lecturers, who would visit the schools to give the first lessons and instruct the teachers in the methodical use of prints and lantern views. The parents of the pupils might be invited to these sessions wherever the accommodations permitted. We have, in fact, often had the opportunity of observing that both parents and children follow with the greatest interest simple, clear, and familiar lessons, practically illustrated by means of pictures, prints, and especially lantern views.

Statistical data, which are very useful for making known the extent of the evils caused by alcohol, produce no effect when they appear as numerical abstractions.

They become expressive and particularly suggestive when transformed into colored diagrams. To the series of pictures and lantern slides the League should add a series of diagrams showing the parallel movement of alcoholism, criminality, mental alienation, mendicity, vagabondage, etc., and others showing the comparative mortality of drinkers and abstainers. The data for making such a series are not lacking; recourse need only to be had to the documents, so numerous and so interesting, brought to notice by the League.

To the end that these three series—the wall pictures, the lantern slides, and the graphic diagrams—may be well adapted to elementary and intermediate instruction, as well as to the popular propaganda, it would seem advisable to refer their selection to the judgment of a commission in which the pedagogical element would be especially represented.

The pictures selected could, moreover, be published in various forms. They might serve to adorn the covers of note and text books; reproduced in miniature with explanatory remarks, they might be distributed among the pupils as rewards of merit; a pamphlet might be made of them and sold very cheaply. This teaching is to make its way everywhere. If these pictures and pamphlets are distributed among the pupils of the schools after having been explained in the class room, they will certainly reach in the end the family hearth, where they will instill correct ideas and afford good counsel, to the comprehension of which, moreover, the children will naturally contribute. Let the school thus become the center from which truth emanates; let its influence not be confined exclusively to the pupils who attend it, but let it extend abroad, even to their homes; let the knowledge that it implants and the counsel that it gives not remain in a form purely oral and transitory—*verba volant*—but let them become living and lasting through the picture and the written comment, so as to serve as well for the education of the parents as for that of the children.

The teacher has other means at his disposal to attain his end. Besides direct anti-alcoholic instruction he may have recourse to indirect. Several branches of the programme are well adapted to giving this instruction, especially reading, writing, composition, arithmetic, object lessons, geography, history, etc. The primary readers should contain a certain number of lessons designed to make known the grievous consequences of alcoholism. Several essays have been made in this direction, and the practice should be encouraged. A considerable number of anti-alcoholic maxims, terse and intelligible, have also been compiled, which might very advantageously be commented upon and then set as penmanship copies. Geography and history lessons furnish at times good opportunities; thus when the teacher is treating of the arctic regions he may say that formerly mariners who went thither took spirits along with them under the belief that alcohol is heating, but that it has been proven since that sailors who abstain withstand low temperatures best. He may recall the circumstance that Nansen attributes to total abstinence from alcoholic liquor the resistance displayed by himself and his men during his expeditions to Greenland. In like manner, when speaking of the tropical regions, he may remark that explorers and the military no longer make use of spirituous liquors there, because it has come to be recognized that they are extremely hurtful in those latitudes. Geography lessons need not be limited to catalogues of names; as each country comes up for consideration the teacher may make known the measures taken there against alcoholism and their degree of efficacy; Sweden, and above all, Norway, will afford him ground for suggestive remarks in this particular. In the history course, he may show that among the causes of the defeat of the Gauls by Cæsar must be mentioned the habits of intemperance and gambling to which their leading men were addicted; speaking of recruiting mercenary troops, he may point out the rôle that artful sergeants have made alcohol play in blunting the will of men of the lower class upon whom they had fixed their choice; he may relate that at the time of the terrible retreat from Russia it was the abstinent soldiers who best resisted cold and fatigue; many other

historic occurrences may be made to furnish an antialcoholic argument. It is not necessary to observe that numerous arithmetical problems may be formulated so as to inculcate an antialcoholic lesson, or furnish an illustration for a lesson previously given.

All these indirect means are useful, all cooperate in enlightening the mind and eradicating prepossessions favorable to alcohol; all furnish the pupils with rational motives for abstention, and dispose them to withstand the evil suggestions which await them out of school. But in this work the teacher will encounter serious obstacles, which he can surmount only by proceeding with tact and circumspection. In severely condemning alcoholism and intemperance does he not run the risk of destroying the respect certain children owe their parents? There are in his class the sons and daughters of saloon keepers, of moderate drinkers, of confirmed drunkards. What will the first think of the business, the others of the habits of their fathers? On the one hand the teacher says to them, honor thy father and thy mother; consequently he can not act out of harmony with this precept in portraying, as do certain fanatical and ill-advised propagandists, the wine shop as a den of iniquity, the keepers of wine shops as licensed poisoners, and drunkards as contemptible objects. Such exaggerations do more harm than good to the antialcoholic cause. The teacher should proceed with more tact and judgment. The wine shop is not essentially bad. In our country especially, since the organization of the first guilds, it has been a place of meeting made necessary by circumstances and by the climate, and it has served greatly in developing altruistic sentiments, in creating a medium where, after the labors of the day, people could assemble for recreation, for the exchange of ideas, and for the discussion of common interests. It is only the abuse of alcoholic liquors which is bad and which is to be contested. It is the rôle of the teacher to set forth the evils caused by this abuse, but he must not through an untimely zeal bring into disrepute a class of his fellow-citizens among whom there are as many respectable persons as in any other class.

He should also be careful not to speak of the drunkard with contempt; it would be unjust and indiscreet. Let him represent him as a sick person to be cured, not as a culprit to be condemned. Let him tell his pupils that it is cowardly to hoot at and torment those who are in a state of intoxication; they are suffering from the effects of poison and need to be taken care of in order to escape from the dangers that threaten them. The drunkard's son can take in such a lesson without danger of losing the respect he owes his father; on the contrary, he will feel pity for him. It is to be noted that in taking such a course the teacher is on the right road, for the passion for drink must certainly be considered a pathological manifestation.

IV.—EDUCATION OF WOMEN.

We have pointed out that one of the causes of alcoholism is the ignorance of everything that relates to housekeeping on the part of a great number of women of the working class. There is as much occasion for the antialcoholic propaganda in girls' schools as in those for boys. The family mothers of the future are not adequately prepared for their essential duties in the elementary and intermediate schools as they exist to-day. The school programme contains too many matters of secondary or even altogether questionable utility, and it does not provide for the real necessities of education. The formula, "Education for real life," is often heard, but it is not applied, or only poorly applied. It is of the highest social importance to lop off from the programme those portions without practical utility, such as a host of dates and historical facts, definitions, grammatical rules and exceptions, which burden to no purpose the memory of young girls, and are of no service in their general education, and replace them by simple and plain instruction in domestic economy and maternal pedagogy. The school day should be divided into two equal parts, one devoted to general studies according to a programme that sacrifices nothing to

useless knowledge, to matters inapplicable to real life, the other reserved exclusively for theoretical and practical knowledge indispensable to mothers of families and housekeepers. The programme of an elementary school for girls should be made up essentially of hygiene, maternal pedagogy, the elements of domestic economy, the art of managing a household intelligently and economically, of preparing simple and nourishing food, of doing the marketing, of keeping in order and mending the clothing, in a word, of all that a mother of a family ought to know in order to render the home comfortable, to make of it a medium of education and recreation. Movements have already been made in this direction. The city of Brussels sends to the "école ménagère et professionnelle" the pupils of its girls' schools in order to be instructed in domestic occupations.

The reform we recommend will necessarily be favorable from an antialcoholic point of view. The improvement of the family surroundings will undoubtedly have the effect of attaching the husband more strongly to his home, and of diverting him from that excessive indulgence in alcohol to which he is too often impelled by the little gratification he finds in an ill-kept household.

We only point out this reform, whose importance will not escape the notice of the Congress.

V.—ESTHETIC EDUCATION.

We have also said that the lack of esthetic education is a cause of alcoholism. The every-day people have need of relaxation and recreation after their toilsome daily labor. If they live amid surroundings where nothing has been provided to develop in them the esthetic sentiment, the taste for art, they will give themselves up to coarse pleasures, and alcoholic potations will have an irresistible attraction for them. All that the common school does to cause that flower of civilization, which art really is, to bloom in the hearts of the children, serves with good effect the antialcoholic cause. That is why drawing, music, elocution, dancing (this latter in connection with the gymnastic exercises) should be included in the programme of the common schools. To these add excursions into the fields for the enjoyment of the beautiful scenery of nature and visits to monumental structures and museums of art. All this contributes to enlighten and elevate the heart, to develop the taste for things really superior and beautiful; all this prevents from falling into habits of a lower order.

Wherever teachers exert themselves in the esthetic culture of the pupils intrusted to their care they indirectly promote the antialcoholic propaganda by teaching them how to occupy the leisure hours of existence agreeably and morally. If they get up or manage associations, brass bands, singing clubs, dramatic societies; if they organize or assist in organizing savings banks, mutual-aid societies, clubs for travel either at home or in foreign parts, they contribute effectively toward ameliorating the conditions of existence on the part of the common people. The number of teachers who have devoted their leisure time to activities of this character is already considerable. They would be more numerous still if they received from the public authorities that encouragement which is too often lacking and which is at times even replaced by an unjustifiable opposition.

VI.—SCHOOL TEMPERANCE SOCIETIES.

We will close this report by saying a few words on school temperance societies. We are of the opinion that they are not to be encouraged. They are based upon a false conception of the nature of children. They are bound to fail, precisely as the school battalions have failed. The school should enlighten the children as to the manifold and disastrous consequences of alcoholism, and we have pointed out the principal means for attaining this end; but we think the teacher ought not to induce his pupils to promise to absolutely abstain from all alcoholic drink during a certain number of years. The child ought not to bind himself by such a promise, which

he will always make complaisantly at the suggestion of the teacher. If the latter has given antialcoholic instruction that is really effective, his pupils, when they have quit school to enter the workshop or engage in some other employment, will be armed against the temptations which will assail them; it is not the promise made at a given moment, nor the diploma given to them upon such an occasion, nor the little banner won by the school temperance society, that will prevent them from drinking alcohol. Let us inform the pupils by means of earnest and continued instruction; let us not burden them down by employing factitious agencies; let us not expose them to breaking a promise given at an age when they knew not what they did, and in circumstances where they could not act freely. Education is too serious a thing that recourse should be had to means which, for all they are of American origin, are none the less in conflict with a healthy pedagogy. The money spent in providing school temperance societies with registers, diplomas, and banners, would be much more usefully employed in the purchase of the apparatus necessary to give some wholesome and useful lessons on alcohol by means of pictures and lantern views. If the attempt has been made, through very questionable statistics withal, to establish the fact that there has been a decrease of alcoholism proportional to the increase of the members of school temperance societies, still the *a priori* inference may be drawn that it is not to the existence of these societies that the decrease in the consumption of alcohol is due; for in order for it to be so, it would have to be conceded that, in Limburg, for example, it was formerly the children and youth who constituted the bulk of the army of alcohol drinkers.

If there are any countries where the struggle against alcoholism has been carried on energetically and has produced superb results, those countries are Norway and Sweden. Now these results have not been brought about, in however small a degree, by "bands of hope" after the American fashion, nor by school temperance societies of the Limburg type.¹ At the School Congress of Gothenburg the majority after a thorough examination pronounced against the formation of these societies; a considerable number of the members, both total abstainers and "moderates," declared strongly against this system, as being antipedagogic and immoral; they also think that a promise should not be exacted from children which binds them for the future, and of which they can not grasp the import.

Numerous Limburg teachers whom we have consulted have confirmed us in our views. They recognize that antialcoholic instruction, whether indirect, didactic, or occasional in connection with other branches, well given, may have useful results, but they add that school temperance societies have no real efficacy; that they cause a loss of valuable time and a waste of money.

¹Statistics of the consumption of fermented and distilled liquors in England, Scotland, and Ireland prove the inefficacy of "bands of hope" alone in destroying a deep-rooted vice. At the Brussels congress (1897) it was asserted that these pupils' temperance societies had already caused a decrease in the consumption of alcohol. Now the official statistics, as summed up by the "Revue encyclopédique du XIX siècle," show that this consumption considerably increased during the last fiscal year. In England there were expended for drink 55 millions of francs more than the preceding year, and 46.6 millions more than the average of the last twenty-five years. The total expense the last fiscal year was 3,862 millions of francs for a population of 40 million persons. This amounts to 97 francs per inhabitant, of which 60 was for beer, 10 for wine, and 27 for spirituous liquors. * * *

To overcome alcoholism there is needed the moralizing influence of the family, the school, and society, the latter acting energetically and perseveringly through the medium of prohibitive laws, as in Norway.—A. S.

CHAPTER X.

THE READJUSTMENT OF THE COLLEGIATE TO THE PROFESSIONAL COURSE.

Read as the Annual Address before the Section of Legal Education of the American Bar Association, August 17, 1898, by Simeon E. Baldwin, LL. D., Chairman of the Section, Associate Judge of the Supreme Court of Errors of Connecticut, and Professor of Constitutional Law in Yale University.¹

There are four stages to a complete education.

The first is open and free by law to every child, in all governments of modern form. It is pursued through the common schools, and stops when enough has been taught to raise him above the condition of illiteracy.

To this primary education may generally be added, in whole or part at public expense, a secondary education which shall fit the student to enter upon the highest intellectual tasks that the acquisition of learning can involve.

The third stage—that of the higher education—is reached at the door of the university; the university, I mean, as distinguished from the college. Here, either by the aid of the State or of charitable endowments, all branches of human learning are taught by men who have dedicated their lives to following them to the end, and to pushing that end farther and farther into the realm of the unknown. Here each newcomer can select his field, and study in view of the special work for which he wishes to be prepared.

A few years, generally not more than three, are thus passed, and then a man goes forth to his life work, but as a learner still. He has yet to get from the world at large that rounding off of all his acquirements, that ability to turn them to account; that sense of proportion; that appreciation of the relations of things; that faculty, in a word, of drawing from knowledge power, which only practical experience can give, and by which practical experience makes the fourth stage of education the best of all.

It is a stage on which one must not enter too late. Irrespective of the social and economic reasons for every man's engaging early in whatever is to be the business of his life, he will do it best when he has not overmuch to unlearn first. There is a certain period after which mere study, unaccompanied by the putting forth of productive energy in contact with the world, makes a man a pedant, turns learning to vanity, and contracts the very soul.

Our American system of legal education contemplates the fulfilment of three at least of the stages which have been mentioned. For the other, that of the university, or its equivalent in this regard, the law school, studies in a lawyer's office may be substituted, though not, in the opinion which has been pronounced by this association, without serious loss.

The limits of primary education are the same for all. The lessons of the world, when the bar is once entered, are to be mastered by each for himself, and in such

¹ Printed in the Yale Law Journal by permission of the American Bar Association.

period of time as each may need. It is the relation between secondary and university or professional education, alone, that is subject to variation by rule.

The conditions which should, and which eventually must, determine this relation have been essentially changed in the United States since the civil war. The progress of the various sciences has compelled the prolongation of every course of professional study. The leading medical, engineering, and mining schools now require four years of attendance; the leading law schools and divinity schools, three. For this there are two reasons. There is more that must be taught, and whatever is taught is taught better. Instruction is given on more scientific methods. Its scope has been widened. Its aims are higher.

In the profession of the law, the multiplication of reports has been at once a cause and an effect of the development of the science of jurisprudence. These press upon the American student with a crushing weight. Citizen of a country in which there are nearly fifty different separate sovereignties, each with its law-making power, and its law-construing power, he must be trained as never legal scholar was before to the use of libraries; to the balancing and comparison of judicial decisions; to the rapid glance that commands the situation, the sound choice between conflicting authorities; and above all, to the power to penetrate through the mazes of case law to those principles which they often illustrate and often obscure.

Concerning the value of cases as a means of legal education, we may not all agree. As to the method of their use, there are those who prefer to ask the student to trace through them for himself, in long succession, the history of legal rules; and others who would rather turn his attention to those which best state what those rules now are. But that their increasing number, in connection with the general advance in commerce and manufacture, has involved fundamental changes in the previous system of law-school instruction, is a proposition from which none will dissent. The business interests with which the bar must deal have been doubled in magnitude and in variety during the last half of the century now nearing its close, and with them has been doubled the complexity of our social life.

Meanwhile a marked change has been wrought in our system of secondary education. We have never, in America, separated this sharply from the work of the university. Until recently, we could not; and we have not yet put our new opportunities to use.

Secondary education in this country began with the foundation of Harvard College. That was patterned after one of those then and still characteristic of the English university—the framework that of a great boarding school for half-grown boys. The first president of Harvard was a young graduate of Cambridge University, where he belonged to Magdalen College. The course of study there is one of three years of three terms each; students being classed as freshmen, junior sophisters, and senior sophisters. Harvard adopted the same plan and the same class names. Fifteen years later her course was lengthened to four years, and the word “sophomore” (which had been a term of student slang at Cambridge) added to the English language as descriptive of college students in their second year.

Yale did the same thing, making her course one of three years until 1710, but styling the middle year students sophomores, instead of junior sophisters.¹ After 1710, the regular course was lengthened to four years; but, to quote from the college laws—²

“for y^e special encouragement of students in their Diligence it is ordered that if a student at y^e end of three years Continuance in y^e school shall in his probation manni-
fest expertness in Reading y^e Hebrew into Greek and into latin and Grammatically
Resolving y^e said languages and in answering such questions in their systems of logick
and in y^e principles of naturall phylosophy and metaphisicks as y^e Rector or any of

¹ I Dexter's Yale Biographies and Annals, 18.

² Ibid, 350.

ye trustees present att ye said probation shall see Cause to propose to him, and be approved by ye trustees att Commencement may Receive a Diaplooma for his first Degree.”

In the next revision of the college statutes, this provision for the better scholars was struck out, and has never reappeared. From the early part of the eighteenth century to the early part of the nineteenth there was, I believe, no American college which did not map out its course of instruction into four set years for four set classes.

Then came Jefferson's great experiment in Virginia. He sought to refashion our whole collegiate system, and bring it into the lines of the Continental instead of the English university. From that day to this the University of Virginia has granted her honors to those who deserved them by their attainments, not by the length of their residence at Charlottesville.¹ The French degree of bachelor of letters is given to those who successfully complete the studies in a certain number of her twelve schools of arts and science; the English degree of bachelor of arts to those who to this add proficiency in certain other schools. Not over three years need be thus occupied by a diligent and capable student. Those who come to the work with insufficient preparation, or pay more attention to the social than to the intellectual life of the place, may take as many as they please. Nor is a diploma held up as the great object and end to be attained. A large proportion of the students in the collegiate department receive none. Their attention is directed to getting an education rather than to getting a label to certify that they have got it.

In 1842, President Wayland, of Brown University, startled the slumbering circles of academic learning at the North by the publication of a book announcing his adhesion to the Virginia plan. His views encountered strong opposition, but at last, in 1850, they were put to the test of actual trial, under his own supervision, and the degree of bachelor of arts offered to all who should show themselves proficient in nine courses, each running through a year. It was thought that three such courses could be taken in one year, but those who preferred were to be allowed to make the nine extend over four years, unless the faculty thought it, in any particular case, a waste of time. The immediate result was that while the number of students in the college had decreased largely during the fifteen years preceding, running down from 195 in 1835 to 150 in 1849, it rose to 195 again in 1851, and to 283 in 1854.

The retirement of Dr. Wayland from the presidency in 1855 was soon followed by a return to the old system of a four years' course, largely of prescribed studies. The experience of Brown, however, was complicated by its perhaps premature demand for the extension of freedom of election between studies, and by the absence there of anything in the nature of professional or university schools. The latter fact may also serve in part to account for another of the positions taken by President Wayland in 1842, that the standard of admission to our colleges was too low. The age generally required for admission was then 14. He proposed to keep the boys two or three years longer at the academy, and to introduce them when they came to college to studies of a wider range and higher character.²

Here his influence proved more lasting. During the last half century the required age for a freshman has been generally raised to 15, and in the older and larger colleges the average age in fact is now 18 or 19. The courses of study have also been universally multiplied and enlarged. Harvard was the leader in this change. In 1877 President Eliot stated officially that her examinations had then become such as to require from applicants for admission to her academic department a full year of previous study, beyond the period demanded by those established in any other American college.³

Side by side with these changes, and others of hardly less moment in our collegiate

¹ William and Mary College also gives the B. A. degree after three years study, if proficiency is shown in a certain number of studies. The College Book, p. 60.

² Wayland on the Collegiate System of the United States, 107.

³ The College Book, 15.

system, has come a development of the professional school into something essentially and radically different from what it was at the beginning of the century, or when Wayland wrote.

A new thing has, indeed, been evolved—the American university. The college, with its plan of secondary education, is a part of it; but it is being steadily relegated to a more and more subordinate position. Its leading teachers find their most congenial work in fields where they can go hand in hand with the advanced student, as common learners from the same sources. The graduate schools in philosophy and the arts are overshadowing those of the undergraduate years. The professional schools are often found to be calling more out of a man, and making more out of a man, than his college instruction ever could or did. But all this new university education takes time; and time out of the best years of active life is something to be dealt out with a sparing hand.

The American college—forerunner and father of the American university—dates from a period when professional schools were practically unknown in English speaking lands. Its aim, we must always recollect, was to give that “liberal education” which frees and leads forth the mind from the narrow circles of local environment; but not to furnish it with technical knowledge of any particular art. It took the boy of 14 and returned him to his parents at 18, to begin the serious work of life under other auspices. He had been taught by this time about as much as the collegian of the present generation has learned at the end of his sophomore year; less of physics but more of grammar; studying as a freshman and sophomore much that the modern student has acquired at school. Next might come two or three years of quiet reading in a country study or office, and then by 21 he was ready to enter one of the learned professions.

A couple of centuries have revolutionized for us almost everything else in education but the length of the college course. It was four years in the seventeenth century, and it is four years still, on the verge of the twentieth. Not because it now takes four years to teach what was then taught. Half of that has been relegated to the preparatory school, and the other half by the aid of better text-books and methods can be far more quickly learned. It is because every student is now taken, in a superficial way, over the whole field of human knowledge, and each is invited to make himself closely acquainted with some particular division of it. For the *trivium* and *quadrivium* we have tried so substitute a rapid view of the *omne scibile*. We try to make our young men universal scholars before they can begin to be professional scholars. We try to make them specialists in some science before they are taught to be specialists in any art.

The result is that in our larger colleges and universities the average age of the freshman is what, in the days of our great-grandfathers, was the average age of their graduates; and both in the larger and the smaller it is greater by two full years than it was even half a century ago.¹ The young man enters college at 19, and leaves it at 23, to commence perhaps a course of professional study, demanding three or four years more. Any system of education which requires twenty-six years of the ordinary man as a preparation for one of the ordinary professions is radically wrong. Life is not long enough to justify such an expenditure of time. The world is not rich enough to pay what it costs. We may even say that the world is too wise not to know that, after a certain point has been attained, its own rough lessons are worth more than anything that can be got from books and lectures.

At 23 a man ought to be among the bread-winners. At 26 he should be, not entering a profession, but reaping its rewards from an assured position in the community.

Which part of its training shall the American university be ready to abridge to reach this end? The tendency has been to scant the professional courses. Few can give four years to the college and then three or four more to the superior schools to

¹ President Charles Kendall Adams, in Johnson's *Cyclopedia* (1893), title “Colleges.”

which it leads the way. It requires more means, more patience, and more time than the ordinary man has to bestow.

The new catechism of the American university comes very close to teaching that the chief end of life is to get an education. It might not be so far wrong if it declared that the chief end of life was to use an education.

Education leads forth the mind to an acquaintance with three kinds of things: Acts, facts, and the relations of these to each other. It is these relations which it is most difficult to master. To know them and to use that knowledge with effect is the life work of the professional man. He must address himself to his task when young enough to give three full years at least to the close study of his chosen art before he begins to essay its practice. It is the inability of the college graduate to do this, in ordinary cases, which keeps so many of them out of the professional schools and—what is worse—which keeps so many professional students either from entering on or from completing a collegiate course.

Andrew Carnegie said some years ago: "The total absence of the college graduate in every department of affairs should be deeply weighed. I have inquired and searched everywhere in all quarters, but find scarcely a trace of him."

This would have less even of the semblance of truth if the college graduate were, as he ought to be, born into the world one year earlier.

Three years is all that has for centuries been required in either of the great English universities (which are really only clusters of colleges) for the bachelor's degree.¹ It is the limit of the German university for the doctorate. It is enough, preceded by the American high school, to give our boys as much of a general education as is good for most of them.

There is a certain top-heaviness that is apt to amuse the world in the average senior when he gives his views on topics of political economy or social science, or the philosophy of history. He knows the latest words of the best men, but it is seldom that he has got hold of the relations of things to which they must be adjusted. He is wise overmuch. He has lived too long in an ideal world, and as part of a factitious community, detached from the actualities of everyday life. To these his professional studies will bring him back. Their commingling of science and art, theory and practice, is what he often needs to restore his life to a just equilibrium.

To such a man—neither the first nor the lowest scholar in his class—it would be a positive gain to cut off the fourth year from his college course if by this he were to gain another year in the professional school. There his speculations are always being corrected by application to concrete things, and everything is tested by constant contact with the common facts of daily experience. His business now is to learn for the sake of what he learns; and twenty years of learning for the sake of discipline should be enough to teach him how to begin work in earnest.

It has been our American system to fix the age below which a boy can not enter college; and to take no thought as to the best age for him to leave it. Might it not be wiser to begin at the other end and ask first, what is the best age for the young man to stop learning and begin earning? I venture to say that he should stop making it his main business to learn by three and twenty. That he should spend three years in professional study, if he is to enter a profession, is now generally agreed. He should leave college then by 20,² nor would most parents wish him to enter it before 17. A three years' course for all would make this possible. So would a four years' course of which the last offered such opportunities for the prosecution of professional studies as would be equal to those afforded in a professional school. In a university where this could be accomplished there would be no break in the continuity of that social life which gives to college days so great a charm. Instead of

¹ Under Queen Elizabeth the course was one of four years. Malden on the Origin of Universities, 124.

² This was the age when the course of instruction was completed in the public academies, corresponding to our colleges, under the Roman Empire.—Newman's Historical Sketches, III, 101.

pursuing other elective courses, seniors proposing to follow the law could devote themselves to political science, general jurisprudence, and constitutional history; those looking to divinity could give their time to moral philosophy, psychology, Hebrew and Hebrew literature; those contemplating the practice of medicine could take up chemistry, biology, and botany.

A year thus spent might either be the basis, as in the case of the "Law and history tripos" at Cambridge University, of an election between taking a bachelor's degree in arts or in the special profession to be entered upon; or it might be allowed to abridge the term of professional study to two years. This last method is, no doubt, more easily adjustable to existing conditions than to cut down the ordinary college course, for all, from four years to three. It reaches substantially the same result as respects those entering the "learned" professions, and has been virtually adopted for them at Yale and Columbia. But it still leaves the college graduate, who proposes to engage in a business career, to enter it a year too late. It is hard for a boy of 20 to descend from the altitude of senior year to the drudgery of a petty clerkship, or the dirt of a machine shop; but it is far harder to a man of 22.

So far as concerns those whose purpose it is to devote their lives to abstract studies, or to teaching, the abridgment of the undergraduate course would simply mean better opportunities for a graduate course. Few young men with these aims now deem their education completed until it has led up to the degree of master of arts or doctor of philosophy, and they would get it at about the same age, under either system.

A third expedient is to allow those who can to complete the number of courses required for the bachelor's degree in three years, and then give them leave of absence during senior year, so that they can devote it entirely to work in a professional school. This has for some years been the Harvard plan.

Of these three methods of reducing the term of university residence, the first, it seems to me, is the wisest as well as the simplest.

Professional instruction is best given by those who belong to the profession in question; and they also can best arrange its proper order. If a law student forms his first conceptions of law by studying general jurisprudence, constitutional history, and political science under the lead of collegiate teachers, he is in great danger of feeling later that he began at the wrong end. Theoretically, to introduce him to his profession from its scientific side seems natural and right. Practically, most law schools have found it a blunder, even for the brighter men. The multiplication table comes before the calculus.

The third plan benefits only a few, and those the ones who would succeed under any system of instruction. The real question is what to do for the average man, and how to save a year more of life in the world for him.

The three years' college course and the four years' college course have both been on trial at Yale, side by side, for more than forty years. "Yale College" proper has required four years of residence as the condition of a degree in arts. The Sheffield Scientific School of Yale University has given that of bachelor of philosophy after three years.

For entrance to either, the student must have a fair acquaintance with the Latin language, and the absence of instruction in Greek is almost the only thing that makes the degree in philosophy mean less than that in arts.

The graduate of the Sheffield Scientific School is younger by one or two years than the graduate of "Yale College" proper; but his training fits him better to enter a medical school; nearly as well to enter a law school; and far better to begin a course of instruction in engineering or any of the applications of the physical sciences to the industrial arts.

The number of those who are graduated from any such institutions is but an imperfect indication of how they are regarded by those having sons to educate; but it is on the whole as satisfactory as anything in the line of statistics can furnish.

The Sheffield Scientific School sent out its first graduates in 1852, and the whole number to the close of the year 1857 numbered less than 50. From that time on the comparative figures for this branch of Yale and for the original academic college are as follows:

	Bachelors of arts.	Bachelors of philos- ophy.		Bachelors of arts.	Bachelors of philos- ophy.
1858-1867.....	1,051	89	1878-1887.....	1,343	482
1868-1877.....	1,142	351	1888-1897.....	1,970	1,144

In other words (using round numbers), the three years' course attracted but one-eleventh as many as the four years' course for the first ten years; nearly a third as many in the next decade; more than a third as many in that following, and considerably more than half in that which closed in 1897.

This steady and rapid march of the scientific school toward a position of equality in numbers is not, I think, attributable to any superiority in the quality or method of instruction. It certainly is not due to any greater attractiveness in the social life of the students, though it has been accompanied by a growing and deepening sentiment of loyalty and love toward "Sheff.," for it is an institution with no college dormitories, no college campus, and few independent traditions and usages of its own. The reason lies on the surface. Three years of work is all that is demanded as the condition of a degree. We Americans spend time and money freely where we believe it to be necessary; grudgingly when it seems called for by tradition rather than by reason.

We have begun to see that the American university is doing something that no European university has ever done.

It is furnishing both secondary and professional education. It is instructing both boys and men.

We have drifted into this position insensibly almost, and, I can not but think, without fully appreciating all the dangers which it risks, all the results which it entails.

To make secondary education worthy of a place in a university scheme, we have advanced it beyond its proper limits. We require of all our college students in their fourth year, and often in their third, the pursuit of branches of knowledge, or the adoption of lines of research, which the experience of the world hitherto has reserved for the few who are seeking the highest degrees in the republic of letters. Hence it is, and for these purposes, that we have trenched on the years of life which that same experience has set apart for other work.

Practically, we have added or sought to add half the German university course to all the English university course and part of that of the public schools which precede it; and called this a college education. Eton, Harrow, Winchester, and Rugby are more like the German gymnasium than the American high school. We take our boys over a wider range of subjects, but do not push them as far on any given line. Freshmen year in college must be added, and perhaps part of sophomore year, to put them where the English or German is when he enters the university.

In theory and aim the English and Continental universities originally were not dissimilar? All were alike planned to teach those who had already received a good secondary education whatever men might desire to learn, as a preparation for the work of life. One might thus study to be a scholar, a lawyer, a divine, a physician, or a man of affairs. Each was free to choose according to his needs.

The peculiar centralizing tendencies in English life, the nature of their aristocracy, and the remoteness of Oxford and Cambridge from the capital and metropolis of the Kingdom, soon confined university education there within narrower limits. While

they professed to teach the *omne scibile*, the professional "schools" until recent days were never anything but names. The three years which were spent at the university enlarged the horizon of the English country gentleman, but may be said to have disciplined the mind without informing it. Practically it was deemed unworthy of a seat of learning to undertake to give men any direct instruction in the art of earning their daily bread. This was to be picked up afterwards, as best might be, in attendance at the inns of court, or at the expense of patients or parishioners.

The practice of medicine was for centuries regarded as something pertaining to the clergy. Those who pursued it were generally monks, and were obliged always to have a license from the bishop of the diocese. With the Reformation came the establishment of a college of physicians and surgeons, but it was founded at London, and although its first president, Linacre, had been an Oxford professor, it had no connection with university life.

To learn the science of law or of medicine, the student must leave the university and go to London. The science of theology, it was unnecessary to acquire in order to become a parish priest. Whoever could procure the presentation to a benefice, if not of scandalous life, was reasonably sure of approval by the bishop.

Under such conditions the English universities became, and have to this day remained, places for acquiring a liberal education of a general character, but not for pursuing professional studies.

From their graduates came the founders of the earlier American colleges, and these, as has been said, were naturally modeled, as far as might be, upon a similar plan. A hundred years later the professional school began to take shape here, and to appear as a graft upon the college stock. At Philadelphia the first American medical school was thus set up in 1764, in connection with the college founded by Franklin, and after its incorporation with the University of Pennsylvania, the earliest course of university law lectures in the United States was delivered there by James Wilson in 1790. At Harvard, Columbia, and Yale similar establishments slowly followed, and during the last quarter of a century they have been multiplied over the country with marvelous rapidity. Particularly is it true of the law school. Of such institutions, as a distinct and complete department of a college or university, the first came into existence at Harvard in 1817 and the second at Yale in 1824. In 1897 there were 78 American law schools scattered over 32 States, with over 10,000 students in attendance. At a steadily increasing number of them, a course of study is required covering three academic years; and at a few graduates may receive advanced instruction for a period of one or two years more, and the degree is awarded of doctor of laws or doctor of civil law.

The further study of philosophy and the arts by college graduates has also, during the last half century, been promoted at many of our universities, and there is no science in which a doctorate can not now be sought, as an evidence of successful application. To pave the way for graduate instruction of this nature, undergraduate instruction has naturally been made more extensive, and so more protracted.

It would seem to be the birthright of our age not to increase but to cut down the ancient term of a collegiate education. Carlyle once said that what brought universities into existence was the want of books.¹ In those days men who would learn a science of whatever kind must do it by listening to the spoken word, and make their own books by laboriously writing out what fell from the lips of the master. A year might then be taken to gain what the art of printing soon made it possible to acquire in a month.

The German professors still seem to ignore the existence of the text-book. They are generally content to teach the ordinary student by the lifeless and time-wasting method of reading or rather dictating a written lecture; and would be startled should one of them interpose a question, however apt. The American teacher who, so far

¹History of Literature, 106.

as he can venture, makes a *seminar* of every class has no such excuse for multiplying his hours of instruction. He is glad that he can refer to works in which what he might otherwise have said has been better said; and that by reading them first his pupils can best come to deal with the questions which he may bring to their particular attention, and make the main subject of his own remarks.

It is, I believe, largely this difference in method between the German and the American and French universities (for the French professor talks to his class instead of reading to them) that has excluded the baccalaureate degree from German use. The certificate granted at the close of the gymnasium or real-school course is not a diploma. Such honors are reserved to crown the higher education alone.

The French have dealt more wisely with this question. The bachelor of letters, under their system of public education, receives his degree at substantially the same stage of progress reached by the German student when he leaves the gymnasium. Two years more at the university is required by the ordinary man to fit him to apply for the admission to the ranks of the licentiates. He is then qualified to receive the doctorate in letters as soon as he is able to present a proper thesis, and defend it upon a day set for its public discussion. This he may prepare wherever and whenever it suits his convenience. He may continue his residence and studies at the university if he chooses, or he may pursue them in any other place where business or convenience may call him. His university course, so far as residence and examinations, need not extend a day beyond two years.¹ The same period of residence was fixed in 1897 for those desiring the degree of doctor of the University of Paris.

There must be some point of life at which, to the average youth, the transition can best be made from the first to the second stage of secondary education—from its simpler to its severer studies. The age at which one could first gain admission to our American college was for more than two centuries 14. During the last quarter of a century it has by some of them been raised to 15. But the great majority delay their entrance until they are two, three, or four years older. The result is that they learn at school much of what they could better learn at college.

Nature herself has indicated to us the period when the higher stage of secondary education can be best begun. It is that which follows close upon the age of puberty. The youth can then acquire, in one year, more than two could have imparted to him at an earlier age. The world is unfolded to him from a new point of view. This is the time when he should be under the best masters and furnished with the best opportunities to seize every familiar truth in its new dress and know it for what it is. It is during these bright days that he should enter on his college life, and, with a mind moving from a new center of being, form those views of things by which his future course will be directed. To linger at school, surrounded by the associations and the associates of childhood, when one is able to begin the work of a man, is a waste of energy. It is not merely procrastination, but repression.

The greatest lessons man has to learn are not those of grammar and mathematics, of modern or of ancient science, except as these all help to make him know himself and his relations to the whole order of the universe.

An eastern fable tells us that when man was created Satan appeared before the Lord and besought that he might be permitted to endow this new being with four things. The archangel Michael preferred a like request. Each was told to prepare his list in secret, and submit it for approval. The devil's was read first. It contained four words: "Women, wine, work, death." The archangel's was then opened. It was the same.

This is the list which the boy first begins to understand as he feels himself expanding into the man. The college is the place to read it in; not, indeed, to read it through; but to read into it and between its lines, the lessons of the interdependence of humanity; of discrimination in choice; of moderation in enjoyment; of regard

¹Am. Hist. Review, III, 422.

for others' rights; of patient continuance in well-doing; of the oneness of time and eternity.

The college receives a youth into a new home in a larger family. It is right in saying that it will admit freshmen at 15. It is wrong in discouraging their coming until a much later age, as it practically does by demanding a preliminary education covering so wide a field. At 16 or 17 the average boy ought to be ready for the average college. Every unnecessary year at the preparatory school means an unnecessary year in the college course, and may mean the loss of a necessary year in a professional course.

For our own profession, we know that three years of study is a practical necessity for the ordinary man. Three years were given, and required by the courts, more generally in the eighteenth century than they have been, until recent years, in the nineteenth. There was time for it, when the college sent out its graduates at 18 or 19.

Nor was the legal education of those days less fitted than that of this to produce great men. It was simpler, but its roots ran deep. There was, indeed, no wilderness of case law through which the student must be led. Of American reports in 1798, but five volumes¹ had been published. Of English, since the close of the Year Books, there had been between 200 and 300; but probably not half of these had ever crossed the Atlantic and hardly 30 were in what might be called familiar use. On the other hand, the young lawyer was expected to know something of the general principles of public law, and to approach jurisprudence in a spirit of scientific inquiry. He was taught general views rather than particular rules. He was encouraged to strike out boldly and reason for himself; to make precedents rather than to follow them. Judicial decisions, in fact, were forgotten almost as soon as they were pronounced. They were like verdicts. The cause was determined; and, after a few years, only the parties recollected the event. Kent became chancellor of New York in 1814. He had had two predecessors, but during his term of office of nine years, not one of their decisions was ever cited before him as an authority.²

The tendency of legal education to-day, if I am not mistaken, is more and more in the direction of enforcing principles and developing the power of applying them. It is our misfortune that we must also dwell so long on the study of the law reports. The time may be well spent where the case shows how the science of jurisprudence may be and has been extended at a single effort by strength of argument and discrimination in judgment. It is to be grudgingly accorded to the mere search for precedent as precedent, or the minute hunt of the antiquary for the random word hastily dropped by some judge of other days, on which abler successors have built up some now acknowledged rule of decision.

When Kent read law in a country office, Grotius and Puffendorf were among the authors most consulted, and Hale's History of the Common Law, Blackstone's Commentaries, and Hume's History of England he made each the subject of an abridgment.³ It is the indefatigable scholar only of whom such things can be expected; but the ordinary man can and must be taught something of public law and constitutional development.

The very fact that most of our American law schools are departments of universities demands this of them. If they belong to a family of scholars, they must do no discredit to their position. The professional school was but slowly welcomed in academic circles. No degrees in the faculty of law were conferred at Yale until nearly twenty years after the organization of her law school; none in divinity until her theological department had been in successful operation for more than forty. Not until last year did Andover Theological Seminary receive the power to grant degrees

¹ 1 and 2 Dallas; Kirby; 1 Root; N. Chipman.

² Memoir and Letters of James Kent, p. 157.

³ Ibid., p. 19.

to its graduates, though it had been a pioneer in theological instruction, and conspicuous in that field throughout the country for three-quarters of a century. No American divinity school, I believe, has yet conferred the doctor's degree in course, though last year the purpose to offer it was announced by one.

There has been a certain feeling among academic scholars that to study a profession was only learning a trade. This sentiment is rapidly disappearing. As the scientific side of the professional course receives greater attention, it is seen to justify itself by the discipline it gives not less than by the knowledge it imparts.

In earlier ages the professional school was an acknowledged seat of learning. The first great university in history, that of Bologna, was but a cluster of professional schools, led and dominated by that of law. They were known as "scholæ majores," in distinction from the "scholæ minores," in which were taught simply the seven liberal arts. Each body of students, associated in the same line of inquiry, was styled a "universitas," and much resembled the "collegium" or "universitas" of Roman society composed of fellow-workers engaged in the same pursuit and incorporated for the advancement of their common welfare. Modern education began when Irnerius, about the opening of the twelfth century, commenced his lectures on the "corpus juris" at Bologna. At Montpellier there arose two schools, in the same century, one of medicine and one of civil and canon law, out of which in the next a university was organized under a papal charter.

The unsystematic texture of the common law was less friendly to its pursuit as a scholastic exercise. The absence of English law schools in modern times left America no guide in this direction. What she has done she has done for herself, slowly, painfully, with hesitating and uncertain step.

Let us frankly confess that during the middle half of this century it was but a cheap education that was offered by the American law school. Harvard, in 1829, sought to raise its standard by requiring five years of study for the bachelor's degree from all who were not graduates of colleges, and three from those who were; but, after a vain struggle of ten years against the tide, the period was reduced to eighteen months.

There were no examinations for entrance, and none for graduation. A nominal course of two years was generally announced, but the studies were commonly so arranged that while the incoming class of every alternate year could follow them in due order from the beginning to the end, the next succeeding class began them in the middle, entering at first on those properly belonging to the second year.

In the days of this ill-ordered scheme of instruction it is no wonder that a legal education was deemed, in academic circles, to be something totally apart from a liberal education. But we of the American bar have a right to insist now that altered conditions shall be recognized and the collegiate system readjusted to meet them. It must be fitted to its environment—the schools to which it sends as well as to the schools from which it draws.

It must seek this for its own sake. It has been the common belief that the number of Americans receiving a collegiate education has steadily decreased when compared to the growth of population.¹ Recent statistics compiled by the Commissioner of Education of the United States disprove this. But they also show that professional and graduate students have multiplied much more rapidly than college students. Of the latter there are now twice as many to each million of our population as in 1872, but of the former there are nearly three times as many.² The country has grown immeasurably in riches since 1872. The losses of the civil war have been repaired. There has been expansion of industrial activity in every direction. Why do so many of our young men pass by the college and flock to professional schools?

¹Bush's History of Higher Education in Massachusetts, p. 19.

²See paper of Hon. William T. Harris, LL. D., on the "Relations of the higher education to the community at large," in Journal of American Social Science Association for 1898.

It is less because they have not the means than because they have not the time which the college demands.

We who are interested in advancing the standard of the professions must seek this readjustment no less for their sake. Less than 20 per cent of our American law students are college graduates. They come to their work unaided by the strenuous discipline and academic spirit which are the peculiar fruit of college life. A reduction of the college course to three years would give its benefits to many of these men, and particularly to those who need it most, I mean the youngest.

Why is this change not made?

Tradition is one of the strongest forces in any system of society which has a long history behind it. Such a tradition has deeply affected the American theory of liberal education. It is that the only liberal education is a general education—an education in universals, with no special purpose in view—and that this can not be given to any one in less than four years' time.

Voltaire, in referring to the great work which had been wrought in the world by Montesquieu's *Esprit des Lois*, said that Man had lost his title deeds, and Montesquieu had found and restored them. Would that some such epoch-making book might come with the coming century, to recover for American youth their long-lost title to be educated for a purpose, to be educated while they are in youth, and as they enter on manhood to enter also on its individual responsibilities, each in his individual career.

The corporations which control our colleges are naturally and properly bodies of slow movement. They are commonly dominated by the president, and he by the policy of his predecessors. Jeremy Bentham said that he did not like boards; they always made fences. Behind their shelter, a blind adherence to traditional policy intrenches itself unseen. It is generally fortified by the sentiment of the older members of the faculty of the institution. Their motto is apt to be "*Quieta non movere.*" Such is the case with regard to the four years' course.

The college, indeed, is essentially a stationary body. The fundamental instruction of youth in every age is much the same. Let me quote from one who has contrasted with that keen faculty of discrimination of which he was so great a master the inherent characteristics of college and university. Cardinal Newman once wrote:

The university is for theology, law, and medicine, for natural history, for physical science, and for the sciences generally, and their promulgation; the college is for the formation of character, intellectual and moral, for the cultivation of the mind, for the improvement of the individual, for the study of literature, for the classics, and those rudimental sciences which strengthen and sharpen the intellect. The university being the element of advance, will fail in making good its ground as it goes; the college from its conservative tendencies will be sure to go back because it does not go forward.¹

Nor is the general current of academic opinion controlled alone by a disrelish for innovations. To surrender senior year, or to turn it into something very different, seems, and perhaps is, a lowering of college aims. These have come to be, in the minds of many of their teachers, to produce great scholars, to develop the best minds to the highest point. They take little satisfaction in the moderate improvement of which the average man or the dull student is susceptible. It is hardly thought worth while to encourage him to come to college at all. "There are many," said a professor of this way of thinking, in one of our largest universities not long since, at a gathering of instructors at which the subject was under discussion, "who enter college that are unfitted by nature to appreciate what it gives. I would not make a college education so cheap that everybody could have it. I would not give a \$10,000 education to a \$500 man."

¹ Historical Sketches, III, p. 228.

There is again, naturally and necessarily, a strong vested interest opposed to any change, to be found in the men whose places a change would endanger.

A three years' college course requires only three-fourths as many teachers as a four years' course. To cut off the superfluous studies means to cut off a corresponding number of superfluous professors or to transfer them to graduate classes. In colleges which form parts of universities such a transfer could be readily effected; but as graduate students in philosophy and the arts are comparatively few, there would be a serious difficulty in meeting the cost of instruction.

Inevitably such a change of system would bring distress to many homes. There would be a weeding out of the least successful; often, too, a lopping off of the most scholarly in the college faculty. Old men who had spent their lives in the service of an institution with which their very being had become identified would be turned adrift, or relegated to distasteful work of elementary instruction.

It is probable, however, that under the system of a three years' course the number of students would be considerably increased, so that its worst consequence to the faculty would be to confine them to a narrower round of intellectual exercise. Many a young man would be willing to face the shorter struggle with poverty whom the added burden of a fourth year, which his instinct tells him is unnecessary, now deters.

The necessity of the readjustment, which has been the subject of this address, has been for fifteen years strongly urged by President Eliot, of Harvard. The average age of graduation from Harvard College had risen by 1883 to 22 years and 7 months.¹ The professional schools of the university were contemplating a prolongation of their courses of study, and the president in his annual report to the corporation indicated his opinion that the college must meet them halfway. In 1886 the medical and law faculties joined in the recommendation that under certain conditions the first year's study in each of these schools might be pursued by a college senior as an equivalent for such branches of collegiate instruction as he might be otherwise required to elect. The corporation referred the matter to the college faculty for their opinion, and four years later that body, not without strong opposition from a large minority, replied that the courses required as a condition of the degree of bachelor of arts might safely be reduced to sixteen. Over fourteen of these are commonly completed by the close of junior year. Four more had been previously prescribed for senior year, and the proposed retrenchment would have cut away half of these, and so put it in the power of the better men to fit themselves within three years for their final examinations.

The corporation agreed to this proposal, but it was defeated the next year by the failure of the board of overseers to concur.

The consideration of this problem has been complicated at Harvard, and is more or less affected everywhere by the gradual extension in recent years of the elective system. If the college student is to study only what he prefers, he ought to be of an age to choose wisely. It would be by no means an unmixed evil if there were a certain retrogression toward the older methods of the fixed curriculum. They came, no doubt, from the day when the college was considered as a higher kind of boarding school, under the personal care of a master, with a common table and general dormitory, and where the pupils were under a strict police supervision and forced even to religious worship by compulsion, but is not the modern American college still conducted on the foundation principle of the academic family, with its daily watch and ward? Do not its first two years still everywhere belong to those who have not yet attained full manhood? If at 21 he can pick his way intelligently, does it follow that he can at 19? The State does not think so, and we of the bar or bench know that the law of infancy needs no justification.

¹ Harvard Graduates' Magazine, I, 53.

At the risk of wearying your patience, let me restate the whole problem and the possible modes of its solution.

Within the past quarter of a century the professional course in the United States has been lengthened by a full year. It was a necessary extension, which must and will be retained.

Within the same period the preparatory school has been forced by additions to the requirements for admission to college to add at least a year to its course of study; thus giving its boys most or all of what they formerly received as college freshmen.

Meanwhile the four years' term for the college course remains unabridged, and the senior class receives instruction mainly in branches formerly taught to resident graduates.

The result is that the average man is nearer 23 than 22 when he receives his bachelor's degree in arts from our oldest universities.

Can it be that the American people will endure the postponement for their sons of the definite work of life, which follows if they can not so much as enter on the practice of a profession before the age of 25 or 26?

I believe that public sentiment justifies and will soon insist on a reduction either of the time now asked from the average student for the college course or of that demanded by the preparatory school. Each of these institutions has been pushed into a position which does not belong to it. The preparatory school should not be occupying the place formerly accorded to freshman year at college. The college senior should not be occupying the place formerly accorded to the resident graduate.

To restore each to its old position would probably be the best solution of the problem. It would serve also to relieve our system of public education from an unnecessary strain. Is it wise, the taxpayer and the sociologist may agree in asking, to offer at the high school the first quarter of a collegiate education to those who for the most part will go no farther? Will it make the boy a better clerk or tradesman, mechanic or farmer—more contented with his life and more able to make the most of it? Or may he find in aspirations awakened only to be unsatisfied, in questions suggested without an answer, and doubts raised which only a fuller training can lay to rest, that "a little learning is a dangerous thing?"

But there are great difficulties in the way of any reduction of the high-school course. It is impossible unless the college yields something, and the college is more likely to yield at the end than at the beginning of its term of study.

It can, with no serious break or surrender of ground, dedicate senior year to graduate work. It can allow its seniors to elect the first-year's studies at a law school in lieu of those of a more strictly academic character. It can, in effect, or it can in form reduce its required years of residence from four to three. It is done already in our leading institutions, by such means of indirection as granting leave of absence to meritorious students for senior year, or allowing them to take the degrees of B.A. and M.A. at the same commencement, or counting their college instruction in law, history, logic, and political science, as equivalent to the first year in a law school or as justifying permission to complete, if they can, the three-years' law course in two years' time.

But these devices are for the benefit of the man of exceptional ability. The welfare of the average man is far more important. The brilliant scholar might wait till 26 or 27 before beginning his professional career, with some hope of bounding at once into a practice that would be the just reward of superior talents. It is the ordinary man whom waiting kills. It is the ordinary man for whose benefit systems of education should be framed. It is his plea that I have sought to put before you to-day.

CHAPTER XI.

THE JUSTIFICATION OF THE PUBLIC HIGH SCHOOL.¹

By H. H. MORGAN, Principal.

I.—TO THOSE WHO HOLD FREE PUBLIC EDUCATION TO BE AN UNJUSTIFIABLE BURDEN UPON THE STATE.

What, then, is the object of education? Undoubtedly the full, complete, and harmonious development of every human faculty. This statement is general, but evidently covers all partial definitions; it furnishes the only valid test of views in regard to general or what is called public education, where the limit is in extent and not in kind, and it shows the fallacy of those who, for the purposes of general education, instead of for the ends of special education, insist upon more or less than the common interests require. To create or to perpetuate caste among the people, whether the caste be of workingmen or of the professions, is, upon the theory and practice of the United States, contrary to the public good. We therefore leave all special training to the benevolence and influence of the private individual. Education does not seek the futile end of equality in wealth, station, or influence; it does not expect, by some subtle process, to change the laws of life. It leads man to recognize (not create) the conditions under which he lives, and by an intelligent recognition move freely and with certainty where now he stumbles blindly; as an animal, he shall know the laws and conditions of his being, so that by compliance with these he shall be free from pain and sickness, and shall be the master and not the slave of his body; as a member of the family or society, he shall comprehend those obligations which form the foundation of his privileges, and consequently move in harmony with the law of the family and of the community. Education, then, is the normal, and therefore harmonious development of all human faculties; the harmony is to be tested as all proportions are tried, by ratio; and that development is harmonious in which "any phase of ability is but a phase of general ability." A man, then, is completely educated when he naturally and readily discharges all of his functions as a human being; an individual is fully educated when he has reached the limit of skill possible to him as an individual; and a man is properly educated in proportion as his instruction leads him toward the full possession of his faculties. What concern, then, has the state in the education of the individual? The answer to this question will vary in form with our conceptions of the state, but however various the forms, the answers must show a substantial agreement.

The state is only an abstract term for the common interests, whether these be centered in one sovereign or be distributed throughout the countless individuals who furnish these common interests. Under a patriarchal form of government, the head of the family becomes an epitome of humanity and looks after every interest of all; under a monarch, the relation is substantially the same; but in a republic, the state

¹ Reprinted from the St. Louis School Report for 1876-77.

is limited to the care of such interests as by the consent of the citizens who collectively form the state are committed to the care of its officers. Rational free will is the basis of American institutions; the citizens, taken collectively, are the sovereign power, and a sovereign can know no compulsion; one of the functions of the state is, therefore, to see that every citizen has open to him the means of ascertaining and of discharging his obligations to his sovereign, and then to exact a rigid accountability; it is to manage all those interests which belong to the community as a community, and whose management can not be trusted to the uncertainties of individual effort.

The American state has an interest in education, because the results of education are essential to the continuance and perpetuity of the state—a necessity perceived even by those governments which disregard the wishes of the governed, but a necessity which can not for a moment be overlooked in a country which in its government aims to reflect the will of its citizens.

The real American state is, then, the will of the whole body of citizens as distinguished from the wishes of any individual, or of any class of individuals; and it is this common will which finds expression in our laws when these are not merely legislative enactments.

For the common good, and as an expression of the common will, it deals with education as at once the right and the necessity of every citizen; it seeks to develop the individual so that he shall be educated as a citizen, and hence contribute most to the common good. The limits of this education are found in the will of the citizens; if these be possessed of the intelligence of the founders of the New England colonies, they will see the supreme interest of education and will limit its extent only by their ability to provide it, and they, like the Pilgrim Fathers, will, by early laying a generous foundation, cause their posterity to wield the influence of the land in which they live; will cause their States to rival Massachusetts in the ability and character of the men and women who determine the standing and influence of the community. If, on the contrary, the citizens narrow public interest to the possession of certain offices and insignia of government, they will cause their community to be noted for ignorance and unthrift, and in spite of any natural advantages will fail to realize their best interests in any direction.

The limit to public education is found in the means and the will of the community which affords it. If the community regards education as a disagreeable but necessary charity, the extent of the education will not be great, and its results will not have high value. If the community looks upon education as a right, but a right to be allowed only within the narrowest limits, its value as an instrumentality in the solution of social problems will be correspondingly small. If the community proposes to do the best by itself, it will place as large a limit as it may in justice to its other interests, and will debate the quality and fitness of the education and not its amount—it will feel that every dollar spent for education is more than a dollar gained to the one who spends it, both in the decreased need for the expenses for other common interests, and in the increased value of every educated citizen. In this country the probable limit, for local communities at least, is the high school, and no community which can afford it deprives itself of this auxiliary to the district school.

The question of a high school may be considered by three classes of citizens. (1) Those who are indifferent to education in itself, and consent to public education only because it is a sociological need. (2) Those who believe in education by itself, but who look upon public education as a gift and not as a right. (3) Those who believe in education as a right as well as a political necessity.

To the first class (those who regard only the political need), the defense of a high school must rest upon the superior economy of a system of schools which includes a high school. It can be shown that equal efficiency can be secured with less expense by this organization than by a system of schools which omits this auxiliary.

A high school will in this light become an economical device. Its claims will

readily be acknowledged by all who can understand that it is always cheap to spend \$100 in one direction if by so doing one can save an otherwise necessary outgo of \$150. The method of substantiating such a statement is twofold: first, to show that from the nature of the case the claim is valid; second, by showing that in actual working the mismanagement of the unskillful does not vitiate this claim. From the nature of the case, we all know that the modern discovery called the division of labor has decreased the expense while increasing the efficiency of the work to be done; we all know that the extent to which this division is to go is determined solely by the amount of work to be done and the superior economy of distributing the labor. In a large dry goods business it is found by experience, as well as by calculation, that the work can be handled most efficiently and at the least expense by employing relatively few superior men who shall be able to use to advantage cheaper labor. If the bookkeeping should require the constant services of five men, whose average salary was \$1,500, that the work would be more efficiently and more cheaply done by employing one superior man at a salary of \$2,500, and by allowing him four ordinary clerks at salaries of \$1,000. The whole order of business depends upon the axiom that a good head can use many hands more deftly and with less expense than many hands can work without a head. In all well organized business, therefore, the party most directly interested has merely to see to it that his subdivisions are not excessive, and that in each department the head and the hands are to justify their existence by turning out the best results at the least expense.

Upon this principle rests the various grades among school officers. First, the superintendent—the head of the whole organization; second, the principals of the various grades; third, the teachers other than principals. Upon this idea, known by experience to be a sound one, rests the grading in schools. As a matter of economy, as well as of efficiency, it is found expedient to classify the work to be done. Hence, in the public schools, where the number of pupils is so large as to justify classification, the authorities begin by creating the primary grade, and in the least advanced communities extend this grading through what would be the sixth or seventh grade of the St. Louis district schools. The limit is determined by the number of scholars, and this in turn by the size and progressiveness of the community. Whether the various grades are collected in one building, or whether, as in our own city, we have two or more classes of schoolhouses, is to be determined solely by the question of convenience and economy. In a small town, whose population justifies only a public school, instead of public schools, the small number of pupils may compel one man to be superintendent, principal of the high school, principal of the normal school, principal of the grammar school, and teacher in each of the grades below the highest. Still, even in this case, a modicum of the full school work is to be done as well as the circumstances will admit. The same thing is true of our private schools, in which the number of pupils is so small that, at their best estate, the classes are put under different teachers in the different grades, but range from the primary scholar to the college student.

The application to our subject then lies here: Is there a sufficiency of high-school work to justify the existence of such a grade? The answer lies in the statistics annually presented through the reports of the board of public schools.

But the objector may say, "I do not question the existence of a sufficient number to justify the existence of the grade, but I do not see why the work should be done at all." This objection might be urged alike by those who consider public education merely as a political need, and by those who regard public education as a gift. It will thus be necessary to reply to the objection here, and to refer to the reply when considering the views of the second class.

The answer to those who doubt the necessity of the work, must be a presentation of this necessity. This necessity, briefly stated, is that a high school exerts upon the grammar school a leverage which could not be obtained so economically by any

other instrumentality, and which without the grammar schools therefore becomes a less defensible expense. It will be admitted that in proportion as the grammar schools do efficiently whatever work the community thinks proper to have them attempt, that they have their validity, and hence, that in so far as they are inefficient, no matter how small their cost, they must become an extravagance, inasmuch as extravagance is waste and not necessary expenditure. The question then turns upon the same argument of increasing the efficiency (not the variety) of the work, while decreasing the total expense. The argument must be as before, that the leverage gained by a high school grade is necessary for the load to be lifted and not for the employment of the lever; that the grammar school demands a high school, and not that a high school requires the grammar school; that the grammar schools determine the necessity for a high school, and not that a high school needs the grammar school; that a high school exists for the grammar schools, and not that the grammar schools exist for a high school.

This leverage can be shown in several ways: First, it is evident that, for a large number of schools, it is cheaper and more wise to recognize the business truth of the division of labor, and to employ as few as possible of the highest grade. To illustrate, it is cheaper and more effective to have one principal and many assistants, than to have several principals; it is cheaper and more effective to have relatively few "first grade" schools, and to let the increase be in the "lower grades" of the system. All this is readily recognized in the grades below that of a high school, and no one has been found to object to a classification which is its own defense. But the same principle applies to a high-school grade which enables one to employ less expensive aid than if the amount of money expended upon the high-school grade was distributed throughout the other grades, for without a principal in the grammar schools, his special abilities must be procured at greater expense through the grades now under his charge; without a superintendent, the work must be done at a larger expense by the principals, and without a high school the work in which cooperation is now possible, must be done at a greater expense and less efficiently by the rest of the organization.

As a matter of practical experience, it has been found in communities that the work was improved in quality, and that it cost less with a high-school course than without it, despite the fact that misconception of the true office and relation of a high school have in many cases led to a mismanagement which prevents our seeing the results in their clearest light.

II.—TO THOSE WHO BELIEVE IN EDUCATION AS A GIFT AND NOT AS A RIGHT.

To these what has been said to the objectors of the first class applies in so far as the gift is made reluctantly. But the gift basis is untenable by any who study those peculiarities of the United States to which we owe any advantages that we have as distinguished from the peoples of other countries as favorably situated with reference to natural resources. The cardinal doctrine of the United States is the recognition of all taken together as the people; the abrogation of the laws of primogeniture, the destruction of all castes except such as naturally arise socially. As a State, we know no rich, no poor; no cultivated, no coarse; no white, no black; no native-born, no foreign-born; no strong, no weak; we know only citizens—good citizens who support the public weal, bad citizens who seek their personal advantage at public expense. As a State, we expect every man to know and perform his civil obligations, and refuse to accept ignorance as an excuse. As a State, we hold that all citizens are entitled to a voice, and that this united opinion shall stand as the will of the State in opposition to the opinions of any class. As a State, we hold that these citizens, who are the true people, shall determine what they consider the common interests, and shall have these administered by the State which is intrusted with these common interests. As a State, we have decided that the common interests demand the free development of

each citizen, and that each one shall contend against his individual disadvantages, but that he shall have no artificial burden of civil disabilities. Be he who he may, he must contend against the greed, selfishness, envy, and prejudices of his fellow-men; but he shall receive from the community only encouragement to better his circumstances and elevate his character. If he meet with the highest success he shall find no barriers in society, but after he has accomplished the arduous task of raising himself from a rail-splitter to the Presidential chair, he shall be received for what he is and not for what he was. The hundred years through which we as a country have lived will satisfy any earnest and honest inquirer that, despite the forebodings which always accompany any change; despite the doubts which seem to oppress many as to the future of our country; despite the disadvantages of the prejudices which enfeebled the efforts even of those who have wrought all that has been accomplished, we have every evidence that the path selected leads to the goal which we would obtain.

We are of those who feel satisfied that our wealthy, or prominent, or useful citizens are such only in virtue of the free activity which our State not only permits but encourages. We see clearly, that but for this freedom of development, and but for the wider intelligence which is due to the attempt to exact from each citizen a clearer sense of his duties, responsibilities, and opportunities, a greater capacity for a self-creating activity—our prominent men would now lack those qualities which make them prominent. We must see with equal clearness that but for the inducements for emigration, our ancestors would have remained in the place from which they came, and as their descendants would have lost our four or five generations of traceable ancestry, and have been occupied with the humble employments that marked our real forefathers. We must see that the advantages which we enjoy are due to the free activity which has arisen in all countries through commerce, and in our own, much more largely from its recognition as a cardinal truth. Hence, those who look upon public education as a gift from the rich to the poor forget that from which their wealth has sprung, as well as its only secure foundation. The increase of wealth in Missouri has accompanied the increase of intelligent activity; a period no longer than my own life has been long enough for the transformation of a town of from 34,140 inhabitants (with an aggregate of taxable wealth reported at \$940,000) to one of the largest cities in the Union, with an aggregate of wealth reported to the assessor at \$168,000,000.

This wealth has arisen from the activity of those who in the beginning had no wealth. Any old St. Louisian knows the history of the fortunes possessed by "our oldest families." It is the increase of an intelligent activity that has, within the last few years, inaugurated manufactures which represent \$48,387,150 of capital and \$158,761,013 of production. It is this same activity that has made St. Louis measurably desirable as a place of living and laboring to the many who have come hither from other places; and it is to the wants created by their coming that those who are to the manner born owe the increased valuation of their property, as well as an increase in the aggregate wealth of the community. But to secure any such results it is plainly and absolutely necessary that independence, self-help, and manhood should be developed at all costs. The development of these qualities is inconsistent with the idea of charity, and the condition of the South, of which I am a loyal son, proves, during its long history, the truth of my statement.

III.—TO THOSE WHO BELIEVE IN EDUCATION AS A RIGHT.

In answer to those who look upon education as a mere sociological necessity, I have endeavored to show the superior economy of a graded system over an ungraded system, and the reasons why the grading should extend through a high-school course.

To those who regard education as a gift, I have replied by endeavoring to expose the fallacy of such a belief, so that without any appeal to their generosity they should

pass over into the third class, and should gauge the limits of this education, not by their charitableness, but by the extent to which the right could be asserted.

There remains then the consideration of the claims of a high school upon those who regard education as a civil right, but wish to have it properly related to other civil rights and to see its limits, as these are determined by the nature of the right, and not by partial and unintelligent legislation. To this class apply all the arguments already adduced in substantiating the claims of a high school upon the two classes already considered; but in addition there are other considerations which must be here represented:

The political necessity—crime, caste, creative ability.

The reciprocal duties of the citizen and the community.

The sufficiency of the education as determined by these considerations.

The ability and willingness of the community to see and to attain its own best ends.

The progress of the city of St. Louis is indicated by the following statistics:

Taxable property:

1864	\$70,000,000
1870	160,000,000
1877	168,000,000

Manufactures:

1860	12,733,948
1870	48,387,150

Products:

1860	27,610,070
1870	158,761,013

Increase, 29.6 per cent per annum.

Population:

1844	34,140
1850	74,439
1860	160,773
1870	310,963
1877 (probably)	483,055

Rate in increase, 1870 to 1876, 12 per cent.

The political necessity for public education arises not only from the inability of those of us who are poor; the community seeks through the instrumentality of education, not only to decrease crime, but also to abolish caste, by allowing the distinctions of society to determine themselves, and to call forth all the ability of our people, instead of being content with the efforts of those who, as individuals, find the stimulus and the means already provided for them. The political necessity takes no account of the humanitarian element, but considers solely the best and most economical administration of the common interests intrusted to the charge of the State. It sees with increasing clearness that a State prospers in proportion to its creative ability, and not in proportion to its population, natural resources, or even the oriental luxury of its money kings. It sees that it is better for the common good that every citizen should have the comforts of life, and the intelligence to seek after these, than that some individual should control the revenues of a whole kingdom; it welcomes skilled laborers as immigrants, not because these can be serviceable to the merchant princes, but because as these laborers have advanced sufficiently far to be stimulated to seek higher prizes it is sure of renewed efforts to secure a more general and a greater prosperity, not only in material resources but in that higher life which alone makes these resources valuable to any community. Hence, in the common interest, and not from humanitarian motives, the State throws such influence as the citizens endow it with towards the promotion of all that leads towards the ends for which alone it

exists. As a State it is satisfied that it is at once cheaper and more useful to discourage crime than to punish it; that it is vital that caste should be confined to society and excluded from public interests; that creative ability should be stimulated, and neither discouraged nor merely ignored.

IV.—THE RECIPROCAL DUTY OF THE CITIZEN AND STATE.

The State, as has been fully set forth, is not a crystallized and unchangeable somewhat, but it is the reflection of the will of all the people who as citizens compose it. Hence the State, like the individuals who compose it, is progressive and must continuously adapt itself to the varying needs of its citizens. We claim for our State governments this quality of perfect flexibility, and we feel its value when we contrast the results of our civil troubles with the far greater destruction which these work under the governments of Europe. Hence it is the business of each citizen to impress his views upon the public to which he belongs in order that the public opinion, as expressed by the State, shall more and more truly represent the best intelligence of the community. In this way the citizen and the State are engaged in a constant interchange, and while the functions of the State can never change, and while the field for the exercise of these functions will always be limited to the common interests, yet the functions of the State will be more clearly defined for those who represent the State, while, at the same time, the individual will be compelled to assume higher and higher responsibilities. Hence we are constantly engaged in committing to individual enterprise those interests which the community regards as individual, while as constantly we impose upon the State the charge of such common interests as we find injured by the ignorance, selfishness, or neglect of individuals.

It is in this way that the individual returns a thousandfold the benefits received through the State by increasing the security and the welfare of the State through whose instrumentality he has prospered. This is the ground for the labors of all public-spirited men, whether they invent ironclads, build bridges, make jetties; whether they conduct foundries, and take a prominent part in every business enterprise which requires ability and capital, and which is to inure to the benefit of themselves and the community instead of themselves in distinction from the community; or whether remote from these enterprises they lend ready sympathy and material aid to all that civilizes, beautifies, and strengthens the community in which they live. Fortunately for us the number of these valuable citizens is increasing, and, even where as individuals they enjoy no universal fame, they can see from day to day the results of their labors in the rapid improvement of the community where their lives are passed.

But every one knows that unless he goes far enough to secure success his capital of time, labor, and money is wasted. Hence the consideration of the sufficiency of the education for the end proposed.

Throughout this discussion we must, if we would reach any sound conclusions, carefully guard against confounding the question of a high school with any prescribed course of study; in considering the sufficiency of education, we must more particularly distinguish between an education in quality and our views as to the particular branches best calculated to insure this sufficiency.

The sufficiency of education must be determined by the previous considerations of political necessity and reciprocity of duty between the citizen and the State, modified by the next and last consideration—the ability of the community to attain what it may desire.

A prevalent view is, that because in times past the “three R’s” constituted all elementary instruction therefore any education which occupied itself with these would be sufficient. To suppose this is, however, to close our eyes to the changes which have been wrought in the world, and to lose entirely the significance of such portions of our history as form the most constant theme of our conversation. The

increased material prosperity which has sprung from the free development of creative activity has changed the conditions of our life, and with the changed conditions has come a change in the needs of education as well as in all of the other institutions of society. Men see that in all true progress in manufacturing, the learned professions, and even theology, we need constant readjustment, but many seem to draw an arbitrary line separating education from these other interests. It must be remembered that as the individuals change, so do they modify all those institutions which are but the expressions of their will. Hence the reasonableness of an objection against any education which, however suitable to times past, is out of relation with times present. Owing to the diffusion of intelligence, and more especially to its application to machinery, skill is now becoming as essential as knowledge was in the times of our fathers. Whether with Cardinal Wiseman we dream of converting the artist into an artisan, or desire with many to secure to our children the ability and desire of earning a living and of contributing to the increase of accumulated wealth, whether this be spiritual or material; or if we take the standpoint of the so-called workingman, and desire a fair day's wages for a fair day's work; or desire to reduce the number of "clerks" (using the word technically, as it is employed by our discourses upon political economy); or desire to see each man reach his fullest development; in all these cases, and in all others that may be stated, we are called upon to face the fact that times have changed and that we must change with them. The education which fifty years ago would have been generous no longer fits a man for the contests of life. The whole movement of physical science and the applied and mechanical sciences is toward a point at which the unskilled workman must disappear.

We frequently meet the suggestion that prominent men of the past were provided with but a scanty education preparatory to a useful influential life, and we do not reflect, as we should, that prominence is merely relative. If these men so distinguished in our histories, as revered in our memories, could be fairly brought into relation with our own times they would possibly lose much of their preeminence. Within our own knowledge many men of prominence in the generations just back of us need perspective for the preservation of their traditional abilities. Therefore we must inquire in regard to the education which we furnish, as to its sufficiency for the objects which justify its mere existence. Those who regard education as a right will admit that the right is valueless unless sufficiently extensive to pay for its assertion. It is upon this idea that communities have proceeded, even if unconsciously, in demanding home education for home talent whenever it existed to an extent sufficient to justify its development. Hence, in public schools, regarded as the people's schools (and carefully distinguishing the true people from the people of the demagogue, and with equal care from the people of the believer in political caste), it is reasonable, and indeed imperatively necessary, that a sufficiency of education should be furnished, notwithstanding the fact that many will, from the necessities of their individual life, be unable to avail themselves of these advantages. That the grammar-school course is under any circumstances insufficient to accomplish the only object of our supporting education at all, will be manifest whether we consider the needs of the many who do avail themselves of a more extended course, the prevention of caste by avoiding the exclusion of any but poor people, the want of intelligence and skill against which we are daily contending, and of which complaint is daily heard in every industry in the community; the narrowness and political imbecility of many so-called intelligent citizens; or the actual results of the products of public education before and since the extension of the course. It is materially of advantage to sustain any reasonable expense for the education of home talent at home. First, because even the money spent by the well-to-do is expended away from home. Second, because it is unprofitable to import workingmen so long as we have a sufficiently large population for which we must provide, and for which we can provide most economically and most satisfactorily, by transferring them from

the ranks of careless and incompetent citizens to the class of self-respecting men, capable and desirous of providing for themselves. In the second place a community gains more wealth in proportion to the number who are able and willing to labor for its acquisition. In the third place, a land is not prospered even materially by the neglect of those other human interests which, while perhaps no more necessary, are of no less importance. Many of those who read these words have spent years working for those changes which we see in the community, and while the return is great, in consideration of the workers, it is so small that to-day Missouri has neither the reputation nor influence which is exerted by the smaller, more intelligent community of Massachusetts, which has had no larger opportunities. Can not, however, this work be done by private schools? Let the past history of Missouri reply, and while to-day there are among our private schools those which do honor to the cause of education, yet it could easily be shown that they owe much of their success to the competition excited by our public schools.

The limit in our community seems to be the high school; partly, because we have not yet reached the point where the opportunities for a higher education are desired by the community; partly because a high school of the present day is about a fair equivalent for the district school course of twenty-five or fifty years ago; partly because we feel poorer than we are; and partly because the many have had the problem of public education presented in a form distorted by undue enthusiasm, by ignorant conservatism, or in combination with interests political or other which tend to prevent a fair consideration. Finally those who believe in education as a need, or as a civil right, and who may assent to all or many of the positions already stated, may inquire as to a limit of this education which shall prevent the error of extravagance while avoiding the stupidity and wrong of parsimony. This limit, stated in general terms, arises from the pecuniary means and political clearness of such a community.

But we must remember that our means have increased together with our needs, and that the disciplinary value of the schools assumes a vast significance in view of the immense population of our city—the consequent growth of social disparity in the community; that we must accept a rational tax in the same spirit that those who own no real property pay for the fire department, the making of streets, etc.

V.—SYLLABUS OF ARGUMENTS IN ANNUAL REPORTS.

For those who desire to pursue this subject further, and to avoid the necessity of repeating anything heretofore published in our annual reports, I add the following references to arguments and historical information in former reports:

1854.

1. Sustaining the reputation of the schools.
2. Infusing greater uniformity in the system and method of discipline and administration.
3. Furnish an annual supply of teachers.
4. Pupils not to be put into the high schools while they can advantageously pursue their studies in the district schools.

1843.

Establishment of a high school recommended. Committee: A. Renard, Edward Jones, B. B. Brown, and Elijah Hayden.

1853.

High school lot purchased and a high school decided upon by the board of public schools.

Opened in Benton school February, 1853—removed to the high school building January, 1856.

1860.

1. Good English education.
2. Classical preparation for such as elect.

1864.

1. Insufficiency of the course of education without high school.
2. Bringing together of the most advanced scholars.
3. Experience of other cities.

EXPERIENCE OF ST. LOUIS.

1. Increasing favor.
2. Healthful and stimulating influence upon district schools in inciting to industry and perseverance—each class gauges itself by the one above. (Pupils in highest classes formerly found to become indifferent as they approached “the completion of their education.”)
3. Opportunities for the poor.
4. Dignifies, popularizes, and renders conspicuous and influential the district schools, and contributes in no small degree to make the reputation which St. Louis enjoys for educational advantages, and is the just pride of those citizens who established and have supported it.

1867.

1. Value not confined to its intrinsic merits, but it becomes the goal, etc.
2. Both indicates and encourages a high standard of education in the public mind.
3. Its graduates staunch friends of liberal culture and advanced learning.

1868.

Admitting for argument that the office of public education is to furnish a course of instruction in the common branches, the high school is sufficiently defended by its influence upon the district schools, furnishing a standard by which are measured the results of their tuition.

1869.

Unites the scattered schools into one organization—through one high school each school acts upon all the others.

1871.

“Our National idea of freedom is here to be realized only by means of productive industry. The creation of wealth is its immediate object. Hence the end and aim is first to secure the possibility of wealth to each and every individual in the nation. The directive power of the country is absorbed in subjugating nature. But for this purpose intelligent skill is demanded. Hence the laborer must be educated. Since there is to be, for all, the possibility of wealth, all must be educated. In this statement it seems that we have inverted means and end. For one would suppose that rational intelligence were of more importance than mere wealth. But in fact, people ask the practical question, ‘What is the use of this or that branch of study?’ and not ‘what culture does it bring.’ On the other hand if we look on another side of the subject we see that there is a great positive value to the position taken, even though it is materialistic. It has been the tendency of industry in former ages and countries to degrade the laborer into a machine. It is clearly the tendency of our civilization to elevate the laborer to a directive power and to emancipate him from the drudgery of labor by the aid of invented machinery. Thus, formerly, the human laborer was rendered half-brute; now the rude powers of nature are utilized and rendered half-human. All this is possible only by means of education of human intelligence. Thus even in the grossest and most materialistic view of our civilization

there is a deep rational purpose, and the selfishness of man builds wiser than it knows; it is overruled by a deeper wisdom.

In defining the functions of education as it is made to exist by society in the form of public schools, its twofold character becomes obvious. If a man is to assume a position of higher directive power; if he is to live in a State where he governs himself, and engage in some useful sphere of industry wherein he makes his brain save his hands, letting the rude forces of nature do the work he marks out for them, it is clear that above all things his education must be a training of the will. Is it not a notable fact that American public schools always lay more stress on discipline than on the speedy acquirement of knowledge? The utmost energy of the teacher is expended in securing from all his pupils the formation of correct habits. Industry, punctuality, regularity, respect for the rights of others—these are the cardinal virtues of the schoolroom, and are the foundation of its order. ‘Order is Heaven’s first law’—this is the maxim of the schoolroom in America. The reason is plain—in our society and government we aim to place as few safeguards as possible around the individual from without, and therefore our system of education must make the character strong and self-determining from within. The individual who shall be called upon for directive power, must first learn self-direction. How can we trust the engineer on the train if he has not a thorough character for regularity and punctuality? Without these, a collision is inevitable. So it is with all direction of machines, and what labor is not performed by machines now? Industry, regularity and punctuality, are the indispensable culture for it. So in the higher realms of directive power; in the control of institutions and in civil governments, such self-culture, courtesy, and obedience to rule as the school engenders, is absolutely essential to success. It may be obtained elsewhere and subsequently, but there is no place where it is so well learned as at school. The acquirement of knowledge is subsidiary to this discipline; at least such is the theory and practice of American schools. It is not strange to find the instruction degenerating into a mechanical routine under the too preponderant influence of the strict discipline. This evil gives us more trouble now than all others. Under the strict tension of the will, the mind is not so receptive of knowledge; it is always prone to become merely formal—a parrot repetition. But the rational purpose of the great stress laid upon discipline in our schools is obvious. Under a monarchical form of government, where external limits are everywhere found for the individual in society; where he is not to be called upon for independent self-direction, it is naturally to be expected that less stress is laid upon discipline in the schoolroom; it follows accordingly that the acquirement of knowledge proceeds there in a more genial and natural manner.”—Report for 1870–71.

1873.

“The publication in the appendix of the catalogue of pupils who have attended the high school since its foundation affords an excellent opportunity for the verification of the statement, often made, to the effect that the high school returns to the community, in the shape of valuable, educated, directive power, far more than an equivalent of its cost.”—J. Cheever, 1872–73.

“The same zeal which has challenged the methods and subjects of the common schools, has with still more emphasis challenged the higher education in our colleges and universities.”

“The discussion widens its scope and extends to many other phases not originally called into question, not only the proper course of study for the public schools, but their right to exist on appropriations from the public treasury. Especially with reference to the public high school, the discussion is a warm one. Teachers and directors of public-school systems, have become suddenly aware that there may be an ‘irrepressible conflict’ between the system of public and that of private instruc-

tion. It is somewhat startling to learn that there are two systems firmly established in our land confronting each other with radically different theories as to a proper course of study. Such hostility could not but develop sooner or later into an open contest. Now that the general attention is directed to education as an element of national and social strength we can no longer avoid a discussion of these differences and of the theories on which they are based. The peaceful victory of industries at Paris, London, and Vienna, and the colossal victories of Prussian arms at Sadowa and Sedan, have aroused statesmen and political economists to the study of public education as essential to national strength in productive industry, and in the field of battle as well. What this education should be, how far it should be carried, whether compulsory or not, whether there should be a different course of education adapted to the supposed destinies of the pupils—these and other kindred questions must be discussed in the light of fundamental principles. On the one hand it is contended, in the interest of productive industry, that the public schools, being for the masses who are destined to fill the ranks of common laborers, should give a semitechnical education and avoid the purely disciplinary studies. The latter should be reserved for private academies and preparatory schools founded by private enterprise and open to such of the community as can afford to patronize them. The higher education in this country conducted in its colleges and universities should, according to this view, have no organic relation whatever to the public-school system, but only to the system of preparatory schools and academies supported by private wealth. That the effect of such a state of affairs is to injure the cause of education in general, who can doubt, when he reflects that such isolation must have the effect of arraying the supporters of the public schools, and those who have received the primary education given in them, against the supporter of higher education and against the class who have received it. For it will result that those who receive a higher education will have been, during their whole course, in a system of schools founded on a basis different from the public schools, having a different course of study and supported in a radically different manner. That the graduates of higher institutions should, under these circumstances, be in sympathy with public-school education is impossible. The public schools would necessarily be the schools of a caste—of the proletariat—the class whose chief organ is the hand, and whose brains are educated solely to serve the hand better. The very persons themselves are called ‘hands’ appropriately. In this country, with its boundless possibilities, living as we do largely upon our hopes, conscious of a rapid development in the past, and of great prospects in the future, with a national history whose biographical side is the story of ‘self-made men,’ aspiration is the leading characteristic of the people, and the poorest immigrant here soon kindles with its impulse, and while he endeavors by thrift to accumulate a fortune, he prepares for its perpetuity by educating his children. There is nothing more favorable in the character of the foreigner newly arrived on our shores than this, that he is everywhere eager to avail himself of the school privileges. To the self-respect born of aspiration, what greater shock can be offered than the establishment of caste schools? Public schools founded especially for the industrial class, to the end that its children being born from ‘hands’ shall be ‘hands’ still and shall not mingle with the children of the wealthy, or with those of the liberally educated. Such discrimination leads the laborer to refuse all school education unless he can afford to pay for it in the private school, to the complete degradation of the public schools. On the one hand, those who have received higher education have been nurtured in an atmosphere of contempt for the free schools of the laboring classes; on the other hand, the laboring classes themselves despise the symbol of their inferiority and the institution designed to make their inferiority hereditary.

“In all times nations have recognized the necessity of educating their directive intelligence. Those who are to rule are carefully educated for this purpose. Public money

has never been grudged for the education of the governing classes. So soon as a State has found that its national strength depended on the education of a special class, that class has at once been provided for. The immense sums recently expended in the various countries of Europe for industrial education, show that statesmanship has at last found out that political prosperity depends upon the prosperity of the civil community. In our comparatively new experiment of 'a government of the people, by the people, and for the people,' to educate the ruling class means to educate all the people."—From Report for 1872-73.

"The high school is, in conjunction with other institutions of higher learning, supposed theoretically to educate directive intelligence for the community at large. That the youth of our city have a right to this education, when with it they can rise to positions of responsibility and honor, as well or better than the people born and educated abroad, whom we must import and retain at large salaries, in case of a deficient native supply, is the conviction of a majority of our people."

"The large number of classes required for the occupations of the boys seems to indicate the superiority of a general education over a course of study limited to the branches required in a few special trades or employments."—From Report for 1872-73.

1874.

Change of life (caused by machinery, etc.,) has compelled a broader education.

VI.—VARIOUS OBJECTIONS ANSWERED.

I. What was intended by the laws under which the common schools were founded.

Answer.—It is within the knowledge of everyone that laws change with our sense of need, and that we should not in education, any more than in any other interest, bind ourselves to never mean more or less than our ancestors.

II. Excessive rivalry between communities, bringing with it extravagant management.

Answer.—To correct the management by cutting off the extravagance and not by crippling the organization.

III. The great expense attending the high-school system.

Answer.—This expense in St. Louis is actually quite small when the number in high-school studies is considered.

IV. The few are prepared for college at the expense of the many.

Answer.—Were this true the few might repay the many, but any examination of the facts would show that only a small per cent of the boys go to college; that this objection ignores the girls, and that an examination of a catalogue, presented in the annual report of 1874, would satisfy anyone that the objection was imaginary.

V. That these are schools for the rich paid for by the poor.

VI. That these are schools for the poor paid for by the rich.

Answer.—This, again, is a question of fact to be determined by an examination of the annual registers.

Any fair dealing with this question will discover that the great majority of pupils represent the children of widows (not rich widows), moderately successful working-men, clerks whose families are too large to admit of proper education under any other circumstances, and, in brief, of people in very moderate circumstances; while, on the other hand, the remainder represent the children of those who might pay for tuition, but who do pay in taxes, so far as the community pays, and who do not believe in separating, by education, their children from the great mass of people in humbler circumstances. Those who believe in a social aristocracy would not demean themselves by allowing their children to mix with the mass which forms the true wealth of the people; those who are so poor that they can not spare the aid of their children and can not avail themselves of the privileges of a good English education, on the other hand, are not much weighed upon by exorbitant taxes. A third class not found

in public schools comprises those children who for any reason need special courses of study, and who therefore necessarily seek private schools, for it must be remembered that in St. Louis, at least, the public schools have always been the people's in the only reasonable use of the word people.

VII. The State ought to put each one in possession of the keys of knowledge; but why should the State tax the Commonwealth to make some men doctors, preachers, etc.?

Answer.—(1) What are the keys of knowledge? Does one become an intelligent voter by learning to write his name, or do we find that this preparation is no longer sufficient? (2) If the three R's are still the keys of knowledge, is their use learned as inexpensively or as effectively without a high school? (3) Is it of no political consequence that the socially successful should not be allowed to dispose of the lives and interests of the less successful? (4) Is it of no consequence that our view should be something more than the selfish or ignorant presentations frequently made by those from whose social position we might expect better things? (5) Does the Commonwealth through a high school make doctors, etc., or does any regard for its history tell a different story?

VIII. "The Workingmen's Catechism."—Are you in favor of a more liberal education in the district schools, inasmuch as so small a percentage enters the high school?

Answer. No, for precisely the reason stated, as it would increase the expense and diminish the returns.

IX. The poorer classes (laborers, draymen, etc.), not using the high school to so large an extent as they do the district schools, they should be relieved of the expense.

Answer. (1) They are relieved of the expense in the same proportion as they relieve themselves of their privileges. (2) The laborers, etc., are not all poor, nor do they constitute the poorer class; clerks, small merchants, steamboat men, teachers, doctors, and ministers also have a reasonable portion of poverty, and their intellectual needs are entitled to some consideration. (3) The argument against caste bears strongly against the creation of a laboring class instead of a class that labors, and those who see the best interests alike of the laborer and of the community are constantly trying to teach all to labor and thus to secure that freedom of movement without which no laborer would be rich—without which the rich would monopolize wealth, and the poor be condemned to eternal poverty—without which the poorer classes would constantly be recruited from those who were crowded out from the class of the rich.

X. Objections to the studies pursued. Objection not affecting the organization, and to be discussed as a separate issue.

XI. Exceeds the rational limit of State education because it is not a necessity.

Answer. Its necessity to the organization for cheapness and efficiency; to the community for community uses.

XII. Creates distaste for hard work.

Answer. Contradicted by the facts in the case.

XIII. Common schools. Poor schools and the high school is an extravagance.

1. Who are the poor that will accept them in this light?

2. State the actual cost.

XIV. Incapacitate them from learning a trade.

Answer. (1) Make a distinction between everybody going to the high school and relatively few going there. (2) Remember that disinclination and incapacity for trades did not begin or increase with higher education. (3) Bear in mind that there exist those who with no less aforethought do not consider their opening to lie in a trade. (4) Note the trade unions and strikes, not because from the insufficiency of the supply the few secure a monopoly, but because the trades are as much overdone as the professions.

CHAPTER XII.

FREE HIGH SCHOOLS FOR RURAL PUPILS.¹

By HENRY R. CORBETT,

Professor in the University of Chicago.

Huxley's famous ideal of the free school system, a ladder from gutter to university, has come near to realization in most of our American States. The free school's triumph over the fee school is all but universal; and we tell with just pride how even the child of poverty can make his way to the highest places in scholarship. But one part of the ladder still remains defective, and for rural communities absent altogether.

The American free school system offers to practically all the people everywhere free instruction for children in the elementary grades. If the people are fortunate enough to live in cities or villages, their children have also free instruction in the secondary grades, since in all sections of the country free high schools are maintained in and for the cities. But the free school opportunities of the country boy and girl have generally come to an abrupt end with the elementary course. True, the State universities have offered them college instruction if they could somehow climb over the gap between the grammar school and the college.

One by one the remaining imperfections in our free school system come up for consideration and remedy. In their turn, we Americans attack our public problems in what seems to us the order of their importance and need. To some of us this question of secondary education for rural pupils has seemed to wait beyond its rightful time. But its hour has struck at last, and it is safe to say that few questions of educational administration have been receiving more general attention than this one, within the last few years. This attention has, however, been given with but little ostentation; and it will not be strange if some should express surprise to hear it ranked among the prominent educational problems of the day. Each State seems to have attacked the problem in its own way and with little regard to what other States were doing. The movement has received its impetus less from the great educators of the nation than from the teachers and people of the several States. Thus, almost unknown to each other, impelled by inward conditions rather than by theories impressed from without, a dozen States have been seeking some way to fill in for their rural pupils the high-school rounds of the free-school ladder.

Eleven years ago, in the council of the National Educational Association, there was presented and discussed a valuable report upon the opportunities of the rural population for higher education. The report bore most directly, of course, upon college preparation, and took the form of an argument for county high schools. A great deal of valuable information was collected bearing upon the conditions at that time

¹Under this heading, Professor Corbett published in the *School Review* (Chicago) of April and May, 1900, a series of articles which deserve general attention. They are here reproduced with minor changes and a few omissions.

in the different States. That inquiry and report no doubt had its influence in bringing about the present remarkable interest in the problem before us.

The time has certainly come for a thorough study of the present status of this movement. The editor of the *School Review* has invited the writer to undertake on behalf of this journal an investigation of the conditions prevailing in the different States in reference to this matter at the close of the century. To this inquiry the present article may be considered a prefatory statement. A brief preliminary survey of the subject at this time will no doubt interest many readers, and perhaps facilitate their cooperation in the fuller investigation contemplated.

Quite various are the plans adopted or advocated in different States. I shall undertake to describe briefly the more important and typical.

1. *Union high schools*, maintained jointly by neighboring rural districts, often with transportation of pupils at public cost. The districts thus uniting for high-school purposes may be either a group of country districts only, or a village district with several adjacent country districts. A number of States have laws authorizing such union high schools, and localities adopting them have been greatly benefited; but the total territory thus organized is so small a part of such States as to make this plan alone seem inadequate to meet the great general demand for free rural secondary education. There seems to be no reason, however, why this plan should not be authorized and encouraged by every State for localities which prefer it.

2. *Township and high schools*.—States in which the township is the unit for taxation and school purposes are gradually adopting laws permitting townships to establish high schools at convenient central locations. This plan is essentially a form of the preceding, and the remarks made in that connection apply here. An interesting variation of this plan contemplates the sale of all the school sites and houses in the township and the establishment of a central graded school, including a high school, with provision for the transportation of pupils at public expense.

An admirable investigation and report on the transportation of rural pupils at public expense has recently been made by Prof. A. A. Upham, of the State Normal School, Whitewater, Wis. It has been printed as a bulletin of information by the State superintendent of Wisconsin, from whom it can no doubt be obtained. Professor Upham's summary is as follows:

From the reports, both printed and written, I gather the following summary of advantages accruing from the plan of transportation of rural school children at public expense:

1. The health of the children is better, the children being less exposed to stormy weather, and avoiding sitting in damp clothing.
2. Attendance is from 50 to 150 per cent greater, more regular, and of longer continuance, and there is neither tardiness nor truancy.
3. Fewer teachers are required, so better teachers may be secured and better wages paid.
4. Pupils work in graded schools and both teachers and pupils are under systematic and closer supervision.
5. Pupils are in better schoolhouses, where there is better heating, lighting, and ventilation, and more appliances of all kinds.
6. Better opportunity is afforded for special work in music, drawing, etc.
7. Cost in nearly all cases is reduced. Under this is included cost and maintenance of school buildings, apparatus, furniture, and tuition.
8. School year is often much longer.
9. Pupils are benefited by widened circle of acquaintance and the culture resulting therefrom.
10. The whole community is drawn together.
11. Public barges used for children in the daytime may be used to transport their parents to public gatherings in the evenings, to lecture courses, etc.
12. Transportation makes possible the distribution of mail throughout the whole township daily.
13. Finally, by transportation the farm again, as of old, becomes the ideal place in which to bring up children, enabling them to secure the advantages of centers of

population and spend their evenings and holiday time in the country in contact with nature and plenty of work, instead of idly loafing about town.

We are in the midst of an industrial revolution. The principle of concentration has touched our farming, our manufacturing, our mining, and our commerce. There are those who greatly fear the outcome. There were those who prophesied disaster and even the destruction of society on the introduction of labor-saving machinery. We have adjusted ourselves to the new conditions thus introduced. Most of us believe that we shall again adjust ourselves to the new industrial conditions. The changes in industrial and social conditions make necessary similar changes in educational affairs. The watchword of to-day is concentration, the dominant force is centripetal. Not only for the saving of expense but for the better quality of the work must we bring our pupils together.

3. *County high schools.*—In most of the Central and Western States the county is the chief corporate unit of local government and taxation. Several of these States have provided by law for high schools under county support and control. Much has been said in favor of this plan. Reference has already been made to the argument made in its favor at the Nashville meeting of the National Educational Association. There seems to be good reason why every State should authorize such schools for counties where the problem can be solved best in this way. But so far, notwithstanding favorable legislation in a number of States, it appears that very few schools are actually in successful operation; and in a State which relies upon this method alone generations will probably pass before any general extension of free high-school privileges to the country pupils will be realized. The chief difficulties in getting such schools started seem to be:

(a) Rivalry of cities or towns for location; each opposing the plan if the probable location would be at a rival town.

(b) The appearance of duplicating expensive plants at the same location—the city where the school is located already having, as a rule, a good high school of its own.

(c) Inaccessibility from remote parts of the county.

(d) The additional difficulty, which results from those already mentioned, as well as from other causes, of securing a vote for the establishment of the county high school and for the special taxation required.

4. *State aid for city high schools*, approved by State educational authorities upon condition of providing free tuition. This plan has solved the problem for many parts of Minnesota, and proves very acceptable there, where such city high schools in all parts of the State are thus open to all comers. This method tends to unify the high-school system, bringing these schools partly under State control and securing a closer articulation with the institutions of higher education. It has lately been adopted in Pennsylvania and other States, and is certain to be an important factor in working out the problem under discussion.

5. *Free attendance of country pupils at existing public high schools*, under legislation providing for the approval of such schools and compensation for the districts maintaining them. This plan has been repeatedly suggested and discussed. It has been in operation for some years in a very successful form in Nebraska, where the law provides for tuition fees at a fixed rate, to be paid by the county in which the pupil resides. The Nebraska law encountered technical constitutional difficulties at first, but was reenacted immediately by the legislature without material alteration. It may still be found weak in some technical points, since the lawmakers are blazing a new path without precedents; but its popularity and success insure its continuance under substantially its present form. The law includes in substance the following provisions:

(a) Free attendance of nonresident pupils at any approved high school in the same county, or in a different county if it be the nearest to the pupil's place of residence.

(b) The State department of education determines annually what schools are prop-

erly equipped and subject to such attendance. This provision has enabled the State department to exercise a most helpful influence upon the equipment and management of the high schools.

(c) Tuition fees at the fixed rate of \$3 per month are paid by the county in which the pupil resides.

(d) Pupils must have the county superintendent's certificate that they have completed satisfactorily the course of study prescribed by the State department for the elementary grades. This clause has been found to supply an exceedingly valuable lever for grading and improving the country schools. Thus the law incidentally tones up the whole State system of education, preparing for higher education, regulating and strengthening the high schools, and stimulating the work in the rural schools.

We have endeavored to outline the various plans which seem to promise solutions for our problem of free secondary instruction for rural pupils. Two or more of these may be, and frequently are, employed together in the same State. Indeed, no one method alone can be considered as fully sufficient, although some of the plans enumerated have seemed, as for example in Minnesota and Nebraska, to provide almost immediately the means for free secondary instruction for any ambitious country pupil throughout an entire State. There seems to be no good reason why several of these plans should not be authorized by law in each State in order to secure a solution best fitted to the needs of each locality, and yet offer immediate relief in some form for every ambitious and competent country student.

That the movement is one of importance scarcely needs argument. Many who may become the choice spirits of the next generation are hidden away undeveloped among these country children. "What could not Massachusetts afford to pay," remarked Dr. Harris, the United States Commissioner of Education, in a recent conversation, "to bring a Daniel Webster out of rural obscurity?" The situation is of course modified somewhat by the low tuition rates charged in many sections in high schools, private normal schools, and the preparatory departments of colleges. But with equal truth it could be said that private enterprise would partly provide for elementary education also were there no public provision. It may also be urged that the cost of tuition is small compared with that of board and other expenses which the pupils must bear. The answer is, first, the item of tuition will in many cases turn the scale in favor of high-school attendance; and, in the second place, a free school—not free food or clothing—is the American ideal. Here we draw the line between State and family functions. Certainly all arguments favorable to public high schools in cities would have equal force when applied to the extension of free high-school privileges to the country districts.

In pedagogical literature and on the programmes of educational meetings the question under discussion has found small space, while among those persistent, united efforts of the friends of education which influence legislatures and produce forward movements it takes rank as one of the vital issues of the day. That it is so regarded is strikingly shown in the opinions quoted below from correspondents in the several States.

It may be in order to remark here that we are not now discussing the high-school question in general. The battle for the free high school has been fought and won. In every city and village the children of rich and poor alike have free access through the high-school portal to the wider and higher mental life, with its better preparation, not only for personal power, but also for social function, whether industrial, professional, or commercial. The people's verdict has been given and we shall not reopen the argument. Our object is simply to point out this very evident corollary—that the country boy is as rightfully entitled as his city neighbor to all these free privileges; and that there are even some reasons for urging his claims with greater emphasis. Yet, strange to say, with few and recent exceptions our whole country

population has remained without free-school privileges beyond the elementary course as provided in the ungraded rural schools.

It is unnecessary to compare the importance of the high school with that of the college or the elementary school. There is no doubt that primary and higher education have received attention first in nearly all our States. As a matter of educational history, the secondary school has grown up first in the shadow of the college, to supply preparation for college courses. "To fit for college" was its original purpose. The primary school has always stood upon its own utility; so has the college and the university. But it is only within recent years that the high school has been recognized as having within itself the reasons for its existence. Chief among these reasons, from the standpoint of society, is the discovery of genius. The great importance to the public of discovering those best fitted by nature to go on to higher attainments has been recognized ever since the days of Plato. Huxley declares that "If the nation could purchase potential Watt or Davy or Faraday at the cost of a hundred thousand pounds, he would be dirt cheap at the money in the narrowest economical sense of the word." What arithmetic can compute the possible unknown loss to society through all the past by failure to discover and develop the latent possibilities of genius?

There is every reason to suppose that many of these are to be found among the children reared in the more natural and normal conditions of rural life. From the standpoint of social utility a better case could probably be made out in favor of free high-school training for country pupils than for those in the city; but no such comparison is necessary, for only equality is asked; and equal opportunity for secondary instruction, irrespective of place of residence, is something so just and so imperative that its claims can no longer be ignored anywhere.

It may be urged, however, in this connection, that progress in school conditions is often best attained by concentrating the efforts of the friends of education on one thing at a time. In some of our States the rural high-school question has not yet become prominent. The reason assigned may be a better one than simple neglect or indifference. It may be said that owing to sparse population or other natural causes the problems of the primary school are so difficult and so urgent as to require all the energy of educational workers and all the resources of the people for their solution. But even in such conditions it ought not to be forgotten that one of the surest and quickest ways to strengthen the primary school is to provide at once the means by which every ambitious youth may secure the high-school training that will make him a good teacher or progressive citizen. The powerful reflex action of the secondary upon the primary schools of the State makes it worthy of serious consideration whether the free high school is not one of the most effective ways to raise the standard of the common school.

In accordance with the announcement, information blanks were sent to a selected list of correspondents representing every State and Territory, and the Provinces of Canada. The list was made up chiefly of the following classes of persons: (1) State superintendents, secretaries or ministers of education of the several States, Territories, and Provinces, (2) professors of pedagogy in colleges and universities, (3) persons known to be particularly interested in this investigation, (4) other prominent educators wherever needed to make several representatives at least from each State and Territory. Many of these names appear in connection with the personal opinions given under the headings of the several States in the synopsis farther on. The information blank was worded as follows, with space for replies:

We solicit your assistance in completing the investigation described therein to the extent of filling out this blank, or dictating answers to the several inquiries by number. The results of the investigation will be sent to all who answer this inquiry.

1. What is your personal impression as to the importance of the question before us? Is it desirable to bring free secondary instruction within the reach of country pupils?

2. Do your State laws permit or require (state which) the formation of (a) Union high schools maintained by several adjacent districts? (b) Township high schools. (c) County high schools. (d) What are the prescribed conditions under which such schools can be organized? (e) What proportion of the entire rural population of your State is at present (or likely soon to be) under the operation of such free high schools?

3. (a) Do your laws provide for State aid to city high schools that give free tuition to nonresident pupils? (b) If so, under what conditions? (c) Are the funds for such aid raised by State taxation? If not, how? (d) What limitations, if any, upon attendance at such schools?

4. (a) Do your laws make any other provision for free attendance of rural pupils at city high schools? (b) If so, is the provision uniform and mandatory throughout the State, applying to all pupils not otherwise entitled to free high-school instruction? (c) State the limitations and conditions, if any.

5. To what extent are country pupils making use of existing high schools by paying tuition? Are fees moderate? Give an estimated average.

6. Are there any other conditions in your State which affect the problem—partially supplying or removing the need, aggravating, or emphasizing it?

7. Has any plan for providing free high-school instruction for rural pupils been proposed for legislation or seriously discussed in your State? If so, give particulars, and the prospect for such legislation.

8. If you can conveniently give references to any publication or document in which this subject is discussed, for either your own or other States, please do so. Include any other source of information—names and addresses of persons interested, articles in periodicals, sections of the school laws, etc.

9. Any other suggestions or remarks.

Address replies to the editor of the *School Review*, the University of Chicago, Chicago, Ill.

The results of our investigation of this subject have been most gratifying. Interesting and instructive facts have been collected beyond our expectations, both in quantity and in importance. We had already discovered, from various sources of information, that several States were moving in this matter, but the fuller and more exact statements we have now secured give added proof of the widespread interest in our subject, and make very evident the timeliness and importance of the investigation.

Before presenting a digest of the data obtained from the different States, a few general remarks and explanations may be of value.

First, as to the answers given to "Question 1," requesting a statement of personal opinion as to the importance of the investigation and the desirableness of the movement. If any doubt existed as to such importance and desirability, it would certainly be dissipated by the strong and emphatic expressions of our correspondents. It will be observed that, without a dissenting voice, they welcome the inquiry, and indorse the movement for equal high-school opportunities. It will be noted that many characterize this question as one of the most important—some deeming it absolutely preeminent—among those now before the educational public. These statements seem careful and deliberate; and such unanimity and emphasis on the part of prominent educators in all parts of the country is certainly most significant.

Union high schools.—In general it may be said that union of districts for high-school purposes, which is permitted as a matter of local option in many States, has not been very extensively utilized. This by no means argues against the desirability of such permission, for if even a few localities are benefited by them the privilege should not be withheld. It simply shows that this measure alone is insufficient, and must be supplemented by other and more adequate means.

Town and township high schools.—Under this caption are to be described conditions in several States which have made admirable progress in the matter under consideration. The tendency in New England, following the lead of Massachusetts and Connecticut, is to make every town responsible for the free high-school instruction of all its qualified students, both in city and country. It must, of course, be remembered in this connection that the New England town is a very different thing from the

western township. The two correspond roughly in average extent of territory, but the New England town has many of the functions of the western county. Generally speaking, however, each town is a school unit, managing its schools as the voters may determine. In Massachusetts and Connecticut the whole population of the State, rural as well as urban, has access to free high-school tuition. This plan has the advantage of requiring the towns to do something while supplementing their efforts by State aid. Every town must either provide for the high-school instruction of all its qualified pupils or pay for their tuition in a nonlocal high school. The experience of these New England States is exceedingly instructive, and should be noted very carefully by all students of the free high-school problem in other States.

Indiana and Ohio are, perhaps, the most instructive types of the township method of handling the question before us. In both States the township is relied upon to provide high-school instruction for its qualified pupils. Both of these States have laws, very recently enacted, similar to the one in Massachusetts, making such provision compulsory throughout the State by requiring school corporations either to organize high schools or provide elsewhere for the free instruction of all qualified pupils.

State aid for high schools.—The principle of State aid has practically solved the problem for Minnesota, and has played a most useful part in Massachusetts, Connecticut, Pennsylvania, Washington, and other States. Details are given under the headings of these several States below.¹

County high schools.—The conditions described in Kansas, Iowa, and Maryland are interesting in this connection. Maryland has a unique system of county organization for all her school affairs. Iowa and Kansas have permitted and encouraged the establishment of county high schools for years, but, as will be seen from the statements below, a very small proportion of the rural population is living under the operation of such schools. Their establishment seems to be necessarily a matter of local option. We have already pointed out in the preliminary article the difficulty of securing a vote for such establishment on account of the rivalry of cities or towns for location, the duplication of expensive buildings and apparatus unless the city gives up its own high school, and the opposition of those who live in remote parts of the county nearer to other high schools.

Use of existing high schools.—A careful study of all the conditions involved seems to me to make it very doubtful whether the creation of a new class of high schools is the best way to reach the country pupils.² The present tendency everywhere is for these pupils to find their way into the city and village high schools. If their tuition in these schools could be provided at public expense so as to multiply, enlarge, and strengthen such schools, we should have immediately, in most States, the best solution of the problem before us.

The village high school needs the larger membership and the increased income from the attendance of the rural population. It has been often remarked, too, that country pupils are on the average somewhat more devoted to study than the city pupils, and hence improve the student spirit and esprit de corps of the school. They usually make more sacrifices to attend, come farther or perhaps board away

¹ Closely related to the subject of State aid is that of State taxation for schools. There seems every reason to favor raising a much greater proportion of the school funds by general State tax. One prominent educator says, in speaking of the unequal burdens of our present local taxation: "We have no such a thing as a State system of education; but a local system under State control."

A large State fund, distributed according to attendance, would go far to solve the problem of free high-school instruction of country pupils. See the statement for the State of Washington farther on.

² This does not refer, of course, to high schools of the same type as those in cities and villages, but established in rural centers with arrangements for transportation of pupils. This idea is full of hope and promise for the future in thousands of rural communities. For a fuller discussion of it see the preliminary article in the *School Review* for April. See also the footnote under the statement for Illinois farther on.

Bulletin of Information No. 5, State Superintendent Harvey, Wisconsin, contains a very full and valuable discussion of this subject.

from home, and are generally less distracted by domestic and social interests. We see, therefore, that the high schools gain in income, attendance, and scholarship. All these reasons make it advantageous to the existing schools to furnish instruction for the rural pupils.

It is better also for the rural people to obtain free high-school opportunities at these schools. Convenience is an important consideration. It is as natural for the village or city to be the high-school center as to be the trade center of the surrounding country. As a rule the country people want the same kind of high schools as the people of the city. If the experiment is ever tried, it will probably be found that the separate schools of agriculture and housekeeping, established for country people only, will be but slightly patronized by the class for whom they are intended, while the greater number of bright, ambitious, country students will pass by the "hay-seed" schools to seek their training as they do now in the industrial, commercial, and literary courses of the city high schools. They know they are the peers of the city students, and they desire to demonstrate the fact. There is no divergence either of talent or of destiny that requires a separation of rural from city high-school students.

I have heard it objected that the country people would under this arrangement have no part in the control and management of the high schools that train their children. I admit the force of the objection. In theory at least it seems at first glance a strong argument against the education of a part of the people in schools controlled by others.

Several points can be made in reply to this objection. First, there is no reason to suppose that the schools would be managed better, or even differently, if the rural population participated, nor is it evident that their interest in such schools would be greater. Again, any well-devised plan will include State regulation and approval of the high schools, in which approval of course the country people will be represented, and by which their interests in secondary education will be better secured than by direct control. And, finally, whatever slight disadvantages remain will be far overbalanced by the advantages already stated.

The legal problem.—If, then, a plan can be devised by which the tuition of country pupils can be secured at public expense in high schools of the existing kind, we should have in most States the most prompt and effective solution of the problem under discussion. But just here comes in one of the most perplexing parts of the whole problem—how to provide in detail for such payment; how to determine the rate of compensation with promptness and equity; how to provide for its payment—whether by district, township, county, or State; how to arrange all this with justice to all and in accordance with constitutional limitations—here is the crux of the discussion.

It is evident from this that one of the most important phases of our subject is the matter of constitutional limitations. We must reach our end chiefly through legislation, and after running the gauntlet of the lawmakers our laws must still meet the irreversible judgment of the courts as to their constitutionality. Since the publication of the preliminary article in the April number of the Review, the Nebraska law, which seemed so commendable and which promised so much, has been annulled by the supreme court of that State. The defect announced was a wholly unsuspected one, viz, the fixed rate of tuition. The law provides for the free attendance of any qualified pupil at some neighboring approved public high school, tuition at the fixed rate of 75 cents per week being paid by the county in which the pupil resides. The logic of the decision is that the actual cost will not be exactly the fixed amount, but will be a shade greater or less. If greater, the school will suffer injustice, and if less, the county will be the loser, and therefore injustice will be forced upon one or the other without consent, in violation of the constitutional safeguards. These safeguards are the same in substance in Nebraska as in other States. If this judicial

doctrine prevails, the recent law of Indiana, which is in the respect referred to identical with the Nebraska law, may also be annulled as soon as it comes before the supreme court.¹

A most valuable supplement to the present discussion would be a thorough investigation by competent legal talent of the constitutional and legal questions involved in the needed laws, and we shall hope to see such a contribution to the literature of the subject made at no distant date. Meanwhile, it is very certain that any proposed legislation in any State should receive, not only the attention of educators and philanthropists, but also critical analysis by the ablest jurists.²

We come now to the most important feature of this report, viz, the statement of conditions in the several States, as far as obtained from correspondents and from public documents. For convenience, we have given under the caption of the several States the expressions of personal opinion of our correspondents wherever such expressions were given.

REPORT BY STATES.

NORTH ATLANTIC DIVISION.

MAINE.

It is important and desirable.—W. W. STETSON, State superintendent.

Very important. Seventy per cent of the leaders of all departments of life are country bred, and if the nation is to advance the early education of these leaders must be better.—W. J. CORTHELL, principal Gorham Normal School.

A district, a union of districts, a town, or a union of towns may establish high schools and receive State aid. About half the rural population of the State has access to such schools. Most pupils who go away from home enter academies where fees are moderate—about \$15 a year.

NEW HAMPSHIRE.

Bills have been introduced in the last two legislatures requiring towns not maintaining high schools to pay tuition of their pupils in neighboring high schools. Both these bills were defeated, but a sentiment favorable to this idea is probably gaining ground.—State superintendent of public instruction.

VERMONT.

Emphatically, yes; it is both important and desirable.—MASON S. STONE, State superintendent.

Most certainly.—Supt. JOHN L. ALGER, Bennington.

No provision for union high schools, but town high schools are required in towns of 2,500 or more people. At present the school boards in towns with no high school may pay tuition of qualified students in other high schools. The law will probably soon be changed from may to shall, which will bring the entire State under the operation of free high schools. Tuition fees probably average \$24 per year. Efforts are being made to secure State reimbursement to weaker districts as now in Massachusetts; also to develop a free transportation system.

There are 26 incorporated (city or village) districts within towns in Vermont. In such cases pupils of the town outside the incorporated district may attend the high school in the village or city at the expense of the town for tuition.

MASSACHUSETTS.

It is decidedly important. The discovery and development of superior ability wherever it exists is one of the important safeguards of a democratic society; but to

¹ It is interesting to note in this connection that the laws in the Province of Ontario, Canada, provide for a ready and compulsory arbitration in the event of dissatisfaction or disagreement as to the rate to be paid by one corporation to another for the free instruction of nonresident pupils. Perhaps the defect alleged in the Nebraska decision can be remedied by applying this principle of arbitration.

² See under "Montana," farther on.

secure this, secondary education should be within the reach of all—not merely of all in the cities. Moreover, free secondary education sufficiently broad and so flexibly administered as to meet the wants of all pupils, whether they intend ultimately to go to college, enter a profession, go into business, or remain on the farm, would undoubtedly tend to check the migration of the best families from the country to the cities—a very desirable result.—Prof. PAUL H. HANUS, department of education and teaching, Harvard University.

Very important and desirable.—Secretary F. A. HILL and Agent JOHN T. PRINCE, of the State board of education.

Union high schools are permitted, but none exist. Town high schools are permitted in all towns and required if there were 500 families or householders in the town at the last preceding census. Such required schools shall have a course of four years and an annual term of forty weeks. A town may, if it chooses, meet only a portion of such requirements in its own high school; provided that it shall make adequate provision for meeting the rest of said requirements in the high school of another town or city. All towns not included above, and not maintaining such high schools, must pay for the tuition of their qualified students.¹

I quote the following from a recent address by Frank A. Hill, secretary of the State board of education:

In 1891 the State took a step which placed it, for the first time, in advance of the founders. It ordered that free high-school tuition thereafter should be the legal right of every properly qualified child in the Commonwealth. Every town, without exception, must furnish it either in its own high school or in that of a neighbor. Other States have gone beyond Massachusetts in making the college or university a part of the public school system, but Massachusetts was the first State in the Union, if not the first in the world, to make it compulsory on all its towns to provide free high-school instruction. Such compulsion bore with hardship, of course, on many small and feeble towns. Hence arose in 1895 the policy in such cases of State reimbursement of high-school tuition payments in towns whose valuation does not exceed \$500,000. These amounts are paid from the State treasury to the town treasurer upon sworn statement of town officials approved by the State board of education. During the year ending June, 1899, \$9,436.67 was thus reimbursed by the State to 59 such towns for tuition fees of 298 pupils in 41 different high schools, at an average rate of \$34.29 per pupil. Rates are fixed by the high schools furnishing the instruction. Thus far, in approving certificates for reimbursement by the State, the question of the right of the State board of education to disapprove a rate has not been considered. Inasmuch as many high schools furnish tuition to towns that are not reimbursed by the State, as well as to towns that are, it is important, for the sake of the former, at least, that rates should be moderate. It is quite possible for a rate to fall under the actual cost of a high school that must be maintained, and yet be pecuniarily profitable to it.

In 1898 the legislature abolished the distinction between first-grade high schools and second, the people having previously abolished it in most of the towns. The length of the high-school curriculum was for the first time fixed; there must be at least one course four years long. A town may maintain a high school for a part of the course (four years) if it will pay for the rest of the course elsewhere. This progressive legislation is, in itself, an expression of the people's conviction of the value of the high school. It has placed the high school in the best legal position it has ever held.

No State money for schools is raised by direct taxation, although some State money is expended for schools. Free transportation of pupils is authorized by law and extensively practiced. Practically, a few towns, not many, find it difficult, from local conditions, to make high-school instruction convenient to their children. Massachusetts seems to have come very close to an ideal solution of the problem: 95.68 per cent of the population have access to free high schools at home, the remainder have free access to these schools away from home.

RHODE ISLAND.

I believe in the idea very strongly.—THOMAS B. STOCKWELL, State commissioner of public schools.

At present about 30 per cent of the rural population have access to free high schools. The proportion will probably be much greater very soon. It is only two years since State aid has been given to high schools. Eastern portion of State sparsely peopled; only two or three villages large enough for high schools. To reach the country pupils will require a good deal of transportation.

CONNECTICUT.

All children residing in towns without a high school may attend free a nonlocal high school. This opens the high schools to all the children of the State.

Any town may establish and maintain a high school, whether primary schools are controlled by the town or by districts therein.

The new law of 1897, as amended in 1899, provides that any town in which a high

¹ It is to be remembered, of course, that the entire rural population of Massachusetts live in towns. The word is used in a different sense in other parts of the country.

school is not maintained shall pay tuition of qualified pupils in an approved high school of another town. Every town, whatever its valuation, shall receive from the State annually in July two-thirds of the amount thus expended.

NEW YORK.

I would enlarge the scope of the high school and make it absolutely free to all pupils, providing by State aid for advantages now secured only by payment of tuition. Every child should be educated free in the high school nearest to him. There should be no favoritism or distinction.—CHARLES R. SKINNER, State superintendent.

At present, although New York has, perhaps, the finest system of city and village high schools in the country, there is practically no provision for the free secondary instruction of rural pupils.

NEW JERSEY.

I regard it as of the utmost importance. I believe in equality of opportunity, and think our country youth are as rightfully entitled to high-school facilities as those of our cities and larger towns.—C. J. BAXTER, State superintendent.

A very vital question. It is most certainly a desirable thing to bring about.—L. SEELEY, professor of pedagogy, State Normal School, Trenton.

A union of adjacent districts for graded school and high school purposes is provided for in a law just passed. Nothing done under it yet. Vote of the people of each district necessary. Nonresident children may attend a neighboring high school free, if the boards of the two districts agree upon the rate to be paid by the district sending the pupils. Nonresidents attend high schools to a considerable extent. Tuition fees average about \$50 per annum.

PENNSYLVANIA.

It is very important.—N. C. SCHAEFFER, State superintendent.

If secondary instruction can be made "practical," it would be a crime to withhold it from the country pupils.—President HENRY T. SPANGLER, Ursinus College.

No provision for free attendance of country pupils. Laws permit high schools only in boroughs above a certain minimum population.

By the new law of 1895 high schools receive State aid in the sum of \$200 for each grade or year of high-school work—\$800 if the school has a four-years' course. It appears that this grant has not yet become operative, owing to lack of special appropriation of funds to meet its provisions. The law seems to include no provision for free attendance of nonresidents, as in Minnesota, and hence has no special significance in the present investigation.

SOUTH ATLANTIC DIVISION.

MARYLAND.

Unquestionably—just as important as for city pupils.—E. B. PRETTYMAN, State superintendent.

Yes; it is desirable.—President E. E. CATES, Frederick College.

In Maryland the county is the unit for all school purposes, all schools being controlled by county boards and supported by county taxation, the State funds being apportioned by counties on the basis of school population. This practically eliminates any serious "rural school problem." All high schools are free to all in the county. Baltimore city is the sole exception, having its own school government and charging fees to nonresidents. The old State academies, supported in part by the State, charge moderate tuition fees to all alike. One or more election districts may build a high-school building and present it to the county board, which must then maintain a school therein.

The system is not reported to work very well in some respects. Politics tends to dominate the schools, and the teaching force in many places is not of a high order. No system is free, however, from either of these evils, and the special problem of opportunity for rural pupils is solved by the county system. Except in one or two very mountainous counties practically all the country people of the State have easy access to free high-school instruction.

WEST VIRGINIA.

Yes; it is important and desirable.—State Supt. J. R. TROTTER.

Laws authorize the establishment of union and township high schools. Very few country people yet under their operation. Practically no provision for free high-school instruction of rural pupils. Number attending city schools not very great. Average tuition fees about \$1.50 per month. Rural population scattered.

GEORGIA.

In Georgia, where no legal countenance is given to secondary education while the State provides both elementary and university education, the question is now of the greatest importance.—Supt. C. B. GIBSON, Columbus.

I indorse the project most heartily. The public high schools of the South constitute the weakest part of a system which is at best imperfect.—Prof. NATHAN B. YOUNG, department of pedagogy, Georgia State Industrial College.

Laws do not authorize any public high schools, but by common consent they exist in cities and some counties, generally for white pupils only. About twelve counties have county high schools, including four counties which combine city and county in school affairs. Only a small fraction of the rural people thus provided for. Estimated average tuition charge for nonresidents about \$40 per year. Some educators are urging county high schools with dormitories for cheap accommodations of poor students.

FLORIDA.

It is desirable to reach country pupils as far as possible with all grades of education—the university when possible.—State Supt. WILLIAM N. SHEATS.

Country high schools authorized. Less than 10 per cent of the rural population under such schools at present. Free transportation of pupils also authorized by law.

SOUTH CENTRAL DIVISION.

TENNESSEE.

Very necessary indeed.—President CHARLES W. DABNEY, Knoxville.

No provision. A few country pupils attend the city high schools; more go to low-grade "colleges." Tuition rates are low.

ALABAMA.

Scarcely possible in the South where the population is so scattered. But it is desirable. What we need most is development of our grammar schools in the rural districts.—President JAMES K. POWERS, State University.

I am of the opinion that the question is one of great importance. I think it is very desirable to bring free secondary education within the reach of country pupils.—State Supt. J. W. ABERCROMBIE.

The law permits township high schools when trustees think necessary. About 5 per cent of the townships have them. There are certain provisions for State aid to high schools. Could not get exact details. No effective provision for free secondary instruction of country pupils.

Average fees for nonresident tuition about \$1 per month.

MISSISSIPPI.

It should be the purpose of every State system of schools to give all children of the State the advantages of free tuition from the most elementary school to the university.—H. L. WHITFIELD, State superintendent.

It is desirable, but not to be expected in our thinly-settled State for years to come perhaps.—J. G. DEUPREE, professor of pedagogy, University of Mississippi.

County high schools are permitted under special charter. There is one such school (for whites) at Fayette, Jefferson County, supported by a special county tax.

Five to 10 per cent of the pupils in city high schools are from the country. Tuition fees average about \$2.50 to \$3 per month.

City high schools may draw on the county for tuition of nonresident pupils during a part of the year, known as the "county term."

The great trouble is sparseness of population. The race issue is also a serious feature. Whites pay fully 90 per cent of the school taxes, while negroes usually get equal advantages. The whites are not likely to assume still greater burdens.

LOUISIANA.

I consider free secondary instruction of the highest importance to country pupils and am aiming to put it within the reach of them all.—State Supt. J. V. CALHOUN.

Township and parish (county) high schools may be established upon petition of parish board, sanctioned by State board of education. State apportionment and local funds used as parish boards judge best. Country pupils usually attend free in the same parish. When city high schools are supported entirely by corporate tax, tuition may be charged.

Average tuition fees charged, about \$25 a year. There are high schools in each of the fifty-nine parishes (counties). About thirty of these schools are in excellent condition.

ARKANSAS.

A matter of paramount importance. No better means for strengthening our governmental fabric than to increase the opportunities for higher education in rural schools.—JOSIAH H. SHINN, State superintendent.

One of the most important educational problems before us; perhaps the most important, as the questions of elementary and university education, at least in bold outline, have been solved.—Prof. J. H. REYNOLDS, education and history, Hendrix College, Conway.

No provision except in town or city districts. Tuition moderate, about \$2 to \$3 per month. Ninety per cent of the people live outside these districts. Various plans have been proposed; no immediate prospects for legislation, although sentiment is growing in its favor.

OKLAHOMA.

It is the most important problem in our educational affairs here. We have a complete school system in which provision is made for all steps in the "ladder" except the secondary training of rural pupils. We expect to do something in our legislature the coming winter. I shall look with great interest for the results of your investigation for the aid it will bring for us in formulating our laws.—DAVID R. BOYD, President University of Oklahoma, Norman.

NORTH CENTRAL DIVISION.

OHIO.

I answer emphatically, it is very desirable.—O. T. CORSON, president National Educational Association.

It is a most important subject. We have just reason to feel proud of our State in this matter. We have 57,000 youth in high schools. Absolutely all of our State is under free high schools. Our further aim is (1) State aid for high schools, (2) State inspection, (3) State gradation. On the whole I feel that we have an enviable record in the growth of high schools, and the sentiment of the State is excellent.—LEWIS D. BONEBRAKE, State commissioner of common schools.

My personal view is that this is the one "burning" question before the American educational public.—Supt. C. L. VAN CLEVE, Troy, Ohio.

In April, 1900, the legislature passed a very important act, which requires townships and special districts either to organize high schools or pay tuition of all pupils who pass the high-school entrance examinations before the county board of examiners. Such payment of fees has been permitted for some years, but the new law makes it mandatory.

The law permits and otherwise encourages (1) township, (2) village, (3) special, (4) city high schools, simply upon act of local boards of education.

Tuition averages probably \$2 per month for village high schools and \$3.50 for city high schools.

Ohio has sixty-two degree-giving institutions, most of them giving preparatory work, and 818 high schools.

The plan of consolidating all the schools of a rural township at the center, with free transportation of pupils, is in very satisfactory operation in a few townships.

INDIANA.

It is one of the most important questions commanding the attention of the educational public. We are having a great deal of experience just now, and are convinced of the good results.—F. L. JONES, State superintendent.

Any incorporated city or town, or any township, may establish a high school for its qualified pupils.

The last legislature made mandatory provision for free high-school instruction of all qualified pupils. The tuition of nonresidents is paid by the school officials of the school corporation from which pupils come at the fixed rate of \$3 per month.

(See in this connection under Nebraska.)

Laws provide that whenever suitable building and grounds for a county high school may be offered to the county from private donors, such property shall be accepted and a high school maintained by county tax. Apparently there are no important results of this law.

ILLINOIS.

It is just as desirable and important that country pupils have opportunities for free secondary instruction as that village and city pupils have them. Let the question be agitated till every pupil shall have such opportunities.—State Supt. ALFRED BAYLISS.

Township high schools authorized. Only 16 townships out of 1,500 have them. About \$90,000 is paid in the State annually for nonresident tuition, varying from 40 cents to \$1 per week.

An effort will be made at the next session of the legislature to authorize free transportation of pupils.¹

MICHIGAN.

It is the most important educational question before the Michigan people.—State Supt. J. E. HAMMOND.

No provision for anything of the kind in the State laws. As in other States, many country pupils attend city and private schools and pay moderate fees.

The educators of the State have made various efforts in this direction for years, but certain classes of politicians oppose it as a movement toward centralization. Sentiment is probably developing slowly in favor of township high schools.

WISCONSIN.

Yes. It is, however, more important to arouse the rural population to a recognition of the necessity for a better education of their children than the district schools now offer. It is also necessary to offer a kind of secondary instruction in many respects different from that now offered in secondary schools; a kind that will appeal to the farmers and command their support.—State Supt. L. D. HARVEY.

I think it is desirable, but am not sure that the creation of a new class of high schools for them is the best way to do it. In this State they find their way into the city high schools, and if the State paid their tuition, as it ought to do, would go in still greater numbers. I fear a separate kind of schools would result in small attendance, feeble schools, and disappointment.—Prof. M. V. O'SHEA, department of pedagogy, University of Wisconsin.

I believe it is desirable to bring free secondary instruction within the reach of country pupils. I believe especially in the consolidation of rural districts and the transportation of pupils to central graded schools.—Prof. A. A. UPHAM, State Normal School, Whitewater.

¹Since the above was placed in type the following item appeared in the Chicago papers: "County superintendents of schools in northern Illinois decided yesterday, at a meeting in this city, that they would at once begin work to secure a transportation system in country districts for high-school pupils. The ultimate aim, it was announced, was to secure the establishment of high-school centers in farming sections and convey to and from them pupils living within a radius of 4 or 6 miles. The transportation system, it was agreed, was the solution of the country high-school problem."

Two or more adjoining towns, or one or more towns and an incorporated village, contiguous territory, may unite to maintain a high school. Less than 1 per cent of the entire rural population of the State is at present under such union high schools.

State aid from the "general fund," given to all approved high schools to an amount not exceeding one half the amount paid for salaries of teachers.

No provision for free attendance of nonresident pupils, but a large percentage of the students are nonresidents who pay tuition ranging from \$15 to \$25 per year. Two thousand five hundred such nonresidents attended in 1899.

Some counties have organized county training schools free to all qualified students who intend to teach. The State superintendent is urging provision for county schools of agriculture and domestic economy, including some of the usual high school studies. Consolidation of small districts with transportation of pupils is also being urged. (See extracts from a paper by Prof. A. A. Upham, of Whitewater, in the preliminary article of this discussion, April, 1900.)

MINNESOTA.

It is important and desirable; but subject-matter should be adapted to the demands of rural life.—D. L. KIEHLE, professor of pedagogy, University of Minnesota.

There are but few things in the educational line more desirable. The fact that most pupils leave school before the eighth grade is completed is an argument for, not against. They need better teachers. It is good high schools and their graduates that make good primary schools. Their influence is everywhere felt.—Ex-State Supt. W. W. PENDERGAST, Hutchinson, Minn.

All pupils in the State have free access to all the approved high schools.

In recompense for such free admission the State gives each approved high school \$800 annually. More than 100 high schools are thus offering free tuition to any qualified student living in the State. Funds for this State aid are raised by direct taxation upon the entire State.

This plan has been so successful that the following statement of conditions for approval will be of interest:

Conditions requisite to acceptance.

(From the rules of the State high-school board.)

The following requirements are in accord with the past experience of the board, and are made with a view to secure conditions which render efficient work practicable and give promise of permanence. The increase of State aid to \$800 justifies great care in admitting schools to the list.

1. A comfortable building providing not less than four grade rooms below the high school, and high-school quarters consisting of at least a main room, a large recitation room, a laboratory, and an office.
2. A well-organized graded school, having not less than four distinct departments below the high school, and including not less than eight years of elementary and grammar-school instruction.
3. A well-chosen geographical library for the sixth and seventh grades.
4. An adequate library of American history for eighth-grade work.
5. Suitable wall maps, a globe, and an unabridged dictionary for each of the upper grades.
6. A liberal supply of reading material in sets for each grade.
7. A well-qualified superintendent, having general charge of grading, instruction, discipline, and of the care of the building.
8. A liberal schedule of salaries. It is not the policy of the high-school board to prescribe salaries, but in the light of experience the board expresses a want of confidence in the ability of a school to earn the State grant of \$800 without salaries liberal enough to secure the services of a competent superintendent and instructors of approved experience. Experience also demonstrates that towns having a population of less than 1,000 people and an assessed valuation of less than \$200,000 are seldom justified in undertaking the expense of supporting a State high school.
9. Scholarly classes, well started in at least the first two years of high-school work, with a good prospect of classes to follow in regular succession to maintain a full four years' course.

A single district or union of districts arranged by the county commissioners, not exceeding 6 miles square, may form an independent high-school district, upon vote of the people of such district.

IOWA.

It is very important that free secondary instruction be brought within the reach of country pupils.—Deputy State Supt. Ross.

I am gratified to find you interested in these lines. Our American people must give more sincere and systematic attention to this problem. I commend your investigation, and shall be anxious to hear the results.—President W. M. BEARDSHEAR, Iowa State College, Ames.

The question is an important one. All the elements of a high-school training open new possibilities to the country pupil the same as to the city boy or girl.—Supt. H. B. HAYDEN, Council Bluffs.

The laws authorize the establishment of (1) union, (2) township, and (3) county high schools, but as yet there are only five or six such schools, although there seems a greater tendency toward them just now.

Some townships are agitating the question of selling existing rural school properties and erecting a central graded and high school, with free transportation of pupils.

A law to provide State aid for city high schools that offer free tuition to nonresidents passed the house last winter, but failed in the senate.

Very many rural pupils attend on payment of tuition fees (\$1.50 to \$2 per month is an average). Probably one-third of the high-school graduates in many cities are from the country.

MISSOURI.

A very important movement.—Ex State Supt. KIRK.

Most desirable. How to accomplish it effectively is one of the most important of educational problems. State aid to city and village high schools that open their doors to all will bring surest and quickest relief.—President W. S. DEARMONT, Cape Girardeau State Normal School.

Union high schools permitted, but so far but very few such unions (country districts adjoining town districts) have been formed, and few are likely to be until some greater inducement is offered by the State. Educators are urging legislation for State aid, based upon grade of school, local rate of taxation, and number of non-resident pupils admitted free.

At present probably 5 per cent of the pupils in high schools are country pupils paying tuition, averaging perhaps \$2 a month.

SOUTH DAKOTA.

Yes; it is important and desirable.—State Supt. E. E. COLLINS.

Township districts may establish high schools, but there are none as yet. No provision for free high-school instruction except in city districts. But few country pupils attend the high schools. Tuition fees moderate, averaging perhaps \$1.25 per month.

NEBRASKA.

This State has twice (1895 and 1899) enacted a law providing for free attendance of all qualified pupils in the State at convenient approved public high schools; tuition at a fixed rate being paid by the county. Each of these laws has been pronounced unconstitutional by the supreme court. The defect pointed out in the law of 1895 was in the method of levying the special county tax—the approved high-school districts being exempted, and the tax, therefore, not uniform throughout the county. This defect was remedied and the law promptly reenacted in substantially the same form in 1899 by the very next legislature—the adverse decision having been rendered just after the adjournment of the legislature of 1897. In April, 1900, the supreme court again annulled the law, this time on account of the fixed rate of tuition, which, according to the decision, must be unjust either to the county or to the district.¹

The law was exceedingly popular and satisfactory both in the cities and in the country, and all classes share the disappointment of its failure in the courts. A somewhat full statement of its features was given in the preliminary article in the *School Review* for April. As matters now stand Nebraska has no provision whatever for the free high-school instruction of her rural pupils. What the next step will be is a question of great interest, not only to the people of the State, but to all who have noted Nebraska's persistent efforts to solve the free high-school problem.

Tuition fees charged by the high schools will average somewhat less than the rate fixed by the law—\$3 per month.

KANSAS.

It is desirable and very important to the industrial and intellectual development of the whole people.—Prof. ARVIN S. OLIN (pedagogy), University of Kansas, Lawrence.

Very important and desirable.—Prof. J. N. WILKINSON, State Normal School, Emporia.

Country school children are as much entitled to free secondary instruction as city children. It is certainly desirable.—JOHN MACDONALD, editor *Western School Journal*.

¹See the paragraph above, entitled "The Legal Problem."

County high schools and union high schools authorized by law. There are no union schools and only one-fifteenth to one-tenth of the rural people are now under county schools, after fifteen years of the law. The chief difficulty is rivalry for location. Any district may vote to pay tuition of its qualified pupils at city high schools. This latter provision is recent, and very little is now, or likely to be done under it. Tuition fees range from \$2 to \$4, and average less than \$3 per month. Nearly every city school encourages the attendance of tuition pupils. In sparsely settled counties the county board may make special arrangements for high-school instruction at the county seat.

WESTERN DIVISION.

MONTANA.

The question of free secondary education for children of rural districts is of the greatest importance.—President JAMES REID, Agricultural and Mechanical College, Bozeman.

Free county high schools may be organized upon petition and vote. The law is very recent and little has been done as yet. Several city high schools have been merged into county high schools. Some doubt is expressed as to the validity of the law. Attorney-General Nolan of Montana writes as follows: "The high-school law, to say the least, is crude and indefinite in the extreme. It is problematical as to how it will be considered by the supreme court, and in what way steps can be taken so as to make possible the issuance of bonds."

Quite a number of nonresidents attend existing town high schools—probably 5 to 8 per cent of their entire attendance. Tuition fees average probably \$3 a month.

Rural districts are sparsely populated. The pressing need seems to be for better elementary and grammar schools.

COLORADO.

Of very great importance; most desirable.—State Supt. MRS. HELEN L. GREENFELL.

I am decidedly in favor of the movement. There is quite a strong sentiment in favor of it in Colorado.—Prof. ARTHUR ALLIN, department of pedagogy, University of Colorado.

The question is important and its solution desirable.—County Supt. F. D. BALL, Douglas county.

A very recent law permits union and county high schools upon vote by people and location by a board afterwards. Nonresident tuition ranges from \$2 to \$8 per month—availed of to a considerable extent. Size of districts and counties very large. Transportation of pupils at public expense is much needed.

ARIZONA.

One of the most important questions before the school public to-day.—F. YALE ADAMS, professor of pedagogy, University of Arizona, Tucson.

Any one, or several adjoining districts having 2,000 or more people, may establish a free high school. Grammar schools may teach high-school subjects. High schools often allow attendance of nonresidents, which increases the revenue, as territorial apportionment is based on attendance. Estimated that one-third of the population of the territory have access to free high-school instruction, and probably any student really desiring it can secure it. The university has preparatory department, and there are two territorial normal schools.

UTAH.

It is both important and desirable.—President J. T. KINGSBURY, University of Utah.

It is important and desirable; but free primary education should first be made efficient and within the reach of all. I would not expend money to give a few free secondary education until after all can be given a common-school education.—State Supt. JOHN R. PARK.

Adjoining districts may unite to form a high-school district supported by special tax. No such union schools yet available for rural pupils; but the country people live mostly in villages, and as soon as able these establish a ninth grade looking to a high school in future. The State institutions of learning all have preparatory departments. Some rural students attend city and private schools. Tuition averages about \$40 per year.

A county system of organization with county high schools is advocated by the State superintendent. (Report, 1896, pp. 20, 21.)

NEVADA.

I think it is important. But the conditions are such here that it can not be done as in more populous States.—State Supt. ORVIS RING.

Union and county high schools are authorized, but very little has been done. There are practically no country pupils in high schools.

IDAHO.

I think it an absolute necessity.—President BLACK, State Normal School, Albion.

No provision whatever. Very few town or city high schools. Nonresident tuition fees moderate.

WASHINGTON.

I indorse everything claimed in the preliminary article (School Review for April). This university and the State Agricultural College are obliged to maintain preparatory departments, which I believe is an injury to the high schools of the State.—President FRANK P. GRAVES, University of Washington, Seattle.

I regard the inquiry as very important and timely.—State Supt. FRANK J. BROWNE.

The State school tax is one-half the entire school taxation. This is distributed on the basis of attendance; hence the schools are usually glad to get students. Qualified students are generally admitted free, or on very moderate fees, not by compulsion, but because it pays the school financially to increase its attendance. The high school rather beckons to the country boy to come.

The State also pays \$100 per annum for each grade above the eighth, thus encouraging the maintenance of high schools.

Union high schools may be formed wherever districts choose to unite.

CALIFORNIA.

The country pupil should have as great consideration as the city pupil. If one should have a high-school education (all agree that he should), the other should have it. District, union, joint-union, and county high schools are helping to meet the difficulty in this State.—State Supt. THOS. J. KIRK.

Your field of work is a valuable one. The imperative need in our public-school systems is the high school for the rural population. If anything can be done in our nation to arrest the movement of population into centers and stay it in the country, it should be done in the interest of our common inheritance.—J. H. HOOSE, department of pedagogy, University of Southern California, Los Angeles.

The question is of the utmost importance. I am glad you are looking into it.—E. E. BROWN, department of pedagogy, University of California, Berkeley.

Union and county high schools permitted. No State aid for any high school. State fund for primary and grammar schools exclusively. To change this will require a constitutional amendment which is being attempted.

Many nonresident pupils attend existing high schools. Fees estimated to average \$20 to \$25 per year of ten months. An educational commission is now at work formulating desirable amendments to the school laws.

CANADA.

ONTARIO.

High schools receive from the legislature aid proportioned to the efforts made by the locality. The county council is required to make a grant equal to that made by the legislature. This latter grant is to meet the cost of instruction for pupils outside the high school district. If this cost can be shown to be greater than the legislative grant, the county grant must be increased accordingly. The law provides for a method of arbitration when required.

The county council may, however, require a portion of the county grant to be paid by the rural pupils in fees not exceeding \$1 per month. It thus follows that the question of free high schools for rural pupils is a matter of county option determined by the county board or council. About one-third of the high schools thus give free attendance to rural nonresidents; and the fees in the others vary from about \$2.50 to about \$26 per year.

NEW BRUNSWICK.

Very important and desirable.—The minister of education.

The entire population of the province is under the operation of free high school privileges. The province has established one high school of high grade in each county and one school in each parish (township) intermediate between the common schools and the county high schools.

There are also high schools in and for the cities. Union of districts for high-school purposes is also permitted by law.

All schools of all grades receive State aid—about one-half the salaries of teachers.

NOVA SCOTIA.

It is desirable. Secondary education has been free in Nova Scotia since 1864.—A. H. MACKAY, minister of education.

All high schools are by law free to qualified students in the section (district). The county academies are high schools free to all qualified students within the county. Practically, all high schools—or most high schools—are also free to students from the country in their competition with the county academies.

Town high schools may charge fees to country students, but generally do not. County high schools receive a special "attendance" grant from provincial treasury. No occasion for the formation of union high schools, as the province subsidizes the county academies and other high schools admit country students free on account of effect on morale of the school. Seven and one-half per cent of all pupils are in the high-school grade (ninth, tenth, eleventh, and twelfth) years of the public school course; about 2 per cent are in attendance at the eighteen county academies; about 4 per cent are taking full course in the other high schools; 1.5 per cent are taking only partial high-school course in these or rural schools with one or more high-school grades.

At least two of the eighteen county academies charge a fee of \$12 a year to students from other counties. Others are generally free to students from anywhere, as the greater the attendance the greater the grant from the province.

The reason why high schools here admit students free when they could charge a fee appears to be partly to show the drawing power of the institution as compared with the neighboring county academy and partly to the good effect of the attendance of students who come for the purpose of study, on the tone of the school. Then, the addition of a few students from beyond the section does not often entail any additional equipment and increases the amount of the "county fund" which is paid trustees in proportion to attendance in all schools of all grades.

I have found much interesting material as to the treatment of the matter before us in foreign countries. But conditions are so radically different as to make these data but very slightly instructive to us.

In England there can hardly be said to exist, even for primary grades, a free-school system as we understand that term, although the conditional subsidy plan has brought about practical State control of all private schools. Secondary instruction might almost be considered as historically the antecedent and parent of the English primary school. The great "public schools" (which here in America we would call private academies) are, next to the universities, the oldest well-established educational institutions of England. As a rule, there is no important difference between the country and city people of England as to opportunities for secondary education.

On the continent the extreme centralization of the school systems makes them so radically different from ours as almost to forbid instructive comparison. Our system has arisen step by step out of the conscious needs of the people, while theirs has sprung full-armed from the head of the State. Almost the same may be said of the Canadian as of the continental systems. In theoretical completeness these ready-made, paternal systems excel ours; and, as a rule, no such gap exists as the one that occasions our present investigation.

It may be in order, however, to point out one very important respect in which our system is superior. The glory and strength of the American schools is the popular sense of pride and proprietorship in them. If the system is still somewhat awkward and incomplete, it is nevertheless our own. The people have made it. Little by little they are steadily improving it, and the popular feeling of responsibility for and

ownership of the public schools gives them a superior strength which has been noted keenly by those who have thoughtfully studied school systems both here and abroad. It may take some years longer for our slower democratic processes to bring free high school instruction within the reach of the rural population. Considering how extremely democratic we are in our fear of centralization, the process is going on rather rapidly now, as this investigation has fully shown; and when with the full consent of the people and through their own acts the desired end is reached, we shall also have the richer gain of a people's enthusiastic use and support of the means of public education.

Prof. J. W. Stearns, the editor of the Wisconsin Journal of Education, discusses the foregoing plan of Professor Corbett, and states the result of the State's efforts, which do not seem very encouraging. He says:

The establishment of township high schools to provide for the training of rural pupils can not be pronounced a success in Wisconsin. The State has provided a special fund for such schools, giving them larger State aid than is afforded to city schools, but they have not multiplied as was expected. Only three or four have been created. Owing to wise management and special favoring circumstances these have succeeded, and in one case at least, at De Forest, the success has been very marked. But there are no indications that others will be established soon. Evidently rural communities do not take kindly to this plan; it is venturesome; it is expensive; it is difficult to bring about such cooperation and harmony in a large neighborhood as gives promise of success in the venture. Besides, there is another solution of the problem which seems better.

Rural pupils seek existing city high schools near to their homes and find them well adapted to their needs. A large number of our city high schools show a very considerable list of "tuition pupils," and some of them exhibit not a little pride in the growth of the list. It is generally considered evidence of the excellence of the high school. A few cities find their accommodations so restricted that, for a time at least, they refuse to receive outside pupils, as is at present the case in Madison. Usually such conditions are temporary, holding only while the community is preparing to erect a new high-school building. In our largest cities also there are a few rural pupils in the high schools, owing probably to the sharp contrast of urban with country life, and to the expenses of living in the city. These cases, however, are few and exceptional. In the State at large it is true that rural pupils flock to the neighboring city high school.

The advantages of this plan over township high schools can easily be seen. The city schools are well equipped, have experienced and well-trained teachers, and are near at hand. The unity of the city government secures them from the jealousies and bickerings likely to arise in rural neighborhoods, and prevents the establishment of a school to weaken and perhaps destroy one that has already been established. They usually offer several courses of study and are affiliated with the work of the normal schools and the universities, thus giving opportunity for considerable elections and for further study if that seems feasible. They can at once offer advantages which township schools can only attain to after years of effort, and perhaps may never realize. Further, intelligent parents count it of much value to their children to see something of village and city life and to be caught up in the stronger currents of social and intellectual movement to be found in the cities. Country life must not be allowed to separate itself from the cities. In fact, with the improved means of transit and communication now rapidly spreading, the tendency is in the opposite direction. It is certainly questionable whether a special class of high schools for rural pupils would not be a great mistake, save as they may undertake special preparation for the conditions and industries of rural life.

Massachusetts, Nebraska, and some other States have taken a further step to strengthen the natural tendency of rural pupils to attend existing city high schools. The State pays their tuition, thus giving to all the young people within its borders free high-school instruction. This tuition is only paid, however, to high schools which have been approved for the work by the State. The additional expense involved in boarding the children away from home while getting their education must be borne by the parents; but they are taxed for their own district school usually as heavily as the inhabitants of cities are taxed for the maintenance of schools, and it is but fair, therefore, that the tuition expense should be paid for them. The wisdom and justice of this provision will in time become apparent to all, and the plan will, we feel confident, be adopted in most if not all of our States.—Wisconsin Journal of Education, August, 1900.

CHAPTER XIII.

REPORT OF COMMITTEE OF THE NATIONAL EDUCATIONAL ASSOCIATION¹ ON THE RELATIONS OF PUBLIC LIBRARIES TO PUBLIC SCHOOLS.

Contents: Prefatory note—Public libraries and public schools—Reading lists: List of books for grades, prepared by Sherman Williams—Supplementary reading—The relation of the school to libraries: List of books for grades, prepared by Charles A. McMurry; list of 100 books for high schools, prepared by J. C. Hanna—Relation of libraries to normal schools—Establishing libraries in villages—Securing libraries for rural schools—Present condition of school libraries in rural schools—Improving poorly managed public libraries—By-laws suggested for library trustees—Hints for cataloguing small libraries—Aids and guides to library work—The librarian's spirit and methods—Work of certain typical libraries—Schoolroom libraries.

LETTER OF TRANSMITTAL.

MAY 31, 1899.

To the Council of the National Educational Association:

GENTLEMEN: We have the honor to submit the following report:

It was impossible for your committee to begin active work until December 30, 1898. We have been unable, consequently, to make very full investigations. There have been sent out, however, by the members of the committee several thousand circulars, letters of inquiry, and requests for aid. The results of this work are incorporated in the report in part. In part they have appeared in an increased interest shown by educational and other journals, and by associations of teachers and librarians during the past year, in the relations of schools and libraries.

J. C. DANA,
FRANK A. HUTCHINS,
CHARLES A. McMURRY,
SHERMAN WILLIAMS,
M. LOUISE JONES,

Committee on Relations of Public Libraries to Public Schools.

PREFATORY NOTE.

By JAMES H. VAN SICKLE,

Superintendent of the north-side schools of Denver and vice-president of the National Council of Education.

[Written for this report at the request of the committee.]

Since the National Educational Association adopted the policy of using a part of its income to investigate and report upon matters of importance in education it has greatly increased its influence and its usefulness. The report of the committee of ten on secondary education, the report of the committee of fifteen on correlation of

¹Appointed by authority of the National council at the meeting of the association held in Washington, D. C., July, 1898. Members of the committee: J. C. Dana, Frank A. Hutchins, Charles A. McMurry, Sherman Williams, M. Louise Jones.

studies, training of teachers, and city school systems, and the report of the committee of twelve on rural schools have been widely read and discussed. Educational practice the country over has been largely influenced thereby; yet the service of these reports has but just begun.

If it is important to the development of the individual that he let his thought go over into action, how true also of an organization like the National Educational Association! Its annual meetings are delightful and inspiring; the volumes of proceedings form a cyclopædia of education of untold value; the papers and discussions, while in the main expressing individual opinion, yet show the general trend of public sentiment as it changes and advances from year to year. But valuable as are the addresses and discussions, the carefully prepared reports of the few special committees thus far authorized by the association have been of far greater service in unifying school work. The more careful investigation made possible by adequate financial support insures conclusions which are likely to be accepted as reliable. In this way more than in any other is the National Educational Association becoming a reforming agent of gigantic power. The new rule requiring the approval of the national council of all investigations carrying appropriation, and placing such investigation under the auspices of the council, insures a careful weighing of values and is a needed and sufficient check upon unwise or needless expenditures.

No investigation yet undertaken promises greater returns than the one embodied in this report upon the relation of public libraries to public schools. The past few years have witnessed a remarkable movement, confined to no one part of the United States, looking toward organizing and directing the reading of children; yet the general and departmental programmes of the National Educational Association gave no indications previous to 1897 that the association recognized its opportunity to direct the movement. In 1896, in response to a circular letter prepared by Mr. J. C. Dana, then librarian of the Denver Public Library and president of the American Library Association, a petition to the board of directors of the National Educational Association was numerously signed, resulting in the creation of a library department, with Hon. Melvil Dewey, of New York, as president. Librarians and teachers worked together in the department from the first with a few definite purposes, among which were the following: To find out what had been done by teachers toward the direction and study of the reading of children; to find out what librarians had done to encourage and assist teachers in this work; to bring teachers and librarians into more mutually helpful relations; to determine the best books for various purposes and their adaptability to children of different ages. The following quotation from the remarks of Mr. Melvil Dewey before the board of directors at Buffalo gives very clearly the aim of the department:

By law the children are put under your influence in their earlier years, when, if ever, they can be taught to love good books so well that in all their lives thereafter they will seize on every opportunity to read them. If the librarians, with their wing of the educational army, can select and catalogue and provide free of cost the best on every subject, the schoolmen, with their wing and with their immensely larger resources both of money and men—and, still better, of devoted women—must send out from the schools, year by year, boys and girls who will be lifelong patrons of the public library, and will in due time help to send their own children along the paths which have proved for them so profitable and pleasant.

* * * But its great work should be the partial recognition that education is no longer for youth and for a limited course in a school to which they give most of their time, but that it is really a matter for adults as well as youth, for life and not for the course, to be carried on at home as well as in the schools, and to be taken up in the hours or minutes of leisure as the proper accompaniment of their regular business or labor. This means that education must be carried on by means of reading, and that if the librarians are to furnish the books and give all necessary help in their proper field, the schools must furnish the readers.

At the Milwaukee meeting, 1897, two committees were appointed—one, with F. A. Hutchins, of Wisconsin, as chairman, to prepare and recommend lists of books and

editions suited for the reading and reference use of pupils in the several grades of the public schools; and the other, with J. C. Dana as chairman, to report on the relations of public libraries to public schools, indicating methods of cooperation by which the usefulness of both may be increased. At the Washington meeting, 1898, these two committees reported. (See Proceedings of the National Educational Association, pp. 1014-1028.)

On the recommendation of the committee on reading lists and editions, the department decided to create a committee of five members instead of two, as before, the new committee, called the committee on relation of public libraries to public schools, to be charged with the duties of the two former committees. An appropriation of \$500 having been made by the board of directors for carrying on the work, the members of this committee were appointed by the National Council of Education.

It seems to be true that the greatest amount of reading is done by children between the ages of 12 and 14, and that by the end of the high-school course pupils settle down to one class of reading matter, whatever that may be. (Proceedings of the National Educational Association, 1897, p. 1019.) The importance of deciding what books are suited to children at this period, and of placing such books within their reach, will be readily conceded. Children will read what they like. If we can find out what they like and then provide it for them from literature true to life, now accessible, we may be reasonably certain that the class of reading settled down to later will never drop below the level of the taste thus formed.

But to begin our selection for the child at the age of 12 is too late for best results. We must begin as soon as he learns to read, or even before, if possible, by reading to him and by story-telling. Not the least of the difficulties is the selection of a few appropriate books from the vast number available. In this matter the report will be found to be of great service. It covers the entire field of home and school reading. In the city the problem is comparatively easy, provided teachers are alive to their opportunities. Here much has been done. In the country and in the small village the problem is more difficult. This report gives valuable experience to aid the teacher in this great work, wherever his lot may be.

I. PUBLIC LIBRARIES AND PUBLIC SCHOOLS.

By SHERMAN WILLIAMS.

The education gained at school must, with the great majority of people, be meager at the best. This may be, and should be, supplemented by extensive reading after the school life is finished. If this work is to be done well, and under favorable conditions, the pupil must, while in school, not only be trained to like good literature, but also, if possible, to use a public library intelligently. This demands cordial relations and intelligent cooperation between school and library authorities, between teachers and librarians.

The library must be regarded as an important and necessary part of the system of public education. It is said that not more than 1 in 500 of the inhabitants of Massachusetts are without library facilities. This should be the condition everywhere, and may be at no very distant time if those who should be most interested—the teachers of the country—will make a unanimous, persistent, and continued effort in this direction. There is nothing that appeals to people more generally, or to which they will respond more readily and liberally, than an effort to establish free public libraries, if the work is carried on with good judgment.

The teachers of a town should know the public library, what it contains, and what use the pupils can make of it. The librarian must know the school, its work, its needs, and what he can do to meet them. He must be able to supplement and broaden the work of the teacher of geography, science, history, or literature. He

should meet the teachers from time to time and become generally familiar with their work, and they should meet with him and become familiar with the library, what it contains, and its methods.

The librarian should make frequent bulletins for school use. He should make lists for collateral reading in history; not merely works on history, but biography, historical fiction, and poems treating of historical events.

The librarian should meet with the pupils occasionally and talk to them upon such matters pertaining to their reading as seems wise. They should have free access to the library shelves. The librarian should issue such special bulletins as may be wise—bulletins giving the books treating of local matters, if there be such, matters of present interest; for example, last winter a special bulletin giving a list of books treating of Hawaii, Cuba, the Philippines, and the Far East would have been of much value.

Children must be directed and trained in regard to their reading. They can no more be trusted to get their own knowledge of and taste for literature unaided than they can get their scientific and mathematical training in the same way.

If it is the duty of the State to see that its citizens know how to read, it is certainly no less its duty to see that they are trained to do the right kind of reading; otherwise the ability to read may be harmful rather than beneficial, both to the individual and to the State.

Not every place can maintain a public library. Some people must be deprived of the library facilities that many places have. But every State can, without great expense, maintain a system of traveling libraries that may reach every community in which there is anyone sufficiently interested to give proper attention to the matter. Some States, notably New York and Wisconsin, have undertaken the work, and anyone interested by writing to Secretary Melvil Dewey, Albany, N. Y., or Mr. Frank Hutchins, Madison, Wis., can learn in regard to the details of the work in those States.

Librarians usually know books much better than teachers do, but children not nearly so well; therefore active cooperation is necessary to the accomplishment of the best results.

Pupils should, while in school, be trained to know and love good literature, to use reference books, to economize time in reading, through the use of tables of contents, page-headings, etc.

Training pupils to read and love good literature is by far the most important work done in school. There is nothing else that a teacher can do at all comparable to it in value. It is the one thing the school does that continues to contribute to one's education so long as he lives. We should never forget that it is not the ability to read, but the use made of that ability that contributes to the destiny of a child.

Someone has said that education consists in formation of habits and the acquisition of tastes. This is certainly the case so far as reading is concerned, and all that the school and library can do, working together in harmony, is necessary to the best success in this matter of forming correct reading habits and good taste in literature.

II. READING LISTS.

By SHERMAN WILLIAMS.

In the preparation of the following lists certain things were kept in mind that should be considered by those who are interested in the work.

It was not thought wise to include any series of school readers. Each community will settle that matter for itself, and any attempt at discrimination on part of this committee would not be productive of good results.

The lists are merely suggestive. It is not expected that anyone will be likely to

use them without change. They furnish a plan, a basis for work, and are to be modified to meet local conditions. There are many books which, while possessing general interest, have a special interest in certain localities. Frederic's *In the Valley* would have a special interest in the State of New York. Parker's *Seats of the Mighty*, Kirby's *Golden Dog*, Parkman's *Montcalm and Wolfe* and *Conspiracy of Pontiac*, Hawthorne's *Twice Told Tales*, Earle's *Social Life in Old New England*, Underwood's *Quabbin*, Bynner's *The Begum's Daughter*, and the novels of Miss Austin would be of greater interest in New York and New England than in other parts of the country. Page's *In Ole Virginia*, Cooke's *My Lady Pokahontas*, Goodwin's *Head of a Hundred* and *White Aprons* are of special interest in Virginia. Lummis' *Spanish Pioneers* will be of greater interest in parts of the Southwest than elsewhere. Miss Catherwood's historical novels will be of greater interest in States bordering on Canada. The story of Joliet, La Salle, Marquette, Hennepin, and others will be of greater interest in the Upper Mississippi Valley. The writings of Boyesen will greatly interest those portions of our country settled by Scandinavians. So the teachers of each section of country must select, in part, those books of local interest. It is not possible that any general list will meet local conditions.

The lists are not intended to be closely graded. The pupils in the same grade differ so greatly in literary ability, taste, and development that the books selected for any grade should have a corresponding difference.

The lists will certainly be criticised, both for what they contain and for what they omit. No list could be made that would not be open to both these criticisms. The critics must modify the lists to meet their tastes and needs. One must always consider both himself and his environment in the work of teaching.

The list for pupils in grades 1 to 12 provides for reading by the class, reading to the class by the teacher and memorizing of certain selections in the first eight grades. While no list for home reading has been made, it is believed that the teacher should, so far as possible, direct a portion of the out-of-school reading of the pupils. There are more books named in each grade than can possibly be read in school, and it will be well to see that some of them are read at home. Provision for having certain selections memorized is made, because it is believed that good reading will not be general in schools in which declamation is not practiced.

The teacher should have at least three things in mind in reading to the class. With the youngest pupils the chief purpose should be to arouse an interest in good reading; with those who are old enough to read for themselves it is well to read a portion of books that the children should read, and then let them get the books and finish them for themselves if they care to do so; with the oldest pupils it is well to read some books that the pupils would hardly comprehend if they read them for themselves, yet not so far beyond their comprehension but that, when read by the teacher, and commented upon occasionally, the meaning would be clear and the thought of interest.

It is not expected that the class will read all the books mentioned in any grade, or that the teacher will read to the class all named for that purpose, but that selections will be made; nor that all books will be read in full.

In the additional lists for grammar grades it is understood that the books named are merely additional books for grades 5, 6, 7, and 8, for the benefit of those schools that can have access to larger libraries. These additional books are intended chiefly for home reading, and are not classified as books to be read in class or by the teacher, though some of them may well be used for these purposes.

It is understood that in very many places there will be great difficulty in getting the books needed, and that it will be impossible at present in many schools; but if sufficient interest be aroused in the matter that difficulty will be met and settled. The first thing is to lead teachers everywhere to feel the importance of this work.

It is thought best to make the list of reference books comparatively short, and to

place first those of most importance, and which most schools in cities and towns will be able to get. In the main, the less expensive books are named first, so that those first on the list will be available to the larger number of schools. There is no limit to reference books that may be used to advantage, save the limit of means to purchase them.

Whenever the cost of a book is given, it is the list price, from which a considerable discount may be had.

It is an excellent plan to keep a record of the reading of the children. This can be best done by having a little book made for each pupil. A book about $4\frac{1}{2}$ by 6 inches, with 24 pages, having a heavy board cover, can be had for about 3 cents. Two of the pages should be ruled for keeping a record of the periodical reading, the remainder for a record of the books read. The book should have on the front cover the name of the pupil. On the first two pages should be written the names of all the periodicals of all kinds that the pupil regularly reads. There should be entered in the first of two columns at the right the year in which he began to read them regularly. In the second column should be written the year in which he ceases to read them. This record, then, will show the periodicals read by the pupil, and the number of years he read them. The remainder of the book should contain a record of the books read, giving author and title. The books should be passed out about once a month for the pupils to make entries. The books should be kept by the teacher and passed on to the next teacher when the pupil is promoted, not becoming the property of the pupil till he leaves school. No criticism should be made regarding the character of the books reported, unless it be a favorable one. Otherwise a correct report is not likely to be made. The keeping of the record will of itself largely control the child's reading. He will read books that he would not otherwise do, because he does not wish to have it known that he is ignorant of that which is generally known by his associates.

These records are of much value in the work of the school. For example, a teacher is to have a new class in American history next month. She sends for the reading record of the class and looks over the little books. She makes lists of those who have read much regarding American history, those who have read little, and those who have read nothing. In this way she knows more of the reading of the class, its knowledge and its tastes, and what she can expect to accomplish, and how to do it, than she would be able to learn in many weeks without this record.

It is well occasionally to have some book read with unusual care. This may be done by making it a basis for rhetorical work. For example, let the book to be read be assigned two months in advance, a part of the class be given topics to write, and others given recitations from the book illustrating certain features. Everyone will read the book with care. When the day for the rhetorical exercises comes, there will be an interest in the book and a knowledge of it that can be brought about in no other way. Of course, every book is not well adapted for such treatment. *Uncle Tom's Cabin*, *Robinson Crusoe*, *Tom Brown at Rugby*, *Evangeline*, *Snow Bound*, and many others will readily suggest themselves. When one book is treated in this way, the pupils trained in the work will ever after be able to read any other book of similar character and get more out of it than they otherwise could have done. Reading must be made something more than merely calling words. Pupils must be trained to see ideas back of the words. They must see the sights described, hear the sounds spoken of, get the author's thought.

Lists of books to be read in grades 1 to 12, inclusive, with special reference to the average country school and the average grade teacher:

GRADES 1 AND 2.

TO BE READ IN THE CLASS.

Beckwith:	<i>In Mythland.</i>	D. C. Heath & Co.	\$0.25
Swinton:	<i>Easy Steps for Little Feet.</i>	American Book Co.	0.25
Pratt:	<i>Legends of the Red Children.</i>	Werner Co.	0.30
Scudder:	<i>Fables and Folk Lore.</i>	Houghton, Mifflin & Co.	0.40
Wright:	<i>Seaside and Wayside, No. 1.</i>	D. C. Heath & Co.	0.25

TO BE READ BY THE TEACHER TO THE CLASS.

Andrews:	<i>Each and All.</i>	Ginn & Co.	\$0.50
Andrews:	<i>Seven Little Sisters.</i>	Ginn & Co.	0.50
Andersen:	<i>Fairy Tales.</i> Many editions.	Cost not over	0.40
Scudder:	<i>Fables and Folk Stories.</i>	Houghton, Mifflin & Co.	0.40
Eggleston:	<i>Stories of Great Americans.</i>	American Book Co.	0.40
McMurry:	<i>Classic Stories for Little Ones.</i>	Public School Pub. Co.	0.35
Judd:	<i>Classic Myths.</i>	School Education Co.	0.40
Burt:	<i>Nature Studies,</i> from Burroughs.	Ginn & Co.	0.25
Baldwin:	<i>Fifty Famous Stories Retold.</i>	American Book Co.	0.35
Kirby:	<i>Aunt Martha's Corner Cupboard.</i>	Nelson & Sons.	0.60
Muloch:	<i>Adventures of a Brownie.</i>	Crowell & Co.	0.80
Wiggin:	<i>Bird's Christmas Carol.</i>	Houghton, Mifflin & Co.	0.40
Wiggin:	<i>Story of Patsy.</i>	Houghton, Mifflin & Co.	0.48

SELECTIONS TO BE MEMORIZED.

"Baby Bye".....	Theodore Tilton.
"A Visit from St. Nicholas".....	Clement C. Moore.
"Sweet and Low".....	Alfred Tennyson.
"Dutch Lullaby".....	Eugene Field.
"Obedience".....	Phœbe Cary.
"The Brown Thrush".....	Lucy Larcom.
"Twinkle, Twinkle, Little Star".....	Jane Taylor.
"Seven Times One".....	Jean Ingelow.
"Little Boy Blue".....	Eugene Field.
"Suppose".....	Phœbe Cary.
"Marjorie's Almanac".....	T. B. Aldrich.
"Little by Little".....	Luella Clark.
"The Dream Peddler".....	Lucy Blinn.
"Do All that You Can".....	M. E. Sangster.
"Nobility".....	Alice Cary.
"The Vicar's Sermon".....	Charles Mackay.
"America".....	Samuel F. Smith.

GRADES 3 AND 4.

TO BE READ IN THE CLASS.

Andersen:	<i>Fairy Tales.</i> Many editions.	Cost not over	\$0.40
Ruskin:	<i>King of the Golden River.</i> Several editions.	Cost not over	0.25
Eggleston:	<i>Stories of Great Americans.</i>	American Book Co.	0.40
Sewell:	<i>Black Beauty.</i>	Weeks & Co.	0.25
Kingsley:	<i>Water Babies.</i>	Ginn & Co.	0.50
Defoe:	<i>Robinson Crusoe.</i> Many editions.	Cost not over	0.25
Æsop:	<i>Fables.</i> Many editions.	Cost not over	0.25
Hawthorne:	<i>Wonder Book.</i>	Houghton, Mifflin & Co.	0.35
Wyss:	<i>Swiss Family Robinson.</i> Many editions.	Cost not over	0.40
Saunders:	<i>Beautiful Joe.</i>	American Baptist.	0.30

TO BE READ BY THE TEACHER TO THE CLASS.

Longfellow:	<i>Paul Revere's Ride,</i> and other short poems.		
Whittier:	From <i>Snow Bound, The Barefoot Boy,</i> and <i>Barbara Fritchie.</i>		
	Biographies of Washington, Franklin, Lincoln, and other great Americans.		
Dickens:	<i>Christmas Carol.</i> Many editions.	Cost from	\$0.12 to \$0.25
	American history, stories from.		
Andrews:	<i>Ten Boys.</i>	Ginn & Co.	0.50
Grimm:	<i>Fairy Tales.</i> Many editions.	Cost not over	0.40
Kipling:	<i>Jungle Book.</i>	Century Co.	1.50

SELECTIONS TO BE MEMORIZED.

"The Barefoot Boy"	John G. Whittier.
"The Children"	Henry W. Longfellow.
"Lullaby"	Alfred Tennyson.
"Snow Bound," first ninety-two lines	John G. Whittier.
"Old Ironsides"	Oliver Wendell Holmes.
"The Sand Piper"	Celia Thaxter.
"Robert of Lincoln"	William Cullen Bryant.
"Paul Revere's Ride"	Henry W. Longfellow.

GRADES 5 AND 6.

TO BE READ IN THE CLASS.

Burroughs: <i>Birds and Bees, Sharp Eyes, and other papers.</i>	Houghton, Mifflin & Co.	\$0.40
Longfellow: <i>Hiawatha.</i>	Houghton, Mifflin & Co.	0.40
Andrews: <i>Ten Boys.</i>	Ginn & Co.	0.50
Defoe: <i>Robinson Crusoe.</i> Many editions.	Cost not over	0.25
Hawthorne: <i>Tanglewood Tales.</i>	Houghton, Mifflin & Co.	0.40
Longfellow: <i>Miles Standish.</i>	Houghton, Mifflin & Co.	0.40
Longfellow: <i>Children's Hour, and other selections.</i>	Houghton, Mifflin & Co.	0.40
Whittier: <i>Snow Bound, Among the Hills, etc.</i>	Houghton, Mifflin & Co.	0.40
Warner: <i>A Hunting of the Deer, and other papers.</i>	Houghton, Mifflin & Co.	0.25
Irving: <i>Rip Van Winkle.</i> Many editions.	Cost not over	0.25

TO BE READ BY THE TEACHER TO THE CLASS.

Craddock: <i>Down the Ravine.</i>	Houghton, Mifflin & Co.	\$1.00
Franklin: <i>Autobiography.</i>	Ginn & Co.	0.40
Gilman: <i>Magna Charta Stories.</i>	Lothrop.	0.75
Tennyson: <i>Enoch Arden.</i> Many editions.	Cost not over	0.25
Irving: <i>Legend of Sleepy Hollow.</i> Many editions.	Cost not over	0.25
Warner: <i>Being a Boy.</i>	Houghton, Mifflin & Co.	0.60
Alcott: <i>Little Women.</i>	Roberts Bros.	1.50
Bolton: <i>Girls who have Become Famous.</i>	Crowell.	1.50
Bolton: <i>Poor Boys who Became Famous.</i>	Crowell.	1.50
Howells: <i>A Boy's Town.</i>	Harper Bros.	1.25
Brown: <i>Rab and His Friends.</i>	Houghton, Mifflin & Co.	0.40
Aldrich: <i>Story of a Bad Boy.</i>	Houghton, Mifflin & Co.	0.70
Sidney: <i>Five Little Peppers.</i>	Lothrop.	1.50

SELECTIONS TO BE MEMORIZED.

"The Chambered Nautilus"	Oliver Wendell Holmes.
"Over and Over Again"	Josephine Pollard.
"The Crow's Children"	Alice Cary.
"Old Ironsides"	Oliver Wendell Holmes.
"The Good Time Coming"	Charles Mackay.
"The Blue and the Gray"	Francis Miles Finch.
"The Brook"	Alfred Tennyson.
"Whittling"	John Pierpont.
"What Might be Done"	Charles Mackay.
"Battle Hymn of the Republic"	Julia Ward Howe.

GRADES 7 AND 8.

TO BE READ IN THE CLASS.

Hale: <i>A Man Without a Country.</i>	Little, Brown & Co.	\$0.50
Longfellow: <i>Evangeline.</i>	Houghton, Mifflin & Co.	0.25
Eliot: <i>Silas Marner.</i> Many editions.	Cost not more than	0.30
Whittier: <i>Snow Bound.</i>	Houghton, Mifflin & Co.	0.25
Lowell: <i>Vision of Sir Launfal.</i>	Houghton, Mifflin & Co.	0.25
Longfellow: <i>Miles Standish.</i>	Houghton, Mifflin & Co.	0.25
Hughes: <i>Tom Brown at Rugby.</i>	Houghton, Mifflin & Co.	0.50

TO BE READ BY THE TEACHER TO THE CLASS.

Yonge: <i>Book of Golden Deeds.</i>	Macmillan.	\$0.50
Ball: <i>Star Land.</i>	Ginn & Co.	1.00
Geikie: <i>Physical Geography Primer.</i>	Appleton & Co.	0.35
Scott: <i>Ivanhoe.</i> Many editions.	Cost not over	0.40
Macaulay: <i>Lays of Ancient Rome.</i> Many editions.	Cost not over	0.25
Scott: <i>Lady of the Lake.</i> Many editions.	Cost not over	0.40
Towle: <i>Pizarro.</i>	Lee & Shepard.	1.00

SELECTIONS TO BE MEMORIZED.

"The Landing of the Pilgrims".....	Mrs. Hemans.
"Song of Marion's Men".....	William Cullen Bryant.
"The Ship of State".....	Henry W. Longfellow.
"The Centennial Hymn".....	John G. Whittier.
"Abou Ben Adhem".....	Leigh Hunt.
"The Manliest Man".....	George W. Bungay.
"The Way to Heaven".....	J. G. Holland.
"Love of Country".....	Walter Scott.
"Daily Work".....	Charles Mackay.
"The American Flag".....	Joseph Rodman Drake.
"Gettysburg Address".....	Abraham Lincoln.
"My Country".....	James Montgomery.
"The Concord Hymn".....	Ralph Waldo Emerson.
"Marmion and Douglas".....	Walter Scott.

GRADES 9 AND 10.

TO BE READ IN THE CLASS.

Scott:	<i>Ivanhoe.</i> Many editions.	Cost not over	\$0.40
Scott:	<i>Lady of the Lake.</i> Many editions.	Cost not over	0.40
Scott:	<i>Marmion.</i> Many editions.	Cost not over	0.40
Shakespeare:	<i>Julius Cæsar.</i> Many editions.	Cost not over	0.25
Shakespeare:	<i>Merchant of Venice.</i> Many editions.	Cost not over	0.25
Cooper:	<i>The Last of the Mohicans.</i> Many editions.	Cost not over	0.40

TO BE READ BY THE TEACHER TO THE CLASS.

Ouida:	<i>Bimbi.</i>	Lippincott.	\$0.75
Macé:	<i>History of a Mouthful of Bread.</i>	Harper Bros.	1.00
Warner:	<i>Back Log Studies.</i>	Houghton, Mifflin & Co.	1.00
Warner:	<i>My Summer in a Garden.</i>	Houghton, Mifflin & Co.	1.00
Goldsmith:	<i>Deserted Village.</i> Many editions.	Cost not over	0.25
Byron:	<i>Prisoner of Chillon.</i> Many editions.	Cost not over	0.25
Gray:	<i>Elegy Written in a Country Churchyard.</i>	Cost not over	0.15

GRADES 11 AND 12.

TO BE READ IN THE CLASS.

Webster:	<i>First Bunker Hill Oration.</i> Many editions.	Cost not over	\$0.15
Coleridge:	<i>Rime of the Ancient Mariner.</i> Many editions.	Cost not over	0.15
Bryant:	<i>Thanatopsis.</i> Many editions.	Cost not over	0.15
Macaulay:	<i>Lays of Ancient Rome.</i> Many editions.	Cost not over	0.35

TO BE READ BY THE TEACHER TO THE CLASS.

Emerson:	<i>Essay on Compensation.</i> Many editions.	Cost not over	\$0.25
De Quincey:	<i>Flight of a Tartar Tribe.</i> Many editions.	Cost not over	0.25
Ruskin:	<i>Ethics of the Dust.</i> Many editions.	Cost not over	0.25
Shelley:	<i>Ode to a Skylark.</i> Many editions.	Cost not over	0.15
Holmes:	<i>Autocrat of the Breakfast Table.</i>	Houghton, Mifflin & Co.	0.60

THE USE OF BOOKS AND LIBRARIES IN GRAMMAR GRADES.

FIRST GRAMMAR GRADE.

Black:	<i>The Four MacNicol's.</i>	Harper Bros.*	\$1.00
Baylor:	<i>Juan and Juanita.</i>	Houghton, Mifflin & Co.	1.50
Boyesen:	<i>Against Heavy Odds.</i>	Scribner.	1.25
Clemens:	<i>Prince and Pauper.</i>	American Publishing Co.	1.00
Ewing:	<i>Jackanapes.</i>	Roberts Bros.	0.50
Taylor:	<i>Boys and Other Countries.</i>	Putnam.	1.25
Stockton:	<i>Stories of New Jersey.</i>	American Book Co.	0.60
Vincent:	<i>The Plant World.</i>	Appleton.	0.60
Weed:	<i>The Insect World.</i>	Appleton.	0.60
Towle:	<i>Raleigh.</i>	Lee & Shepard.	0.60
Wiggin:	<i>The Story of Patsy.</i>	Houghton, Mifflin & Co.	0.60

SECOND GRAMMAR GRADE.

Stowe:	<i>Uncle Tom's Cabin.</i> Many editions.	Cost not over	\$0.50
Richards:	<i>Captain January.</i>	Estes & Lauriat.	0.35
Burnett:	<i>Little Lord Fauntleroy.</i>	Scribner.	1.25
Dodge:	<i>Hans Brinker.</i>	Scribner.	1.50
Ouida:	<i>The Dog of Flanders.</i>	Lippincott.	1.00
Alcott:	<i>An Old-Fashioned Girl.</i>	Roberts.	1.50
Bunyan:	<i>Pilgrim's Progress.</i> Many editions.	Cost not over	0.50
Dickens:	<i>Christmas Stories.</i>	Burt.	0.75
Butterworth:	<i>Zig-Zag Journeys.</i>	Estes & Lauriat.	1.50
Verne:	<i>Around the World in Eighty Days.</i>	Coates.	0.50
Du Chaillu:	<i>Under the Equator.</i>	Harper Bros.	1.00
Scudder:	<i>Bodley Books.</i>	Houghton, Mifflin & Co.	2.00
Bolton:	<i>Famous Leaders Among Men.</i>	Crowell.	1.50
Scudder:	<i>George Washington.</i>	Houghton, Mifflin & Co.	0.40
Towle:	<i>Magellan.</i>	Lee & Shepard.	0.60
Towle:	<i>Sir Francis Drake.</i>	Lee & Shepard.	0.60
Towle:	<i>Vasco de Gama.</i>	Lee & Shepard.	0.60
Brooks:	<i>Historic Boys.</i>	Putnam.	1.50
Brooks:	<i>Historic Girls.</i>	Putnam.	1.50
Eggleston:	<i>Strange Stories from History.</i>	Harper Bros.	1.00
Drake:	<i>Indian History for Young Folks.</i>	Harper Bros.	3.00
McMurry:	<i>Pioneer History Stories of the Mississippi Valley</i>	Public School Pub. Co.	0.50
Watson:	<i>Boston Tea Party.</i>	Lee & Shepard.	0.50
Wright:	<i>Children's Stories of American History.</i>	Scribner.	1.25
Wright:	<i>Children's Stories of American Progress.</i>	Scribner.	1.25
Guerber:	<i>The Story of the Greeks.</i>	American Book Co.	0.60
Guerber:	<i>The Story of the Romans.</i>	American Book Co.	0.60
Baskett:	<i>The Story of the Birds.</i>	Appleton.	0.65
Geikie:	<i>Geology Primer.</i>	Appleton.	0.35
Ker:	<i>From the Hudson to the Neva.</i>	Lothrop.	1.25
Carpenter:	<i>Geography Reader of Asia.</i>	American Book Co.	0.60
Fiske:	<i>War of Independence.</i>	Houghton, Mifflin & Co.	0.40

THIRD GRAMMAR GRADE.

Wallace:	<i>Ben-Hur.</i>	Harper Bros.	\$1.50
Blaekmore:	<i>Lorna Doone.</i>	Harper Bros.	1.00
Holland:	<i>Arthur Bonnicastle.</i>	Scribner.	1.25
Cooper:	<i>The Pilot.</i> Many editions.	Cost not over	0.50
Jackson:	<i>Ramona.</i>	Roberts.	1.50
Stevenson:	<i>Black Arrow.</i>	Roberts.	1.25
Scott:	<i>Kenilworth.</i> Many editions.	Cost not over	0.50
Scott:	<i>The Talisman.</i> Many editions.	Cost not over	0.50
Irving:	<i>The Alhambra.</i> Many editions.	Cost not over	0.50
Dickens:	<i>David Copperfield.</i> Many editions.	Cost not over	0.50
Kingsley:	<i>Westward, Ho!</i>	Crowell.	0.50
Larcom:	<i>A New England Girlhood.</i>	Houghton, Mifflin & Co.	0.75
Cooke:	<i>Stories of the Old Dominion.</i>	Harper Bros.	1.50
Saintine:	<i>Picciola.</i>	Burt.	1.00
Hale:	<i>A New England Boyhood.</i>	Cassell.	1.00
Frederic:	<i>In the Valley.</i>	Scribner.	1.50

FOURTH GRAMMAR GRADE.

Austin:	<i>Standish of Standish.</i>	Houghton, Mifflin & Co.	\$1.25
Cooper:	<i>The Spy.</i> Many editions.	Cost not over	0.50
Page:	<i>Two Little Confederates.</i>	Scribner.	1.50
Wiggin:	<i>Polly Oliver's Problem.</i>	Houghton, Mifflin & Co.	1.00
Martineau:	<i>Peasant and Prince.</i>	Ginn & Co.	0.50
Seawell:	<i>Decatur and Somers.</i>	Appleton.	1.00
Yonge:	<i>Book of Golden Deeds.</i>	Maemillan.	0.50

III. SUPPLEMENTARY READING.

By ROBERT C. METCALF, Boston, Mass.

[Written for the report on the relations of public libraries to public schools, at the request of Sherman Williams.]

The term "supplementary reading" usually includes all books used in school, except text-books and reference books. The "school reader" is not a book for supplementary reading. Geographies and histories are text-books; dictionaries and encyclopædias are reference books. Supplementary reading is additional reading matter to be used for various purposes.

1. Some supplementary reading is designed to train pupils in the reading of good books. This kind of reading meets the demand of those who say that having taught the child to read we should teach him what to read. It leads directly to the reading

of the best literature. It contributes to the æsthetic culture of the one who reads. It broadens and deepens his daily living by making the mind more keenly alive to all that is beautiful in nature and in art. It enriches life by bringing to it the inheritance of the best thought of past ages.

2. Another kind of supplementary reading may be termed "collateral." It is used to supplement the work in history, geography, and science. It enlarges the pupil's view of the subject in hand. It helps him in clearing up doubtful points. It shows him the truth from the standpoint of another writer. It strengthens the impression upon his mind, and makes it more permanent. Undoubtedly it adds greatly to the interest which pupils take in their school studies, and hence is of very great value. Supplementary reading of all kinds has a direct bearing upon the pupil's English. Unconsciously he is influenced by the style of an author, and is impressed by his thought and by his choice of words to give the thought expression. If the teacher is a man or woman of culture, this impression is deepened by a judicious discussion of what is read, and by a somewhat careful examination of the author's mode of expressing his thought. But while we say that supplementary reading has a direct bearing upon the pupil's English, it should not be inferred that the teacher's main purpose, while using the supplementary reading, is the improvement of the pupil's ordinary mode of expression. The main purpose is the improvement of the pupil's thought, the bringing him into intimate relations with the best minds of the literary world, and the giving of frequent opportunity for this influence to shape his expression.

REFERENCE BOOKS AND BOOKS FOR COLLATERAL READING.

Books of reference and books for collateral reading should be furnished generously to all teachers, whether in graded or ungraded schools. It is necessary that such books should be near at hand when occasions for their use arise. It is when the pupil is eager to learn, when his interest is most intense, that the information should be furnished. To wait until the close of school, when some library may be visited, or even to wait until a book may be secured from some other room in the same building, is often fatal to the purpose of the teacher. "Strike when the iron is hot," is a rule equally applicable to pedagogics and mechanics. Collateral books should be consulted in the presence of the teacher, so that he may direct the search of the pupil. To use reference books to advantage requires much skill. To "run down" a subject will often require the use of several collateral or reference books, and the pupil needs training in this work. One book may give only a hint of the information wanted, and this hint would be lost upon a pupil who had not been trained to seek for information. It is a mistake to appoint only the few bright pupils to consult reference books. All need this training, and the teacher must not only use skill, but he must be patient while the slow, and even the dull, acquire this power of investigation. The teacher must always keep in mind that mere information, a knowledge of facts, is but secondary in the education of his pupils. Knowing how to consult books for information is often of more value than the facts themselves. "How to use books" is of prime importance in the education of the child. Hence the value of reference books and books for collateral reading, and the importance of careful and systematic training in their use in schools of all grades.

BOOKS FOR GENERAL READING.

Training pupils in the reading of good books for the purpose of cultivating a taste for what is best in literature must receive more extended treatment. We have in mind now not so much the increase of the pupil's scholarship as the systematic training of his moral nature—not so much the intellect as the heart. The child must be led to love that which is lovely and to hate that which is hateful. When the two are presented for his choice, he must involuntarily choose the former. One who hesitates is lost.

Books for general reading, to be used for the purpose just named, should, when possible, be furnished in sets, the number of volumes in a set being equal to the number of pupils in the class. These books should be well written, have a high moral purpose, and be of such a character as to interest the pupils for whom they are intended. They should be books of travel, biographies of famous men and women, historical stories, and works of fiction suited to the age and intellectual growth of the pupils. In the selection of books, it should be borne in mind that with parents or with teachers children will read and will enjoy books of a much higher grade than they would be likely to select for their own reading. Boys and girls of 12 or 14 years of age, whose tastes have had no special training, will listen with eagerness to Thackeray, Dickens, and Scott, to Longfellow, Holmes, and Tennyson, if a mother or some favorite teacher reads aloud to them. Care must be taken, however, that the reading matter be suited to the age and advancement of the pupils, for much of the reading should be done by themselves. The reading from the large sets of books just described should be done by the pupils at home. A chapter or a given number of pages should be assigned by the teacher, to be read by the children as an evening lesson. The teacher must prepare his work as carefully as the work on any evening lesson should be prepared. Notes should be taken of points worthy of comment, characters worthy of study, and natural objects worthy of being described. In short, such preparation by the teacher should be made as will enable him to call the attention of his pupils to what is likely to interest or instruct.

This preparation having been made by both teacher and pupils, the work of the "reading hour" will be full of interest. This "hour" falls on the day following the home preparation, and usually occurs but once in each week. The books are all returned by the pupils, and in response to simple notes, hints, or suggestions by the teacher, they tell the story in their own words. Characters introduced by the author should be discussed in a simple way; references to natural scenery and to works of art should be pictured to the imagination, and described by the children as a test of the correctness of their mind pictures; and, finally, the study should reach back to the author as one who has become, for the time being, a companion of the children, and who is worthy of their love. Pupils soon begin to appreciate the skill of an author in so arranging the incidents of his story as to bring out the peculiar qualities of his characters. Their interest is enlisted in behalf of the good and the true, and they instinctively loathe that which is low, mean, and dishonorable.

The deepest impressions are often made when works of fiction are under discussion. Here the author is not required to confine himself to facts, but may use his imagination and his judgment in outlining the peculiarities of his characters. A portrait may be a perfect likeness and yet may seem to flatter the subject. The painter has produced his likeness by combining a number of "best expressions" taken at different sittings. Dr. Watson (Ian Maclaren) explains that his "Dr. MacLure" was a composite, made of lovable characteristics borrowed from a number of physicians whom he knew. So it is in the best fiction—an ideal character is presented, having perhaps no prototype in real life, but formed from characteristics which are easily recognized in many of our friends or acquaintances. Thus the best and deepest impressions made upon children—yes, and upon adults also—are often gained from a careful reading of the best fiction. The reading hour gives an opportunity for conversation, and even for discussion, which may be of the greatest value to the pupils. Not only will a love for reading be gained, but a taste for good reading will be cultivated which will protect them from much that is harmful and debasing.

The conversations and discussions connected with the reading hour are also of great help to the children in their use of English. The reading furnishes them with thoughts, their interest in what has been read gives them a strong desire to express their thoughts, and thus the conditions are favorable for the best kind of language work. It is by practice that we learn to use English, and by careful practice that

we learn to use it well. The gain in the pupils' ability to express themselves in good English by such practice as has been indicated will be so marked, and even extraordinary, that teachers are in danger of using the reading hour for a language lesson rather than for the higher purpose of cultivating a taste for good reading.

It will be remembered that the kind of work described above can be carried on to the best advantage when large sets of books are furnished and the reading of the children is done at home. But on account of the expense large sets of books are not always available. If there are several classes in the town or village, all of the same grade, expense may be saved by sending the books from class to class, thus giving an opportunity for several readings of the same book during the same year. Three full sets of books circulated among three classes will probably furnish each one with all the reading matter needed during the year; and then, as these pupils pass on to a higher grade, they find three different sets for their use during the succeeding year. Thus the expense of furnishing the schools of a given town with large sets (forty or fifty volumes) of books for supplementary reading is not so great as might be supposed.

HOW TO USE SMALL SETS OF SUPPLEMENTARY READERS.

It is doubtless true that the large sets of books, to be read at home by the pupils and to be followed by a conversational exercise during the "reading hour," are better adapted for use in the grades above the sixth than in any of the lower grades. Experience has seemed to prove that the art of reading must be carefully taught during the first six years in school, and success in teaching depends largely upon an abundance of practice, which requires an abundance of time. To meet this demand for time teachers have been compelled to substitute in place of the home reading, which has been described above, a semiweekly exercise in class reading during school hours. In other words, the time for reading in the six lower grades has been divided between teaching reading, where much time is given to training in the art of oral expression, and practice in reading, where special attention is given to gathering thought from the printed page, and later to restating the thought by the children in their own words.

When supplementary books are read in the class room the progress in reading is much less rapid, and there is great danger that pupils will lose their interest in the work; but a skillful teacher will overcome this difficulty, and will avoid the danger by reading, occasionally, a chapter to the class or by giving with sufficient fullness the substance of certain portions of the book.

Much good work may be done in the six lower grades with sets of only three supplementary books. One book is used by the teacher, and the other two are in the hands of the pupils. One of the pupils reads aloud to the class while the rest listen to the reading. All must be prepared to tell in their own words the substance of what has been read. The books composing these sets must be carefully selected and should be of such a character as will secure the interest of the children. If carefully selected, the pupils will listen with the closest attention; moreover, they will demand of the pupil reader his best effort, in order that they may get the full benefit of the story.

The exercise in the reproduction of the story which has been read, and in the discussion of matters of interest connected with the reading, is the same in kind as that which has already been described. The language exercise, which follows this reading, will prove just as fruitful with the little children as with those who are more advanced.

The exercise in listening is in itself of great value, for it trains the pupils in hearing and in telling, and thus contributes much to the comfort of the teacher in most of his exercises in the class room.

POETRY.

A love for poetry seems to be innate with children, its first manifestation being in the nursery, where *Mother Goose* and similar collections of nursery songs furnish a pharmacopœia sufficient for the healing of most of the sorrows of babyhood. Fairy tales and folk stories, fanciful tales and wonder books follow in order and furnish an abundance of literature for the primary-school age. The child's fancy finds free range, and his world is pictured with images of beautiful spirits whom he has learned to love, or of evil spirits from whom he shrinks. Later these fancies find their illustrations in real life, and the lessons of childhood become the foundation of the wisdom of maturer years.

Memory gems of a few lines each, and short poems adapted to children of the primary-school age, should be read aloud by the teacher and committed and recited by the pupils. The poems should be carefully selected and none but the best admitted to the treasury of the school room. The teacher should feel that he is selecting and hanging pictures for all time, and that the children's minds are the art rooms which he is furnishing. His selections must be the most helpful, as well as the most beautiful, of the productions of our best artists.

In the grammar-school grades experience has shown that the best results have been gained when the works of one poet have been studied by the pupils for a year. A miscellaneous collection of poems may interest, and the poems may instruct, the children who read and commit them to memory; but no piece of literature, whether prose or poetry, accomplishes its highest good with the student until his study reaches back from the letter of the work to the soul of the author, and a year's time is none too long to gain that intimate acquaintance which alone will reveal the choicest treasures of the author's heart. Some of the most satisfactory work in literature in grammar schools may be traced directly to a love for the poet, born into the heart of the pupils through reading his life in the thoughts woven into the lines he has written. Whittier, and Holmes, and Longfellow, and Lowell become patron saints to the children who for months in succession look into their faces, think their thoughts, and feel the inspiration of their genius.

A few books only are necessary for the study of poetry; but every schoolroom should contain a library of well-selected works for ready reference and for use by the pupils during their leisure hours.

This report can be brought to a close most fittingly by two or three brief extracts from *Books and Culture*, by Hamilton Wright Mabie:

There is no magic about the process of enriching oneself by absorbing the best books. It is simply a matter of sound habits patiently formed and persistently kept up. Making the most of one's time is the first of these habits—utilizing the spare hours, the unemployed minutes, no less than those longer periods which the more fortunate enjoy. To "take time by the forelock" in this way, however, one must have his book at hand when the precious minute arrives. There must be no fumbling for the right volume; no waste of time because one is uncertain what to take up next. The waste of opportunity, which leaves so many people intellectually barren who ought to be intellectually rich, is due to neglect to decide in advance what direction one's reading shall take, and neglect to keep the book of the moment at hand.

To learn how to treat the odds and ends of hours so that they constitute, for practical purposes, an unbroken duration of time, is to emancipate oneself from dependence on particular times, and to appropriate all time to one's use; and, in like manner, to accustom oneself to make use of all places, however thronged and public, as if they were private and secluded, is to free oneself from bondage to a particular locality, or to surroundings specially chosen for the purpose.

Within the compass of a very small room, on a very few shelves, the real story of man in this world may be collected in the books of life in which it is written; and the solitary reader, whose personal contacts with men and events are few and lacking in distinction and interest, may enter, through his books, into the most thrilling life of the race in some of its most significant moments.

IV. THE RELATION OF THE SCHOOL TO LIBRARIES.

By CHARLES A. McMURRY.

THE FUNCTION OF THE SCHOOL IN INTRODUCING CHILDREN TO THE PROPER USE OF BOOKS.

The center around which cluster all the problems which relate to the reading habits of children is the public school. The family, in many cases, is doing more than the school, to be sure, but it is the school, after all, in the great average of cases, which must give the children a taste for books and an introduction to their proper use. It is only in exceptional cases that parents have knowledge and the means to supply children with suitable books, and, what is more important, with the right guidance and sympathy in making a close acquaintance with them.

We may well inquire, therefore, what the proper function of the school is in teaching the great body of children how to appreciate and use the best books. Within the last few years teachers have begun to realize that this is one of the few great privileges and duties of the school. To teach children how to read, so that they could make use of books, newspapers, etc., was once looked upon as a chief object of school work. We now go far beyond this, and ask that teachers lead the children into the fields of choice reading matter, and cultivate in them such a taste and appreciation for a considerable number of the best books ever written that all their lives will be enriched by what they read. This is one of the grand but simple ideals of the schoolroom, and lends great dignity to every teacher's work in the common schools. The most solid and satisfactory reasons can be given why this should be done in every schoolroom. These substantial materials of culture belong to every child, without exception. They are an indispensable part of that general cultivation which is the birthright of every boy and girl. The child that by the age of 14 has not read *Robinson Crusoe*, *Hiawatha*, *Pilgrim's Progress*, *The Stories of Greek Heroes* by Kingsley and Hawthorne, *The Lays of Ancient Rome*, *Paul Revere's Ride*, *Gulliver's Travels*, *The Arabian Nights*, *Sleepy Hollow*, *Rip Van Winkle*, *The Tales of the White Hills*, *The Courtship of Miles Standish*, *Scott's Tales of a Grandfather*, *Marmion*, and *Lady of the Lake*, the story of Ulysses and the Trojan War, of Siegfried, William Tell, Alfred, and John Smith, of Columbus, Washington, and Lincoln—the boy or girl who has grown up to the age of 14 without a chance to read and thoroughly enjoy these books has been robbed of a great fundamental right; a right which can never be made good by any subsequent privileges or grants. It is not a question of learning how to read—all children who go to school learn that; it is the vastly greater question of appreciating and enjoying the best things which are worth reading. Judged on this standard of worth, the reading exercises of our schools have acquired a tenfold deeper significance, and all teachers who have looked into the matter have felt a new enthusiasm for the grand opportunities of common-school education. There is no doubt, whatever, among intelligent people, that good literature is a powerful instrument of education. It is by no means the whole of education, but when the reading habits of children are properly directed, their interest in suitable books cultivated and strengthened, their characters are strongly tinged and influenced by what they read. If their minds are thus filled up with such stimulating thought material, and their sympathies and interests awakened and cultivated by such ennobling thoughts, the better side of character has a deep, rich soil into which it may strike its roots. So profound has been the conviction of leading educators upon the value of the reading matter of the schools for the best purposes of true education that the whole plan of study, and the whole method of treatment and discussion, as touching these materials, have been reorganized with a view to putting all children into possession of this great birthright.

To prove this we will state briefly a few of the changes which have already taken place in many of our best schools:

1. Good literature of high quality, from the fertile brains of the greatest writers, has been put into every grade of the common school, from the first year on. This means, of course, that all sorts of information books, in geography, science, history, etc., have given place to better, classic material. We shall see later that these information books have their proper place in school work, but they should never be allowed to crowd out the people's bible of good literature.

2. In the first three grades, since children have not yet learned to read, but are in the process of acquiring this art, they must get their introduction to the best stories suited to their age by the oral presentation of the teacher. Teachers of primary and intermediate grades are everywhere rapidly acquiring the art of presenting stories, and the stories which they offer are the best which the literature of Europe and America has thus far produced. The result is that the teachers themselves are becoming deeply interested in this material, and they are discovering how powerful and stimulating its influence is upon children. The children are aroused to a new interest in school work, in striking contrast to the dullness and tedium of the old A B C method in learning to read.

3. The works of our best American writers—Bryant, Longfellow, Emerson, Whittier, Holmes, Lowell, Hawthorne, Irving, Burroughs, and others—have acquired a new and untold significance for American children. These men themselves, without exception, were exemplars of a simple, elevated mode of life, thoroughly patriotic and American, and beautiful illustrations of those words of Longfellow familiar to every school child:

Lives of great men all remind us
We can make our lives sublime,
And departing leave behind us
Footprints on the sands of time.

4. One of the strong marks of this genuine literary revival in our common schools is the rapidly growing disposition to read literary wholes, not selections or fragments—the whole of *Snow Bound* and *Among the Hills*, of *The Building of the Ship*, of Ruskin's *King of the Golden River*, of Webster's *Speech at Bunker Hill*, of the *Vision of Sir Launfal*, of Emerson's *American Scholar*, of *Gulliver's Voyage to Lilliput*, of *Horatius at the Bridge*, of *The Hunting of the Deer*, of Bryant's *Sella*, of Burrough's *Birds and Bees*, etc. This reading of the masterpieces as wholes with children in the regular reading exercises of the school has opened the eyes of teachers and pupils in an astonishing way, and is destined, moreover, under still better teaching in the future, to give a depth and spiritual value to the work of our schools which are beyond all price.

We have discovered, also, that the best English writers are as much ours as our cousins' across the water; that Shakespeare, Ruskin, Tennyson, Arnold, Burke, Scott, and Addison are fully as valuable to us as our own writers, and that their works also must be read as literary wholes.

5. A new principle for the grading and arrangement of literary materials throughout the school classes has been applied. The suitability of the thought, the appropriateness of the story to arouse the interest and sympathy of the children, are made the chief test to determine the place in the grades where a literary whole shall be used. In this way the child has become the center of study, and a very common-sense, practical result has ensued. Children are asked to read what best fits their age, temper, and understanding. It is no longer a question of learning to read, but of learning to appreciate and enjoy what is most worthy the attention of a child. It is the development of the best feeling and intelligence of children, rather than a droning over words and phrases in a mechanical process of learning to read. That chil-

dren learn to read fluently and with expression is certain, just to the extent of their true appreciation and insight.

It has been discovered that the literatures of America, England, Europe, and Asia are already drawn upon to find just the best-suited materials for children of the successive grades. We may yet find that stories as diverse in origin and location as *Hiawatha*, *Robin Hood*, *Don Quixote*, *Siegfried*, *Ulysses*, *Sinbad the Sailor*, the *Lilliputians*, and *Joseph in Egypt* are needed at different points in the school course to give children what best suits their mental growth. At any rate, we are rapidly finding out that the best of all the ages, from Abraham to Kipling's *Jungle Stories*, is needed to educate children. It is an inspiring thought that the proper bringing up of a commonplace American child requires us to sift out the gold nuggets from a whole series of civilizations. This sifting and arranging of materials has been going on for many years, and the series of standard books now recommended for children in some of our best schools insures to them the stimulating and liberalizing influence of a large number of the best books of great authors.

This body of educative thought material, properly handled, discussed, and read in the schools, becomes the nucleus around which to collect and organize the reading of a lifetime. Moreover, the interests and tastes cultivated upon these books will determine what kind of books and to what extent they will be read in the following years.

Having insured a proper place and respect for this indispensable nucleus in which reading habits and tastes are to find root and grow strong, we may next inquire into the function of the school in giving children a proper opinion of the value and use of the great body of information books, history stories, geographical readers, travels, biographies, science narratives and descriptions, histories, current magazines, reference books, etc., which contribute so largely to a full equipment for life.

Within the last few years great progress has been made toward supplying the schools with a large quantity and variety of supplementary and informational reading. The lessons in history, geography, and natural science are constantly enlarged and enriched by this sort of reading, to which children are freely referred in studying their lessons.

This use of varied material requires greater skill upon the part of teachers, a wider range of information, and the ability to organize and unify these diverse sources of information with the regular lessons. But this kind of study, if carefully planned and skillfully executed, gives the boys and girls better materials of thought, more independence in using books, and a wider range of knowledge. It points directly to the library as a necessary and very efficient agency of popular education.

A small library is becoming indispensable to the teachers and pupils of the grammar school in carrying out the legitimate work of the school. In order to give definiteness to this idea of a small library, suppose it to consist of 500 to 1,000 books, containing the best classic stories, poems, biographies, histories, travels, novels, and books of science suitable for the use of children below the high school. The necessity for such a choice selection of library books is made evident by an examination of the children's present studies in history, geography, and science. History stories are now read in nearly every grade of the common school, to some extent even in the primary. Only a few years ago it was customary to limit the historical studies to the final year of the grammar school, to what is now generally known as the eighth grade. But now history stories are regularly used in all the grades, from the third to the eighth, inclusive. In the third, fourth, and fifth grades, or years, of the common school, stories are skillfully narrated by the teacher, discussed, and reproduced by the children. It is possible in this way to give them a very keen and hearty impulse toward biography and history. With this interest thoroughly awakened upon the biographies of such American heroes as William Penn, John Smith, Columbus, Magellan, Williams, La Salle, Champlain, George Rogers Clark, Lincoln, and Fremont, it is very easy to introduce children to that considerable body of American biography which is the very best introduction to American history.

The elements of heroism and adventure, the strong traits of personal character and

manliness, which these American stories exhibit, give these historical stories a great moral value. At the same time the dreary memory drill upon the skeleton outlines of political events has given way to a native interest and enthusiasm for the striking personalities in our past life as a nation.

Closely allied to this early biographical story of our own country are the famous epic stories of European countries, the stories of Alfred, King Richard, William Tell, Romulus, Horatius, Ulysses, and Achilles, and such historical narratives as the *Retreat of the Ten Thousand*, *The Struggles of Thermopylæ and Marathon*, *Scott's Tales of a Grandfather*, and other famous stories, which in most cases have a strong historical setting and significance. Our schools are now being abundantly supplied with interesting and instructive books of this character. Only a few of them can be thoroughly worked over and assimilated during school hours. Enough, however, can be done and is being done in many cases to give a vigorous training in this kind of study, and to awaken interests which soon grow into habits of study. In order to give the great body of teachers unmistakable proofs of the variety and excellence of these historical stories and poems, a short list of choice books will be appended to this article.

Now, it is evident that a carefully selected library of the best books of this character should be found in every grammar school. There will be a considerable number of boys and girls in every school who will be well prepared by such school studies as we have just described for a profitable use of these books in private reading. Children in general can not supply these books. The parents, in most cases, have neither the means nor the judgment for their proper selection. There should be no ambition on the part of teachers to make bookworms of children, and it is certainly advisable to avoid an indiscriminate and loose reading of many books. The teachers should not only give children a careful and appreciative introduction to a few of the best books, but they should also try to advise and assist children in forming profitable habits of reading. In occasional general exercises before the whole school, and in private talks with the children, many a valuable hint may be given in regard to what books to read and reread, how to study out and appreciate the characters; in short, how to assimilate what they get from books.

In geographical studies a change, somewhat similar to that which has taken place in history studies, has been brought about in the last ten years. Instead of the meager outlines of geographical topics, and in place of the endless map questions and names for memorizing from the third grade on, we have begun to select instructive and interesting topics, which are treated with a richness of detail, illustration, and description that awakens the best thought and interest of children.

Much of this work also has to be done in the early grades by the oral presentation of the teacher, and after a year or two of such home geography, by excursion and descriptive geography, by important topics, the children are prepared for making a good use of the geographical readers and books of travel, which have now attained great excellence and value. Here again it is necessary that the school library shall be well equipped with a careful selection of the best recent books.

It need not be feared that this method of study and use of books will lead to a superficial, fragmentary, or unsystematic knowledge, but it will require better classroom instruction on the part of the teachers, and more ability to organize knowledge derived from reference and other library books. Here again, as in history, quite a goodly number of the children may be led on to excellent habits of voluntary and private study. Perhaps the best proof of the right instruction in the class room is the tendency of children to extend their knowledge by later voluntary readings in the use of the library.

A short list of books will also indicate how enterprising our best book firms are in supplying what our libraries need in the way of geographical readers, travels, guide books, picturesque narratives, etc.

In the field of natural science there is a third great realm of study which has been

lately brought under the direct jurisdiction of the schoolmaster. It is only within the last few years that any considerable number of schoolmasters and schoolmistresses have begun to appreciate what a glorious field of study has been opened to the common school. But books and libraries seem to stand in a different relation to nature study from that already ascribed to history and geography. In this case nature herself is the book to be studied, and no artificial book should come in between the observer and the leaves of nature's own book. Nature study, when properly managed in elementary schools, is a direct protest against the wrong use of books. By means of excursions upon the campus, in the fields, gardens, and woods; by experiments in physics and chemistry in the laboratory; by watching birds among the trees, insects upon the pond, butterflies on the clover, trees in their blossoms and fruitage, the weeds by the roadside, vegetables in the garden the children are acquiring the first indispensable impressions and that happy enjoyment of the wonders and beauties surrounding them in nature without which all later study from books and scientific treatises is unreal and unmeaning.

After all, the difference between science and the other studies (history and geography) is not so great. We do not begin history and geography with books in the first two or three years, but with oral discussion and presentation. In fact, no study can be properly begun with children from books. It is only after the children have acquired some taste for a study and have accumulated considerable knowledge in its concrete forms that books can be used to advantage. And so it is with books of science.

In the first four grades of the common schools, and to a large extent in the higher grades, science studies should be carried on almost wholly without books. Their appreciation and insight into nature in many directions should be steadily cultivated, not through the reading of books, but by direct contact with the senses and by exercise of the thinking powers upon present objects. Most of the efforts thus far made to introduce children to nature by means of books are farcical and fruitless. But as the children grow older, having accumulated a considerable variety of knowledge and sympathy for nature study, the best books on these subjects will be found very helpful. The teachers, indeed, will find books necessary at all times in guiding their efforts in nature study, but with this we are not now chiefly concerned. It will be found that for children in the intermediate and grammar grades there is quite a collection of science books that should be made easily accessible to them in the library. Indeed, some of them can be used to advantage in the supplementary reading in the grades in reading classes. Such, for example, are *Short Stories of Our Shy Neighbors*, by Mrs. Kelly; *Glimpses of the Plant World*, by Fanny Bugen; and *Town Geology*, by Charles Kingsley. Another class of books that children should learn to enjoy is that of Burroughs and Thoreau—the sympathetic and literary side of nature study. Some of these, like *Birds and Bees*, and *Wild Apples*, like the poems of Bryant and Whittier, have gone into our school readings as classics. Then there are the works of the masters of science, Huxley, Tyndall, Darwin, etc., which combine scientific knowledge and genius with literary power, and are great books for students and adults to read. It is now possible to make up a list of science books, one or two hundred in number, which would add greatly to the value of a school library. There is also a great need for teachers to be more abundantly supplied with these fuller and more inspiring sources of study as a help and guide in observation.

We have seen thus that, besides the usual reference books such as dictionaries, cyclopædias, atlases, etc., there are four great groups or classes of books which need to be carefully selected and well represented in a typical school library.

1. The best permanent literary books suitable for children's study and reading. This, for general educative purposes, must remain the nucleus of any school library.
2. Historical stories, biographies, narratives, and histories.
3. Geographical readers and books of travel.
4. Books on the leading phases of natural science.

The extent to which such a library is well used is a significant test of the efficiency of our whole educational activity in the schools.

It will be seen from the preceding discussion that the purpose of the school, in addition to teaching children to read, is to give them a spirited introduction to the chief kinds of reading matter, to develop such tastes and habits of reading and consulting books that they will be disposed in their later years to make the best use of their power to read. The mere ability to read is of very little value; in some cases it is a positive misfortune, when the reading matter is vicious and the taste for such demoralizing books is cultivated. When the children are ready to leave school, their self-education will begin in earnest. One of the best things that the school can do is to launch people upon their independent life with a taste for good reading matter and a judgment sufficiently developed for selecting the right classes of books. The school library and the public library must furnish the chief opportunities for children in their later school years and during the years which follow school life for carrying out any plans of reading. The teachers and parents and the librarian, as far as possible, should come to an understanding and agreement as to what books they would recommend, and encourage children to read.

One of the results of the attention recently paid to good literature in our schools is seen in the growing disposition of parents and children to read and discuss the standard books together. Many of the more intelligent and thoughtful parents are willing to spend their evenings with their children, reading and interpreting such books as *Gulliver's Travels*; Hawthorne's *Grandfather's Chair*; the lives of Lincoln, Webster, and other Americans; the story of Ulysses; the stories of King Arthur, the Greek heroes, the Bible stories; and also the plays of Shakesp are, Plutarch's *Lives*, historical biographies, and other books of history and travel, as well as of geography and science.

It is not uncommon for teachers and principals of schools to call together the parents and explain the character of our reading matter, the selection of proper books for children, and the advantages of parents reading with their children. There is, probably, no one thing that can accomplish more in making the home what it ought to be than such home readings of books which are recognized by all as among the best. Fortunately, the parents will be benefited as much as the children; for the books that we have had in mind are just as interesting and valuable to grown people as to children. They are books that do not lose their charm. Much has already been done in this direction; but vastly more must be done in the future. The home and the school properly working together can do a great deal in this way in creating a happy and healthful moral atmosphere, which is most favorable to the development of strong and symmetrical characters. What has been done, therefore, is only a beginning of what should be done all over this land and for the children of all classes in myriads of homes. But to accomplish this, libraries must be numerous and well equipped, far beyond anything which is common among us now. The public library, with its well-stored shelves of choice books, becomes as necessary as the schoolhouse itself. The librarian, trained and cultivated, should know as well as the teachers themselves what books are suitable for school children and young people. Librarians, therefore, should not only be experts in classifying and cataloguing books, but they should be trained experts in estimating and selecting reading matter for educative purposes. Many of the professional librarians have already responded to this requirement, and a great deal has been done in some of our towns and cities, like Boston, Minneapolis, New York City, and smaller cities, to bring the public librarians into vital touch with school children during these years of educative growth and character-building.

A library should furnish a good collection of books in all the principal departments of study. In this way a child in the course of his education may widen out his knowledge and interest in many directions. For the sake of general, all-sided cul-

ture it is desirable that a child should be many-sided in his development, and yet a library may produce an excellent effect upon a child by giving him an opportunity for cultivating a strong liking for one limited class of books. It is a great and successful stroke of education thoroughly to awaken and interest a child in one branch of study, and to make him acquainted with a few of the masterpieces in this narrow field. This one enthusiasm may be enough to make a reader and student, while a child who has never acquired a taste for any one class of books will remain dull, and shallow, and commonplace. From this standpoint, a good library, even though it be not very large, may contribute efficiently to the educational growth of a variety of students.

In fact, the library can do for the student what no school can do. It can furnish the opportunity for that fuller and richer study in any one branch of science in which the student has become deeply interested. The school of necessity covers all branches of study with about equal or impartial care. It can not go deeply into any subject. The best it can do is to open up the subject and develop a healthy and hearty appetite for that kind of knowledge. But the library can furnish just that broader and select material which can develop a strong and permanent enthusiasm. The school can do little more than awaken an appreciation for a few masterpieces of forensic literature; but the library should contain all the great speeches of Burke, Fox, Chatham, Cicero, Webster, Sumner, etc., where the boys who have a special taste for this kind of literature can find the best in abundance. The same is true for those who have a taste for history, or art, or the drama, or fiction, or biology.

CLASSIC READINGS FOR THE FIRST FOUR GRADES OF THE COMMON SCHOOLS.

- The Adventures of a Brownie* (for teacher), Harper Bros.
Kindergarten Stories and Morning Talks (Wiltse), Ginn & Co.
Talks for Kindergartens and Primary Schools (Wiltse), Ginn & Co.
Grimm's Fairy Tales (Wiltse), Ginn & Co.
German Fairy Tales (Grimm), Maynard, Merrill & Co.
Fables and Folk Lore (Seudder), Houghton, Mifflin & Co.
Danish Fairy Tales (Andersen), Maynard, Merrill & Co.
Poetry for Children (Eliot), Houghton, Mifflin & Co.
The Story Hour (Wiggin), Houghton, Mifflin & Co.
Robinson Crusoe, Public School Publishing Co.
Æsop's Fables (Stickney), Ginn & Co.
Andersen's Fairy Tales, Part I, Ginn & Co.
Seven Little Sisters, Ginn & Co.
Hans Andersen's Stories, Houghton, Mifflin & Co.
Fairy Tales in Verse and Prose (Rolfe), Harper Bros.
Stories Mother Nature Told Her Children, Ginn & Co.
Andersen's Fairy Tales, Part II, Ginn & Co.
Child Life in Poetry, Houghton, Mifflin & Co.
Child Life in Prose, Houghton, Mifflin & Co.
Arabian Nights (Aladdin), Maynard, Merrill & Co.
Six Stories from the Arabian Nights, Houghton, Mifflin & Co.
Gulliver's Voyage to Lilliput, Maynard, Merrill & Co.
Kingsley's Greek Heroes, Ginn & Co.
Hawthorne's Tanglewood Tales, Houghton, Mifflin & Co.
Arabian Nights (Hale), Ginn & Co.
Gods and Heroes, Ginn & Co.
Gulliver's Travels, Ginn & Co.
Adventures of Ulysses (Lamb), Ginn & Co.
Hawthorne's Wonder Book, Houghton, Mifflin & Co.
Stories of the Old World (Church), Ginn & Co.
Ulysses Among the Phœnicians (Bryant), Houghton, Mifflin & Co.
Kingley's Water Babies (Macmillan), Ginn & Co.

CLASSIC READINGS FOR THE FIFTH TO THE EIGHTH GRADES OF THE COMMON SCHOOL.

- Hiawatha*, Houghton, Mifflin & Co.
Lays of Ancient Rome, Houghton, Mifflin & Co.; Maynard, Merrill & Co.
King of the Golden River, Ginn & Co.
Stories from Herodotus, Maynard, Merrill & Co.

- Children's Treasury of English Song* (choice poems, fourth to seventh grades), Macmillan.
Grandfather's Chair, Houghton, Mifflin & Co.
The Sketch Book, Ginn & Co.; American Book Co.; Maynard, Merrill & Co.
Miles Standish, Houghton, Mifflin & Co.
Snow Bound, etc., Houghton, Mifflin & Co.
Tales of a Grandfather, Ginn & Co.
Birds and Bees, Houghton, Mifflin & Co.
Dickens's Christmas Carol and Cricket on the Hearth, Houghton, Mifflin & Co.
The Christmas Carol, Houghton, Mifflin & Co.; Maynard, Merrill & Co.
The Stories of Waverley, Macmillan.
The Lay of the Last Minstrel, Ginn & Co.; Maynard, Merrill & Co.
Autobiography of Benjamin Franklin, Ginn & Co.; Houghton, Mifflin & Co.; Maynard, Merrill & Co.
Hunting of the Deer, Houghton, Mifflin & Co.
Bunyan's Pilgrim's Progress, Ginn & Co.
Evangeline, Houghton, Mifflin & Co.; Maynard, Merrill & Co.
Grandmother's Story of Bunker Hill, etc., Houghton, Mifflin & Co.
Sella, Thanatopsis, and Other Poems, Houghton, Mifflin & Co.; Maynard, Merrill & Co.
Tales from Shakespeare (Lamb), Macmillan.
Sharp Eyes and Other Papers, Houghton, Mifflin & Co.
Tales of the White Hills (Hawthorne), Houghton, Mifflin & Co.
Enoch Arden and The Lotus Eaters, Maynard, Merrill & Co.
Sohrab and Rustum, Leach, Shewell & Sanborn; American Book Co.
Bunker Hill Monument (Webster), Ginn & Co.; Houghton, Mifflin & Co.; Leach, Shewell & Sanborn; American Book Co.
Seven American Classics, American Book Co.
Cricket on the Hearth, Houghton, Mifflin & Co.; Maynard, Merrill & Co.
The Succession of Forest Trees, Houghton, Mifflin & Co.
Peasant and Prince, Ginn & Co.
Rab and His Friends (Brown), Home Book Co.; Maynard, Merrill & Co.
Silas Marner (Eliot), Leach, Shewell & Sanborn.
Vision of Sir Launfal, Houghton, Mifflin & Co.
Under the Old Elm, etc., Houghton, Mifflin & Co.
Julius Caesar, American Book Co.
Lady of the Lake, American Book Co.; Maynard, Merrill & Co.; Ginn & Co.; Houghton, Mifflin & Co.
Burke's American Orations, D. C. Heath & Co.; Maynard, Merrill & Co.
Webster's Reply to Hayne, Maynard, Merrill & Co.
Lincoln's Gettysburg Speech, etc., Houghton, Mifflin & Co.
Merchant of Venice, American Book Co.; Ginn & Co.
Marmion, Ginn & Co.; Maynard, Merrill & Co.; Houghton, Mifflin & Co.
Masterpieces of American Literature, Houghton, Mifflin & Co.
Roger de Coverley Papers, American Book Co.; Houghton, Mifflin & Co.; Leach, Shewell & Sanborn.
Selections from Ruskin, Ginn & Co.; Leach, Shewell & Sanborn.
Emerson's Fortune of the Republic, etc., Houghton, Mifflin & Co.
Bacon's Essays, Ginn & Co.; Maynard, Merrill & Co.
The Holy Grail and Sir Galahad, Maynard, Merrill & Co.
The American Scholar, etc. (Emerson), American Book Co.
Plutarch's Lives, Ginn & Co.
Vicar of Wakefield, Ginn & Co.
Rasselas, Leach, Shewell & Sanborn; Ginn & Co.
Swiss Family Robinson, Ginn & Co.
Irving's Alhambra, Ginn & Co.
Readings from the Spectator, Educational Publishing Co.
Tom Brown at Rugby, Ginn & Co.
Longfellow's Tales of a Wayside Inn, Houghton, Mifflin & Co.
The Peasant and the Prince, Ginn & Co.
Peabody's Old Greek Folk Stories, Houghton, Mifflin & Co.
Undine, Ginn & Co.
Selections from Ruskin, Ginn & Co.
German Household Tales (Grimm), Houghton, Mifflin & Co.
Stories from the Arabian Nights, Houghton, Mifflin & Co.
The Hoosier School-Boy, Charles Scribner's Sons, New York.
Homer's Iliad (Pope's), Ginn & Co.
Don Quixote, Ginn & Co.
Fanciful Tales (Stockton), Charles Scribner's Sons, New York

Being a Boy, Houghton, Mifflin & Co.
Tom Brown's School Days (Hughes), Houghton, Mifflin & Co.
Scott's Quentin Durward, Ginn & Co.

BOOKS OF SCIENCE.

A Few Familiar Flowers, Ginn & Co.
Outdoor Studies, American Book Co.
The Story of the Solar System, D. Appleton & Co.
Botany for Young People (Gray), American Book Co.
The Story of a Piece of Coal, D. Appleton & Co.
Town Geology, The Macmillan Co.
Coal and Coal Mines, Houghton, Mifflin & Co.
Birds of Village and Field, Houghton, Mifflin & Co.
In Birdland (Keyser), A. C. McClurg & Co.
Bird Life, D. Appleton & Co.
Familiar Trees and their Leaves, D. Appleton & Co.
The Ocean of Air, Educational Publishing Co.
Frail Children of the Air, Houghton, Mifflin & Co.
Butterflies, Henry Holt & Co.
Inmates of My House and Garden, The Macmillan Co.
Romance of the Insect World, The Macmillan Co.
News from the Birds (Keyser), D. Appleton & Co.
Animal Life in the Sea and on the Land, American Book Co.
Recreations in Botany, Harper Bros.
The Stories of the Trees, Thomas Nelson & Sons.
The Fairy-Land of Science, D. Appleton & Co.
A Naturalist's Rambles About Home, D. Appleton & Co.
Animal Memoirs, 2 vols. (Lockwood), American Book Co.
The Population of an Old Pear Tree (E. Van Bruyssel), Macmillan & Co.
Plants and their Children (Dana), American Book Co.
A Reader in Botany (Newell), Ginn & Co.
Short Stories of Our Shy Neighbors, American Book Co.
Sunshine (Amy Johnson), Macmillan & Co.
Natural History in Anecdote, Dodd, Mead & Co.
The Soil (King), The Macmillan Co.
How to Study Plants (Wood), American Book Co.
Four-Footed Americans, The Macmillan Co.
The Great World's Farm, Seeley & Co., London.
The Natural History of Aquatic Insects (Miall), The Macmillan Co.
Philip's Experiments (Trowbridge), D. Appleton & Co.
Birds through an Opera Glass, Houghton, Mifflin & Co.
Madam How and Lady Why (Kingsley), The Macmillan Co.
The Natural History of Selborne (White), Ginn & Co.
Boys and Girls in Biology (Stevenson), D. Appleton & Co.
Glimpses at the Plant World (Berger), Ginn & Co.
Up and Down the Brooks (Bamford), Houghton, Mifflin & Co.
Science Sketches (Jordan), A. C. McClurg & Co.

BOOKS OF GEOGRAPHY AND TRAVEL.

Carpenter's Geographical Reader of North America, American Book Co.
King's Geographical Reader, 6 vols., Lee & Shepard.
Our American Neighbors, Silver, Burdett & Co.
Rupert's Geographical Reader, Leach, Shewell & Co.
The Information Readers, 4 vols., Boston School Supply Co.
The Great American Industries, 2 vols., A. Flanagan.
Ballou's Footprints of Travel, Ginn & Co.
Appleton's General Guide to the United States and Canada, 2 vols., D. Appleton & Co.
Shaler's The Story of Our Continent, Ginn & Co.
Stories of Industry, 2 vols., Educational Publishing Co.
Lakes of North America, Ginn & Co.
Lummis' A Trip Across the Continent, Charles Scribner's Sons.
Parkman's The Oregon Trail, Little, Brown & Co.
Badlam's Modern Europe, Silver, Burdett & Co.
Tarr's Physical Geography, The Macmillan Co.
Johannot's A Geographical Reader, American Book Co.
Heilprin's The Earth and its Story, Silver, Burdett & Co.
Hutchison's The Story of the Hills, The Macmillan Co.

Baedeker's guidebooks of Great Britain, the Rhine, etc., Karl Baedeker, Leipzig.
 Scribner's *Geographical Reader*, American Book Co.
 Badlam's *Views in Africa*, Silver, Burdett & Co.
 Carpenter's *Geographical Reader, Asia*, American Book Co.
 Smith's *Life in Asia*, Silver, Burdett & Co.
Australasia and the Islands of the Sea, Silver, Burdett & Co.
 Reclus's *The Earth*, Harper Bros.

HISTORICAL STORIES, FROM THE FOURTH TO THE EIGHTH GRADE.

Stories from the History of Rome, Macmillan.
Story of the Iliad, Macmillan.
Tales from Spenser, Macmillan.
Heroes of Asgard, Macmillan.
Story of the Odyssey, Macmillan.
Tales of Troy, Public School Publishing Co.
Tales from English History, Harper Bros.
Ten Boys on the Road from Long Ago, Ginn & Co.
Tales of Chivalry, Harper Bros.
Magna Charta Stories, Inter-State Publishing Co., Boston.
Stories of Our Country, American Book Co.
Pioneer History Stories, Public School Publishing Co.
Book of Golden Deeds (Yonge), Macmillan.
Jason's Quest, Leach, Shewell & Sanborn.
Ten Great Events in History, American Book Co.
Ivanhoe, Ginn & Co.
The Making of New England, Charles Scribner's Sons.
Historical Classic Readings, Ethingham Maynard, New York.
The Beginnings of New England, Houghton, Mifflin & Co.
Conspiracy of Pontiac (Parkman's), Little, Brown & Co.
Story of Columbus, Educational Publishing Co.
Odysseus, Charles Scribner's Sons.
The Story of the Chosen People, American Book Co.
Stories of the Thirteen Colonies, American Book Co.
The Story of the English, American Book Co.
The War of Independence, by John Fiske, Houghton, Mifflin & Co.
Story of Troy, American Book Co.
The Story of Caesar, American Book Co.
George Washington, Houghton, Mifflin & Co.
The Story of the Romans, American Book Co.
Watch Fires of '76, Lee & Shepard.
Twelve Naval Captains, Charles Scribner's Sons.
Stories of Great Inventors, Educational Publishing Co.
Fifty Famous Stories Retold, American Book Co.
Stories of Colonial Children, Educational Publishing Co.
The Children's Life of Abraham Lincoln, A. C. McClurg & Co.
Story of Aeneas, American Book Co.
Stories of Great Americans, for Little Americans, American Book Co.
Children's Stories of American Progress, Charles Scribner's Sons.
The Boys of '76, Harper Bros.
Southey's Life of Nelson, Ginn & Co.; American Book Co.
The Discovery of America, 2 vols., by John Fiske; Houghton, Mifflin & Co.
Old Virginia and her Neighbors, 2 vols., by John Fiske; Houghton, Mifflin & Co.
The American Revolution, 2 vols., by John Fiske; Houghton, Mifflin & Co.
The Critical Period of American History, by John Fiske; Houghton, Mifflin & Co.
Decatur and Somers, D. Appleton & Co.
Westward Ho! Macmillan.
Old Stories of the East, American Book Co.
Macaulay's Earl of Chatham, Leach, Shewell & Sanborn.
Macaulay's Life of Johnson, Leach, Shewell & Sanborn.
Macaulay's Lord Clive, Leach, Shewell & Sanborn.
The Life and Writings of Addison, by Macaulay; American Book Co.

The following list of one hundred books for high schools is selected by Principal J. C. Hanna, Oakpark, Ill.:

ONE HUNDRED BOOKS OF UNQUALIFIED VALUE FOR HIGH-SCHOOL STUDENTS TO READ.

FICTION.

1. <i>Rab and his Friends,</i>	Brown	21. <i>Last Days of Pompeii,</i>	Bulwer
2. <i>Lorna Doone,</i>	Blackmore	22. <i>Robinson Crusoe,</i>	Defoe
3. <i>Last of the Mohicans,</i>	Cooper	23. <i>Story of a Bad Boy,</i>	Aldrich
4. <i>Tale of Two Cities,</i>	Dickens	24. <i>The Pathfinder,</i>	Cooper
5. <i>The Three Musketeers,</i>	Dumas	25. <i>David Copperfield,</i>	Dickens
6. <i>The Hoosier Schoolmaster,</i>	Eggleston	26. <i>Twenty Years After,</i>	Dumas
7. <i>Silas Marner</i>	Eliot	27. <i>Mieah Clarke,</i>	Doyle
8. <i>Pilgrim's Progress,</i>	Bunyan	28. <i>Kenilworth,</i>	Scott
9. <i>The Man Without a Country,</i>	Hale	29. <i>Waverley,</i>	Scott
10. <i>The House of Seven Gables,</i>	Hawthorne	30. <i>Gulliver's Travels,</i>	Swift
11. <i>Tom Brown's School Days,</i>	Hughes	31. <i>Vanity Fair,</i>	Thackeray
12. <i>Les Misérables,</i>	Hugo	32. <i>Henry Esmond,</i>	Thackeray
13. <i>Westward Ho!</i>	Kingsley	33. <i>Cloister and Hearth,</i>	Reade
14. <i>Hugh Wynne, Free Quaker,</i>	Mitchell	34. <i>Scottish Chiefs,</i>	Porter
15. <i>Treasure Island,</i>	Stevenson	35. <i>Hyppatia,</i>	Kingsley
16. <i>Ivanhoe,</i>	Scott	36. <i>Soldiers Three,</i>	Kipling
17. <i>Quentin Durward,</i>	Scott	37. <i>Kidnapped,</i>	Stevenson
18. <i>Uncle Tom's Cabin,</i>	Stowe	38. <i>The Talisman,</i>	Scott
19. <i>Ben-Hur,</i>	Wallace	39. <i>The Emperor,</i>	Ebers
20. <i>Harold,</i>	Bulwer	40. <i>Schönberg Cotta Family</i>	

ESSAYS, ETC.

1. <i>Autoerat of the Breakfast Table,</i>	Holmes	6. <i>Essay on Burns,</i>	Carlyle
2. <i>Sketch Book,</i>	Irving	7. <i>Earth and Man,</i>	Guyot
3. <i>Essay on Milton,</i>	Macaulay	8. <i>The Book of the Ocean,</i>	Ingersoll
4. <i>Being a Boy,</i>	Warner	9. <i>Sir Roger de Coverley Papers,</i>	Addison
5. <i>Birds and Bees,</i>	Burroughs		

POETRY.

1. <i>Evangeline,</i>	Longfellow	11. <i>L' Allegro,</i>	Milton
2. <i>Vision of Sir Launfal,</i>	Lowell	12. <i>Il Penseroso,</i>	Milton
3. <i>Snow Bound,</i>	Whittier	13. <i>Lady of the Lake,</i>	Scott
4. <i>Tent on the Beach,</i>	Whittier	14. <i>Marrion,</i>	Scott
5. <i>Selected Poems,</i>	Burns	15. <i>Merchant of Venice,</i>	Shakespeare
6. <i>Childe Harold,</i>	Byron	16. <i>Julius Caesar,</i>	Shakespeare
7. <i>Ancient Mariner,</i>	Coleridge	17. <i>Macbeth,</i>	Shakespeare
8. <i>Elegy in a Country Churchyard,</i>	Gray	18. <i>As you Like It,</i>	Shakespeare
9. <i>Lays of Ancient Rome,</i>	Macaulay	19. <i>Princess,</i>	Tennyson
10. <i>Lycidas,</i>	Milton	20. <i>Idylls of the King,</i>	Tennyson

MISCELLANEOUS.

1. <i>The Gold Bug and Other Tales,</i>	Poe	13. <i>The Story of the Plants,</i>	Grant Allen
2. <i>Stories from Homer,</i>	Church	14. <i>Homer (Princes of Literature),</i>	Gladstone
3. <i>Stories from Virgil,</i>	Church	15. <i>Books and Readings,</i>	Porter
4. <i>Prose Translation of Odyssey,</i>	Butcher and Lang	16. <i>The Story of the Cowboy,</i>	Hough
5. <i>Classic Myths in English Literature,</i>	Gayley	17. <i>The Story of the Mine,</i>	Shinn
6. <i>Old Times on the Mississippi,</i>	M. Twain	18. <i>The Story of the Indian,</i>	Grinnell
7. <i>Curious Myths of the Middle Ages,</i>	Baring-Gould	19. <i>The Story of the Railroad,</i>	Warman
8. <i>Two Years Before the Mast,</i>	Dana	20. <i>Citizen Bird,</i>	Wright and Cones
9. <i>Wonder Book,</i>	Hawthorne	21. <i>Brave Little Holland and What She Taught Us,</i>	Griffis
10. <i>Tanglewood Tales,</i>	Hawthorne	22. <i>How Marcus Whitman Saved Oregon,</i>	Nixon
11. <i>Jungle Books, 2 vols.,</i>	Kipling	23. <i>Society in Rome under the Cæsars,</i>	Inge
12. <i>The Story of Primitive Man,</i>	Clodd	24. <i>Stories from Herodotus,</i>	Church

BIOGRAPHY.

V. REPORT OF THE SUBCOMMITTEE ON RELATION OF LIBRARIES TO NORMAL SCHOOLS.

By M. LOUISE JONES.

RELATION OF THE LIBRARY TO THE PUPIL TEACHER.

The subcommittee on normal schools and libraries briefly considers the problem from three points of view: (1) What book equipment has the pupil teacher a right to demand of the normal school? (2) What is the relation of the library to that demand? (3) How far are the normal schools realizing their opportunity?

Since young men and women enroll in normal schools for the purpose of making adequate preparation for the profession of teaching, it seems that the least the institution should do is: First, to train them so to discipline their own mind as to make all its functions in the highest degree serviceable to themselves; second, to help them to acquire such a fund of knowledge as will make them wise guides for the children; third, to give them such an understanding of the human mind as will enable them to train wisely the children committed to their care; and fourth, to give them such an acquaintance with books as shall enable them to know and choose the best for the child, and to train it how to use the contents to greatest advantage. The importance of the first two has been realized from the first; the third now engages attention; but the fourth is comparatively a new field. What can the normal schools furnish in the way of book and library equipment, and what is being done?

The student enrolls in the normal school in a double sense: He is there to develop

his own capacity, and thoroughly to furnish himself unto the great work of teaching. The first involves academic training similar to that offered in other institutions of liberal culture, and calls for a similar use of books; the second asks an equipment for the profession of teaching, and demands a culture in books otherwise less needful. All students require training in thorough, comprehensive research, but the pupil teacher must enter upon it with the idea of becoming an *index rerum* for his future schoolroom, and of learning to correlate whatever can be mutually related. Personal conviction and class-room stimulus will avail little unless the library be there to do its part. In an academy one may perhaps be satisfied to study Virgil with a lexicon and a work on mythology; but the normal student can to advantage turn to parallel passages in the play of *Hecuba* and the tragedy of *Agamemnon*; or read Longfellow's *Enceladus*, Tennyson's *Ænone*, Wordsworth's *Laodamia*. The student of science in an academy may be satisfied to do laboratory and field work, but the pupil teacher must learn to correlate his work in biology with the nature element in literature, or his pupils may not go from Burroughs and Thoreau and Ernest Ingersoll to field and forest and laboratory. The college boy may rest satisfied with *In Memoriam* as an elegiac poem, but some day the pupil teacher will need to associate it with Emerson's *Essay on Friendship*, Trumbull's *Friendship the Master Passion*, or the story of *David and Jonathan*, in order to teach the sacredness of human friendship. No history of education in the United States is comparable to that made by the student himself in a small, well-selected, professional library. In a normal school worthy of the name text-books can be little more than inspirations and suggestions for personal, independent work in library, or laboratory, or afield. The teacher himself must *be* before he knows how to train being.

Again, he who has, as sole capital for his profession, a life certificate to teach in the common schools of the State is "poor indeed." Given a natural aptitude for teaching, instinct should prompt him to study his own personality with reference to his educative power. One may need myths and folklore, songs and exercises, poems and pictures; the library is his only possibility. The little white schoolhouse on the prairies of the West or in the pineries of the North may demand of another an accurate knowledge and speedy recognition of bird and beetle, moth and butterfly, or a rich supply of mechanical devices; the library should richly supplement museum and laboratory. There, catalogued, indexed, and easily accessible, should be found, not in single copies alone, but sometimes in duplicate sets, whatever will increase his efficiency and promote the interests of the community.

Nor is it sufficient for the library to furnish the student what he needs as a teacher; it must, as well, enable him to satisfy the child whom he is to educate. It is no longer safe for a young man or woman who expects to teach to put off acquiring a general knowledge of books until after the professional training is over. The American boy and girl will read, and, next to the intelligent parent, teachers have the best opportunity for wise guiding. Let the normal library be rich in literature for children, and it will not be long before instructors will see to it that teachers are correlating work for their own enrichment with literature that will be attractive to their pupils. Books satisfy one craving only to create a fresh one. The judicious teacher who arrested the attention of an idle, pugnacious little fellow with stories of Greek heroes little realized that she was turning the tides of destiny and making him an honor man in college Greek. The one who placed a copy of Burns's poems in a boy's hand little realized that thus the Quaker lad would find his own poetic instinct. A book on birds in the hand of a child made one man an ornithologist of no mean note. How many more the world might have had, if children had been given proper literature, we shall never know, but it will be criminal in the future to mar such a possibility. In several States, normal schools not only are placing such literature on their shelves and making use of it in class rooms, but their pupils in the field are establishing schoolroom or village libraries, and in large measure duplicating what

they found on the shelves where they were taught. And this is as it should be. If the people look to normal schools for trained teachers, then they have a right to demand that these teachers come to them prepared to name the best books, and to use them in the best way after they are purchased. "No teacher, worthy of the name, should rest satisfied until, having chosen a book for a child with as much care as a physician would use in selecting his instruments, he sees that child as an interested and successful reader of the same."

Thus far we have considered the possibilities of the library as it has direct bearing on the pupil teacher and the book problem of the future schoolroom. Has the student himself, by virtue of being a student, any rights which the library is bound to respect? The teaching profession was the last to feel that it needed a training school of its own, and the last to appreciate the necessity for a literature distinctly professional. The universities early recognized the necessity for schools of law, medicine, and theology, and that upon the libraries of professional literature connected therewith depended student efficiency. Not until the first normal schools were established in the United States was teaching recognized as in any true sense professional in character. An education more or less general was deemed ample qualification. That normal schools have successfully demonstrated that teaching is a profession and demands a professional literature is evidenced from two facts: First, that a university can no longer hold its title in fee simple without establishing a department of pedagogy; and, second, that all thinkers are studying the problems of education both from the historical and philosophical points of view, and giving to the profession the results of their ripened conviction or of their patient investigation. Thus there is a rapidly growing didactic literature that no normal school can afford to be without.

The sections of the library devoted to child study, psychology, history of education, and other strictly professional subjects, should be full and complete. It were far better that in a normal school less be expended on laboratory and museum, and more upon these departments of the library. The teacher can be taught to manufacture much of his own apparatus and to make his own museum, but how shall he train the child aright if he do not know the evolution of the race, the history of its educational development, and the growth of the human mind? Teaching is so recent a science that its history can not yet be written with any fullness; hence normal libraries should become storehouses, in which are being gathered together whatever will supplement text-books and enable pupil teachers to pursue independent investigation. Nor should the professional side of academic studies be neglected. It may be just as necessary for some future teacher to look up the origin, growth, and decay of the gender idea of nouns as to trace the rise and growth of political parties. Too long have normal libraries been purely academic in character. It is high time for them to become professional as well. The normal school is called upon to do professional work, and to the end that its pupils may have every advantage to know the history and philosophy of their own profession, and that the instructors in it may be able in turn to contribute the results of their own scholarship applied to the problems of the age, the library should lay the world under tribute for whatever will enrich their field of inquiry and constitute their field of authority. The generosity which the States so unanimously show to their great universities will in time be extended also to the normal schools. It can not come too soon, if the common schools, for which the normal school exists, are to remain the lines of fortification for the Republic and preserve the integrity of the nation.

Lastly, since the students are here in the capacity of pupil teachers, they and their constituency have a right to demand of the library a favorable opportunity to study child life in literature. Every well-equipped normal school has its model training department, serving the double purpose of enabling its students to teach under the watchful eye of a competent critic, and to study the unfolding life of the child. It is here that they begin to realize that theirs is not to teach books, but to educate; that

streams of impulse are to flow into and become character; that a satisfactory and happy future is conditioned upon a good to-day. Nevertheless is it true that the child is isolated from the world of environment in which he is destined to live. Each little child is to pass from this isolation and seclusion to determine its own relation to environment; yea, more, to adjust itself to its former companions in the schoolroom, now also transformed by changed conditions into a force new and, to some extent, incomprehensible. The thoughtful man and earnest maiden will scarcely be contented to let the legal requirement suffice for the study of the child. They should have the opportunity to turn to literature, where the lifeblood of the race spirit pulses warm and free. It is interesting to watch the novice call the attention of the child to the world outside,

The beauty and the wonder and the power,
The shapes of things, their colors, lights, and shades,
Changes, surprises,

and hear her say: "God made it all." But it is impressive, when she turns to literature, to watch the child in the realm of activity, to study how and by what its life is being shaped, to be thankful that even a child may lead from tumult into peace, and from sin unto righteousness.

This is and should be the function of the library in a school where teachers are trained to serve the State by educating its future citizens.

LIBRARY EQUIPMENT AND ORGANIZATION.

One of the serious problems in any educational institution must be the equipment and organization of its library, and this is peculiarly true where self-culture and professional training are to be secured at the same time. The library of a normal school can not afford to ignore a student's right to efficient service, because, directly and indirectly, it thus influences the entire State. Whatever of advantage the student derives from a well-arranged library, whatever he may learn of library methods, is quite likely to be of benefit to the community where he teaches. From the beginning, books should be classified according to one of the best systems in general use, and, if possible, like the one at the State university, so that, from crossroads to campus, library usage may be easy.

Whether the books be in charge of an untrained librarian or of a member of the faculty, it is not impossible to arrange books and shelves by system, and train students to preserve the classification. Author and title catalogues can be made in harmony with the chosen system, and when 500 volumes are on the accession list, an expert cataloguer is needed, to double the efficiency of the library. Often the portions of a book most valuable to a student are suggested neither in the title nor in the table of contents; as, for example, the home of Napoleon Bonaparte on the island of St. Helena described in one of the Consular Reports, or some of the interesting facts of educational history treasured in the reports of the Bureau of Education published in the seventies and eighties. An expert cataloguer may seem a heavy expense for a small library, but the smaller the collection of books, the more necessity for using them to their fullest extent. A library expert interested in educational matters is practically an assistant in every department of instruction. She makes herself acquainted with the curriculum and familiar with the lines of work pursued in the several departments; anticipates class-room requirements; and is ready to meet them; is able to take students in groups, and, by timely talks, not only to increase their library knowledge, but help them to understand a book. A country lad, after fifteen minutes with such an expert, said recently: "That talk with Miss R. was worth more to me than a term's work with any professor. I know how to take hold of a book now and get some good out of it." Experience strengthens the belief that a scientifically trained librarian is invaluable in a normal school, and more to be desired than large accessions of books without a complete catalogue. In an ideal normal school, senior pupils will

have opportunities to assist the librarian in this work and thus become familiar to some extent with the methods of interesting students in good literature.

Each year periodical literature becomes more valuable. This is evident, whether we consider the price that must be paid for the earlier volumes of any leading magazine, if perchance they are even in market, or whether we consider the articles that appear in the current month. No teacher can afford to live behind his age, and to do otherwise requires a generous supply of current periodical literature. Notably is this true of whatever is professional in character. Any magazine worthy the attention of a student in normal schools is worthy of preservation in permanent form. Barnard's *Journal of Education* was long ago out of market, and the earlier numbers of the *Child-Study Monthly* are practically beyond the reach of the many normal schools that failed to order them when current. Too much emphasis can not be laid upon the necessity of buying and binding periodical literature.

Poole's *Index* and kindred publications unlock this mine of wealth, and yet students often regret that the subject catalogue does not include magazine articles. In the study of the library problems this member of the committee has been led to believe that some portion of the student body in a normal school should be allowed to make such a catalogue for magazine articles. It need not and should not be a part of the regular catalogue, but, in a case exclusively its own, be an integral part of the library equipment. It will serve two purposes—aid the new student to make more effective research, and enable one further advanced to acquire some skill in bringing out subject-matter by topics, thus training him to be an efficient helper in schools where an expert librarian is not an immediate possibility.

One of the best sections of the library should be devoted to public documents, both State and national. Here earnest workers will be found turning the pages of geological surveys for land slopes and scale of foothills, for identification of birds and insects, for descriptions of rare plants and native flora. Government reports are an inviting field for workers in sociology, political economy, history, and finance. Reports of the Bureau of Education, from the first volume to the present, furnish much that the student of the history of education can not find elsewhere. Census reports offer a comparative study of no mean value, and throw light upon many a knotty question in debate. *The Growth of Industrial Art*, a public document, is good supplementary reading for a class in history of art, and *Records of the Civil War* are the raw material out of which the new philosophy of history will fashion many a chapter. What is true of Government reports is equally true of State documents. Where should they be found if not in normal schools, where is forged the anchor of our ship of state? One institution is gathering extra volumes of the National Educational Association reports. Of the last issue alone several copies are on the library shelves, while three or four times as many are stored in the packing room for future need.

This is preeminently the age of associations. Men of wide culture and similar tastes group together for the purposes of scientific investigation, historical research, or a study of the problems of the age. The results of their labors are published as monographs; yet, from the reports received by this committee, it is evident that few normal schools are enriching their libraries with such accessions. Where shall we look for the *Herbartian Yearbook* if not in the library of a State normal school? Where may we expect to find the publications of the American Historical Society and others of like nature if not where pupil teachers most do congregate? To the meagerness of legislative appropriation is doubtless due this state of affairs. Whatever the cause, is there not some remedy? The nation fosters education. Her school system is at once her pride and the source of her strength. For its maintenance she has made liberal grants. The States, on the whole, are generous. If they are not beneficent toward normal schools, it is because they have not seen the necessity; and who shall make the need known if not the schools where teachers are in training for

city, village, yea, and country districts? Some of the largest libraries in these professional schools have charged students a small fee and thus materially advanced library interests. Where the libraries are small and the appropriations correspondingly meager, a revenue in some way from the student body itself seems the only other method. Successful in some States, why not in all?

The strictly professional side of a normal-school library can not be too strongly urged. A knowledge of United States history is deemed a necessary requisite for intelligent citizenship. Much more is it essential that he who is to train the child for future sovereignty in a republic should himself be familiar with the rise and development of great educational movements, know the men who were able to inaugurate them, the methods of attaining success, and in what way these same educational movements have shaped the history of great peoples. Whatever can be made to throw any light on the development of mind, or the formation of character, should be the student's to enjoy. The memorizing of a text-book on psychology or ethics may have good disciplinary value, and be serviceable as a nucleus around which to grow, but the evolution of the skilled teacher, able to build brain without weakening it, and form character without marring it, is the product of the library rather than the class room. The survival of the fittest may be all right in the physical world, but human life costs too much, and is worth too much, to be sifted by any selective process. Mind-endowed creations can not be thus rudely handled, or even left to their own inherent tendency to grundle or decay. The new gospel calls any human life sacred and asks the teacher to cherish it, strengthen it, fit it for enjoyment of life and for usefulness to society. This gospel demands a reverent and responsible study of the child; but before the teacher may safely undertake this study of the living child, and the shaping of child destiny, there ought to be most faithful work in the library, to determine what is a normal or abnormal child, the possibilities of the one, the impediments to the progress of the other; what builds, what mars. In no department of pedagogical work is there more promise of success than in this, nor one that offers a finer culture. The literature on the subject is so rich, both in facts offered and in the culture possible therefrom, that ample provision should be made in every normal-school library for thorough and exhaustive study of the same, not only on the historical and scientific side, but also in the realm of literature. There may be a question as to how far a normal school should furnish so-called culture literature in duplicate sets for pupil teachers, and thus free them from the necessity of beginning a library for themselves; but there can be no question as to the duty of filling the child study alcoves with whatever will help to the thorough understanding of the processes of human development, and in sufficient quantities so that each pupil teacher may work unhampered. It is interesting to watch the student go from the text-book on the *Study of the Child* to the well-filled shelves in the pedagogical department of the library; from there to the cases of general literature for the books in which child life figures; from there to the cases devoted to juvenile literature, where he may satisfy himself as to what a child should read; and then to the child himself. Two incidents have come under my own observation during the preparation of this report. Some young men were playing games with a group of little children at twilight, when a teacher passed by, saying: "What a merry time you children are having!" One of the young men promptly answered: "We are studying the children without their knowing it."

Another day a thoughtful young man who had always seemed more interested in books and facts and things than in human life said: "I am longing to enter the professional year. I want to begin the study of the child. I can not pass one on the street without saying to myself, 'Little mystery, I wish I understood you!'" These are evidences of the growing interest in child study where a library creates a desire for the study.

Finally, is it too much to say that professional training of teachers has reached

that period in its development where the library must be one of the chief factors in the training of pupil teachers; that the instructor, worthy of the chair he occupies, must be familiar, not only with the books and service of his own department, but familiar as well with whatever the pupil teacher must use along kindred lines in his own schoolroom, and be able to help to correlate the work of his own department with that which the pupil is deriving from every other department as well; that the librarian must be a member of the faculty, as much as the teacher of mathematics or psychology, in order to understand the curriculum and be able to supplement classroom instruction with library investigation?

Is it too much to say that we can not hope to make pupil teachers intelligent readers of books, able to grasp the content of paragraph and chapter, estimate them at their true value, and correlate them with knowledge previously acquired, unless we release them from the old-time enslavement to text-books and grant them the freedom of the modern library? Is it too much to say that the library is not now holding its true place in the training of pupil teachers? Is not Carlyle right when he says, "The true university in these days is a collection of books?" And may I not add that the ideal normal school is to regard text-books as mere signboards, teachers only as wise guides; while the library and training school are the true realm where the pupil of to-day, through a process of evolution, is to become the teacher of to-morrow?

SUMMARY OF REPORTS RECEIVED FROM STATE NORMAL SCHOOLS.

The subcommittee on the relation of normal schools and libraries mailed circular letters to each normal school, State and private, listed in the last published Report of the Bureau of Education. Reports have been received from about three-fourths of the schools. A number of these, owing to "pressure of work," were not returned until late in May or early in June, and therefore are not fully embodied in this summary. The letters sent out were designed to secure information in regard to the equipment and management of libraries; to ascertain what normal schools are doing, not only to create an interest in literary culture, but an acquaintance with literature; and how far it is expedient to teach library science. The following summary is the result of that investigation:

The reports received from private normal schools are few and often incomplete; hence they are not embodied in this report.

The State normal school at Terre Haute, Ind., reports 25,000 volumes, the largest normal-school library in the United States. Three schools have libraries of 15,000 volumes; 6 have 10,000; 18 have about 5,000; 19 have, in round numbers, 2,000; 4 have about 1,000 volumes.

So far as heard from, no State normal school is without some library advantages, although many have less than 1,000 volumes. The presidents of two of the more recently established schools have generously placed their private libraries in the normal building, and given students free access thereto; in another the professor of psychology turns over to student use his valuable private library, and in the same institution the educational reports in English, French, and German, so necessary to a student of didactics, are the loan of a public-spirited man. The regular library of this school in cultured New England is 3,500 volumes. What has not the self-sacrificing missionary spirit of New England done for school as well as church!

The libraries of these schools are supported in the main by legislative appropriations. In a few instances a regular fee is charged, varying from 50 cents per term to \$2 (Terre Haute) per annum. The senior class in one school makes a generous annual gift to the library, and this amount is expended for books; in another a graduation fee is charged, and this goes to the support of the library. As a general rule, books are selected either by heads of departments or by a committee chosen from the faculty. In most instances the funds are under the control of the general office, and library bills are paid there; but in thirteen of the schools the library committee is directly responsible for the funds and makes report to the general office.

Only eighteen schools expend any portion of the appropriation for periodicals and newspapers. This amount varies from 2 per cent in one school to one-half of the appropriation in another. The average seems to be from 8 to 10 per cent of the legislative appropriation. The rest of the institutions, so far as they have a magazine library, secure it by voluntary contributions from the students, or by small fees charged for the purpose. A few libraries take a large number of periodicals, including all, or

nearly all, magazines devoted to science or philosophy, didactics or current literature, and, when bound, make them a part of their general library. It is a matter of regret that the number is not larger, and that even of those who place a generous supply of magazines on the reading tables so few bind any number of them at the end of the year. The following is significant:

Table showing the number of libraries that bind the leading periodicals.¹

Twenty-four schools out of 50 reporting on this topic have copies of the text-books in general use in the State; 32 out of 42 reporting purchase duplicate sets of books needed for special research or study in the several departments; 20 out of 46 aim, either by lectures or class instruction, to give pupils some idea of catalogue making; 5 have a short course in bibliography; 12 give instruction in what is called the methods class; 12 leave this to the classes in rhetoric or literature; 22 librarians make it their duty to prepare lists of "sources of information" on various topics; 13 are glad to have the seniors work with them in the library and do give them a training of no slight value; 17 schools so arrange library matters that the alumni have the use of new books, and thus are helped to keep abreast of the times; 53 schools permit pupils to take books home for reading or study; and 47 allow them to visit the shelves for research and study.

There is a general conviction that, since the State does so much for students, and since the supply of books on the shelves of the library is inadequate to the demand, students should be charged a small library fee. It is little for the student, but it means much to the library.

It is safe to say that comparatively few libraries have, as yet, been able to make a scientific classification of books, and in one instance, at least, volumes already purchased can not be used in daily study for lack of room for library cases.

This summary is necessarily crude and imperfect, because reports were received at a date too late for proper treatment. The subject of libraries in relation to educational institutions is so important—and particularly is this true in relation to normal schools, colleges, and universities—that the wish is here expressed that the work begun this year by the council may be continued for one or more years, until a report worthy of this great department of education shall be within reach of every such institution of learning in the Republic.

VI. ESTABLISHING LIBRARIES IN VILLAGES.

By F. A. HUTCHINS.

Any village can secure and support a free public library when the people fully understand the value of such an institution. The first step, therefore, toward securing such a library is to convince the people that libraries are an essential part of a system of education. It is equally important to show them a practical plan for maintaining a library at a reasonable expense.

A public library should be as much a public institution as a public school, and should be maintained by the public for the same reasons, though experience has proved that the two institutions usually thrive better under separate boards working in harmony.

Persons who desire to establish a local library should first study the laws of their State regarding libraries. Fourteen States have State library commissions which have authority to aid in organizing public libraries by means of letters and pamphlets, or by sending their officers. Such bodies can give the most effective help, and every

¹No notice taken of less than three libraries binding the same magazines.

State should have one. Any one of these commissions will usually send helpful literature to persons in other States than their own. Twenty States have State library associations which desire to aid new libraries, and the American Library Association can also give help. (For the addresses of the executive officers of these bodies see Appendix.) A pamphlet entitled "*Statistics of Libraries and Library Legislation in the United States*" can be obtained without cost from the United States Bureau of Education at Washington, D. C.

In States which have neither library commissions nor associations, information and suggestions can usually be obtained from librarians in the large cities. The personal counsel of experienced librarians who have some general idea of the local conditions should be obtained, if possible. When the leaders in the local movement have settled upon a practicable plan for establishing and supporting a library, they should educate public sentiment through the local press, from the platform, and by private appeals. Include in the canvass all citizens, irrespective of creed, business, or politics. To ignore any class is to imply its indifference to education and to invite its hostility. To assume that a man from the uneducated classes, or a local politician, is interested in any movement for the public good is a great aid in getting his sympathy and active help.

Enlist the support of the business men who are interested in advertising the town. Show them what other places are doing, and arouse their civic pride. If you can get an agreement by the village board to pay the running expenses of the library, provided the citizens will equip it, organize a movement to raise a suitable sum of money. When you can convince your business men that if a library is started it can be permanently maintained they will often contribute cheerfully to get a large collection of books, when they would not give anything for a small one. Start with the largest gifts of money that you can get. Let money come later from entertainments. Do not start your enterprise with gifts of books. If books are taken, let it be after all the money possible has been raised. A healthy old library can endure gifts of discarded books, but new libraries are often imperiled by them.

It is generally advisable, before canvassing for funds, to find what the running expenses of a library will amount to—how much it will cost for rent, librarian's salary, fuel, light, and printing. If possible, make an itemized statement of what the expenses will be. Many people have an exaggerated idea of the cost of a library, and fear heavier taxes than are necessary.

If you canvass the town, make the canvass so close as to include every family. Have all factions represented on the canvassing committee. Everyone who gives will feel a stronger interest in the library. As a rule, the libraries which are the result of united effort do better work in their early years than those which are founded and entirely supported by individuals.

All the newspaper articles about libraries, and all the arguments in public and private, should assume that the library will be primarily intended to benefit the children. This will make it easier, when the time comes, to get a good librarian and to get the right books and liberal rules.

The library board should include the person who is at the head of the local school system, two or three who have acknowledged business sagacity, and others who have literary knowledge. Women should, of course, be among the number.

If possible, get a trained librarian to help you in organizing. If you can not get one to visit you, write to him or visit him. There is a world of helpful library experience for those who insist upon getting help from it.

The local librarian should, if practicable, be early chosen, so that she may aid in selecting the books and organizing the library. The usefulness and ultimate success of the library will largely depend upon her ability and zeal. She must have force, tact, and the "library spirit." She must have the power as well as the desire to interest and help the children. An article in the *Library Journal* (April, 1899), by

Clara W. Hunt, of Newark, N. J., describing the work that should be done by the librarian of a children's library in a large city, applies with equal force to the person in sole charge of a library in a small community. Miss Hunt says:

When all has been said and done about devices, and schemes, and baits, there is nothing that will take the place of, or count for as much as, personal contact of librarian and children. If the librarian is an honest lover of children, and if she knows their books, not simply from the lists, but from actually reading them, she can do a thousand times more for the boys and girls than all the bulletins, catalogues, bright covers, and every other material device put together. If she is all this, and much more, she will be interested in every individual child that comes into her room. She will remember their likes and dislikes; she will make every child feel that she is a friend, and yet never let them suspect that she is interfering with their choice of books; she will confide in the children and win their help and confidence; she will use her specially intelligent boys and girls as a sort of book committee to help her decide on what books the children will like; she will interest the children in keeping the room supplied with wild flowers and other treasures of the woods; and some day, when she is particularly busy, she will help more people than suspect it by getting one of the older girls to read to the little ones who are growing too noisy over in their corner. She will have a mind above caring about the fiction per cent in her room, believing that it is a higher aim to help the boys and girls to be good than to be merely wise, and knowing that the child's character is more strongly influenced by the ideals of his dear story-book friends than by Gradgrind facts.

One can not lay down definite rules under this head of personal work, but by means of it the children's room and library may become a synonym for everything that is beautiful and helpful and uplifting to the child—a second home from which the boys and girls go out with enthusiastic interest in the world about them, with more than the germs of a taste for history, or poetry, or biography; with the reading habit formed, and the consciousness deeply rooted in their minds that books may always be their friends and teachers; with a distaste, it is hoped, for weak, trashy books; but, above all, with higher ideals of manhood and womanhood; and with aspirations to be brave and honest and pure, like the lifelong friends who have come to them through that dear medium, the book.

The village library and librarian should do for the children from sordid homes what the home library and the cultivated father and mother do for the children from refined homes. They should train the children to love good books, to appreciate all their beauties, to handle them carefully, to talk about them, to be fit companions for genuine book lovers, and to go to books habitually and instinctively for pleasure in idle hours, and for comfort and strength in times of stress.

No paid stipendiary, no woman who is merely negatively good, can do this work; but a woman with soul and tact, who feels the responsibility and charm of her work, will grow under it until she becomes a living force in the hearts of her children and in the homes of the community.

SELECTING THE BOOKS.

In selecting the books get the advice of experienced librarians of public and school libraries. Some excellent annotated "lists of books" have been made by competent persons, and the titles of a number of these will be found in the Appendix.

The first books purchased for a library should include a large proportion for children; because the most enduring and effective work can be done for the children, and because the best books for children are enjoyed by everybody. When the children's classics have been read in the homes, and the parents feel that the books are helping their children to become better, more intelligent, the library has won a place in the public heart which will insure its permanent support.

The first books purchased must be wholesome, but they must also be interesting to untrained readers. The test of experience must be applied to these books. Choose those that librarians of good judgment agree are deservedly popular. Fortunately, there are a few hundred of such books. Many of these are standard and can be bought at low prices in durable editions. The first purchase may include books of far greater average merit than any subsequent purchase. As far as the

average reader is concerned, the best 500 popular books are worth all the rest. Do not put too much money in historical sets or bulky biographies and scientific and reference books. With untrained readers the habit of reading for pleasure must precede the habit of studying. Watch the reading of your patrons, and when you find that they are beginning to study, buy along the lines of their interest. Do not use all of your money for books at first, but save some to get a few new books occasionally, when you know more of the tastes of the readers. Frequent purchases of books keep up the interest in the library.

In preparing your list for the book dealer describe the editions of the standard books which you wish. It is usually best to get bids from a number of dealers. A reliable bookseller can frequently help you in selecting the best editions for your purpose. Do not waste money in the purchase of expensive sets or bulky compilations from agents.

PREPARING BOOKS FOR THE SHELVES AND CHARGING.

The work of classifying and cataloguing the books and providing a system of loaning them belongs generally to the librarian, and needs a preparation that should be obtained either by personal instruction in a well-managed library, in a library training school, or by the study of some of the excellent manuals prepared by trained and competent librarians.

MISCELLANEOUS.

In the purchase of fittings and supplies, in the making of rules for the management of the library, in the making of by-laws for the government of the library board, and in considering the many questions of library management, appeal should be taken to the experience of librarians as given in the handbooks and pamphlets referred to elsewhere in this report. The rules for the management of the library should be as simple as possible, and should be designed to secure the fullest and best use of the library by the individual which is consistent with the rights of the public. The books of the library should be loaned, without charge, to persons of all ages who will obey reasonable rules, and all people should be made to feel that they are joint owners in the library. As fast as possible, all borrowers should be trained to select their books from the shelves, under proper guidance. Special assistance and help should be given to schools and teachers, and there should be no bars of any kind between the people and the books that may safely be removed. Librarians with the right spirit and tact find it possible in most communities to train the children and the older people to "browse" among the books, to keep them clean and neat, and to be orderly and thoughtful of the rights of others. Children especially should be systematically taught to handle books carefully and lovingly, and the best time to do this is when the books are new. The volumes of a public library should not need paper covers.

THE READING ROOM.

Shall we establish a reading room in connection with the library? This question is often a most perplexing one. The usefulness of a good, well-managed reading room in connection with a public library can not be fairly questioned, if the experience of the best of these rooms is taken as a guide. A reading room without proper supervision may become a public nuisance.

When a community can maintain a good library and a good reading room it should do so, but the library is of more worth than the reading room, and a good library should not be injured to maintain a poor reading room. A boy ought to spend his evenings in reading rather than in idleness, but if he has a good book the best evening reading room is that which contains his mother. •

In its early days the library may often meet the most urgent needs of a small town

if it is open but two or three times each week, and the money saved from shortening the time required of the librarian and the saving in light and fuel can be used for books when the collection is small. With a reading room the temptation to draw upon the scanty book fund for money for periodicals and more "open days" is very strong. When a good collection of books has been secured, and the library has gained a secure place in the public regard, the reading room will be wanted and will get adequate support without crippling the library.

GIFTS FOR LIBRARIES.

It is becoming more and more popular for people of wealth to contribute liberally to build beautiful library buildings or to provide endowments for libraries. Such gifts bless those who give and those who receive, but when the hope of such private gifts leads the community to delay establishing public libraries, the hope may be a curse. The best way to get large gifts is to make good use of small ones. Many a wealthy man has only a vague idea of the wide usefulness of a library, but when he has seen one at work in his own community there comes a growing appreciation of its work and a desire to help it. The best way to learn to manage a large library wisely is to manage a small one. When all the people of a community have made a united struggle and many sacrifices to found a library, a large gift or gifts will give them a delight and a feeling of personal gain that will not follow a gift in which they have no share. Do not wait for large gifts. If you do your duty, help and growth will come in due time.

VII. SECURING LIBRARIES FOR RURAL SCHOOLS.

By F. A. HUTCHINS.

In January of the present year a subcommittee of the committee on libraries and schools sent out a circular to leading teachers in each State asking information as to the number, size, and use of libraries in the rural schools. The replies show that, in the great majority of the States, few rural schools have adequate libraries, with a due proportion of books for the smaller children. In a few States—California, Montana, Minnesota, Wisconsin, Michigan, New York, and New Jersey among others—the money to purchase rural school libraries has been partly or wholly provided by the State, but in the great majority of our States the money has been obtained by appropriations by school boards, gifts, entertainments, or public subscriptions.

In States where the laws require the purchase of suitable school libraries the State departments of education furnish lists of the best books and often aid in training teachers to use the books to good advantage. It seems best, therefore, to devote this chapter to the discussion of the problem which meets the teacher who must get the money for a school library from local sources.

A teacher or school trustee who would secure a good school library must first know what benefits will be secured by a library, and must have the enthusiasm and persistence, as well as the knowledge, to make other people understand these benefits.

A well-selected small library for children may do much more good in proportion to its cost than any of the large popular libraries. The best books for children, read and reread, are of much more worth to the child than a careless reading of the best, the second-rate, and many indifferent books. The boy or girl upon the farm who has read, many times over, in the school and at home, *Seven Little Sisters*, *Black Beauty*, *Robinson Crusoe*, *The Man Without a Country*, *The Great Stone Face*, and a few other children's classics; who knows the best biographies of Washington, Lincoln, and Franklin through frequent reading, is almost certain to become a habitual reader of good books. The best books for children are of so much more worth than the second-

best that a teacher who can get a few of the best books for her children has the greatest encouragement to do so.

Each rural school should have a library of from twenty-five to a hundred volumes, which should include wholesome and interesting books for the pupils of all the grades. A library must usually grow by small annual or occasional accretions. It is important to secure the best books in the first purchase, so that the good results of their use may be quickly apparent. The child must get the reading habit before he gets the study habit, and if the teacher must choose for the first purchase between a few entertaining and inspiring stories, like *Black Beauty*, and a few books of information, like the children's cyclopædias, she should choose the former. When the children and parents have fairly grasped the idea that books are a means of pleasure and inspire to better living the library will grow. The wholesome books that are read for pleasure will procure the means to buy the books of information.

The teacher who would secure a school library should therefore know and love the children's classics. If she does not know them she must learn of them through other teachers, librarians, county superintendents, State departments of education, or educational journals. When she has read the best of the books she will find herself eager to have others enjoy them. Enthusiasm for books is the foundation of success. Enthusiasm begets enthusiasm. "I have heard that this is a good book" goes unheeded, when "this is a delightful book," given convincingly, inspires the pupil to get and read it.

When the teacher knows and loves the best books, she should find means to get one or more of them, and use them to show pupils and parents that good books give pleasure, inspiration to better living, and broaden the school work. Through doing this she would find the means to get more books.

In this, as in all other lines of work, she must learn to do by doing. The ability to lead comes only to those who try to lead. Her first efforts to convince people of the necessity of a school library may not be successful, but if she loves books and perseveres she will convince others.

Sometimes the first money for a school library comes from the pupils. A few years ago a determined teacher in a poor neighborhood induced each pupil to give her one or two eggs each week. On the Saturdays she carried these a few miles to a country store, and with the money obtained from their sale bought a few books. Sometimes teachers and pupils have raised money by entertainments and subscriptions after concluding an agreement with the school board that the board would give as much as the school would raise.

When the earnest teacher has secured a few good books, she can get others, if she will use the first wisely. A few books should be called the "school library." When not in use, they should be kept in a box or case, with a simple system of records. The pupils should be taught to keep the volumes clean and neat, and to have reasonable pride in their library and the neatness of their books. At every opportunity pupils and parents should be shown by object lessons the power of the books to entertain, inspire, and instruct. If the teacher knows the books as she should, opportunities will be abundant, and the books will often become the subjects of the daily talks at the homes as well as at the school.

In expending the money for the school library, take pains to get its full value. Do not buy of agents or unintelligent book dealers. Buy durable editions. There are fifty or more editions of *Robinson Crusoe*, but only two or three that are suited to your purse and your needs. Take the advice of intelligent teachers and librarians, not only in selecting the books, but, in the case of the older books, in choosing the editions. You will be safe in choosing from the lists recommended in this handbook.

You should only rarely pay the list price for a book. Discounts vary according to the amount of your purchase and the kind of books bought. The publications of schoolbook publishing houses are generally subject to smaller discounts than those

of houses which publish miscellaneous books. Here, as elsewhere, get information from those who have had more experience. Untrained readers, and many others, like small books. To the child who has read little it seems a great task to attempt to read a large book. The great majority of teachers buy too few small and simple books for their school libraries.

SUGGESTIONS.

The following suggestions by Miss Gertrude E. Woodward, of Ypsilanti, Mich., are so practical and well considered that they will be found very helpful:

If you have not money enough to buy books, make your own. Encourage pupils to bring newspaper clippings on interesting subjects. You will soon have enough to make half a dozen scrapbooks. Sort the clippings into geography, history, literature, biography, and the like. Let the children carefully mount them on uniform-sized pieces of paper, then they may be placed between two pasteboard covers and treated as reference books. This is good work for the boy who always has his lessons and never has enough to do.

A book which will be interesting to children is one which contains the programmes of entertainments and school exercises given during the year. These programmes, by the way, need not necessarily be printed. Let the drawing class furnish the design for them. A very pretty book may be made of these designs, and pupils are always interested to know that their productions are valuable enough to be bound.

When the birthday of a great man is celebrated put his picture up in your school-room for several days, until the pupils have become familiar with the face. When not in use these pictures should be kept in a box secure from dust.

Children should learn to take pride in having a library in the room and in keeping it in the best condition possible. Let some pupil be librarian and keep the books in order for a week at a time.

What has just been said assumes that the schoolroom possesses shelving, in some form or other. But what if it does not? Well, if not, do just as you did when you had no money to buy books. You made them, and you can more easily make the book shelves. Any boy in your room will get you a box from a grocer. Make the shelves of the cover of the box. Line inside of box and shelves with cambric, if rough. Usually, however, there will be some carpenter near by who will gladly help if you can get him interested. Let pupils help as much as possible, for the chances are that they will want to make similar cases for themselves, and that is to be desired.

When books through use or accident become torn or damaged in any way, remedy the mischief as quickly as possible. Always keep on your desk a little jar of flour paste. It is the only thing to use in mending torn pages, inserting loose leaves, mounting scrap pictures, etc. It is made in ten minutes from the following receipt, and costs practically nothing: Paste: (a) One tablespoonful flour in cup; one tablespoonful cold water in cup; (b) four tablespoonfuls cold water in pan; one-fourth teaspoonful powdered alum in pan. Mix (a) until perfectly smooth. Heat (b) to boiling. Pour (b) slowly on (a), stirring always in the same direction. Pour all back into pan and heat, stirring until thick. It will be of the consistency of jelly.

When pasting clippings lay the article to be pasted face down on a slate and paste from center of paper toward the edges. The slate furnishes a smooth surface and can easily be cleaned.

Card system of keeping memoranda:

Arbor Day celebrations.
King, R. M. School inter-
ests and duties, pp. 123-146.

Card or paper is cut into pieces 3 by 5 inches. Cost of white paper which takes ink, 6 to 10 cents per pound. Put one item on a slip. File slips alphabetically by first word on top line. Keep standing on edge in a box. Comments can be made on the reverse side of slip. In this way preserve authors, titles, and subjects of books, addresses, and clippings small enough to be mounted on slips.

A pamphlet on Arbor Day, by N. H. Eggleston, may be obtained without cost from the Department of Agriculture, at Washington, D. C. Other pamphlets are issued by the Bureau of Education, at Washington. Another class of books which may be obtained free, or for a few cents, is the illustrated guidebooks issued by the various

railway companies throughout the United States; also the lake and ocean steamship companies. Beautiful books descriptive of Mackinac, the wonders of Yosemite, and the Yellowstone National Park may be had for 5 and 10 cents. They serve as attractive reference books in geography.

Pictures may be mounted on the felt paper used as carpet lining. It can be obtained at any carpet store, and costs 2 cents a square yard.

If you have no wall space on which to place pictures, clippings, etc., make a folding screen, cover it with cloth of one color, and pin on whatever is to be displayed.

VIII. THE PRESENT CONDITION OF SCHOOL LIBRARIES IN RURAL SCHOOLS AND VILLAGES OF LESS THAN 2,500 INHABITANTS.

By F. A. HUTCHINS.

On account of unavoidable delays the subcommittee which was appointed to investigate the present condition of school and public libraries in farming districts and villages of less than 2,500 inhabitants was unable to begin its work until January, 1899. It was found necessary to complete the work of this subcommittee by May 1. A large proportion of the circulars of inquiry which were sent out in January were answered so late in April that it was impossible to tabulate the results.

The circulars were sent to all the State departments of education, to all State library commissions, to a large number of librarians and leaders in educational work in all parts of the country, and to nearly all normal schools. The presidents of the institutions last named were asked to select from among their teachers and students careful observers who had recently taught in small communities or had recently had unusual opportunities for inspecting school libraries in their States. Replies have been received from nearly all the States and Territories. While these show that the pupils in only a very few States have respectable library facilities, and that a great proportion have none, they also show that in every State the leaders understand the necessity of school and public libraries, and are making a determined and hopeful fight for better conditions.

The spirit is well illustrated by the remark of the superintendent of public instruction in a Southern State. After filling out the blank and looking it over, he writes: "The showing is bad, but we mean to make a revolution in this matter."

Nearly all the villages in New England and New York have free public libraries, and although many of them are poorly managed, the library commissions and library associations in those States are rapidly improving them. In the States mentioned, and in Michigan, Wisconsin, Minnesota, New Jersey, Montana, and California, where the States aid rural school libraries, nearly every school has a library, and these libraries are growing in size and improving in quality. In a few other Northern States quite a proportion of the schools have fair libraries, and occasionally there are some notable school libraries.

It may be fairly said that in no State in the Union have all, or nearly all, the children in rural communities adequate school and public library facilities, and that in fully half of the States pupils do not have free access to suitable collections of books.

The school libraries do not, as a rule, have a suitable proportion of simple books for the smaller children, nor are the books, as a whole, well selected. The replies seem to indicate that the libraries are generally kept in the schoolhouses, and the books are loaned to the children without unnecessary restrictions. The more careful observers usually report that only a very small proportion of children have access to a good number of children's books at home. Ninety per cent of the children who attend school seem, from the replies, to come from homes where newspapers are taken. In two-thirds of the States comparatively few of the children have the opportunity to read the best of the children's periodicals; the same States report that a large proportion of the families are supplied with them. Only a few rural schools

subscribe for them, and very few have a supply of children's classics for supplementary reading. Enough schools, however, report such aids to prove that the belief in their value is growing.

A large proportion of village schools seem to have collections of books, though most of them are not well selected for their purpose.

A very small proportion of the public libraries in villages are well conducted, and many of the leading teachers do not seem to know how various are the methods by which a good public library may help the public schools. Very few of the librarians have had special training for their work.

The most serious difficulty in receiving school libraries and in getting a good use of the books is found in the fact that most of our teachers did not learn to love books in childhood.

IX. IMPROVING POORLY-MANAGED PUBLIC LIBRARIES IN SMALL COMMUNITIES.

By F. A. HUTCHINS.

Many small public libraries which have been long established have little educational value.

Some of these libraries can only be used by members of a small association or upon the payment of a fee. Such libraries should be made free, and usually the same methods should be used in securing that result as are necessary in getting a free public library. Suggestions for such work are given in a preceding chapter. It is, of course, important to have the owners of the established library give it to the village, or loan it, upon the agreement of the village to maintain it as a free library.

Often these poor libraries are free to the older people, but the librarian is so unaccommodating, and the books are so uninteresting that the patronage is very limited.

Frequently the board of directors includes many estimable people who have long held their positions, and who are serenely unconscious of the fact that their library is "behind the times." Like Rob Roy, these benevolent old public functionaries are "ower good for banning and ower bad for blessing." No one likes to displace them, and yet the library will not do the best work until it is managed by a board of intelligent, enthusiastic people.

Poor libraries almost invariably have poor librarians. Good libraries can not be maintained with incompetent librarians. They may have books of undoubted value and still be worthless, because the books are not of the kind that interest the people of the community, and do not include the best books for children.

To improve a poor library the people should be made to understand its defects. The teachers and leaders of public opinion should learn the methods in vogue in the best small public libraries, and they should demand better service.

The librarian should know how to lead children from the good books to the best. She should be able to help the teachers and pupils of the schools to find the books and reading material that will aid them in broadening the work of the class room. She should manage to get all the children in the town to come to the library and to make them feel at home there. She ought to make her library a workshop for the teachers, the professional people, and the village study clubs. She ought to know how to use pictures to attract children.

The library should have the good books that are being talked about in the outside world. It should buy a few books frequently, rather than large orders rarely.

If the board can not employ a librarian who is thoroughly competent, the individual members of the board should give their incompetent employee as effective help as possible.

Library boards may say when confronted with a list of reforms that should be

made: "We can not do these things." They may say: "It is unsafe to allow little children to take books; it is unsafe to allow access to the shelves." A sufficient answer to these assertions is found in the fact that the best small libraries do these things without trouble, to the satisfaction of everybody, and to the good of their communities.

A small public library can not give the wide opportunities for study that can be found in the great libraries, but it can give much more individual help and much more individual freedom, and the librarian who hates to work to train her patrons to use these advantages should give place to a more capable person.

It often happens that libraries are started with ideals that are not attainable. A committee of good men will select books of undoubted merit that do not interest the masses of the people. After a few years of trial these able professional gentlemen, who know little of children's books, will make a further effort to get public patronage and will buy full sets of E. P. Roe, Amanda Douglas, Castlemon, Alger, Ellis, Optic, "the Elsie books," and similar stuff.

The reading of a single volume, or even of two or three such volumes, is not seriously harmful, but a boy or girl who reads "sets" of such books as the "Castlemon books" or the "Elsie books" loses relish for the best children's books, and often acquires a morbid passion for reading that injures their work in school and at home.

It may be necessary sometimes to have a somewhat sensational story to draw the habitual "dime novel" reader from the street, but at a time when we have admirable and entertaining books for children in abundance it is almost criminal to give them such unwholesome trash as some public libraries offer.

Librarians, like teachers, need professional training, and all who are interested in the improvement of our educational system should learn of the many opportunities now offered to librarians for professional improvement; for, after all, the best means of improving your library is to put it in charge of a trained librarian or to help your librarian to secure professional instruction. If you can not do this at first get a good librarian to visit your library, talk to your teachers and to your women's clubs, and suggest practicable improvements. Your State should have an effective library commission, with ample resources, to aid you in your efforts. Other States have them, if your State has not. Why should your State lag in securing so important and effective an educational agency? The personal aid which the officers of such a commission can give you is the most effective help in establishing and improving free public libraries.

X. BY-LAWS SUGGESTED FOR A BOARD OF LIBRARY TRUSTEES.

By W. R. EASTMAN, Albany, N. Y.

[Written for the report on the "Relations of public libraries to public schools," at the request of F. A. Hutchins.]

1. *Officers.*—The officers shall be a president, secretary, and treasurer, who shall be elected annually by the board from their own number.

The secretary shall record all the official actions of the board, and have custody of all its official books, records, and documents, except those in current use by another officer.

The treasurer shall receive all funds belonging to the library, and keep the same in a separate account till paid out on written order of the finance committee. He shall keep an accurate account of every receipt and expenditure, with date, purpose, and amount, and report the same at the annual meeting and whenever required by the finance committee.

2. *Meetings.*—The regular meetings of the board shall be on the (first Monday) of ——— each month, at ——— p. m., at the library.

The annual meeting shall be on the (first Monday) ——— of (month) ——— in each year. Special meetings shall be called by the president, or by request of any two trustees, for the transaction only of business stated in the call.

3. *Committees.*—The board shall choose at the annual meeting three standing committees, on (a) finance, (b) books, (c) administration, each consisting of one, two, or three members, to serve for one year and till successors are elected. They shall act under the direction of the board, and shall report to it from time to time.

The finance committee shall have charge of all library finances, and audit all bills and the accounts of the treasurer and the librarian.

The book committee shall control and supervise the selection, buying, exchange, and binding of books and periodicals, and the sale and exchange of duplicates or rejected books. It shall examine the library from time to time, and report at the annual meeting.

The administrative committee shall have charge of the operations of the library and reading room, the furnishing and care of the building and rooms, the arrangement, printing, and disposal of catalogues, and of all matters relating to stamps, plates, labels, and printed forms in use.

4. *Librarian.*—The librarian shall have charge of the library and reading room, and be responsible for the care and safety of the books and other library property; classify and arrange all books and publications, and keep the same catalogued according to such plans as may be approved by the board; exercise control over all other employees of the board, and promptly report any delinquencies to the administrative committee; keep exact and detailed accounts of all money received from fines and other sources, report the same monthly at the regular meeting of the board, and pay all money to the treasurer at least monthly; report monthly the number of books added to or lost from the library, and submit an annual report at the annual meeting, and discharge such other duties as may be prescribed by the board; but in performance of his duties no debt or liability of any kind shall be incurred by him without express authority from the board.

RULES FOR BORROWERS IN A SMALL LIBRARY.

[From the Wisconsin Library Commission Handbook.]

Rules should be as simple as possible, and not designed to restrict liberty, but to prevent encroachment and secure the greatest good to all.

RULES.

Borrowers.—Adults are entitled to draw books by filling out an application blank. Children must obtain the signature of parents or other responsible guarantor.

Borrower's card.—If a borrower's card is lost, a new one will be given after seven day's notice, or upon payment of 5 cents.

Number of volumes.—(1) Two books not fiction, or (2) one work of fiction and one not fiction, may be drawn at a time. Two volumes of the same work are considered as one book.

Time kept.—A book may be kept two weeks, except recent fiction marked "Seven-day book."

Renewal.—All books, other than "Seven-day books," may be renewed for fourteen days.

Overdue books.—A fine of 1 cent a day will be imposed for books kept overtime.

Hours.—The library shall be open every week day, holidays excepted, from _____ to _____.

XI. HINTS FOR CATALOGUING SMALL LIBRARIES.

By W. R. EASTMAN, Albany, N. Y.

[Written for the report on the "Relations of public libraries to public schools," at the request of F. A. Hutchins.]

1. *Accession.*—All books of a library should be recorded in an accession book. Provide a blank book with numbered lines continuing across two pages. Rule columns for date, number, author, title, source—i. e., name of dealer from whom bought or name of giver, and cost of each book, and another column for remarks. The books should be entered as soon as received and in any order, and the accession number written in a certain place in each book, for the purpose of reference.

2. *Arrangement.*—All books should be arranged by groups or classes of literature more or less numerous, according to number of volumes in each. In a very small library all history might be in one class. In a large library history or travel would be divided by countries. Science might be in one group or in several groups, to divide the number of books conveniently.

Books of reference, philosophy, religion, sociology, science, fine arts, language, literature, travel, biography, history, fiction, and juvenile books may be considered distinct classes. More complete classification is desirable, and may be secured by the use of either the decimal or expansive system.

When the revision by classes is satisfactory, arrange the books in each class in

alphabetic order of author's names, but books of individual biography should be in the order of the names of persons whose lives are written. This arrangement allows the placing of new books in their true order at any subsequent time.

When two or more books are by one author, arrange them under his name in alphabetic order of titles, unless the books have volume numbers, when the arrangement may follow that order.

3. *Marks*.—To preserve this arrangement every book should have two or three marks plainly and neatly written on a label on the back of the book.

The first mark is to indicate the class or subject group to which the book belongs, and may be either a number or a capital letter or letters, according to the system preferred. In many libraries, where the largest class is fiction, the absence of any mark in the place where the class mark is usually put is a sufficient indication of a book of fiction.

The second mark is the initial of the author's surname, and when several authors in the group have the same initial they should be arranged in alphabetic order, and all after the first be distinguished by the addition of a number—i. e., if five authors have the initial B, the marks would be "B," "B 1," "B 2," "B 3," "B 4." This is called an "author number." A more exact number for the author's name may be found by Cutter's revised alphabetic order tables.

A third mark must be added when one author has several books in one class. The first letter of the first word of the title, not an article, may be added in the form of a small, or "lower-case" letter to the author number. E. g., if S 4 be the author number for Walter Scott, S 4k will be the book number for Scott's *Kenilworth*. When there are several titles beginning with the same letter, two or more small letters should be used to keep the alphabetic order.

4. *Call number*.—A combination of the class number, author number, and title mark, when needed, is the "call number" of the book, and must be plainly marked on the inside cover and on a label on the back of each book. It should be used in charging the book to avoid much unnecessary writing. A bookplate for the inside cover of each book is desirable.

5. *Shelf arrangement*.—Books should be placed on the shelves in the exact order of the call numbers, with spaces between the subject groups.

6. *Lending*.—A book should not be lent until accessioned, assigned to its place, and plainly marked with its accession and call numbers.

7. *Catalogue*.—A catalogue of all the bound books should be provided. This may be either an author index or a subject list following the order of the books on the shelves, or both. It may be on cards if preferred.

A card catalogue has many advantages. Cards for new books may be added at any time in their proper place. By writing two or more cards for each book, the same book may appear both in its subject order and under the name of its author, and also, if desired, under its title. Cards may be kept in a box, tray, or cabinet drawer.

8. *Bookshelves*.—A bookshelf for ordinary books in a popular library should not be more than 3 feet long and 8 inches wide, and the bookcase should have 10 inches' upright space between shelves. Special shelves should be provided for larger books. For this reason movable shelves are recommended.

Ten books on an average can be placed on 1 foot of shelving. To provide for frequent additions it is well to leave vacant space on every shelf, and to leave the top and bottom shelves empty. It is a safe rule to provide shelving for double the number of books to be placed on them at the beginning. Allowance must also be made for width of uprights supporting shelves. If cases are 8 shelves high, and all the above allowances are made, 26 feet of wall shelving will be needed for 1,000 books. A floor case with two faces, 13 feet long will also provide amply for 1,000 books.

XII. AIDS AND GUIDES IN LIBRARY WORK.

[The following lists were revised from the lists in the Handbook of the Wisconsin Free Library Commission by the City Library, Springfield, Mass., at the request of F. A. Hutchins.]

I. BOOKS ON LIBRARY WORK IN GENERAL.

Hints to Small Libraries, by M. W. Plummer. New York: Denslove & Comba, 1898. \$0.50.

Gives brief directions for beginning and running a library, and preparing books for the shelves.

Library Primer, by J. C. Dana. Chicago: Library Bureau, 1899.

A handbook giving briefly the most necessary details of library science and methods, with directions for starting a library.

Public Libraries in America, by W. I. Fletcher. Roberts Bros., 1894. \$1.

A brief history of the public library and laws relating thereto, with some details of library management and work.

Statistics of Libraries and Library Legislation in the United States. From Report of the Commissioner of Education for 1895-96. Washington: United States Bureau of Education, 1897. Free.

Papers Prepared by the American Library Association in 1893, edited by Melvil Dewey. Washington.

A collection of the papers written for the meeting of the American Library Association at the Columbian Exposition; published in pamphlet form by the United States Bureau of Education. Free.

II. BOOKS ON CLASSIFICATION AND CATALOGING.

Decimal Classification and Relative Index, by M. Dewey. 5th edition. Boston and Chicago: Library Bureau. \$5.

Abridged Decimal Classification and Relative Index, by M. Dewey. Library Bureau. \$0.50.

Made to meet the needs of small and slowly increasing libraries.

Expansive Classification, by C. A. Cutter. Parts I-VI now published (work unfinished). Write for particulars to C. A. Cutter, Forbes Library, Northampton, Mass.

Rules for a Dictionary Catalog, by C. A. Cutter. 3d edition, 1891. Washington: United States Bureau of Education.

Library School Rules for Author and Classed Catalogs, edited by M. Dewey. Library Bureau. \$1.

Includes accession and shelf-list rules.

American Library Association List of Subject Headings for Use in Dictionary Catalogs. Library Bureau. \$2.

Cutter's Decimal Author Table. Library Bureau. \$1.25.

A scheme for giving to each work its own exclusive book number, so that the books stand on the shelves alphabeted by authors under each subject.

III. AIDS IN SELECTING BOOKS.

Catalog of the American Library Association Library, 1893. Washington: Bureau of Education. Free.

Catalog of 5,000 volumes shown at the Columbian Exposition. Gives authors, titles, publishers, and prices. Shows how books should be cataloged and classified. Includes a model dictionary catalog.

List of Books for Township Libraries; with supplementary lists for graded and high-school libraries. Address State superintendent, Madison, Wis. Free.

Suggestive List of Popular Books for a Small Library. Madison, Wis.: Wisconsin Free Library Commission, 1898. 2d edition. Free.

List of Books for Girls and Women and their Clubs, edited by A. H. Leypoldt and George Iles. Library Bureau, 1895. Paper, \$0.50; cloth, \$1.

Invaluable to every librarian or member of a book committee of a public library.

Class List of a Library Recommended for Schools. Albany, N. Y.: University of New York, 1896. 2d edition, revised. \$0.05.

Reading for the Young, and Supplement. A classified and annotated catalog by J. F. Sargent, combined with supplement by Mary E. and Abby L. Sargent. Library Bureau. Cloth, \$1.50.

Annotated Bibliography in Fine Art. Painting, sculpture, architecture, arts of decoration and illustration by Russell Sturgis, and music by H. E. Krehbel. Edited by George Iles. Library Bureau. Paper, \$0.50; cloth, \$1.

Publishers' Weekly, the American book-trade journal. New York: 59 Duane street. \$3 per year.

Publishers' Trade List Annual, the latest catalog of American book publishers. New York: *Publishers' Weekly* office, 59 Duane street.

Complete Descriptive and Price List of the Public School Library of Minnesota; a classified list of books selected and recommended by the Public Library Commission of Minnesota. St. Paul, Minn., 1896. Free.

A full list of books, by school grades, as well as classified.

References for Third-Grade Teachers, compiled by May H. Prentice, Cleveland (O.) Public Library, 1898.

A useful book, not only for teachers, but for the librarian.

"Librarian's Help Series." Lists of books, with brief annotations; prepared by the library department of the Baker & Taylor Co., New York. Free.

No. 1. *American History*.

No. 2. *Spain, Cuba, Naval History, and Science*.

No. 3. *Literature and Education*. Books of 1897 and 1898.

Library List of Books for Public and School Libraries. New York: The Baker & Taylor Co.

Selected List of Books for School Libraries. Chicago: McClurg, 1898.

Catalog of a Model Library—500 Volumes. New York: Scribner's. Free.

New List of Books for School Libraries. New York: Scribner's. Free.

All of these are briefly annotated and classified lists by leading publishers.

Best Fifty Books of 1898, Suitable for a Village Library. Compiled yearly by the public library division of the University of the State of New York from notes by librarians.

One Hundred Books of 1898. Bowdoin College library bibliographical contributions. Compiled by Professor G. E. Little, Brunswick, Me.

A list carefully selected from the *Annual American Catalogue* and annotated with references to reviews in periodicals, favorable and unfavorable.

Monthly Cumulative Book Index. Minneapolis, Minn.: Morris & Wilson. Monthly. \$3 per year.

Write to leading publishers for catalogs, which will be sent free.

IV. LITERARY JOURNALS.

Book Buyer. New York: Scribner's. Monthly. \$1.50 per year.

Book News. Philadelphia: John Wanamaker. Monthly. \$0.50 per year.

Critic. New York: 27-29 West Twenty-third street. Monthly. \$2 per year.

Dial. Chicago: 24 Adams Street. Semimonthly. \$2 per year.

Nation. New York: Box 794. Weekly. \$3 per year.

Literary World. Boston: 1 Somerset street. Fortnightly. \$2 per year.

Bookman. New York: Dodd, Mead & Co. Monthly. \$2 per year.

New York Times Saturday Review of Books and Art. New York: *The Times* office Weekly. \$1 per year.

V. LIBRARY PERIODICALS.

Library Journal. Official organ of the American Library Association. New York: 59 Duane street. Monthly. \$5 per year; single number, \$0.50.

Public Libraries. Edited by M. E. Ahern. Chicago: Library Bureau, 217 Madison street. Monthly. \$1 per year; single number, \$0.20.

XIII. THE LIBRARIAN'S SPIRIT AND METHODS IN WORKING WITH THE SCHOOLS.

By J. C. DANA.

INTRODUCTORY NOTE.

In recent years a good many elaborate investigations have been made, by teachers, psychologists, and others, of the reading of children; what books and papers they read; what kind they most enjoy; what books furnish them with good ideals; what ones seem most to influence their lives.

The replies to these questions have led to little in the way of definite conclusions. Few people can so frame a set of inquiries as to make the answers to them of value, even if those answers are clear and honest. Few teachers—and most of the inquiries have been made by teachers—can put a set of questions to their pupils in such a way as to get from them straightforward, unprejudiced replies.

Furthermore, the atmosphere of school, the wishes of principal and teachers, as expressed, for example, in courses of study and in books for reading placed in the pupils' hands, or within their reach, all tend to influence the children in making their replies much more than one would at first suppose. If, for example, a large number of answers received from a number of different towns in any given State show that *Black Beauty* has been much read and greatly enjoyed by children in grades 4 to 7, one may at first conclude that *Black Beauty* is a book which appeals to the youthful mind through its own unaided attractiveness, and that, if it stood on the shelves of any open library with many other good books for children, it would be one of the first books to be selected and read by a very large majority of those who used that library. Further consideration, however, probably calls attention to the fact that *Black Beauty* has, for certain definite reasons, been introduced into the schools of that State and vigorously pressed upon the attention of the children by school boards, superintendents, principals, and teachers, and that the children have by no means chosen it spontaneously. And so a careful examination of the influences surrounding the young people who have made answer to these many inquiries into children's reading shows that in every case little reliance can be placed on most of the conclusions drawn from them. As in other departments of child study, we have here as yet done little but illuminate our ignorance. This is helpful, of course; very helpful, indeed, if we recognize the light we get for what it is, and do not take it for something else.

From these inquiries into children's reading, however, and from kindred investigations made by those interested in child study in general, in experimental psychology, and the like, we seem to be able to draw a few very general conclusions, such as these:

That the time when the habit of reading is most likely to be formed is in the years from 11 to 16. That in the years from 6 to 16, and especially during the first part of the period, the influence of the teacher in determining the choice of books read may be very great. The teacher of average ability, it would seem, can, if she will, guide the choice and interest of most of her pupils.

From these facts, and from the like generally admitted fact that this period from 6 to 16 is one in which tastes and habits in general are most easily and most commonly formed and the general trend of life most seriously affected, we can conclude further that books can have and do have a greater influence for good or ill, on the lives of most people, by affecting them when they are young, than we had supposed, and this influence, through the teacher's guidance, can be made to work for good even more strongly than we have dared to hope.

This conclusion, vague and general as it seems at first to be, is of the greatest moment to the librarian. She commonly has on her shelves hundreds and thou-

sands of volumes—rather hastily selected, not carefully examined—which she is handing out almost at random on every day to scores of young people who have little powers of selection, and will take, one must fear, the book that is full of the evil communications which corrupt good manners as eagerly as the one which is wholesome in all its influences. She is busy. She has little time to put the right book into the right hands. She likes her library to be popular. She, perhaps, is impressed more by the quantity of books read than by their quality. If she is wise she sees that for the educational work her library is trying to do, especially with young people, she needs the help of those who can give care and thought to the individual. She sees that the free public library should hasten, after equipping itself with the best obtainable material for children's reading, to interest parents and teachers in that material, and persuade them to assist in guiding the reading of the children who borrow books. This means, in the present state of society, when parents take a very moderate degree of interest in the books their children read, that as far as its work with young people is concerned the public library must, if it would do good and not harm with its books, rely to a very great extent on the assistance of the schools.

The library can, no doubt, be of great help to the teachers; and much space in other parts of this report is taken up with suggestions to teachers of how they can get much of value out of the public library. But our report will fail in one of its most important missions if it does not bring home to many librarians, very strongly, the fact that, as far as its work with young people is concerned, it can do little without the sympathetic cooperation of teachers.

How, then, shall the librarian conduct herself, and how shall she manage her library in order to get from the teachers of her community the maximum of sympathetic cooperation, and be of the greatest possible assistance in the education of the young? These questions I have tried to answer, not fully, but in a suggestive way, by giving a brief statement of the equipment the librarian of an ideal library must have for this work and of the things that an ideal library may do in its cooperation with the schools.

THE LIBRARIAN AND HER EQUIPMENT.

In establishing helpful relations between libraries and schools in any given community the things that are most necessary on the librarian's part are sympathy with the end in view and a broad appreciation of the particular situation. This sympathy and appreciation will lead to good work, whatever the conditions. The special knowledge and skill needed can be acquired in the doing.

Another very important qualification of the librarian, and perhaps the most rare, is a wide and sympathetic knowledge of books of all kinds, especially books for young people. This wide knowledge of books is not the product of a night, or of a week, or of a month, or even of a year of toil and study. It is a knowledge which is in large part not knowledge, but native talent; and the knowledge which goes with this native talent is acquired only by reading scores and hundreds of books with care and with interest.

The librarian, then, is and has been an enthusiastic reader. During the early years of her life, and especially from 10 to 14, she familiarized herself, not as a duty, but as a pleasure, with the best of children's books; with the children's books we call classics. We call them such, not because they are necessarily the very best books that can be written or have been written for children, but because they contain expressions, characters, incidents that are constantly reappearing in literature, and are interwoven with the life of the race. They are the books that have become a part of the birthright of every American child. They are alluded to and they are listed in large part in Mr. McMurry's section of this report. The librarian who did not know and enjoy these when young is poorly furnished for work with children.

The librarian understands library management. If she has had no technical training in a library school, or has not had experience in a well-managed library, she gets some of the books and periodicals mentioned elsewhere in this report and reads and studies the subject, and learns by doing.

She realizes that books are tools, are not sacred things, and find their best end in being worn out by reasonable service.

She is fond of children, is patient with them, and understands them. Experience in teaching for a few years would be of the greatest assistance to librarians who are trying to work with schools.

There are now in print, and a number of them are noted elsewhere in this report, many lists of books for children and teachers, several of them well annotated. Copies of these lists our librarian has at hand, and is ready to lend, and makes use of them constantly in adding to her collection.

In the last twenty years a great many articles on the reading of children, literature for the young, and kindred subjects have appeared in leading periodicals of this country, and a number of books, some of which are mentioned elsewhere in this report, have appeared on the same subject. These books, or as many of them as possible, the librarian studies herself and places with the teachers' books in the teachers' corner.

As the librarian's field of work widens she discovers first of all, if she is honest with herself, her own limitations in respect to the wide and intimate book knowledge already mentioned, and then she discovers it also in her associates, the teachers. It is inevitable, in view of the character of the preparatory training the average teacher gets, that in wide knowledge and keen appreciation of literature, and especially of literature for children, she should often be lacking. We have decided that books proper for children to read are excellent things, and should be easily accessible to them. We have asked for them, and authors and publishers have supplied them. We attempt now to do with them the things we see should be done, if we are to get out of them that which we wish to get, and we discover that those to whom we must appeal to make proper use of them are themselves very lacking in knowledge of them. We are improving in this respect, but little has yet been done toward making the average teacher thoroughly conversant with children's books, with making her such a reader of books as she must be before she can do with children the things we wish to have done. But the fact of the presence of the books themselves in libraries and schools, and the daily use of them, and the general realization of the possibilities in them, will bring about in a few years a vastly better equipment in this direction, in the teaching force as well as in the library force, than we have as yet had.

The librarian realizes that, after all, a collection of books, however good, however well housed, however attractively arranged, is of little value, has little vital force, and does not count for much in the community unless there is added to it the right kind of a librarian. A good librarian is more than half of a good library. Realizing this fact, she tries to live up to her opportunity.

While she feels that the most efficient allies in her work are the teachers, and while she feels that unaided by them she can do little for the vast majority of her young students and readers, still she does not at all relax her own vigilance. She keeps a watchful eye on as many of the children as possible; she lends only what she thinks to be the best of books; she is unceasing in her efforts to learn which are the best; she notes the character of the readers who ask for what she fears are books of doubtful value; she checks the story mania where she can; she looks for opportunities to turn attention from better books to the best books; she does not think any habit is good so it be a reading habit; she keeps it in mind that books are for pleasure, but for the pleasure of a lifetime, and not of the day only; are for profit, but not profit in money only; are for knowledge, perhaps not for knowledge she can ever care for, yet good and useful still; are for wisdom, but possibly not for wisdom as she sees it.

She is always mindful that she is a public servant, not a ruler; that she is a counselor, not a faultless guide; that she is a student of books with the children as fellow-students, not a teacher who has already learned all that books can teach.

THE LIBRARIAN AND THE TEACHERS.

The librarian has no special card for teachers, for she finds that by adopting a modern charging system she does not need to make distinctions between her borrowers. She can lend to any person six or sixty books as easily as one, and a special card makes a distinction which by those other than teachers may be thought invidious.

She has a teachers' corner in the library, and keeps there, with special books for teachers, copies of the best and latest pedagogical books and journals and lends them.

She prints occasionally and distributes through the schools brief statements in the form of circulars of what the library does with children, what it would like to do, how it helps teachers, and how it would like to help teachers.

She prints also from time to time brief selected lists of books, magazine articles, poems, speeches, etc., on special topics, like geography, American history, flowers, birds, Longfellow, Lincoln, Arbor Day. If possible, she prints these lists all in the same form on sheets of the same size, so that the teacher preserving them may keep and handle them with ease. These are posted on the bulletin board and freely distributed.

She forms a reading committee of teachers to help in selecting from the new and old publications the best books for young people and in deciding what books it is best to supply in large quantities and to urge the children to read.

She takes note of teachers' institutes and the topics up for discussion in them, and she keeps watch of educational journals to see what problems are being discussed, and makes up lists and buys books accordingly.

She does what she can to induce teachers to add library departments to their county, district, or State associations, or at least to give up a portion of the time at the meetings of such associations to the consideration of problems which touch her work.

She endeavors to have teachers, principals, and superintendents on the committees of her library, especially on those having to do with its general economy, arrangement, and selection of books. She makes the fact felt that her institution is a part of the educational system of the community, is not something separate from the schools, but a part of them.

She visits the superintendent of schools, and the principals, and teachers. She does not make of her work the opportunity to impress them with the fact that she has a "mission," and that she proposes to elevate the community by her books; and she does not insist that teachers generally are dull if they do not at once make use of her library, but she tactfully makes it plain that her library is there to be used.

She meets with the teachers whenever occasion offers, and is ready to talk with them about matters in her field at all times.

She visits schoolrooms, where she can do it without seeming to intrude, and makes herself familiar with the teacher's work, its opportunities, its needs, and its limitations. She gets the courses of study used in school. She learns what books are already in the schoolrooms; what ones are used as supplementary reading; what, and how many, have been bought in sets, and in every way makes herself thoroughly familiar with the present resources of teachers and children in the way of books.

She always works in sympathy with, and with the full knowledge of, the superintendent and in accordance with his suggestions and wishes.

She ventures, if teachers do not borrow voluntarily, to suggest to them that they can take books to their schoolrooms and see if they can make use of them there. This is not an easy thing to do, for unless the teacher is in sympathy with this work, to put books in her hands may be to waste good material. For the teacher who is

beginning to use books in her daily work the simpler they are the better. Picture and story books, such as she can lend to restless pupils, either for use in the school-room or to take home, are the best.

She looks up such a subject as geography, and by examination of the text-books used and by talks with teachers discovers what she can do to assist in making the subject more interesting. She finds, perhaps, that pupils call at the library for certain specific books, or for books on some special topic which the library lacks, and she equips the library well for such a call next time. She encourages teachers to borrow from the library, for a few weeks or a term, books on the topics of geography, or history, or science, which may be uppermost for the time.

She asks teachers and principals to give her in advance names of topics and subjects of study on which the children may ask for books later. She announces on her bulletin board that books on such and such a topic will be found in such a place, or are such and such books.

If one or two teachers begin to take an interest in the library and borrow books from it for schoolroom use, and their experiments are successful, the librarian lets this fact be widely known.

She does not forget that the teacher's occupation is very wearing; that the best teachers are often the busiest; and that it is the best teachers whom she most wishes to interest. The teacher must keep her children to the course of study as it is laid out; and no matter how flexible that course may be, still it is true that to do the things that must be done each day takes nearly every moment of her time. Opportunity to do the work with children suggested in this report is not easy to find. The wise librarian is not discouraged, therefore, even though most of the teachers she attempts to interest are slow to take up with her suggestions.

As soon as the time is ripe and her supply of books permits, she lends them to interested teachers, in groups of ten to fifty, to put into their rooms as schoolroom libraries. The school authorities may, of course, supply these schoolroom libraries themselves. It is, perhaps better, however, that they be supplied by the library. In the library will usually be found the best collection of books to draw from, and the most skill in their handling. The schoolroom library is to be used just as are the books the teacher may have of her own or may have secured from the library for her desk. She uses them either for reference work, or lends them to pupils to take home. If she does the latter, then the schoolroom library is in effect a branch library; and the schoolroom library, under the supervision of the teacher, is the ideal branch library for lending books to young people. The teacher with forty pupils and fifty books, the latter changed from month to month as she may choose, and as the wishes of her pupils may indicate, can with little difficulty put the right book into the right hands time and again, when the librarian, with the best intentions in the world, finds it impossible to do more than supply each child's request, without regard to the fitness of that request.

The librarian hears it said not infrequently, by librarians, that teachers ask more and are more exacting in their requests generally than any other class of library patrons; but she says that it seems proper that this should be so. She is glad that they make use of her library. She is glad that they make complaints, and is not disturbed by them. She discovers that their demands are generally not so much in the spirit of fault-finding as in the desire to get out of the library all that can possibly be got. And she encourages, rather than discourages, the asking spirit in all the teachers with whom she comes in contact.

THE LIBRARY BUILDING, OR ROOM, AND THE CHILDREN'S DEPARTMENT.

The building for an ideal library, or the room in which it is placed, is simple in the extreme. The best arrangement for a small library is one large, well-lighted room without partitions. The cases are low, and are set sufficiently far apart to

allow several people to pass between them at once without crowding. The tables and chairs are near the books. If a corner for work is needed, it is separated from the rest of the room, not by a partition, but by a light rail. The desk is near the entrance, and the visitor having passed this desk is literally "in" the library and among its books.

A corner in the library is given up to children. The children's books are here arranged in classes, just as are other books in the library and with the same marks. Stories and books on other subjects are not ordinarily shelved together in one series, though for some special purposes or occasions they may be so arranged.

The cases for children's books are low, not over five feet high, and lower still would be better, and the books are not put lower than two feet from the floor. This gives two or three rows of books one above the other, at the utmost, and prevents crowding among those who are looking them over. The lower the cases are, the easier it is to keep watch of the unruly and noisy. Furthermore, if the cases are low, the tops of them serve excellently for globes and vases, and any articles of interest one may wish to put there.

There is a globe in the children's corner, and a place to hang up a large wall map, which is changed from time to time.

On the walls are pictures attractive to young people, preferably in colors. These pictures are such as one would wish to have in the schoolroom. They are large and broad in treatment.

A bulletin board in or near the children's corner has on its lists of entertaining books—general lists, lists on special topics; pictures, sometimes of a general nature, sometimes having to do with one subject; a set of pictures of animals, or birds, or great buildings, or eminent men. The same bulletin board holds, in large type, an occasional sentence or verse of poetry, such as experience shows children are attracted by and are fond of learning.

THE LIBRARIAN AND THE CHILDREN, AND THE CHILDREN'S DEPARTMENT.

The librarian makes the process of getting a borrower's card at her library very simple for the young people. She, perhaps, thinks it wise to insist that the card be signed by a parent, not so much to protect the library as to engage the interest of the parents in what the young people read. She does not feel, however, that this is essential. She surrounds the process of the signing of the name, the giving of the card, and the presentation of a slip containing library rules and information with sufficient dignity to make it seem of importance to the children.

She keeps her library immaculately neat and clean and trains the children to help her in this work, establishing a library league for this purpose, if possible. It takes time and patience to lead children to keep in order the books they themselves use, but it is not impossible and is worth the doing.

She notes that the weak points of American children are not timidity and nervousness. Still, she realizes that many of the children, perhaps those whom it would be best worth her while to assist, are shy about visiting a new place and are slow to ask questions. She meets such individuals more than half way.

The children's department is made especially strong in entertaining stories, the children's classics already alluded to being first chosen. It is far better to purchase a large number of duplicates of each of 15 or 20 standard books that children read than it is to scatter the money they would cost over the whole field of children's literature and buy a large amount of inferior stuff.

The librarian has investigated the subject of children's reading for herself and has come to the conclusion, as have all others who have given the matter serious attention, that in the children's corner in the public library, or in the schoolroom library, or in the library in the school building, or in any collection of books anywhere to which children are to have access, low-grade books, no matter how popular they

may have proved themselves to be, are not needed in order to attract children, and that poorly written, unreal, fourth-class, silly stuff is not needed as sweetmeats and temptations to draw children to a collection of good books in an attractive library.

She learns from talks with teachers whom she has interested in the subject that the reading of wholesome children's books does not, save in very unusual cases, distract the minds of the children from their studies. She learns, on the contrary, that the bright children, the well-informed children in the schoolroom, are the ones who are likely to be eager and wide readers at the library.

With the children's books she puts the books suitable for reading aloud to children by parents and teachers. It is difficult to draw the line definitely between these two classes. In selecting the books suitable for young people it should be borne in mind that there is much good literature which children themselves will not read, but like to have read to them. Some of this literature can very well be put with the books the children like to read themselves.

The reference books for children in their own department are not many in number and are simple. One or two encyclopedias, an atlas, a dictionary, and a few sets of periodicals, like *Harper's Monthly*, with its index, and *St. Nicholas*, serve better than more elaborate books.

The librarian, while supplying a special corner for children and giving them there easy access to the books adapted to their wants, does not forget that an important thing in education is ability to use a large library to advantage. She encourages, so far as the arrangement of her room permits, the use of the main library by young people. She tries so to train them, or help them to train themselves, that they are not lost or dazed in a large collection. She helps the very young people to make use of the laboratory method in the library, as science teachers lead them to use it in physics and chemistry. She finds that children quite quickly catch the spirit of investigation, the spirit of the seeker after truth, and thus become students in the best sense of the word.

To help the children to make use of reference books she calls attention to such helps as tables of contents, page headings, indexes, and bibliographies. She gives them an opportunity to consult encyclopedias and dictionaries of varying character. She encourages them to study by topics.

So far we have spoken of books on their artistic, literary, general-culture side, the side which, for the younger children at least, must always remain the most important. But there is another side, distinct still from both the "culture" side and from the scientific side, with which the zealous librarian must acquaint herself, would she do her best work, especially with children who have reached the ages of 16 to 18. This is the purely utility side. There is no calling in life, from bricklaying to architecture, from shoemaking to railroad building, that does not have the results of latest experience and observation in regard to it set forth in periodicals and books. These periodicals and books are more or less accessible in every public library. The majority of boys, about 95 out of 100 who attend our schools, are on their way to some manual, semimanual, or clerical calling. They will be able to equip themselves better for their calling, whatever it may be, if they make themselves familiar with its literature. The humblest workman in the humblest occupation can adapt himself better to his work, and will have a better chance of advancing in it, if he reads up to it. This is an aspect of printed things which is rarely touched upon in the schools. The sympathetic librarian, as she sees boys grow to young manhood under her eyes, will watch their tastes and inclinations where she can; will note the occupations they are likely to enter, and direct them to the utility literature of those occupations.

The librarian makes a collection of pictures, saving therefor old periodicals that are well illustrated, and making requests for old numbers and back volumes that are past other usefulness, to be used for their illustrations. She gets together and mounts

on cardboard collections of designs, of pictures illustrating the work of different artists, of pictures to be used in geography and history and science study. These she arranges in groups, hangs on her bulletin board, and lends to teachers, one at a time or many at a time.

XIV. WORK IN CERTAIN TYPICAL LIBRARIES.

By J. C. DANA.

The libraries mentioned in the following notes are not exceptional. They are typical of a large number, in which some of the things mentioned in the foregoing outline have been attempted.

Nearly twenty years ago Mr. Samuel S. Green, librarian of the free public library, Worcester, Mass., delivered an address before the American Social Science Association on the relations of public libraries and public schools. In this address he outlines or hints at nearly all the things that have been done since 1880, in bringing libraries and schools into closer relations; and during those twenty years Mr. Green has again and again urged upon teachers and fellow-librarians the necessity for active cooperation, would they produce the best results from their efforts. The Worcester library has been the pioneer in the world, in the work this report considers.

The library league was first tried by the Cleveland, Ohio, library, after a suggestion borrowed from Col. George E. Waring, of the street-cleaning department, New York City. Colonel Waring appealed to the children in certain parts of the city to form leagues and subscribe to an agreement to help to keep the city clean and beautiful. The Cleveland library established a library league. In joining this league the children signed an agreement to try to handle the library books with care and to persuade others to do the same. The experiment was very successful, and led to other things than simple care of books. It has given the library a hold on many thousand children, and has helped to strengthen the library's hands in working with the teachers. No library in the United States has shown a more admirable public spirit than has that of Cleveland, and any librarian who may be contemplating bringing children and teachers into closer relations with her collection of books can not fail to get inspiration and suggestions from the reading in the Cleveland reports of things that have been done there in recent years.

At the free library of Pratt Institute, Brooklyn, in its new building, special accommodations have been made for children. The attendants in charge of the children's department have studied to equip themselves for the work, and are constantly devising ways of interesting children and leading them to the use of better books. Exhibitions of pictures, of notable men and women, of notable buildings, of special regions, of birds, animals, etc., accompanied by book lists, are attractively put up in the children's room from time to time. In no other library has a more careful study of the problem of the children and their books been made.

The free circulating library of New York City includes now eleven or twelve branches. These branches are in part rather inadequately housed. It is interesting to see how an enthusiastic library spirit has been able to make books and papers attractive, especially to the young in the poorer quarters of the city, even with very insufficient accommodations. Several of the collections of books number only nine or ten thousand volumes; room for readers may be very limited, and yet access to shelves is permitted and children are controlled and interested, and are in many cases led into habits of good reading.

In Buffalo, N. Y., there were school libraries in a number of the school buildings of the city. These were about a year ago turned over to the public library. They were found to contain a good deal of useless material. This was set aside, and the old libraries were replaced by collections of books adapted to each school, sent out from the library and changed more or less from time to time, as teachers and principals desired.

The public library of Detroit, Mich., has for twelve years been sending school circulating libraries to different school buildings of that city. It now has about 10,000 volumes in these collections. They go to all grades above the fourth, there being a total of some 80 boxes for their transportation. The library in each room is changed once in four months. No one school is likely to get the same books oftener than once in two or three years. The purpose of these schoolroom libraries is to give every child in the public schools some acquaintance with good literature. The books are in charge of the principal of each building, and are given out for home reading under very simple regulations.

In Milwaukee the teachers, under the general supervision of the librarian and his assistants, issue library cards to their pupils. These cards having been issued, the teachers go to the library and, being admitted to the shelves, select enough books for their pupils. To aid the teacher in her selection, lists have been published of books for young people and of books for special purposes. The books the teacher selects are placed in boxes and sent by the library to the teacher or to the school. They are changed after eight weeks. In 1897 23,000 books were thus issued nearly 90,000 times.

In Utica, N. Y., courses of reading have been published in cooperation with the library. These courses contain two lists, one for the grammar schools, the other for the lower grades. Some of the books in these courses are read by the teachers to the pupils and then discussed in class, others are read in the class, and others read by the pupils out of school. The teachers are asked to see that out-of-school reading has been profitably done. Excessive reading is discouraged.

One of the first school systems in the country to adopt the schoolroom library was that of the North Side, or District No. 17, of Denver, Colo. Small collections of books, about fifty in number, were placed in nearly all of the schoolrooms of the district several years ago, and have been kept up and extended over the whole district since. A brief account of this system as carried on in North Denver is made a part of this report.

The free public library of Evanston began cooperative work with the schools about three years ago. Its experience shows how much can be done with limited means, a small supply of books, and narrow quarters. Through several schoolroom libraries it reaches many families who would not otherwise hear of the main library. The assistant librarian in charge of this work visits each school as often as possible, and holds teachers' meetings for the discussion of children's books and plans of future work. The teachers come often to the library and suggest books for purchase. The cooperative spirit extends to superintendents, principals, teachers, and all the library staff. The school libraries contain each 100 books chosen for the six lower grades. Each has a printed, graded list. The collections go from one room to another, remaining three months in each building. The librarian mounts the colored plates from the *Art Amateur* and similar publications, and lends them for art studies or to brighten schoolroom walls, and mounts pictures of birds and animals gathered from all sources for use in nature study, and saves other pictures for historical and geographical work. These pictures cost, when mounted, less than 2 cents apiece. They are lent separately or in groups. The library has formed a children's library league. The assistant librarian talked with the teachers of each school in regard to it, and circulars were distributed to the children before forming it. The teachers presented the subject to the children, and also looked after the matter of registration. The children from the graded schools near the library and from the high school visit the library frequently for reference work, and the librarian and her assistant give them training in the use of reference books. The library prints a set of special holiday bulletins. It reserves books for class and essay work. During the year the library gives exhibitions of such collections as that of birds with nests and eggs, a collection of drawings lent by some artist for the occasion, or of pictures from the library's supply. The library has established a children's corner, with open shelves, containing books and numbers of young folk's periodicals, and finds that the young people discover attractive books which they did not know of and could not know of through the unsuggestive medium of the catalogue.

XV. SCHOOLROOM LIBRARIES.

By CLARISSA S. NEWCOMB,

Librarian, North Side Schools, Denver, Colo.

[First published in the Colorado School Journal. Added to the report at the request of J. C. Dana.]

To one who knows how to use books a well-selected library is one of the most valuable means of education. The training of children in the choice and use of books is therefore an important subject to all teachers. An early beginning is necessary, or else the great majority—those who leave school before the higher grades are reached—wholly escape this training.

But how shall this training be given, is the question. How shall we bring the child in touch with good books? Our experience in district No. 17, Denver, leads us to believe that each schoolroom should have its library. We have found that a collection of fifty books in a room, chosen with reference to the age and ability of the pupils

in that room, is the most satisfactory means of forming a taste for good literature. We have tried other methods—the central library, the library in the principal's office, and the plan of moving books from one room to another. The room library—that is, a certain number of books which are the permanent property of the room—has proved the best, because it acts as a training school for the use of the larger public library. We favor the room library for the purpose of getting the little folks accustomed to the use of the books and for the immediate use of the pupils in the upper grades. The more expensive books, which can not be afforded for each room, are kept in the principal's office. Thus the pupils are led to the public library, for the use of which these small collections have well trained them. That this room-library plan increases the demand for books from the public library has been demonstrated to us by the greater number of cards now held by the pupils.

Beginning with the second grade each room in the district has its own collection of books, which remain there from year to year. As the children go from grade to grade they are each year brought in contact with another set of books new to them. Instead of moving the books we move the children. Each room has its reference books and its books for lending. When not in use these are on a table or on shelves accessible to the children at all times. The pupil thus becomes acquainted with the books and feels a personal pride of ownership, and the close contact of the child with the books teaches him to love and respect them. He becomes interested in reading and familiar with his own small library.

Fewer disappointments occur in the selection of books than where the collection is larger; hence, fewer obstacles are presented in the formation of a love for reading. The range of choice is narrowed, and the teacher feels the responsibility of directing the children's reading, for the library is but another tool with which to mold the character of her pupils. All become readers if the teacher is skillful and tactful and enters sufficiently into child life to appeal to the pupils. Many teachers have found the library an effective means of reaching and interesting dull or indifferent pupils.

The teacher can influence and largely control the children in their choice of reading. A reference to a book little used is enough to commend it to someone in the room, and its reputation is established. Or some pupil may be asked to give an extract from a book he has lately read. That will interest the other children, who will wish to learn more about it. The recitation is made brighter, and that book goes into the homes and keeps the children from the street.

Each book is selected not alone because of its intrinsic merit, but also because it has proved interesting to several children of like age and grade. No mistakes have been made when we have left the matter to the children. They know what they enjoy. When we find any attractive book we try it in a room. If it is approved by those relentless little judges, the children, we buy a copy for each room of that grade. In the case of a very popular book we sometimes place two or more copies on the shelves.

We do not attempt to force upon the children books that are highly instructive or which we think they ought to like. We try to supplant the trashy stuff by providing them with good yet interesting books. Our aim is to give them a love for good literature, for when they have acquired that we need have no fear that their education will stop when they leave school.

No child should be expected to read every book in the room library. The reason is obvious. Tastes differ among the children, as among adults. Out of the fifty books, representing history, biography, adventure, fairy stories, etc., each child will no doubt find some which he will enjoy. Within the room list we let the child select for himself. Any book which is really enjoyed, which enlarges the range of thought, which makes him happier, is worth the reading even though it has no visible purpose as a part of his school education.

I. POPULAR EDUCATION AND NATIONAL ECONOMIC DEVELOPMENT.

By J. TEWS, Berlin.

[*Note by the translator.*—The author attempts to show the influence of a more complete education of the people upon national economic development. Though he chiefly refers to conditions prevailing in Germany, his deductions are applicable elsewhere as well. He first shows that higher culture or civilization is dependent upon diversified industrial pursuits and highly developed skill in labor. In the second section he shows that, “mutatis mutandis,” industry is dependent upon culture or education, general as well as special; and in his last section he suggests reforms in the education of the people in all strata of society, which do justice to the demands, both of culture and of industrial skill. Numerous quotations from standard writers enhance the value of the dissertation, which is here offered in English to show the trend of German popular education. The subject has been before the German National Teachers’ Association for several years; also state and provincial associations have discussed it, and all agree substantially with the author, as is seen from various statements in the annual reports of this office since 1894-95. The following is the translation of Professor Tews’ work:]

I.

The success of the efforts to lift the young to the same plane of civilization on which the adult generation moves, and to advance them beyond that plane, will always be dependent to a certain degree upon the economic conditions under which a people live. If all the treas-

ures of culture of the most civilized nations were made accessible to the Samojedes (a tribe in northern Siberia) or to the Peschärähs (inhabitants of Tierra del Fuego) in their own vernacular even, they could take in but a modest part, since all their forces, including thought and will-power, are employed in making a livelihood. And, vice versa, the most civilized people would sink into irredeemable barbarism, even if they retained possession of their purely intellectual culture, their literature and works of art, were they deprived of technical skill and mechanical contrivances—that is to say, if they were deprived not only of machinery and devices, but also of the technically educated human power which could partly restore the former machinery or replace it by new inventions. Their energies would be absorbed in satisfying purely physical necessities, and their former height would be attained only in the course of time by the creation of new technical contrivances replacing crude physical labor. Such a people would, of course, exert all its power to keep from sinking lower.

Pioneer farmers struggling against a wilderness are an example akin to the above theoretical instance, with this difference—that they take along with them whatever mechanical aids can be possibly transported.

In ancient times the incompatibility between physical labor and higher mental development formed a political dogma, not only in the despotic Orient, but also in republican Hellas and Italy.¹ The free Greek, therefore, never engaged in any physical labor whatsoever, while the slave was debarred from all culture of free citizenship. This view was not the invention of an aristocracy, but was based upon actual observation. Were it impossible to lighten the pressure of coarse manual labor by perfecting methods of work, the general cultivation of mankind would be nothing but an idle dream. Man has become free to direct his energies in a different direction only by learning how to shift the burden of manual labor on other shoulders. Domestication of animals, utilization of the forces of nature, and, in particular, the wonderful mechanical appliances of the present are the foundations upon which a higher national culture can develop. Without such aids the higher culture of one portion of a people must necessarily mean the degeneration of the other. To satisfy the great necessities of cultivated Athenians and Romans required the work of many slaves.

Highly developed culture, therefore, requires a corresponding economic foundation. If this is not given by a large development of

¹ Aristotle says: "Neither a mechanic nor a day laborer can be virtuous." Demosthenes addressed the Athenians with the words: "Whoever is occupied with low and trifling things can have no broad and high-minded thoughts." What Plutarch says is in accord with this: "We often take pleasure in his work, but have no respect for the workman. No noble youth who has seen the Olympian Jupiter would care to be Phidias." The tribes which conquered Rome originally had no respect for labor, either. Tacitus tells us of them: "They consider it cowardice to gain by the sweat of the brow what can be won with blood."

mechanical contrivances, human hands and human bodies must create it. Millions must dig, hew, chisel, carry, and run, so that as many thousands may enjoy a life of higher civilization. What immense results are obtained by one single machine!¹

Machinery it is that has brought higher development within the reach of all. It has relieved the slave of his burden, and it will bring men to the same level on a higher plane, just as they were once at the same level on a lower.

On the other hand, the form of economic labor is dependent upon the intellectual culture of the laborer.

The higher the intellectual culture, and the more firmly established the ethical culture of a people, the more energetic will their efforts be toward perfection also in an economical respect. Highly civilized nations take a much more comprehensive view of the task before them than the less civilized, not only because of their greater attainments, but because they aim much further beyond the present. Economics and culture are interdependent, but their progress is seldom in even steps. At a given period the one is often seen in advance of the other, until the direction of thought tends toward the one less progressive and raises it to preëminence.

The labor power of nations varies in compass and in kind; the higher the culture the greater the variation. With culture the perception of national characteristic talents grow, calling forth the effort to develop them to their utmost. The progressive development of labor power is, under all circumstances, necessarily dependent upon ethical strength, for personal improvement is always a wearisome task. Whoever possesses no ethical energy succumbs either to the depressing influence of necessity or to the enervating influence of luxury. The existence of strong moral family ties is of paramount importance. Where they are wanting the growing generation

¹The noted economist Roscher portrayed the marvels of the machine as follows: "Machines do the work that would be too large or too small for the hand; they effect the wonders which fables relate of giants and dwarfs. With a machine of six compound levers, the long arms being ten times as long as the short ones, a workman with one-kilogram power can move 1,000,000 kilograms. A large steam hammer can beat with full weight 200 to 300 times a minute and yet fall so softly as to crack a nut. In one second a rolling machine can make a sheet 36 cm. from 1 c. c. of iron. Very thick wires could not be made at all without machines. War vessels have engines with 7,000 horsepower, and 7,000 steam horsepower is equal to the capacity of 40,000 actual horses. In an English cotton mill 750 workmen with one machine of 100 horsepower turned out as much work as 200,000 hand spinners. From 1 kilogram of raw cotton a machine can draw a thread 600 miles in length. At the Paris exposition in 1867 there were exhibited armor plates 18 inches thick, and side by side with them tin sheets of which 4,000 formed a layer no thicker than 2½ cm. By means of the steam press 10 compositors and 5 printers can turn out as much work as 200,000 to 300,000 copyists could five hundred years ago. This increased power by means of machines and engines is often a decided saving of material. The more quickly iron is changed by the hammer the less fuel is consumed. An especial advantage of machines is that they do not grow tired, but continue to move with uninterrupted endurance and therefore superhuman uniformity. Think of our chronometers. Our railroad companies now use machines which print 70,000 tickets daily, supply 40,000 with continuous numbers, and count up to 140,000. How many mistakes and miscalculations men would make at this work." [Some of these statements prove that the quotation is not recent, for the latest inventions far surpass these achievements. See Note 1 in appendix, p. 752. (Tr.)]

degenerates, and the national capacity for labor gradually decreases until the consciousness of the evil brings about inward reaction.

The higher the development a people attains the greater use it makes of natural forces, and the more highly intellectual the resulting character of labor the less significance attaches to purely physical force, and the greater the prominence of intellectual energy and action. Highly civilized nations are distinguished by the diversity of their prominent characteristics in action, by which in turn the character of their attainments is governed.—*From Die Arbeitskraft der verschiedenen Völker, by J. Deutsch.*

The man of culture has no taste for mere manual labor; it makes him unhappy.¹ If the existence of a nation were therefore at stake for want of men inclined and able to perform purely physical labor, the general cultivation of the masses necessarily could not be countenanced. Friederich Nietzsche was opposed to it. This unhappy philosopher says, among other things:

Since much rough, hard work must be done, men must be retained to do it, in so far as labor-saving machinery can not be used. If the necessity and refinement of higher education penetrate into the working masses, the laborer suffers disproportionately at his work. A cultured workman seeks leisure, he does not ask for lighter work; he wants to be free from work and lay the burden of it on other shoulders. To satisfy his desire we might propose the introduction of savage tribes from Asia and Africa; the civilized world could exploit the uncivilized, and in this way ignorance could be regarded as subjecting to slave labor. In point of fact, the degree of culture of laborers and employers is so close in European countries that a continuance of exacting irritating mechanical drudgery will rouse a feeling of rebellion.

Close investigation proves that though Nietzsche has observed the fact in question correctly, he has entirely overlooked the influence on the development of technical contrivances which this very impulse exerts. Because the cultivated laborer is disinclined to coarse work, he strives to shift this work elsewhere. Whenever human power can be subjected, slavery is the outcome. Where this condition does not obtain, the work is forced upon brute animals or inanimate nature. That is to say, the man disinclined to physical labor becomes an inventor and devises a technical process which he who finds contentment in labor could never call forth. Great inventors have not always been the most industrious men. Since the work before them was inadequate for their advanced minds, they thought out new methods and mechanical contrivances. There can, therefore, be no policy more injurious to the common weal than that of keeping the

¹ "Increasing popular education has awakened in the working people the consciousness of the burden of mechanical work, the weight of which was not so heavily felt in former times. In England, two persons, on an average, must be occupied with mechanical work so that the third person may enjoy the fortunate condition of not needing to engage in such work. The more philanthropists do to raise the working people from a condition of slavery and ignorance, the deeper that consciousness grows in the workman and the more discontentedly he asks himself why he must spend his life at the vise and loom and deny himself all the higher pleasures of existence which he sees others enjoy to an excessive degree without apparently doing any work."—*Wm. Thomas Thornton.*

laborer upon the lowest possible intellectual level. It is true, for existing methods and for the utilization of mechanical aids at present available, human power may thus be secured, but the way to progress in labor methods and technique is thereby obstructed. That policy may be conservative, but it is antiprogressive.

If man did not endeavor to free himself of crude manual labor, we should to-day, as at the beginning of civilization, be loosening the crust of the earth with a tree fork, instead of plowing with steel steam-plows; the backs of men would still be the sole means of transportation, and we should still be walking instead of riding and driving. Our whole progress in mechanics is the result of man's determination to free himself of physical labor, or to transform it into purely mental or intellectually physical. And the inventors, to whom we owe this progress, have been mostly simple workmen of more active minds than bodies, and employers with insufficient human and animal labor power. That our technical contrivances did not exist in ancient times is a direct consequence of slavery. How this presents itself to the mind of a socialistic writer we see in Bellamy's "Equality."¹ Slaves could do nothing but resign themselves to sheer drudgery. In eastern Germany conditions very like these prevail. The low stage of economic development in agriculture is largely due to the fact that landowners have always had sufficient labor power at their disposal from among the ignorant Polish masses. The most radical means of civilizing the Slavic elements in eastern Germany and to remove the blight from agriculture would be to forbid the immigration of ignorant laborers from Poland. The scarcity of workmen would not bring ruin on agriculture; on the contrary, a generation of farmers would arise, as it did in America, who would make use of every suitable mechanical device, and lay all heavy work on animals and labor-saving machinery and implements. Then the laborer would work with his mind. It is almost inconceivable that under present conditions of civilization a want of ignorant individuals should be felt. On the contrary, there will always exist a want of laborers able to meet the demands upon intelligence, skill, and self-command.

Man follows the road to higher civilization not from choice, but from necessity. All nations whose necessities of life have been supplied without effort on their part have remained on a low grade of civilization. Neither have those which easily gained a livelihood by means of primitive implements made any progress in technical contrivances. The proverb says, "Necessity is the mother of invention." To urge civilized man to a perfection of technics he should be deprived of all inferior means of labor. The unparalleled development of the United States of America can be explained by the want of inferior labor power, which forced technical or mechanical progress upon the people.

¹ See Note 2 in appendix, p. 753.

The more advanced labor methods and the use of machinery require and, therefore, as a matter of course, develop mental and moral power. It is a current but erroneous assertion that machinery makes a machine of man, crushing him down in mind and body. Even superficial comparison between a population engaged in rough farming and one engaged in manufacture proves that machinery does not force the mind under. The assertion applies only when work at machines is exacted for too long a time to the exhaustion of strength and under unhygienic influences.

Factory laborers are generally not below, but above, farm laborers in Germany. Moreover, manufacturers employ a large number of individuals profoundly intellectual and strictly moral. Even the dirtiest factory girl could hardly rank below the woman who does the coarse work on a nobleman's farm east of the Elbe River. The proposition that machinery saps mental energy, while farm labor favors the development of a highly intellectual life is untenable. That under like conditions the reverse is true is substantiated by many proofs.¹

¹The following is derived from military circles: "Neglected and uneducated recruits form an undeniable contrast with those from districts with advanced schools and intensive labor power, with a healthy industry and high standing agriculture. The blessing of modern elementary schools is, in this case, sensibly evident, and the thoughtful observer is forced to adopt correct views on the ethical value of popular education. The number of cases of military punishment inflicted on soldiers coming from different parts of the country is in inverse ratio to the degree of culture in these parts; large cities, however, on account of their special conditions, make statistical tables somewhat confusing."

The Saxon Statistical Quarterly says: "The factory workman occupies by no means a low position with respect to personal morality. In Saxony, for instance, day laborers, house servants, apprentices in workshops, and petty officials are relatively more strongly represented among malefactors. On the 3d of December, 1858, there were 377 mechanics and trade laborers in Saxon prisons, and 466 in workhouses; factory hands numbered only 38 and 52, respectively. Of the largest cities, Chemnitz has the fewest criminals. Reports from factory districts are, in general, rather favorable, while districts in which home manufacture predominates, especially the weaving industry of the Lausitz district, report very unfavorably. Leipzig has a larger contingent of criminals than the factory town of Zwickau."

Deputy Bebel, in his speech in the Reichstag, January 13, 1899, says: "I should like to ask the gentlemen of the army commission which soldiers they prefer, the uneducated or the intelligent worker? They will certainly declare in favor of the latter as being better able to understand his duty. In the preceding session I referred to the debate in Munich on the question of the percentage in the army of recruits from agricultural districts. In that debate General von Sauer declared it to be a great advantage for the army that the greater number of recruits came from cities and industrial districts, as they are more able and skillful than those from rural districts. For the complete training of the individual soldier the greatest intelligence is necessary. Men from cities are more serviceable, too, because they have frequently had some gymnastic training, which is an unusual acquirement in the country. Moreover, when reserves from the country are summoned for review and temporary service they have often forgotten what they learned; city workmen are in this case again better and more serviceable."

•

Technical progress has made it possible to satisfy the great necessities of highly civilized man without condemning a great number of others to slavery. Power has been liberated for highly civilized life. Any retrogression in economic development would, therefore, signify a heavier burdening of man with inferior kinds of labor, and either less participation in or the total suppression of advanced intellectual life.

Evidently, then, the more individuals there are able to labor in conformity with improved methods the richer a nation must be, and the stronger, considered from an economic standpoint. Less can be produced with hoe and spade than with implements driven by steam. He who uses the old-fashioned spinning wheel necessarily remains far behind him who uses the most modern spinning machine.

The wealth acquired through economic development is the strongest incentive to higher national culture. Adequate means for the general education of the masses are thereby furnished. Yet the least acquaintance with politics shows that the advocates of the people are obliged to fight for the means which will secure such a result.

II.

If it has been proved that the education of a nation, the higher culture and civilization of mankind, depend upon economic conditions, and especially upon the kinds of economic labor, the question for investigation remains: Whether, and how, economic labor depends upon education. Not to confine the inquiry within too narrow limits, we should first understand the term "education," as applied in the considerations which will be adduced.

WHAT IS EDUCATION?

A number of different and irreconcilable answers are given to this question whenever proposed. I shall not at first give an answer, but attempt to find one. Everyone is able, or thinks himself able, to distinguish an educated from an uneducated person. With the same assurance we classify nations into educated and uneducated; and when we are asked to state the distinguishing features of education, we are at a loss for an answer. The educated man shows qualities and powers which are either lacking or, at least, lie dormant in the uneducated. They are the result of the teacher's work; under his direction they have been developed. As the gardener cultivates the wild rose and apple tree, so the educator influences the growth of man. He develops many powers and abilities which nature bestows only in embryo. In consequence education is development beyond natural conditions. The uneducated man, therefore, is nothing less than the man by nature. "In its broader sense, education is the development of natural talents

through contact of the individual with the treasures of civilization accruing from society; in fewer words, through the influence of the objective on the subjective intellect." (Jodl.) Hence, in civilized nations, there are few or none uneducated, and the distinction lies between more or less education. That we so often hear of the uneducated is because we do not reflect upon the degree of education possessed by the "common man," it being by comparison the lowest, and also because our idea of education is incomplete and one-sided.

Education expands in proportion to human talents and powers and the endless measure of human action.

There are as many kinds and purposes of education as there are directions of civilization, education being a process of which civilization, or culture, is the result. Whenever man works, gathers experience, and acquires knowledge and skill of lasting benefit to the human race his legacy to future generations must be bestowed through the channels of discipline, schooling, and habit.—(Jodl.)

Since, however, development never takes place in full measure, and never in the same proportions, education leads to that manifold variation of life in individuals and whole nations so interesting to the philosophic historian, distinguishing mankind from the brute creation and civilized from barbarous nations. From this circumstance we deduce a second reason why educated persons are frequently looked down upon as uneducated. The observer may look for special intellectual powers where great emotional gifts have been developed, or he expects a well-cared-for body and polished conventional manners where the person in question has devoted all his energy toward acquiring a special science, or a certain skill, or an art. The ideal of a perfect education will ever be a harmonious development of all human powers, but this harmony can not be defined with mathematical precision, else the "know it all," with a smattering of every kind of knowledge, would be the best-educated man. As there is no simple law of geometry for the lines of beauty in nature, so there exists none for the perfection of human education. The value and charm of education lie in the multiplicity of combination that will not leave any powers dormant; otherwise a man loses as an individual and forfeits the ability to understand and enjoy the talents of another who has specially developed the power neglected in himself.

The development of all talents to a certain point, and a knowledge of all learning to a certain degree, we consider general education. As has been said, its value is not simply ideal, it makes social life in its nobler bearings possible. The possessor can look up to all heights of knowledge. True, he can not attain them, but he has an idea, faint as it may be, of how far they reach. He who has no thorough general education can not fully comprehend what others are. General education, therefore, has a social value. He who possesses it is one of an educated community; he who lacks it is excluded. Technical or

professional, briefly termed special, education, on the other hand, is that part of education which fits us to work with creative ability for ourselves and others. Nevertheless, it can not be said with truth that general education has only a social, and technical education only an economic value. The truth is only that anyone possessing only a general education is not fully equipped for participation in economic action. His education must be supplemented by technical knowledge and skill. General education, however, is the trunk from which technical education branches. Without the former the latter is in most cases impossible. In many important callings technical education is but a small part of the whole; in others it plays a more important part. The neglect of general education has disadvantages from an economic standpoint; the social disadvantages are even greater. He who lacks adequate general education is like a stranger in the world. There is no tie between him and his fellowmen, and he can not fulfill the duties incumbent upon him as an intelligent member of a community. He who has only a general education is a worthless economic factor, a passive observer of economic action who defrauds the world of its material tribute. He enjoys without payment; he is a drone in the human beehive. The practical aim of human education is expressed in the old saying, "Professional in one" (special education) and "amateur in all" (general education).

If after this I am called upon for a definition, I should pronounce education in its formal relation a development of the powers and gifts of man as not affected by the mere process of nature. Friedrich Nietzsche, in his *Schopenhauer as Educator*, says:

That is the secret of all education, it furnishes no artificial members, waxen noses, spectacled eyes. That which claims to supply these gifts is but a false imitation. Education means liberation, a clearing away of all weeds, rubbish, and vermin prejudicial to the life of tender germs, a giving out of light and warmth, the quiet fall of nightly rains. It is an imitation and a worship of nature, motherly and merciful; the perfecting of nature, when it restrains cruel and merciless traits, and directs them toward good, and when it covers with a veil what of nature is dark and mournful. It is true there are other means for self-knowledge, there are other ways of awakening from the stupor in which we live as in a cloud, but none is better than the direction of a teacher and educator.

In the language of Nietzsche, though not as he means it, this "Ueberschensch" (man of gigantic stature in every regard, physically, intellectually, and emotionally) alone is able to master the attainments of civilization to a greater or less degree. But he has not only been enabled to imbibe knowledge without aid, much of it he made his own during the process of education. The way of development is paved with the presentation of the works of culture and civilization. The teacher develops the mental and moral powers of his pupils by means of the poems of Schiller, Goethe, and Uhland, the pictures of Holbein and Kranach, and by means of mathematical theorems and phys-

ical laws; and while so doing the teacher makes these treasures of art and science a lasting possession during the life of the student. The teacher distinguishes between the development of inborn powers, or formal education, and the acquisition of information. This distinction, however, is only ideal, in practice the two are inseparable, and to attempt to separate them implies a perverse, one-sided theory.

That the one or the other trend is so often stubbornly advocated in educational literature to the exclusion of the other side of education, is because such advocacy is the outcome of the struggle in school politics. Diesterweg would never have become so prejudiced an apostle of exclusive formal or general education, had not a narrow-minded school-bureaucracy, in his time, attempted, most unreasonably, to limit the course of study of the public elementary school to a few studies, and firmly resisted the harmonious development of all mental powers. His struggle, therefore, did not deal with calm, dispassionate, theoretical propositions that could stand their ground before scientific criticism. To use the language of Lessing, Diesterweg stepped on the other end of the board (went to the extreme). If this master of pedagogy had labored in other times, his writings would have been free of this prejudice.

In judging of the education of a person we do not ask for the one or the other—that is, for his general education alone or his special knowledge—but we ask for both combined. Generally, and especially in examinations, preference is given to facts. Consequently those with a vigorous memory but little creative power receive commendation and good positions, which they fill indifferently, and thus bring undeserved blame on the schools they attended.

If we remember that education means development, that it is an increase of intellectual capacity, we must be careful in using such positive expressions as “a finished education” or “a half educated man.” True education consists not in leading to an end or in finishing the development, but in the very contrary. A development begun by education and its attendant acquisition of knowledge can only cease when nature cries halt—namely, at an age when the powers decay. He who has had a good teacher is influenced by him during his whole life, and the gratitude frequently shown to teachers rests on the firmest foundation.

Though the educated man has entered upon a course of uninterrupted development, there are certain boundary lines and points of view which determine his advance as the constellations define the infinity of the starry host. So we return to the assertion of a more or less completed education. But we must not look upon this completion, so far as the intellect is concerned, as a certain well-defined amount of knowledge, but as consisting in the existence of positive intellectual relations between the elements of education. “The essence of education

is the generality and universality of views rather than the amount of knowledge" (Diesterweg). The educated man has a picture of the world within him, the uniformity of which his own intellect must have created. In other words, he must have gained a world-view (Welt-Anschauung).

The picture of the world or the world-view of individuals need not be alike; in fact, they can not be, but are as different as talents and powers on the one hand differ from acquisition of information on the other. And as we expect no geometric relation in the latter, but only harmony in an esthetic sense, so a man's picture of the world may conform to his individuality; complete in itself, however, it must be without any wide gaps; otherwise the realization of thought process, namely, a consistent world-view, is impossible. Both ideas of education thus dissolve into one again. A harmonious education, whether formal or material, is the only complete education, but it is complete at every stage.

Moreover, as has been already said, every man should be prepared by special education, according to his surroundings, for a useful, practical participation in the life about him, so that his education may have a certain market value. The educated man wanting in this preparation must, in the spirit of bluntness peculiar to practical life, be designated as miseducated.

Whoever would deny the value of education must change the conceptions of greatness, beauty, and perfection found in the human race. He would needs teach that the bud compressed within a brown envelope is of greater worth than the blooming or fruit-laden branch developed therefrom through nourishment under the benign influence of the sun. To him the egg must have a greater value than the bird hatched from it, which delights the eye of man with its plumage and his ear with its song. He must place the rough marble above the statue carved by the master's hand. In a word, by him greater worth must be given to what is undeveloped, to the embryo, than to that which has attained full development. Force he must rank below feebleness, and he must close his eyes to the beauty with which education clothes man. With the aid of natural forces a few educated persons can accomplish that which is impossible to millions of the uneducated. The mind finds expression in the countenance of an educated man. There beams a light from his eyes, the mirror of a liberated soul, which in the uneducated is but a faint glimmer.

Education is a specifically human work. Man as a member of a community alone possesses power, expedients, and knowledge wanting in the individual and not to be acquired by his own efforts unassisted, but forming a common intellectual possession; a capital constantly increasing, newly invested, converted into labor, and transferred to succeeding generations through thousands of channels enriching and vivifying. From the kind and manner of the transfer it depends whether this intellectual capital is to be a dead factor, or whether it is to be converted into a living force. Hence

the almost passionate interest evinced in all educational questions since mankind has become conscious of the significance of its cultural possessions; hence also the inexorable tenacity with which political parties and social groups, whose ideals are in the past or in the preservation of what is existing, guard just those channels from which the stream of education is to flow on to succeeding generations, in order to regulate and *at times color it* according to their own notions."—(Jodl.)

Therefore, he who claims to cherish a love for mankind in his heart, who would be a true Christian, can not oppose the work of education. Humanity, true love of neighbor, as taught by the Nazarene, that love which makes it our duty to share with our neighbor whatever we consider best and most valuable in our lives, makes it a sacred obligation upon us to teach the people and their children.¹

For this reason education must go from the castle to the hut, from the gentleman's to the laborer's home. Education is a process of ennobling, a development beyond that which is naturally human. We labor to cultivate plants and animals. We improve roses, fruit trees, horses, and dogs by training, and should we not do the same by flesh and blood like our own? It is in our power to develop human beings into an existence a thousandfold more splendid than anything the gardener's and fancier's art can produce, and we would not? Jupiter chained Prometheus, the bearer of light, to a rock; and even to this day we hear of the happiness of ignorance and stupidity. But no paradise of barbarism exists on earth. Where there is no civilization man is exposed to poverty, immorality, and bondage, giving himself up to every brute instinct. We find paradise on earth only where man does not live merely in obedience to the desires of his senses, but rises to lofty heights occupied by only a limited number, among whom, alas, some look down from this vantage ground, cold and unloving. That paradise we would gain for all our brothers and sisters, and the road that leads to it is that of the highest and best possible education.

If these views are shared, the opinion may be accepted that the education of man must be an end in itself; every one of the people should be educated as well as possible without respect to other ends. Nevertheless, it is advantageous to make known in ever widening circles the

¹ Dr. Schmitz, suffragan-bishop of Cologne, says: "The commonest laborer in the country, the simplest maidservant, the most ignorant woman laborer in the worst districts * * * must be an object of our care, since we are bound to elevate them to a higher intellectual life. All of us bear this responsibility. The landowner is wrong in saying he need not instruct his servants. The priest transgresses when he says: "I will keep the people in ignorance so that they may remain pious." No, he must educate as well as instruct them, that their faith may be the more intense." In an article of the Center Party on Equality in Prussia (Bachem, Cologne) it is said: "Of course, the half idiot who can hardly recite the Lord's Prayer suffers the least temptation to losing faith; but according to such reasoning we might say with the pessimist: It is best to be a stone, for that enjoys no pleasure and suffers no pain. Life and religion are by no means as simple as that. And if, finally, knowledge and high mental aspiration rob us of a Tertullian, they will give us back an Augustine."

great results of a more advanced national education for the life of a nation. The nation will then incline more to support the efforts of its teachers.¹

In the present instance we are considering only the economic significance of a more advanced national education. The fact, however, must not be forgotten that economic excellence in individuals, as well as in nations, can not be achieved in the absence of certain moral, political, and social qualities. This fact is so generally admitted that it does not require closer investigation. As the qualities referred to are in no small degree the result of careful education, and especially of thorough school training, it is no exaggeration to call the labor question a question of education and training.²

If we consider education specially in its significant bearing upon national economic development and upon the position of individuals in business life, the importance of special education, as has been stated before, is greater than that of general education. Its significance in practical life is so generally recognized that it is needless to dwell upon it. But the fact is often ignored that a good special education must be based upon a thorough and broad general education; that he whose general education is deficient can not acquire a higher and thorough special education. Special education without general education is as a house without foundation, or sowing without plowing. Nevertheless, in times when industrial evils cry for redress, special education is unduly emphasized and general education depreciated.³

Thus special preparation is often advocated at the expense of thor-

¹ Dr. J. Conrad, professor in Halle, said in his *Handbook of Political Sciences*: "It is desirable for education to have itself in view as an end, and not be made openly or covertly subservient to other purposes. In point of fact, however, especially in cases where better situated persons apply the means necessary for the further education of others (beyond that of the elementary school) such other purposes play an important part; be it that the students are either led or kept in certain defined directions, or are protected against influences considered dangerous to existing social conditions."

² Dr. G. von Schönberg says in his *Handbook of Political Economy*: "The labor question is also an educational question. The better the school training the higher the labor capacity and the morality of the laboring people. All measures of the administration to establish a good condition of public schools (compulsory attendance, sufficient number of schools and teachers, thorough instruction) are also means for the solution of the labor question. No outlay is more productive than that which the State applies to the education of its future citizens."

³ Professor Ahrens, in Kiel, director of an industrial school, said recently: "What is the good of having acquired a fine general education, if we are simpletons in practical business life, forced to acknowledge, 'That which we know we can not use, and that which we use we do not know.' If general industrial excellence, cleverness, and artistic skill, in short, the productive capacity of the nation, were forced to seek bread despite general education, then we should rather set store by less knowledge and greater ability for practical work. Therefore, instead of compulsory general supplementary schools, we should establish schools with definite relation to practical callings—industrial, agricultural, and commercial schools."

ough general education, which seems a grave error. It does not seem superfluous to recall some opinions of competent authorities on this point, for the best judges of the industrial education question are loud in their advocacy of a thorough elementary training before special education is begun.

The value of popular education seems to be least appreciated among agricultural people. The political press has published a number of more or less authentic expressions of farmers, not only underrating the training of the mind, but advocating its entire neglect, as far as farm laborers are concerned. A farmer of West Prussia is said to have stated: "The most ignorant laborers are the best." The following words are attributed to a large landholder in Pomerania: "No education is necessary for gathering potatoes." A nobleman of Mecklenburg is said to have remarked to a teacher who applied to him for an appointment in school: "I need three oxen for my plow, and if the one behind the plow can call out 'Gee!' and 'Whoa!' at the right time, nothing more is necessary." Even in the Prussian House of Lords it has been said: "If we teach the peasant how to calculate and keep accounts he is ruined. His duty is to plow and to drive; he need know nothing of accounts." In the memorable debate in the Prussian House of Deputies from the 9th to the 11th of February of 1898, in which the school question was discussed with reference to agricultural interests, the better education of the farm laborer was pronounced not only superfluous and indifferent, but even undesirable and harmful. Deputy Szumla spoke of the farm laborer of Austrian and Polish Galicia as the ideal workman. "The people, of whom one-half can hardly read and write, think of nothing save their work and wages; they are the most respectable people in the world and could serve as models in ethics for our German laborers." He emphasized particularly "that there is no vestige of politics among them; not one of them knows what politics are." Deputy Count Strachwitz expressed these views still more forcibly. He would in all seriousness keep the whole working class of the eastern section down to a proposed level of education. He said: "I believe that the only effective means is to provide for a certain increase of population by immigration from Poland, after the extent of the demand for working hands is known. A less pretentious working class would soon be formed, and to my mind this is most desirable."

It should, however, be stated that the other party of the House which supports a reactionary policy did not see fit to indorse these views. The conservatives declared against the introduction of uneducated laborers and against the lowering of educational standards. But their recommendations and motions would certainly have the effect of lowering the educational level of the rural population. Whether the party as such realized what would be the effect of their efforts, and whether the minister of agriculture intended to promote such tendencies, is not

easily decided. At all events, it is especially worthy of note that intelligence among laborers was publicly declared by this party to be neither unnecessary nor harmful. One of the conservative speakers, the royal councilor of state from Halle, von Mendel-Steinfels, even confessed that "the strongest and most intelligent persons are required for the management of agricultural machines," and deplored that many of such men locate in cities.¹

The importance of a more advanced education for agricultural people has received special notice elsewhere. At the last general meeting of the Society for National Education, Dr. von Gossler, president of the province of West Prussia, and also a landed proprietor, said: "The greatest present necessity of farmers is a better, and especially a scientific, education." The Economic Society of Pomerania has recognized the necessity of a better schooling for farm laborers, even though much restricted, and perhaps specialized.

These views are fully confirmed by scientific men. I will confine myself here to citing the following opinion:

Agriculture requires more judgment, care, and skill on the part of laborers to-day than a hundred years ago. This is due to the more varied uses of ground, to the employment of finer and more complicated implements and machinery, and to the better feeding and care of animals; furthermore, to the fact that human labor forms a much greater portion of the total product now than heretofore, and consequently the product of an establishment depends in a greater degree upon the profitable utilization of human labor.—(Handbook of Political Economy, by Professor Schönberg.)

When agriculture was primitive, and the farmer satisfied his wants by the products "in natura," farming could be followed with comparatively little education. To-day the farmer needs a thousand things which he must buy; again, he must sell, so he must be a merchant. Furthermore, the elementary means of utilizing soil and animals are no longer adequate; he must understand his occupation as an industry, and be mindful of its continual progress. His every necessity cries aloud for a higher education than mere reading, writing, and arithmetic can offer. This is the true meaning of the agrarian question; it is not one of the price of grain. How to prepare farmers who are abreast of the times, and in a position to develop the latent resources of the soil, is the task of the people's or elementary common schools.

A few remarks on Danish agriculture deserve insertion here. Denmark is a country with many flourishing rural popular high schools. Sons and daughters of peasants attend them to extend and strengthen their general education. Maikki Friberg, a woman thoroughly acquainted with the Danish peasantry, expresses a very favorable opinion of the excellent work rendered by these high-school pupils, and attributes the rise of the butter trade of Denmark to the better education of the peasantry.²

¹See note 3 in Appendix, p. 753.

²See note 11 in Appendix, p. 754.

In Germany particularly the farmer requires a more advanced education. Only intelligent men can be prosperous farmers in Germany. Nature has not endowed the soil with untold riches. Within its boundaries there are no districts of inexhaustible productiveness; no wheat fields, as in Roumania and Hungary; no "black earth," as in Russia; no fertile plains yielding an abundant harvest without much labor, as in the Argentine Republic and the United States of America. In Germany the gods have made success dependent upon industry and, above all, upon intellectual and technical training. It were no idle question to ask how many of its inhabitants could be supported if the population were upon the low level of civilization of former centuries, or on a level, for instance, with that of Russia. Surely not one-half of the present number. Thirty millions of the fifty-five would be forced to emigrate or die out if industry, commerce, science, and art did not support them. German agriculture can only maintain its ancient honorable position in national economics by intensive cultivation of the soil and giving preference to the highest products of husbandry. Times have changed within a generation. The luxury of ignorance can hardly be found to-day in the day laborer's cottage.

A thorough school education is, of course, still more necessary for industrial and commercial workers. What would German industry be to-day without common schools! It is not to be thought of. Especially is industry on a small scale altogether dependent upon the educational standpoint of those engaged in it.¹

We are just now living through a period of hard times, it is true. The man of small means, the mechanic in his home shop, is waging a useless war in many branches against industry on a large scale—that is, the factory. In some parts of the Empire the former is in the ascendant, or the factory does not as yet enter into competition with him. But industry on a small scale has been suffering less from the influence of business depression than from the incapacity and meager education of those engaged in it during the past few decades. Who at present becomes a mechanic? In many districts not even the mechanic's sons themselves. They get to be officeholders, teachers, specialists in the practical arts, factory hands, anything but mechanics. They find in the callings specified a freer existence, but often one with few, if any, prospects. Mechanics to-day come either from the country, the sons of day laborers, or from the lowest ranks of city work-

¹ "The present business dealings of mechanics have long since done away with the simple forms of earlier times; they have become more and more merchant-like. Purchase, payment, sales, etc., all presuppose much more knowledge, a higher degree of intelligence and commercial ability than was expected of mechanics in former years. Aside from his thorough practical (i. e., technical) education, the mechanic must meet the demands of the time, which call for a general education as well, if he wishes to enjoy success."—(H. Böttger, *Manual for Mechanics*.)

men. These recruits, because of their deficient education, have not what is most necessary for their calling in critical times—quick comprehension, adaptability, etc.¹

It is reasonable to suppose that development will again be along other lines. The increase of officeholders will grow less, industry on a large scale will attain its fullest growth, and the younger generation will cease to go in these directions; then many forces will be spared for trades that are now lost to them. But shall we wait idly until this happens? We can do better by improving the people's schools in villages and cities, making them a secure foundation for industrial labor, and by seeing to it that the knowledge gained in them may be preserved and broadened in supplementary and special schools of all kinds.

If the application of education in the pursuit of agriculture has been with difficulty brought about, its value in industry has not been doubted for a long time past. Some men, and particularly some corporations, have opposed the motion of a broader education for apprentices and youthful laborers. On the whole, however, all manufacturers and tradesmen are convinced that great results can not be attained by apprenticeship alone, however carefully it may be guided, but that it must be supplemented by special school education.

It is not so long ago that leaders in industry and commerce expressed themselves against compulsory education. In 1854 the Chamber of Commerce at Aix-la-Chapelle (Aachen) declared that "compulsory attendance at school and the reduction of working hours for the young would have a bad effect on the condition of the lower classes." Whether these views are still entertained in that body is a question;

¹In judging a crime of omission or of commission, our reason prompts us to consider not only separate impulses and their immediate motives, but to investigate the former life, youth, and education of the defendant, in order to establish the more intimate connection between cause and effect, and thus to establish mitigating circumstances for the accused, if possible. The economic condition of a nation, or of a class, where deficiencies or glaring evils are discovered, should be considered from a similar point of view. It is not only important to learn that this or that branch of industry has gone to the wall from a domestic or a foreign cause, but we are interested in knowing how the faulty condition arose; what were the early years of the industry in question; whether those engaged in it made good and proper use of the period of development and learning, and above all whether they commanded sufficient means for the training of existing talents. Therefore, if our trades are not all that they should be, if much is inadequate and deficient, the responsibility rests not only on the present generation, but on its teachers and progenitors, on state and society that refused the means necessary to bring them to perfection. The saying "The child is the father of the man" is a paradox verified in life. The deepest and richest foundations for the actions and conduct of the adult man are laid during youth, and the causes of failure or success often lie far back in the past. The actual conditions of individuals, as well as of classes and of nations, are effects, the causes of which are rarely found in sudden bursts of luck or misfortune, but in the silent forces of previous education."—(H. Böttger, *Manual for Mechanics*.)

but judging from general political manifestations in that region they are not. It is a noteworthy fact that the members of the conservative party in industrial districts are much more in favor of popular education than their colleagues in agricultural districts. The hyper-aristocratic merchants in commercial centers likewise show a proportionately generous spirit of sacrifice for popular education. They know that industry and commerce can not thrive without an intelligent class of laborers. Bebel, the socialistic leader in Parliament, himself praises enterprising manufacturers and merchants for their appreciation of intelligence in workmen. He then goes on to say:

Every intelligent man of enterprise in England and America (in these countries there is not a difference of opinion even among farmers on this subject) says that the most intelligent laborer is the best and cheapest, on account of being the most competent and responsible. The higher the grade of intelligence and the better the schooling of our laborers, the greater the advantage for industry and agriculture. These are the views of my party, but I am sorry to say they are not shared by all parties.—(Bebel, speech in the Reichstag, January 13, 1899.)

Anyone who has given thought to labor at and with machines knows that every workman in factories must have an advanced education to fill his position satisfactorily. The invention of machines is reserved for a chosen few, but an appropriate use of them and working with and among them require a man of technical skill and intellectual and ethical development greater than that of a mere drudge. Roscher, who has by no means very modern views on the high results of elementary schools, writes in his *System of Economics*:

If those who despise learning repeatedly call to mind that Wyatt, Lewis, Arkwright, Hargreaves, Crompton, J. Kay, Jacquard, were self-taught men, mostly poor uneducated weavers, that Cartwright was a theologian, Watt not at all a trained mechanic, it does not follow that genius and chance can ever take the place of schools. Statements of great weight of English factory owners go to show that a good education makes the workman more clever, versatile, and ready to grasp a new idea. In this respect the laborers of Saxony, Switzerland, and of America are often ahead of the English.

And J. G. Kohl, in his *Travels in England and Wales*, remarks:

Under the present conditions of manufacture, when so much is done by machinery and intricate instruments and the little done by hand is diminishing day by day, discretion, systematic order, punctuality, and good conduct grow more and more important. And as all these qualities are developed and encouraged by careful education, education itself gains in significance day by day. I believe that at the present day there are few, if any, enlightened mechanics who are not of the opinion that those factories in which the greatest number of well-raised and educated workmen are employed yield the largest results and the best work in the best way.

Wörrishofer, the well-known factory inspector of Baden, says:

Intelligent direction is not alone sufficient for the progress of industry. In less civilized countries, or in former times, with a less educated and less civilized labor class, incapable of applying advanced technique, the same success in industry could not have been achieved; for the reason that the necessary, and often ignored, pre-

supposition of progress and success is that their attainment depends upon intelligent instruments, down to the least important workman. Let it not be said that perfected machinery renders unnecessary intelligence in inferior agents. That is true only in a very limited sense, for the demands upon the responsibility of performance and upon right judgment in the direction of labor processes by means of machinery have become greater. We need only in thought remove intelligent direction, together with perfected machinery, into earlier times to see the falsity of the assertion that human labor exercises less and less influence on the success attendant upon industry with the progressive development of mechanical appliances.

Dr. von Schulze-Gävernitz, the renowned professor of economics, is of similar mind. He says:

Machines, which are getting to be more and more complicated, require a certain affectionate handling, a thorough understanding on the part of the workman of the technical thought embodied in them, just as the English thoroughbred horse must be led by understanding and love, lest it refuse obedience to the rough treatment of an inexperienced groom. As the highly-developed type of factory labor requires an intelligent appreciation of its individualities, and gives the best results where it receives a certain sympathy for its aspirations from the employer, * * * so the more and more artistic machinery will not bear unwilling and ignorant management. Even the masterpieces of the human mind give the best results when the operator has risen to the height of intelligent labor.

The rough Polish laborer, farming the fields of Posen and upper Silesia, could not have amassed the wealth of a Krupp and a Borsig, even under the most intelligent direction. The better educated laborer works not only better but on the whole cheaper than the one who is ignorant. This fact is often confirmed in treatises on economics, by contrasting the workmen of Russia with those of western Europe.¹ Our industrialists therefore earnestly try to keep educated hands, and to employ none other. They are favorable to education from a proper understanding of their own interests. Some, it is true, have the notion of a slave machinery devoid of right and intelligence, but such can never and never do become either Krupps or Borsigs.

The difference between workmen who have attended school and those who have not is much more conspicuous in countries where school education is a rare thing, as, for instance, Russia, than in Germany and England. We are indebted to the well-known professor of political economy, Dr. von Schulze-Gävernitz, for some facts on Russian factory labor which shed a strong light on the subject in hand. They prove that in manufacture ignorant labor is worth much less than intelligent.² The inferior achievements of the Russian workman compared with the Belgian and the German have received the attention of other writers.³ The writings of an older author, J. G. Kohl, belonging to the middle of the nineteenth century, are even more valuable, since school education was at that time not so general in western Europe. The passages referring to this subject are found in *Travels in England and Wales, Volume II*, and are so emphatic and

¹ See Note 5, p. 754, in Appendix.

² See note 6, p. 754, in Appendix.

professionally correct as to deserve special consideration at this time. In one the writer quotes an English factory owner's opinion on the value of school education for laborers;¹ in another he compares laborers of different nationalities with respect to their natural abilities and with respect to their school education, at the same time showing the value of education, not only for capacity of work, but for duties of civil life. The last assertions are based upon the statements of a manufacturer of Zürich (Switzerland) whose 600 to 800 workmen were of all sorts of western European nationalities.²

The significance of a thorough school education for the economic prosperity of a country is nowhere so clearly defined as in the Kingdom of Saxony. Saxony is the leading industrial State of Germany. It is that not because of its natural wealth, but because of the universal education of its citizens. The Social Correspondent of Bohemia says on that subject:

Saxony is to-day a rich country. Yet, within recent times the poverty of its mining district population was proverbial. The once rich silver mines had been almost exhausted; the bobbin trade, which had been developed by the wearing of lace caps, fichus, and cuffs, during the Rococo period, was no longer encouraged by fashion. Manufacture, too suddenly developed under the continental exclusion of English goods through Napoleon I, was too weak to compete with the English after the overthrow of the French system. Thus, after the Congress of Vienna (1815), economic evils arose in Saxony which weighed heavily on the greater part of the population. However, prudent appreciation of industry, invention of new methods, incessant practical labor, commercial excellence, widespread, yet thorough popular education, wise administration, and economic penetration have removed these evils, virtually wiped out poverty, and lifted the State to a degree of industrial importance almost unrivaled. Saxony, inconspicuous as to size, and of little political influence in the Vienna congress, has since been lifted far above the significance of its extent by systematically teaching the people to cultivate a bee-like diligence, and to acquire the world market for the products of their industry. Since the establishment of the "Zollverein" (custom's union) and the reestablishment of the German Empire Saxony has grown to be a very wealthy State. The people are noted for special skill in all branches of industry. So much is well known. Their skill, however, is not innate, but acquired. It is an outcome of a broad and fruitful education, wisely regulated from the beginning. Saxony has not been in vain the cradle of an educational reform, breathing life into all educational efforts. Justice demands recognition of its priority among the German States and its circumspection in the matter of popular education. The decree of February 14, 1803, during the reign of Frederick Augustus, and the general school law of March 4, 1805, brought about this improvement on a large scale. What was then sown, the present is reaping. The remarkably good elementary or people's school system of Saxony is the strong foundation on which is reared an extensive and lofty superstructure of technical schools; to these latter is due the economic skill of Saxony, which has brought about the national prosperity.

The position of Saxony in the German Empire is that of the Empire with respect to Europe and the rest of the world. Whenever foreigners speak of the economic successes of Germany, they dwell upon the influence of the people's (elementary) schools. Two quotations from

¹See note 7, p. 755, in Appendix.

²See note 8, p. 756, in Appendix.

foreign expressions may suffice; one from nonprogressive East Russia, the other from Belgium:

The German teacher is a man of short stature but of great mental calibre. He commanded recognition at Sedan, and crowned the Prussian King with the imperial crown handed to him by Bismarck. With untiring energy he is at present applying himself to his work with perseverance and method. A survey of his work shows that he is preparing the most startling surprises. The English had hardly expected to cope so soon with an equal competitor in industry, commerce, and colonization. But their eyes were suddenly opened to the fact that the Germans had not only caught up to them, but were surpassing them in many ways. * * * If in the history of the new German Empire the army has drawn the full measure of what the teacher has prepared, we also must give the most earnest attention to the effect of German school education. Otherwise the German teacher would ensnare us in times of deepest peace, and throw us, close neighbors in Asia now as in Europe, from one surprise into another.—(Nowja Wremja, January 29, 1898.)

Baron de Haulleville has published an article in the Brussels Journal on Germans in Brussels, in which he says with emphasis:

The causes of the great and irresistible expansion of German influence are: Instruction, education, and discipline. The elementary schools of Germany are, on the whole, the best in Europe; children there learn to fear God and respect authority. In military service this education is supplemented by the science of discipline. Every German learns strict obedience and, consequently, learns how to command. Combine, so the conclusion reads, the marvelous system of technical education with this education in elementary schools and with disciplinary training, and you have the secret of the present power of Germany, political and economic, with its future inevitable consequences.

The knowledge that all relations of political and social life and, in particular, economic conditions depend upon the education of youth has made its way especially in those times when there was a question of saving a community or a nation from retrogression or even from ruin. The most enthusiastic panegyrics on schools and national education were composed in Prussia after the disastrous year 1806, in Austria after 1866, and in France after 1870; and at the present day we hear in Spain, humiliated by the war with the United States, cries for a thorough reform of national education neglected under church guardianship. Greater value, however, attaches to education from an economic standpoint in the extended literature pertaining to the industrial defeat of Germany in Philadelphia in 1876 than by the foregoing historical examples in which general political relations received the greater consideration. Similar discussions have been published by the foreign press for a number of years, ever since the knowledge came home of what great economic factors the people's schools of Germany are, if combined with an extended system of supplementary and technical schools.

In times of economic progress we incline too much toward ignoring the relations between popular education and economic national development. It is in the nature of man to grasp but one, and that the most prominent, fact in a succession of phenomena. That is why the

tasks set before civilization are often neglected to an incredible extent in such times. England, whose past furnishes an unexampled industrial development, made comparatively little use, during its most successful periods, of the proceeds of economic labor, in order to raise a better educated labor class. Only since she sees her supremacy in industry threatened has she tried to make these omissions good. In the last ten years she has increased the amount spent on elementary schools from \$44,268,000 to \$68,068,000, thereby far overshadowing Prussia, which without sufficient reason is called "the land of schools." Prussia with about one million more inhabitants than England and Wales together, spends fully twenty-four millions less—that is, about as much as England and Wales spent ten years ago.

The Germans, therefore, have no reason to look down upon England, even though her schools may not come up to theirs in many respects as yet. The millions that she is now spending for education will bear fruit in the near future. Do we Germans need another actual "débâcle" to rekindle our zeal? It almost seems as though the powers were in the ascendant which are opposed to advanced popular education. Fine words are heard in parliament and elsewhere, but with many their deeds rather prove that these words serve only to conceal thoughts.

III.

Popular education has another effect upon national economic development besides that of increasing wealth production. It likewise¹ promotes a more equal distribution of the results of labor. The more

¹ Concerning the effect of good common schools upon the entire social life, Lorenz von Stein says, in his *Manual of Administration*, as follows:

"The import, extent, universality, and freedom of elementary education indicate the force and direction of the whole social movement of an epoch, and in such a way that its existence and extension, as well as its organic connection with all other educational factors, mean the elevation of the lower strata and especially their approach to the intellectual plane of the better situated strata of society. The common schools, or, as they are called in Germany, the people's schools, fill out that distressing gap between illiterate ignorance and culture which exists in some countries. No true social progress is possible without well-organized elementary education. Where this is wanting, there is felt the absence of the great intermediary link for the transition of one class to another—in short, the element of equalization of classes and the wiping out of class distinctions. [The American common school, for instance, is a grand crucible within which the most heterogeneous nationalities and the most distant social elements are fused into one homogeneous nation of equal legal and social rights. There is no factor that could have secured this end in the United States better than the great equalizer, the common school.—Tr.] The social struggle in countries lacking common schools becomes therefore rough and brutal. Though it may have the increase of welfare as an aim, it has despotism as a consequence. Thorough and universal elementary education alone can change matters, more by its principle than by its substance. Wherever good and progressive elementary schools exist, the social advance of the lower strata is continuous. The possibility of a violent revolution decreases with the advance of general education."

educated a nation is in its entirety, the more lively the effort to share the national wealth, material and intellectual. Social struggles thus arise which tend to lessen that preponderance of fortune, education, and political power which a few possess among an uncivilized or little educated people. That is one of the chief reasons why popular education is looked upon with such disfavor by some. Social and political prejudices are added to erroneous economic ideas. In the meantime, they who place the common good above the supposed interests of individuals and particular classes will not only advocate a greater equality of cultural treasures, but use their full power to bring it about.¹ That is the only way to social peace; and, at the same time, the only way to make the proceeds of labor serve to develop the whole nation.² If this tendency is opposed by force, revolutionary ideas grow in the public mind, threatening our whole civilization. The famous professor of political economy, Wilhelm Roscher, says on this point:

The higher the civilization the greater honor attaches to labor; barbarous nations despise it as slavish. A working class that is despised and recompensed below the dignity of man will surely show the estimation in which it is held by the bad quality of its work. Adam Smith commented on the diligence of well-paid workmen. Labor will necessarily be the more distasteful to the ignorant the lower their wages. In the long run, it always serves the interests of the employer to pay his workmen well. Permanently high wages are among civilized nations most closely connected, as cause and effect, with a flourishing condition of the people. On the one hand, they attest the high productiveness of national industry, as well as wisdom, self-esteem, and self-control among the numerous lower classes, which virtues are only found in connection with political liberty, and social esteem on the part of the higher classes. On the other hand, they enable the large majority of the people, who must support themselves by wages, to occupy a creditable position, in which they can decently educate their children, enjoy the present, and provide for the future. With low wages, all equality before the law, all active participation in affairs of state, are merely exasperating phraseology, simply privileges (private rights) of the minority. Without contentment among the lower classes, neither the liberty of the middle nor the domination of the upper classes is secure in countries of high civilization with sensitive and mobile social conditions.

The best intended efforts for the equalization and general distribution of wealth, education, and power will never succeed in establishing perfect equality. Inequality will and must exist. But one who is gifted by nature should see before him the possibility of ascending the

¹J. E. Thorold Rogers says:

“The excellence of a social condition does not now consist in the abundance of acquired and amassed wealth, but in such an actual distribution of the same as assures the greatest possible enjoyment of life, and the best hope to all whose sustained efforts create present national industry and the prospect of its further growth.

²The “*Arbeiterfreund*,” volume 35, says on this subject:

“The chief dangers of modern civilization do not lie in the wholesome struggle for subsistence forced upon us. They are not of an economic but of a moral nature. We must see to it that the increasing massing of capital now taking place in all civilized nations does not provoke a feeling of anger or lead to effeminacy, but that capital be usefully applied, appropriately distributed, and made to serve noble ends.”

social ladder; even he who is not specially talented and belongs to the poor, should not be held back to his disadvantage and the advantage of others, his equals in mind, by arbitrary obstacles. This standpoint was most strongly demonstrated in systematic form in the speech with which Professor Schmoller, of Berlin, opened the conference on the social question in Eisenach, which is here quoted:

In all progressive steps toward division of labor, in all reorganization of industries, business affairs, labor contracts, and in any new legislation referring to these, the first and almost only question raised is, Will present production be increased thereby? and not the equally important one, What effect will that have upon humanity? Will the new organizations, new arrangements, and new legislation furnish or create moral factors, without which society can not exist? Will they train the youthful elements of society sufficiently, or better than before? Will they influence adults with respect to diligence, economy, honesty, and family life, so that progress is likely in these directions as well as in economics? These are questions equally important with the one asked first. The members of this conference are convinced that the neglect of this psychological connection between economic readjustment and reorganization and the moral condition of the nation is the germ of the evil, and that reform must be based upon the recognition of this 'causal nexus.' Their judgment on the labor question is founded on these views. That the workman dresses and lives better to-day, and that perhaps not so many thousands die of slow death from hunger as in past centuries, offers but little encouragement. The first consideration is, whether the conditions of life in which most workmen live to-day, promise them moral and economic progress; that can not be said of the majority. Instead, the contrast between them and the wealthy, educated classes grows more marked every day. Moreover, the contrast in material things is not nearly so dangerous a portent as the difference that has arisen in regard to culture, education, views, and ideals.¹ History teaches that all higher civilizations, the Greek, the Roman, and others, declined on account of similar contrasts, class struggles, and revolutions—that is, the utter inability to reconcile the higher and the lower classes. The same dangers, if yet in the far distant future, threaten our civilization, unless we succeed by means of equal laws, general education, and military discipline, as well as many social reforms, in elevating, educating, and reconciling the lower classes to such a degree that they will form a harmonious and peaceful, because contented, part of the social organism.

Equalization in the sense in which the socialistic party interpret the term is not our ideal of society. We consider that society nearest the normal and healthiest which consists of different grades, of easy transition from one to the other. Our present society is like a ladder that grows in length at both ends, the middle rungs of which are breaking out, while there is no hold save at the top or bottom.

We believe that too great an inequality in wealth and income, or a too bitter struggle between the classes, must in time overthrow all our political institutions and bring us again into the danger of an absolute government. Therefore, we believe that the state can not be indifferent to such a development.

We expect state, society, and every individual anxious to cooperate in the work of the present, to be inspired with a great ideal. This ideal can and must be no other than to bring a constantly increasing proportion of the nation to a participation in all the higher benefits of civilization, education, and prosperity. That can and must be the duty of our reform efforts; the great democratic duty in the widest sense of the term, as it seems the great aim of universal history.

¹The difference between the degree of education of a knight, during the time of chivalry, and that of a peasant, was not near so great as that existing between a scientifically trained man and an ignorant farm hand to-day.—Tr.

The article by Henry Herkners on "Economy and luxury from the standpoint of national free will," is also one of note, and may be looked upon as an appeal to the conscience of those in possession of power. The following is a quotation:

It is not difficult to understand that a greater inequality in income and wealth, on economic, educational, and political grounds, portends a fatal national disease. How can economic conditions flourish, how can a national market exist, if the masses are scarcely able to buy necessities? The elevation of the purchasing and consuming power of the labor class is alone able to overcome, in some measure, the chronic disturbances in the economic cycle, and to bring consumption and production closer to equalization. The moral and intellectual dangers that threaten the golden heights of wealth and work in the deep abyss of misery are very apparent. In the end we must acknowledge to ourselves that political development leads irresistibly to a greater equality of public rights and to a more extensive participation of the masses in public power. If economic development among the people does not keep equal pace with the equalization of rights, or even if it exert a contrary influence and accentuate the difference in wealth and education, a catastrophe is unavoidable. If the method of production by capital and the economic rule of the people are to be a blessing, the people must understand how to overcome the dangers. Sharp social contradistinctions must be softened. The treasures of civilization and culture must be disseminated among the working class, and material culture must be further advanced by better distribution.

The social problems devolving upon industrialists from their position in the economic organism of the present need not be considered here.¹

It is a part of the duties of teachers to labor for the general dissemination and distribution of all treasures of culture among the people. The fact that this tends to their own prosperity we must pass over.² Let it suffice that such equal distribution increases the power, happiness, and development of all grades of society, even of the higher classes.³ Development destined to benefit all can not exclude the lower classes. National wealth must not be in possession of the few, as was the case in the Roman Empire. Concentration of capital means the downfall of a nation.⁴

IV.

Unfortunately, a general development of the laboring people to a higher degree of culture meets with great opposition in Germany. Why? Lord Bacon has said with truth: "Knowledge is power," or, more clearly expressed: "Human knowledge and power are one, for ignorance frustrates every successful issue." But just because this is well known, because it is an axiom that a learned or educated people is a strong people, strong from an economic and from a political standpoint, certain persons and political factions would confine knowl-

¹ See Note 9, in the Appendix, p. 758.

² See Note 10, in the Appendix, p. 759.

³ See Note 11, in the Appendix, p. 759.

⁴ See Note 12, in the Appendix, p. 760.

edge and culture to a few select circles, and consider them privileges (private rights), like many other good things in State and society. That such a view is partisan, devoid of every higher point of view and consideration for country and the common good, needs no further demonstration. It is just as clear that special interests suffer by these views as that the feudal knights of the Middle Ages sealed their own doom, as well as that of the peasants, by their short-sighted policy with respect to vassalage. The noblemen of northeastern Germany of to-day are ruining themselves, first of all, by withholding advanced education from the farm laborers.

That lower instincts, and especially selfishness, play a great part in party politics is easily understood. But it would be a mistake to base a party programme on this; such a programme does not satisfy those of an earnest moral nature. With them considerations of a general nature turn the scale, and there are considerations of this kind also which have the effect of making it difficult for the mass of the people to acquire a better education, or of debarring them from it altogether. Those reactionary politicians who base their political principles on a world view, believe that a political system can not exist without a broad layer of working people with little education and engaged in none but physical labor, and that the common good requires this basis of ignorance. This notion has had so great a hold on the wisest men of antiquity (Aristotle, Plato) that they considered slavery indispensable. The opinion that the mass of the people can not be brought to act from free, personal resolve, is decisive for keeping them intentionally in a state of intellectual dependence. The falsity of these views has been proved by modern nations, notably by the United States, but still these views must be ever and anon held up to be combated.

In the beginning of the nineteenth century, when Germany was politically rent asunder, and Prussia lay crushed at the feet of the ruthless conqueror, Fichte addressed the following words, seemingly forgotten to-day, to the German people and government:

That people whose very lowest classes possess the broadest and most general education will be the mightiest and happiest of its times—invincible to its neighbors, envied by its contemporaries, and a model of imitation for them.

Fichte's views were at that time enthusiastically received in the most influential circles. To build up the shattered state through a better education of youth, all eyes turned to the best source to be found—Pestalozzi. So it happened that this educational genius, so misjudged in his less expansive fatherland, received general recognition in the land of the Hohenzollern, and exercised a penetrating influence on schools in Prussia, and subsequently in all Germany.

Three generations separate those times from ours, a period full of developments and revolutions. Popular education has celebrated one

triumph after another. It has won battles, acquired the world's trade, subdued poverty, and, to be just, lessened immorality and crime. Nevertheless, this resplendent triumph of the benefactress education is regarded by those who consider themselves the highest, not only with indifference, but with jest, mockery, and even animosity. Why is this?

The conviction that the lowly born should remain on their low plane, that it is the divine order, and that it is absolutely impossible to raise the masses to a high plane of culture and education, is as old as the hills. The more ancient social fetters have been loosened, however, the stronger the conviction has become that many a one may pass easily from the lowest to the highest stage of human existence and culture. Many born in the hut have now the right to sit side by side with the children of the wealthy. The oftener old barriers have been broken through or surmounted, however, the more zealous become the efforts of certain persons and political factions to prevent such cases. The number of those who have a contempt for the masses is less; the number of their enemies is greater. Among the upper ten thousand the insane idea has gained ground that the elevation of the lower classes is detrimental to the higher. "Rise, that I may be seated!" is what the city magnate and the feudalist regard as the actual motive of all thorough efforts in behalf of popular education. The owners of large estates fear to lose their humble farm hands; councilors of city and state, officials of all kinds, dread for their own sons the competition of men from the "common people" in filling positions which, in the opinion of many, should be conferred according to the old custom of caste. All are afraid of forfeiting some of their small advantages. The elevation of the many means to them the decadence of the few. Development suggests to them the fable of the fox and the goat in the well. We recognize in this the same lamentably narrow view of general culture which we meet in discussing the position of our country in the world economics.

What is to become of our fatherland is the keynote of the general lamentation, if other nations develop a productive industry? Who will buy of us? According to this idea, we live, in a certain measure, on the lack of culture in other nations, as the educated of a nation live on the lack of culture in the masses. A cursory view convinces us of the fallacy of that argument. The contrary is true. When the large majority of our nation were poor and ignorant, the present well educated and enormously rich led a beggarly existence, that the present laboring man would not be satisfied with. The poor and uncivilized produce little, and are, therefore, insignificant competitors. But they use or consume still less, and are, therefore, still more insignificant buyers. If Africa, South America, and Asia were more civilized, what a market they would be for Europe! In every branch of commerce the more

highly cultured have the advantage. They buy more cheaply and sell at higher prices. Apart from their greater circumspection in commercial transactions, their products are what the less civilized desire, and they exchange less attractive goods. So the great man need not tremble before the growth of the small one. On the contrary, those who have cause to distrust their power may well be afraid that others may grow beyond them. Only sycophants and nepotists, privileged weaklings, and not the most highly educated, show any interest in keeping the aspiring down.

The educated are raised with the elevation of the broad basis of national life. The peaks of Chimborazo and Gaurisankar do not rise from the swampy valleys of the Amazon and Ganges rivers, but from the mighty backbone of the Andes and the Himalaya.

The opponents of a more advanced education for the masses think they represent the interests of a circumscribed minority; but in that they err also. They even prevent the development of their own class. The nobility of Prussia east of the Elbe River are impoverished by clinging to the idea that they must have an ignorant population of farm hands, while industrialists in the western part of the country and English lords, on the other hand, are getting richer and richer, because they understand the saying, "Live and let live." However absurd the idea of repressing the laboring people may be, it exercises greater influence on public life than any of us dream of. The animosity of feudalists, for instance, toward every measure which will promote higher development of our economic existence is rooted in the same views. If they can not raise more grain and sell it at an acceptable figure, they think their political power and existence annihilated or at least threatened. That a life of higher development in a country increases first of all the demand for food, and that this demand makes articles of food more profitable, the large land owners mentioned do not seem to understand. If food sells dear, the laboring man must deny himself meat, bread, eggs, etc., the very articles that can be made the most profitable. This adopting the habits of the badger, as is so often the case, destroys prosperity and progress.

Shall we ever succeed in convincing the opponents of popular education of the fallacy of their views? No rapid or present success, indeed, can be expected. The ground must be contested inch by inch. Every breastwork raised in their defense must mercilessly be overcome. Finally, the time will come when truth shall conquer; when no class and no calling shall believe it to their interest to maintain ignorance; when those who wish to hold a place of authority must be properly prepared for its duties. Education and culture have gradually spread from the higher to the middle classes. If the progress of development suffers no unforeseen setback, education, if not the high-

est kind of culture, will soon be a common possession, at least among the most civilized nations. Then personal incapacity or one's own fault alone, and not rank and station, will be the only hindrance. Only on such a basis can true aristocrats, in the noblest meaning of the word, arise and lead a higher, purer, and nobler existence than is possible to an aristocracy that regards its livelihood as based upon ignorance.

An aristocracy built upon an educated lower class may be truly considered the flower of the human race, while one rooted in the slime of ignorance must occupy a low moral position. To an aristocracy which would prevent the spread of the light of heaven the words of Denzel apply: "No human heart beats in the breast of him who recognizing the power of education, would withhold it from the people and build up a wall between himself and those beneath him." These remarks, at one time pronounced with such vehemence for the public ear, should to-day be brought to the notice in particular of every one participating in the administration of public affairs. Every government official, down to the lowest, should hear a course of lectures on educational politics (*Kulturpolitik*). The conviction should be fostered in all, that the highest and most important factors in a modern community are highly educated men, and that in all public arrangements, even those of a purely economic and purely political nature, administrators of public affairs should not lose sight of this fact. Only a nation that is in earnest with the education of the masses can expect to hold an honorable position to-day.

Now is the opportune time to emphasize the connection between popular education and economic development in Germany. We are in danger of resting inert upon our modest laurels. Our machines work, and our locomotives and steamers transport enormous loads over land and sea. We have a host of inanimate slaves, in comparison with which the human slaves of antiquity are as nothing. If we apply the properly trained human force to this immense apparatus, if each one of us does his part, and no idle or incompetent member is found among us, we can produce goods and means far above our daily wants, useful in elevating our posterity by the enjoyment and application of the accumulated treasures of civilization, especially the elevation of those who as yet know, enjoy, and imagine little of all that is great, noble, and beautiful.¹ To find out the ways to be traveled, the means to be employed, and the obstacles to be overcome, is the first duty of the German teachers.

In the foregoing it was my intention not to direct my efforts at definitely formulated results. My only object was to present and illustrate facts that must be considered in studying the question in

¹ See note 13 in the Appendix, p 760.

hand. In looking over what I have written the following conclusions present themselves:

(1) General education is the foundation and necessary antecedent of increased economic activity in all branches of national production in agriculture, small industries, manufactures, and commerce. (The ever increasing differentiation of special and technical education, made necessary by the continual division of labor, must be based upon a general popular education and can not be successful without it.)

(2) The consequence of the increase of popular education is a more equal distribution of the proceeds of labor, contributing to the general prosperity, social peace, and the development of all the powers of the nation.

(3) The economic and social development of a people, and their participation in the international exchange of commodities, is dependent upon the education of the masses.

(4) For these reasons the greatest care for and the fostering of all educational institutions is one of the most important national duties of the present.

APPENDIX.

Note 1, p. 725.—Mr. Samuel Andrew, secretary of the Oldham Master Cotton Spinners and Manufacturers, a practical spinner, equally esteemed by employers and workmen, delivered a most instructive lecture on "Fifty years' cotton trade," at the meeting of the economic section of the British Association, held in Manchester, September, 1887. He discussed in a modest but most interesting manner the development of the cotton industry in England during the reign of Queen Victoria and its present condition.

The lecturer, whose name and experience vouch for the correctness of his assertions, stated that at the time of the Queen's accession to the throne home work predominated, but that spinning had already come under the factory system. He compared the low, dark, poorly-ventilated mills, not fireproof, of that time with the high, roomy, well-lighted, well-ventilated, and mostly fireproof buildings of the present. Industrial and labor-saving machines have been improved, with the result that machines now have greater capacity and that there is less need for human labor.

Concerning the success of these efforts, Mr. Andrew said:

"(1) In the year 1837 seven workmen were required for 1,000 spindles; in 1887 only three were needed. (2) If we consider the average length of a mule and the length of thread produced per spindle, at that time and at present, every workman in a cotton mill, be it man, woman, or child, produces four times as much thread as in the year 1837. (3) The cost of production can not be exactly estimated; one fact, however, remained deeply rooted in the memory of cotton manufacturers of that time, namely the great strike in Stalybridge, when "4 shillings 2 pence or sweat" was posted on the walls of the mills. That meant, spinners demanded 4 shillings 2 pence per 1,000 hanks of No. 50 thread, or they would burn the mills down. To-day (in 1887) hundreds and thousands of pounds of No. 50 are rapidly spun at 1 shilling one-half pence per 1,000 hanks; consequently for one-fourth the price demanded during that strike. (4) Improvements in the construction and

arrangement of buildings as well as of machines, like warps, lines, and other automatic apparatuses, enabled the workman to do his work with one-half the exertion formerly required, and I can prove that the wages are now double what they were in 1837."

In weaving, the rapidity of mechanical looms has likewise increased. A woman can now take charge of four looms instead of two, and the average wages have doubled. It must not be forgotten that reference is not made to the latest inventions in machinery. The machines in question, with the exception of the ring spinning machine, are the machines of 1837, but constantly perfected in detail. The great capacity of the single workman, despite the ten-hour law, is not to be attributed solely to the progress in machinery, but partly to the increased skill and dexterity of spinners trained from early youth to their work, without interruption, and their close attention and diligence directed toward getting as much out of the machine as possible, not always to the advantage of its cleanliness and good condition.

Note 2, page 727.—From Bellamy's *Equality*, page 40:

"It is a constant study of the administration so to bait the less attractive occupations with special advantages as to leisure and otherwise as always to keep the balance of preference between them as nearly true as possible; and if, finally, there were any occupation which after all remained so distasteful as to attract no volunteers, and yet was necessary, its duties would be performed by all in rotation. As, for example, I said, the work of repairing and cleansing the sewers. If that sort of work were as offensive as it must have been in your day, I dare say it might have to be done by a rotation in which all would take their turn, replied the doctor, but our sewers are as clean as our streets. They convey only water which has been chemically purified and deodorized before it enters them, by an apparatus connected with every dwelling. By the same apparatus all solid sewage is electrically cremated, and removed in the form of ashes. This improvement in the sewer-system, which followed the great Revolution very closely, might have waited a hundred years before introduction but for the Revolution, although the necessary scientific knowledge and appliances had long been available. The case furnishes merely one instance out of a thousand of the devices for avoiding repulsive and perilous sorts of work which, while simple enough, the world would never have troubled itself to adopt, so long as the rich had in the poor a race of uncomplaining economic serfs on which to lay all their burdens. The effect of economic equality was to make it equally the interest of all to avoid, so far as possible, the more unpleasant tasks, since henceforth they must be shared by all. In this way, wholly apart from the moral aspects of the matter, the progress of chemical, sanitary, and mechanical science owes an incalculable debt to the Revolution."

Note 3, page 737.—The obstacles in the way of the introduction of machines into backward country districts are shown in the following statement of agrarian conditions in Pomerania: "The hand is still in prominent use for individual operations, and it does not seem as though machines will ever enter into competition with it. They are sold at a high price and are only used to a limited extent. Besides, careless and awkward manipulation can not be avoided on account of the deficient training and inexperience of the operators, however carefully they may have been selected. In consequence, the machinery often refuses to act, and just when business is most pressing all dispositions are upset. This occasions innumerable setbacks, especially in view of the difficulty of procuring without notice expensive human labor or other temporary assistance, and necessitates intricate and expensive repairs. Moreover, the occasions of accidents are increased in the most fateful manner. Those who come in daily contact with the apparatus become careless, utterly neglecting the already inadequate precautions to be taken against accidents, so that they get easily hurt."—(Rural labor conditions. *Laborer's Friend*, Berlin, 1885.)

Note 4, page 737.—"But what is to become of these young men (the students of rural high schools) later? many a one may ask. Will they not dislike physical labor, aspire to something higher, and thus make themselves very unhappy? Not at all. The young man goes back to his workshop or to the plow as before; but he works with a more cheerful spirit, because now the whole world is larger and infinitely more beautiful to him. Labor is no longer a heavy burden to him, but a joyful duty, an honor. By means of it he serves not only his family, but his country and all mankind. Thus, for instance, the peasants of Denmark have united and established large farms everywhere. The so-called peasant butter has altogether disappeared from the trade, and the exportation of prime butter has increased from 18,000,000 to 79,000,000 pounds a year. So with the exportation of hogs and pork. Within late years great progress has been made in the planting of barren wastes. All over the country we find athletic clubs, sharpshooters' societies, reading rooms, and libraries. Wherever we look we see the traces of animated industry."—(People's High Schools in the North, by Maikki Friberg.)

Note 5, page 741.—"In the mills of Vladimir, Russia, which manufacture very simple material, one workman is employed to 0.8 of a loom; in England the average is one workman to 2.8 looms, and in northern Lancashire, in case of the simplest manufacture, even one to three or four looms. Setting aside preparatory work and considering the weaving alone, one workman in Vladimir for simple material operates two looms; in England, four to six. As regards wages, the English workman earns three to five times as much a week as the Russian; nevertheless, the cost of labor by products are only a little lower in Russia than in England, and noticeably lower only in those large factories of Moscow that have adopted the nine-hour law. This difference in favor of Russia is more than equalized by appropriations for dwellings for workmen, as well as by the costs of supervision and management, which are far higher in Russia than in England. In England the weaver is his own overseer, and can therefore demand the latter's wages. This distinction is especially characteristic. While with the elevation of the labor class in England applications for positions of trust are numerous and the attendant salaries smaller, so technical knowledge is rare in Russia, and foreigners are employed at very high salaries. Russian factories swarm with a staff of technical employees, while in England the much lighter supervision is in the hands of a plain man from the ranks of the labor class."—Dr. von Schulze in *The Cotton Industry in Moscow, Vladimir.*

Note 6, page 741.—The same author (Dr. von Schulze) says: "The extension of the elementary school curriculum and the existing factory laws are Europeanizing the Russian factory hand. Recently the question of compulsory education has been thoroughly agitated. In every public meeting it has been advocated, and every newspaper is discussing it. Every year the attendance is increasing in district, parochial, and government schools, and in consequence the still large proportion of illiterates in factories is diminishing. In the opinion of factory owners of penetration, industrial labor is being advanced; they believe that illiterates will remain on the very lowest stage and can only be used in Russia for what is known as 'black work,' requiring nothing but physical strength. For operating machines, they are unprofitable; and to do preparatory work or superintend, they are utterly unfit. Even for purely physical labor the man who can read and write is preferable; he understands how to take hold of his work and thus save muscular force. Fewer accidents occur when intelligent labor is employed, and the loss of time and material is less. These facts were lately maintained at the congress for technical education in Moscow, and, as Madame Janschull tells us, they were confirmed by American experience. From all this it follows that intelligent labor is better paid than ignorant. This holds good at the very entrance into a factory, and the difference increases in subsequent years. At the congress mentioned before, Lehestakoff read a report communicating

the following interesting data furnished by a noted industrial concern in Moscow (a calico printing and dyeing establishment):

Age of workmen.	Number of workmen.	Wages of—		Difference in favor of educated workmen.
		Workmen who can read and write.	Illiterates.	
		<i>Copecks.</i>	<i>Copecks.</i>	<i>Per cent.</i>
15 to 20 years.....	427	33.5	31.1	8+
20 to 25 years.....	282	51.0	45.6	12+
25 to 30 years.....	297	62.1	48.2	25+
30 to 35 years.....	203	89.7	59.8	50+
35 to 40 years.....	166	88.5	64.8	37+
40 to 45 years.....	91	88.9	69.7	28+
45 to 50 years.....	56	107.5	71.4	51+

“The more advanced ages (above 50), which show irregularities, are omitted; reading and writing are exceptional among them, and besides, very few workmen in the concern are over 50.

“The explanation of this surprising difference in wages is found in the fact that children are trained at school to attention and mental exertion, upon which all human labor is based. In visiting many Russian elementary schools I noticed the little muzhik with his blond round head and his red cotton shirt—the tribute which he pays to the cotton industry. With astonishing zeal he applies himself to the secret art of letters, and tries to master that fine instrument, the pencil, with his clumsy fingers. Up to the present day liquor has been the only friend of the workman during leisure hours—a friend whose acquaintanceship brought with it headache and omission of duty. The Russian who has learned how to read is fond of reading. I remember to have observed on the Dnieper and Volga steamboats that readers were always surrounded by a large audience. Manufacturing districts report that the workman has grown beyond the childish reading matter the people’s libraries offer him. As we know, only a small number of writings that have passed the censorship are allowed in people’s libraries. The better employment of leisure no doubt increases the endurance and skill of workmen at labor.”

Another quotation from a different source confirms the foregoing: “How great the waste of human labor in the Russian iron industry is, and how insignificant the accomplishments of the Russian iron workers are, we learn from the fact that 142,486 workmen were employed in 1893 in the Ural district for the manufacture of half a million tons of pig iron and 360,000 tons of steel and rod iron. Accepting the Belgian workman as a standard, only 11,165 men (according to Radzig) would be required for a like result. Even in the works of highest technical standing in south Russia (Radzig, Vol. I, p. 104) 6,284 workmen could do the amount of work for which 14,030 are now employed. The capacity of a workman in the iron mines of the Ural amounts to about 50 tons, in south Russia to about 39 tons, while a German miner turns out about 370 tons.”—(Dr. C. Ballod, Yearbook of Legislation, Administration, and Economics in Germany.)

Note 7, p. 742. “There existed—and still do exist,” writes Kohl, “many prejudices among manufacturers detrimental to the progress of good schooling, general mental development, and even morality among workmen. Among such prejudices are the following: It is thought, firstly, that general education and thorough knowledge stand in the way of a workman’s excellence in doing any kind of special work; secondly, that the use of strong drink by the laborer is advantageous to the employer because it stimulates the laborer to do excellent work; and thirdly, that especially good workmen are as a rule especially hard drinkers, and their faults should be overlooked on account of the excellence of their work. To add weight to the first

proposition, English manufacturers make a special reference to the German workman to prove that general education and better training are detrimental to any kind of special work, and that what they call "special training" is the most useful for the purposes of factory employees. How great this prejudice against well brought up and generally educated workmen was, we see from the pertinent questions proposed to some enlightened factory owners by the 'poor law commission.' Recently this prejudice has been weakening, and to further its decline the 'poor law commission' considered it necessary to publish the evidence given. Here is a quotation from the statements of Mr. Fairbairn, one of the largest manufacturers of machinery in Manchester. This experienced gentleman, beyond a doubt one of the best judges on the subject, spoke as follows of the usefulness of a more advanced education and training for workmen: 'In our establishment we intrust the most difficult operations of a piece of work to the best trained and most educated workman. If, for instance, an engine, a water wheel, or any piece of machinery is to be built, we must select a number of responsible and intelligent workmen. In nine cases out of ten the choice falls on a man of better schooling, who can not only draw a little, calculate dimensions, write letters, make analyses, and take special or accidental circumstances into consideration, but who understands how to deal in the wisest and most careful way with those with whom he comes in contact. The advantage of a good general education is particularly apparent in changing about with work. The operations in our factory are especially varied, and we always find that it requires an early mental training for a man to be able to undertake a certain series of operations in the best way, so that they do not miss their effect or fail in their intended purpose. Men of such abilities are always found among those who have enjoyed a good school education. Occasionally men arise who are gifted with a strong nature, and who do more for themselves than any school could do; but these are isolated exceptions. A school education is not exactly necessary for better work in the lowest departments with the simplest kind of contrivances. In this case, the very least trained persons are as good as the well educated. Such rough hand work requires only special drill. But it does not follow that this special drill could not be combined with a general education, and that it need be hindered in its development thereby, apart from the fact that a workman is never so much of a machine as never to be called upon to do a different kind of work from what he has been engaged to perform.' If then, general education does not injure special drill, and if general skill is even necessary in a great many cases of exception, it is, on the other hand, of the greatest advantage in all other relations and connections between employer and employee independent of the labor required. For instance, in all questions affecting wages, we always find that the best educated workmen are the most reasonable in their demands, the most peaceful and modest in their behavior, and the most willing to abide by appropriate or necessary changes in the wage schedule or arrangement of workrooms and labor whether they be to their advantage or to their disadvantage. Ignorant and uneducated workmen are opposed from a kind of constant blind jealousy against their employer to even such changes as are designed for their direct advantage. While they live in constant animosity and hatred against their employer, the bond is drawn closer between the educated workmen and their employer. In every case, when a disturbance or a strike threatens, we need only call our best educated men together and reason with them. Generally the dissatisfaction and disturbance is quieted by them. The better educated men, likewise, live more harmoniously together; and, on the whole, we enjoy more rest and peace the more educated men we employ."—(J. G. Kohl, "Travels in England and Wales.")

Note 8, p. 742.—"I came to England and read in an industrial report a further account of the English workman by one of the foremost Swiss manufacturers in Zürich, Switzerland, who owns one of the largest machine factories on the Continent,

and employs 600 to 800 hands, natives of Switzerland, Saxony, Wurttemberg, France, Denmark, Norway, Poland, Bohemia, Hungary, Holland, Scotland, and England. As the questions presented to this gentleman are highly interesting, and his replies very positive, clear, and comprehensive, and as he, at the same time, compares only English-speaking with German-speaking workmen, I shall quote at length the report of his testimony, which is a complete treatise on the subject in question. The most noteworthy questions and answers were: 'How do you classify the workmen of different nations with whom you have had the opportunity of becoming acquainted, with respect to those abilities which are natural endowments, as distinguished from those which are the product of the work and efforts of the schoolmaster and educator?' 'In this regard I give *Italians* preeminence, the *French* are next in order, and after them come all the *northern nations*, which are on about the same plane in this respect. Among these northern nations I place all of *Teutonic* origin, the *English* included. The quick and energetic natural intelligence of the Italians is shown in their extraordinarily quick comprehension of every new kind of work given to them; they grasp at once the meaning and thought of their instructor, and adapt themselves to new conditions with much greater facility than any other nation. The French have the same characteristics as the Italians, but in a lower degree. The English, Swiss, Dutch, and German workmen are slower of comprehension than those mentioned.'

"The second query was: 'What are the differences among these nations with respect to knowledge and special technical education?'—'The preference must undoubtedly be given to English workmen; they are trained and educated for the special branches of industry and the arts to which they have devoted all their thoughts and skill. But as men of general business knowledge, and for general service, and as workmen by whom a manager prefers to be surrounded, I should most decidedly prefer the men of Saxony (Germany) and Switzerland; and first of all those of Saxony, because they have received a very careful general education, which has developed their power of comprehension beyond the limits of a special occupation and prepared them to undertake any kind of business after a brief preparation. If I engage an English workman for the construction of steam engines, he will understand his work perfectly, but nothing more. Though he may be intimately familiar with the construction of steam engines, he will be awkward and helpless in other branches of mechanics. He can not adapt himself easily to new conditions, and is unable to give good advice and hand in clear and well-written reports and letters on the different branches of his work. Therefore, the workman of Germany will, as a rule, hold precedence over the English and be in a position above him, and on account of his skill and general serviceability he is more apt to become an overseer or a foreman.' 'Is the greater general serviceability of the workman of Saxony, or indeed of any workman of good education, combined with greater morality and better habits and manners?'—'Most assuredly is this the case. The better-instructed and more carefully trained workmen are sober and frugal. They are moderate in their enjoyments, which are of a sensible and more select kind. They are also much more polite and try to move in better society, which they seek without forcing themselves, and by which they are, therefore, the more readily accepted. They cultivate music, read, enjoy the pleasures of nature, and arrange excursions into the country. They are more economical, and their economy goes beyond their own small purse; they save for their employer also. They are, therefore, honest and deserving of confidence.

"The detrimental consequences of deficient education are particularly conspicuous in Italians who, despite their better natural talents, belong to the lowest class of workmen. Although, as I have said, they comprehend quickly, still it seems to me that for want of education and skillful development their mind lacks all logic, all system, and all rational classification, and is totally unable to sum up, so to speak, any series of observations and experiences, or to draw sound conclusions from a part

to the whole. This is especially apparent when several Italians work together. Every Italian, separately and alone, will quickly and skillfully perform any operation assigned to him, but as soon as many work together everything is confusion. They do not understand how to divide their different parts in cooperation. The most energetic direction and attentive classification by those in charge are required to make the working of a number of Italians together a success and gain its purpose. The Neapolitans are the most clever people in the world, each for himself. But when they are employed in numbers we notice the same lack of what I have called logical schooling and system. I have been constrained in every instance to appoint superintendents and inspectors of northern nationality over them—for instance, German or Swiss—although these had less natural aptitude they were better adapted by education to direct and control the whole work with circumspection and system. Laborers from northern Italy, and especially of Lombardy, combine a better education with natural aptitude. In those occupations in which they are experienced, as, for instance, construction of roads, canals, agriculture, etc., I consider them as competent as any nation in the world, if not more competent.'

“‘What is the character of the Dutch workmen whom you employ?’—‘The Dutch employed by us are mostly shipbuilders. Like the English they are specially trained for their work. Their general education is not of a very high order, but it is sound, and decidedly above that of the English. We have found them to be exceptionally honest, economical, orderly, and trustworthy.’ ‘Have you ever employed Scottish laborers, and what are their characteristics?’—‘We find that the Scottish workmen get along better on the Continent than the English. I attribute this principally to their better education, which makes it easier for them to adapt themselves to all circumstances and emergencies, and enables them to get along better with their colleagues, and in fact with all with whom they come in contact. As they generally possess a knowledge of the grammar of their own language, it is easier for them to learn foreign languages. They have great taste for reading and try to move in good society. This desire makes them careful of their conduct, and animates them with the inclination and zeal to cultivate themselves for such society.’

“‘Do you place the Scottish workman on equality with the North German and Saxon?’—‘As workman, he may stand higher in his special branch, but as a man in his social position he is not so cultivated and has lower tastes and less universal knowledge, and hence less serviceability than the Saxon and other German workmen.’ What rank do you assign to English laborers in regard to love of order and knowledge?’ ‘Although with regard to the special work to which they have devoted themselves, English workmen decidedly take the lead, their conduct is anything but good. They are ungovernable and negligent, and the least worthy of confidence and respect of all the nationalities represented in our establishment. In saying this I express the experience of every manufacturer on the Continent with whom I have had the opportunity of conversing; and English manufacturers on the Continent are loudest in their complaints. This characteristic, however, does not belong to those English workmen who have enjoyed the benefit of education, but only to the ignorant in proportion to their deficiency. When the poorly trained English laborers are set free from the iron fetters of a strict discipline in which they are kept by their lords and masters in England, and if they are treated on the Continent with that urbanity, friendliness, and kindly feeling which educated workmen expect and receive from their employers, they lose their balance, so to speak. They forget their position and, in a short time, grow to be uncontrollable and useless. On the other hand, well-educated English workmen quickly adapt themselves to their position and assume an appropriate manner.’”—J. G. Kohl, *Travels in England and Wales*.

Note 9, page 747.—“In industrial circles greater leisure should be combined with a less strong desire for purely personal gain. The social judgment of the employer

should not only take the amount of profit into consideration, but, in the first place, the number of educated, happy, and contented men which his undertaking creates. No one blames a manufacturer for claiming a return for the risk he runs, or for drawing a salary for his management of affairs. But the insatiable and inconsiderate desire for the constant increase of wealth; the pursuit of profit for profit's sake, stunting all the better instincts of man, and the zeal for amassing capital are grave mistakes. Our wealthy people should spend, indeed, a great deal more, but not for enervating luxuries, such as table delicacies, jewels, dress, sport, gaming, and sensual enjoyments. Prosperity and leisure should be devoted to the extension of education among the masses, to the advancement of the general well-being, or to the elevation of moral and mental attainments—art, literature, science, and intellectual and noble enjoyments. Much money is spent at the present day for the promotion of art, but in such a way that it is very doubtful whether art is really benefited. It may be said that wealth is much more indebted to art than art to wealth.”—(Economy and Luxury, by Henry Herkner.)

Note 10, page 747.—In his German Public Opinion A. Damaschke says on the connection between educational and social problem as follows: “The position of German teachers can not be separated from that of the German people in general. If the people advance, those to whom their children are intrusted advance with them; and, if the people fall back into impotence and insignificance, the position of those upon whom the mental development of the people depends loses in importance. Does not history confirm this truth? When the masses consisted of bondmen and serfs, mechanics and invalid soldiers sufficed as teachers. Only when social disturbances led to national rupture, which raised the people from bondage, could teachers, in our sense of the term, exist. And it was only when the grant of equal and direct franchise declared the people of age that teachers could acquire their present important position. When in our times the workmen, the large majority of our nation, aspire to elevation, when they demand ‘education and work’—that is, a full participation in the treasures of our much praised civilization—the question is one that affects teachers closely. The decision in this struggle is a decision on their position and all issues of school and education. It is self-evident that teachers will not blindly accept what is represented as ‘social;’ that they will consider, prove, and reflect upon the patriotic character of that which presents itself as a social question. Acquainted with the laws of existence and decay, they will naturally oppose all that that does not mean organic reform. The chief consideration, however, will always be that social reform bears the closest relationship to the affairs of the teachers. Whoever does not consciously labor to hold and improve his position in the great struggles of our times fails to fulfill not only the duty which he owes to all as an educated member of society, but the special duty incumbent upon him toward schools and his colleagues.”

Note 11, page 747.—“The higher the standing of morals and religion, ethics and law, the more perfectly churches and schools are organized and exert a wholesome influence, the deeper all social discipline and the process of intellectual and moral elevation and education reach into the lowest strata, the more the different classes come in contact with one another and the better they understand one another, the more the higher classes look upon their position as a higher duty and not as an occasion for greater enjoyment, exercise of power, and for amassing wealth, the more readily the elevation of the lower strata and a new education of the middle strata will succeed. The increasing inequality of individuals and classes is the natural side of progress in civilization. The intellectually moral side is that the rising aristocratic powers lift up all others to their level—it is an ever-successful democratization. What the near future has in store for us no one knows. Inequality will probably be greater for a time. Single branches of the class of mechanics may disappear altogether. But the point is that we know and believe that there are high moral forces and tendencies which prevent a great, healthy nation from being divided into a few

capitalists and large numbers of proletarians; and it behooves us to enter the service of these forces.”—(Böhmert.)

The conclusions of the Evangelic-Social Congress (June 10, 1897) have the same tenor. “It notes with satisfaction the conviction of Professor Schmoller, based upon scientific observation, that the economic development of modern times does not necessarily lead to the dissolution of the middle class, so important for the adjustment of social contrasts, and which experience has proved to be of such consequence in regard to national ethics and religion. The disappearance of certain parts, it is true, can be foretold, but others will continue to exist, and those that decline will be replaced by new. The congress, therefore, considers it necessary to uphold the tendency commended by the Professor, which will further this wholesome process by the elevation of school and technical education and by strengthening the ethical forces of the whole nation. At the same time it will benefit economically and socially those of the lower classes who can never form a part of the middle classes. We shall not find it necessary to change the foundations of civil society, for civil society is not in decline, but only in a state of transformation. Therefore, all the great forms of a civil-ethical order in family, state, and all graduated conditions of human intercourse are not antiquated. No future is fundamentally different from the present or the near past.”—(Böhmert, in *Germany as an Industrial Country and the Development of the Middle Class*, 1897.)

Note 12, page 747.—“Equality of rights and education for all are the embodiment of the fundamental Christian idea of the brotherhood of man, and mean the reestablishment of natural selection, without which a higher development of mankind is impossible. This force receives entirely too little attention, and yet its recognition would solve many an enigma in history and show us plainly the way in which we should go. Every community and every State that suppresses the principle of natural selection by artificial laws and moral regulations is positively destined to decline. Slowly, perhaps, but surely, the physical and intellectual qualities of the people will degenerate. Where a class intermarries only among its own members, and bequeathes the same hereditary traits, the race will soon show signs of degeneration. Slavery, the spirit of caste, and the maintenance of classes are the causes of cretinism, both above and below—above in dispensing with the wholesome struggle for subsistence and in favoring the propagation of disease germs; below in depriving better talents of space, air, and light for prosperous development, and exposing whole classes to degeneration and decay. A number of oriental nations have found their merited fate on this descending scale, and others will meet theirs—not because the genius of history so wills it irrevocably, but because they lack wise self-knowledge. And so the nations of the west, with the Romanic and the Germanic in the lead, will go the way of all flesh, unless a new political wisdom wards off their destruction in time. The forms of law in themselves, however, will only hasten the process of destruction by adding permanent civil war to class distinctions. The greatest treasures of the higher culture will not be a protection against it, if the whole national tree be not restored to health in its roots, trunk, and branches. Let the constantly spreading egotism, the thoughtless sensuality, among our aristocrats and bourgeoisie and the bent, pitiful forms in our factory districts be a timely warning, so that our people may not be trodden under foot by foreign conquerors powerful in health and civilization. Let us give this “fourth estate” that which makes them our equals in the struggle for existence, that which alone can reestablish the principle of natural selection in our society, namely: Equal education with equal rights—education, and again education! Then weakly individuals may succumb and unhealthy branches die, but whole classes, in the end the whole nation, will not come to destruction.”—(From *Equality before the Law*, by G. Hirth, 1873.)

Note 13, page 751.—“From the benches of parliaments, from university chairs, and in all the streets and byways the workman hears: ‘You are free. No one hinders

you in the development and realization of your powers. Work, save, and get rich, as those did whom you envy.' But society denies him the means and cuts off from him the possibility of acquiring the intellectual training that would give him the ability to rise above a purely vegetative existence in his work at machines. Indeed, it gives every preference to those who profit by his intellectual inferiority. In industrial districts thousands of working children are starving. From early morning till night their little hands are busy helping to earn a livelihood for the family. Teachers complain of their physical inactivity and mental torpor in school."—(Charles Bücher, in *The Question of Industrial Education and Retrogression*.)

II. STATISTICS OF EDUCATION IN CENTRAL EUROPE,

AND COMPARISONS WITH OTHER EUROPEAN COUNTRIES.

CONTENTS.—*Part I.*—Introduction, importance, value, and definition of educational statistics—Table 1, Attendance in Prussian elementary schools—Table 2, Special features of the Prussian elementary schools—Table 3, Expenditures of the Prussian elementary schools—Table 4, Continuation schools in Prussia—Table 5, Secondary schools in Prussia—Table 6, Attendance in Prussian universities—Table 7, Statistical review of elementary schools in the German Empire—Table 8, Supplementary schools in Germany—Table 9, Secondary schools in the German Empire—Table 10, Universities—Table 11, City schools—Table 12, Public libraries—Table 13, Schools in Bavaria—Table 14, Schools in Würtemberg—Table 15, Schools in Saxony—Table 16, Schools in Baden—Table 17, Schools in Hessa—Table 18, Schools in Hamburg—Table 19, Summary of schools in Austria—Table 20, Schools in France—Table 21, Elementary schools in England and Wales—Table 22, Comparative review of education and its results.

Part II.—Results of education—Statistics of illiteracy—Education of army recruits in Prussia—Illiterates among recruits in European countries—Illiterates among inhabitants—Same in different provinces—In other German States—In other European countries—Dr. Petersilie's summary—Table 27 compiled in Bureau of Education—Ratio of illiteracy in Switzerland.

INTRODUCTION.

Under the caption "Unterrichts-Statistik" the Encyclopedia of Pedagogy, by W. Rein (Jena, Germany), contains a number of statistical summaries of education in central Europe, which may lay claim to the distinction of remarkable accuracy and simplicity. The technical terms used and the classification of schools are so specifically German that if they were literally translated they would probably be misunderstood in the United States. Hence it has been necessary to adapt the work to American conditions by applying our terminology in tables and text. Some data have been brought up to a later date than those in Rein's encyclopedia. The German author confines himself largely to statistics derived from official reports, and does not indulge in estimates of any kind. Wherever he departs from official sources he states the source used, and thus enables the reader to judge as to the value of the information given. The following is the adaptation of both text and tables:

PART I.

IMPORTANCE, VALUE, AND DEFINITION OF SCHOOL STATISTICS.

In late years much importance has been attributed to statistics of education. Countries in which public education has reached a high degree of perfection, and whose school systems are well developed and successfully managed, are ready to show in statistical array their various educational conditions. Scholars of international repute have attempted from time to time a comparison of the school statistics of different States and nations. But the school systems of the civilized nations have developed quite independently of one another. The technical designations of the numerous institutions of learning, as well as the extent and limits of the different categories of schools, are very unlike and, moreover, legislative regulations, economic conditions, and habits of life and conduct of the people have caused essential differences in educational affairs, so that international and even interstate comparisons of school statistics should not be overrated (see those of the United States, Germany, Austria-Hungary, Switzerland, for example, in which countries school affairs are not centralized), even though they be mathematically correct, a thing that can not be claimed for all such comparisons. Above all, the educational conditions of a country should not be considered as wholly dependent upon the number of schools and teachers, for the general state of culture of a people does not always correspond to its school statistics. The intellectual culture of a people having a highly developed industrial and commercial activity, a free political constitution, and an influential daily press, and offering to all its citizens participation in public affairs is, as a matter of course, greatly enhanced by these agencies, even though it may have inferior and insufficient public schools. Its intellectual life, down to the lowest stratum, is kept in motion, and its education is constantly growing. It is of essential importance for the general advance of culture of a people that, aside from public schools, other sources of enlightenment be opened and institutions be established which will enable the child to enlarge and deepen the education he acquired in school. The comparatively high degree of development of such institutions, and the publicity given to all affairs of state and society in England and in the United States, are the reasons why the degree of general culture in these countries is not behind that of countries in which, by means of compulsory school attendance, education has been given an impetus, the result of which is an almost utter absence of illiteracy.

International comparison of the conditions of school systems and education has, therefore, to take into account very complicated politi-

cal and social relations that can not be rubricated in a statistical scheme; hence official statistical statements as to number of schools, teachers, pupils, expenditures, etc., can not claim to be reliable standards of comparison between nations; therefore, the following tables do not claim to be regarded as standard measures of the culture of the States or nations mentioned therein. These tables do nothing more than characterize the efforts of certain States in a few important directions, but this they do better than would be possible without numerical data.

Among the different educational statistics those of illiteracy are often erroneously taken without critical analysis as a standard measure of civilization. They should be used with the utmost caution. Even if the number of illiterates were obtained in the same manner, which is not the case, it could not always be used as a standard measure for reasons indicated above.

The object of educational statistics is twofold: First, to state in tabular form the classes and numbers of educational institutions and other items, such as attendance, grading of pupils, school age, expenditures; second, to show the results of these institutions. The first class of data embrace what is properly called school statistics; the second, statistics of culture or civilization. In both classes statistics perform the duty of stating present conditions according to the last obtainable information, and by means of comparisons showing the results of changes noticed. A high degree of perfection has been reached in school statistics proper, but in some civilized countries we find the statistics of culture, naturally, in an undeveloped state. As was said before, illiteracy has so far been regarded in most countries as the standard measure; little or nothing is known of the proportion of population possessing a thorough secondary or a thorough higher education. For, to take the percentage of students enrolled in high schools as a measure for secondary education in a population is manifestly wrong, inasmuch as only a small percentage of them ever graduate. A like condition prevails with reference to higher education. Moreover, it would be utterly futile to measure the culture of any nation by the number of students it has in certain educational institutions, since their results vary not only in individual cases, but in institutions of the same kind. Again, for example, "illiteracy" is not measured by a uniform standard. While in one country (Prussia, for instance) the number of army recruits unable to read and write is considered, in another (Switzerland) the recruits are subjected to a rigid written and oral examination to see whether they have a thorough elementary education in reading, writing, arithmetic, geography, history, business methods, etc., and all who do not come up to a reasonably high standard are said to be illiterate, and are ordered to attend schools provided by the Federal Government. The method used in Prussia revealed, in

1896-97, a proportion of one-tenth of 1 per cent of illiterates; the method used in Switzerland revealed a proportion of 3 per cent in 1896.

The field of educational statistics has been greatly extended lately, partly by the establishment of a variety of new educational institutions, and partly by the development and increase of older ones. Among the new establishments or agencies may be classed institutions for supplementing elementary education, special schools for a great variety of purposes, public libraries, efforts for popularizing higher studies by public lectures, and others. The statistical treatment of all these new educational agencies is fragmentary in continental Europe, while other countries, such as England and the United States, furnish data for such institutions as carefully gathered as for the common schools.

The systems of special and professional schools in central Europe, in the last few decades, have experienced an extension beyond the boldest expectations of those interested; but an exhibition of their statistics can not be made as complete as that of common elementary, secondary, normal, and higher schools, hence they are omitted in the following tables.

The most exact "school census" in Europe is taken in Prussia, where statistical data are gathered every five years. The beginning of regular periodical school statistics in Prussia dates back to 1822, in which year information on the following points was required:

- (1) Number of schools (and buildings).
- (2) Number of regular teachers (men and women).
- (3) Number of special teachers (men and women).
- (4) Number of pupils (boys and girls).

The scope of the inquiry was twice expanded by other items of information called for. This was done in 1837 and in 1858. The present Prussian form of inquiry, and, consequently, that of its school statistics, date from the year 1886, and have been repeated in 1891 and in 1896. The tabular forms and blanks for this quinquennial "school census," as the Germans call it, are framed according to the most approved scientific methods of statistics, and facilitate a rapid and accurate comparison. Switzerland also furnishes a very complete statistical exhibition of its educational facilities; and so does Austria-Hungary, only much less frequently. The following tables chiefly illustrate the educational conditions of Prussia, other German States, Austria (Cislithania), and Switzerland. Other countries are mentioned only where vital data are needed for comparison.

Several of the following tables concerning Germany are based on data of the year 1891-92, because in order to make a comparison possible the statistics had to be of the same year, the lesser states of Germany not having published reports since that date; while some reports

of larger states date from 1894 (Saxony), 1895 (Bavaria), 1896 (Prussia). This is plainly seen in several of the following tables where some new entries have been made for Prussia and Saxony, to show the great increase in attendance and expenditures of late years.

TABLE 1.—Attendance in elementary schools in Prussia.

Classes of schools in Prussia, 1896.	Urban and rural schools together.			
	Number of schools.	Number of classes.	Number of teachers. ¹	Number of pupils.
A. People's or elementary schools.....	36,812	93,357	5,279,849

Number of pupils.....	4,838,247	4,916,476	5,236,826
(2) Number of public schools in cities.....	3,718	3,871	4,242
Number of class rooms.....	23,081	26,616	30,090
Number of pupils.....	1,503,906	1,615,455	1,773,370
(3) Number of public rural schools.....	30,298	30,871	31,896
Number of class rooms.....	43,453	46,305	50,221
Number of pupils.....	3,334,341	3,301,021	3,463,456
(4) Number of classes in public schools.....	75,097	82,746	92,001
Number of boys' classes.....	10,096	12,168	14,422
Number of girls' classes.....	10,297	12,281	14,552
Number of mixed classes.....	54,704	58,297	63,027
(5) Number of ungraded schools.....	17,744	16,600	15,892
Number of pupils.....	1,146,701	968,598	886,864
Number of schools of two classes or grades.....	8,845	9,474	10,181
Number of pupils.....	1,073,459	1,047,507	1,061,716
Number of half-day schools.....	5,409	5,878	6,817
Number of pupils.....	571,474	568,235	621,820
Number of schools of three grades.....	3,919	4,477	4,920
Number of pupils.....	833,013	850,333	889,703
Number of schools of four grades.....	1,352	1,553	1,709
Number of pupils.....	449,741	476,403	489,900
Number of schools of five grades.....	649	692	863
Number of pupils.....	285,282	274,412	320,166
Number of schools of six grades.....	1,187	1,551	1,830
Number of pupils.....	829,823	994,952	1,102,642
Number of schools of seven or more grades.....	290	425	733
Number of pupils.....	215,225	303,221	485,835
(6) Number of pupils in city schools:			
Boys.....	745,187	805,182	881,704
Girls.....	758,719	810,273	891,666
Number of pupils in rural schools:			
Boys.....	1,676,857	1,662,376	1,743,012
Girls.....	1,657,484	1,638,645	1,720,444
(7) Number of children taught in mixed classes, i. e., boys and girls together:			
Boys.....	1,766,807	1,718,269	1,764,393
Girls.....	1,745,343	1,691,812	1,739,963
(8) Religious denomination of pupils:			
(a) Protestant.....	3,062,956	3,107,701	3,236,481
(b) Catholic.....	1,739,402	1,766,835	1,901,013
(c) Other Christian.....	9,569	11,554	12,317
(d) Jewish.....	35,420	30,386	27,015
(9) Number of places for regular teachers.....	64,750	71,731	79,431
Of these were occupied.....		70,711	78,895
Number of special teachers (religious teachers, candidates, and those for manual training and woman's handiwork).....	35,655	41,354	39,944
Number of teachers for woman's handiwork.....	34,270	36,871	37,193
Number of teachers of religion.....		2,407	2,252
(10) Of the regular teachers there were:			
(a) Protestant men.....	40,900	44,937	48,670
Protestant women.....	2,551	3,545	4,574
(b) Catholic men.....	16,549	17,959	20,112
Catholic women.....	4,233	4,890	5,662
(c) Other Christian men.....	21	5	3
Other Christian women.....	11	1	1
(d) Jewish men.....	432	336	347
Jewish women.....	53	58	62
(11) Religious denomination of the schools:			
(a) Protestant.....	23,122	23,749	24,487
Number of teachers.....	41,539	46,282	50,715
Number of pupils.....	2,993,852	3,050,864	3,228,560
(b) Catholic.....	10,061	10,154	10,725
Number of teachers.....	19,632	21,547	24,264
Number of pupils.....	1,613,497	1,635,779	1,749,731
(c) Jewish.....	318	244	246
Number of teachers.....	407	305	308
Number of pupils.....	13,270	9,519	8,123
(d) "Simultaneous" or mixed schools.....	515	595	650
Number of teachers.....	3,172	3,597	4,144
Number of pupils.....	217,628	220,314	250,412
Number of pupils taught by teachers of their own denominations:			
(1) Protestant.....	2,913,689	2,973,775	3,148,354
(2) Catholic.....	1,582,464	1,612,167	1,727,582
(3) Jewish.....	13,249	9,502	8,123

TABLE 3.—Expenditure for public elementary schools, for the years 1886, 1891, and 1896.

	1886.	1891.	1896.
Expenditures for salaries	\$21, 073, 443	\$26, 241, 972	\$31, 871, 323
Other expenditure (including building).....	6, 645, 081	8, 559, 648	12, 377, 041
Total.....	27, 718, 524	34, 801, 620	44, 248, 364
Salaries of the regular teachers.....	19, 704, 782	24, 134, 361	29, 186, 261
Pensions paid regular teachers.....	682, 659	1, 420, 666	2, 023, 318
Expenditures for building.....	4, 483, 228	5, 190, 850	7, 760, 797

TABLE 5.—*The secondary schools of Prussia, including their preparatory classes.*

Institutions.	1886.	1891.	1896.
1. Gymnasia (classical high schools):			
Number of schools	263	270	276
Number of teachers	4,766	4,776	4,877
Number of teachers in preparatory department	301	284	277
Number of students	80,450	77,127	80,024
Number of pupils in preparatory department	10,336	9,470	9,206
2. Progymnasia (incomplete gymnasia):			
Number of schools	40	44	49
Number of teachers	343	406	442
Number of teachers in preparatory department	21	24	17
Number of students	4,692	5,027	5,431
Number of pupils in preparatory department	637	522	282
3. Real gymnasia (without Greek):			
Number of schools	89	86	83
Number of teachers	1,632	1,561	1,351
Number of teachers in preparatory department	124	129	102
Number of students	24,929	25,626	24,341
Number of pupils in preparatory department	4,414	4,168	3,758
4. Realprogymnasia (incomplete realgymnasia):			
Number of schools	86	85	64
Number of teachers	646	620	448
Number of teachers in preparatory department	59	54	34
Number of students	8,994	8,901	6,287
Number of pupils in preparatory department	1,709	1,572	934
5. Upper Realschulen (without Greek):			
Number of schools	12	9	26
Number of teachers	282	221	624
Number of teachers in preparatory department	14	18	50
Number of students	4,839	4,137	11,357
Number of pupils in preparatory department	759	784	2,013
6. Realschulen (no Latin or Greek):			
Number of schools	17	20	78
Number of teachers	289	375	1,032
Number of teachers in preparatory department	38	39	94
Number of students	4,790	7,059	20,887
Number of pupils in preparatory department	1,297	1,338	3,477
7. Higher burgher schools:			
Number of schools	22	36	} 1
Number of teachers	305	535	
Number of teachers in preparatory department	39	56	
Number of students	6,432	12,142	
Number of pupils in preparatory department	1,835	2,585	
TOTALS.			
A. Humanistic institutions (sections 1 and 2):			
Number of schools	303	314	325
Number of teachers	5,109	5,182	5,319
Number of teachers in preparatory department	322	308	294
Number of students	85,142	82,154	85,455
Number of pupils in preparatory department	10,973	9,992	9,488
B. Realistic institutions (sections 3 to 7):			
Number of schools	226	236	251
Number of teachers	3,155	3,312	3,455
Number of teachers in preparatory department	274	296	280
Number of students	49,984	57,865	62,872
Number of pupils in preparatory department	10,014	10,447	10,182

¹ These schools are now classed among Realschulen.

EXPENDITURES FOR THE SCHOOLS MENTIONED IN TABLE 5.

1. Salaries for principals and teachers, etc., in 1899	\$8,257,532
2. Remuneration for special instruction in 1899	422,122
3. Incidental and administrative expenses in 1899	1,637,727
4. Pensions (not yet known) in 1899	
Total reported	10,317,381

TABLE 6.—*Attendance in Prussian universities.*

Winter of—	Number of professors.	Number of students matriculated.	Number of students not matriculated.	Total number of students.
1870-71	863	6,666	1,062	7,728

Other denominations	1,509	1,564

TABLE 13.—*Schools in Bavaria, Germany—Continued.*

ELEMENTARY SCHOOLS—Continued.

	1887-88.	1892-93.
Total expenditures for elementary schools	\$3,550,856.00	\$4,249,886.00
Incidental and building	1,543,329.00	1,863,191.00
Personal	2,007,525.00	2,386,695.00
Per capita of population63	.75
Per capita of pupils	4.13	5.20
Total income of teachers ¹	3,653,978.00	4,370,208.00
Regular teachers	2,955,668.00	3,622,986.00
Principals	352,329.00	356,498.00
Assistants	245,981.00	390,724.00
Industrial supplementary schools	239	253
Pupils	27,589	31,321
Teachers	1,335	1,592
Expenditures	\$98,784.00	\$136,862.00
Per capita of pupils	3.57	4.28
Agricultural supplementary schools	545	477
Pupils	10,396	9,022
Teachers	866	758
Expenditures	\$37,874.00	\$38,104.00
Per capita of pupils	3.58	4.37

¹ It is seen from this total, which is larger than the total expenditures for schools, that the free rental, use of land, and extra income for services in church as organists, have been counted in when computing the teachers' income.

TABLE 17.—*Schools in Hessa, Germany, 1896.*

1. Simple public elementary schools 900, in 27 of which the sexes are separated, in 56 the sexes are separated only in the upper grade, and in 907 there is no separation of sexes.

In regard to religious denomination of the pupils, 49 schools are Protestant, 50 Catholic, 2 Jewish, and in 889 the schools are common.

The grading in classes has proceeded as follows: 509 schools are one-room schools, 240 have two rooms, 110 three rooms, 63 four rooms, 62 more than four rooms.

Tuition fees are paid in 348 elementary schools; 642 offer tuition gratuitous.

The number of pupils is 155,335, or 76,982 boys, 78,353 girls; 104,821 are Protestants, 47,256 Catholics, 2,369 Jews, and 889 of other denominations.

The number of teachers is 2,496, of which only 179 are women.

2. Supplementary or continuation schools 901, of which 746 are one-room schools, 101 have two rooms, 54 three rooms or classes.

The number of pupils is 24,623.

3. Private elementary schools 55, with 3,972 pupils, 245 teachers.

4. Advanced elementary schools 30, with 4,021 pupils, 164 teachers.

5. Secondary schools: 7 gymnasia with 2,696 students, 122 teachers; 4 similar schools with 1,863 students, 90 teachers; 11 modern high schools with 4,526 students, and 187 teachers. Total, 9,085 students, 309 teachers.

6. The State subsidy for the support of secondary schools for the period 1894–1897, was \$115,352.

Secondary schools in France.—In 1887 there were 106 lycees, 246 city colleges, 302 private secular, and 349 church schools, a total of 1,003 institutions. In 1893 there were in lycees 54,807 students, in city colleges 33,012 students, a total of 87,819 in the public secondary schools. The private schools had 14,028 and the church or parochial schools 51,377; the boys' seminaries had 23,849 students, a total of 89,254 students in schools other than public. The expenses for public secondary schools were in 1894 \$4,383,848, and incidental expenses \$393,242, or a total for public secondary schools of \$4,777,090.

¹ According to Hübner's Statistical Tables.

² Including Algeria.

³ About.

⁴ Total enrolled.

⁵ Total enrolled; in attendance at close of year only 601.

⁶ Of 1,000 women at marriage, 538, and men at marriage, 379, could not sign the register.

⁷ Never attended school.

⁸ Number of children receiving instruction; not number in schools.

⁹ These 30 were not illiterates, but only imperfectly prepared.

¹⁰ Including all attending common school and public high schools.

¹¹ Inhabitants over 10 years of age.

PART II.

STATISTICS OF ILLITERACY, OR THE RESULTS OF EDUCATION.

In nearly all European countries the extent of illiteracy existing is found when the annual draft of recruits for the army and navy is taken. The results of this annual inquiry are defective, in so far as they represent only the male sex, and even that only so far as they deal with able-bodied men found capable of bearing arms and of undergoing the rigid discipline and arduous duties of military life. It is a matter of note that physical deformity or weakness, the result of accidents in youth, such as loss of an eye or limb, and other causes which unfit a boy for army service, unfit him also in many cases for attending school. Mental weakness often goes with physical weakness. Hence it is to be supposed that the rate of illiteracy found would be larger if all representatives of the sex of a certain year were examined, for among those who are rejected as unfit for the army a considerable number of mental cripples, or illiterates, would be found. On the other hand, the examinations of recruits with reference to their schooling has this advantage: They occur annually, i. e., at brief intervals, and enable

the authorities to notice any progress or retrogression in the elementary education of a part of the country from which the illiterates come, and quickly resort to remedial measures. Thus, for instance, the results of examination of recruits of 1899 may safely be used to judge the conditions of the schools ten years previous, the recruits being on an average 19 or 20 years of age.

Some statisticians regard as more reliable the rate of illiteracy found in counting those persons who can not sign their marriage certificates, for in this case both sexes are considered. The result of such periodical inquiry would, however, be reliable only if the ages in each case are correctly stated; besides, many persons can write their names but little else. After all, the standard derived from this mode of inquiry is not any more reliable than that derived from the examination of recruits, for fully two-fifths of the marriageable population of the civilized nations of Europe never marry. Other considerations confuse the ratios of illiteracy found through the census at intervals of ten or five years. It makes a great difference if, to determine the extent of illiteracy, all persons are counted, or only those over 6, or 7, or 10 years of age. The United States makes the age of 10 the limit in counting illiterates; Italy the age of 6.

In Prussia the results of illiteracy tests, to which army recruits are subjected, have been recorded since the beginning of the nineteenth century. The following table shows a commendable decrease in the original Prussian provinces:

TABLE 23.—*Ratio of illiteracy among Prussian army recruits.*

The State.....	9.30	5.52	2.38	.33

In the year 1865 the number of illiterates in Prussia was 3,480 among 63,032 recruits; in 1898 only 170 illiterates among 151,832 recruits. Aside from this change for the better, it is to be noted that in 1865 there were 4,685 recruits who could not speak or read German, but who spoke Polish; in 1898 that number had dwindled to 264. These figures show the progress the German public elementary schools have made in Polish districts. The following table gives the facts for the

whole State in compact form for the last thirty-four years, both as to illiteracy and as to the number of non-German-speaking recruits:

TABLE 24.—*Education of Prussian army recruits.*

1897-98	151,393	264	151,662	170	151,832	.11

¹The numbers for 1865-66 are missing.

NOTE.—The figures refer to the army recruits only. The navy was too small for many years to consider the sailors in these calculations. In late years the navy recruits are subjected to the same educational tests, and these reveal an even more favorable showing than those of the army.

The numbers in the foregoing table reveal a steady progress in elementary education in Prussia. The few which interrupt the decrease in the ratio are results which may be attributed to war years (1866-67 and 1870-71), in which the authorities were less rigid in accepting recruits who in other years would have been rejected.

The table deserves special attention for its second column, stating the number of non-German-speaking recruits. The decrease in these numbers is certainly most gratifying to the Prussian school authorities. While that column gives the totals for the State, it may be interesting to note the ratios for the three provinces in which the Poles live. Of every 100 recruits, those who spoke Polish only were as follows:

Years.	Province of East Prussia.	Province of West Prussia.	Province of Posen.	District of Oppeln.	State.
1867-68	11.55	8.54	35.02	44.76	6.06
1872-73	8.64	10.45	37.00	44.53	6.54
1877-78	7.96	10.19	34.55	41.98	6.29
1882-83	5.44	7.17	29.12	43.43	5.67
1887-88	2.03	11.96	26.45	19.90	4.15
1892-93	.52	4.16	25.04	6.14	2.60

A comparison of the ratio of illiteracy of Prussia with those of the other German States is not very favorable to Prussia, owing to the Polish population in the eastern provinces mentioned in the foregoing table:

Illiterates among 1,000 army recruits.

	1884.	1890.	1898.
Kingdom of Prussia	19.1	7.0	0.16
Kingdom of Bavaria8	.5	.02
Kingdom of Wurttemberg.....	.2	.1	.03
Kingdom of Saxony	1.5	.1	.02
Grand Duchy of Baden.....	.2	.2	.02
Alsace-Lorraine	7.2	3.3	.10

Similar minute statistical data are not available from other countries of Europe. Still from other sources, notably from census returns, enough material is at hand to show the effect of education in late years, and to determine what rank a country occupies as to illiteracy. Hübner's Tables, a most trustworthy statistical handbook, offers the following tables:

TABLE 25 (a).—*Illiterates among 1,000 army recruits.*

² Over 10 years.

Essential differences in the results of school education according to age and sex are revealed by a table compiled by Dr. Petersilie, of the Prussian department of education. According to this authority there were illiterates in every 10,000 inhabitants, as follows:

TABLE 26.—*Illiterates in every 10,000 inhabitants.*

	1881	5,599	6,140	5,389	7,293

The following table is reproduced from the Annual Report of this Bureau of 1896-97. It was compiled in this Bureau, and the sources

of information are stated in the last column. Only slight corrections have been made, new data being exceedingly rare:

TABLE 27.—Percentage of illiteracy in Europe.

Group.	Countries (or States).	Percentage.	Date.	Sex.	How found.	Sources of information.
Teutonic nations.	German Empire	0.11	1896	Male	Army recruits ..	Imperial bureau of statistics, Berlin.

A few details of statistics of illiteracy found in official publications of Austria (without Hungary) may follow:

In 1890 there were in every 10,000 inhabitants:

Age.	Illiterates.	Age.	Illiterates.
6 years	6,342	21 to 30 years	2,741
7 years	3,863	31 to 40 years	2,812
8 years	3,014	41 to 50 years	3,090
9 years	2,520	51 to 60 years	3,381
10 years	2,413	61 to 70 years	3,389
11 to 20 years.....	2,410	Above 70 years	3,429

In the same year there were in Austria, to every 10,000 male illiterates, the following number of female illiterates:

Age.	Entirely illiterate.	Semi-illiterate.	Age.	Entirely illiterate.	Semi-illiterate.
10 years	1,020	974	51 to 60 years.....	1,228	2,429
11 to 20 years	1,184	1,277	61 to 70 years.....	1,272	2,718
21 to 30 years	1,192	1,695	Above 70 years.....	1,278	2,529
31 to 40 years	1,169	1,823			
41 to 50 years	1,176	2,017	Average.....	1,109	1,772

A peculiar condition is found in the reports from Austria-Hungary, namely, that many persons can read but not write.

Illiterates in every 10,000 inhabitants.

Mother tongue.	Could neither read nor write.		Could only read.	
	Males.	Females.	Males.	Females.
German	1,456	2,373	260	1,113
Magyaric	2,859	3,778	412	1,350
Slavonian	3,483	4,075	1,212	2,624
Servian	6,635	7,998	100	252
Roumanian	8,127	9,278	128	81
Ruthenian	8,126	8,675	624	685
Average	4,416	5,354	391	1,075

In Prussia the difference between the eastern and the western provinces is quite remarkable with regard to illiteracy. In order to illustrate this we must go back to the census reports of 1871:

	Illiterates per 10,000 recruits.		Illiterates per 10,000 recruits.
EASTERN PROVINCES.		WESTERN PROVINCES.	
East Prussia	5,240	Saxony	726
West Prussia	7,283	Sleswick-Holstein	807
Posen	7,284	Hanover	1,186
Pomerania	2,303	Westphalia	1,027
Brandenburg	1,405	Hesse-Nassau	750
Silesia	2,815	Rhenish Prussia	1,460
City of Berlin	411	Hohenzollern	394

Average for the State	2,423
Of every 10,000 Protestants.....	1,797
Of every 10,000 Catholics.....	3,697
Of every 10,000 Jews	1,920
Of every other denomination.....	1,398

Quite differently from the way in which the German and Austrian authorities determine the amount of illiteracy existing do the Swiss authorities proceed. They examine the recruits, as already stated, not merely with regard to their ability to read and write, but subject them to a rigid examination in reading, penmanship, composition, arithmetic, Swiss history, and geography. That this examination is very rigid and comprehensive may be seen from the fact that a number of graduates of secondary schools fail to obtain the highest mark. Only 65 per cent of those who come from grammar schools reach the highest mark, while 93 per cent of graduates of special and professional schools reach it. Of the graduates of classical schools only 90 per cent reach the highest mark, and only 98 per cent of the same graduates succeed in obtaining the highest mark in two branches. A still more significant proof of the rigidity of these examinations is found in the fact that, in 1897, 5 per cent of the university students and 1 per cent of the teachers entering the army failed to reach the highest mark in this elementary examination.

The following two summaries are culled from Swiss official reports:

Marks received out of every 100 candidates.

Year.	Very high marks.	Very low marks.	Medium marks.	Year.	Very high marks.	Very low marks.	Medium marks.
1886.....	17	21	62	1892.....	22	11	67
1887.....	19	17	64	1893.....	24	10	66
1888.....	19	17	64	1894.....	24	11	65
1889.....	18	15	67	1895.....	24	11	65
1890.....	19	14	67	1896.....	25	9	66
1891.....	22	12	66				

Within eleven years the number of highest marks rose 47 per cent, that of satisfactory marks a little less than 7 per cent, and that of the lowest marks decreased 52 per cent.

Marks obtained by every 100 recruits.

[Results of Swiss examination of army recruits.]

Year.	High marks in—				Low marks in—			
	Read- ing.	Compo- sition.	Arith- metic.	History and geog- raphy.	Read- ing.	Compo- sition.	Arith- metic.	History and geog- raphy.
1886.....	69	48	54	35	9	19	18	32
1887.....	72	52	58	38	8	16	13	28
1888.....	71	51	54	40	8	16	14	25
1889.....	75	52	53	42	6	13	15	23
1890.....	76	53	57	41	6	13	12	24
1891.....	78	55	62	45	4	11	10	21
1892.....	79	57	60	46	4	10	10	20
1893.....	82	57	65	47	3	10	9	18
1894.....	80	57	64	46	3	10	9	18
1895.....	81	56	63	46	3	10	10	18
1896.....	83	59	64	48	3	8	9	17

Recruits who fail in this examination in the elementary branches are called illiterates. This is a very different standard from that used in other countries, and it therefore accounts for the comparatively high percentage of illiteracy attributed to Switzerland in the tables preceding.

III. EXPENDITURE FOR EDUCATION IN PRUSSIA.

The statement has often been made that in Prussia the annual expenditure for education amounts to only 50 cents per capita of the population; but in this no account is taken of provincial funds and municipal school taxes, nor yet of the tuition fees paid in all kinds of secondary and special schools. The truth is that the expenditures for education of the common people—that is, for the establishment and maintenance of elementary schools alone—amounts to \$2.10 per capita of the population, exclusive of tuition fees, which are only another kind of tax, and rightly deserve to be included in the total expenditures for education. But for purposes of comparison these fees are not usually included. Recently the Prussian minister of worship and education, Dr. Bosse, resigned, after holding the office for seven years. The educational press of Berlin subjected this period of seven years to a critical analysis, and showed the progress of education in the Kingdom by comparing the amounts spent for education in 1892 and in 1899. This showing is here reproduced with the use of American terms, in the hope that it may show the fallacy of the frequent erroneous statements referred to above.

First it will be necessary to state all the expenditures made by the minister of worship and education in the two years mentioned, and then to eliminate the items not properly coming under the head of education. In the fiscal year of 1892-93 the regular payments for the State made by the minister amounted to \$24,144,001; in 1899 the total was \$32,786,441, which shows an increase of \$8,642,293, or 35.79 per cent. If compared with the sum spent for common-school education in the United States, to wit, \$188,641,243 (derived from income from permanent funds, State taxes, local taxes, and all other sources), the Prussian amount would seem small, but the total mentioned comes from the State treasury only. On the same basis of comparison, we should take the amount paid for education in the United States derived from State taxes only, which was in 1896-97 only \$35,062,533. A country of about 72,000,000 inhabitants paying \$35,000,000 for education does not appear particularly generous when compared with another of about 31,000,000 inhabitants paying \$32,000,000.

But this comparison is based on a fallacy, because we must eliminate large sums from the total paid by the Prussian state for the maintenance of the church. Such expenditures amounted to \$3,651,023 in

1892-93, and \$5,555,062 in 1899, an increase of 52.15 per cent in seven years. Large sums were also expended for the department of medical affairs of the State. The sums paid to purely educational institutions were \$18,806,169 in 1892-93, and \$25,313,854 in 1899, or an increase of 34 per cent. These figures give us a basis for comparison, but not true enough, because in Prussia all permanent funds are administered by the State, and it is reasonable to suppose that in the budget of the minister the income derived from this source is included in the State's quota of expenditures for schools. The exact amount is not known. But the yield from this source in the United States is known to have been, in 1896-97, \$7,846,648. Adding this to the amount of State taxes quoted, we get a total of \$42,909,181.

The comparison would then stand as follows:

	Year.	Inhabitants.	State's quota for education.
United States.....	1896-97	72,000,000	\$42,909,181
Prussia.....	1899	33,000,000	25,313,854

This showing would be decidedly in favor of Prussia if there were no funds but those which the State supplied. That is, however, not the case. As a rule the State's quota for any public purpose is greater in European States, where the people are accustomed to look toward the government for aid, while here in the United States we help ourselves first and call for aid from the State when local means are inadequate. Local taxation, therefore, bears the burden of support of the school in this country. The amount spent for education derived from local taxation in 1896-97 in the United States was \$127,960,761. This quota is proportionately very much larger than that of Prussia. The Berlin educational press gives the following estimate of the amount raised in Prussia by local taxation:

Educational institutions are only partially supported by the State, hence the minister's budgets give only incomplete information concerning the increase of expenditure for educational purposes during the seven years alluded to. It is necessary to add the local taxes raised by communities for school purposes. It is impossible to give the figures for the same years, but the official statements made in 1891 and 1896 may suffice for comparison. The report of 1891 may be used properly, since it can not differ greatly from that of 1892, essential changes not having occurred during the period of Count von Zedlitz's administration (1891-92). In 1891, then, the local taxation for educational purposes yielded the sum of \$14,893,000, and in 1896 it yielded \$24,038,000, which shows an increase of 61.34 per cent in five years. The recent passage of the law regulating and augmenting the teachers' salaries, required another increase of \$2,618,000 in the communal expenses for schools; hence the local taxes for school purposes rose from \$14,000,000 to \$26,500,000. It is reasonable to estimate the total expenditures in 1899, for elementary schools alone, to be \$49,564,000.

In a like ratio the expenses for secondary schools have increased. While they amounted to \$7,378,000 in 1892-93, they rose to \$10,353,000

in 1899, an increase of 40.32 per cent. The State's quota for the support of the institutions of higher education (universities and others) rose from \$2,000,000 to \$2,500,000 in the same period. No notice is taken of the permanent funds of universities which are administered separately.

And now we have a better basis for comparison:

UNITED STATES.	PRUSSIA.
Inhabitants in 1896-97 (about) 72,000,000	Inhabitants in 1895 (census) . 31,855,123
Sources of funds expended for common-school education:	Expenditures for education:
State taxes \$35,062,533	State's quota, including
Permanent funds 7,846,648	permanent funds \$25,313,854
Local taxes 127,960,761	Local taxes 26,656,000
Other sources 17,771,301	State's quota for second-ary schools..... 10,353,000
	State's quota for higher education 2,500,000
Total ¹ 188,641,243	Total 64,822,854

Thus we see that Prussia, with 32,000,000 inhabitants, paying \$64,822,854 for education, is apparently far behind the United States with 72,000,000 inhabitants, paying \$188,641,243 for like purposes. The difference, however, almost disappears when two facts are considered: (1) Though elementary education in Prussia is gratuitous (since 1888), secondary education and higher education are not. There should, therefore, be added to the Prussian total a sum representing the tuition fees, which is a tax for the individual who uses the institutions. Of course there are also secondary and higher institutions of learning in the United States where tuition fees are charged. Usually the amount of tuition fees in Germany is estimated at one-third of the total income of a school. One-third of \$12,853,000 is \$4,284,000. This sum might properly be added to the expenditures for school purposes in Prussia, making the sum total \$69,106,854. (2) Another fact will tend to diminish the difference alluded to, namely, that the purchasing power of money is greater in Germany than here, and that salaries of teachers, though they be lower in Prussia, are often more adequate than here, owing to the teachers' life tenure of office and the use many teachers have of a dwelling and of a piece of land for garden purposes.

Still another fact will tend to make the difference smaller. It is that the foregoing statements do not take into account the enormous number of special schools in Prussia maintained by societies, communities, and provincial governments, the aim of which is to prepare pupils for occupations in life. They are agricultural, industrial, commercial, art,

¹To the sum total for the United States should properly be added the expenditures for public higher education.

drawing, trade, and other schools, very few of which have entered the State system of education as yet, but are likely to do so in future.

IV. THE SCHOOLS OF BERLIN IN 1898.

In presenting a summary of the educational statistics of the city of Berlin (see p. 794) the object has been to show the astonishing variety of educational agencies of a metropolis, the capital of a country which is frequently pointed out as an example of centralization of governmental authority by those who favor the greatest possible extent of local or self-government in educational affairs. A glance at the table reveals the fact that Berlin has 103 secondary schools (52 public and 51 private) and 306 elementary schools (293 public and only 13 private). This large number of secondary institutions would seem out of all proportion under ordinary American conditions, and is partly accounted for by the smallness of the institutions. By comparing the number of students in secondary schools with the number in elementary schools, one arrives at a more just appreciation of the statistics offered. In 1898 there were altogether 37,520 students in secondary schools and 225,725 pupils in elementary schools (not counting technical, industrial, or trade schools), a proportion of nearly one-eighth secondary students (or exactly 14.2 per cent) in the total number. The percentage of secondary students in the United States rarely rises above 5 per cent of the total number enrolled in city schools. Hence there must be a particular cause for so phenomenally high a percentage of secondary students in Berlin.

This is indeed the case, and it is for the purpose of clearly illustrating this cause that the following table has been compiled. It will be seen that the public as well as the private secondary schools have many more students under than over 14 years of age; to wit, 24,275 under and 13,245 over 14. In the United States pupils, when entering the high schools, are as a rule 14 years old, that is to say, beginning at 6 years of age they pass through a four-years' course of primary school and a four-years' course of grammar school, the high school simply being the third story of the common-school edifice. This is not the case in Germany. The German high school of whatever kind is not the culmination of a common elementary school system, but it reaches down four years lower than our high schools, and includes the four grammar-school grades. It begins its course at the ninth or tenth year of the pupil's age; it builds its course independently of the common elementary school upon a four-years' course of primary instruction, obtained either in the common elementary schools or in preparatory schools attached to the high school. The causes for this segregation may be found in the social conditions prevailing in the old country. But whatever the causes, the fact establishes the wide differences in the numbers alluded to.

If, then, for argument's sake only, the number of secondary students in Berlin over 14 years of age is considered, which is 13,245, the percentage of the sum total is found to be a trifle over 5, or about the same ratio that is found frequently in large cities in the United States. Thus it is seen that the proportion of students aiming at an advanced and superior education is not much greater than in this country, but the schools are smaller, and afford much better opportunities for training and individual attention to the students by the teachers than if the schools were large and had thousands of students under one roof.

Maintaining a great number of high schools gives the authorities a chance to offer a variety of courses of study which would be impossible in large institutions, where uniformity is necessary from an administrative point of view. In the first place, it is noticed that girls and boys are taught in separate high schools. It is claimed in Germany that, at the high-school age, the two sexes can not profitably be taught together, but that separate schools enable the teachers to do justice to the intellectual and emotional peculiarities of the sexes, which manifest themselves in various ways. For instance: During the years of adolescence (14 to 18) the methods of training and teaching must be adapted to the nature of the individual more than at any other time. Girls are passive recipients of knowledge; they memorize, take statements on trust, consult printed authorities, and generally accept knowledge as it is offered, while the boys are not apt to accept authorities, they are critical, at least dubious, like to acquire knowledge by self-activity in roundabout ways, create it in themselves by investigating facts and phenomena; they like to argue themselves into knowledge—they experience knowledge, and need not memorize it. Of course, so it is claimed, this feature of the boys' character needs separate boys' schools, for to teach both sexes together, after they have entered upon high-school studies, would seriously affect the character of either sex. This statement of the German view is not made to controvert it or to sanction it; it is made only to explain the great number of high schools in Germany. The methods of teaching, then, are different; so are the modes of training, and also the matter of instruction in girls' schools differs from that of boys' schools. In the former the chief subjects are literature and languages and branches which refer to forms rather than to contents, while the principal subjects in boys' high schools refer to realistic knowledge, mathematics and natural science (except in classical schools which are preparatory institutions for the learned professions).

In the second place, there are varieties in the secondary schools for boys and in those for girls. Some of the boys' schools prepare for the universities; some only for the philosophical faculty of the universities; some for other higher seats of learning, such as polytechnica, mining

and agricultural schools. Still others, the so-called Realschulen, prepare their students for commercial or industrial pursuits. Young men who do not intend to enter upon higher studies attend the secondary schools of lower grade, and the course of study is framed so as to meet the demands of practical life.

Another interesting feature of the table is the long list of special schools for industrial pursuits. There are 6 of them of a very high order, in which higher mathematics and languages are taught in connection with trades (see table), and 18 of a lower order, all maintained by the city exclusively. As was shown in a previous Report of this Bureau, the city of Berlin expended in 1896-97 about \$220,000 for such special schools, including \$80,000 for 23 industrial evening and secular Sunday schools for boys and girls.

In regard to tuition fees, the rule is that in all public elementary schools, 262 in number, tuition is free; in 31 (being preparatory departments of high schools or church and society schools) a moderate tuition fee is charged; but all high schools charge tuition fees, and are to a large extent supported by these fees.

The high or secondary schools mentioned in the table are not all municipal schools—that is, they are not all established and maintained by the city—but some are State (or royal) schools. Six of the gymnasias or classical schools are royal, one of the Realgymnasias, two of the public high schools for girls are royal, also the normal school. This seemingly odd feature of the schools of Berlin is accounted for by the historical fact that in former days the communities attended only to elementary schools, while the State established and maintained secondary and higher institutions. But during the second half of the nineteenth century the German cities raised their standard of public education by entering into the field of secondary education, and trying to supplement the work of the State by administering to the wants of industrial and commercial men.

The table does not contain any data of the institutions for higher education in Berlin, such as the university, the polytechnicum, the art school, the music conservatories, and other institutions of high rank, like the School of Mines.

The schools of Berlin, Germany, in 1898.

[Estimated population, 1,805,119.]

V. EXPENDITURES FOR HIGHER EDUCATION IN THE CIVILIZED WORLD.

[Reported for 1897-98 and 1898-99.]

While most civilized nations make some efforts at establishing complete systems of elementary schools, all have higher seats of learning, many of which are of venerable age. This proves that education invariably works downward into the broader layers of society. First, the State establishes universities and colleges, then preparatory and secondary schools, and lastly an elementary school system. This process is plainly illustrated in an article on "History of the German school system" (see Annual Report of 1897-98, Part I, pp. 3-82). Similar observations are made in other countries, and while it would seem as though Great Britain were an exception to the rule stated with regard to secondary schools, it must be borne in mind that the people of England supplied the demand from their own initiative. Higher educational institutions act as incentives to students of secondary schools, and to enter a secondary school is the ambition of the elementary pupil. If the elementary pupil saw nothing higher to aim at he would soon sink back into a state of self-satisfaction, which is a foe to progress.

Therefore, to state what the various countries of the civilized world pay for higher education is establishing a standard measure by which their general education may be gauged. This will indirectly indicate their standing in elementary education, and a comparison with their reported percentage of illiteracy will show, if not exactly, yet approximately, that generous expenditures for higher education are a reliable indication of well-advanced secondary and elementary schools in any country where such generosity is shown.

In the following tables a careful detailed statement of expenditures for higher institutions of the civilized world is made, based in most cases upon reports to the editors of the *Minerva*, *Jahrbuch der gelehrten Welt*, by university treasurers and secretaries, and in cases where reports were missing estimates are made to supply the deficiencies, but such occasions are rare.

The general conclusion from the summary on page 806 is that in Europe the Anglo-Saxons, or, generally speaking, the Teutonic nations, are ahead of the Latin or Romanic nations, and they in turn, with the exception of Spain, leave the Slavic nations far behind.

The table is necessarily very fragmentary for Asia, Africa, and South America, while wherever the English have established colonies or conquered nations institutions for higher education have sprung up in great number. Witness Australia, Canada, and India. Our own country assumes an honorable place in the list.

Where the institutions mentioned in the list have failed to report their expenditures for 1898-99 the amounts reported for a previous year have been copied. The cases are easily detected by comparing the statements of the two years. Of the European nations, only Norway and Denmark show a slight decrease. All others show an increase.

NOTE.—The reason why Germany pays comparatively little for higher education, that is, compared with England and the United States, is found in the fact that German secondary schools reach far into the college course. There should, therefore, be added to the foregoing totals a sum equal to the expenditures for the two higher grades in gymnasia and other schools preparing for higher seats of learning.

II.—UNITED STATES.

In other parts of this Annual Report (Vol. 2) may be found the details of expenditures for higher education in the United States. If the total amount reported by each institution were accepted as spent for higher education, the per capita would be 35 cents. But if a reasonably estimated sum spent for the secondary and elementary preparatory departments of the higher institutions be eliminated, the per capita proves to be 22 cents for 1897-98. Since this chapter goes to the press several months earlier than the statistical tables of Volume 2, it is impossible to state the facts for 1898-99. A fair estimate places the per capita at a trifle higher than that of the previous year.

VI. CHILDREN'S CLAIM UPON CHILDHOOD.

“Die Zeit” (The Times), a weekly in Vienna, Austria, recently contained a lengthy article on the subject of “Children’s claim upon childhood,” in which a number of most important facts are stated. They are viewed from an educational standpoint and illustrate conditions which are met in Germany and other northern countries, as well as in some States of this country, by strict laws regulating factory or child labor, and by laws compelling school attendance. Stripped of its objectionable expressions, the article may be of service for the comprehension of educational conditions in Central Europe. The facts it mentions are gleaned from laws, regulations, and official reports of governments and societies. The following is an adaptation of the article:

To understand to what extent children are protected from the premature exaction of labor, it is necessary to study the school laws as well as the labor laws. The Austrian school law was passed by the so-called Liberal party in 1869 and revised by the Conservative party in 1883. This law, which certainly contains more ample provisions for popular education than that of former years, furnishes evidence of the interest of the Liberals as representatives of the people. This “pearl of Austrian legislation,” as the school law has been called, contains in paragraphs 9, 24, and 60 regulations granting manufacturers the right of employing children.

When the Conservatives succeeded in gaining the majority in Parliament in 1883, they revised the law in the interest of agriculturists; that is to say, by means of the so-called “individual and general instigation of school-attendance laws,” in paragraph 21 of the school law, they granted the same right of employment of children to

farmers. In both industrial and agricultural pursuits children may be employed between the twelfth and the fourteenth year of age.

In the same year in which this revision took place Parliament instituted an investigation of the labor laws by one of its committees. This extended from April 30 to May 8. The result of this investigation was an amendment to the "Gewerbeordnung" (regulations concerning industry). In Article IV a number of supplementary regulations affecting child labor were adopted. Thus section 94 reads:

"Children shall not be regularly employed in industrial pursuits until the completion of their twelfth year of age. From their completed twelfth till their completed fourteenth year of age, children shall only be regularly employed in industrial pursuits if it can be done without injury to their health, and without retarding their physical development, or interfering with the requirements of the school law. For children eight hours is the maximum length of a workday."

In paragraph 95 child labor is forbidden between the hours of eight in the evening and five in the morning. According to paragraph 96 (*b*), children 14 years of age and under shall not be employed in factories. But so long as this prohibition does not apply to farming and shopwork, the evil is not remedied. The position of working children has not been improved by paragraph 96 (*b*). Children discharged from factories are given over to unrestricted labor by parents who, driven by want, hire them out for all sorts of labor outside of factories.

In Germany protective child-labor laws have existed since 1891, and the Government seems inclined to protect children against excessive domestic labor also. On December 13, 1897, the imperial secretary of the interior announced in the Reichstag that governmental inquiries into the industrial occupations of school children had been instituted, and that their results would be submitted to the committee on labor statistics for their use in framing legislation. In the meantime the imperial chancellor drew the attention of the various state governments to the great increase of child labor in industrial pursuits. This measure was provoked by the many inquiries made by German teachers and teachers' unions during the past few years. Through the untiring efforts of Mr. Agahd, a teacher in Rixdorf, near Berlin, a widespread interest has been aroused with regard to child labor. At present a great deal of material is available for a thorough study of the subject in Germany. In Austria, as yet, there has been little systematic inquiry. Apart from a few scattered notes in pamphlets and journals, and the efforts of several teachers in Vienna who in 1898 distributed by circular letters inquiries under fifty-three headings, next to nothing of child labor is known.

The extent to which child labor is utilized in farming districts in Austria may be learned from the official school reports respecting attendance at schools. Compulsory attendance laws are mitigated, either in behalf of entire communities or upon application of individuals, in those crown lands where eight years' attendance is compulsory; these are Upper and Lower Austria, Salzburg, Carinthia, Tyrol, Bohemia, Moravia, and Silesia. How extensively the rural population set children to work is seen from the fact that the greatest number of communities enjoying the right of mitigation of attendance laws make use of that right. During the school year 1893-94 as many as 93,745 children within the limit of two years below the required age for dismissal enjoyed general;¹ and 55,905 individual² mitigation of enforced school attendance. Hence during the school year 1893-94, in the eight crown lands mentioned, 149,750 children of the age above specified were excused from attending school during the summer.

In the decree of the minister of education, June 8, 1883, various grounds of exemption from attendance during the seventh and eighth years are adduced, so that there is

¹ Mitigation granted to all children of a school district within the age of two years below the required limit for dismissal.

² Mitigation granted to some parents for their children upon application.

practically no obstacle in the way of hiring children out as farmer's help. The party which brought about these amendments did it in order, as asserted in parliament, to improve the condition of the peasants. They gained adherents to their cause by the promise of cheaper wages and by drawing attention to the fact that in consequence of mitigation of school laws it would be possible to lessen the burden of school taxes by a better utilization of the force of teachers (by asking teachers to teach two sets of pupils each in half-day schools). Cheaper wages are not only a consideration for the small farmer, but also for the large landowners. The general mitigation of school attendance law, applicable to all children 13 and 14 years old in a school district, makes of the children of poor farmers, peasants, and cottagers a class of help that works for starvation wages.

School authorities are also aware that even younger children are hired out to work. This is proved by the official reports in Carinthia, for example, a crown land where the amended law is in force. In the report of 1894-95 the following was stated:

"In summer regular school attendance in Carinthia suffers, as is generally known, by the many 'free' children who in many schools number more than half, as high even as two-thirds to three-fourths, of the entire enrollment. These children and their mothers are supported by the farmers in return for light services rendered by the children, such as tending flocks, etc., and in case of punishment for unjustifiable absence from school are released from service."

The school board of Görz and Gradisca, where only six years' daily attendance is compulsory, quotes in its reports of 1895-96 and 1896-97 the following, among other reasons, for absence:

"Poverty forces parents to hire out their older children as assistants, or to put them to service beyond the borders during the summer."

On page 9 of the appendix to Report IV, 1896, of the school authorities of Lower Austria, it is stated as follows:

"In the lower districts the larger children are in many cases taken from school to work in the garden and fields, to tend flocks, and to help in hunting game."

In the labor congress held in Zürich, 1897, Dr. Quark, of Frankfurt-on-the-Main, said:

"In Wurttemberg, Germany, children are imported from Tyrol and Vorarlberg (Austria) for service on farms. This traffic is under the direction of Austrian clergymen, who have formed a regular organization for this purpose."

More is learned of this traffic in children and its organization from the Tyrol Gazette. In the issue of November 13, 1897, it says:

"The Tyrol Society for Protection of Children held its annual meeting on November 8 in Perfuchs. From the report handed in by Secretary Streiter we glean the following:

"The society this year transported 290 children to Friederichshafen (on Lake Constance) by way of Ravensburg and returned 250. The trip from Mals to Landseck was given by the railroad company free, for which assistance the society expresses its thanks. Through the kindness of the directors of transportation a private train and boat were placed at the disposal of the society. The contract was drawn up under the superintendence of six guides, and most of the children found good homes. The wages were fairly good. The amount received by those who returned was 14,014 marks (\$3,335.33), not including a double suit of clothes."

The educational journal, *Teachers' Opinion*, commented editorially on this report, and received the following communication:

"Why go to distant lands for what is within easy reach? This occurred to me when I read your article on the Tyrol traders in children in No. 22 of the *Opinion*. We need not go to Tyrol, nor beyond the confines of Lower Austria, for only six hours' ride from Vienna we find exactly the same conditions. In the district of Pöggstall children are put out to service to an extent hardly equaled. The people

are extremely poor. To eke out half an existence many take foundlings from the foundling asylums in Vienna. Such a mite, it is supposed, has naturally forfeited all right to education. For the support of a foundling, according to age, three to six florins (\$1.50 to \$3) a month are paid by the managers of the asylum. This is not the only advantage gained from these children. From early morning till late at night they are required to do heavy housework. During the summer tending flocks and herds is their only occupation. Instead of being in school these victims of society must look after oxen and goats, to receive as their reward for the day's diligence a piece of dry bread, a potato, and a small allowance of thin soup. The authorities trouble themselves very little about whether these children attend school or not. The rich farmers, too, keep such foundlings to get their work done cheap. Now, what do such children learn in the society of servants, cattle, and goats? Schools are powerless against these factors, and still the fault is laid at their door. In some schoolrooms 75 per cent of the children are foundlings. It often happens that such children are absent from school because they get nothing to eat at home."

If such conditions prevail in the cultivated districts of Austria proper, one may easily imagine the state of affairs respecting child service in the eastern and southern Crown lands. In countries where six years' attendance at school is compulsory, so-called repetition or continuation schools have been established for children 13 and 14 years of age. These schools discontinue in March, so that pupils "may not be deprived of the opportunity of devoting themselves to practical pursuits."

The results of special inquiries presented by the teachers of Pomerania (Prussian province, Germany) point out the dangers threatening the health and morals of working children. More than 46 per cent of the children at work in the country, with whom these inquiries dealt, were in danger of losing their health, while more than 70 per cent were exposed to moral danger. But all the misery in which these children live, all the neglect they suffer in the interest of the peasants, does not compare with the fearful fate that befalls children of the lowest classes in cities. In the country children are excused from school so that they may earn wages; in the city these unfortunates must attend school and work for wages besides. For many the school is a place of refuge; the hours spent there are hours of rest. Who can blame a child for falling asleep during lessons when he has to work early in the morning and again till late in the evening? He often drags his tired body to school in the hope of receiving a card which entitles him to a meal.

The mere mention of the different occupations of school children gives an insight into the surroundings the influence of which school is called upon to counteract. The following statements are based upon articles that appeared in the June number (1898) of the *Teachers' Opinion*, and upon information received from Vienna teachers. Unfortunately, the inquiries cover only 53 school classes (or rooms), 37 girls' and 16 boys', in School Districts II, IX, XIV, XVI, and XVIII. Among 2,740 children attending these schools, 353, or 13 per cent, were employed partly in factories and shops and partly in heavy housework; 129 worked away from home. Children in domestic industries and home work are occupied, for instance, in making cigarette wrappers and cases; in bookbinding; in making paper flowers, envelopes, toy money banks; in papier-maché work; in making net lining for men's hats; in knitting and crocheting; in stringing beads; in making dolls, fans, collars and cuffs, shirts, corsets, and belts, etc. The time for work for children from 8 to 14 years of age varies; on school days it is from two to ten hours; in vacation and on holidays the maximum reaches fourteen hours.

A 10-year-old boy works four hours a day in making cigarette wrappers and receives 45 kreutzer (about 22 cents) for 1,200 wrappers. Another child works seven to eight hours a day, and with the help of mother and sisters finishes 120 flowers at 1 kreutzer apiece. (A kreutzer is the hundredth part of a florin worth 48.2 cents.) A girl 13 years of age works nine hours a day stringing beads; during

vacation she works sixteen hours. Her average pay is 15 kreutzers (7 cents). Sixty beads form a string, and twelve strings make a bundle. The pay for a bundle is 3 kreutzer (1.4 cents).

A second group of working children is engaged in shops and hotels or inns. The number of the latter is extraordinary in Vienna. A number of mechanics can maintain their independence only by hiring apprentices. Some do not furnish room and board for their help; these employ their own and other children from 8 to 14 years of age, and pay them a few kreutzer. In all trades such conditions prevail. In 16 boys' schoolrooms there were found a mason, an upholsterer, two cabinet-makers, a shoemaker, a painter, and a rope maker. The working hours were regulated by the amount of business done by their employers. A teacher in the second district makes the following remark in his report concerning one of his boys: "Stays at home in busy times; poorly fed; drinks brandy now and then; smokes often."

The occupations of children in hotels and restaurants are most demoralizing and prejudicial to health. They serve as waiters, venders of bread and cigars, dish-washers, and set up the pins in bowling alleys. A teacher in the second district, in whose room, during 1897-98, 6 out of 22 boys were engaged in bowling alleys, remarks: "All children employed in hotels, inns, and restaurants are sleepy and unfit for lessons the day after one of service." Often worse evils arise, because guests offer them beer and wine. The conversations which they hear and the scenes they witness exert a decided and evil influence upon their morals.

In Germany the police regulations forbid the employment of children in taverns. In Austria the minister of trade decreed May 27, 1885, as follows: "It is allowable to employ children as waiters, or otherwise, from 8 in the evening till midnight." And this decree is approved by the minister of the interior. The people of Vienna are so accustomed to their "bread boys" that no bread would seem palatable unless bought from such children. Whoever takes the trouble to observe these 8 or 10 year old boys on a Sunday afternoon in a Prater coffeehouse is filled with indignation against the indifference of the large crowd, eating, drinking, and enjoying the music, unmindful of the fact that between the tables children are wandering about that have the right too to enjoy Sunday, but have lost their claim upon childhood.

Children engaged in heavy domestic labor at home or among strangers form a large group. In Vienna hundreds of girls 10 to 14 years of age are "in service." They often work in one household before school hours, in a second after school, and in a third at night.

Errand boys and girls, milk carriers, paper carriers, stable boys, etc., form a large group of working children. Paper carriers and milkmaids are often busy three hours before the opening of school. Juvenile paper carriers are usually employed by those who purchase rounds from publishers. If these are poorly paid one can imagine what wages the children receive. These children usually belong to the class that regularly fall asleep in school between 8 and 9 o'clock. Small boys are also employed at railroad freight depots for unloading. One teacher in the tenth district has in his class two boys, aged 11 and 13, who are employed during school time in unloading freight. They are thoroughly neglected. From September 16, 1897, till February 15 one boy was absent from school 142, the other 130 half days.

A number of children add to the family income in their own way. They peddle various articles, as cakes, matches, buttons, pictures, and violet powder, or pick up from the streets wood, coke, coal, iron, and rags. The peddlers can be seen any day in taverns and especially in the Prater restaurants during the summer, but the different collectors must be sought at their work. Mornings and evenings one is sure to find children gathering wood and coal at railroad stations. In the morning, for instance, when the carts leave the northern yards, children with baskets on their arms stand waiting to follow them and pick up every piece that falls. Younger brothers and sisters may be freezing at home. Who, then, can censure the child

who, trembling with cold and impatient at the slowness with which the pieces fall, helps himself now and then from the cart itself.

In conclusion it may be remarked that a number of children are engaged to work during certain seasons only. Those deserving first mention are the makers of Christmas tree ornaments and the like. Poor young creatures must work till far into the night, so that the children of the well-to-do may rejoice. There may be many other branches of industry in which children are employed. An entire review of the evil will be possible only when the authorities institute an investigation into the question of child labor. Every educator must indorse positive prohibition of child labor for wages. In Austria the minister of trade and industry has repeatedly advocated shortening the term of school attendance. The near future holds out no hope that the State will interfere and abolish child labor. In November, 1898, the district board of public schools in Vienna proposed measures to the city council on this question, but since the doing away with the evil of child labor can not serve the interests of any political party the members of which consist of industrial classes still pursuing old methods of trade, it is hard to believe that there will be any kind of satisfactory settlement in the city. The school authorities, or anyone desiring to ameliorate present conditions in this respect, can always count upon the support of teachers. It is to be hoped that teachers will not be left alone in their demand that the children's claim upon childhood be heard.

The foregoing statement of facts may find some official confirmation in the following comprehensive table taken from the publications of the Royal Statistical Bureau of Würtemberg, which in turn credits it to the work of the Imperial Statistical Bureau in Berlin. A glance at the summaries will convince the reader that child labor is by no means a myth in Germany, despite the strict compulsory school attendance laws in force there. Nearly a quarter of a million of children under 14 years are wage-earning, but that does not mean in many cases that the children are illegally kept from school, but that they have availed themselves of the provision of the law which allows the local school authorities to exempt children from further regular attendance after 12 years, if they have acquired a tolerably complete elementary education. It is reasonable to suppose that by far the most of the 214,954 wage-earning children are between 12 and 14 years of age, many of whom attend evening schools. For particulars the table may be consulted.

Wage-earning children under 14 years in Germany.

	Population, census of 1895.		Population under 14 years, census of 1895.		Number of wage-earning children under 14.		Ratio of children under 14 to every 1,000 inhabitants.		Ratio of wage-earning children under 14 to every 1,000 inhabitants.		Ratio of wage-earning children under 14 to every 1,000 children under 14. 1 These numbers include all children who earn wages in agriculture, forestry, mining, industry and building, commerce and transportation, domestic service, civil and church service, and other occupations not easily classified.

The foregoing census table has been subjected to a thorough analysis by a teacher in Rixdorf near Berlin, Conrad Agahd, a gentleman much interested in the question of child labor. Some of his publications have been referred to in the previous pages. Lately he published in the *Zeitschrift für Philosophie and Pädagogik* (Vol. VI, No. 5) a very careful analysis of the census table, and adds to it some details gathered by himself and other teachers, which explain the official returns. His article is here translated:

No one [says Mr. Agahd] will deny that children should enjoy home, school, and fresh air, but necessity, selfishness, and competition have been mightier than true humanity. In view of this fact, the Imperial Government in Germany and some of the separate states of the Empire have deemed it necessary to take measures forbidding child labor in factories. For the first time the imperial census statistics (volume "Berufsstatistik") report facts, inadequate though convincing, relative to the occupation of children not reached by the protective labor laws; and since their publication the need of more extensive legislation has been recognized. The reports of boards of trade and inspectors have also, so far as industry is concerned, furnished an abundance of material which legislators may use. Nevertheless, it is indisputable, that teachers deserve the credit of having aroused the public conscience on this subject. The results of an official inquiry, instituted by the imperial chancellor (department of state), will likewise soon be ready for publication.

The best proof of the necessity of agitating the question is the immense extent to which children of school age are employed in trades of various kinds. The trade statistics referred to report 214,954 children, of whom 40,499 are under 12 years of age. They are distributed as follows:

Occupation.	Children under 14 years of age.		
	Boys.	Girls.	Total.
A. Connected with agriculture.....	94,121	41,004	135,125
B. Connected with industry	30,618	7,649	38,267
C. Connected with commerce.....	3,596	1,790	5,296
D. Of different kinds not easily classified.....	325	1,487	1,812
E. Connected with army and navy	867	86	953
F. Other public service and professions.....	848	32,653	33,501
G. Domestic service.....			
Totals	130,285	84,669	214,954

Agriculture and domestic service are not included in the new investigation set afoot by the state government. The chancellor's order reads: "Much of the lighter employment in agriculture—for instance, the tending of cattle—is especially adapted to children." But of this more anon.

In considering industry, we shall mention only those occupations of the 152 specified which the report itself notes as conspicuous. The following table refers to children under 14 years of age:

Occupations.	Total.	Boys.	Girls.
Brickmaking.....	1,575	1,453	122
Blacksmithing.....	989	982	7
Locksmithing.....	2,075	2,062	13
Spinning.....	1,148	459	689
Weaving.....	2,199	1,057	1,142
Knitting.....	426	143	283
Embroidering.....	382	160	222
Lace making.....	183	59	124
Paper and pasteboard work.....	232	108	124
Cabinetmaking.....	2,107	2,078	29
Bakery.....	1,919	1,803	116
Butchery.....	988	947	41
Tobacco-factory work.....	792	333	459
Plain sewing.....	1,223	1,223
Tailoring.....	2,156	1,729	427
Shoemaking.....	2,026	1,962	64
Bricklaying.....	2,272	2,152	120

We add to this list a few other items: There were working in smelting works 211 boys, 30 girls; in coal mines, 62 girls; in stone cutting, 28 girls; in glass works, 225 boys, 46 girls; in precious metals, 244 boys, 220 girls; in iron foundries, 181 boys, 15 girls; in cutlery shops, 119 boys, 12 girls; in machine manufactories, 457 boys, 35 girls; in rubber goods, 24 boys, 9 girls; in bookbinding, 267 boys, 105 girls; in flour mills, 371 boys, 14 girls; in breweries, 196 boys, 10 girls; in distilleries, 34 boys, 8 girls; in carpentering, 599 boys, 18 girls.

These figures are anything but encouraging for education at the close of the nineteenth century. Under normal conditions children receive only a moderate amount of instruction at elementary schools, and yet a large number are withdrawn before they have attained their fourteenth year. There are 3,449 not 14 years old who are already apprenticed to some trade. Moreover, the figures given in the census returns (see table on p. 816) are minimal, a significance the report itself specifies, and principal callings only are considered.

For the sake of completeness, we mention a number of conspicuous occupations in trade, commerce, public service, shows, music, and theater. They serve to illustrate the term "minimal numbers" used in the report.

Class.	Occupations.	Children under 14 years.

E 8.....	Music, theaters, shows.....	467	62	529

To C 5 may be added the fact that in one express office of a Berlin suburb alone 36 children are employed. C 20 may be supplemented by saying that thousands of children are employed thus during part of the day. In cases falling under E 8 the so-called "higher interests of art" play an important part. In "Archives for Social Legislation and Statistics" it has been proved recently that the diminution of child

labor in factories is no proof of the diminution of child labor in general. As far as industry is concerned, it means only the opening of other fields for child labor. But even though, as has often been statistically demonstrated, the exploitation of children prevails to a greater extent in home industry than in factories, no philanthropist would desire a return to former customs which were obviated by legal enactment. The suppression of child labor in factories has been a great blessing. There only remains to take the next logical step—that is, to extend the blessings of the law to supervision of home industry. The benefits of the protective imperial labor law would be jeopardized if the present conditions are allowed to remain unchanged. If the imperial law prohibiting child labor in factories had not been passed, there would be engaged to-day in factories at least 40,000 children of school age. According to the reports of the boards of trade in Prussia, there were thus engaged in 1886, 21,053; in 1888, 22,913; in 1890, 27,485; in 1892 (the date of the passage of the law), 11,212; in 1895, 4,327; in 1896, 5,312. The last figure again shows an increase.

Moreover, trade statistics and the reports of inspectors give no representation of the actual extent of child labor. A large number of occupations are not mentioned at all, and others are only treated summarily in the official tables. Moreover, age, amount of work done, the necessity or uselessness of the occupation, and its influence on health, morals, and school life are specified within the narrowest limits, whereas the study of details is absolutely indispensable for remedying the existing evils.

The author has examined the subject uninterruptedly since 1894, and has collected facts concerning 3,267 boys. Carefully prepared special tables show results from which the following are taken:

Among 3,267 boys, 600 earned money by doing regular work. Of these, 121 were bread carriers, 63 newsboys, 104 bowling-alley boys (a large number in Berlin), 62 errand boys, 24 worked in factories and workshops (in abattoirs, tobacco, button, whip, and pen factories), 56 were cloth binders, and 170 were polishers, weavers, tin and rag gatherers, carousal (merry-go-round) boys, waiters, beer tappers, milk boys, and peddlers.

A classification of these boys by grade shows the following:

	Upper grades.	Middle grades.	Lower grades.
Bakers' boys.....	67	41	13
Newsboys.....	18	27	18
Bowling-alley boys.....	43	35	23
Errand boys.....	23	32	7
Boys in factories and workshops.....	8	11	5
Cloth binders.....	20	23	13
Others.....	33	84	56

Of 357 children belonging to the first or highest grade in school there were 104 wage-earning (29.13 per cent).

Of 405 children of grade II there were 108 (26.66 per cent).

Of 600 children of grade III there were 131 (21.83 per cent).

Of 580 children of grade IV there were 122 (21.03 per cent).

Of 664 children of grade V there were 119 (17.92 per cent).

Of 661 children of grade VI there were 16 (2.42 per cent).

Or 27.82 per cent in the two upper grades, 21.44 in the two middle grades, and 10.17 in the two lower grades.

Of the 600 wage-earning pupils there were: Orphans, 7 ($1\frac{1}{8}$ per cent); half orphans, 68 ($11\frac{1}{3}$ per cent); those whose parents were living, 525 ($87\frac{1}{2}$ per cent).

Compared in age with others the wage-earning children were as follows: In grade II, 76 out of 108 (70.36 per cent) were older; in the middle grades, 113 out of 253 (44.84 per cent) were older; in the lower grades 50 out of 135 (37.03 per cent) were older than the average pupil of their classes.

The bakers' boys worked summer and winter from 3.30 to 6.30 in the morning on week days; on Sundays the working hours were increased to five (cleaning tins, etc.). Newsboys worked four hours daily; a shorter time on Monday. Bowling-alley boys were engaged until 10 and 12 o'clock at night, and sometimes even till 3 in the morning. Cloth binders were especially overworked during the busy season. Flower venders, pretzel peddlers, shooting-gallery boys, and waiter boys work until midnight. The working hours of factory hands are not always regular. The wages of bakers' boys vary between 2 and 6 marks a month (50 cents to \$1.50), inclusive of breakfast. Newsboys are, in part, assistants of their parents, otherwise their wages average 4 to 4½ marks a month (\$1 to \$1.12). Milk boys get 2 to 3 marks (50 to 75 cents). Bowling-alley boys 5 cents an hour, besides tips, and 1 cent extra "for all nine."¹ Cloth binders receive between 6 and 16 or 30 cents, or 1½ cents an hour or per dozen, according to size. The selling of flowers pays especially well.

Through continued agitation in the educational press, conditions have been improved in about thirty cities and in some rural districts. The teachers of Pomerania in particular have shown a most active interest. The provincial authorities of Potsdam supplemented the teachers' investigations with official inquiries, the results of which have not been published as yet. A comprehensive order addressed to the city authorities and school inspectors, however, may be accepted as an indorsement of the teachers' work. Dr. Jacusiel so considered it, and made the author's treatise in the report the subject of a special discussion. He writes, using the words of the governmental order, as follows: "In some of the principal districts of Berlin 1,013 out of 11,440 school children were employed in trades; 898 of them worked more than four hours; 283 began to work before 6 o'clock in the morning; 205 worked after 9 o'clock at night, and 642 on Sundays." After mentioning the kinds of occupation, he says that "the usefulness of some light occupation, especially in the open air, is demonstrated; but in view of the harm so frequently done to physical, mental, and moral growth by child labor, all branches of such labor must be dealt with according to law." The various authorities were admonished by him also to take a deep interest in opposing the employment of school children in trades.

The attention given by teachers to the subject was an encouraging sign. The executive committee of the National Teachers' Association of Germany proposed the theme for discussion. Fruitful work among the local and provincial associations led to the introduction of investigations made by the bureau of statistics in large cities, as, for instance, in Breslau, Dresden, Charlottenburg-Berlin, Stettin. Mr. Fechner, in Berlin, who read a paper on child labor before the national teachers' union at Breslau, has since then published the following facts: "In cities and elsewhere where child labor in trades, shops, or home industries is in vogue, 233,500 pupils have been questioned. Of these about 30,500 were wage-earning—that is to say, 13 per cent. If we include Berlin, 423,500 school children have been questioned, of whom about 56,000 worked for wages. The ratio is the same. That the investigations are confined more to rural districts proves that rural and industrial occupations are often so closely combined that separation is difficult. The summaries show that 25 per cent or 9,246 of 35,573 children were employed in labor." Altogether, 646,173 were questioned, including those counted by Fechner; of these 83,500, or full 12.9 per cent, worked. In the rural districts the ratio rose to 25 per cent. The most distressing conditions prevail in factory or industrial cities, and in provinces in which home industry is frequent.² In Mülhausen the ratio was 25 per cent; in Altenburg, 33.6 per cent; in Schmölln and Hohenstein-Ernstthal, 60 per cent.

¹ European bowling alleys have 9 pins. The falling of all nine at one stroke occurs more seldom than in this country where 10 pins are used.—Tr.

² The term "home industry" needs an explanation. The Germans mean by it weaving or other manufactures for which the workmen own their own tools, such as looms, and for which they work by the piece at home. Every member of the family able to aid is called upon to take part in the work. Hence, the great number of children engaged in home industry after school hours.

The city bureaus of statistics of Charlottenburg-Berlin and Dresden give by far the most complete reports on actual extent of child labor; on the kinds and duration of occupation; on the ages of children working for wages; the uselessness or necessity of the occupation; the conditions of labor, whether at home or among strangers, etc.

A copy of the scheme of inquiry recently instituted by the imperial chancellor, Prince von Hohenlohe, is here given to show its simplicity. Its purpose is outlined in the introduction: "The purpose is to ascertain the extent and degree to which school children are employed in trades, shops, and industries."

KINGDOM OF PRUSSIA.

Questions covering the occupation of wage-earning school children during the month of February, 1898.

(1) Place of school { City
Rural district. } in County ———

(2) Kind of school.

(3) Number of grades in school.

(4) Number of classes in school.

(5) Class and grade for which the statements are made.

(In ungraded schools questions 3 and 4 are left blank.)

(6) Number of boys ———. Number of girls ———.

(7) Number of boys ——— and girls ——— who were earning wages in February, 1898.

State exactly the nature of the occupation.	Total wage-earning.		Of these worked more than 3 hours a day.		On how many days a week more than 3 hours a day.	
	Boys.	Girls.	Boys.	Girls.	Boys.	Girls.
(For the convenience of the teacher a large number of occupations were named.)						

Place and date.

Signature of the class teacher.

The statistics published by the imperial statistical bureau, based on the census of 1895 (see table on p. 816) unfortunately cover only a modest fraction of child labor, and the sum total of 214,954 children found by the enumerators to be wage-earning does not nearly express the real facts.

In taking up the results of the teachers' inquiry much better information is gleaned. Their labors have proved that children are employed to a deplorable extent in agriculture and industry, and that child labor conceals great dangers (*a*) when the strength of children is overtasked, or they are called upon to work at too early an age; (*b*) when play time and night and Sunday rest are too much shortened; (*c*) when they are exposed to the inclemencies of the weather; (*d*), in addition to (*a*) and (*b*), when they are kept in close confinement. All this has reference to physical injury only. But they proved that also the most pernicious moral injuries threaten and often occur: (*a*) Among cattle tenders, bowling-alley boys and girls, peddlers (whether at fixed points or on the street), butchers, and ballet girls; (*b*) moreover, when the labor is performed (1) without intelligent supervision, (2) without proper separation of the sexes, (3) without parents' control of the wages, (4) when adults utterly disregard decency in conversation and deportment; (*c*) when young cattle-tenders are obliged to sleep with servants. Injuries of this kind are often manifested by disregard of authority, the dangers of precocity, sensuality, and brutality. Teachers have also brought to light the direct detriment to school life as manifested by (*a*) inertia and dullness during lessons; (*b*) decreased diligence at home, and hurried, slovenly written work; (*c*) frequent tardiness; (*d*) absence from school; (*e*) conspicuously irregular promotion; (*f*) lack of progress of a whole class which contains many wage-earning children. We quote the following figures relative to children who were

obliged to deliver breakfasts in Charlottenberg. The results apply to the winter months only.

	Boys.	Girls.
Children carrying breakfast—		
Before 4 o'clock a. m.	20
Between 4 and 4.30	85	10
Between 4.30 and 5.....	65	11
Between 5 and 5.30.....	88	11
Between 5.30 and 6.....	41	24
About 6 and later.....	50	23
Total.....	349	79

Of these children 104 were not 10 years old, 147 were between 10 and 12, and the others over 12 years old.

In Dresden it was found that 1,282 wage-earning children were between 6 and 11 years old. In Liegnitz 445—that is, 36 per cent of all the wage-earning children—were under 10 years of age. In Altenburg 33 per cent of the wage-earning children belong to the lowest grades in school. Halle numbers 40 per cent under 10 years, and as many as 56 per cent engaged in home industry.

If in the discussion of this subject there is to be found a ray of light, it might be looked for in the afternoon occupations; but the following figures disappoint us: In Charlottenburg the older boys worked longest, but 72.1 per cent even of the boys, between 12 and 14 years of age, worked six hours and more after school hours. Worse even than that is the fact that a number of boys are occupied between 8 o'clock and midnight. In Brunswick 1,625 (or 88 per cent) of the wage-earning children work after school hours; of these 436 (27 per cent) work between 8 and 10 p. m.; with 111 (7 per cent) working hours extend beyond 10 o'clock. Bowling-alley boys especially are engaged at night; in Mühlhausen 13 work after 10 o'clock; 3 work until 12 and sometimes later; in Charlottenburg 9 work after midnight, and 9 from 10 till midnight; 86 per cent of these boys, then, worked after 10 o'clock, and if the working hours are the same in all places, as we have the right to believe, Rixdorf, a suburb of Berlin, having 101 bowling-alley boys, must have about 86 who are obliged to walk home after midnight, some as far as to Berlin.

The teachers in their investigations found large numbers of children who are compelled to work before school hours till they are physically tired; at school they are confined to mental application for 3 to 5 hours. Not a few are also employed during the noon intermission and again in the afternoon till late at night. In view of these conditions the appointment of school physicians seems advisable, though there are teachers who maintain that many physicians are not thoroughly acquainted with the subject of school hygiene. The publication of the results of medical examinations of working children would offer astonishing disclosures. An insufficient amount of sleep retards growth, weakens the power of resistance against the influence of disease, creates predisposition to illness, and favors the development of hereditary weakness. Even though the actual sickness be not the outcome, the constitution is always weakened.

Rev. Mr. Schönberger (Berlin) in his report to the synod brings out the moral dangers in a strong light. He shows that out of each 100 youthful convicts in the penal institution at Plötzensee, near Berlin, 70 had worked during their school term as bowling-alley boys, breakfast carriers, and newsboys. Fechner (Berlin) states that in pursuance of official inquiries bakers have testified that they could not send out apprentices to deliver breakfast orders on account of the moral dangers to which they would be exposed, hence they employ children under 12 years of age, presuming that they are safe. Bowling-alley boys learn to know the taste of spiritous drinks

very soon, and, surely, peddling, shows, ballets, etc., are dangerous schools. If a child's character is to be poisoned, then the "higher interests of art" are hard to understand.

There is much complaint about children's utter disregard for authority. We are dealing with one of its causes. Work at too early an age makes children too independent. They aid in supporting the family, manage their own pocket money, and can not be controlled. In the course of one teacher's investigations he learned of the existence of a "club," the members of which were very well posted on questionable localities; and they told of their knowledge with a candor that was deplorable. If, after they are dismissed from school, all authoritative influence ceases, the result is utter disregard of all authority.

Indolence, too, is noticeable. The teachers who have kept an eye on such children after they had left school have observed that bowling-alley boys who have received high wages are never disposed to become apprentices in workshops. Girls, too, who have worked among strangers for wages, enter factories after they have been confirmed in church. Often they have been overworked in domestic service, and hence do not choose that kind of work when free from attending school. These young girls are replacing adult home servants and nurses. In Charlottenburg alone 61 girls of school age were compelled to work 40 to 50 hours, 24 even 50 to 60 hours, and 4 as many as 60 hours and over (one 72 hours) a week. Sad as this may be, the facts are vouched for. One can hardly blame girls for losing their taste for work in private families.

Children working in the country for wages are likewise exposed to moral dangers. This has been proved beyond contradiction by 58 reports of teachers who investigated conditions in the province of Pomerania. In 3,275 cases this was found to be beyond doubt; in 312 to 653 cases a doubt was justifiable.

The figures that relate to the harm done to school life are even more discouraging. The statistics of Hanover (teacher Garlee) show 13 per cent (141) of wage-earning boys unsatisfactory in diligence and attention; 15 per cent (167) lazy, inattentive, and sleepy. Among the girls the conditions of the highest class were worse (21 per cent); of the second class, similar to those in boys' schools. Home lessons were poorly performed by 286 (26 per cent) boys and 32 per cent girls, 6 per cent of both sexes bringing worthless work. The progress in study of "almost one-half of the wage-earning pupils is below normal." The statistics of industrial districts show a still more deplorable condition of affairs. Wherever there is a large number of working pupils the evils mentioned exist. The promotion in school of wage-earning children in Rixdorf (near Berlin) is very irregular; only 70 per cent of grade II, 50 per cent of Grades III and IV, 57 per cent of Grades V and VI were promoted at the close of the year 1897. Reports from Halle, Gera, and Mühlhausen record similar facts.

The questions sent out from the imperial chancellory are to include all children employed in any industrial pursuit, but not those earning wages in agriculture, horticulture, fruit and wine culture, or domestic service. It is not apparent why these are excluded, since individual investigations have revealed the fact that fully three and one-half times as many children under 14 years of age work in rural pursuits.

No one will doubt the wisdom of the following words of the imperial authorities: "From consideration of health, the employment of children for light work in gardening and agriculture, at which their strength is not overtaxed and during which they enjoy physical exercise in the open air, is not only permissible but useful and desirable." But, on the other hand, a proclamation of the governor of the province of Silesia deserves equal attention: "It is most desirable that the school authorities and teachers relax the demands of school duties in the interests of our home industry (culture of sugar beets) as far as possible and compatible with undisturbed progress in school studies. The employment of school children must not be

abused. Proper supervision should be instituted to protect these children against moral dangers. Compelling them to work on Sunday and distributing brandy among them can not be allowed under any circumstances. If laxity in the observance of the law in any direction or abuses are noticed, the government will regret to be obliged to draw limitations or revoke its concession of employing child labor. I therefore beg the local commissioners (Landräthe), in the interest of both agriculture and public education, to earnestly oppose existing evils and to aim at suppressing them."

No German state government legislated against the evils connected with tending of flocks and herds until they were so glaring that measures became urgent. Such measures are now necessary in southern and eastern Germany, where, through the agency of a special society (Young Flock and Herd Tenders' Association, Tyrol), 290 children were imported in 1897 from Tyrol, Austria. For the sake of 34 florins, on an average, they were taken from their families and sent to Baden. Complaint is even made that the law of compulsory school attendance applies to them as well as to native children.

But even where no such associations exist conditions are bad enough. The state of affairs seems to be particularly bad in the province of Posen. At the provincial teachers' meeting of 1897 it was stated that the school of Pomykowo (Lissa Co.) numbered 65 pupils, of whom 32 were employed in work at home and 12 by strangers. The other 21 were still too small to work. Thirty-eight children, including 13 girls, tended cattle; the others worked in the fields from 4 a. m. till school time, again during the noon intermission, and from the close of the school session till dark. The flock and herd tenders receive no wages but clothing, and the field workers 15 to 20 marks (\$4 to \$5) a year.

Another teacher reported: "Only 2 out of a class of 55 do no farm labor; 20 are employed by strangers. Of these 2 were 6 years, 1 was 7 years, 2 were 8 years, and 3 were 9 years old. Those over 10 years are usually hired out to strangers." On one estate children receive 25 to 40 pfennigs (6½ to 10 cents) a day for working from 6 till 10 a. m.

When such facts are compared with the words above quoted from the imperial order, and with the attacks on elementary schools by the conservative party in the Diet of Prussia, or with the numerous demands to exempt children from school attendance during the summer term, the increase of holidays, the introduction of half-day schools to meet the want of labor, and when the new law of Weimar and the old protective law of Anhalt are considered, the friends of popular education begin to be apprehensive. An economist of high repute spoke against the protective regulation in force in Anhalt, hence it is well to quote it in full:

"Children must be 8 years of age before they can be called upon to do a full day's work; under that age, they may be engaged for only half or two-thirds of a day. As soon as the number of workers in any place exceeds 25, the sexes should be separated and sent to work under supervision. Children at work should be separated according to both age and sex. Their working hours are to be from 6 o'clock in the morning till 6 o'clock in the evening, with two hours' recreation at dinner. If the children are obliged to walk home, working hours must be so arranged that they may arrive home not later than 8 o'clock. If wagons are used for transport, overcrowding and accidental falling out should be prevented. No work is to be required before morning lessons in school. On hot days employers must provide sufficient drink. Violaters of these rules are to be fined 15 marks."

It is incredible that objections should be raised to such regulations; yet it is done openly in the legislature.

Strange employers engaging children for work require much more of them than parents who use them as assistants at home. Proof of this fact is found in the foregoing statements as to time of labor. Employers want work for their money, and

this applies especially to a large number of children who are employed in domestic service. The statistics gathered in Charlottenburg are eloquent on this subject. The efforts of teachers who make the inquiries are frequently opposed by those who employ children, especially by bakers. In Berlin the motion was made by some confectioners to employ only adults to deliver breakfasts, and to charge the customer a small fee for service, but it has never gone into effect. In Spandau bakers protested, as also in Mühlhausen and Hamburg.

The objections noted above lead to the consideration of the attitude of State and district authorities toward the subject. Several communities, as Hamburg, Stettin, Luckenwalde, Heppenheim, Giessen, Dresden, Reinickendorf, Mühlhausen, and Spandau, have endeavored to suppress the worst abuses by means of police regulations. In Hamburg the Hanseatic superior court declared such a regulation contrary to law; but in a similar case in Mühlhausen the Imperial supreme court decided the contrary as in harmony with the police law, according to which city authorities have the right to enforce regulations for the protection of health and morals. This decision of the highest court of the Empire has prompted the minister of education and the minister of the interior to recommend cities to establish similar regulations. Finally, after lengthy consideration, Berlin, which was in this respect far behind its suburbs and other cities, decided that children under 9 years of age should not be employed, nor older ones between the hours of 8 p. m. and 6 a. m. Heretofore the suburbs have always referred to Berlin as the place where such regulations were most necessary, and now the city has reversed the case. At all events, the regulations for Berlin were first proposed by the school committee of the city council and framed by a joint committee of school and police authorities.

During the last two years the subject has been discussed in associations, such as the Woman's Union, the Society Against Ill-Treatment and Abuse of Children, and the Society for the Hygienic Education of Youth; in socialistic clubs and in political party meetings. Friends of humanity have not allowed the subject to drop out of sight.

In conclusion, it may be mentioned that during the winter of 1898-99 city school inspector, Dr. Zwick, of Berlin, opportunely referred in the Reichstag to the crying evils during the discussion of a bill for protection of trades, and he proposed a number of beneficial measures. The question is happily not a party issue. Meanwhile, all interested in it must await the result of the official inquiry.

Radical measures are expected for the protection of laboring children. Statistics, which have revealed with such brutal frankness the oppression practiced upon children of school age, is silent on the number of children under 6 years who are forced to work for wages. Police regulations alone are inadequate; still, they are better than nothing at all. The differences apparent in the State and the provincial laws prove the necessity of Imperial legislation. Money is likewise needed for the support of indigent children and mothers. Help must be solicited.

Moreover, the citizens have a duty in the premises: All should take an interest in the question and rescue children from being torn away from childhood before they have learned to know it.

VII. MEDICAL INSPECTION OF SCHOOLS IN GERMANY.

The medical inspection of schools, which of late years has engaged the attention of the public, and particularly of educators and physicians, has gained a firmer basis for advancement in Germany in consequence of the definite attitude of the Prussian minister of worship, education, and medical affairs. Opinions for and against medical inspec-

tion have been expressed. Educators in general opposed it because of the extensive demands of some physicians and hygiene specialists. If these extreme demands were granted the inspections, periodical and regular, would infringe upon the functions of teachers and seriously imperil the orderly procedure of schools. Many justifiable requirements could be satisfied as easily by teachers, properly trained, as by physicians. Physicians generally favor the plan, because with them it involves both pecuniary gain and professional authority. Lately the contention has lost some of its acerbity, but it has not come to an end.

In this conflict of opinions the experience gained under conditions existing in the city of Wiesbaden seems to offer a solution. To study these conditions the Prussian minister of education sent two of his councilors, Mr. Brandi, of the division of schools, and Dr. Schmidtman, of the division of medicine, to Wiesbaden, and forwarded their reports to all State school officers located at the capitals of the provinces, and also to the provincial school board of Berlin. The following statements are based upon Dr. Schmidtman's report, published in German in the *Medicine and Hygiene Quarterly*.

In the spring of 1895 about 7,000 pupils of the city public schools—that is, practically all the children of school age—were subjected to a medical examination by order of the city council of Wiesbaden. The result proved that 25 per cent were sick, physically defective, or suffering even from contagious diseases. This one examination showed the practical significance of medical inspection for the health and the education of children, as well as for the interests of school authorities. In proper appreciation of this result, and in pursuance of the proposition made by Councilman Kalle, whose opinion on this subject is especially worthy of consideration, the city, by way of experiment, in 1896 appointed four temporary medical inspectors of schools. Their duties as fixed by law comprised—

(1) The examination of all new pupils who failed to furnish a medical report on their physical condition.

(2) The keeping of a medical chart or record for fourteen days for every child not in health.

(3) A medical consultation hour in every school, with

(4) Examination and inspection of class rooms with respect to furniture, light, ventilation, heating, cleanliness, etc.

(5) Brief lectures to teachers on questions concerning the health of children.

Each physician received \$150 a year for these services. The favorable result of this preliminary arrangement has led to the permanent appointment of six medical inspectors. The health certificate given to every newly admitted pupil mentions, besides name, residence, vaccination, etc., the following points: General build, height, weight (each school has apparatus for measuring and weighing), chest measure, con-

dition of chest and stomach, skin diseases, measurement of spine and limbs, eye and strength of vision, ears and hearing, mouth, nose, and speech, special remarks and propositions for treatment in school, remarks for parents, observations of teachers.

The medical inspectors have pronounced 7.6 per cent of the children afflicted with pronounced or incipient curvature of the spine; 9 per cent predisposed to rupture, not noticed until their examination; and 13.6 per cent suffering from eye and ear complaints, etc. These facts are a protest against the customary assertions that these complaints are brought on by attendance at school. Regular examinations promise to prevent the introduction of infection and disease germs into schools. Hence the appointment of medical inspectors is evidently a generally useful measure.

In 1895 as many as 45.7 per cent of 6,949 children were well built, in contradistinction to 45.6 per cent of somewhat defective build and 8.7 per cent of bad physical formation. These figures prove that the children of the poorer parents are inadequately fed. The warm breakfast of oatmeal and bread supplied from voluntary contributions and distributed from December till March, in the public schools of Wiesbaden, meets a positive necessity.

Experience in that city has not substantiated the objections raised against medical inspectors. Teachers recognize that the action of these officials promotes educational ends without interfering with order, and the interest of teachers in behalf of the health of children has grown more active. Dr. Schmidtman, from whose reports these facts are gleaned, considers the way clear for the combined action and mutual support of teachers and physicians in behalf of schools and the civilization dependent upon them.

The Prussian minister of education, Dr. Bosse, therefore addressed an order to the various provincial governments, regarding the introduction of regular medical examinations and the inspection of all educational institutions. It reads in part as follows:

“Medical inspection in the schools of Wiesbaden has proved that many infirmities, diseases, and predisposition to disease are found in children of large cities before their entrance into school, which after subsequent recognition are erroneously attributed to attendance at school, and which, moreover, imperil the health of other pupils. It is of interest to learn the state of health of children in rural districts by means of the medical examination of a large number of children who either have been just admitted to school, or have attended some time, so that it may be judged from the facts deduced whether permanent medical inspection be necessary in rural schools, and to what extent. The provincial school authorities are therefore ordered to select about six schools in each county (Regierungs-Bezirk), where children about to be admitted, chosen from various grades of the population as far as

practicable, shall be examined by the health officer, assisted by the local school inspector and teacher, to ascertain whether they may be admitted without danger to other pupils, and whether they can attend all or some of the classes (this refers to dispensation from gymnastic exercises, etc.) without prejudice to their physical development. In regard to the first point, the investigation should cover infectious and contagious diseases, especially scarlet fever, measles, whooping cough, and diphtheria. With regard to the second point, the general build, mental development, constitutional diseases, and physical infirmities should be considered.

“The inspection of class rooms from a hygienic standpoint is likewise required, and the following points are to be considered: Number of children, capacity of rooms, cleanliness, natural and artificial light, window shades, temperature, ventilation and heating, condition of the air, seats and desks and other furniture. The inspection of school-houses includes that of grounds, in regard to drinking water, drainage, and vicinity of factories.”

According to the opinions of the educational press in Berlin, the medical inspector is welcome as a physician. School hygiene, however, is not so much a subject of medicine as of pedagogy. Of course, teachers at both universities and normal schools require a better preparation in hygiene than heretofore. If official physicians as such had a seat and vote in the local school boards all reasonable demands would be met, and not a single physician should assume the right of tutelage over schools and teachers, as the clergymen have heretofore done in their official capacity as local school inspectors. It is that which the teachers fear and, as the Berlin journals urge, not without reason.

VIII. SECONDARY EDUCATION AS VIEWED BY SCIENTISTS IN GERMANY.

The *Münchener Allgemeine Zeitung* (General Gazette of Munich) recently reported upon the subject of secondary education at length, and since the opinions of important German scientists are quoted, it is deemed of sufficient interest to American educators to publish the article in English. The reporter of the Gazette is Prof. L. Fleischner, of Budweis, Bohemia, Austria. The occasion for this symposium of opinions was the seventieth annual convention of German scientists and physicians at Düsseldorf, in Rhenish Prussia. The following is the report:

That educational questions are proposed for discussion and argued at almost every meeting of scientific men is an encouraging sign of the increased appreciation of their importance. It is not surprising, therefore, that among the many papers read at the seventieth conven-

tion of German scientists and physicians, held at Düsseldorf in September, 1899, there were some of vital interest to educators and the general public, for the reason that they gave a clear idea of the strong undercurrents in education which in no far distant future will reach the surface.

That many of these topics had been amply discussed and most carefully considered before—that is, at the December conference in Berlin, called together by Emperor Wilhelm eight years previous—is not unworthy of note. The fact that secondary schools do not attain their desired end because of faulty organization, bad methods, or too extended or restricted a curriculum had no weight whatever in calling that December conference. Considerations altogether foreign to schools and their functions led to the assembling of those forty-four trustworthy men of different stations and vocations. As the invitation read, they were to meet “for consultation on a number of important questions affecting the secondary schools of Prussia.” In his cabinet order of May 1, 1890, the Emperor, in his capacity as King of Prussia, had already expressed the purpose “to make the various grades of schools useful in resisting the expansion of socialistic and communistic views;” consequently to make it their business to oppose social democracy. Nevertheless, purely didactic questions, proposed by the minister of education, were also considered at this conference. To these the Emperor added seven others referring to school hygiene, course of study, methods of teaching, and mental overtaxing, which were of the same tenor as those discussed in Düsseldorf. However, the members of this later convention did not confine themselves to conditions in Prussia or in Germany.

In Austria two questions of school reform are being much agitated. An inquiry started by the Vienna weekly, *Die Wage* (The Balance), a year ago, gave a number of well-known educators an opportunity of expressing their views on the reform of secondary schools.¹ These opinions were collected and published in pamphlet form. They referred to the same questions that were debated in Düsseldorf, and the learned men at Vienna arrived at the same conclusion as the German scientists. The chief fault of the gymnasium (the classical high school) was thought to be inadequate object lessons, leaving the graduate deficient in observation. Some complained of burdening the pupils with the study of Greek, while Latin was generally considered necessary, still it was maintained by some that English and French should be substituted for the dead languages. Mention was also made of laying too much stress upon memorizing in these classical schools, thereby neglecting other powers of the mind. The education offered in the realistic high school (*Realschulen*) was considered a sufficient preparation for tech-

¹ “Was leistet die Mittelschule?” (What does the secondary school accomplish?) Published by the editor of *Die Wage*, Vienna, 1898.

nology, but these schools, it was claimed, ought to offer a general education of a higher order than at present. All agreed, however, upon a uniform secondary school with a six-years' course, and this proposition received marked approval in the convention.

If we turn our attention from these general statements of school reforms considered in the past to the different papers read at Düsseldorf, we shall find, as has already been remarked, that the same questions were there debated as in Berlin, 1890, and in Vienna, 1897. The movement toward a comprehensive school reform which, like all great modern events, will one day be regulated by international agreement is not coming to a standstill; ceaseless agitation is one of its characteristics; the indifference that once prevailed has been effectually supplanted by an active interest dominating all spheres of society.

The paper of Professor Klein, of Göttingen, on "Universities and Polytechnic Institutes," deserves first mention. The lecturer voiced the demand of the Polytechnic Institutes for more stringent conditions of admission, as well as for greater assistance from the State in the establishment of secondary technical schools, so-called preparatory schools. He spoke further of a possible union of both, the university and the polytechnicum, but at the same time, he advised representatives of universities to strive to avert a disruption of higher education which is threatened by the antithesis of theory and practice. As the development of polytechnic institutes necessitates their adopting some university arrangements in their organization and management, so the universities in turn should not be idle spectators of the progress in the engineering arts.

Professor Klein joined his arguments, in a certain sense, to those expressed by Professor Riedler in a book entitled "Our Universities and the Demands of the Twentieth Century."¹ This book had only been published shortly before, and had excited much comment on account of its bold attack on several evils existing in the system of higher and secondary education of German. (A briefer statement of his views published in the educational press was presented in the Annual Report of the Commissioner of Education of the year 1897-98, pp. 216-222.) In his estimation, those educational factors should be considered in the preparatory schools which can no longer be ignored in modern civilization, and these reforms are desirable, because the coming century will be one of economics, and in that field higher problems than ever before will confront the nations. Both, Riedler and Klein, refer to the defective connection between universities and practical life, as well as to the circumstance that these highest exponents of education pay too little attention to economic questions of the day.

¹"Unsere Hochschulen und die Anforderungen des 20. Jahrhunderts." A. Riedler, Geh. Regierungsrath und professor. 4. Auflage, Berlin, 1898.

At the close of the century, he asks the justifiable question: How must the highest educational institutions be planned in order to meet the demands of the future? His remarks, it is true, sound like a eulogium on polytechnic institutes since these fit their students for practical industrial pursuits without neglecting scientific investigation. His opinion is, that universities will be obliged to replace their tendency to specialization by instruction which grasps more of the totality of knowledge. To bring about a closer relationship between both groups of institutions, Riedler would rearrange the faculties into faculty of arts and faculty of technology. In the polytechnic institutes a corresponding arrangement would be necessary, but an improvement in the department of general culture would at first suffice. Representatives of polytechnic institutes should, however, strenuously oppose a mere annexation of technological sciences to the curriculum of universities, as the influence of their own schools would thereby suffer, and the studies themselves come to naught. Riedler, in conclusion, proposes plans of effecting these reforms, to pave the way for equal rights for the institutions of whose equal merit he is convinced.

The other papers of a pedagogical tendency read at the convention of scientists treated under different titles one and the same subject: "Mental overtaking in high schools." Whether the discussion be of "classical or realistic high schools with reference to overburdening;" or of "cause and prevention of nervousness in pupils of secondary schools;" or of "changes in the organization of high schools to relieve mental overtaking;" or, finally, of "measuring mental capacity and fatigue," the tenor of all is dissatisfaction in regard to the tasks imposed upon pupils. Articles upon articles and many books have, likewise, been written on these subjects. From the many, one may be selected¹ in which the author discusses this question in connection with the reforms instituted in the northern countries, and openly censures the faults that cling to the German educational system even after the December conference in Berlin. Equipped with a complete knowledge of the subject, he demonstrates that the customary terms, "general education" and "learned education" (*allgemeine und gelehrte Bildung*), are no longer synonymous. In his opinion, the pupils of secondary schools may be divided into three groups. To the first belong those who already in the lower grades show their inability to meet the requirements of the school; they drop out very soon. Those in the second group attend two or three years longer before entering upon practical life. Comparatively few finish the course and are graduated; and many among these enter upon practical life without attending higher institutions of learning. "Only a

¹ "Schulreformen und Schulreformbestrebungen in den Skandinavischen Ländern." W. Wetekamp, Oberlehrer am Realgymnasium zu Breslau. Breslau, 1897.

school which takes these facts into consideration can attain its object of being a preparatory school for life, and such is the reformed school."

The author proceeds to describe this reformed school as it exists in Scandinavian countries. In Norway the high school consists of an intermediate school with six grades and a gymnasium with a three years' course, one branch of which is devoted to the humanities, the other to natural science and mathematics. In Denmark the course is divided into one of four years, upon which a two years' higher course follows, devoted to either the classics or to natural sciences including mathematics. In Sweden three lower grades form a general uniform foundation for all secondary schools; in the fourth grade only pupils are allowed an option in Latin or English and drawing. (Note.—It must be understood that all these secondary schools build upon a foundation of elementary education lasting four years or more, i. e., from the sixth to the tenth or eleventh year of age.) Wetekamp also mentions the tedious discussions provoked in the legislative bodies of the countries mentioned by school reforms, as well as the report of the commission that declared the proper beginning for improving instruction to be found in "adapting it to the susceptibility of the juvenile age and in considering the aims and means of school education from the standpoint of the boys' needs and aspirations." Concentration he thinks necessary with respect to the number of studies, but more even with respect to their subject-matter. From the illustrations the author deduces that throughout Scandinavia there is no indication of turning aside from the path of reform adopted years past—that is to say, to begin Latin and Greek earlier; on the contrary, the general desire is to continue within present lines until a new, modern, uniform school is formed out of the present multiplicity of schools. Views differ only upon the speediness in the adoption of these reforms. Wetekamp does not doubt that in Germany, too, the dead languages will sooner or later be removed from the lower six grades of the high schools and will not be obligatory in the higher grades. The history of education in all civilized countries so plainly shows a development in this direction that we would have to close our eyes not to see it. He concludes with these words: "When schools are nourished by the life around them, then alone can they fulfill their task of preparing for life. Whether we be in sympathy with the details of their reforms or not we must be grateful to these northern nations if, favored by simpler conditions of life, they take the lead in reform, and gather experiences which we may be able to turn to account."

At the convention in Düsseldorf, prominent speakers also demonstrated the consequences of straining and overtaxing the mind by the present system. These complaints are by no means new; silenced by the pressure of political events, they break forth again with increased vehemence. At the time of the conference in Berlin a great deal had

been written upon the necessity of physical training. Attention need only be called to the valuable works of Preyer, and particularly to his lecture on "A New German School" before the Lette Society in Berlin, February 5, 1890. In this he proposed, among other things, that theoretical instruction (i. e., lessons which employ the intellect only) be confined to morning hours, that afternoon hours be devoted to recreation, and that home lessons and public examinations be omitted. It seems as though he had foreseen what was proved in Düsseldorf eight years later, namely, that one-fourth of the number of pupils are physically below par (*körperlich minderwerthig*); one-tenth the number in the lower grades of intermediate and secondary schools suffer from nervousness, which, with all its attendant effects, increases to an alarming extent in the higher grades, in single cases as high as 60 per cent, whereas 20 per cent are victims of insomnia.

The same speaker further complained of the unnecessarily long working hours, the unsuitable distribution of work over the whole day, and of other evils arising from the fact that "lawyers and philologists compose the boards of trustees, to the exclusion of experts in hygiene." This gives the present writer the desired opportunity of referring to two noteworthy lectures of Dr. Emil Kräpelin, professor of psychiatry in Heidelberg, which he delivered a year ago and again in Düsseldorf. In both papers, entitled "Mental Work" and "Over-taxing the Brain,"¹ the author discusses the question in its connection with mental capacity and the latter's dependence upon food, sleep, and physical exercise. Upon experiments made by professional men he forms conclusions that agree with the requirements set by the convention to make the pupils' burden lighter. After mentioning some pedagogic, didactic, and hygienic circumstances, and quoting the investigations of Leo Burgerstein, of Vienna, who proved that tired children may be forced to sit still and keep silence, but not to be thoroughly attentive, Dr. Kräpelin concludes that with the present extent of instruction "tiresome teachers are a necessity, for if all teachers understood how to awaken and hold an absorbing interest in their lessons, children would be incited to continual mental exertion in spite of fatigue, and the consequences would be disastrous, or, at least, hard to estimate." The necessity of shortening the time of work must be repeatedly emphasized. It is not enough that children help themselves through enervation and consequent lack of interest, since a decrease of susceptibility on the part of the pupils destroys the fruit of instruction, and since continued exertion in spite of fatigue is injurious as a stimulant taken habitually.

The author proposes, in the first place, a shorter period of time for each lesson, as well as a separation of the intellectual work into two

¹ "Ueber geistige Arbeit" und "Zur Ueberbürdungsfrage." Dr. Emil Kräpelin. Jena, Gustav Fischer, 1897.

chief divisions: The morning should be devoted to the greater number and to the more difficult studies; lighter work should fill in the afternoon; home lessons should be limited so as to allow plenty of time for play and sleep. Professor Kräpelin knows perfectly well that his propositions can not be carried into effect without a radical change in present methods and management, and he shows how such a change can be brought about. The general aim of instruction would require consideration, and children would be placed (in the class room) according to their capacity for work, since the different degrees of taxability are about the same among them as among adults. What one group could bear without injury would overtax another group of pupils perhaps not less talented.

In conclusion, he says "That within old lines and in the old form, schools are not able to meet the pressing demands of the future. School education (Unterrichtsbetrieb) has expanded in widely different directions, but the measure is full to overflowing." The same thought was expressed in all the papers read at the convention: Schools must be adapted to changed conditions of life and civilization, for the best conceivable schools grow out of date in the course of time. Mention was likewise made of the system of granting social privileges to high schools, an arrangement which attaches important tangible advantages to certain kinds or grades of knowledge,¹ and whereby boys of mediocre intellect are induced in great number to enter secondary schools. The question was put whether this monopoly had not better be abandoned. It was further urged that efforts be made toward a change, in the sense that all the students should learn the results of intellectual conquests of the past, so that they may come to a lively understanding of the present through their knowledge of the past. This evidently refers to the demand to base every study upon a historical basis, be that astronomy, mathematics, geography, or anything else. The reporter in conclusion says:

All the reforms of a pedagogical nature, advocated at the convention in Düsseldorf, should be received with wise moderation and careful reflection. The proper medium must be adopted, which, setting aside antiquated forms overruled by development in civilization, will meet the true necessities of the times and the nation, in proper measure and with the best suited means, without merely serving an ephemeral utilitarianism directed only by what is latest in vogue. When that idea has once taken root we need have no fear for the German high schools, at least not for such as take a firm stand against superficiality and shallowness by their scientific method and their strong purpose to teach science. Then the question of school reform, at present striking at the roots of all civilization and conditions of life, will be solved, in a sense that we need not say with Heinrich von Treitschke, the historian, "adding a violent breaking with the oldest traditions of education to the mighty commotion of the time."

¹The reporter here refers to the privilege of abbreviating the term of military service by two years, if a certain examination in high schools (at the close the 6th grade or the seventeenth year of age) is passed.

IX. THE GERMAN COMMERCIAL CLERK.

The annual reports of the Commissioner of Education of recent years in their references to Germany have contained a number of statements—statistical, descriptive, and argumentative—concerning governmental efforts in preparing youth for special vocations, for agricultural, industrial, and commercial pursuits. Attempts were made to demonstrate the intimate relation existing between Germany's recent phenomenal progress in industry, technology, and commerce, and the vast system of special schools that base their course of study upon a thorough elementary or secondary education, as the case may be. English publications confirm this view, but English and American visitors to Germany are almost unanimous in saying that the present astonishing expansion of Germany's industrial and commercial activity is not solely the result of these special schools, but is due to a variety of causes. They see as chief cause the consistent general education that was inaugurated by the German States during the eighteenth century, and that has since been carefully supported by compulsory school-attendance laws, so that the whole people has been trained consistently and incessantly. This general education, it is claimed, accustomed the people to regularity and order, to clear thinking and broad views, to patient and painstaking industry, and enabled them to practice what they learned in their occupations in life. A certain mechanical skill and useful habits, accumulated through generations in families and communities, became of eminent use when the era of machine labor began, just as thorough familiarity with geography and the ability to speak foreign languages aided the commercial man when German industry sought foreign markets.

The opinion of many Englishmen is particularly strong upon the present impossibility on their part to compete with the present state of general education in Germany, owing to the length of time it takes to change the national habits. They say: It is impossible to compete with the "German clerk," for instance, or with the thrifty and economical German housekeeper, or with the skillful German factory laborer, who is more than a mere "hand," owing to his home and school training. It is said that the English workman, clerk, or whatever he may be, even though he has received an elementary education, is not the patient, plodding, economical man that the German of like grade is. The same is true of the American. There is a radical difference, it is said, between the Englishman and the German, a difference that can only disappear after a century's school and home training, such as the Germans have had. This is plainly set forth in the following article by Prof. J. J. Findlay, of London, a man who has lived for many years in Germany and is qualified to judge and to

indulge in comparisons, knowing, as he does, the German schoolboys as well as the English.

All this may be true, but there is another reason, not often stated because not so well known, which determined the education and conduct not only of many German boys, but of whole nations. It is the fact that the Germans were a poor people. They were incredibly poor, and the same reason which made the population of our American West so thrifty, industrious, and successful, viz, the poverty and necessary privation of the pioneers, had a like effect in Germany. Under unspeakable hardships the Germans at the beginning of the nineteenth century had to labor to uphold their States and earn a livelihood. In consequence of the Napoleonic wars Germany was thrown into confusion and the people were impoverished. They were poor then, and they remained poor until the year 1871, when an unexpected wealth fell to them, and money flowed through all the channels of intercourse and raised the purchasing power of the people. Industry took an upward start then, and when in the course of time the limits of the purchasing capacity of the German nation were reached, over-production took place, and industry invaded foreign markets. This was the golden time of commerce, and men were ready to meet its demands, men of general culture and linguistic training. On the other hand, the Englishman had for over a century been the trader of the world and the supplier of manufactured goods. He was rich, is rich now, and will be rich as long as his commerce is maintained. Wealth, however, prevented him from fostering the virtues and forming the habits attributed to the Germans. The neglect of establishing a national system of education in England until 1870, of course, must be considered as a weighty error, which is especially weighty in the argument mentioned.

It may be said that the many elementary and secondary special schools in Germany—agricultural, mining, industrial, technological, art, and commercial schools—as well as the innumerable continuation and drawing schools, are rather an *effect* of the enormous expansion of industry and commerce than a *cause*. Few of these schools date their establishment before 1870, and few of their graduates can have had much influence upon the increased wealth-producing activity of Germany. It is reasonable to say that the men who were the originators of that expansion saw the necessity for the future to prepare a generation which can meet the ever-increasing demands life makes upon the individual and the nation. It is precisely the same case as when we see a poor man slave himself and deny himself luxuries in order to enable his children to gain a better education than he received, saying, "My children shall not go through the trouble I went through." Hence it would seem that the argument in favor of a general education is upheld by the facts in the case.

Professor Findlay's article, which follows, appeared in the Fortnightly Review of September, 1899:

There can be little doubt that the country is at last alive to the fact that the doctrine of competition has developed a new phase. Thirty years ago we rejoiced in the competition of goods; we boasted that England could hold her own anywhere with anyone, either in the manufacture of wares or in their exchange; to-day, however, we are confronted with another form of competition—the competition of men with intellect and will power, adapted to fight the battle of to-day, just as our coal and iron were adapted to the earlier phase of competition.

Our opponent in this new war is the German clerk. He assumes many forms and plays many parts, but in one and all of these he steadily makes his way in every country, and in every large city in the world against his English rival. It may be worth while to indicate exactly how he is manufactured so as to fit so precisely the needs of the commercial market. It is all the more necessary to make the inquiry because so many false impressions have got abroad as to the mode by which this valuable article is produced. Thus it is supposed that we can turn out a similar article—an English clerk or commercial traveler—by the simple plan of setting up a school or two and awarding certificates and prizes to the best students. Unluckily for us, the process is not so easily or rapidly accomplished. The fact is that the German clerk, as we have learned to know him since 1880, it has taken about sixty years to produce; and it will take us just about as long to create a homemade article of the same quality, if we care to try and compete in this line.

This sounds discouraging, but it is no use blinking facts. A human machine, be he clerk, mechanic, or plowman, has to be grown and cultivated with at least as much care and patience as Mexican rubber, and he presents obstacles to cultivation which no foresight or skill in organization can overcome. Now the Germans have not, during these sixty years, set themselves purposely to create the invaluable commercial weapon; he is mainly the outcome of tendencies in the life of the people, and these have only in a small degree been assisted from efforts expressly designed by the State and by men of business toward the same end. If, then, we propose to compete, we are bound to have regard not only to those positive measures of minor importance which have been planned with foresight, but to the governing factors in the situation which place our English houses of business at so great a disadvantage. For, although in Germany these factors may have operated unconsciously, it is quite conceivable that we may imitate their methods by design, and in course of time produce a similar result.

There are two leading factors which have been at work during these long years, both contributing to the success of the business world. First, the Germans have developed a liking for culture and books, for an indoor, sedentary life, for intellectual intercourse, which no other country in the world can parallel, except, perhaps, the smaller Teutonic peoples about her, Holland, Norway, Sweden. Now a commercial life is not the ideal outcome of these tastes—your real native German boy longs to be a professor and to write a book—but work in a countinghouse is an alternative which is far preferable to digging beets and potatoes in the field. Commerce has its intellectual rewards to a man whose chief interest in life is in reading and thinking. Your typical German is genuinely interested in learning all that he can about foreign nations, not only because he may profit thereby in pocket, but because he likes to learn things. Everyone who has lived in Germany must have been struck by this general feature of the people in contrast to ourselves. We are credited with greeting the foreigner with "arf a brick;" the German greets him with a polite bow and with broken English. And the English which he speaks may be "broken" at first, but it soon improves by diligent use of opportunities. There are at this moment many thousands of our countrymen, boys, girls, and students, as

well as adults, in the fatherland, and nine out of ten of these are talking English! for the benefit, of course, of German commerce.

Hence the German system of education, which is popularly supposed to be the sole agent in creating the German clerk, is an effect and not a cause. The boy likes his school; his family fosters his tastes; they talk English or French with him constantly. You will not find a town on the north coast where English is not heard in families which boast of being refined or educated. The ordinary middle-class parent in Germany knows more about the real nature of education, and the conditions which will make schooling successful, than our English cabinet ministers. But they possess this knowledge, not because they have studied the subject, but because they have grown up with it, as part of the life of their city and country, all through the century.

Second, your German has always been poor and thrifty, content with a salary which his English colleague would scorn. No doubt, since 1880, things have altered for the better (or worse?); patriotic Germans complain that the luxurious habits which have begun to prevail since the victory over France started the country on its career of phenomenal prosperity. But we in England have, for at least two hundred years, maintained a standard of comfort far in advance of what obtains abroad; and although food is cheaper in London than in any other city in the world, it is the foreigner and not the Englishman who finds that he can make a profit out of a "living wage."

These are the two governing factors in the situation, and they would have created the competition in any case, since the increase of population in Germany, fostered by discontent at heavy taxation and despotic government, is always driving young men out of the country.

Nevertheless some importance must be attached to the positive measures, to which we have referred, undertaken by government and by chambers of commerce. These consist, firstly, in the establishment of commercial colleges and universities (*Handelshochschulen*), where boys who have already received a good modern education can learn all about the world's trade, and can qualify for responsible posts in large firms. Secondly, in sending teachers abroad, so that they may return properly qualified to teach modern languages and commercial geography, both in the schools and the commercial colleges.

What, then, can we do in England to fight this competition? Can we, in fact, attempt to fight it at all? So far as it is simply a problem of the standard of comfort we can not adopt any measures which will keep out the German clerk. If he will do for a guinea what the English clerk will only do for two guineas, then he will inevitably hold the market; the Englishman must either forego his extra guinea or find other work. So far he has preferred to seek for other work, and we can not blame him.

However, this is not the only factor. The first and leading element in the situation is the nature of the English schoolboy and his upbringing at home as well as at school. We can not take our boy and transform him in a few months into a German clerk; to achieve such a transformation we should have to begin with the boy's grandfather, and make him a little less of a barbarian!

But some of the leeway can be made up, if we go the right way about it. What has happened in Germany as a result of national tastes and tendencies can be achieved in England by definite public-spirited effort. A few commercial colleges will do a little, but they will not do much; and indeed they are bound to fail unless we feed them with pupils such as are supplied in Germany from the modern secondary schools (*Realschulen*). The one main reform which is possible of achievement is to foster every school which provides a sound, complete course of education for boys of the so-called middle classes. And this fostering care must be exhibited, not only by the education department, but by every local and imperial authority.

Unfortunately, there is very little sign of encouragement among public men. The

Duke of Devonshire has produced a bill for secondary education, but it has remained in the House of Lords, and there is every reason to fear that any such bill will be killed by the opposition of vested interests which profit by the present forlorn conditions of culture. And the bishops may oppose reform because they fear that religion will suffer unless the church controls the schools; primary teachers will, it is feared, oppose any reform which does not promote the interests of the primary teacher. It remains to be seen whether there is enough genuine zeal for culture among the middle classes of this country to make it worth the while of either political party to take up the cause of secondary education. If not, we shall deserve to suffer from the competition of continental countries which are enlightened enough to understand that modern commerce depends upon a knowledge of the world, and that this knowledge can best be acquired by sound modern schooling, fostered by the home, supported and supervised by the State. We can not, for many years, hope to create in English society such a general atmosphere of culture as prevails in Germany, nor need we desire to do so, for the German type is not wholly to be admired; but we can do something to make the English schoolboy a little less of a barbarian, and his teachers, the masters in our secondary schools, are only waiting for the necessary countenance and aid from Parliament. Until public opinion takes the matter in hand, it is idle for us to complain of commercial competition.

The foregoing is reenforced by an article of Prof. Edward J. Goodwin, of the High School for Boys and Girls, in New York, published in the *School Review* (Chicago, November, 1899), which article is here reproduced to show some of the secret forces that produce the "German commercial clerk," as well as other factors of the prosperity of the empire.

RESULTS IN THE PRUSSIAN GYMNASIUM.

It may be said at the outset, that nowhere else in the world are the general conditions more favorable to good schools than in Germany. In no other country is a sound education more necessary for the maintenance of the integrity of the nation and the autonomy of the race. The instinct of national preservation acts as a powerful incentive towards such a system of discipline as shall result in seriousness of mind and a readiness to submit to rigid laws. If we were surrounded on either side by powerful and aggressive enemies, and if our national existence depended upon our having a large number of highly educated and well trained men, it would be less difficult to impress our people with the importance of a vigorous and scientific training. As it is, there are not a few of the patrons of our secondary schools who not only do not believe in the necessity of subjecting boys to systematic and thorough discipline, but decidedly object to it when their own children are concerned.

In any attempt to estimate the value of the training of the gymnasium, or to find out how the secondary schools of Prussia obtain their results, the first thing to be reckoned with is their peculiar system of school government. It is effective and complete to the last degree. The order is so perfect, and the attention of the pupils to the work in hand is so absorbing and persistent, that the superficial observer can not fail to be impressed with admiration for the system and pity for the boys. The sources of such a severe form of school government must be sought for, I believe, outside of the school. In the presence of a large standing army, the belief that there is urgent need of maintaining it at the highest point of efficiency, and the strict enforcement of a rigid code of civil and criminal law, have more to do with fixing the standard of discipline in the schools than the schools themselves. No American teacher would wish to see such an artificial and arbitrary standard of school government established here. It is neither possible nor desirable. The purposes of school

government in the two countries are widely different. German children are trained to submit to authority, but our boys must be taught to govern themselves. The former are to be the subjects of a prince, the latter are to participate in the government of a free state. This difference in the purposes of school government involves a corresponding dissimilarity in methods of discipline. In the one country the control of the school is direct, absolute, and sometimes severe: in the other the teacher constantly appeals to the reason of both pupils and parents, and exercises strict authority under the law only as a last resort. To bring a school under effective control by methods that command the assent of reasonable and liberty-loving pupils is just as difficult, and quite as essential, as to give skillful instruction in the several subjects of study. Our boys, as we believe, must have a definite degree of freedom of action, the larger the better so long as the proper work of the school is not interfered with. But to determine where the liberty of the pupils shall end and the restraint of the school begin is a question so complex and delicate that it often taxes to the utmost the wisdom and resources of the teacher. The Prussian schoolmaster is not called upon to solve any such perplexing problem. The time, thought, and energy which we expend in school management he may devote to strengthening his scholarship and increasing the efficiency of his instruction.

But in respect to effectiveness of organization the superiority of the Prussian gymnasium is very great. I use the word organization to include the curriculum of studies, the character and methods of instruction, and the training, appointment, and pensioning of teachers. In formulating and executing wise plans of education a centralized government has immense advantages. The wisest men may be called upon for counsel, and the ablest men of the Empire may be intrusted with the responsibility of administering the affairs of the schools. In Germany a great school reform may be inaugurated in a day; in America reforms come only after long periods of discussion and agitation.

In Germany there is a splendidly elaborated system of State schools; in America there is a kind of local option in education. The general looseness and weakness of our organization seem to be a part of the price that we have to pay for our free institutions. The right of our municipalities to organize and direct their own schools is as carefully guarded and persistently maintained as if the perpetuity of the civil liberties of the people were dependent upon it. The slowness of the decadence of the old New England district school system is a striking illustration of the stubbornness with which our people resist all tendencies toward centralization of government. Under our present municipal form of organization, we can not expect to have such a uniformly good system of schools as we find in Prussia or any other State of Germany.

Another source of weakness in our education becomes apparent when we begin to examine our courses of study. They are more varied in their form and content than the climate and productions of the localities which they represent. They lack coherence, rational order, and stability. They are subject to the caprice of school superintendents, principals, teachers, and influential members of school boards, who may, or may not, be well informed in the philosophy of education. In Germany, however, programmes of studies are carefully matured by wise and learned men after a protracted and profound study of the ends and means of education. Our lecturers on education talk in a wise way about the correlation of studies, but in Germany we may see the principles of correlation in actual operation in the courses of study and methods of instruction. This is especially true in the gymnasium (classical high school), where we find a definite and elaborate scheme of studies and careful attention to the details of instruction. I can not attempt within the limitations of this paper to give a formal analysis of the curriculum of the gymnasium. And yet, it is easy to find embodied in it several of the most important principles formulated by the committee of ten. I quote from page 16 of their report: "It is inevitable, therefore, that specialists in any one of the subjects which are pursued in the high schools or colleges

should earnestly desire that the minds of young children be stored with some of the elementary facts and principles of their subjects, and that all the mental habits, which the adult student will surely need, begin to be formed in the child's mind before the age of 14." The acceptance of this most important general truth would revolutionize our elementary education. Germany has already accepted it, and demonstrated its practicability and utility. The boy of 14 in the gymnasium has had something more than the husks of learning. He has had five years of Latin, two years of Greek, five years of history with related geography, five years in the elements of arithmetic, algebra, and geometry, four years of natural history with one of physics, and a continuous course of five years in German, religion, writing, drawing, singing, and gymnastics. A comparison of these subjects of study with those that are set before a boy from 9 to 14 years of age in an average American grammar school, will show very clearly one of the means by which the German gymnasium achieves such large results. The pupil's vigor of application, range of thought, and grasp of subject-matter, during these golden days of a boy's education, are much greater than they are with us. Their programme of studies is much more extensive and intensive than ours, and, although the gymnasium is a clearly defined classical institution, only about 35 per cent of its time is spent upon Latin and Greek. It is worthy of note, too, that there are no short courses in any subject of study. German, Latin, history, mathematics, science, religion, singing, and gymnastics are pursued continuously for nine years, while French and Greek are studied respectively seven and six years.

I have already alluded to the great superiority of the organization of the Prussian schools. To my mind the most important and striking characteristic of this organization is the large number of class exercises. The average number per week for the nine years of the curriculum of the gymnasium is thirty-three. This includes singing, drawing, and gymnastics, but excludes English and Hebrew, which are electives. It is well-nigh impossible to exaggerate the far-reaching significance of this fact, when we attempt to compare the achievements in scholarship of the Prussian gymnasium with the results attained in the secondary schools of the United States. Twenty lessons a week nearly represent the maximum in our best schools. What would be the outcome if we could enlarge this number by 50 or 60 per cent? The curriculum could be enriched, more subjects of study could be pursued continuously, and the effectiveness of the instruction could be increased. Consider the amount of energy our pupils spend in misdirected and futile efforts. Compute the time that is wasted before they acquire the habits of study or the power of persistent application by means of which the student grapples successfully with subjects that are hard to understand. In the gymnasium this loss is minimized. For instance, perplexing problems in mathematics are solved under the eye and guidance of a teacher. The paradigms of Latin and Greek are clearly taught in the class room; they are not memorized as disconnected facts, but practice in the use of words in their right relation goes on "pari passu" with a study of their forms. This stimulating help of the teacher insures rapid progress, and runs clear of the errors and misconceptions that pupils make, who spend only time enough with the teacher to recite the lessons that they have learned elsewhere. It must be, too, that no inconsiderable number of our pupils fail in scholarship for the lack of just such skillful and systematic instruction as the German teachers give, and which we can not impart for want of time. Those who survive the struggle in our schools are doubtless more self-reliant than the students of the gymnasium, but, since only about two-thirds as much time is given to their instruction, they can not fairly be expected to attain the same standard of scholarship.

In listening to the recitations in foreign languages I was forcibly impressed again and again with the fact that the instruction of the gymnasium appeals to the sense of hearing more than to the sense of sight. In our own schools it is quite common to see translations from English into foreign languages written by pupils on black-

boards and corrected in the presence of the class. An exercise of this kind in the gymnasium did not once come under my observation. An equal amount of work was often done orally in less than half the time. But written lessons were not wholly neglected. Test exercises written in blank books, and subsequently corrected by the teacher, were sufficiently frequent to acquaint the instructor with the progress of each pupil and the accuracy of his knowledge of vocabulary, forms, and syntax. The rapidity of these oral exercises was quite wonderful, and surpassed anything of the kind that I had ever seen in the schools of this country. This unusual facility in oral recitations is of course a natural consequence of a greater fullness and readiness of the memory. In the younger classes the demands made upon this faculty are severe and continuous. The Germans seem to recognize more clearly than we do that the years preceding adolescence are best adapted to the acquisition of knowledge through the memory.

A writer in a recent number of the *School Review* declared that the aims of classical study in Germany have undergone radical modifications in recent years. My observations agree with this declaration. The official statement of the general aim of the study of Latin in Prussia is expressed in these words: "The understanding of the more important classical authors and philological training." It was clearly evident in the instruction that the order of importance of the two general aims mentioned agrees with their order of precedence. In the more advanced classes the examination and discussion of the content of the classic authors occupied a large share of the time of the recitation. Questions concerning the modes of warfare, the institutions of government, and the forms and essence of the morality, religion, and philosophy of the ancient Greeks and Romans constantly recurred. In one recitation where a group of boys 11 years old were reading Nepos the greater part of the hour was spent in a discussion suggested by the words "columna rostrata." The central purpose seemed to be to inspire the boys with humane thoughts and high ideals. The study of the laws of language is necessarily made prominent in the elementary classes, but in the latter part of the course this gives way to the critical examination of the content of the literature.

The method of teaching history to classes of young pupils seemed to be a successful combination of the lecture and recitation. The lesson began with a quiz on the review, which was conducted with great rapidity and animation. The questions covered a wide range, and were evidently designed to fasten permanently upon the memory a general outline of important historic data. The quiz was followed by a lecture on the topic of the next day's lesson, which occupied about half of the hour. The lecture was so vivid and skillful that one class which I saw was quite carried away by their interest in the teacher's narrative. There are obvious advantages in thus blazing the way through a period of history for a class of young students who are too immature in judgment to find a way for themselves. In a class of older pupils I saw a good illustration of the so-called seminar method of studying history.

Nothing excited my admiration more than the simple device by which the gymnasium endeavors to exercise an almost complete control over the literature that the boys read during the years of childhood and youth. Every class room that I visited contained a small portable closet, in which was kept a collection of interesting books, carefully selected and adapted to the age and maturity of the class. The supply is kept good by occasional contributions from the boys, and the books are given out with sufficient frequency to provide the boys with all the books that they have time to read out of school. A scheme so simple and salutary as this is worthy of general adoption.

The incentives that operate upon the minds of the pupils in the German secondary schools likewise demand consideration. The graduates of the gymnasium not only escape two years' military service, but they are the only ones permitted to study law, medicine, or theology in the university. The right to compete for the honors and

emoluments of the learned professions is, therefore, open only to those who succeed in the gymnasium. This privilege must tend not only to bring the most ambitious boys into the gymnasium, but to incite them to the loftiest achievements in scholarship.

But what shall we say of the German schoolmaster? In all essential respects he is a professional man. He is trained for his duties with the utmost care and forethought, and in turn is required to carry on his work of instruction with an equal degree of precision and skill. After graduating from the gymnasium and the university, he must serve an apprenticeship of two years without pay under the supervision of some head master before he can become a candidate for an appointment. These precautions insure the selection of only the most worthy candidates, and tend to produce a class of teachers who are mature in years and scholarship and well informed as to the purposes and methods of instruction. Add to this permanency of tenure and the certainty of a pension, and we have a combination of conditions that yields a class of men who have a capacity for skillful and efficient service that is unsurpassed by the teachers of any other country.

The chief reasons for the excellent results obtained in the German gymnasium may be summarized in a single sentence. They are national institutions; they are believed to be essential to the national welfare; they easily maintain the strictest and most effective discipline; they have a broad, well-balanced, and substantial programme of studies; the number of hours per week devoted to class exercises is exceedingly large; the purposes of the instruction are clearly defined; the methods of instruction are well considered and wisely adapted to meet the ends designed; the incentives to study are extraordinary, and the teachers are well trained, mature, scholarly, secure in their positions, and sure of a pension when overtaken by ill-health or old age.

Prof. W. Weinig, the principal of a commercial college in Bellinzona, Switzerland, writing on the subject of commercial education, lays special stress on the study of foreign languages. His paper is here reproduced:

ON THE VALUE OF PROFESSIONAL TRAINING FOR BUSINESS MEN.

Some years ago there appeared a certain book by Mr. Williams, entitled "Made in Germany," which caused a great sensation in the commercial world, especially in England. Its purport was to show the steadily increasing progress of German industry and trade. Everywhere, it said, English goods and English trade were being confronted with the so much abused German made articles. It was acknowledged that the much vaunted English commodity could no longer compare so favorably with the goods "made in Germany," and it was regretfully stated, with illustrations by means of official figures, that the trade in the foreign articles (and the trade of the foreigner itself) were making large inroads on the formerly exclusively British markets. How far this well-established fact indicated a serious danger ahead may be judged from the subsequent efforts made in England toward imperialism and the protectionism so closely connected with it.

And yet, this had only been a symptom of deeper-lying causes and effects of which I may be allowed to adduce one more particularly to the point. In fact, this state of things had long been patent to the unbiased observer. Nations do not stand still, or if they do they are left behind by their more active and intelligent competitors. An unmistakable sign of such successful competition was the outcry raised in England, and chiefly in its huge metropolis, over the foreign clerk pressing in everywhere and elbowing his British rival out, to such an extent that the national sentiment grew alarmed and cries of "fair play" and "England for the English" were fairly dinned into the ears of every head of a firm who wanted employees.

It may be interesting and useful to look a little more closely into the above-mentioned facts. Why do the imported goods hold their own against the product of the highly-skilled native workman? Why did and do English firms still prefer foreign clerks? Evidently because they have a better insight into commercial matters, because the foreigner works more expeditiously and accurately; in short, because he is in every way better fitted for his calling than his native colleague. There is, of course, no need to tell in so many words that the foreign clerk is superior to his homebred rival because he went out into the world carefully instructed and equipped with a general knowledge of everything he could possibly be in want of. And this would indeed seem urgently needed in our days, considering how rapidly one invention follows another, how keenly progress in every department of human activity is watched and espied by thousands of thousands of eager eyes, to be at once utilized for practical purposes, and considering what efforts need to be made to maintain the old ground and to secure new outlets for the world's products.

It will ever be an eloquent testimony to the perspicacity and activity of our Swiss trading community to have perceived the one-sidedness and stodginess of the old established routine and to have promptly found ways and means for enabling the growing-up generations of commercial men effectively to grapple with the difficulties they would be sure enough to encounter. Comparisons are odious; and yet, without disparaging the good done by our neighbors and others, we may point with some pride to the advantages our commercial instruction in particular is able to bestow; the tradesman of the new school will compare with the routine-man taught by rote like the modern rifle with the time-honored crossbow, or like a modern ironclad with the once respected three-decker.

To mention only one of the many disadvantages besetting a commercial man of the old school—the imperfect knowledge of foreign languages. What principal, having had to deal with employees of the old school, but has been made painfully aware of the deficiencies in the learning acquired in this respect by his subordinate? Well may he have been satisfied if the latter could make out at a pinch the bare meaning of the letter of a foreign customer, but how much more so when he had to interpret by word of mouth the intentions and desires of the would-be purchaser? Or, again, what bungling and consequent loss have not been caused, even by clever business men, passing from one line of business to another?

While calling attention only in passing to the immense progress realized during the last ten years in the teaching of modern languages, let us consider at leisure what our modern thoroughly up-to-date instruction is able to do both for the future commercial clerk and for the principal who is anxious to secure employees who are fully up to the mark in every requirement of their calling. The gain accruing from a sound, broad commercial training will, we hope, appear clear enough after a perusal of the following description of the apprenticeship which our future merchants, traders, and bankers have to serve in our college (*Scuola Cantonale di Commercio*, Bellinzona, Switzerland).

The first requisite one has to look for in a future man of business (and which we first of all demand in our students) is that he should possess a satisfactory rounded-off education, so that our specializing and higher instruction may set in with full effect; that is to say, we never once think of receiving an individual who does not in every way appear capable of being fitted for the commercial career. And this business capacity will not show before the age of 14 or 15 years. If we are so far satisfied, we begin providing him as good a training in three or four languages as can be had from teachers examined and paid by the State—our college, being a public institution, offers the strongest guarantees for there being found none but highly competent men on the staff—all our courses to extend over five years. All instruction is given with a view not to scholarship, but to future practical use. And, as a matter of fact, no diploma is conferred upon any one pupil who is not able to speak fluently, and to write correctly, the more important modern idioms (French, Spanish,

Italian, English, and German). This may, to an English-speaking person, appear "a large order," but we may add that we Swiss, being on the confines of three of the above nations, are by nature so far favored that a good steady effort will infallibly bring us to the end in view. Besides, his large international trade has ever compelled the Swiss merchant to consider the possession of several idioms a foremost essential to success, as well as to encourage every endeavor likely to shorten the once tedious way of acquiring foreign languages.

At the same time our students are initiated into the manifold branches of knowledge which every educated man of our time may be supposed to possess, only much more so. This purpose, only just mentioning political economy, commercial law, commercial statistics, etc., is served by a good, solid instruction in merceology (*Waarenkunde*), which enables our students, helped by an enormous collection of samples of all the more important trading articles, to discriminate both the various qualities of goods and their adulterations. This, of course, is made concurrent with a sound training in chemistry and natural science.

But a far larger part of our attention, as may be expected, has to be given to commercial arithmetic, and especially the model countinghouse. Scarcely any modern business college can do without this latter. In this department of our college the students, under the guidance of a specialist, perform the everyday work occurring in a business office; here they apply the theoretical knowledge imparted to them in the courses on bookkeeping, commercial calculation, etc. The model countinghouse represents a trading company with the teacher as principal and the students as employees. After having made out the assets, the teacher goes through a series of (fictitious) commercial operations in order to teach the pupils the way of setting them down in the books. Some have charge of the ledger, others of the daybook, some of the invoice books, others again of the cashbook, etc., and still others of the correspondence which is required for the accurate performance of the transactions intended. From time to time, say once a month, these functions are interchanged between the students, so that at the end of one year every one has had, in his turn, to discharge the duties of each department.

Or again, every individual pupil represents a firm, and the head of the model countinghouse (the special teacher) tries to get as many kinds of trades represented as may be possible. One pupil trades in colonial produce, another does the banking, a third assumes the part of the manufacturer, and so on; two others again combine to form a trading company. Next, the students do business with one another, carry on correspondence, hand each other invoices, make remittances by means of checks, drafts, etc.

The specialist teacher in this branch gives particular attention to the practical application of the more important systems in bookkeeping, as well as to the continual practice in commercial calculations, theories of exchange, commercial law, and, as much as possible, tests his pupils in every branch of commercial science. The teacher, however, is not tied down to these operations only. Owing to his relations and connections in the world of trade, he will, from time to time, induce them to engage with his department in a pro forma business transaction, which will thus come as near doing real business as can be, inasmuch as correspondence, entries, abstracts of invoices, bills, checks, etc., are real. Such an operation differs from a real business transaction in nothing but the fact that goods are not being forwarded.

So far, then, we supply the minds of our pupils with a store of knowledge, languages, and the various ways and means of utilizing them. But I fancy I hear someone saying: This is all very well; but, after all, it will scarcely come up to the attainments of our practical business man. Well, this objection, too, has been foreseen and met in our course of instruction. It is true that even in many of our Swiss "business colleges" this defect is not remedied yet. Still, I think we can show conclusive evidence that our students at least on leaving us do not need to envy their practical rival.

It has been said above that our course extends over five years, the first three of which

are devoted to the acquiring of as much theoretical and practical knowledge as an apprentice may pick up in three years in a firm. Now, our last two years are intended for "commercial practice," one of our most important subjects in so far as the students there become real customers and take an active part in the doings of real firms. This "commercial practice" forms a distinctive feature of our college, and consists, briefly stated, in reading, discussing, and explaining market reports, price lists, account sales, invoices, etc., which are sent us by Swiss and foreign business houses. These reports, etc., are complemented by the study of the corresponding items in the various foreign daily papers and periodicals to which we are subscribers.

In this branch particular attention is being paid to the correspondence with actually existing, not merely fictitious, firms. We constantly and successfully endeavor to increase our number of houses which are disposed to keep up a regular correspondence with our two highest classes. At present, our students entertain an active interchange of letters in the four languages with many important Swiss, French, Austrian, and English firms concerning the more intricate business matters, such as arbitration, contested claims, claiming damages, etc. Of this branch typewriting and shorthand form essential features.

Thus an important silk export firm at Zürich has intrusted to us the English and Italian correspondence with their English and Italian customers. The replies again pass through our hands; we may, therefore, say that we are transacting real business operations. Another important Austrian firm, having a partly disputed claim on a Swiss client, asked us to see the matter through. Our highest class carried on an extremely interesting correspondence in German and Italian with the creditor, the debtor, the court of bankruptcy, and after many attempts at an amicable settlement we had to compel the debtor to file his schedule. Thus our students, besides getting practical experience, are also taught the professional secret, the strictest injunctions in this respect being enforced.

Moreover, these relations with real firms afford our students excellent practice in several languages, together with a certain knowledge of the customs of the various countries. A foreign business letter written by a thorough man of business gives rise to a great many discussions, and its tenor, expressions, and abbreviations create at once the greatest interest and convey the most enduring impression. Another means of introducing our pupils into practical business life is afforded us by the obliging offer of our local bankers and merchants who, during a few months, initiate our highest class in all banking operations, in conformity with a fixed program.

We have thus, supported by our public-spirited commercial community, realized that aim, which alone can crown the endeavor of any college of this kind, expressed in the maxim: "Theoretical instruction, if it is to be of any use at all, must needs be combined with practical attainments."

We rejoice to say that up to now the students who, after a severe examination, could be awarded a diploma, have always given the highest satisfaction to their employers, and we think we have practically proved that the man of business, as much as any other, is all the better fitted for his vocation by receiving as good and as varied a training as possible, and that the employee trained as has been outlined in the foregoing sketch is a safer guarantee for thoroughly good work and success than any, however confident, individual who lacks the systematic and therefore complete instruction, the broad knowledge, and the special attainments with which we equip our students.

X. STATISTICS OF THE SWISS SCHOOL SYSTEM.

From the *Jahrbuch des Unterrichtswesens in der Schweiz* for the years 1896-97 and 1897-98 a brief summary of statistics is here given, which will enable the reader to recognize the sum total of educational efforts in Switzerland at a glance. Switzerland is a democratic republic, and has a population of 2,986,848, according to the census of 1894. The total number of elementary pupils in public and private institutions is 647,116, or 21.7 per cent of the population. If the population estimated for 1898 were taken as the divisor, the ratio would be about 20 per cent. The total number of students in secondary and higher institutions is 28,385, or 0.95 per cent, so that the proportion of the population attending school of some kind is over 22 per cent. This is a remarkably good showing, if compared with France, England, Austria, and smaller European states. The ratio is even a trifle larger than that of the whole of Germany, and is only surpassed by that of Saxony in Germany.

Wherever the data are given in the "Jahrbuch," the numbers of pupils are specified as to sex. With regard to nationality the Swiss Government does not recognize a difference, the population being made up of Germans, French, and Italians, and the three languages are officially used in all public documents. In 1888, 2,083,097 inhabitants spoke German, 634,613 French, 155,130 Italian, and 38,387 Romansch. Most, if not all, educated people in Switzerland are able to speak two languages—many speak three.

The number of teachers is stated in all the tables save two. In Table D (continuation schools) that item is omitted, because these evening, holiday, and secular Sunday schools are taught by the teachers of the public, primary, and grammar schools; hence it would be an unnecessary duplication in counting the teachers. The average daily absence of pupils in 1894-95 amounted to 13.4 per cent, of which 10.9 per cent were excused, 2.5 per cent not excused. In 1897-98 the daily absence was 11.8 per cent, of which 9.7 per cent were excused, 2.1 per cent not excused. An average daily attendance of 88.2 per cent (86.6 per cent, respectively) is a good showing.

Not counting the children of kindergartens and maternal schools in the total of elementary pupils, the proportion of elementary and secondary enrollment is 96.4 to 3.6 per cent.

The Statistical Yearbook of Education in Switzerland shows at first glance the great number of school types found in the little Republic. The federal constitution expressly forbids the central Government to assume control and maintenance of education, except in a few cases specified, to wit: The polytechnic institute, schools for army recruits, industrial, agricultural, and commercial schools. The twenty-five Cantons, or States, have each sole charge of their public schools, precisely as is the case in the Empire of Germany and in the United States. There is little, if any, uniformity in the educational organizations of

Switzerland. Everywhere the schools are managed according to local laws, and organized to suit local predilection and needs. A consequence of this condition is that the laws requiring obligatory attendance differ very materially as to length, beginning, and end of school term. That these laws are strictly obeyed, however, is a fact which speaks well for the training in self-government of the Swiss citizens. Concerning the organization of the various types of schools the following explanation may be desirable:

1. *Institutions for the pre-scholastic age.*—Kindergartens and maternal or infant schools are conducted essentially according to Fröbel's principles and practices, but one vital difference deserves to be mentioned. While the kindergartens of German Switzerland exclude all instruction in reading, writing, and arithmetic, these branches form an essential part of the course in the "écoles enfantines" of French Switzerland. In the French Cantons the school laws expressly state that the infant or maternal schools are to be regarded as preparatory to the elementary schools. They are also considered in the French Cantons as integral parts of the elementary school system. This plainly shows that the German-speaking Cantons of Switzerland imitate Germany, where kindergartens are nowhere made a part of the school system, and the French-speaking Cantons imitate France, where the maternal schools are a legitimate part of the public-school system.

From this statement of the purposes of the institutions the further fact is explained that in western (or French) Switzerland, in Vaud, Neuchatel, and Geneva, the cantonal governments have the duty of establishing and maintaining maternal or infant schools in every school district, while in German Switzerland the establishment and maintenance of kindergartens are left to the initiative of private persons and corporations. The only exception is the Canton of Basel (city), which, through the law of 1895, makes the State assume the expenditures for kindergartens; that is to say, allows the Government either to subsidize private institutions and thus to make them public, or to establish new institutions at its own expense.

2. *Elementary schools*, called primary schools, after the model of the French and Italians. As a rule, attendance at these schools is obligatory for six, seven, or eight years—in exceptional cases, also nine years, but in every Canton this elementary course is followed by attendance at supplementary or practice schools for one, two, or three years. This supplementary education is compulsory in some Cantons, in others it is voluntary. In the Canton Basel (city) the elementary school is divided into four years' primary and four years' grammar school. In Geneva, Neuchatel, and Vaud, the course is divided into infant, primary, and supplementary departments. In Valais, the primary (6 years) and the supplementary or continuation schools all belong to the elementary group. The following table is inserted here

to show what legal requirements exist in the various Cantons of Switzerland with reference to the terms of compulsory attendance:

Term of compulsory school attendance in Switzerland.

Cantons (or States).	Age of admission (years).	Day schools—Number of years of compulsory attendance.	Continuation schools—Number of years of compulsory attendance.
1. Zurich	6	6	3
2. Berne	6	8-9	(1)
3. Lucerne	7	7	2
4. Uri	7	6	2
5. Schwyz	7	7
6. Obwalden	7	6	2
7. Nidwalden	7	6	² 2
8. Glarus	6	7	2
9. Zug	6	6	3
10. Freiburg	6	3-9
11. Soleure	7	4-8
12. Basel, city	6	8
13. Basel, country	6	6	3
14. Schaffhausen	6	8-9
15. Appenzell, I.	6	7	2
16. Appenzell, II.	6	6	2
17. St. Gall	6	7	2
18. Grisons	7	8
19. Aargau	7	8
20. Thurgovia	6	5-9
21. Tessin	6	8
22. Vaud	6-7	8-9
23. Valais	7	8
24. Neuchatel	7	6-7	2
25. Geneva	7	6	2

¹ Girls are required to attend industrial and domestic science school one year.

² Only for boys.

³ Only eight years for girls.

⁴ Only seven years for girls and one year industrial school.

⁵ For girls, eight years day school and two years singing and industrial school.

Women's handwork.—In all the Cantons of Switzerland instruction in female handwork (knitting, embroidering, sewing, darning, etc.) is a part of the course of elementary schools for girls. Although not everywhere legally, it is practically an obligatory branch. Where the cantonal school law fails to make instruction in woman's handwork obligatory it is left to the communities to make regulations regarding it. This is the case in Uri, Obwalden, Appenzell I. Rh., and Valais; all the other 21 Cantons specify female handwork as an obligatory branch of study for girls. In a large number of Cantons domestic science, or housekeeping, is part of the instruction given to girls under the head of female handwork, while in some Cantons domestic science is provided for in extra lessons. In 15 Cantons the law does not mention housekeeping. In some Cantons where coeducation is in vogue, the girls have the same lessons given to boys, requiring as many hours a week, and female work is taught in addition to the other branches, thereby requiring the girls to spend more hours in school than the boys. Some Cantons, on the other hand, try to obviate this inequality by exempting the girls from some school exercises so as to gain time for the work especially designed as female. Thus in Uri, Schaffhausen, and Valais, the girls are excused from gymnastic exercises; in Tecino, from gymnastics and grammar; in Lucerne, from drawing and gym-

nastics, and so on. In Basel (city) the sexes are strictly separated in schools, and the courses of study of boys' schools differ from those of the girls' schools. The differences are not great, but sufficient to allow the girls time to acquire proficiency in domestic accomplishments.

3. *Continuation or supplementary schools.*—Attendance in elementary schools ends, according to local laws, indicated in the preceding table, at 14, 15, or 16 years of age, but generally in Switzerland the idea prevails that the knowledge acquired in elementary schools needs constant refreshing, as well as extending and deepening, to make it of use for the duties of practical life. The gap between the fourteenth and the eighteenth or nineteenth year of age—that is, from the close of school to the time of entering upon practical life—should be bridged over, and the results of school education secured by a continuation of school work. Guided by this consideration, all the twenty-five cantonal governments have established systems of evening, secular, Sunday, and holiday schools, called “*Fortbildungsschulen*” (literally, further developing schools). In the school laws of some cantons the object of these schools is stated to be preparation for the educational examination of army recruits, and therefore attendance during two or three winters preceding the conscription is required. This preparation is deemed so important that attendance is made compulsory for boys. This is done in the cantons of Uri, Schwyz, Obwalden, Nidwalden, Zug, Freiburg, Appenzell i. Rh., Tecino, Vaud, Valais, and Neuchatel; but in Berne, Lucerne, Soleure, Basel (city), and Basel (land) attendance is optional; while no courses for army recruits are arranged in Zurich, Glarus, Schaffhausen, Appenzell a. Rh., St. Gall, Grisons, Aargau, Thurgovia, and Geneva. These latter-named cantons, however, have supplementary schools for boys of 14 to 18 years of age. Attendance at these schools is obligatory in 13 cantons, optional in 7 cantons, and in 5 cantons it is left to local school authorities to regulate the attendance.

The term continuation school (*Fortbildungsschule*) has become a technical term in German Switzerland, as it has in the German Empire; that is to say, in the common use of the language it has assumed a specific meaning. It is used for institutions the students of which are beyond the legal elementary school age, yet do not acquire more than elementary branches. These schools offer no instruction in higher mathematics, nor in foreign or dead languages; they are in no sense secondary schools as that term is understood in the United States. They are open only in winter, and rarely require more than six hours of attendance a week. The teachers of elementary day schools are also the teachers of evening or continuation schools. Their courses of study, though differing widely, have all the well-understood object of giving the boys a practical turn of mind, that is of offering them knowledge which has direct bearing upon the occupations which they have chosen. Nevertheless there is very little uniformity in

these schools, even in name. They are variously called "evening schools, repetition schools, burgher schools, repetition courses, supplementary schools or courses, holiday schools, practice schools."

4. *Grammar or advanced elementary schools*, called in Switzerland secondary schools. To this class of schools, which is not to be confounded with preparatory or high schools in the United States, belongs a large number of institutions which aim to meet the local needs of better situated people and ambitious children. They are parallel with the four higher grades of elementary schools where such schools have eight or nine grades. They have the purpose of extending as well as firmly securing the results of primary education, and are, therefore, properly styled advanced elementary schools. Only two cantons have decreed obligatory attendance for these schools, to wit: Basel (city) and Geneva. It is plainly seen that in their organization these advanced day schools must be organically connected with the primary schools, and this gives rise to a great variety of courses of study prescribed for them; for as the primary schools, on which these advanced schools are based, vary in extent of time, aims, and to a degree also in matter and methods of instruction, so must the schools vary which continue their work. Some of these advanced schools charge tuition fees, others do not.

It is interesting to notice what names they assume. In the cantons of Zurich, Berne, Lucerne, Uri, Schwyz, Glarus, Zug, Basel (city), Vaud, Thurgovia, Neuchatel, and Geneva they are called secondary schools; in the Canton of Freiburg, *écoles regionales*; in the cantons of Soleure, Basel (land), and Aargau they are called *Bezirksschulen*, that is, central schools; in Schaffhausen, Appenzell a. Rh., Appenzell i. Rh., and St. Gall they are called *Realschulen*, that is, realistic schools; in Grisons and Valais they are called *Fortbildungsschulen*, or continuation schools; in Tecino one of them is called *scuola maggiore*, or higher school.

A special feature of all these advanced elementary schools is that they teach another language beside the mother tongue. In this they differ from the American grammar schools, but that difference does not raise these schools to the dignity of the secondary schools in the United States, because a second living language (usually French in German cantons and German in French cantons) is almost a necessity in Switzerland, where German is the mother tongue of three-fifths of the population, French that of nearly two-fifths of the population, Italian that of 155,130, and Romansch that of 38,387 inhabitants.

5. *Secondary schools*, called middle schools, as in Austria. These institutions may be grouped, as is done in the following tables, into (1) normal schools for the professional preparation of teachers; (2) preparatory schools, academies, and classical high schools; (3) schools which do not aim at preparation for college or university, yet offer an education of secondary character. The highest classes of some of the

schools, grouped under advanced elementary or grammar schools, might justly be ranged with the secondary institutions, for there is no clearly defined boundary line between them and the secondary schools; their courses of study often overlap each other. The middle schools, or secondary schools, as that term is understood in the United States, all have the well-understood object of offering an education higher than elementary, giving instruction in either classical or modern languages, or both, in higher mathematics, universal history, natural sciences, and natural history—that is, in the common high-school branches. To these are added special sciences when the school has a professional character—as, for instance, the normal schools, the technical, industrial, commercial, and other schools. It may be stated that some of these secondary schools reach into the college course, and are, in fact, called communal colleges. Girls are not found in classical high schools; they attend high schools of their own. Hence we may group the Swiss secondary schools as follows: (1) normal schools; (2) preparatory schools or classical high schools; (3) girls' high schools; (4) professional schools, such as technical, industrial, commercial, and agricultural schools.

6. *Higher education.*—This is represented by one federal polytechnical institute (at Zurich); five universities (at Zurich, Berne, Basel, Geneva, and Lausanne); two academies of college rank (at Neuchatel and Freiburg); one theological school (at Luzerne), and one law school (at Sitten). The table marked K gives information concerning their attendance. Women are admitted to the universities and to the Academy of Neuchatel.

The following are the tables referred to:

I. SCHOOLS OF ELEMENTARY GRADE.

A.—*Kindergartens and maternal schools.*

Year.	Number of schools.	Pupils.		Total	Women teachers.	Number pupils to 1 teacher.

XI. DEFECTIVE CHILDREN OF SCHOOL AGE IN SWITZERLAND.

In 1895 the Swiss National Teachers' Association petitioned the Federal Government to institute an inquiry among the local authorities of the 25 cantons or states as to the actual number of children of primary school age who may be classed as defective, namely, (a) of weak intellect only, (b) of weak intellect with concomitant physical defects, (c) idiotic, deaf-mute, and blind, (d) morally depraved or neglected.

The Government acceded to this request and sent out so-called "census cards" to all local authorities, especially to teachers, and the results were tabulated and published in the Swiss Yearbook of Education by the secretary of the cantonal school authorities of Zürich. It must be understood that the inquiry referred to children of primary school age only—that is, between the ages of 6 and 11—it being supposed that such defective children never succeed in reaching the grammar or the high schools. The total number proved to be 13,155 in a

total of 463,548 pupils attending primary schools, or 2.8 per cent. Of this number—

- (1) 5,052, or 39 per cent, were weak-minded to a slight degree.
- (2) 2,615, or 20 per cent, were weak-minded to a high degree.
- (3) 1,848, or 14 per cent, were weak-minded in consequence of physical defects.
- (4) 2,405, or 18 per cent, were idiots, deaf-mutes, blind, etc.
- (5) 1,235, or 9 per cent, were morally depraved or neglected.

13,155

In order to facilitate the use of these statistics for educational purposes, the editor of the yearbook takes up the first two items only, leaving the third, fourth, and fifth out of consideration, institutions for such cases having long been established. It is especially the children of weak intellects in the primary schools that impede the progress of entire grades in schools by their want of capacity or inability to keep step with their schoolmates.

There are, then, according to the inquiry, 7,667 among 463,548 children between the ages of 6 and 11 who in some degree are weak-minded, but not wholly incapable of receiving school instruction—that is, a proportion of $16\frac{1}{2}$ to every 1,000 children.

A similar inquiry instituted by the Swiss teachers themselves in 1888, without the aid of the federal or cantonal governments, but embracing all children of primary and grammar grades, or children from 7 to 14 years of age, had almost the same results: Ninety-six per cent of the weak-minded children found were in primary and only 4 per cent in grammar grades.

It is interesting to note how the 7,667 children (items 1 and 2) of weak intellect found are disposed of :

- (1) 567 children receive instruction in special class rooms.
- (2) 411 children are in asylums for weak-minded.
- (3) 104 children are in orphan asylums, where they receive home instruction and special care.
- (4) 5,585 children are attending regular schools, but commitment to special asylums or classes is recommended.
- (5) 534 children are attending regular schools, but separation from their normally endowed classmates is not desired or necessary; and for
- (6) 466 children the question has been left unanswered.

7,667

Since the results of the inquiry by the teachers in 1888 and this later inquiry in 1896 are very similar, it may be asserted that the enumeration was taken with great care, and that the instructions given out by the central authority have been obeyed. A further proof of this is the intelligent manner in which the majority of communities replied to the separate questions proposed. It was particularly enjoined to state what physical defects the children had, if any,

and the replies enabled the central authority to tabulate the results as follows:

Weak-minded children of all grades, with or without concomitant defects.	Weak-minded children—							
	Recommended to be taught in separate classes.		Already taught in special classes.		Recommended to be committed to asylums.		Already in asylums.	
	Number.	Per cent.	Number.	Per cent.	Number.	Per cent.	Number.	Per cent.
Simply weak-minded ...	2,665	69.9	315	55.6	843	48.9	239	58.1
Also with defective hearing	483	12.5	97	17.1	337	19.6	82	20
Also with defective sight	162	4.2	33	5.8	71	4.1	25	6.1
Also with defective speech	241	6.2	59	10.4	138	8	21	5.1
Also with nervous affections	46	1.2	24	4.2	57	3.3	12	2.9
Also with physical defects	146	3.8	36	6.4	76	4.4	12	2.9
Neglected or depraved ..	118	3.1	3	.5	202	11.7	18	4.4
Physically defective only							2	.5
Total	3,861	100	567	100	1,724	100	411	100

The total in this table does not agree with the foregoing (7,667), but the editor explains certain eliminations from the detailed tables which reduce the number to 6,563. It is obvious that the number of children recommended for special attention agrees proportionally with that of children who already have that attention, and that the number of cases of concomitant defects runs in the same proportions.

The following table gives the percentages with reference to the total number:

	Number.	Per cent.
Weak-minded, total	6,563	100
Recommended to be taught in special classes	3,861	59
Already taught in special classes	567	9
Recommended to be committed to asylums	1,724	26
Already in asylums	411	6

Switzerland has a population of 2,986,848 (census of 1894) and a comparatively large number of physically defective inhabitants, owing to the mountainous condition of the country and other causes of a pathological nature. But a proof of the care with which the people, accustomed to self-help, treat unfortunate members of the community, is this late move of ascertaining the mentally defective children, and providing for their proper education in either special class rooms or special asylums. The advice to separate the intellectually weak from normally endowed children and instruct them in special classes, so as to relieve the teacher of elements that impede progress of the schools, originated in Germany. It was first advocated in 1875 in the German educational press, and has since been carried out there extensively in

city school systems. Here in the United States a similar step is taken in some cities, as is seen from an account in the Annual Report of this Bureau, 1896-97, Part I, pages 141-160.

In an article on "Prevention of mental diseases," in the American Journal of Sociology, Prof. Julius Morel gives some facts worth noticing:

Dr. Koch, formerly director of the asylum for the insane at Zwiefalten (Wurttemberg, Germany), has urged many times the necessity of special instruction and education for children of arrested intelligence and has proclaimed the necessity of creating special schools for them. In Germany, England, and the United States this idea has found many partisans, and the results obtained thus far seem to promise well for the new system. If it has been impossible to give to these undeveloped children a moral and intellectual restoration, so that they can receive instruction and learn a trade suitable to their intellectual ability, none the less have they succeeded in improving them to such a degree that they have been able to regain the intellectual level of other children with whom they have been in class and to move forward with these. They have awakened dormant qualities which with many children do not appear until a certain epoch of existence, but which appear earlier in others who have fortunately met in their way intelligent and devoted teachers who understood how to employ special methods of instruction.

Dr. Keller, of Copenhagen, has undertaken this noble task in Denmark with genuine success, as his excellent recent report demonstrates. In England Drs. Shuttleworth and Beach have obtained brilliant results. In the United States the works published by the National Conference of Charities and Correction prove that such rational educational enterprises for the children of the working people deserve encouragement. But in my opinion Germany bears the palm for laborious and incessant labor. During the last four years a journal has been published there for teachers, entitled "Die Kinderfehler—Zeitschrift für pädagogische Pathologie und Therapie in Haus, Schule und sozialem Leben." This periodical is published under the direction of the celebrated alienist, J. L. A. Koch; of Christ. Ufer, director of the Reichenbach schools at Altenburg; Dr. Zimmer, professor of theology at Herborn, and J. Trüper, director of a special asylum for feeble-minded children at Sophienbad, near Jena. This journal counts among its contributors all in the world who are interested in this kind of reform for children, and its scientific contents deserve to be known by all who are occupied with social questions.

In Belgium, although there are four asylums for backward children in the country, there is only one real specialist, Dr. Jean de Maar, of Brussels, who occupies himself seriously with this question. Personally, when I was attached once to the hospice of Guislain at Ghent, I, as well as my predecessor, Dr. B. Ingels, encountered insuperable obstacles in the effort to introduce the new modes of instruction with backward children.

In brief, it has been established that the results obtained are remarkable, and that governments can not give too much assistance to these schools for backward children, who, without them, are sure to descend to degeneration and mental complications.

In respect to those who remain incapable of such intellectual and moral progress, it will be necessary to segregate them for life in special establishments, as I have shown in a work published in 1896 in the Journal of Mental Science, "The need of special accommodations for the degenerate." The unhappy beings are dangerous to society. I have the deep conviction that this would be one of the most hopeful social measures, and would contribute to prevent the increase of mental troubles in the degenerate, and at the same time would contribute very much to diminish crime.

XII. GERMAN SCHOOLS IN FOREIGN COUNTRIES.

A French report on German schools in foreign countries has recently appeared, written by Prof. J. Roux. It appeared in a serial publication entitled "Questions diplomatiques et coloniales," third year, No. 52, 1899. A writer in the *Deutsche Zeitschrift für ausländisches Unterrichtswesen*, No. 1, volume 5, discusses the contents of Roux's book and adds further information. This review is here reproduced in translation:

Since 1871 the French have strained every nerve to strengthen and elevate their country in all departments of learning and skill. Since that year they have made a close study of the German army, as well as of German educational institutions and of the German language, as they credit the victories of Sadowa and Sedan to the German schoolmasters. When rapid economic progress followed upon the German political advance movement, and commerce and industry rapidly developed; when the Germans found new markets for their manufactures, and were encouraged to establish colonies of their own so that German emigrants need no longer serve as "cultural fertilizers for other nations," so to speak; when they began to give the necessary consideration and support to their many brethren throughout foreign countries, the French energetically followed their example. They have recently also bestowed attention upon the German schools outside of Germany, by the agency of which German colonists and emigrants who so often, and in a short time, lose their nationality among the citizens of foreign nations, may not only preserve their language, customs, and culture, but influence other people morally and materially to the advantage of their own mother country. One of the best-versed French authorities on the subject of such schools is Prof. J. Roux, of the faculty of the commercial college at Limoges. His report on "German schools in Constantinople," published in No. 48 of "Questions diplomatique et coloniales," has been succeeded by a comprehensive treatise on "German schools outside of Germany." As this work is most interesting from a national standpoint, and contains many a profitable lesson, a few of its chief thoughts are here presented.

"German emigration," the author begins, "which has for a long time been considered a cause of weakness, is in my opinion an indirect source of prosperity." The reviewer says: "Such would be the case if the millions of emigrants preserved their nationality amid their foreign surroundings; but in most cases it is already lost in the second generation."

"In earlier times," the author continues, "the German emigrant quickly forgot his native country, a country which was little known in his new abode, and which could not aid him when in trouble. But a different order of things prevails since 1870, and Germans abroad unite to promote a patriotic work." Such actions can not be considered to be of frequent enough occurrence.

"To preserve their nationality," says Professor Roux, "German colonists, bound more closely to their mother country by the increasing trade of Germany, have founded many societies and schools. Before 1870, the number of the latter was small; those of Antwerp, Valdivia, Osorno, Valparaiso, Rio de Janeiro, and Constantinople were the only ones mentioned." The author might have mentioned the oldest German school in South America, Buenos Ayres, established in 1843. Among the foreign German schools in Europe, those of St. Petersburg (Annen school, 1736; Peter's school, 1762) and Moscow (1838), the many in the Baltic provinces, that of Stockholm (fifteenth century), the four German schools in Copenhagen, those of the Hague (1865), Bukharest (1778), Jassy (1839), Milan (1860), Genoa (1869), Naples

(1833), and others have been omitted from his list. Since 1870, German schools have rapidly increased in number. Roux makes mention of only 22, while for South America alone the names of 52 others could have been quoted.

The author then refers to the rapid increase of Catholic and Protestant missions, which have more than doubled in number since 1885, and now include 1,580 schools, with 83,000 pupils. In a footnote he states that the French establishments in Asia Minor alone number 70,000 pupils. According to his information, the German Protestant missions in South Australia support 32 institutions, with 1,200 pupils.

Roux furthermore emphasizes that German settlers acted independently in the establishment of their schools and did not wait for assistance from the home Government. The schools in Valparaiso, Caracas, Athens, and Johannesburg are cited as admirable examples. To the last two, Germans at home have contributed large sums; 50,000 marks (\$12,500) since February, 1898, that is, in eighteen months, to Johannesburg, which amount increased to 80,000 marks (\$20,000) at the end of June, 1899, the city of Hamburg alone giving 27,000 marks.

That Germans at home now, in contrast to former times, assist their compatriots abroad with large sums of money, and that the membership of the German School Association has recently greatly increased; also that considerable amounts are annually collected by this association for the support of German schools outside of Germany, are facts which give the author occasion proudly to assert that much larger amounts have been collected by the "French alliance," that instrument of faith, union, hope, and love, created by a handful of good Frenchmen—an association which, as Roux exclaims in his article on German schools in Constantinople, "constitutes for our country an instrument of action and external influence, more powerful, perhaps, than the diplomacy and the arms of our neighboring Empire." But as the contributions of the German School Association increase from year to year he calls upon his countrymen: "In this new struggle we must not be outdistanced by our rivals."

The author continues the comment on the support which German schools abroad receive annually from the home Government since the reestablishment of the Empire. He states the reasons which Germany has for lending assistance and enumerates the amounts paid. Roux mentions the fact that the financial report for the fiscal year 1899 contains the petition for raising the fund for the support of schools abroad as well as other patriotic institutions established for common benefit—hospitals and charitable societies—and he believes that the petition will be granted because of the interest all classes of society take in the expansion of German influence and the extension of German nationality. He says: "We Frenchmen desire it, and confidently hope for it. Still, all these sums," Roux continues, "are far below those which the Italian Government annually expends for its schools abroad, now a million lire (1 lira=19.3 cents), in 1895-96 only 645,000 lire; while France spends 800,000 francs (1 franc=19.3 cents) on its establishments in the Orient and in the Far East. In this work of education abroad competition is becoming more intense, more bitter. * * * France will be called upon for new sacrifices."

That the Bohemian School Association collects more than four times the annual receipts of the National German Association might have been here mentioned in order. In connection with the support given by the German Government, the author speaks of further concessions to be granted under certain conditions, as well as of the zeal of German officials abroad in strengthening existing German institutions in every possible way as well as founding new schools. "Schools," he adds, "are the true centers of propaganda of German influence, and through them it is hoped to preserve patriotism and fidelity to the Empire in the hearts of emigrants."

After the discussion of the schools themselves the author applies himself to the consideration of the German press, which portion of his exposé may be omitted. He then passes on to the defects of German schools abroad, which Germans see disclosed with a feeling of sorrow. In this they seem unlike the French, who would find pleasure in exposing their faults, and showing the deficiencies of national efforts.

Until now we had thought no nation more inclined to grumble or to criticise its own efforts than the German. With respect to the faults the author refers to the incompetent personnel of German foreign schools, especially those of the colonies in Brazil. The "partisans of Germanism" are therefore justified in their petition to the Reichstag for an amelioration of these evils by larger support, by regulation and permanency of teachers' positions, and by an acknowledgment of their claim to pensions and other rights and privileges.

After these observations Roux concludes with the reference to the real danger that now menaces French influence through foreign German schools, a danger not to be exaggerated since it arises more from emigration than from education abroad. A quarter of a million Germans emigrate in a year, while the French unfortunately do not leave their mother country and are relatively less numerous in foreign countries. "Still, natives," he continues, "who can cultivate no taste for German (Prussian) discipline and prefer our institutions undertake to represent us, attracted by the familiar and cordial kindness of our race and by the sociability of our ideals." According to the author's statement the French school in Madrid numbered in 1898 61 French and 107 Spanish pupils among 181, while in the German school 30 of 45 pupils were Germans. The same percentage is found in almost every case in Spain. In the reviewer's opinion this is easily understood. The Catholic French school is preferred by the Catholic Spaniards, because they are of similar origin. Yet we read in an article on German colonization in Brazil (*Colonial Yearbook XI*, 3) that the people of Brazil prefer German schools to their own, because of thoroughness and solidity. In Rio, for instance, four-fifths of the 250 children in the German school are Brazilian. That the same conditions prevail elsewhere we learn from Dr. Schwatlo, the principal of the German school in Constantinople, who published the "first foreign German school enjoying the privilege to examine for abridged military service" in the *German Colonial Gazette*, October 5, 1899. The reference reads: "The Imperial Lyceum or Galata-Serai, established under French auspices, has utterly decayed. The French themselves feel much disappointed at the results of schools conducted by orders and congregations, and send their children to German institutions."

The author closes with deductions from his remarks, saying: "If we are to maintain a prominent position in foreign countries we must double our exertions. The Government must give large support to our institutions abroad and grant generous appropriations to the Alliance Française." He then calls upon his countrymen, who are, as he observes, united for patriotic purposes, to support the work of the alliance with their money, and defines the duty of the press incumbent upon it for the preservation of French influence in the world. "Undoubtedly," he concludes, "no Frenchman will forget either our late humiliations or the slow increase of French population in contrast to the fecundity of the Germanic race which makes it so dangerous for the French. But"—and this is his consolation—"we shall not forget that the reputation of a nation in foreign countries depends mainly upon its authors and artists, and that in art success is insured by worth and not by numbers."

XIII. ATTENDANCE IN HIGHER INSTITUTIONS OF LEARNING OF FOREIGN COUNTRIES.

On preceding pages of this chapter the per capita of expenditures for higher education in the various countries of the civilized world has been stated. That statement is based upon the returns contained in *Minerva* (*Jahrbuch der gelehrten Welt*), the editors of which remark, in their preface, that they submitted the items of attendance and expenditure of each institution to the authorities of that institution

(secretary or treasurer); hence any quotation from Minerva is supported by the local authorities of the institutions mentioned. Where the authorities failed to correct the statistics of the previous year, the editors inserted these, rather than to leave a blank. But in every such case, it is indicated to what year the financial statement or the statistics of attendance refer.

These explanations are made here to show the reliability of the statements quoted from that valuable work. The following six tables are compiled from the same source. They show the attendance in (A) the universities and colleges in fifteen foreign countries, first, of all such institutions from the last reports made by them, then in Table AA of only such institutions as reported their attendance in 1899. Table B gives the attendance in other higher seats of learning, in technological, agricultural, mining, forestry, and veterinary institutions, variously called schools, academies, colleges, and institutions; while Table BB shows the attendance of 1899 only of such institutions as reported in that year. Table C combines the first two tables, showing thereby the number of students in attendance upon all higher seats of learning in the fifteen countries, while in the accompanying Table CC the nonreporting institutions are eliminated, so as to obtain the latest possible statements and to establish a true basis for comparison.

In order to facilitate the use of the tables, the compiler has stated, in each case, the ratio of increase or decrease. These columns of ratios deserve attention, inasmuch as they plainly show in which countries there is an increase in the number of students and in which a decrease.

General deductions from the tables are easily made: (1) The Teutonic nations are in the front rank, not only in the number of students in higher institutions but also in the ratio of increase. Russia and Italy are also progressing. (2) The increase in technical institutions, such as polytechnic institutes and agricultural and mining schools, shows throughout a larger percentage during the year 1898-99 than in universities and colleges. We note, for instance, that while the attendance in universities in Germany increased 6.5 per cent, that of the technical institutions increased 8.2 per cent. In Austria the increase in universities was 4 per cent, in technical institutions it was 7.8 per cent. In Russia the increase in universities was 1.2 per cent, in technical institutions it was 7.7 per cent. Such figures are significant, inasmuch as they indicate that the industries of Europe and America are claiming more thorough and more special preparation than formerly and that the commercial instinct is wide-awake, though it does not seem as though the old ways of classical education required by university study are abandoned, for the increase in attendance in universities is much larger than the ratio of annual increase in the population.

TABLE I.

A.—Attendance in universities and colleges, institutions not reporting in 1899 included.

Country.	Number of institutions.	Number of students.		Increase.	Decrease.	Net.	Rate of increase.	Rate of decrease.
		1898-99.	1897-98.

XIV. INDUSTRIAL AND COMMERCIAL SCHOOLS IN HUNGARY.

CONTENTS.—I. *Industrial schools*.—Introduction and history—Organization—Schools for apprentices—Continuation schools for journeymen—Workshops for schools—Industrial technical schools—State industrial schools—Women's industrial schools—Industrial drawing schools—Lower trade schools in Temesvar—Manual training and home industry—Industrial museums.

II. *Commercial schools*.—Commercial schools for apprentices—Same for women—Higher commercial schools—The Oriental commercial school in Budapest.

The following is a statement prepared by Josef Szterényi, royal councilor and chief of division of industrial and commercial education in the department of commerce at Budapest. The statement is a fitting supplement to the statements regarding schools of this kind in central Europe, published in the Annual Reports of this Bureau of previous years, hence its early rendition in English, which is here offered:

A.—INDUSTRIAL INSTRUCTION.

HISTORY.

Industrial instruction in Hungary—that is to say, instruction tending to foster industries—reaches back several centuries, to the time when Christianity was introduced into the country.

The first beginnings of industrial instruction are found in the convents, especially in those of the Benedictines, who maintained regular workshops, each of which was the nucleus of a school in which knowledge of trades, skill in their pursuit, and love for industrial labor were fostered.

The first explicit information about these schools reaches as far back as the thirteenth century, in which, among the monks, a number of skilled architects were noted. Several now existing architectural monuments were planned and executed by Benedictine monks.

From the convents instruction with industrial tendencies spread to the cities, where in the fourteenth and fifteenth centuries several schools were maintained in which all the branches were taught that were considered essential for commercial and industrial life.

However, instruction with a decided industrial tendency may be said to have commenced with the introduction of systematic instruction in geometry, which took place during the sixteenth century. During the seventeenth century geometry was fittingly supplemented by the introduction of drawing. This branch was particularly promoted by the order of the Piarists, who already taught architecture and industrial drawing.

While during the preceding centuries industrial instruction was chiefly fostered in convents by religious orders, it became general in Hungary during the eighteenth century, and the entire educational

system was organized chiefly under the initiative of Empress Maria Theresa. She gave the impulse to the organization of State institutions of learning in 1774, but previous to that, in 1770, the Royal Drawing School at Budapest was organized; this is the first secular school of that kind in Hungary.

The new school organization was published in 1777. It required that every city should organize a national school in which drawing was to be an obligatory study, but other studies also were to consider industrial and commercial relations; this is plain from the fact that it was ordered to teach arithmetic with applications to commercial and industrial pursuits.

In 1779 a first attempt was made in Hungary to establish an industrial school combined with a workshop; that is, at a time when scarcely any of the Western nations had any, or at least very few, of such institutions, though these nations were much further advanced industrially and commercially.

At the same time humanitarian institutions, such as schools for deaf mutes and blind, promoted industrial pursuits by teaching certain trades, such as bookbinding.

In 1783 a noteworthy decree was published by the Government which required of cities the establishment of Sunday drawing schools, making it obligatory for apprentices in workshops to attend them regularly. This decree was accompanied by a detailed course of study in drawing with explanatory remarks. A court decree of 1795 made the one of 1783 more effective.

This second decree stated that upon penalty no master was allowed to receive a boy as apprentice unless he had passed through the elementary school, and that every apprentice should attend the Sunday drawing school for at least a year, otherwise he could not obtain his certificate of having completed his apprenticeship. Journeymen, also, were obliged to attend these Sunday schools for a year, for without a certificate of attendance upon such a school they could not become master workmen. Heavy penalties were inflicted if a journeyman had been admitted by any guild as master without having proved by documentary evidence that he had enjoyed a year's instruction in drawing.

In consequence of this royal decree instruction in drawing became general among apprentices and journeymen, and hence industrial instruction received a uniform organization.

This was the status of industrial education during the first half of the nineteenth century. At the close of this period a unique system of lower trade schools was established in Budapest and a few provincial cities in which apprentices were taught partly on Sundays, partly in the evenings of work days, reading, writing, arithmetic, book-

keeping, and drawing. At about the same time the capital city, Budapest, established a higher industrial school, which years afterward developed into the present polytechnicum.

The history of the system of special schools in Hungary during the nineteenth century is very rich in changes. The necessity of systematic instruction for industrial people made itself felt; both the State Government and society felt it. This led in 1872 to the passage of a law which made it a duty of apprentices to attend regularly so-called apprentice schools, and the law of 1884 made it a duty of communities to establish and maintain such schools whenever in any community there are 50 apprentices working in shops or factories; and the masters of trade are obliged to procure their attendance at these schools.

But the Government was not satisfied with the inauguration of lower evening and holiday schools. It was found of eminent importance to provide for schools in which foremen and masters of trade should be educated, to whom the special education of apprentices could be intrusted. Several schools of this kind were established for different branches of industry, such as for weavers, wood and metal workers, and for the ceramic industry; these schools furnished a considerable number of experts. But while all industrial schools were at first the result of private initiative they afterward became State institutions with the exception of apprentice schools, which through the law of 1884 were, and remained, communal or local institutions.

A glance at the following table will show the great increase in the expenditure on the part of the State for industrial schools. The State paid:

Years.	Through the department of commerce.	Through the department of education.	Years.	Through the department of commerce.	Through the department of education.
1868.....	\$500		1883.....	\$22,345	\$57,093
1869.....	1,500		1884.....	28,412	65,051
1870.....	2,600		1885.....	24,108	83,399
1871.....	2,705		1886.....	26,408	83,911
1872.....	2,450		1887.....	28,121	90,351
1873.....	3,200		1888.....	19,378	89,507
1874.....	9,400		1889.....	20,941	83,947
1875.....	5,012		1890.....	23,526	80,421
1876.....	8,363		1891.....	32,592	86,050
1877.....	8,230		1892.....	38,232	91,043
1878.....	8,042		1893.....	90,025	98,127
1879.....	8,600	\$12,499	1894.....	127,791	104,863
1880.....	8,860	12,710	1895.....	144,846	90,000
1881.....	7,792	23,865	1896.....	175,500	95,500
1882.....	16,694	42,002	1897.....	242,500	37,700

From these data it is seen that the State has increased its expenses for industrial education five hundred and sixty fold within thirty years. But it should be borne in mind that the State is not the only agency that supports this special education; cities, counties, and towns, and particularly chambers of commerce and industry, pay annually large

sums for the same purpose. In 1895-96 the apprentice schools alone had cost the communities \$254,297, of which sum the State paid nothing.

Thus, in the briefest possible outlines, the most important points are stated concerning the history of industrial education in Hungary; but enough has been said to show that the country is doing its duty in the field of special education in the interest of national economy, and a glance at the present conditions may serve to show in detail how these schools are managed and what they attempt.

ORGANIZATION.

Industrial education is organized in a complete system, all the parts of which are organically connected. Its organization is uniform though it makes allowance for local conditions and needs. It is divided into two main parts: (*a*) Apprentice schools and (*b*) technical schools proper. The former are under the control of the department of education, the latter under that of the department of commerce, which latter has a special bureau for industrial education, the chief of which is the royal superior-director. But both departments, that of education and that of commerce, have supervision of all the schools devoted to industrial education. Essential changes in the courses of study can be made only upon agreement of both departments. In order to obtain the best possible advice concerning questions of organization, curricula, choice of text-books, and devices for teaching, a board is appointed, called the State Industrial School Board, consisting of 32 members, partly professional industrial teachers, partly manufacturers and merchants, and some professors of the royal polytechnicum. This board is the highest advisory authority for the system of industrial schools. It is independent of the two departments, and acts under authority of a statute approved by the King.

The teachers of apprentice schools are usually teachers of common elementary and high schools, who teach in these evening and holiday schools for a small additional salary. The technical schools proper all have regular faculties, the members of which are regarded as State officers. The professors in schools for woodworkers, weavers, metal workers, and machine builders are graduates of the department of mechanical engineering in the polytechnicum; those in schools for stoneworkers and masons are sculptors and architects; those in schools for the ceramic arts are chemists, sculptors, and modelers. Each one of these teachers is sent abroad for a year or more at the expense of the State, before he is appointed definitely, to study his branch in noted schools of other countries, or he is sent to a university to enter as a student of a special branch. The professional preparation of foremen and work superintendents appointed in these schools is provided for in the same way. The department of commerce sends annually a number

of these teachers abroad to study the condition of the trades which their schools represent, and to visit schools of similar character, so that every teacher has a year's travel to study after three or four years of work.

The system of industrial schools consists of (1) apprentice schools; (2) journeymen's schools; (3) trade schools; (4) industrial technical schools; (5) higher industrial schools; (6) women's industrial schools; (7) industrial drawing schools or schools of design; (8) one public lower industrial school; (9) schools of general culture in which some industrial branches are taught; (10) industrial museums.

I.—APPRENTICE SCHOOLS.

These form the lowest step of the system and are under the control of the minister of education. Attendance at these schools is obligatory; it was made so by the law of 1872. Formerly attendance on the part of apprentices was obligatory only where such schools existed, but since 1884 the cities and towns having at least 50 apprentices were obliged to establish such schools and make attendance obligatory. Masters of shops and owners of factories failing in their duty to send their apprentices to these schools are liable to fines of 50 florins (\$25).

The law provides that the city or town councils must establish and maintain apprentice schools; the expenses are to be defrayed from fines and a special tax not exceeding 2 per cent of the State school tax. In cases where these sources are inadequate special subsidies are granted by the minister of education. County funds are established, the interest of which is used to support these schools. In urgent cases, even the capital may be used to establish them.

Every trade apprentice is obliged to attend these schools during the entire time of apprenticeship. They have three grades, and a boy may enter at 12 years of age, after having gone through the elementary school; but since many boys fail to go through the entire course of the elementary schools, many apprentice schools are obliged to have preparatory classes.

The instruction takes place in evening and on holidays, and is given seven hours per week—two hours each on two week days, and three hours on Sunday. The three hours on Sunday are exclusively devoted to drawing. The branches of instruction are (1) the mother tongue, (2) geography, history, and nature study, (3) penmanship, (4) arithmetic and bookkeeping, (5) drawing and sketching. The course is given in detail by the central government. If the religious communities desire to have these apprentices taught religion, they may do so, but they must do it at their own expense. In order to make these schools very effective, special courses for teachers are arranged. In 1895–96 Hungary had 366 apprentice (evening and holiday) schools with 72,676 pupils and 2,150 teachers. In places where there are not enough

pupils (50 to begin with), apprentices are obliged to attend the elementary continuation schools till they are 15 years old. The city authorities appoint a special inspector, usually a professional teacher, who reports upon the condition of the apprentice schools to the city council as well as to the State government. The Government inspects the schools through its own functionaries.

II.—SCHOOLS FOR TRADE JOURNEYMEN.

These schools are advanced apprentice schools; attendance in them is not obligatory, but they are well patronized in cities. Their maintenance depends partly on tuition fees, partly on contributions of city and State governments. The number of such schools is about 20 in the whole State; they have about 1,000 students, and are supervised like the apprentice schools.

III.—SCHOOL WORKSHOPS.

The workshops for apprentices form the second step of the industrial school system, but the first step of the system of technical education. They belong to the department of commerce. Their object is to supply the trades with skilled laborers and particularly aid the industries known as home industries in contradistinction to factory industries. The course is one of three years, except for boys preparing for special branches of work, for whom extra courses are arranged, lasting from three months to one year. The three year courses are both theoretical and practical, chiefly practical, of course. In drawing and designing much valuable work is done. About ten hours a week are devoted to theoretical instruction and about forty hours a week to practical application. Boys must be 12 years of age to be admitted and have completed the course of the elementary school. These school workshops differ from the manual training schools in this: They teach one or at most two trades, while in our manual training schools no trades are taught, but the use of tools and material is aimed at. In Hungarian trade workshops no theoretical instruction is given to boys who come to perfect themselves in certain branches of home industry.

Beside these workshops conducted as schools, there are a number of factory work schools, maintained by the owners of factories who intend to prepare their own workmen for special work. The workmen, chosen by the foremen or owners of the factory for the purpose of attending school, are paid like regular workmen.

Beside these, there are school workshops of a peculiar nature called wage work schools. The students of these take material home and bring the completed work to the institution. School workshops are connected with the following industries: (1) Weaving, (2) braiding, (3) stoneworking, (4) toy industry, (5) lacemaking, (6) ceramic industry.

IV.—INDUSTRIAL TECHNICAL SCHOOLS.

These technical schools are the youngest branch of the industrial school system and the most promising type of practical schools. They form the third step of the system, and their chief object is to aid Hungarian industry by preparing well equipped laborers of a high type who can act as master workmen and directors of factories. These technical schools (that, at least, is the intention) are to develop handicrafts by degrees into art industry. This necessitates, of course, a systematic, theoretical, and practical education. Each of these schools is provided with the necessary power machines.

The course is one of four years, except in the weaving schools, where it is of two years, and the locksmith's school, which has a three years' course. The theoretical instruction claims from 4 to 8 hours a week, drawing from 14 to 18 hours, and instruction in workshops from 20 to 30 hours, so that the whole number of hours of work per week is from 50 to 52. The theoretical lessons embrace general and technical branches, as is seen from the following schedule:

Time-table of Hungarian technical schools.

Branches.	Schools for woodworkers.				Schools for metal workers and machine builders.				Schools for stone workers and clay modelers.				Schools for textile workers.

NOTE.—To this must be added from 20 to 30 hours shop work per week.

The conditions of admission to these schools are as follows: The applicant must have completed his 12th year of age, and either have completed the elementary school course or the two lower grades of a

high school. In exceptional cases graduates of the apprentice evening schools are admitted. The weaver's schools admit only boys 14 years old. Many of the technical schools are boarding schools, having ample dormitories.

At the close of the course the students receive a diploma, which facilitates their employment and enables them, after two years' practical work as journeymen, to become master workmen. State factories and railroad shops prefer to employ the graduates of technical schools.

The schools for the building trades differ in essential points of organization from those described in the foregoing. They are not independent technical schools, but connected with some other industrial institutions. Their courses are either three whole years or four winter semesters, and during the building season the students are engaged in practical work. The graduates are only journeymen in their trades; to become masters in brick or stone masonry, stone cutting, or carpentry several years of practical work are required and a final examination before a trade board of examiners. Students who pass the four years' course in school may acquire the right to act as masters after another four years of practical work without examination.

The following industrial schools are found in Hungary:

(1) Two State schools for woodworkers in Homonna and Ujpest, in which cabinetmakers, turners, and wood carvers are prepared. Number of students in 1895-96, 17 and 14, respectively.

(2) Four schools for the wood and metal industry in Arad, Klausenburg, Marosvasarhely, and Szegedin. Besides the branches taught in (1), there are taught branches for locksmiths, art workers in wrought iron, and machine builders. In one of these schools (Klausenburg) stokers of engines and others are also taught. The 4 schools have together 318 students.

(3) There are 2 schools exclusively devoted to metal work. They are situated at Budapest and Gölniczbánya; number of students, 77.

(4) There are 2 weaving schools in Késmárk and Nagy-Disznod. The former applies itself to both hand weaving and mechanical weaving; the latter is devoted to wool weaving exclusively; number of scholars, 23.

(5) There are 3 schools for stoneworkers and the ceramic arts in Székely-Udvarhely, Zalatna, and Ungvár. In these schools stone-cutting, ornamental sculpture, clay pottery, tile making, and stone polishing are taught. The number of students in 1895 was 100.

(6) There are 2 watchmakers' schools at Budapest and Klausenburg; number of students, 47.

(7) The leather industry is represented by a school at Nagy-Szeben, in which chiefly shoemaking and saddlery are taught; number of students, 11.

Hence there were in Hungary, in 1895-96, 16 industrial schools, with 616 students.

In this connection it may be mentioned that a number of advanced burgher schools have opened workshops in which the boys are induced to occupy themselves with trade work, but though heartily supported by the Government, the idea did not find a like support among the people and with teachers who think that the general education offered in such schools should not be burdened with prosaic, so called, practical occupations. At first such shops were established quite numerous, but of late they have been abandoned, so that in 1895-96 there were only four schools of that kind left. It is generally thought best to let the children obtain a thorough elementary education, and after that induce them to enter practical pursuits in purely industrial schools.

V.—STATE INDUSTRIAL SCHOOLS.

As the highest step of the system of Hungarian industrial schools below the Polytechnicum at Budapest may be regarded the State industrial schools. They are advanced institutions aiming at a thorough preparation of foremen and factory owners. Their course is one of three years, but it has been found desirable to increase it to four years. Applicants for admission must have graduated from a burgher school or have passed through the four lower grades of a secondary school. In some of these schools practical experience in shops is required also. The students who pass the examination for graduation are thereby not only entitled to an abridgement of their military service to one year, but also to a preference in the appointment to subordinate offices in postal, telephone, railroad, and customs bureaus.

The best feature of these schools is found in the excellent facilities for practical shopwork offered the students. These shops are built on a large scale and contain the latest technical inventions. The organization of these schools is uniform except that in their time tables they differ, but only in so far as the local conditions require. Of the 48 to 50 hours per week of instruction, 20 to 26 are devoted to shopwork. Instruction is not gratuitous, but tuition fees are paid.

The school at Kassa is chiefly devoted to mechanics and machine construction, but teaches also electro-technique and political economy.

The school at Budapest is the largest institution of this kind in eastern Europe, having five distinct departments: (1) Architecture, (2) mechanical engineering, (3) chemistry, (4) metal work, and (5) wood industry.

The theoretical branches taught to the students of all the five departments are: Hungarian language, arithmetic, geometry and algebra, physics, chemistry, free-hand and instrumental drawing, machine construction, political economy, and bookkeeping. Each department of this school has, of course, its own course of study in practical work. The following lists will show how thorough that work is.

Course in architecture.—Architecture, architectural drawing, modeling, architectural geometry, materials, foundation laying, surveying, building mechanism, theory of construction, making estimates, bridge and hydraulic engineering, history of architecture, and practical shopwork.

Course in mechanical engineering.—Drawing from nature, mechanics, technology of wood, machine construction, constructive drawing, technology of metal, agricultural machinery and its drawing, surveying, railroad machinery, mill building, paper mills, electro-technique, and 21 hours a week practical shopwork.

Course in chemistry.—Modeling, general chemistry, inorganic chemistry, laboratory practice, organic chemistry, mechanical drawing, inorganic and organic technology.

Course in metal industry.—Free-hand drawing from nature, mechanics, locksmithing, simple iron construction, modeling, heating and ventilation, wells, pumps, fire engines; waterworks, electro-technique, and 24 hours a week shopwork.

Course in woodworking industry.—Modeling, drawing from nature, technology of wood, theory of construction, constructive drawing, and 23 hours a week shopwork.

The number of teachers in 1895-96 was 232. There were, in addition to these day courses, a number of special winter courses, one for the building trades with 143 students, and one for stokers and engineers for stationary and locomotive engines with 800 students. To these courses are admitted only men engaged in factories and shops.

A small State industrial school for joiners is situated in Brasso, the chief subject of study of which is artistic wood carving.

VI.—INDUSTRIAL SCHOOLS FOR WOMEN.

These institutions have the purpose of preparing women for suitable occupations or wage working. Their organization is uniform in essentials. Admission is granted only to those who have completed an elementary school course. In some of these schools for women theoretical instruction is given, which is, however, confined to the three branches language, arithmetic, and bookkeeping. Drawing is taught in every one of these schools for women. The course is one of two years, and tuition fees are charged. There are 11 of such schools, some of which are subsidized by the State, others are private or municipal schools.

VII.—INDUSTRIAL DRAWING SCHOOLS.

In other countries, notably in the United States, such institutions are called schools of design. This branch of the Hungarian industrial-school system is the most modest of all, comprising only a few institutions. Their object is exactly that of other schools of this kind in Germany, France, Austria, and the United States, namely, to raise

industrial art to the highest possible perfection by inventing new designs and new modes of introducing art into industrial pursuits. In 1895-96 these schools of design had 1,083 students, of which only 91 were women.

VIII.—LOWER INDUSTRIAL SCHOOLS.

At present there is only one lower school of this kind. It is located at Temesvar. It prepares young boys for entering shops as apprentices. It has 238 students. It is the intention of the Government to raise this school to the dignity of a secondary school as soon as the funds available reach an amount which will permit doing so.

IX.—MANUAL TRAINING.

Schools of this kind are so well understood in this country that a description of course and organization is not necessary. There were only four of them in Hungary in 1895-96. Separate buildings are used for the boys, who come from their day high schools for a specified number of hours per week to get instruction in cardboard and wood work.

X.—INDUSTRIAL MUSEUMS.

These museums are mentioned last because they are not, properly speaking, schools, but aids for all industrial schools of the State. There are four of them—in Budapest, Marosvasarhely, Klausenburg, and Nagy-Szeben. A general exhibition of all industrial arts is open all the year round; special exhibits of the products and methods of separate trades are arranged for in each of these museums, and lectures to the workmen, foremen, and masters of shops and factories are held at certain times, which are well attended. Naturally each industrial technical school has, if not an extensive museum, certainly the nucleus of such an institution, just as a school has its own library.

B.—COMMERCIAL INSTRUCTION.

The history of commercial schools in Hungary is briefer than that of industrial schools. The oldest statements concerning commercial education date from the beginning of the eighteenth century. They plainly show that there were in existence at that time some commercial schools, but they were conducted by monks. In the middle of the nineteenth century an agitation took place in favor of commercial preparation which resulted in the establishment of schools for that purpose. But during the decade from 1880 to 1890 the greatest activity was shown in that direction, owing to the phenomenal expansion of trade of neighboring nations. While industrial education has become exclusively an affair of the State, commercial education has been left to the initiative of societies and private persons. The State merely

points the way in which these schools shall develop, and secures that prerogative by State subsidies.

The system of commercial schools in Hungary may be said to be divided into three steps or grades: Commercial apprentice schools, commercial courses chiefly arranged for women, and secondary commercial schools or colleges. Besides, there is an institution of special organization and purpose, the Oriental Commercial Academy. At present all commercial schools are under the direction of the minister of public instruction, who directs them in agreement with the minister of commerce with reference to questions of organization and course of study. There is a motion pending in parliament to place these schools under the exclusive direction of the minister of commerce.

I.—COMMERCIAL APPRENTICE SCHOOLS.

These schools are in essentials identical with the industrial apprentice schools. The law which makes attendance obligatory in industrial schools includes also commercial schools. Both are evening and secular Sunday schools. The vital difference between these two kinds of schools is found in the course of study. The following branches are taught to commercial apprentices: Reading, copying, geography, commercial arithmetic and office practice, banking and correspondence, bookkeeping, physics, knowledge of merchandise, elements of political economy, and penmanship; together, 28 hours a week.

In 1895 Hungary had 74 commercial apprentice schools, with 344 teachers and 4,699 students. In places where not 50 apprentices are found to establish such a school the apprentices are required to attend the industrial school, where they will receive special attention as commercial students.

II.—COMMERCIAL COURSES FOR WOMEN.

These schools are not separate institutions, but connected with city schools, in the upper grades of which special preparation is offered to young women for entering upon accountant's duties. The courses last ten months each, and are arranged for in different schools every year. The branches taught are commercial arithmetic, bookkeeping, banking, correspondence in Hungarian and German, knowledge of merchandise, commercial geography, and penmanship. In 1896 there were 16 of such courses given, in which 592 girls took part. Like the commercial and industrial apprentice schools, these courses are under the supervision of the minister of education.

III.—SECONDARY COMMERCIAL SCHOOLS.

A higher step of commercial education is formed by the secondary schools devoted to this purpose. Their course is one of three years. Only graduates of burgher schools and students of classical and

modern high schools who have passed through the first four grades are admitted. A rigorous examination at the close of the course, conducted under supervision of the two departments—that of education and that of commerce—decides upon graduation and the granting of a diploma, which ranks equally with the diploma of any other State secondary school. This diploma also entitles the holder to one year's army service, instead of three years. It is instructive to see the distribution of time devoted to the various branches of study. The course is given below. During 1897 Hungary had 35 of such secondary commercial schools, with 4,983 students. The total expenditures for these schools amounted to \$125,000, of which amount the State contributed \$39,000.

IV.—HIGHER INSTITUTION FOR ORIENTAL COMMERCE.

There is one higher institution of learning in Hungary (Budapest), the purpose of which is to train young men for independent positions in the commercial world and for administrative offices, consular service, etc. It offers specially fine opportunities for learning oriental languages and commercial practice. Its course is one of two years. Admitted as regular students are (1) graduates of any secondary commercial school, (2) graduates of classical secondary schools, and (3) commercial apprentices who have at least a four years' practice and can prove that they possess the knowledge of graduates of a secondary commercial school. As a hearer, may be admitted anyone who is

engaged in commerce and proves that he can take part in the studies with profit to himself.

The following studies are found in the course: Roumanian, Servian, Bulgarian, Turkish, Modern Greek, and Italian languages. Each of these languages is taught six hours a week, except Italian, to which only four hours are devoted. A regular student must choose at least two of these languages. Besides linguistic branches, the following are taught two hours a week each: Ethnographical and historical description of the Orient; commercial geography; tariff duties and foreign commerce in connection with legal questions concerning consular service; transportation; the French language, three hours, and special commercial branches, three hours. The students also undertake, annually, journeys and voyages into oriental countries to study the status and methods of export, and other things necessary for thorough men of commerce and for consuls. The expenditures necessitated by these journeys, as well as all other costs of the school, are borne by the State.

XV. CORPORAL PUNISHMENT IN THE ELEMENTARY SCHOOLS OF PRUSSIA.

During the year 1898 two criminal cases were tried in courts of Prussia in which the defendants were teachers accused of maltreatment of pupils such as pulling out of hair, boxing ears which resulted in the destruction of the child's eardrum, excessive caning, and other improper punishment of pupils. The defendants were found guilty and fined 150 marks (\$35.70) and costs, including expenses for medical treatment of the injured children. The courts in rendering judgment stated that the defendants had acted contrary to law and the regulations which define the limits within which corporal punishment may be inflicted. The law referred to is merely the common law derived from judicial decisions in the past, and the decisions rested chiefly on departmental regulations which date back to 1859 and have been subject to frequent changes. The most authoritative regulation dates back to 1888. It is similar to regulations in force in American schools, where corporal punishment is not prohibited. The courts further said that as officers of the State, acting "in loco parentis," these teachers had overstepped the limits of their prerogatives, because they had gone beyond that which is allowed a father, and as teachers they had acted unpedagogically and unwisely.

The cases referred to assumed an unenviable notoriety, owing to the brutality displayed by the defendants, and they, as well as frequent complaints of other cases of excessive punishment which were not brought before the bar of justice, induced the minister of public

instruction, Dr. Bosse, to issue a new regulation, which, in absence of a state school law, had legal force. It was dated Berlin, May 1, 1899, and read as follows:

The supervisory school authorities, as I willingly acknowledge, have hitherto seen to it that excessive corporal punishment in the schools was avoided, for careful inquiries have proved that such cases have been rare in the past, and that few corrective measures on the part of the authorities have been found necessary. But lately a few cases of cruel punishment have occurred which induce me to call the attention of supervisory school authorities to this matter, and to urge them to use all their power to prevent excessive corporal punishment of children.

The prerogative of a teacher to punish his pupils corporally, if necessary, is not questioned. But it should be impressively urged that such punishment is to be applied only in extreme cases, after all other disciplinary means have been exhausted, or in cases of grave misdemeanor, and that in no case should punishment degenerate into maltreatment dangerous to the health of children. It seems desirable to remind teachers of the provision in existing regulations which allows the use of a thin rod or cane in chastising, but excludes the use of rules or blackboard pointers; also that hitting with books, slapping the face or head with the hand, knocking the chest or back with the fist, pulling the hair or ears, or violently shaking the children, and similar acts make teachers amenable to the law. Furthermore, that punishment without cause, frivolous or habitual punishment, especially the application of chastisement for poor work, lacking talent, or for insignificant faults of children, should be severely dealt with by the authorities.

In order to prevent abuse of the teacher's right to punish in a school at the head of which is a rector (or head teacher), I decree that corporal punishment shall take place only with the latter's approval. In other schools such punishment shall not be resorted to except with the consent of the district school inspector. Wherever this is made impossible by local circumstances, the inspector shall at once be notified of cause and kind of punishment in each case. Young teachers, acting only provisionally, must not be placed in positions where they are alone and without immediate authority over them. Under no circumstances shall the right to punish corporally be granted to them.

Above all, the abuse of the right to punish and improper application of corporal punishment is best prevented when the teachers manifest their moral influence through instruction and training, and when they adhere to the principle that corporal punishment (aside from grave but rare infractions) had best be avoided. School children certainly should be trained and kept in good order and discipline; but the means to that end are not found in bodily chastisement; they are rather found in the personality of the teacher, in his moral influence, in his methods of teaching, and in his manner of maintaining external order. Where the ethical character of a teacher, his conscientious discharge of duty, his earnest but amiable treatment of children, his thorough instruction commands the esteem and awakens the love of the school toward him, experience teaches that the causes of corporal punishment disappear, except in rare cases of degeneracy. On the other hand, in schools where corporal punishment is resorted to frequently, the cause is invariably found in the teacher's grave errors in conduct and official acts, in his instruction and manner of training.

I hereby order the provincial authorities to instruct the district school inspectors to discuss this matter with the teachers of their districts during regular meetings, to warn them not to abuse their right to punish, and to instruct them regarding the proper means of successful school discipline, as well as the correct application of corporal punishment.

Teachers found abusing their right to punish should be severely dealt with by the

supervisory authorities, for parents must not lose the confidence that their children will be saved from improper chastisement, and receive loving parental treatment, though kept under firm discipline.

Scarcely had this been published when the teachers were up in arms against the new rules, that the school principal or, in cases of ungraded schools, the school inspector, should be asked for his consent in every case of corporal punishment, and that every such case of punishment should be reported to the local supervisory authorities. Frequent meetings were held, and the new regulations severely criticised. The argument was advanced that they undermined the teacher's authority, and in times in which, through socialistic agitation, all governmental authority was placed in question it would be hazardous to curtail the teacher's disciplinary power. It was further argued, both in teachers' meetings and in the press, that the changed industrial conditions which diminished the parental influence, through the father's and often, also, the mother's absence from home, demanded an increase rather than a diminution of the teacher's prerogatives, who stood "in loco parentis." Petitions were addressed to provincial governments which set forth the impossibility of the teachers to perform their duties as instructors and educators if the new regulations were strictly carried out. Delegations waited upon those high in authority, and even the minister himself had to listen to protests from teachers. This led to a new publication from the minister, dated July 27, 1899. It reads as follows:

My decree of May 1 concerning the application of corporal punishment in elementary schools has created doubts which induce me to return to the subject. The decree starts with the declaration that the teacher's right to punish corporally in necessary cases is not questioned. I am chiefly concerned in making provision that this last and extreme means of discipline be limited to cases which absolutely require it, and that every violent and inhuman excess be prevented.

The ethical reason for corporal punishment in school rests upon the parental right of education and training transmitted to the teacher, without which right the school could not accomplish its educational task. School discipline should under all circumstances bear the stamp of parental discipline. Viewed from the standpoint of principle, the educational limits for the application of corporal punishment through the teacher are plainly seen in each individual case.

The advice that every teacher must, as far as possible, try to make the application of chastisement unnecessary, through the influence of his word and his whole personality, has of late been sadly neglected. Severe bodily punishment is often counted among the requisites of daily school life and as a condition of good class results. While it is certainly true that in cases of innate brutality, unyielding defiance, and confirmed indolence occasional chastisement may not only be beneficial to the individual pupil but serve as a warning example to his schoolmates, it is equally true that habitual application of severe punishment for slight misdemeanors or in cases of want of intellectual capacity, particularly if the application occurs in classes attended by both sexes, will not only not prevent the degeneration of youth, but, by deadening the feelings of the pupils, lower the moral atmosphere of the school. This is especially true among children to whom school is to offer that parental care which is lacking in their homes. Experience confirms the fact that the best teachers

make least use of their right to punish corporally, and that young, inexperienced teachers succumb to the temptation, often dangerous to their own future, of attempting to aid unsatisfactory efforts on the part of the pupils by frivolous and frequent use of the rod.

A number of cases of improper and extreme punishment have been recently brought to my knowledge, some in which, owing to sickly conditions of the children, chastisement has led to fatal results, and these cases show the necessity of emphasizing the limits within which the application of corporal punishment is allowable, to call attention to the portentous responsibility of a teacher in this respect, and to take measures to prevent habitual and frivolous use of the rod without grave cause, as well as application of chastisement in moments of anger or any sudden fit of emotion.

But there is one point in my order of May 1 to which serious objection is raised—i. e., the regulation that a teacher should first secure the consent of his principal or school inspector before he resorts to corporal punishment. This point has found incorrect interpretation in public discussions, since it would be entirely within the limits of the order, if teachers secure the consent of their superiors during a general discussion concerning the conditions of their classes, so that they may resort to corporal punishment at once in cases of emergency with degenerate pupils. Such consultations may result in the most ample permit on the part of the superiors to inflict corporal punishment for cruelty, insubordination, and laziness of certain pupils known to require such treatment at times.

In general, however, and as a rule, I should like to see the instructions of my order of May 1 carried out—namely, that any chastisement made necessary by serious misdemeanor be applied after school hours, and after consultation with the head teacher, principal, or inspector, as has been the rule for many years in the counties of Merseburg (order of April 15, 1863), Köslin (order of February 24, 1868), and Königsberg (order of April 14, 1860), which rules are found in Schneider and von Bremen, Volume III, page 244. The views contained in these local regulations are essentially the same that I desire to see accepted for the use of corporal punishment in the entire State.

In the press cases are reported of parents who made their children acquainted with my order of May 1, in a manner calculated to undermine the teacher's authority in the eyes of those who are intrusted to his parental discipline. I hope that such cases, if they have occurred at all, will remain isolated, and I acknowledge expressly that in so serious a danger to school discipline any teacher shall be unhampered in the application of his legal prerogative to punish pupils. Any teacher who is confronted with such a case—i. e., in which parents question his legal right to punish corporally—may consider himself free from the barrier of a previous consultation with his superior, and resort to such punishment. In explaining my order of May 1, the authorities are asked to make this clear to the teachers.

If malevolence and indiscretion should thus make it impossible to the department of education to check excesses of the teachers' right to punish by occasioning greater evils of insubordination, the department would wish to be free of the responsibility for cases which gave rise to the order of March 1. In general, I have confidence in the self-control and fidelity to duty which the Prussian teachers have so often shown under the most difficult circumstances, and which will also show them the lesson to be learned from the experiences of recent years.

As regards provisionally appointed teachers, I repeat that they should not be placed in schools without a principal or rector. If this is unavoidable, it is most desirable to make wise selections and choose only such young teachers as have given special evidence of faithful discharge of duty and of self-control. Such teachers may then be treated with equal confidence concerning corporal punishment as other teachers.

This explanation on the part of the minister essentially modified his first order, but it did not satisfy the teachers. To American teachers this would seem strange, but there is a feature of the Prussian school administration not generally understood in this country, which explains the deep-rooted dissatisfaction among the teachers with the minister's order and subsequent amendment. It is this: The rector or principal of a public school in Prussia is the superior of the other teachers in his school only in formal duties, such as assignment of pupils, collecting and summarizing reports, representing the school on festive occasions, and acting as chairman in faculty meetings. He has no right to interfere in the instruction of the teachers, they being to all intent and purposes his equal as educators. The teachers claim that asking for his consent in cases of corporal punishment is equivalent to giving the principal disciplinary power over the teachers, a power which they are unwilling to grant, and which the authorities have hitherto prevented. The teachers are in professional training and social standing equal to the principal of the school, and may at any time be promoted by the school board to positions as rectors or principals. These considerations led the teachers and the press, both professional and political, to further remonstrances addressed to those higher in authority, and the frequent cases of insubordination and defiance among the pupils in large cities whose parents belong to the socialistic party, one of the chief principles of which is the inviolability of the dignity and integrity of the individual, gave strong emphasis to the remonstrances.

In the midst of these contentions came the resignation of the minister of education, Dr. Bosse. One of the first acts of his successor, Dr. Conrad Studt, was to rescind the order of his predecessor. He did this by means of the following rescript, dated January 19, 1900:

The execution of the orders of May 1 and July 27, 1899, referring to the teachers' right to punish, contain provisions which have caused such difficulties and objections that I feel constrained to rescind these orders, and it is done herewith.

The right to punish on the part of men and women teachers and the mode of exercising this right, are, as heretofore, based upon the legal acts in force and the two orders explaining the legal provisions. Said orders are those of April 3, 1888, and October 22, 1888, in both of which proper instructions are given to teachers concerning the manner of exercising their prerogative.

Teachers who are found guilty of excesses and improper application of the right to punish can not hope to receive mild judgment from me. Like my predecessor, I expect faithfulness to duty of all the supervisory authorities (school councilors, district and local school inspectors, rectors, and head teachers), and that they will insist upon a sober-minded, strictly legal application of the right to punish, a right which is granted for exceptional cases only. I expect that they will relentlessly oppose every misuse of the right in question, and furnish young teachers with proper instruction and advice, so that unjustified and excessive application of corporal punishment is obviated.

Teachers, both men and women, shall immediately after each lesson enter a memorandum of each applied chastisement, with a brief statement of its cause or necessity, in a register prepared for the purpose. The supervisory officer, or principal, shall

countersign this register at every visit to the schoolroom, after having taken cognizance of the new entries, if there are any. If doubts arise in his mind concerning the propriety of any cases of punishment, or the frequency of their occurrence, he shall discuss the matter with the teacher.

Any teacher who fails to make the entries, or who persists in exceeding his legal right by improper or too frequent use, despite the warning he received from his superiors, shall be temporarily or permanently deprived of the right to punish independently.

One of the most effective means to accustom young teachers to a conscientious use of the right to punish is found in thorough instruction concerning this point during the normal school preparation. I therefore urge the provincial governments to make it a duty of directors of normal schools to give special care to this subject during the course.

It is reasonable to suppose that this last-quoted order of the new minister will be the final word in the matter, though there is still occasional grumbling heard in the educational press of Prussia over the new duty of keeping a "whipping register," and "to spend precious minutes in making entries after each lesson."

XVI. FROEBEL'S SYSTEM OF EDUCATION AND THE SPREAD OF THE KINDERGARTEN.

By BARONESS VON BÜLOW-WENDHAUSEN.

NOTE.—The author of the following article recently visited the United States, where she delivered a number of lectures to people interested in kindergartens and Froebel's System of Education. In reply to certain opponents of the kindergarten in Germany, she published a statement in the "Dresdner Anzeiger" in which is given an account of the rapid growth and expansion of the kindergarten in different parts of the civilized world. On account of the valuable information it contains, it has been deemed advisable to reprint the article here in English.

A more interesting study than that of the development of man can hardly be conceived. That it receives less attention than others is probably due to its not being considered of more importance in the customary course of instruction in history.

The history of civilization teaches that the development of man has been one of uninterrupted progress, but always in one direction or another, never in all directions alike. In this way mankind has been led from one epoch to another.

Modern German history, the history of our civilization during the past 150 years, records the most widely different epochs. A period of research, investigation, and the philosophy of Leibnitz and Kant was succeeded by one of poetry; Schiller, Goethe, and a host of other writers, exerted their influence on mind and heart. Every chord of feeling vibrated strongly in the anguish of the Napoleonic period, and in the self-sacrificing patriotism and enthusiasm that mark the closing century.

This powerful exaltation of mind and heart, the inclination toward

“deep introspection,” and the delight, verging upon sentimentalism, in all that is spiritual, noble, and beautiful, was followed by a reaction. Comparisons between ideal views and the facts of existence were instituted and produced a discord manifested in a discontent with real conditions, which was heard finally in the confusion and unrest of the middle of the century. Poetry was forced into the background and replaced by a far-reaching materialism. Then, before the change could be realized, a period of sober investigation, invention, and practical effort, a period of machines, and thereby an entirely novel and intensely surprising epoch in the history of civilization, had dawned.

The consequences were an increased demand upon the greater capacity of performance, and the attendant necessity of a general and broader education. The demand for more knowledge forced schools to introduce a larger number of studies, and in a short time the mental strain on children justified the most anxious fears. General over-taxation of the mind brought on nervousness, which, with all its evil consequences, and in combination with the new conditions of life, began to fill hospitals and insane asylums. In schools the effort was made to counteract the mental strain by physical exercise. Gymnastics, games, and manual training were introduced in the courses of study. However, the better development of the senses did not greatly manifest itself; intellect, power of observation, and mechanical skill—that is, facility in the use of the hand—were not cultivated to an adequate degree. The capacity of the individual was not brought up to the required level. The disproportion between desire and ability led to the most distressing and alarming conditions of individual and public life; and the struggle for subsistence brought on the despairing egotism from which the present is suffering. To-day, the most optimistic observer of present conditions can no longer fail to conclude that education and the preparation for the duties of life and labor are insufficient; he must admit that new times demand a new education. History also teaches that every new epoch with its new demands produces a prophet competent to teach the world what it needs to know. The prophet of a new system of education was not lacking. Friedrich Froebel was that prophet.

Baroness von Marenholtz-Bülow says:

The genius of mankind descends to earth in an individual almost always unnoticed, and only after his death is his importance recognized.

Thus it was with Friedrich Froebel. Unnoticed, he was a genius gifted with all the talents necessary for his mission. Somewhere in a small principality of Thuringia, but in the very heart of Germany, this simple old man inquired into human existence. Into the ebb of insufficiency and the midst of the ever-increasing necessity of higher competency and greater labor capacity he introduced the new system

of education which made possible a better development of all human powers or talents, mental as well as physical. Froebel said to himself: "It is not right to consider only the physical development of a child during early youth. As body and mind are born together, both must form the very beginning, and be appropriately assisted in their growth. This assistance must be given in the order of nature. What is natural with a young child? Play." Further on he says: "If to-day's neglect can not be made good even the next day, and especially with children, because of the rapid strides of their early development, then, in order to lose nothing, we must begin at once to assist them. But how can we influence a young child and an infant at the breast? Only by proper impressions, then by proper play, and later, but long before instruction by word is possible, by the child's own actions."

Froebel closely watched the being of a child in all its manifestations (impulses); and while studying the history of man's development, he learned the requirements of the individual's development. "As the species develops, so also does the individual in plant life, in animal life, in the life of man."

Froebel found the spring of his "new education" in the history of education. Basing his system on the progress of mankind in its infancy, he educates and instructs children by giving them, in the same order of succession, the occupations and manual exercises followed by mankind in its development.

All development is the result of action, or, as Froebel says, of work. His genius enabled him to discover the law that governs all work. He called it the formative law, and reasoned that man can not work differently from nature, as he himself is a product of nature, the highest "spiritually endowed." When he discovered the law, he ingeniously applied it to education and thereby made it possible for a child to be a "creative power," as he expressed it, even if only in play. In origina-tive play, children learn the suitable helps and in their action apply them toward their own development and instruction in the most childish way. These beginnings should be made in the nursery. If a child has so far advanced as to move about freely and joyously as an independent creature, if the first grade of the new education has been passed on his mother's knee, Froebel offers the places where it can rank among those of its own age as a "member of the whole," in order to be able to live its own life and develop in its childish way by playing and by its own action. "Power is won in flight," says the poet.

The places where this is offered and attained Froebel calls "kindergartens." In her Collection of Thoughts, Baroness von Marenholtz-Bülow says:

The regeneration of man must commence with the regeneration of children. The dominating egotism of the present must be replaced by true public spirit and an all-embracing love; all labor must be more or less transformed into creativeness

(Schaffen) by unshackling the inventive power. Creativeness lifts man up to the likeness of God and insures him the greatest possible happiness on earth. * * * In the kindergarten, egotism can not easily prevail. Self-denial and sacrifice are voluntarily and without coercion brought by the spirit of love into a community whose very existence demands self-control. The charm of unaccustomed surroundings and a large number of playmates lead to proper behavior.

In another place she says:

To call that which is beautiful and good into existence is the greatest happiness of man and, at the same time, the highest pleasure of childhood. To give children this happiness, this greatest pleasure, in their earliest youth is the aim of the kindergarten, followed by the school and youth garden.

These words explain the essence and significance of the kindergarten.

In 1852 the genius returned to its heavenly home; Froebel died, still unknown, but in full confidence that his doctrine would live on. On his deathbed he exclaimed: "A truth can not die." He was right. At the time of his death there were about sixteen kindergartens in the world; now, not fifty years later, these institutions encircle the globe. They are firmly established not only in Europe and America, the two continents representing the highest civilization of the present, but many Mongolian, Malay, and negro children are happy in their kindergartens. How happy we learn best from their own immature judgment. Not long since I heard a child say to its mother:

It is too bad that the kindergarten only keeps in till 4 o'clock and is not open on Sundays and during holidays. It ought to keep in always and all the time until we go to bed, and begin again every day early in the morning.

Mothers appreciate the value of kindergartens; not lazy mothers, but just those who do honor to their title and are educators of their children in the true sense of the term. Children would not speak so enthusiastically or go to kindergarten so willingly, nor would their mothers extol their educational influence if kindergartens did not offer to children what their innermost nature demands.

Unknown—in truth! When Froebel closed his eyes few had any suspicion of the significance of his teaching for educational reform. The ridiculous suppression of kindergartens in Prussia (Froebel, as we know, had been mistaken for his nephew, who was politically compromised) drew attention to kindergartens for a short time; but, says Baroness von Marenholtz-Bülow, their introduction into Germany was thereby made almost impossible. A few prominent men, it is true, supported Froebel and his ideas in speech and the press. But it is an accepted and well-known fact that but for Froebel's enthusiastic disciple, Baroness von Marenholtz-Bülow, a long time would have elapsed before the introduction and spread of kindergartens. We must not forget that 1852 was only the beginning of the era of

machinery, and that the greater part of rough labor was still done by hand. It was only during the following decades that a better preparation for labor, now general, became a burning question.

The publication, *Bertha von Marenholtz-Bülow and her Life*, gives a detailed account of the introduction of kindergartens, an isolated example of its kind for all times. An upheaval of what had been fixed for centuries, by a novel thought that was to penetrate the development of coming generations and, though acknowledged by all to be a necessity, still meeting violent opposition, proved the adage: A prophet is not without honor, save in his own country. The introduction of the new idea was not to be effected as though "from above" or by energetic men, but by a woman who herself modestly uttered the complaint, "Who will believe a woman that it must be so and obey her?"

Froebel met her in May, 1849, at his country seat in Liebenstein, and she at once grasped his ideas with unbounded enthusiasm. Dr. Wichard Lange reports the event in the *Rheinische Blaetter*, of 1867, in his characteristic style:

The moment in which the intellectual baroness crossed his threshold at Liebenstein was a most important one for Froebel and his mission. The moment was decisive for the progress and spread of his work in many ways. A woman of unusual mind, possessed of a fine and thorough classical education, offered her whole life and being to this mission and formed the never-wavering resolution to devote her whole material and intellectual resources to the carrying out of these ideas. She made the effort to learn all the secrets which lay buried in the soul of the pedagogical genius and to which she so often knew how to give intelligent expression.

In another place Lange continues in the same terse language:

Well equipped, she made her appearance on the great stage of the world, not, at first, as a speaker and writer, not with ostentation and pretension. She drew a sharp line between personality and cause, wanted nothing for herself, no advantages, no honor, no riches. Her name was to remain unpublished and was not to be mentioned when merit was to be won. This timidity which seems to be innate with the best and most excellent women she was forced to set aside later; her friends were not so discreet as herself. The entrance into public life of such a woman for so great a mission did not seem to them an offense against womanly dignity. They recognized in it rather a powerful means toward the general promotion and realization of Froebel's ideas of education. So she spurred and was spurred until, in the end, she was willingly and generally acknowledged the chief representative and actual apostle of the kindergarten cause. Her method of work is above comparison. Intellectual and idealistic, as she was, she never hesitated to move in the lowest strata of society whenever the good of her cause was at stake. Position and birth admitted her to the highest circles; mind and talent fitted her in an eminent degree to move among the first of every nation. She effected just as much by her inspired words as by her personal appearance, practical views, and excellent suggestions. Princes and others in power were forced to speak with her. "Knights of the intellect" felt it imperative to argue with her and publicly express their opinion. What can not such a woman attain! Ten men could not have done what she accomplished. The revocation of the ban against kindergartens published by a Prussian cabinet is due to her

alone. She carried the fundamental ideas of these institutions into England, France, Holland, Belgium, Switzerland, Austria, and Italy. It seemed almost as though the German thought was destined to be transplanted into foreign soil, there to be first developed and then reintroduced into Germany. Germany, however, did not hold back; nevertheless, what has been done on native soil is due more to Baroness von Marenholtz-Bülow than to all the other representatives of the Froebel cause.

Now, let us trace the growth of the kindergarten. In the year 1854 an exposition of educational material was held in London. Baroness von Marenholtz-Bülow exhibited the whole Froebel kindergarten material, together with an explanatory statement. Soon afterwards she visited England herself. During a stay of six months she delivered a number of lectures and interviewed representative men and women to urge them to establish a propaganda for the Froebel cause. The first article on the subject in the English language was written jointly by her and the Countess of Krockow; and was entitled: *Woman's Educational Mission*, being an exploration of Friedrich Froebel's system of infant gardens (Darton, London). Several kindergartens were established at the time; since then they have not only become a firmly rooted institution in England, but are very much in favor, and kindergarteners are trained in various institutions. Names like Miss Emily Schireff, Miss Eleanor Heerwart, Mr. Lord, Mrs. Salis Schwabe, Miss Snell, Mrs. Michaelis, Mr. Karl Froebel (Edinburgh) and others are connected with the movement. Kindergarten associations have been formed and many articles explaining the idea published.

In January, 1855, we see the baroness in Paris, astonishingly active. The cardinal of Tours, Mgr. Marlot, later archbishop of Paris; the celebrated Marbeau, the founder of protective associations for children; the patriotic counselor of the consistory, M. Martin Pachon, and the philosopher and economist, M. Fourier, with his disciples, were among the many soon won over to her cause. The minister of public instruction was prevailed upon to appoint a committee for the investigation of the method, and the practical demonstration proved altogether satisfactory. Through the philanthropist Jules Mallet the system was introduced into different Catholic asylums; schools and convents accepted it. The Empress Eugenie herself became interested. The best representatives of the press considered the question. The editor, M. Riche Gordon, founded a paper, *La Science de Mères* (mothers' science) to further the Froebel scheme. She herself wrote the celebrated pamphlet *Les Jardins d'Enfants* (the kindergartens), which has been translated into many languages, and was at once published in Spanish. She delivered more than a hundred lectures, working early and late. Representative men from the highest to the lowest stratum of society, leading scholars like Edgar Quinet and the historian Michelet, whose hundredth birthday was celebrated by the world of letters in every country, became her friends. In the beginning of

his beautiful work *La Femme* (woman), Professor Michelet writes of his first reception of the Froebel idea:

It is not enough to promote natural energy (Rousseau, Pestalozzi, Jacotot, Fourier, etc.); it must be encouraged by preparing its course of action. That is what Froebel's genius discovered. When last January, his amiable disciple, Madame von Marenholtz, explained his doctrine to me, at her first words I recognized it to be the education for our times and the only kind with a claim to truth, etc.

When the baroness left France, the Froebel system had been introduced into Paris and many of the smaller cities, and was indorsed by all thinkers who form the widest social circle. (See *Labor and New Education*, by Baroness von Marenholtz-Bülow and Louis Walther.) Satisfactory progress was made in France during the next ten years, but at the breaking out of the Franco-German war, France became a child of sorrow to the Froebel cause. This could not pass out of existence, for "a truth can not die." But the German names *kindergarten* and Froebel were rejected because of the hatred against Germans. Nevertheless, whether the kindergarten continues to exist in the method of Madame Pape-Carpentier under the name of maternal school, or whether the "methode intuitive" borrows all from Froebel and then impertinently derides his "German sentiment," the kindergarten remains, though somewhat altered to its detriment. The time will surely come when the inevitable change on earth shall subdue the violent hatred. If I be right, it seems to be already gradually coming. Froebel will then again receive his deserts in France, and his, the only true kindergarten, will again flourish in that country. In the meantime the French Government has twice sent teachers to the Froebel Institute, in Dresden, to become acquainted with its organization and mode of procedure.

In 1857, we find the baroness in Belgium, by invitation of the aged President Rogier. Here again she manifests the same energetic spirit for work. Here again the committee of investigation expresses approbation. The system is introduced into different protective institutions, schools and convents, even into Jesuit monasteries. As early as then, kindergartens were established in Brussels, Ghent, Antwerp, Namur, Nivelles, etc., and normal kindergartens founded. In this country, the baroness wrote her popular work, *Manuel des Jardins d' Enfants*. Since then kindergartens have continued to flourish in Belgium; compulsory attendance has obtained for thirty or forty years.

Leaving Brussels to visit her royal friend, the Princess Henry of the Netherlands, the latter afforded the baroness the opportunity of introducing kindergartens into Holland. In Amsterdam, she spoke before the Society for the Common Weal, and won over to her cause ministers of state Van Rochuszen and Van Thorbecke, besides many prominent and intellectual men and women. The system was at

that time introduced into the renowned deaf and dumb institute of Rotterdam; kindergartens were also established in many different places. The interest manifested by Madame van Calcar was most important for the cause; she never ceased to exert her influence for its advancement. On a second visit in 1864, when the baroness spoke before the congress of the Society for Social Science, in Amsterdam, Madame van Calcar showed her several well-conducted kindergartens in that city and in The Hague. The institutions have since aroused public interest, and Holland at present boasts of many normal institutes and kindergartens in all its cities.

The aforementioned congress convened again in 1865, in Berne, Switzerland. The baroness, who was present, aroused an interest in kindergartens. Professor Raoux, of Lausanne, became their zealous advocate; Madame von Portugall espoused their cause in Geneva, and Miss M. Bachmann worked for them in Berne. For over thirty years kindergartens have been in general favor throughout French and German Switzerland.

As early as 1859, the baroness worked for the cause in Alsace. With the assistance of the Köchlin ladies the first kindergarten was founded in Mülhausen. The value of the system for a manufacturing town was easily recognized. Much has since been done for kindergartens in Alsace. Madam Löper-Houselles is even now an earnest worker in Strassburg and other cities.

The first kindergarten in Spain was established about 1859 or 1860 by a Miss Gräfl. Professor del Rios taught Froebel's ideas at the university, and during the seventies Count Vale de San Juan studied at the Froebel Institute in Dresden, to introduce the system into Spain. Recently several graduates of the Froebel Institute went to Spain; one of them taught the little King, who liked the occupations, especially plaiting. Spain has the fewest kindergartens, excepting perhaps Portugal, which is the only country that has sent no pupils to the Froebel Institute. When, however, we read of the disadvantages under which public schools labor in Spain, and of the misery of their teachers, we cease to be surprised. About 1860, the granddaughter of Professor von Fichte, Miss Johanna Sack, founded the first kindergarten in Constantinople. Very recently a Macedonian woman studied at the Froebel Institute. In Turkey, as in Arabia, there are kindergartens in the strangers' quarters. In the beginning of the seventies several rich Greek women studied at the Froebel Institute, and succeeded in introducing the system into Greece. Among them were Madame Lascardi and Miss Zoto.

The kindergarten was enthusiastically received in Italy. When the baroness visited that country in 1873 she found the kindergartens of Mme. Della Vida Levi and Professor Pick established in Venice. She stayed one year in Italy teaching and inspiring. At her request

Minister Correnti secured an appropriation of 20,000 lire (about \$4,000). The syndic of Florence, Peruzzi, gave a building and garden, and furnished gardeners and pecuniary aid for the first kindergarten in Florence. To-day we find kindergartens in all parts of Italy; in Rome, Naples, and Udine there are large normal kindergartens. In 1882, on the one hundredth anniversary of Froebel's birthday, an envoy from the Italian Government brought two albums to the baroness in Dresden, containing the expression of thanks of forty cities in Italy in which kindergartens exist. Since then the system has made rapid progress. Many institutions of humane purposes and protective tendencies, such as orphan asylums and schools for the defective, are now directed according to Froebel's ideas.

In the Danubian countries, Roumania and Servia, the system was likewise introduced. Professors and ministers of state even paid it the highest honor by becoming students at the Dresden Institute. Bulgaria was most enthusiastic in its praise. Not only was the Froebel method declared compulsory from the infant to the youth garden, but fourteen students were sent to Dresden by the Government to be educated as teachers.

Kindergartens are also found in Scandinavia and other parts of northern Europe. In the seventies they were established in Helsingfors, and since then in many other cities. They are known even in Iceland. In Denmark several graduates from Dresden have been doing good work for a long time. Lately a kindergarten association has been organized for the founding of kindergartens and the preparation of directors; it publishes a paper. School Inspector Bagger is at the head of the movement.

Russia offers a rich field for the new system of education. Kindergartens have been in existence there since the sixties, when the Grand Duchess Helena Pawlowna, the great patroness of Baroness von Marenholtz-Bülow, sent three Russians to Berlin to study the system. Kindergartens are found throughout the Russian Empire; in the Baltic provinces, as, for instance, in Riga and Dorpat, as well as in Finland. St. Petersburg numbers several, among others the public kindergarten of Princess Tenischeff at English Kai, and the kindergarten of Miss von Werther. Moscow, Odessa, and the Caucasus are not without them. All, however, have been established by private contribution. As yet the Government has done nothing, and until public schools are generally provided for, the general introduction of kindergartens in Russia will be reserved for the future.

It is quite a well-known fact that for the past twenty-five years kindergartens have been a compulsory institution in Austria, through the efforts of Minister von Stremeyer. They flourish in all parts of the country, in Bohemia, Moravia, and the Polish crown lands. In Hungary many women of position, besides Countess Hessenstein, the

friend of Baroness von Marenholtz-Bülow, interested themselves in the kindergarten cause. In Tyrol, Austria, the first kindergarten was opened during the stay of the baroness, and, with her assistance, by the celebrated Dean Hörfarter in Kufstein in presence of the governor, Count Taffe. The kindergarten has since become popular in Tyrol. In many cities of Austria, as, for instance, in Brünn, Prague, and Vienna, normal schools for kindergarteners are found.

Before we turn our attention to German kindergartens we must cast a cursory glance over other countries. In none of them is the kindergarten unknown. Kindergartens have been in existence in Australia for a long time; in Sydney and Melbourne there are seminaries for the education of directresses. In Africa the Bishop of Natal, who became acquainted with the baroness in London, established a kindergarten in his see in 1855. In the south we find them in Cape Colony; in the north, in Egypt. The best kindergartens of Asia are found in Japan. There the little children enjoy the Froebel games with as much enthusiasm as those of Europe. In China and India kindergartens are chiefly confined to the foreign colonies; there are some, however, for native children. Inspired by the Dresden kindergartens, a Russian princess founded one even in Persia.

The most extraordinary progress has been made in America. The Froebel system is there accepted not only as the foundation of education, but also as the foundation of instruction. Kindergartens connected with the public-school system occupy veritable school palaces. Mothers know and love them and often attend to see their children play. No teachers' meeting ever passes over in silence the kindergarten and Froebel. His method is appreciated and accepted by all, from the highest functionary to the humblest rural teacher. In his preface to the English edition of the aforementioned biography of Baroness von Marenholtz-Bülow, Dr. W. T. Harris, the United States Commissioner of Education, says: "In 1873 there were 158 kindergartens in the United States. Twenty-five years later, in 1897, there were 200,000." These figures speak louder than words. Kindergartens flourish in other parts of America, especially in Canada. They have also been introduced into the Argentine Republic. In New York two Spanish editions of *Children and Their Being*, by Baroness von Marenholtz-Bülow, were given to me, of which one was intended for the Argentine Republic.

Let us turn our attention to Germany. The German Empire ranks next to the United States in its number of kindergartens. There are very few small cities in Germany in which the kindergarten is not represented. Its introduction is unusually interesting in many respects, and is explicitly described in the baroness's "Life." We can mention only the most interesting data.

In 1860 the never-idle baroness succeeded in influencing a new cabi-

net to revoke the prohibition of kindergartens in Prussia. The way was thereby cleared, and kindergartens began their uninterrupted progress in Germany. In 1863 the heart's desire of the baroness, to make the kindergarten accessible to the lower classes, was fulfilled. With the help of a woman's society, a kindergarten was established in Berlin deserving of the title "public kindergarten." Since then public kindergartens have been established in nearly all large cities, many asylums have opened kindergartens for their pupils, and many factories have now kindergartens for the children of their operatives. The kindergarten has truly become a means for national education.

From 1860 to 1870 normal institutes for kindergartens were established in all large cities of Germany for the purpose of preparing directresses, which were much in demand. The better situated families are employing kindergarteners and trained nursery governesses for the education and care of their infants.

In 1866 the untiring apostle of the cause wrote her first two important German works, *Children and Their Being*, and *Labor and the New Education*. These furnished a guide for instruction. Others began to write on the same subject, and a periodical, the *Modern Education*, the exponent of Froebel thought, founded by her, published numerous articles from her pen and others in support of the cause.

During these many years the baroness, with untiring energy, aroused the interest of thinkers in Germany. Many accepted and supported the Froebel idea. Pedagogues like Ad. Diesterweg (Berlin), Wichard Lange (Hamburg), Karl Schmidt (Cöthen), School Councilor A. Berthelt (Dresden); professors like von Fichte (Tübingen), von Leonhardi (Prague), Schliephake (Heidelberg), Ahrens (Leipzig), and R. Virchow (Berlin) not only interested themselves in the subject, but advocated its cause. When, with her assistance, the General Education Society was founded in Dresden, 1872, and the kindergarten method was energetically advocated by its branch societies, the movement made rapid strides forward. Other societies were founded, as, for instance, The Kindergarten Association of Thuringia, The German Froebel Union, with many local branches, and an organ, The Kindergarten.

In 1874, Director Bruno Honschmann, the biographer of Froebel, could with truth say, "Chiefly through her (the baroness's) comprehensive efforts toward organization, education on the basis of Froebel's principles has become one of the most important questions of the day and assured his merits an indisputable claim."

On the 21st day of April, 1882, the whole civilized world celebrated the one hundredth anniversary of Froebel's birthday. The growth of kindergartens was then fully appreciated. Representatives from every district of Germany flocked to Dresden, the central point of interest, being the residence of Baroness von Marenholtz-Bülow and the seat of

the General Education Society. Dr. Wichard Lange, the editor of the collected works of Froebel and the most illustrious orator of the occasion, dwelled upon the general growth of kindergartens, and amid a storm of applause from the immense assembly thanked Baroness von Marenholtz-Bülow "in the name of humanity."

In 1885 the educational idea of Friedrich Froebel received its philosophical foundation through Dr. Froschammer, professor in the University of Munich, in his work *Organization and Culture of Human Society*. We refer, likewise, to the article by Dr. F. A. Steglich, of Dresden, on the philosophical foundation given by Froschammer.

When we review the present position of the Froebel kindergarten in the German Empire we must acknowledge its general introduction. But is the fundamental idea generally understood? That is not to be expected so long as kindergartens and normal schools for the training of directresses are not under State control and supported by State funds, as is the case with the Froebel Institute in Dresden. Meanwhile, we must rest content with the fact that the municipal government of all cities, even Dresden, has come forward with pecuniary aid for kindergartens and normal institutes, thereby acknowledging their usefulness for national education. In the end the native country of the prophet of "the new system of education" will do him the greatest honor. Germans are slow but sure. During the meetings for the promotion of manual training in Germany it has frequently been said: "The Froebel method and its formative law is the true principle of labor." German teachers, too, overburdened as they are now, and therefore difficult to approach, will begin to show a preference for the Froebel kindergarten, and perhaps may soon find the time to learn to know this new education better.

We, however, the representatives of the cause, look expectantly into the future. How few years must pass before the Froebel doctrine will be introduced into the curriculum of the upper classes of girls' schools in Germany and the educators of the future generation will learn the science of greatest importance to them. The kindergarten will then cease to be a mere fragment in the sum total of educational exertions. The new education will then begin at the mother's knee. Kindergarten training will be continued in school and youth gardens, and in consequence of the better general preparation of children for all studies, the schools will find their duties lighter and gain the time for some important branches of knowledge now excluded for want of time. The time will then have come when man will again be joyfully conscious of the idealistic side of his existence, when he will be able to free himself from the bonds of materialism and egotism, and break their chains by his greater competency and increased labor capacity gained through the better development of his talents. With a new pleasure in life, man will enter upon a new era.

CHAPTER XV.

PUBLIC PLAY GROUNDS AND VACATION SCHOOLS.

About ten years ago public-spirited men and women in Germany, incited by reports of health officers and the advice of physicians generally, came to the conclusion that the city parks might be utilized in a better way than had been the case by being, either entirely or partially, given over to the children. Public play grounds might be established in the parks and other available spaces set apart for the same purpose. They were aware of the desirability of offering school children opportunities to enjoy the open air and wholesome surroundings in park groves during summer vacation, and at the same time of protecting them from evil influences of street life and adding to their store of knowledge by awakening the power of observing natural objects and phenomena. The last, but by no means the least of the objects in view was to arrange for public games which would facilitate sociability and a brotherly spirit among all classes of city children. The city fathers were petitioned to designate suitable parts of the city parks for the purpose, particularly parks which were centrally located or not too far from schoolhouses. These requests were readily granted and the park commissions exhibited laudable zeal in selecting pretty, shady, and otherwise desirable places. Societies were formed to procure the necessary funds to buy loads of sand for the little ones, balls, bats, footballs, tennis screens, and other things for games of all kinds, and gymnastic apparatus. Teachers were employed to guide the children in their games, suggest new ones, decide disputes, answer questions with regard to things new to the children, and make themselves generally useful without becoming oppressive by exercising school authority. These teachers were paid at first by the associations, but later, when the beneficent results became apparent, the city school authorities assumed the payment of salaries of teachers thus engaged in vacation and on holidays. Great care was taken in the selection of suitable persons, for not every teacher is able to act as "playfellow" and guide.

The engraving on p. 897 shows the grounds set aside for public games by the city authorities of Dresden, Saxony. They adjoin the "Grosse Garten" a centrally located park. Other cities in Germany have similar spaces set aside in their parks.

The idea found the active support of influential men, such as members of Parliament, of State legislatures and city councils, provincial, county, and city officials, professional men, especially physicians, and private donations were willingly made. The press favored it heartily. The movement spread rapidly, and to-day there is scarcely a city in Germany and other countries in central Europe in which children's public play grounds are not arranged in prominent and easily accessible parts of the parks. Naturally, the proximity of a park to a school or a group of schools brought the children of that locality together, and teachers who were especially gifted in managing children—born organizers—were secured to be on the spot for certain hours of the day and do the best their ingenuity could suggest.

In 1897, Mr. E. von Schenkendorf, member of the Reichstag, published his sixth report of "Public playgrounds and open-air plays for children in Prussia." In that report a summary was given of the movement in tabulated form, from which the following items are culled to show the extent of the movement in Prussia alone. Reports were sent in from city school principals in reply to a circular letter of inquiry.

Among the 3,616 schools replying 1,985 had public play and gymnastic exercises combined; 1,272 conducted public plays outside of gymnastic exercises; and 359 had as yet failed to arrange for games.

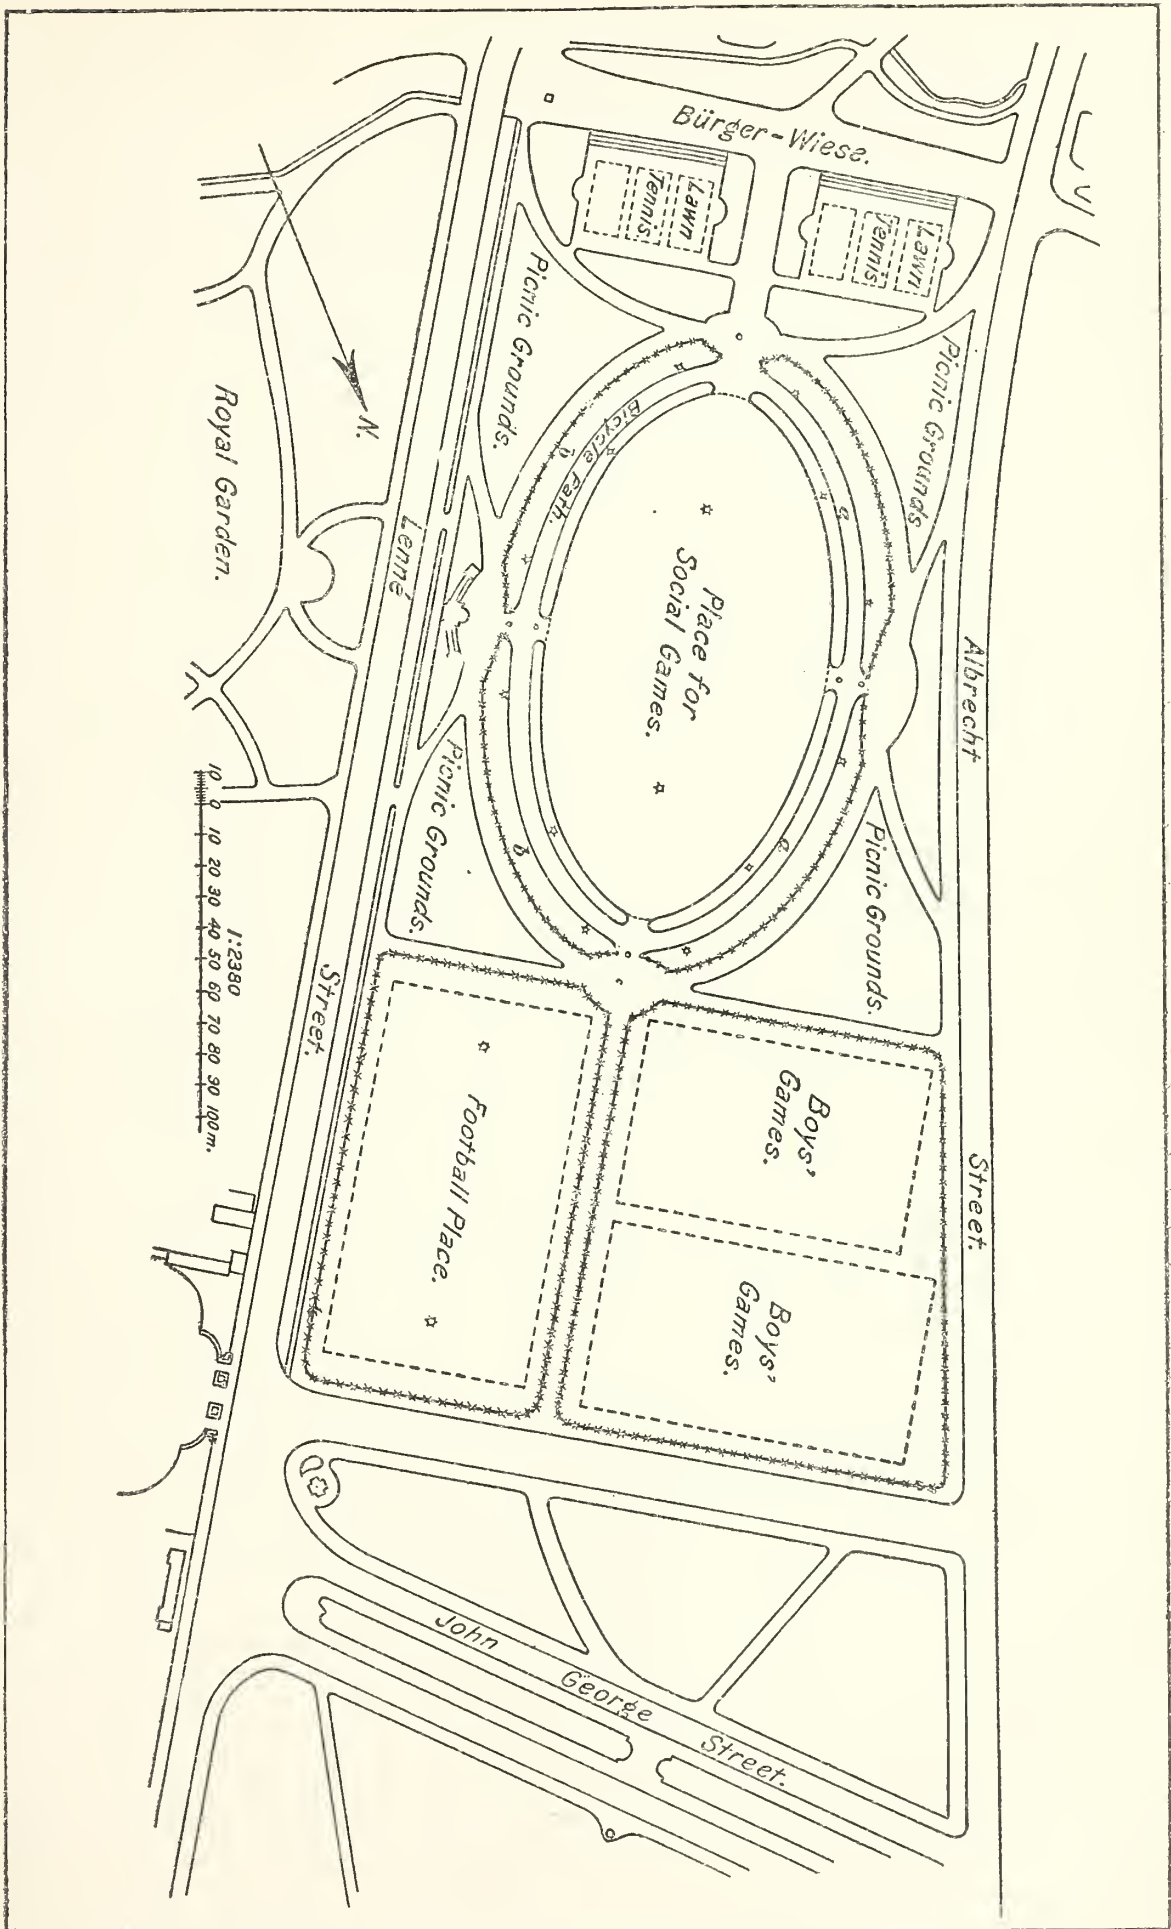

The time devoted to open-air play varied between one and three hours a day, four times a week.

The playgrounds were located quite near the school grounds in 2,147 cases; in 303 cases it was five minutes' walk from the schoolhouse; in 256 cases between six and ten minutes; in 187 cases between eleven and twenty minutes; in 70 cases the grounds were still more distant. In 294 replies this item was not mentioned.

The size of the grounds set aside as public playgrounds varied between 10 ars (1 ar = 100 square meters) and 100 ars; 644 grounds were covered with turf; 1,029 were graveled; 309 were of firm clay; 596 were sandy; and 460 of other or varied soil.

The methodical way of doing things in Germany, and the fact that no person there can draw a salary from the public exchequer unless he have a diploma attesting to the fact that he has had the required preparation for the work to be performed, induced the authorities to prepare certain teachers especially for the purpose. Hence, teachers' courses in conducting play have been given in twenty-one cities, and during the five years, from 1890-1895, as many as 795 persons received instruction; 568 men were prepared for boys' games; 227 women for girls' games.

The idea of thus aiding children in the enjoyment of their summer vacation and holidays and adding to their happiness has spread into other countries, notably Austria-Hungary, Sweden, Denmark, Holland, and Switzerland, where similar efforts are now made with varying

The new public play grounds in the City Park at Dresden, Germany.

success. In Sweden, Austria, and Switzerland particularly the public play grounds are becoming very popular. Everywhere in these countries the German manner of promoting the idea has been adopted—i. e., utilizing public parks and preparing suitable teachers.

In the United States the idea has also found fertile soil, especially in cities having many tenement houses—such as New York and Philadelphia. Yet “when two do the same thing, it is not the same.” Here the idea has taken another form, as will be seen from an interesting account of Dr. Ellen C. Putnam, secretary of the committee on public play and vacation schools in Providence, R. I. In that city the feature of offering instruction during the summer months seems to predominate. Miss Putnam’s account is here given in full.

VACATION SCHOOLS AND PLAYGROUNDS IN PROVIDENCE, R. I. ¹

The vacation-school and playground movement, already initiated by private effort in over twenty cities of the United States, now entirely under municipal control in Philadelphia and New York, is based upon the following considerations: The environment of children living in the poorest wards causes physical, mental, and moral degeneration. It is as much the interest of the Commonwealth to provide wholesome influences during the midsummer months as during the nine months of public schools, the work of which suffers by such intermission, not only among the poorest children, but among those of thriftier classes who remain in the city during the hot season. The movement is a social endeavor to provide, for children who can not otherwise obtain them, certain essential advantages that parents of intelligence and means prefer themselves to control, in vacations, and do not desire from public sources. Accordingly vacation schools should supplement conventional public education by securing a much greater amount of muscular activity; by encouraging a much greater degree of self-expression, self-reliance, and initiative; by presenting the more refining possibilities of environment so attractively as to mold tastes in choosing recreations and occupations. To secure these objects, nature study, manual and art work, and physical exercise are offered under conditions of the greatest freedom compatible with efficiency and, when possible, carried on in the open air. No books are used, and ideas of play and enjoyment are associated with the school events whenever practicable.

The commissioner of public schools, the superintendent of public schools in Providence, the director of drawing, and the principal of the Manual Training High School served in 1899 upon an advisory council with others to aid the citizens’ committee on playgrounds in an experimental vacation school recommended in its report for 1898 as necessary in conjunction with summer school playgrounds.

The main features of the best vacation schools elsewhere were adopted in the school opened in the Benefit Street primary school on the first Monday after the Fourth of July, continuing with a session from 8.30 to 12 daily, except excursion days and Saturdays, for six weeks. Early in the closing week of neighboring public and private schools, circulars descriptive of the proposed entertainments and occupations were given children by their teachers. Later each teacher gave admission tickets to those wishing them who, in her judgment, were suitable, the ticket to be forfeited by three absences. The number was limited to 280, an average of 30 pupils to each vacation teacher. In addition, 340 waiting-list tickets were issued. Applications greatly exceeded the supply. The name, address, age, and grade of each ticket holder were

¹ Reprinted from the Rhode Island School Report, 1899.

sent to the vacation-school secretary, who classified them before opening day according to age and sex, this basis being adopted because of its necessity in outdoor gymnasium work, where stature and strength had to be considered for adjustable apparatus. A few cases of exceptional physical development were transferred later. No detriment from this classification was reported in other departments. Class A, ages 12 to 15; Class B, ages 10 to 12; Class C, ages 8 to 10, were each divided into two sections of 30 girls and 30 boys. The kindergarten and transition rooms were assigned 100 children, ages 4 to 7, too young to be included to advantage with the other classes in occupations or excursions.

Admission was "forfeited by three absences" in 209 cases, about 100 occurring in the first week. Many of these children, some with their parents, came for readmission, saying, "We didn't know it would be so good;" "We didn't think you meant it." Their places had been immediately filled from the waiting list. The remaining 109 forfeitures occurred chiefly among children under 10 years of age for the following reasons in about 70 per cent of the cases (about 30 per cent were not investigated), given in order of their frequency: Absent first day or two of school from carelessness, third absence unavoidable; visiting other localities and family picnics; for an accidental reason; wanted to sleep mornings (evenings at shore resorts or in theater service); proud, and could not afford shoes in summer. The management encouraged bare feet. The expense of school dress and school cleanliness for an extra six weeks is a consideration in some cases. After the first week the oldest class was practically constant, out of 60 rarely less than 57 being present. The average daily attendance was 213. The children were chiefly of Anglo-American, Jewish, Irish, Swedish, and colored parentage (in order named).

Instruction was wholly departmental, 11 special teachers (chiefly from high schools) being secured, and classes passing from room to room with no trouble. Periods of one hour (even on alternating days) enabled departments to accomplish more with less vitality wasted on transit and readjustment of material. The usual weary restlessness from monotonous occupation was not experienced, because of the physical and mental variations in work during the hour. To enable the special teachers to give exclusive attention to technical affairs, a school secretary had charge of class lists and filling vacancies, bells, visitors, and similar routine executive service. By her preliminary classifying and arranging, the regular class-room work was able to begin as efficiently at 9 a. m. on the first day as on any later day, the opening exercises at 8.30 being omitted in order to read class lists and send sections to their rooms. Each department planned its work, adapting it to the vacation-school idea, in consultation with the specialist in that line who had generously accepted membership in the advisory council for that purpose.

The fact that attendance was purely voluntary insured the presence of those only who enjoyed coming. This and the genuine interest in a programme both novel and of a character that always appeals to child nature eliminated the necessity for many of the restraints and observances customary in public schools. The temperament and ability of the instructor were reflected in the behavior of his classes here as elsewhere. Another year even greater confidence should be placed in the children by instituting self-government methods successfully tried elsewhere.

Opening exercises, conducted by one of the teachers from 8.30 to 9 o'clock for classes A and B, were planned to teach patriotism, twenty minutes being given to reading a story (continued from morning to morning until finished), after which came the flag salute and "America." E. E. Hale's *A Man Without a Country* made a deep impression upon many. Nature stories also were read, as Kipling's *Rikki-tikki-tavi*, or Bayard Taylor's *Boys of Other Countries*. These, with brief talks concerning foreign and native animals drawn upon the blackboard to illustrate the stories, held closest attention. The authors also were spoken of and others of their stories

suggested to take from the public library. Many library cards were given out. Class C in another room had similar exercises, more juvenile stories being chosen. At 9 o'clock they passed to their several departments.

Kindergarten and transition children arrived at 9 o'clock, many mothers being unable to send the youngest earlier. Their attendance was more irregular than that of older children. They were not taken on excursions, continuing their usual programme instead. In other cities children of these ages have been taken on excursions of their own when a relative could accompany the child as care taker. In the kindergarten nature study started from the huckster's cart (a familiar object), the family it supplied, the farm it came from, the farm animals, utensils, and occupations. Indoor sand boxes were developed into farms, seeds planted and grown during the six weeks. Outdoor boxes permitted freer construction of country objects. Manual work was in clay modeling, sewing, weaving, cutting, and pasting. Nature songs and industrial song games helped the aim "to develop through play and to interest in the outside world through games."

In the transition room the huckster's team and farm again formed the basis of nature study. Fruits and vegetables from the cart were modeled in clay, drawn in colors, cut from paper, and talked about. Much was done to develop freedom of expression in the child by free drawing and modeling, free cutting, and construction in sandboxes (out door and in), all to illustrate some story or some special subject. In the daily story telling the child's interest was held and mental initiative developed by questions until to the child it seemed almost his own creation. Restlessness was immediately relieved by interrupting any story or occupation with perhaps acting out a picnic, running, picking flowers, throwing imaginary bouquets, racing to their seats to escape imaginary showers; or they were rocking chairs, or a train of cars, after which they returned with freshened interest to their "work." Both these departments should have had their excellent programme supplemented by at least one excursion to a real farm.

Each class in manual training was given twenty-four hours. In sloyd, 30 boys and 1 girl, ages 12 to 15, had four exercises: Garden stick (pine), footstool (whitewood), pen tray (gum wood), and bread board (gum and bass woods), in which the tools used at carpenters' benches were marking gauge, two-foot rule, jack plane, try square, knife, sandpaper, plane, three-quarter-inch bit, chisel, file, backsaw, cross-cut saw, hammer, nails, dividers, gouge, scraper, spokeshave, clamps, and glue. The different woods were interesting and the use of the tools fascinating. The attendance after the first week was practically constant, and often the privilege of working overtime was begged for. They "worked with a greedy haste, realizing that the time was limited," and very excellent results were produced by many. The jointing of five pieces of stock required a considerable degree of mental effort, and they applied themselves to it with commendable patience, persistence, and ability, "those completing it rising considerably in the estimation of their companions." Mischief offered no greater attraction than the work, and was therefore not indulged in.

Whittling exercises for ages from 8 to 12, at desk boards, were six-inch rule, plant marker, yarn and thread winders, flower pin; ages 10 to 12 whittled also letter opener, pencil sharpener, and knitting needle. The material was one-eighth inch basswood, and tools were pencil, knife, rule, compass, square, and sandpaper. Six girls elected this work instead of sewing.

Sewing was planned to teach useful stitches in making useful articles. Girls only had it, and it was very popular. Boys should have one utility lesson weekly. Articles made were: Bean bags, individual workbags, pincushions, needlebooks, dusters, towels, and knit face cloths. The older girls planned, cut, and made aprons. A few as a reward used fancy stitches on doilies. Friday was mending day, for which children brought articles from home to be repaired. With windows widely open,

the children sitting informally in groups, quietly chatting and intently stitching, varied by frequent trips to the teacher for assistance, no onlooker could doubt their enjoyment and profit during the hour.

For the art classes an artistic influence at once began upon entering their class room, decorated with casts, pictures, color, graceful forms in pottery, and various jars of grasses, leaves, and flowers. They were given water colors from the start, and used natural objects exclusively as models. A little work was done with pencil and crayon. Grasses and flowers, mounted butterflies and birds, and the human model, as well as landscape sketching, not only taught them outline and color, but to notice and appreciate the beautiful in the common things around them. Considerable time was given to composition and design. Their interest was decided and improvement remarkable. The color, brush, and composition work done in the schoolroom helped much in the landscape studies, and a glance at the drawings made on the first excursion, and at those made on the last, is sufficient to show the gratifying progress in outdoor work. The enthusiasm of expert teachers, the strong appeal of color to children, and their interest in such models as these, held their attention from beginning to end of the course.

The outdoor gymnasium, under the direction of a gymnast skillful with children, was used by girls and boys on alternate days, art classes changing in correspondence. On the only two rainy mornings an upper room from which desks had been removed was no less entertaining as a temporary resource. Exercises were adapted to different strengths and statures. The first half-hour was given to apparatus work, the second to gymnastic games. The apparatus consisted of a frame 12 by 20 feet, with which were 4 climbing poles, 2 pairs flying rings, 2 vertical ladders, 2 adjustable ladders, and 1 combination horizontal and vaulting bar. Files of four upon it at once enabled the director to give individual attention. In addition there was apparatus for running jumps, with sand boxes for mattresses, also bean bags. The apparatus was placed under a wide spreading elm, and was pleasantly shaded at all hours. The janitor sprinkled the gravel twice daily. Each child was too intent on his own efforts, and comparing others, for discipline to be an effort. Shouts of laughter or applause testified to the keenness of their enjoyment. The gymnastic games, apparently of inexhaustible variety, had four characteristics—they were competitive; the competition became cooperation by including the whole class; they called out both mental and physical agility; they required vigorous muscular effort, with natural rest intervals. One could not fail to note that along with the development of the vital organs and muscular system there was parallel evolution of mental qualities, such as promptness, intentness, ideas of initiative, cooperation and leadership, fair play and the justice of rules, together with the stimulus of hearty fun and laughter. This hour was physically and mentally invigorating—the ideal for school gymnastics and school recesses.

Nature study, as the summer season dictates, predominates in vacation schools. Resourceful teachers who can directly introduce nature to the child without the medium of books are indispensable. An attractive personality, a liberal education as well as pedagogic, and some experience in the special art of teaching children from natural objects and in the fields, are essential to a desirable nature teacher, for the reason that the features and phenomena of the subject taught are everywhere manifest and manifold, and especially stimulating to the childish mind; thus avenues for education spontaneously open that can be utilized only by one considerably versed in science and in the arts of child companionship. The object is to cultivate refining enjoyment of outdoor life by intelligent interest in natural objects and pleasure in scenery—important as preventive of grosser hours in these days of easy access to the suburbs.

The features of the department were six pedagogic excursions, a school garden

and indoor study of flowers, leaves, and plants collected from the garden or fields or on excursions; also study of the vegetable and animal contents of the several window boxes, glass jars, and aquaria. In a sunny lot behind the school each child was given a square yard of garden, which he outlined with closely laid rows of stones. The lot was undoubtedly (and unnecessarily) an eyesore, but the instructors claim that their gardens were most interesting to the owners and that they should be continued. School gardens are numerous in Germany, France, and other countries, and there are a few in America. The children planted the seeds of flowering and of economic plants, such as vegetables, grains, leguminous plants, etc., noted the results of varying conditions of soil, moisture, light, and heat, and learned the weeds that were removed. To their great joy the edible roots, such as radishes, were "big enough to eat" at the end of six weeks, but the rest many transplanted and carried home to see the cycle from seed to seed completed. The grubs, worms, and ants discovered in weeding were explained to them; the bees, butterflies, and the interdependence of animal and vegetable life; and they carried to the schoolroom leaves for the moth worms and food for the turtle, frog, lizard, and snake.

The excursions, on Tuesday, from 9 to 4 o'clock, were two to Roger Williams Park, one each to Hunt's Mills, Eagle Park, and Lake Meshanticut by special electric cars, and one to Shawomet Beach by steam cars. Fifteen children were assigned to each teacher, outside volunteer aid coming on these days. At about 11 a. m. classes were exchanged between the art and nature teachers. At noon lunch was eaten, followed by free play until they started for home. It is needless to say that a pedagogic excursion can not be conducted without special preparation. Assistance was generously given by one of the faculty of the State Agricultural College active in their summer normal school for nature study, and by a special student of the native birds of Rhode Island, also by the curator of the park museum. A preparatory excursion of the teachers and volunteer aids under the leadership of one of these specialists was taken a few days before each excursion. The resources for the nature classes were studied and sites for sketching chosen. The day before the excursion a blackboard map was used to show the teachers where the different classes were to work or the paths they were to explore, with places for obtaining water, for lunch, play, etc., and written memoranda of places and hours given them. Some details of arrangements were developed as the result of experience on earlier excursions, and unforeseen obstacles arose, all of which another year can better. It is desirable to have a director of excursions, and it would often be an advantage to divide the children as on the last excursion, the older going to Shawomet, the younger to the park. The former can thus go greater distances and do better class work, while the latter have a line of nature study more adapted to their capacities. Classes were instructed in the menagerie and museum at the park, and the sketching ground was good. Bird day among the woods and hedges at Hunt's Mills was an afternoon excursion, as the late afternoon hours were best for finding the birds. This was more valuable and interesting because of the previous week's class-room work having been upon native birds studied by means of stuffed skins freely handled, an excellent collection being given for the purpose. Insect day at Meshanticut and beach day at Shawomet were similarly prepared for. Flowers that they had especially studied in the class room were greeted in their habitat with the delight of welcoming old friends.

The real progress made can be appreciated only by those who were privileged to contrast the pleasures most enjoyed on the last excursion with those most wanted on the first. They learned, not realizing a "lesson," to respect the comfort and proprieties of public highways by finding that interesting objects to talk about and singing were more fun than tin horns and racket; that cheap drinks and munching cheap candies were nonessentials in a good time; that the beauty of their pleasure grounds should not be disfigured with the débris of lunches. A companionship between teachers and pupils, not possible upon school premises, gave to many the only opportunity of

their lives to enjoy a country day with a sympathetic, refined, and educated friend, while to all it was a privilege pregnant with valuable influences.

On the last day a "lawn party" was given by the children (at their request to help the fund); their work was on view and the gymnastic department exhibited for the visiting relatives and friends. In October an exhibition of the art and manual work was made at the annual meeting of the Rhode Island Institute of Instruction and subsequently placed in a window on Westminster street for a few days.

It should be mentioned that the principal of the Benefit street primary school reports the children returning in the fall in exceptionally good condition, and that progress along lines influenced by the vacation work has been noticeably rapid during the winter.

The cost of this vacation school was about \$850, \$632 being for salaries. Some essentials to the amount of about \$250 were contributed, and tools for stoid were loaned from the Manual Training High School.

An open-air gymnasium was conducted afternoons in the vacation school grounds under the same director. One hundred sixty-five tickets were issued to another set of boys (only), ages 9 to 16. The daily attendance was about 100, many of them distinctly gamins who, for the sake of the gymnastic work and games, which they entered into with zest, chose to conform with the playground requirements as to profanity, fighting, and obedience to the director. Saturdays their two baseball teams held a series of contests on Lincoln Field before large audiences of their friends.

Where school boards have only morning sessions of vacation schools they utilize premises and equipment afternoons as playgrounds; also conducting them in other school yards. The evolution of the summer school playground programme has progressed for six years along similar lines in Providence and elsewhere. It is not an easy matter to make the barren yards in the poorest sections continuously attractive to children for whom the variety (and occasional shade) of gutters and sidewalks have a unique fascination. A single fine tree in a yard solves half the difficulty. The majority are graveled wastes confined by high board fences, concentrating the glare and heat of the sun. Two or three adults as leaders in games, while doubling expenses, have not been found to increase the usefulness of the playgrounds proportionately. But by dividing the entertainments into distinctly separate departments, with an especially qualified person over each, the results have fully justified the outlay. Each of the forty candidates for an appointment was required to present abstracts of three articles on vacation schools and playgrounds appearing in recent numbers of the press, also a paper answering the following questions:

1. Games, without apparatus: (a) What active games (at least six) do you intend playing with children from 7 to 14 years of age? (b) Why do you choose each? (c) What will be its influence upon development: Physical? (d) Mental? (e) Moral? (f) What quiet games? (g) Why? (h) Influence?
2. When will you choose an active and when a quiet game?
3. What amusements or occupation (not games) will you undertake?
4. What inexpensive material (or games) would you like, and for what purpose?
5. How will you use the two sand boxes? (Answer fully and concisely.)
6. What plan (give reasons) have you in mind for the conduct of (a) the first day? (b) The first week? (c) The eighth week?
7. What immoralities do you expect to find, and how will you correct them?
8. How can you make the flag exercises a nucleus for instruction in patriotic, civic, and social relations and duties?
9. What special objects would you have in view in calling at the homes of the children?
10. How would you conduct a mothers' meeting? Give plans for two meetings.

Three playgrounds for children under 16 were opened at Africa street, Charles street, and Willard avenue primary schools, continuing eight weeks, six days weekly,

from 8.30 a. m. to 5 p. m. In New York they are open until 10 p. m., their reading rooms being also open Sundays. Two first-floor rooms and the sanitary conveniences of the buildings are used. One room is used for play on rainy days, the other as a reading room, experience having shown the impossibility of children enjoying or properly handling magazines and table games out in the noisy, sunny yard, while every child wishes for periods of interruption of active play by quieter entertainment. The reading rooms were freely decorated with the national colors in bunting: every window ledge filled with large boxes of greenhouse plants, of which some children became loving caretakers; upon the walls a large number of low-hung pictures loaned by friends; and with small chairs and tables the room hardly suggested remembrances of school. The public library loaned a generous supply of children's books for neighborhood circulation, and they were in constant use. An abundance of suitable magazines, papers, and picture books were contributed. The public library's rules for orderliness were observed; but games that would not interrupt the quiet were allowed, as checkers, various card games, jackstraws, dominoes; also at regular hours daily the attendant read stories aloud. These attractive, cool reading rooms were very popular.

The following is the programme in one of the yards, where a new and desirable feature was introduced: A primary teacher of resourcefulness and ability to handle large numbers of children was in charge of one side of the playground, where an awning 20 by 12 feet gave the only shade. Under it seats were placed for the quieter entertainments—dolls, making dolls' clothes, story-telling, singing, and games. For more active fun a set of five swings, rolling hoops, ring toss, bean bags, jump ropes, croquet, two sand boxes (10 by 5 feet), with trowels and building blocks, were some of the material.

On the other side of the house a skillful turner with the "play temperament" led gymnastic games, which were enthusiastically joined by the older ones—boys and girls alternately using the two sides of the playground. There should have been gymnastic apparatus also. Funds did not permit continuing this arrangement through the summer, but the brief experiment demonstrated that it is a most desirable one, and that it is more worth while to spend \$250 to make one ground excellent than \$130 each on several incomplete ones. The average daily attendance was 250; after the gymnast was discontinued, 150. At the close of the summer the contents of the window boxes were given to their faithful caretakers for home decoration. On the last afternoon over one hundred children were taken to the museum and menagerie of the park, after which they lunched in the grove.

These playgrounds, concentrating children's entertainment in limited areas under supervision, are one stage of vacation school work, and not to be confounded with the ideal playground of large open space with abundant opportunity for free play. Millions have been expended upon the school plant for the good of children, and in crowded centers of population, at least, economic considerations should prevent its lying idle one-third of the workdays of the year. The yards are easily accessible—a necessity for the smallest and convenience for the larger children, while the influence of the regular school upon the childish mind is only greater when it also becomes the center of their social interests. Classes in whittling, sewing, gardening, etc., are strong attractions in such playgrounds.

CHAPTER XVI.

THE OLD SOUTH WORK.¹

By EDWIN D. MEAD.

The extent of the obligation of Boston and of America to Mary Hemenway for her devotion to the historical and political education of our young people during the closing period of our century is something which we only now begin to properly appreciate when she has left us and we view her work as a whole. I do not think it is too much to say that she has done more than any other single individual in the same time to promote popular interest in American history and to promote intelligent patriotism.

Mrs. Hemenway was a woman whose interests and sympathies were as broad as the world; but she was a great patriot, and she was preeminently that. She was an enthusiastic lover of freedom and of democracy, and there was not a day of her life that she did not think of the great price with which our own heritage of freedom has been purchased. Her patriotism was loyalty. She had a deep feeling of personal gratitude to the founders of New England and the fathers of the Republic. She had a reverent pride in our position of leadership in the history and movement of modern democracy; and she had a consuming zeal to keep the nation strong and pure and worthy of its best traditions, and to kindle this zeal among the young people of the nation. With all her great enthusiasms, she was an amazingly practical and definite woman. She wasted no time nor strength in vague generalities, either of speech or action. Others might long for the time when the kingdom of God should cover the earth as the waters cover the sea, and she longed for it; but, while others longed, she devoted herself to doing what she could to bring that corner of God's world in which she was set into conformity with the laws of God, and this by every means in her power, by teaching poor girls how to make better clothes and cook better dinners and make better homes, by teaching people to value health and respect and train their bodies, by inciting people to read better books and love better music and better pictures and be interested in more important things. Others might long for the parliament of man and the federation of the world, and so did she; but, while others longed, she devoted herself to doing what she could to make this nation, for which she was particularly responsible, fitter for the federation when it comes. The good patriot, to her thinking, was not the worse cosmopolite. The good State for which she worked was a good Massachusetts; and her chief interest, while others talked municipal reform, was to make a better Boston.

American history, people used to say, is not interesting; and they read about Ivry and Marathon and Zama, about Pym and Pepin and Pericles, the ephors, the tribunes, and the House of Lords. American history, said Mrs. Hemenway, is to us the most interesting and the most important history in the world, if we would only open our eyes to it and look at it in the right way; and I will help people to look at it in

¹Parts of this statement of the Old South Work, in its earlier form, appeared in the Report of this Office for 1894-95, Vol. 2, pp. 1311-17. It is now reprinted as enlarged and brought down to date (1899).

the right way. Our very archæology, she said, is of the highest interest; and through the researches of Mr. Cushing and Dr. Fewkes and others among the Zuñis and the Moquis, sustained by her at the cost of thousands of dollars, she did an immense work to make interest in it general. Boston, the Puritan city—how proud she was of its great line of heroic men, from Winthrop and Cotton and Eliot and Harvard to Sumner and Garrison and Parker and Phillips! How proud she was that Harry Vane once trod its soil and here felt himself at home! How she loved Hancock and Otis and Warren and Revere and the great men of the Boston town meetings—above all, Samuel Adams, the very mention of whose name always thrilled her, and whose portrait was the only one save Washington's which hung on the oaken walls of her great dining room! The Boston historians, Prescott, Motley, Parkman; the Boston poets, Longfellow, Lowell, Emerson, each word of every one she treasured. She would have enjoyed and would have understood, as few others, that recent declaration of Charles Francis Adams's that the founding of Boston was fraught with consequences to the world not less important than those of the founding of Rome. All other Boston men and women must see Boston as she saw it—that was her high resolve. They must know and take to heart that they were citizens of no mean city; they must be roused to the sacredness of their inheritance, that so they might be roused to the nobility of their citizenship and the greatness of their duty. It was with this aim and with this spirit, not with the spirit of the mere antiquarian, that Mrs. Hemenway inaugurated the Old South Work. History with her was for use—the history of Boston, the history of New England, the history of America.

In the first place, she saved the Old South Meetinghouse. She contributed \$100,000 toward the fund necessary to prevent its destruction. It is hard for us to realize, so much deeper is the reverence for historic places which the great anniversaries of these late years have done so much to beget, that in our very centennial year, 1876, the Old South Meetinghouse, the most sacred and historic structure in Boston or in the country, was in danger of destruction. The old Hancock house, for which, could it be restored, Boston would to-day pour out unlimited treasure, had gone with but feeble protest only a dozen years before; and but for Mrs. Hemenway the Old South Meetinghouse would have gone in 1876. She saved it; and, having saved it, she determined that it should not stand an idle monument, the tomb of the great ghosts, but a living temple of patriotism. She knew the didactic power of great associations; and every one who in these twenty years has been in the habit of going to the lectures and celebrations at the Old South knows with what added force many a lesson has been taught within the walls which heard the tread of Washington and which still echo the words of Samuel Adams and James Otis and Joseph Warren.

The Old South lectures have proved that our American history can be presented to our young people in such a way as shall awaken their deepest interest and make them want to come again and again for more and more; they have shown to those who have been concerned in the management how broad and rich and varied are the fields into which the young students may be led; and they have made all serious people who have attended the lectures feel their important practical bearing, how close the relation of history to politics, and how potent an instrumentality such lectures may be made for the promotion of good citizenship. Not every city has its Old South Meetinghouse, with the wealth of association which, as already said, lends such reinforcement to the impressiveness of the meetings where the names of Winthrop and Franklin and Samuel Adams are upon the tongue; not everywhere can broad subjects be rooted in local history and illustrated by local landmarks as in Massachusetts, and especially in Boston, with their great line of colonial and revolutionary traditions—and the utility of such local interests, their stimulation to the imagination, their provocation to thought, can not be valued too highly; not everywhere can such munificence be hoped for as that which has made

possible the interesting experiment at the Old South Meetinghouse. But there is no American city where girls and boys and parents and teachers can not be gathered together in some place where the spirit of Winthrop and Adams and Washington and Lincoln will be in their midst; there is no American city which is not a joint heir to our national history, nor whose local history is not ten times more interesting and didactic, ten times more closely connected with broad general movements, than those suppose who do not think about it; and there is no city without citizens quite able to support, and teachers, ministers, and lawyers quite able to prepare, series of lectures which shall do the work which it is the aim of the Old South lectures to do in Boston, of awakening in the young people, who are so quickly to control the nation, a true sense of their indebtedness to the present and the future, by awakening in them a true sense of their indebtedness to the past.

The machinery of the Old South work has been the simplest. That is why any city, if it has public spirited people to sustain it, can easily carry on such work. That is why work like it, owing its parentage and impulse to it, has been undertaken in Providence and Brooklyn and Philadelphia, in Indianapolis and Madison and Chicago and elsewhere. That is why men and women all over the country, organized in societies or not, who are really in earnest about good citizenship, can do much to promote similar work in the cities and towns in which they live. We have believed at the Old South Meetinghouse in the power of the spoken word and the printed page. We have had lectures, and we have circulated historical leaflets.

What is an Old South lecture course like? That is what many teachers and many young people who are not conversant with the work will like to know. What kind of subjects do we think will attract and instruct bright young people of fifteen or sixteen, set them to reading in American history, make them more interested in their country, and make better citizens of them? That question can not, perhaps, be better answered than by giving one or two Old South lecture programmes. We will take the course for the summer of 1894 and the course for 1899. The course for 1894, for instance, was devoted to "The Founders of New England;" and the eight lectures were:

William Brewster, the Elder of Plymouth, by Rev. Edward Everett Hale; William Bradford, the Governor of Plymouth, by Rev. William Elliot Griffis; John Winthrop, the Governor of Massachusetts, by Hon. Frederic T. Greenhalge; John Harvard and the Founding of Harvard College, by Mr. William R. Thayer; John Eliot, the Apostle to the Indians, by Rev. James De Normandie; John Cotton, the Minister of Boston, by Rev. John Cotton Brooks; Roger Williams, the Founder of Rhode Island, by President E. Benjamin Andrews; Thomas Hooker, the Founder of Connecticut, by Rev. Joseph H. Twichell.

It will be noticed that the several subjects in this course were presented by representative men, men especially identified in one way or another with their special themes. Thus Edward Everett Hale, who spoke on Elder Brewster, is certainly our greatest New England "elder" to-day. Dr. Griffis, whose book on Brave Little Holland was being read at the time by so many of our young people, is an authority in Pilgrim history, having since prepared a work on The Pilgrim Fathers in England, Holland, and America. It was singularly fortunate that the Governor of Massachusetts at the time could speak upon Governor Winthrop. Mr. Thayer is the editor of the Harvard Graduates' Magazine and a special student of John Harvard's life and times. Mr. De Normandie is John Eliot's successor as minister of the old church in Roxbury. Rev. John Cotton Brooks is a lineal descendant of John Cotton, and has preached in his pulpit in St. Botolph's church at old Boston, in England. President Andrews, of Brown University, was certainly the very best person to come from Rhode Island to tell of that little State's great founder. Mr. Twichell, the eminent Hartford minister, was the chosen orator at the celebration of the two hundred and fiftieth anniversary of the founding of Connecticut, in 1889. With such a list of speakers as this, this course upon The Founding of New England could not help being a brilliant and valuable course; and so it proved.

The year 1899 was the centennial of the death of Washington. The memory of Washington is always kept green at the Old South. Each Washington's Birthday celebration is made a means of emphasizing anew his services and character, and this celebration, when the Old South prizes are always awarded, is one of the most stirring events of the Old South year; but in this centennial year the entire summer course was devoted to The Life and Influence of Washington, the several lectures being:

Washington in the Revolution, by Mr. John Fiske; Washington and the Constitution, by Rev. Edward Everett Hale; Washington as President of the United States, by Rev. Albert E. Winship; Washington, the True Expander of the Republic, by Mr. Edwin D. Mead; Washington's Interest in Education, by Hon. Alfred S. Roe; The Men who Worked with Washington, by Mrs. Alice Freeman Palmer; Washington's Farewell Address, by Rev. Franklin Hamilton; and What the World has Thought and Said of Washington, by Prof. Edwin A. Grosvenor.

How admirable a thing it would be if there could be given in every city and town in the country during this Washington centennial time such lectures upon the life and influence of Washington. A hundred towns could do nothing better than adopt bodily this Old South programme. Few places can plan to use these lecturers, although Brooklyn for many years regularly, and other places occasionally, have arranged to have each summer's course of Old South lectures repeated for their people by the Old South lecturers. Most places will use their own people—ministers, lawyers, editors, teachers—as their lecturers; and it is better that they should. But many should be glad to follow this Old South programme, and in connection could be used many of the Old South leaflets relating to Washington. The Old South leaflets and lecture programmes, good for us, are also, it is a pleasure to find, meeting needs like ours in a hundred places. It is not for a Boston public only that we work.

The Old South lectures—thanks to Mrs. Hemenway's generosity—still active by provision of her will—are entirely free to all young people. Tickets are distributed among the boys and girls of the public schools by their masters—the masters and superintendent of the Boston schools having always been the glad and efficient cooperators in the Old South work in all its branches. Tickets are also sent to all persons under twenty, applying in their own handwriting to the directors of the Old South work, at the Old South Meetinghouse, and inclosing stamp. Older people can come if they wish to, and a great many do come; but these pay for their tickets. It is understood that the lectures are designed for the young people. We tell our lecturers to aim at the bright boy and girl of fifteen, and forget that there is anybody else in the audience. If the lecturer hits them, he is sure to interest everybody; if he does not, he is a failure as an Old South lecturer. We tell them to be graphic and picturesque—dullness, however learned, is the one thing which young people will not pardon; we tell them to speak without notes—if they do not always satisfy themselves quite so well, they please everybody else a great deal better; and we tell them never to speak over an hour—we pardon fifty-nine minutes, but we do not pardon sixty-one. Persons starting work like the Old South work in other cities would do well to remember these simple rules. Any person looking in upon the great audience of young people which on the Wednesday afternoons of summer fills the Old South Meetinghouse, will quickly satisfy themselves whether American history taught by such lectures is interesting. For the Old South lectures are summer lectures—vacation lectures—given at 3 o'clock on Wednesday afternoons. They begin when the graduation exercises and the Fourth of July are well behind, in the last or next to the last week in July. Our lectures are not meant for idlers. We do not aim to entertain a crowd of children for an hour in a desultory fashion. Our lecturers do not talk baby talk. The Old South work is a serious educational work. Its programmes are careful and sequential, making demands upon the hearers. It assumes that the young people who come are students, or want to be; and, by consistently assuming it, it makes them so. Dr. Hale, who has addressed these

Old South audiences oftener, perhaps, than anybody else, remarked at the opening of a recent course upon the notable development in the character of the audiences in these years of the work. It is no longer safe, he said, to say 1603 at the Old South, when you ought to say 1602.

The first regular course of Old South Lectures for Young People was in 1883, although there had of course been much Old South work of various kinds done before that. There have therefore been seventeen annual courses. The subjects of these courses are as follows:

Early Massachusetts History, The Makers of Boston, The War for the Union, The War for Independence, The Birth of the Nation, The Story of the Centuries, America and France, The American Indians, The New Birth of the World, The Discovery of America, The Opening of the West, The Founders of New England, The Puritans in Old England, The American Historians, The Antislavery Struggle, The Old World in the New, The Life and Influence of Washington.

The complete programmes of all these courses, giving the subjects of the several lectures, together with the subjects of the leaflets printed in connection, have been published in a special circular, which can be obtained at the Old South. A thought always with us in laying out our programmes is, as has been said, the thought that the programme which serves us well may also serve others well; and this makes them the more carefully considered. We work in the hope and expectation that our lectures may be repeated, if not by our lecturers, then by others taking the same subjects, in other places and that with the lectures may go our leaflets also. The eight leaflets for 1899, accompanying the eight Washington lectures, were:

Washington's Account of the Army at Cambridge in 1775, Washington's Letters on the Constitution, Washington's Inaugurals, Washington's Letter to Benjamin Harrison in 1784, Washington's Words on a National University, Letters of Washington and Lafayette, Washington's Farewell Address, Henry Lee's Funeral Oration on Washington.

The eight leaflets accompanying similarly the lectures on the The Founders of New England, noticed above, were:

Bradford's Memoir of Elder Brewster, Governor Bradford's First Dialogue, Winthrop's Conclusions for the Plantation in New England, New England's First Fruits, 1643, John Eliot's Indian Grammar Begun, John Cotton's God's Promise to His Plantation, Letters of Roger Williams to Winthrop, Hooker's Way of the Churches of New England.

The Old South Leaflets are prepared primarily for circulation among the young people attending the Old South lectures. The subjects of the leaflets are usually immediately related to the subjects of the lectures. They are meant to supplement the lectures and stimulate reading and inquiry among the young people. They are made up, for the most part, from original papers of the periods treated in the lectures, in the hope to make the men and the life of those periods more clear and real. Careful historical notes and references to the best books on the subjects are added, the leaflets usually consisting of about twenty pages. A single instance more will suffice to show the relation of the leaflets to the lectures. The year 1889, being the centennial both of the beginning of our own Federal Government and of the French Revolution, the lectures for the year, under the general title of America and France, were devoted entirely to subjects in which the history of America is related to that of France, as follows:

Champlain, the Founder of Quebec; La Salle and the French in the Great West; The Jesuit Missionaries in America; Wolfe and Montcalm; the Struggle of England and France for the Continent; Franklin in France; The Friendship of Washington and Lafayette; Thomas Jefferson and the Louisiana Purchase; The Year 1789.

The corresponding leaflets were as follows:

Verrazzano's Account of his Voyage to America; Marquette's Account of his Discovery of the Mississippi; Mr. Parkman's Histories; The Capture of Quebec, from Parkman's Conspiracy of Pontiac; Selections from Franklin's Letters from France;

Letters of Washington and Lafayette; The Declaration of Independence; The French Declaration of the Rights of Man, 1789.

The Old South Leaflets gradually began to attract the attention of teachers of history outside of Boston, and ten years ago the publication of a general series was begun, to meet the needs of schools and colleges and literary societies and classes. Every teacher of history from Maine to California now knows, we think, of the Old South Leaflets. They are sold at a price just covering the cost, 5 cents a copy, or \$4 for a hundred copies, the aim being to bring them within easy reach of everybody, especially of schools and those wishing to circulate them in connection with lectures, as at the Old South. This series of Old South Leaflets now numbers a hundred.¹ * * *

These leaflets are also furnished in bound volumes, each volume containing twenty-five leaflets, the one hundred leaflets already published making four volumes. All persons wishing to preserve the leaflets for reference will find this form the best. Each annual series of eight leaflets, illustrating the lecture subjects of the year, is bound in a neat paper cover, and these little collections well serve clubs and classes studying these special subjects.

The virtue of the Old South Leaflets is that they bring students into first-hand instead of second-hand touch with history. That, indeed, may describe the Old South work altogether. It has been an effort to bring the young people of Boston and America into original relations with history; and it has been, we think it may properly be said, the foremost popular effort of the kind in the country. This is why it has won the attention and commendation, so gratifying to us, of the educators of the country. Our joy in the Old South work has been the joy of being pioneers and the joy of knowing that we were pioneers in the right direction. We should have known this if others had not known it; but we do not deny that the warm words of the historical scholars and teachers of the country have been very grateful and very helpful to us. The Old South work is "in exactly the right direction," John Fiske has said. It is a pleasant thing to remember that it was at Mrs. Hemenway's instance and at her strong solicitation that Mr. Fiske first turned his efforts to the field of American history; and almost everything that appeared in the earlier volumes of his magnificent series of historical works was first given in the form of lectures at the Old South. "To Mary Hemenway, in recognition of the rare foresight and public spirit which saved from destruction one of the noblest historical buildings in America, and made it a center for the teaching of American history and the principles of good citizenship," is the dedication of the volume upon *The American Revolution*. In this connection, and for the sake of the information which it gives, may be quoted the following words from the preface to Prof. James K. Hosmer's *Life of Thomas Hutchinson*: "This book, like the lives of Samuel Adams and young Sir Henry Vane and the *Short History of Anglo-Saxon Freedom*, has been written for the late lamented Mrs. Mary Hemenway—a carrying out of her Old South work. That noble woman's candor was as remarkable as her patriotic enthusiasm. While stimulating in every way she could interest in and love for our country and the men who brought it into being, she had a kind thought for the foe who honestly stood against them, and she desired to have justice done the victim as well as to have praise rendered the victors." In Mr. Fiske's *School History of the United States*, perhaps the most popular history in the schools, the Old South Leaflets are constantly commended for use in connection. "The publication of these leaflets," he says, "is sure to have a most happy effect in awakening general interest on the part of young students in original documents." To the same effect writes Mr. Montgomery, whose text-books in history are so widely used in the schools. James MacAlister, the president of the Drexel Institute in Philadelphia, writes: "I regard the Old South work as one of the most important educational movements of recent times." Mr. Herbert Welsh, of Philadelphia, wrote a special tract about the Old South work, and spread

¹ See list of titles given in an appendix to this chapter, but omitted here to avoid repetition.—ED.

it broadcast in Philadelphia. He had been deeply impressed by the Old South work when he came to lecture for us a little while before. "The secret of the success of the Old South plan," he said, "is that it teaches history from a living and most practical standpoint. It is the application of the best that our past has given to the brain and heart of the youth of the present." "Why should not this simple and effective plan be made use of in Philadelphia?" he asked; and the next year Old South Work was inaugurated in Philadelphia, the lectures to the young people being given in the Old State House, where the Declaration of Independence was signed and the Constitution framed. President Andrews, of Brown University; Prof. Herbert Adams, of Johns Hopkins; Professor Hart, of Harvard; Prof. Woodrow Wilson, Mr. Horace E. Scudder, and others, have written in the same warm way. Mr. Tetlow, the master of the Boston Girls' High School, and masters all over the country unite in welcoming the leaflets. "To teach history by the study of original documents," writes one, "has been the dream of the best instructors; but this dream may now be realized through the inexpensive form in which these originals are presented." "The educational world," writes Miss Coman, the professor of history at Wellesley College, "is coming to recognize the value of teaching history, even to young people, from the original records rather than from accounts at second or third hand. I rejoice that these documents have been made accessible to the children of our public schools." "We may talk about such documents all we please," says Mr. Huling, the master of the Cambridge High School, "and little good will be done; but, when the pupil reads one of these for himself, he is indeed a dull fellow if he does not carry away a definite impression of its place in history." "I wish," writes Mr. Belfield, the principal of the Chicago Manual Training School, who has done more than anybody else to promote the Old South movement in the West, "that the series could be brought to the attention of every school superintendent, high-school principal, and teacher of United States history in the country." "The Old South Leaflets," says Professor Folwell, the professor of history in the University of Minnesota, "ought to be scattered by millions of copies all over our country."

It is a satisfaction to be able to quote such words from such persons, for they are a great reinforcement of our commendation of this missionary work in good citizenship to the attention of the country. For that is what the Old South work is—a missionary work in good citizenship—and feeling it to be that we "commend ourselves." We wish that societies of young men and women might be organized in a thousand places for historical and political studies, and that our Old South Leaflets might prove of as much service to these as they are proving to our Old South audiences and to the schools.

The Old South summer lectures are chiefly for the older boys and girls in the schools, the children in the high schools, and the upper grammar grades. For the younger children we have each spring and autumn a "children's hour," a name descending from the earliest days of the Old South work, when such faithful service was rendered by Miss Alice Baker and Mrs. Kate Gannett Wells. The "children's hour" is filled by varied, simple, and picturesque talks and by music. The autumn "hour" in 1899, the Washington year, had three speeches on the three visits of Washington to Boston and several songs by a great chorus of the children, including the ode composed and sung on the occasion of Washington's visit in 1789.

The Old South Work aims to do more than serve the pupils of the Boston schools. It aims also to serve the teachers. There have been few years since the Old South Meetinghouse was saved when some course of lectures has not been provided especially for the teachers. Mr. Fiske's courses in many successive years were chiefly for the teachers of the city. Dr. William T. Harris and others have similarly addressed the teachers. Rev. Edward G. Porter's lectures upon Old Boston, first given at the North End in connection with a local work carried on by the directors of the Old South work for several seasons in that section of the city, were of peculiar interest.

In the spring of 1899 Prof. Albert B. Hart delivered a course on "The Spaniard and the Anglo-Saxon in America."

The Old South Work is not simply a means of doing something for the young people of Boston. It is also a means of getting something from them and setting them to work for themselves. Every year prizes are offered to the graduates of the Boston high schools—graduates of the current year and the preceding year—for the best essays on subjects in American history. Two subjects are proposed each year and two prizes are awarded for each subject, the first prize being \$40 and the second \$25. The subjects are announced in June, just as the schools close, and the essays must be submitted in the following January. The prizes are always announced at the Washington's Birthday celebration. The subjects proposed each year for the essays are always closely related to the general subject of the lectures for the year, our aim being to make the entire work for the year unified and articulate, each part of it helping the rest. Thus the subjects for the essays for the year when the lectures were devoted to The Founders of New England were:

1. The Relations of the Founders of New England to the Universities of Cambridge and Oxford.
2. The Fundamental Orders of Connecticut and their Place in the History of Written Constitutions.

The subjects for 1899, the Washington year, were:

1. The American Revolution under Washington and the English Revolution under Cromwell: Compare their Causes, Aims, and Results.
2. Washington's Plan for a National University: The Argument for it a Hundred Years Ago and the Argument To-day.

I think that many would be surprised at the thoroughness and general excellence of many of these essays written by pupils just out of our high schools. The first-prize essay for 1881, on The Policy of the Early Colonists of Massachusetts toward Quakers and Others whom they regarded as Intruders, by Henry L. Southwick, and one of the first-prize essays for 1889, on Washington's Interest in Education, by Miss Carolyn C. Stecher, have been printed, and can be procured at the Old South Meetinghouse. Another of the prize essays, on Washington's Interest in Education, by Miss Julia K. Ordway, was published in the *New England Magazine* for May, 1890. One of the first-prize essays for 1890, on Philip, Pontiac, and Tecumseh, by Miss Carolyn C. Stecher, appeared in the *New England Magazine* for September, 1891; one of the first-prize essays for 1891, on Marco Polo's Explorations in Asia and their Influence upon Columbus, by Miss Helen P. Margesson, in the *New England Magazine* for August, 1892; one for 1893, on The Part of Massachusetts Men in the Ordinance of 1787, by Miss Elizabeth H. Tetlow, in March, 1895, and one for 1898, on The Struggle of France and England for North America, by Miss Caroline B. Shaw, in January, 1900. The *New England Magazine*, which is devoted preeminently to matters relating to American history and good citizenship, has from the time of its founding, ten years ago, made itself an organ of the Old South work, publishing many of the Old South essays and lectures, and always noticing in its Editor's Table everything relating to the progress of the movement.

The young people who have competed for these Old South prizes are naturally among the best students of history in their successive years in the Boston high schools. They now number nearly 200, and several years ago they formed themselves into an Old South Historical Society. Many of the Old South essayists have, of course, gone on into college, and many are now scattered over the country; but more than half of their number, not a few of them teachers in the schools, are to-day within sound of the Old South bell, and the monthly meetings of the society are most interesting. No young people's society in the country is doing better historical work. There are always some careful historical papers read by members at the meetings, and there is discussion. There are frequently fresh voices from the outside, some of the most eminent scholars of the country having been guests of the society.

The present president, Mr. Joseph Parker Warren, is a Harvard instructor, and the secretary, Miss Margesson, is a Wellesley graduate. The society is rapidly becoming an efficient factor in the general Old South work. It has various active committees—a lecture committee, an essay committee, an outlook committee, and others—and its leading spirits are ambitious for ever larger service. The members of the lecture committee assist in the distribution of tickets to the schools and in enlisting the interest of young people in the lectures. The members of the essay committee similarly devote themselves to enlisting the interest of the high schools in the essays. They also read the essays submitted each year, not for the sake of adjudging the award of prizes—that is in other hands—but that there may always be in the society scholarly members thoroughly cognizant of the character of the work being done and of the varying capacity of the new members entering the society. The office of the outlook committee is to keep itself informed and to keep the society informed of all important efforts at home and abroad for the historical and political education of young people. It watches the newspapers, it watches the magazines, it watches the schools. It reports anything it finds said about the Old South work and about its extension anywhere. At the next meeting, I suppose, it will tell the society about any new school history and about any new text-books in civil government which have appeared. I hope it will tell how much better most of the series of historical readers published in England for the use of the schools are than the similar books which we have in America. It is sure to say something about the remarkable growth of work like its own among our young people; and it is sure to report such utterances as those of President Clarke and other leaders of the Christian Endeavor movement upon the importance of rousing a more definite interest in politics and greater devotion to the duties of citizenship among the young people in that great organization. Especially has it noticed in this time the historical pilgrimage, that interesting educational movement which suddenly appeared half a dozen years ago full grown—a movement which would have enlisted so warmly the sympathies of Mrs. Hemenway, who felt, as almost nobody else ever felt, the immense educational power of historical associations. It has doubtless told the society what Mr. Stead has written about historical pilgrimages in England, and Mr. Powell and Dr. Shaw and others in America.

The historical pilgrimage arranged and conducted by members of the University Extension Society of Philadelphia in the summer of 1894 commanded much attention from the newspapers and from the educational public. It was worthy of attention. For a large body of thoughtful men and women from twenty States to unite in a pilgrimage to our historic New England places was something to be noted as a pregnant and potential new educational factor; and from that time the historical pilgrimage became a distinct instrument, and a most useful one, in our life. It was noteworthy, also, as an index of the development of interest in American history in twenty years; for an enterprise like this would not have been dreamed of twenty years before. It was fitting that this first band of American historical pilgrims should be received and welcomed publicly in Boston at the Old South Meeting-house; for no other place in these years has been the center of such earnest and fruitful efforts for the development of this popular historical interest.

In 1896 the Old South Historical Society took up the matter of historical pilgrimages practically for itself. It adopted the historical pilgrimage as a regular feature of its yearly programme, and it has continued it with increasing and noteworthy success. The society may freely claim that no other historical pilgrimages in the country are so carefully prepared for and so well carried out, with such distinct educational results, as its own. There have now (1899) been four of these annual pilgrimages—the first to old Rutland, Mass., “the Cradle of Ohio;” the second to the homes of Whittier by the Merrimac; the third to the King Philip country, Mount Hope, on Narragansett Bay, and the fourth to Plymouth. A full day is given to the pilgrimage. The trip itself is always delightful, a luncheon is served at mid-

day, and this is followed by half a dozen bright speeches. The expenses are kept very low. Invitation is given to all young people or others who wish to join, and the later pilgrimages have been made by great parties of 600 people. Careful circulars and pamphlets are prepared well in advance, outlining the history connected with the places and discussing the best books; and the historical pilgrimage becomes one of the most educative events of the Old South year, as well as one of the most joyful. In addition to the important annual pilgrimage the members of the society themselves make occasional pilgrimages to interesting historical places near Boston. One of the latest of these was to Brook Farm, and there was much reading in connection about the interesting socialistic experiment identified with that famous place.

An idea of the serious and scholarly work being done by these splendid young people can best be given by inserting the programme of the present winter's work, 1899-1900. The general subject chosen for study is Economic and Social Forces in Massachusetts to 1800, and the outline for the ten monthly meetings is as follows:

I. September 26. The Country and the People. Papers: (1) The Indian Tribes. (2) The Physical Geography of Massachusetts and its Effects upon the People. (3) The European Immigrants.

II. October 10. Productive Industries. Papers: (1) The Fisheries. (2) Agriculture. (3) Manufactures.

III. November 14. Commerce and Communication. Papers: (1) Transportation and Communication. (2) General Survey of Massachusetts Commerce. (3) Trade with Africa and the Indies (including the Slave trade). (4) The Navigation Acts and their Influence upon Massachusetts Commerce.

IV. December 12. The Currency of Early Massachusetts. Stereopticon lecture by Mr. Andrew McFarland Davis.

V. January 9. Social Life. Mrs. Abby Morton Diaz will be the guest of the evening, speaking upon the home life of the early Massachusetts settlers. Papers: (1) Homes and Home Life (2) Sports and Amusements. (3) Social Intercourse. (4) The Influence of the Clergy and of the Government.

VI. The Influence of Economic and Social Conditions upon Institutions. February 13. The Church. Papers: (1) History of Congregationalism. (2) Church and State. (3) Sectarian Controversies and Persecutions. (4) Religious Life of the People. March 13. The Government. Mr. William B. Weedon will be the guest of the evening, speaking of the influence of social and economic forces upon the government in early New England. Papers: (1) Town Government. (2) The General Court and the Colonial Magistrates. (3) The Royal Governor and the Influence of the Crown.

VII. April 10. Law and its Administration. Papers: (1) The Common Law in America. (2) Colonial Judicature of Massachusetts. (3) Colonial Legislation of Massachusetts.

VIII. May 8. Intellectual Life. Papers: (1) Schools and Colleges. (2) Learned Professions. (3) Music and the Fine Arts.

IX. June 12. Literature. Mr. Edwin D. Mead will be the guest of the evening, speaking upon the intellectual life of Massachusetts during the first two centuries of her history. Papers: (1) Descriptive and Historical Writings. (2) Ecclesiastical Works. (3) The Literature of the Revolution. (4) Newspapers and other Reading Matter.

This programme is followed in the society's circular by several pages of bibliography, most thoroughly and discriminatingly compiled. The outline altogether would do credit to any historical society in the land, and it is entirely the work of the young people themselves. The subject studied with similar thoroughness the year before was the History of the Spanish Power in America, and preceding years had been devoted to the Antislavery Struggle, and the Heritage of Slavery. The young people are constantly lending a hand to other young people needing assistance in historical and political studies. The North End Union, the South End House, and Denison House have all had their help, and a dozen of them carried on classes for an entire season at the Marcella Street Home.

Many societies of young people all over the country might well take up such historical studies as those in which the Old South Historical Society interests itself. They should also interest themselves in studies directly political and social. We have

in Boston a Good Citizenship Society. This is not a part of the Old South Work, but it is a society in whose efforts some of us who have the Old South Work at heart have been deeply interested, and its lectures were long given at the Old South Meeting-house. The lectures have dealt with such subjects as Qualifications for citizenship, Municipal reform, the Reform of the newspaper, the Revival of public spirit in our country towns, and the Better organization of the world. One season the lectures were upon *A More Beautiful Public Life*, the several subjects being: The lessons of the white city, Boards of beauty, Municipal art, Art in the public schools, Art museums and the people, and Boston, the city of God. These subjects, and such as these, young men and women might take up in their societies with great benefit to themselves and to their communities. Our young people should train themselves also in the organization and procedure of our local and General Government, as presented in the text-books on civil government now happily becoming so common in the schools. The young men in one of our colleges have a house of commons; in another college—a young woman's college—they have a house of representatives. Our Old South Historical Society has talked of organizing a town meeting for the discussion of public questions and for schooling in legislative methods. Why should not such town meetings be common among our young people?

Why, too, will not our young people everywhere, as a part of their service for good citizenship, engage in a crusade for better music? Good music is a great educator. Bad music is debilitating and debasing. That was a wise man whom old Fletcher quotes as saying, "Let me make the songs of a people, and I care not who makes the laws." How many of the young men and women in the high schools have read what Plato says about strong, pure music in education in his book on *The Laws*? Indeed, it is to be feared that not all the teachers have read it. I wish that a hundred clubs or classes of young people would read Plato's *Laws* next winter, and his *Republic* the next, and then Aristotle's *Politics*. Do not think they are hard, dull books. They are fresh, fascinating books, and seem almost as modern in all their discussions of socialism, education, and the rest as the last magazine, only they are so much better and more fruitful than the magazine. They make us ashamed of ourselves—these great Greek thinkers—their preaching is so much better than our practice; but it is a good thing to be made ashamed of ourselves sometimes, and we need it very much here in America in the matter of music. We are suffering in our homes, in our schools, in our churches, our theaters, everywhere from music of the trashiest and most vulgar character, and this is said with no failure to recognize the great amount of splendid work that is being done. Let us go to school to Plato; let us go to school to Germany and England. We aim to do something in behalf of this reform at the Old South. Our large choruses from the public schools at many of our celebrations have sung well. At our last "Children's hour," as already mentioned, 200 girls from the Wells School, assisted by good soloists, rendered admirably the old ode composed and sung when President Washington was received in Boston in 1789. But we wish to do a real educational work not only as touching patriotic music strictly, but as touching better music for the people generally. It was an "Old South boy," the winner of one of the early Old South prizes, who two or three years ago conceived and organized the magnificent series of public organ recitals in Boston, given under the auspices of the Twentieth Century Club, which attracted so much attention throughout the country, encouraging similar efforts in other cities, and giving impetus to the interest which has resulted in the Boston municipal concerts. One day we shall have an Old South chorus. We hope some time to have a good organ at the Old South, as we hope to have the old meetinghouse altogether in much better shape in a near future than in the last years. If in some future the ghosts of some of the great Greeks stroll into the Old South Meetinghouse, we hope they may find it the center of influences in behalf of pure and inspiring music which will be as gratifying to them as the devotion to the State which is inculcated there would surely be.

OLD SOUTH LECTURES AND LEAFLETS.

The Old South Leaflets were prepared primarily for circulation among the attendants upon the Old South Lectures for Young People. The subjects of the leaflets are immediately related to the subjects of the lectures, and they are intended to supplement the lectures and stimulate historical interest and inquiry among the young people. They are made up for the most part from original papers of the periods treated in the lectures, in the hope to make the men and the public life of the periods more clear and real.

The Old South Lectures for Young People were instituted in the summer of 1883, as a means of promoting a more serious and intelligent attention to historical studies, especially studies in American history among the young people of Boston. The success of the lectures has been so great as to warrant the hope that such courses may be sustained in many other cities of the country.

The Old South Lectures for 1883, intended to be strictly upon subjects in early Massachusetts history, but by certain necessities somewhat modified, were as follows: Governor Bradford and Governor Winthrop, by Edwin D. Mead. Plymouth, by Mrs. A. M. Diaz. Concord, by Frank B. Sanborn. The Town Meeting, by Prof. James K. Hosmer. Franklin, the Boston Boy, by George M. Towle. How to Study American History, by Prof. G. Stanley Hall. The Year 1777, by John Fiske. History in the Boston Streets, by Edward Everett Hale. The leaflets prepared in connection with these lectures consisted of (1) Cotton Mather's account of Governor Bradford, from the *Magnalia*; (2) the account of the arrival of the Pilgrims at Cape Cod, from Bradford's Journal; (3) an extract from Emerson's Concord Address in 1835; (4) extracts from Emerson, Samuel Adams, De Tocqueville, and others, upon the Town Meeting; (5) a portion of Franklin's Autobiography; (6) Carlyle on the Study of History; (7) an extract from Charles Sumner's oration upon Lafayette, etc; (8) Emerson's poem, Boston.

The lectures for 1884 were devoted to men representative of certain epochs or ideas in the history of Boston, as follows: Sir Harry Vane, in New England and in Old England, by Edward Everett Hale, jr. John Harvard, and the Founding of Harvard College, by Edward Channing, Ph.D. The Mather Family, and the Old Boston Ministers, by Rev. Samuel J. Barrows. Simon Bradstreet, and the Struggle for the Charter, by Prof. Marshall S. Snow. Samuel Adams, and the Beginning of the Revolution, by Prof. James K. Hosmer. Josiah Quincy, the Great Mayor, by Charles W. Slack. Daniel Webster, the Defender of the Constitution, by Charles C. Coffin. John A. Andrew, the Great War Governor, by Col. T. W. Higginson. The leaflets prepared in connection with the second course were as follows: (1) Selections from Forster's essay on Vane, etc.; (2) an extract from Cotton Mather's *Sal Gentium*; (3) Increase Mather's Narrative of the Miseries of New England; (4) an original account of The Revolution in New England in 1689; (5) a letter from Samuel Adams to John Adams, on Republican Government; (6) extracts from Josiah Quincy's Boston Address of 1830; (7) Words of Webster; (8) a portion of Governor Andrew's Address to the Massachusetts Legislature in January, 1861.

The lectures for 1885 were upon The War for the Union, as follows: Slavery, by William Lloyd Garrison, jr. The Fall of Sumter, by Col. T. W. Higginson. The Monitor and the Merrimac, by Charles C. Coffin. The Battle of Gettysburg, by Col. Theodore A. Dodge. Sherman's March to the Sea, by Gen. William Cogswell. The Sanitary Commission, by Mrs. Mary A. Livermore. Abraham Lincoln, by Hon. John D. Long. General Grant, by Charles C. Coffin. The leaflets accompanying these lectures were as follows: (1) Lowell's Present Crisis, and Garrison's Salutory in the Liberator of January 1, 1831; (2) extract from Henry Ward Beecher's oration at Fort Sumter in 1865; (3) contemporary newspaper accounts of the engagement between the Monitor and the Merrimac; (4) extract from Edward Everett's address at the consecration of the National Cemetery at Gettysburg, with President Lincoln's Address; (5) extract from General Sherman's account of the March to the Sea, in his Memoirs; (6) Lowell's Commemoration Ode; (7) extract from Lincoln's First Inaugural Address, the Emancipation Proclamation, and the Second Inaugural Address; (8) account of the service in memory of General Grant, in Westminster Abbey, with Archdeacon Farrar's Address.

The lectures for 1886 were upon The War for Independence, as follows: Samuel Adams and Patrick Henry, by Edwin D. Mead. Bunker Hill, and the News in England, by John Fiske. The Declaration of Independence, by James MacAllister. The Times that tried Men's Souls, by Albert B. Hart, Ph. D. Lafayette, and Help from France, by Prof. Marshall S. Snow. The Women of the Revolution, by Mrs. Mary A. Livermore. Washington and his Generals, by George M. Towle. The Lessons of the Revolution for these Times, by Rev. Brooke Herford. The leaflets were as follows: (1) Words of Patrick Henry; (2) Lord Chatham's Speech, urging the removal of the British troops from Boston; (3) extract from Webster's oration on Adams and Jefferson; (4) Thomas Paine's Crisis, No. 1; (5) extract from Edward Everett's eulogy on Lafayette; (6) selections from the Letters of Abigail Adams; (7) Lowell's Under the Old Elm; (8) extract from Whipple's essay on Washington and the Principles of the Revolution.

The course for the summer of 1887 was upon The Birth of the Nation, as follows: How the men of the English Commonwealth planned Constitutions, by Prof. James K. Hosmer. How the American Colonies grew together, by John Fiske. The Confusion after the Revolution, by Davis R. Dewey, Ph. D. The Convention and the Constitution, by Hon. John D. Long. James Madison and his Journal, by Prof. E. B. Andrews. How Patrick Henry opposed the Constitution, by Henry L. Southwick. Alexander Hamilton and the Federalist. Washington's Part and the Nation's First Years, by Edward Everett Hale. The leaflets prepared for these lectures were as follows: (1) Extract from Edward

Everett Hale's lecture on Puritan Politics in England and New England; (2) The English Colonies in America, extract from De Tocqueville's *Democracy in America*; (3) Washington's Circular Letter to the Governors of the States on Disbanding the Army; (4) the Constitution of the United States; (5) The Last Day of the Constitutional Convention, from Madison's Journal; (6) Patrick Henry's First Speech against the Constitution, in the Virginia Convention; (7) the *Federalist*, No. IX; (8) Washington's First Inaugural Address.

The course for the summer of 1888 had the general title of *The Story of the Centuries*, the several lectures being as follows: *The Great Schools after the Dark Ages*, by Ephraim Emerton, professor of history in Harvard University. *Richard the Lion-hearted and the Crusades*, by Miss Nina Moore, author of *Pilgrims and Puritans*. *The World which Dante knew*, by Shattuck O. Hartwell, Old South first prize essayist, 1883. *The Morning Star of the Reformation*, by Rev. Philip S. Moxom. *Copernicus and Columbus, or the New Heaven and the New Earth*, by Prof. Edward S. Morse. *The People for whom Shakespeare wrote*, by Charles Dudley Warner. *The Puritans and the English Revolution*, by Charles H. Levermore, professor of history in the Massachusetts Institute of Technology. *Lafayette and the Two Revolutions which he saw*, by George Makepeace Towle.

The Old South Lectures are devoted primarily to American history. But it is a constant aim to impress upon the young people the relations of our own history to English and general European history. It was hoped that the glance at some striking chapters in the history of the last eight centuries afforded by these lectures would be a good preparation for the great anniversaries of 1889, and give the young people a truer feeling of the continuity of history. In connection with the lectures, the young people were requested to fix in mind the following dates, observing that in most instances the date comes about a decade before the close of the century. An effort was made in the Leaflets for the year to make dates, which are so often dull and useless to young people, interesting, significant, and useful. Eleventh century: Lanfranc, the great mediæval scholar, who studied law at Bologna, was prior of the monastery of Bec, the most famous school in France in the eleventh century, and archbishop of Canterbury under William the Conqueror, died 1089. Twelfth century: Richard I crowned, 1189. Thirteenth century: Dante, at the battle of Campaldino, the final overthrow of the Ghibellines in Italy, 1289. Fourteenth century: Wyclif died, 1384. Fifteenth century: America discovered, 1492. Sixteenth century: Spanish armada, 1588. Seventeenth century: William of Orange lands in England, 1688. Eighteenth century: Washington inaugurated and the Bastille fell, 1789. The Old South Leaflets for 1888, corresponding with the several lectures, were as follows: (1) *The Early History of Oxford*, from Green's *History of the English People*; (2) *Richard Cœur de Lion and the Third Crusade*, from the *Chronicle of Geoffrey de Vinsauf*; (3) *The Universal Empire*, passages from Dante's *De Monarchia*; (4) *The Sermon on the Mount*, Wyclif's translation; (5) *Copernicus and the Ancient Astronomers*, from Humboldt's *Cosmos*; (6) *The Defeat of the Spanish Armada*, from Camden's *Annals*; (7) *The Bill of Rights, 1689*; (8) *The Eve of the French Revolution*, from Carlyle. The selections are accompanied by very full historical and biographical notes, and it is hoped that the series will prove of much service to students and teachers engaged in the general survey of modern history.

The year 1889 being the centennial both of the beginning of our own Federal Government and of the French Revolution, the lectures for the year, under the general title of *America and France*, were devoted entirely to subjects in which the history of America is related to that of France, as follows: *Champlain, the Founder of Quebec*, by Charles C. Coffin. *La Salle and the French in the Great West*, by Rev. W. E. Griffis. *The Jesuit Missionaries in America*, by Prof. James K. Hosmer. *Wolfe and Montcalm: The Struggle of England and France for the Continent*, by John Fiske. *Franklin in France*, by George M. Towle. *The Friendship of Washington and Lafayette*, by Mrs. Abba Goold Woolson. *Thomas Jefferson and the Louisiana Purchase*, by Robert Morss Lovett, Old South prize essayist, 1888. The Year 1789, by Rev. Edward Everett Hale. The Leaflets for the year were as follows: (1) *Verrazzano's Account of his Voyage to America*; (2) *Marquette's Account of his Discovery of the Mississippi*; (3) *Mr. Parkman's Histories*; (4) *The Capture of Quebec*, from Parkman's *Conspiracy of Pontiac*; (5) selections from Franklin's *Letters from France*; (6) *Letters of Washington and Lafayette*; (7) *the Declaration of Independence*; (8) *the French Declaration of the Rights of Man, 1789*.

The lectures for the summer of 1890 were on the American Indians, as follows: *The Mound Builders*, by Prof. George H. Perkins. *The Indians whom our Fathers Found*, by Gen. H. B. Carrington. *John Eliot and his Indian Bible*, by Rev. Edward G. Porter. *King Philip's War*, by Miss Caroline C. Stecker, Old South prize essayist, 1889. *The Conspiracy of Pontiac*, by Charles A. Eastman, M. D., of the Sioux Nation. *A Century of Dishonor*, by Herbert Welsh. *Among the Zuñis*, by J. Walter Fewkes, Ph. D. *The Indian at School*, by Gen. S. C. Armstrong. The Leaflets were as follows: (1) Extract from Address by William Henry Harrison on the Mound Builders of the Ohio Valley; (2) Extract from Morton's *New English Canaan* on the Manners and Customs of the Indians; (3) John Eliot's Brief Narrative of the Progress of the Gospel Among the Indians of New England, 1670; (4) Extract from Hubbard's Narrative of the Troubles with the Indians (1677) on the Beginning of King Philip's War; (5) The speech of Pontiac at the Council at the River Ecorces, from Parkman's *Conspiracy of Pontiac*; (6) Extract from Black Hawk's Autobiography on the Cause of the Black Hawk War; (7) Coronado's Letter to Mendoza (1540) on his Explorations in New Mexico; (8) Eleazar Wheelock's Narrative (1762) of the Rise and Progress of the Indian School at Lebanon, Conn.

The lectures for 1891, under the general title of *The New Birth of the World*, were devoted to the

important movements in the age preceding the discovery of America, the several lectures being as follows: The Results of the Crusades, by F. E. Hamilton, Old South prize essayist, 1883. The Revival of Learning, by Prof. Albert B. Hart. The builders of the Cathedrals, by Prof. Marshall S. Snow. The Changes which Gunpowder Made, by Frank A. Hill. The Decline of the Barons, by William Everett. The Invention of Printing, by Rev. Edward G. Porter. When Michel Angelo was a Boy, by Hamlin Garland. The Discovery of America, by Rev. E. E. Hale. The Leaflets were as follows: (1) The Capture of Jerusalem by the Crusaders, from the Chronicle of William of Malmesbury; (2) Extract from More's Utopia; (3) The Founding of Westminster Abbey, from Dean Stanley's Historical Memorials of Westminster Abbey; (4) The Siege of Constantinople, from Gibbon's Decline and Fall of the Roman Empire; (5) Simon de Montfort, selections from Chronicles of the time; (6) Caxton at Westminster, extract from Blade's Life of William Caxton; (7) The Youth of Michel Angelo, from Vasari's Lives of the Italian Painters; (8) The Discovery of America, from Ferdinand Columbus's life of his father.

The lectures for 1892 were upon The Discovery of America, as follows: What Men Knew of the World Before Columbus, by Prof. Edward S. Morse. Leif Erikson and the Northmen, by Rev. Edward A. Horton. Marco Polo and his Book, by Mr. O. W. Dimmick. The Story of Columbus, by Mrs. Mary A. Livermore. Americus Vespucci and the Early Books about America, by Rev. E. G. Porter. Cortes and Pizarro, by Prof. Chas. H. Levermore. De Soto and Ponce de Leon, by Miss Ruth Ballou Whittemore, Old South prize essayist, 1891. Spain, France, and England in America, by Mr. John Fiske. The Leaflets were as follows: (1) Strabo's Introduction to Geography; (2) The Voyages to Vinland, from the Saga of Eric the Red; (3) Marco Polo's Account of Japan and Java; (4) Columbus's Letter to Gabriel Sanchez, Describing his First Voyage; (5) Amerigo Vespucci's Account of his First Voyage; (6) Cortes's Account of the City of Mexico; (7) the Death of De Soto, from the Narrative of a Gentleman of Elvas; (8) Early Notices of the Voyages of the Cabots.

The lectures for 1893 were upon The Opening of the Great West, as follows: Spain and France in the Great West, by Rev. William Elliot Griffis. The Northwest Territory and the Ordinance of 1787, by John M. Merriam. Washington's Work in Opening the West, by Edwin D. Mead. Marietta and the Western Reserve, by Miss Lucy W. Warren, Old South prize essayist, 1892. How the Great West was settled, by Charles C. Coffin. Lewis and Clarke and the Explorers of the Rocky Mountains, by Rev. Thomas Van Ness. California and Oregon, by Prof. Josiah Royce. The Story of Chicago, by Mrs. Mary A. Livermore. The Leaflets were as follows: (1) De Neca's Account of his Journey to New Mexico, 1535; (2) Manasseh Cutler's Description of Ohio, 1787; (3) Washington's Journal of his Tour to the Ohio, 1770; (4) Garfield's Address on the Northwest Territory and the Western Reserve; (5) George Rogers Clark's Account of the Capture of Vincennes, 1779; (6) Jefferson's Life of Captain Meriwether Lewis; (7) Fremont's Account of his Ascent of Fremont's Peak; (8) Father Marquette at Chicago, 1673.

The lectures for 1894 were upon The Founders of New England, as follows: William Brewster, the Elder of Plymouth, by Rev. Edward Everett Hale. William Bradford, the Governor of Plymouth, by Rev. William Elliot Griffis. John Winthrop, the Governor of Massachusetts, by Hon. Frederic T. Greenhalge. John Harvard, and the Founding of Harvard College, by Mr. William R. Thayer. John Eliot, the Apostle to the Indians, by Rev. James De Normandie. John Cotton, the Minister of Boston, by Rev. John Cotton Brooks. Roger Williams, the Founder of Rhode Island, by President E. Benjamin Andrews. Thomas Hooker, the Founder of Connecticut, by Rev. Joseph H. Twichell. The Leaflets were as follows: (1) Bradford's Memoir of Elder Brewster; (2) Bradford's First Dialogue; (3) Winthrop's Conclusions for the Plantation in New England; (4) New England's First Fruits, 1643; (5) John Eliot's Indian Grammar Begun; (6) John Cotton's God's Promise to his Plantation; (7) Letters of Roger Williams to Winthrop; (8) Thomas Hooker's Way of the Churches of New England.

The lectures for 1895 were upon The Puritans in Old England, as follows: John Hooper, the First Puritan, by Edwin D. Mead; Cambridge, the Puritan University, by William Everett; Sir John Eliot and the House of Commons, by Prof. Albert B. Hart; John Hampden and the Ship Money, by Rev. F. W. Gunsaulus; John Pym and the Grand Remonstrance, by Rev. John Cuckson; Oliver Cromwell and the Commonwealth, by Rev. Edward Everett Hale; John Milton, the Puritan Poet, by John Fiske; Henry Vane in Old England and New England, by Prof. James K. Hosmer. The Leaflets were as follows: (1) The English Bible, selections from the various versions; (2) Hooper's Letters to Bullinger; (3) Sir John Eliot's Apology for Socrates; (4) Ship-money Papers; (5) Pym's Speech Against Strafford; (6) Cromwell's Second Speech; (7) Milton's Free Commonwealth; (8) Sir Henry Vane's Defence.

The lectures for 1896 were upon The American Historians, as follows: Bradford and Winthrop and their Journals, by Mr. Edwin D. Mead; Cotton Mather and his Magnalia, by Prof. Barrett Wendell; Governor Hutchinson and his history of Massachusetts, by Prof. Charles H. Levermore; Washington Irving and his Services for American History, by Mr. Richard Burton; Bancroft and his History of the United States, by Pres. Austin Scott; Prescott and his Spanish Histories, by Hon. Roger Wolcott; Motley and his History of the Dutch Republic, by Rev. William Elliot Griffis; Parkman and his Works on France in America, by Mr. John Fiske. The Leaflets were as follows: (1) Winthrop's Little Speech on Liberty; (2) Cotton Mather's Bostonian Ebenezer, from the Magnalia; (3) Governor Hutchinson's Account of the Boston Tea Party; (4) Adrian Van der Donck's Description of the New Netherlands in 1655; (5) The Debate in the Constitutional Convention on the Rules of Suffrage in Congress; (6) Columbus's Memorial to Ferdinand and Isabella, on his Second Voyage; (7) The Dutch Declaration of Inde-

pendence in 1581; (8) Captain John Knox's Account of the Battle of Quebec. The last five of these eight Leaflets illustrate the original material in which Irving, Bancroft, Prescott, Motley, and Parkman worked in the preparation of their histories.

The lectures for 1897 were upon The Antislavery Struggle, as follows: William Lloyd Garrison, or Antislavery in the Newspaper, by William Lloyd Garrison, jr.; Wendell Phillips, or Antislavery on the Platform, by Wendell Phillips Stafford; Theodore Parker, or Antislavery in the Pulpit, by Rev. Edward Everett Hale; John G. Whittier, or Antislavery in the Poem, by Mrs. Alice Freeman Palmer; Harriet Beecher Stowe, or Antislavery in the Story, by Miss Maria L. Baldwin; Charles Sumner, or Antislavery in the Senate, by Moorfield Storey; John Brown, or Antislavery on the Scaffold, by Frank B. Sanborn; Abraham Lincoln, or Antislavery Triumphant, by Hon. John D. Long. The Leaflets were as follows: (1) The First Number of The Liberator; (2) Wendell Phillips's Eulogy of Garrison; (3) Theodore Parker's Address on the Dangers from Slavery; (4) Whittier's Account of the Antislavery Convention of 1833; (5) Mrs. Stowe's Story of Uncle Tom's Cabin; (6) Sumner's Speech on the Crime Against Kansas; (7) Words of John Brown; (8) The First Lincoln and Douglas Debate.

The lectures for 1898 were upon The Old World in the New, as follows: What Spain has done for America, by Rev. Edward G. Porter; What Italy has done for America, by Rev. William Elliot Griffiths; What France has done for America, by Prof. Jean Charlemagne Bracq; What England has done for America, by Miss Katharine Coman; What Ireland has done for America, by Prof. F. Spencer Baldwin; What Holland has done for America, by Mr. Edwin D. Mead; What Germany has done for America, by Miss Anna B. Thompson; What Scandinavia has done for America, by Mr. Joseph P. Warren. The Leaflets were as follows: (1) Account of the Founding of St. Augustine, by Francisco Lopez de Mendoza Grajales; (2) Amerigo Vespucci's Account of his Third Voyage; (3) Champlain's Account of the Founding of Quebec; (4) Barlowe's Account of the First Voyage to Roanoke; (5) Parker's Account of the Settlement of Londonderry, N. H.; (6) Juet's Account of the Discovery of the Hudson River; (7) Pastorius's Description of Pennsylvania, 1700; (8) Acrelius's Account of the Founding of New Sweden.

The lectures for 1899 were upon The Life and Influence of Washington, as follows: Washington in the Revolution, by Mr. John Fiske; Washington and the Constitution, by Rev. Edward Everett Hale; Washington as President of the United States, by Rev. Albert E. Winship; Washington the True Expander of the Republic, by Mr. Edwin D. Mead; Washington's Interest in Education, by Hon. Alfred S. Roe; The Men who worked with Washington, by Mrs. Alice Freeman Palmer; Washington's Farewell Address, by Rev. Franklin Hamilton; What the World has thought and said of Washington, by Prof. Edwin A. Grosvenor. The leaflets were as follows: (1) Washington's Account of the Army at Cambridge in 1775; (2) Washington's Letters on the Constitution; (3) Washington's Inaugurals; (4) Washington's Letter to Benjamin Harrison in 1784; (5) Washington's Words on a National University; (6) Letters of Washington and Lafayette; (7) Washington's Farewell Address; (8) Henry Lee's Funeral Oration on Washington.

The Old South Leaflets, which have been published during the years since 1883 in connection with these annual courses of historical lectures at the Old South Meetinghouse, have attracted so much attention and proved of so much service that the directors have entered upon the publication of the leaflets for general circulation with the needs of schools, colleges, private clubs, and classes especially in mind. The leaflets are prepared by Mr. Edwin D. Mead. They are largely reproductions of important original papers, accompanied by useful historical and bibliographical notes. They consist, on an average, of sixteen pages, and are sold at the low price of 5 cents a copy or \$4 per hundred. The aim is to bring them within easy reach of everybody. The Old South Work, founded by Mrs. Mary Hemenway, and still sustained by provision of her will, is a work for the education of the people and especially the education of our young people in American history and politics; and its promoters believe that few things can contribute better to this end than the wide circulation of such leaflets as those now undertaken. It is hoped that professors in our colleges and teachers everywhere will welcome them for use in their classes, and that they may meet the needs of the societies of young men and women now happily being organized in so many places for historical and political studies. Some idea of the character of these Old South Leaflets may be gained from the following list of the subjects of the first hundred numbers, which are now ready. It will be noticed that most of the later numbers are the same as certain numbers in the annual series. Since 1890 they are essentially the same.

No. 1. The Constitution of the United States. 2. The Articles of Confederation. 3. The Declaration of Independence. 4. Washington's Farewell Address. 5. Magna Charta. 6. Vane's Healing Question. 7. Charter of Massachusetts Bay, 1629. 8. Fundamental Orders of Connecticut, 1638. 9. Franklin's Plan of Union, 1754. 10. Washington's Inaugurals. 11. Lincoln's Inaugurals and Emancipation Proclamation. 12. The Federalist, Nos. 1 and 2. 13. The Ordinance of 1787. 14. The Constitution of Ohio. 15. Washington's Circular Letter to the Governors of the States, 1783. 16. Washington's Letter to Benjamin Harrison, 1784. 17. Verrazzano's Voyage, 1524. 18. The Constitution of Switzerland. 19. The Bill of Rights, 1689. 20. Coronado's Letter to Mendoza, 1540. 21. Eliot's Brief Narrative of the Progress of the Gospel among the Indians, 1670. 22. Wheelock's Narrative of the Rise of the Indian School at Lebanon, Conn., 1762. 23. The Petition of Rights, 1628. 24. The Grand Remonstrance. 25. The Scottish National Covenants. 26. The Agreement of the People. 27. The Instrument of Government. 28. Cromwell's First Speech to his Parliament. 29. The Discovery

of America, from the Life of Columbus by his son, Ferdinand Columbus. 30. Strabo's Introduction to Geography. 31. The Voyages to Vinland, from the Saga of Eric the Red. 32. Marco Polo's Account of Japan and Java. 33. Columbus's Letter to Gabriel Sanchez describing the First Voyage and Discovery. 34. Amerigo Vespucci's Account of his First Voyage. 35. Cortes's Account of the City of Mexico. 36. The Death of De Soto, from the Narrative of a Gentleman of Elvas. 37. Early Notices of the Voyages of the Cabots. 38. Henry Lee's Funeral Oration on Washington. 39. De Vaca's Account of his Journey to New Mexico, 1535. 40. Manasseh Cutler's Description of Ohio, 1787. 41. Washington's Journal of his Tour to the Ohio, 1770. 42. Garfield's Address on the Northwest Territory and the Western Reserve. 43. George Rogers Clark's Account of the Capture of Vincennes, 1779. 44. Jefferson's Life of Captain Meriwether Lewis. 45. Fremont's Account of his Ascent of Fremont's Peak. 46. Father Marquette at Chicago, 1673. 47. Washington's Account of the Army at Cambridge, 1775. 48. Bradford's Memoir of Elder Brewster. 49. Bradford's First Dialogue. 50. Winthrop's Conclusions for the Plantation in New England. 51. New England's First Fruits, 1643. 52. John Eliot's Indian Grammar Begun. 53. John Cotton's God's Promise to his Plantation. 54. Letters of Roger Williams to Winthrop. 55. Thomas Hooker's Way of the Churches of New England. 56. The Monroe Doctrine: President Monroe's Message of 1823. 57. The English Bible, selections from the various versions. 58. Hooper's Letters to Bullinger. 59. Sir John Eliot's Apology for Socrates. 60. Ship-money Papers. 61. Pym's Speech against Strafford. 62. Cromwell's Second Speech. 63. Milton's A Free Commonwealth. 64. Sir Henry Vane's Defence. 65. Washington's Addresses to the Churches. 66. Winthrop's Little Speech on Liberty. 67. Cotton Mather's Bostonian Ebenezer, from the Magnalia. 68. Governor Hutchinson's Account of the Boston Tea Party. 69. Adrian Van der Donck's Description of New Netherlands in 1655. 70. The Debate in the Constitutional Convention on the Rules of Suffrage in Congress. 71. Columbus's Memorial to Ferdinand and Isabella on his Second Voyage. 72. The Dutch Declaration of Independence in 1581. 73. Captain John Knox's Account of the Battle of Quebec. 74. Hamilton's Report on the Coinage. 75. William Penn's Plan for the Peace of Europe. 76. Washington's Words on a National University. 77. Cotton Mather's Lives of Bradford and Winthrop. 78. The First Number of The Liberator. 79. Wendell Phillips's Eulogy on Garrison. 80. Theodore Parker's Address on the Dangers of Slavery. 81. Whittier's Account of the Anti-slavery Convention of 1833. 82. Mrs. Stowe's Story of Uncle Tom's Cabin. 83. Sumner's Speech on the Crime against Kansas. 84. The Words of John Brown. 85. The First Lincoln and Douglas Debate. 86. Washington's Account of his Capture of Boston. 87. The Manners and Customs of the Indians, from Morton's New English Canaan. 88. The Beginning of King Philip's War, from Hubbard's History of Philip's War, 1677. 89. Account of the Founding of St. Augustine, by Francisco Lopez de Mendoza Grajales. 90. Amerigo Vespucci's Account of his Third Voyage. 91. Champlain's Account of the Founding of Quebec. 92. Barlowe's Account of the First Voyage to Roanoke. 93. Parker's Account of the Settlement of Londonderry, N. H. 94. Juet's Account of the Discovery of the Hudson River. 95. Pastorius's Description of Pennsylvania, 1700. 96. Acrelius's Account of the Founding of New Sweden. 97. Lafayette in the American Revolution. 98. Letters of Washington and Lafayette. 99. Washington's Letters on the Constitution. 100. Robert Browne's Reformation without Tarrying for Any.

OLD SOUTH ESSAYS, 1881-1898.

* * * The subjects of the Old South essays from 1881 to 1899 are given below, in the hope that they will prove suggestive and stimulating to other students and societies. It will be observed that the subjects of the later essays are closely related to the subjects of the lectures for the year.

1881. What was the policy of the early colonists of Massachusetts toward Quakers and others whom they regarded as intruders? Was this policy in any respect objectionable, and, if so, what excuses can be offered for it?

Why did the American colonies separate from the mother country? Did the early settlers look forward to any such separation; and if not, how and when did the wish for it grow up? What was the difference between the form of government which they finally adopted and that under which they had before been living?

1882. Ethan Allen and the Green Mountain Boys; or, the early history of the New Hampshire grant, afterwards called Vermont.

The town meeting in the Old South Meetinghouse on July 22 and 28, 1774.

1883. The right and wrong of the policy of the United States toward the North American Indians.

What were the defects of the "Articles of Confederation" between the United States, and why was the "Constitution of the United States" substituted?

1884. Why did the Pilgrim Fathers come to New England?

The struggle to maintain the Massachusetts charter, to its final loss in 1684. Discuss the relation of the struggle to the subsequent struggle of the colonies for independence.

1885. Slavery as it once prevailed in Massachusetts.

The "States rights" doctrine in New England, with special reference to the Hartford Convention.

1886. The Boston town meetings and their influence in the American Revolution.

English opinion upon the American Revolution preceding and during the war.

1887. The Albany Convention of 1754, its history and significance, with reference to previous and subsequent movements toward union in the colonies.

Is a Congress of two Houses or a Congress of one House the better? What was said about it in the Constitutional Convention, and what is to be said about it to-day?

1888. England's part in the Crusades, and the influence of the Crusades upon the development of English liberty.

The political thought of Sir Henry Vane. Consider Vane's relations to Cromwell and his influence upon America.

1889. The influence of French political thought upon America during the period of the American and French revolutions.

Washington's interest in the cause of education. Consider especially his project of a national university.

1890. Efforts for the education of the Indians in the American colonies before the Revolution.

King Philip, Pontiac, and Tecumseh: Discuss their plans for Indian union and compare their characters.

1891. The introduction of printing into England by William Caxton, and its effects upon English literature and life.

Marco Polo's explorations in Asia, and their influence upon Columbus.

1892. The native races of Mexico, and their civilization at the time of the conquest by Cortes.

English explorations in America during the century following the discovery by Columbus.

1893. The part taken by Massachusetts men in connection with the Ordinance of 1787.

Coronado and the early Spanish explorations of New Mexico.

1894. The relations of the founders of New England to the Universities of Cambridge and Oxford.

The Fundamental Orders of Connecticut and their place in the history of written constitutions.

1895. New England politics as affected by the changes in England from 1629 to 1692, the dates of the two Massachusetts charters.

The character of Cromwell as viewed by his contemporaries. Consider especially the tributes of Milton and Marvell.

1896. Early historical writings in America, from Captain John Smith to Governor Hutchinson.

The Harvard historians, and the services of Harvard University for American history.

1897. The History of Slavery in the Northern States and of Anti-slavery Sentiment in the South before the Civil War.

The Antislavery movement in American literature.

1898. The Struggle of France and England for North America, from the founding of Quebec by Champlain till the capture of Quebec by Wolfe.

The History of Immigration to the United States from the close of the Revolution to the present time. Consider the race and character of the immigrants in the earlier and later periods.

1899. The American Revolution under Washington and the English Revolution under Cromwell: Compare their Causes, Aims, and Results.

Washington's Plan for a National University; the Argument for it a Hundred Years Ago and the Argument To-day.

CHAPTER XVII.

PUBLIC, SOCIETY, AND SCHOOL LIBRARIES.

References to preceding Reports of the United States Bureau of Education, in which this subject has been treated: In Annual Report, 1870, pp. 541, 542; 1871, pp. 668-677; 1872, pp. liii-lvii, 820-887; 1873, pp. lxxxviii-xciv, 729-763; 1874, pp. lxxxvii-xcii, 753-793; 1875, pp. civ-cvii, 797-883; 1876, pp. cxxiii-cxxv, 777-779; 1877, pp. cxxxi-cxlii, 583-585; 1878, pp. cxxii, 599-600; 1879, pp. clvii-clviii, 618-619; 1880, pp. clxvi-clxvii, 738-741; 1881, pp. cci-cciv, 668-671; 1882-83, pp. clxxxv-clxxxviii, 694-699; 1883-84, pp. clxxxiii-clxxxiv, 724-737; 1884-85, pp. ccxxix-ccxxx, 691-782; 1885-86, pp. 716-719; 1886-87, pp. 901-972; 1887-88, pp. 1031-1039; 1892-93, pp. 575-583, 691-1014; 1893-94, pp. 1503-1504; 1895-96; pp. 339-599; 1897-98, pp. 673-692. See also in each Report statistics of libraries of schools and colleges. Refer also to index in each Annual Report from 1888-89 to 1898-99 for libraries in foreign countries.

Clark, pp. xxxv, 1187; *Rules for a printed Dictionary Catalogue, Part II*, by C. A. Cutter, pp. 89; Circular of Information No. 1, 1880, *College Libraries as Aids to Instruction*, by Justin Winsor and Otis H. Robinson, pp. 27; Circular of Information No. 1, 1881, *Construction of Library Buildings*, by William Poole, pp. 26; 1881, *Library Aids*, by Samuel Green, pp. 10; 1886, *Statistics of Public Libraries in the United States*, pp. 98, reprinted from 1884-85 Annual Report; 1886, *Special Report New Orleans Exposition 1884-85*, pp. 650-655; 1891, *Rules for a Dictionary Catalogue*, by Charles A. Cutter, pp. 140; third edition, with corrections and additions, reprinted from the 1876 special report; Circular of Information No. 7, 1893, *Statistics of Public Libraries in the United States and Canada (in 1891)*, pp. 213; 1893, *Catalogue of A. L. A. Library of 5,000 volumes, for a popular library*, pp. 592; 1896, *Papers prepared for the World's Library Congress, held at the Columbian Exposition*, edited by Melvil Dewey, pp. 691-1014, reprinted from Annual Report 1892-93; 1897, *Statistics of Public, Society, and School Libraries in the United States, and Library Legislation in the United States, being chapters viii and ix reprinted from the Commissioner's Report for 1895-96*.

STATISTICS FOR 1900.

The number of public, society, and school libraries in the United States of 1,000 volumes and over is 5,383, according to reports collected by this Bureau in 1900. This shows an increase of 1,357 libraries in less than five years. The number of volumes in the 5,383 libraries was 44,591,851 as compared with 33,051,872 in the 4,026 libraries reported at the beginning of the year 1896, the remarkable increase of 11,539,979 volumes or almost 35 per cent in the five years.

The statistics of libraries for 1900 will be found summarized in tables 1 to 9 and the statistics in detail for each library will be given in the concluding pages of this chapter. Tables 10 to 14 reproduce the most important items in similar tables for 1875, 1885, 1891, and 1896.

Table 1 gives the number of libraries, the number of volumes, and the number of pamphlets reported from each State and shows the increase in number of libraries and volumes and the percentage of increase in volumes in each State and geographical division. The North Atlantic Division has 2,473 of the 5,383 libraries and a million more than half the number of volumes in the United States. New York alone has 718 libraries with 7,496,509 volumes; Massachusetts, 571 libraries with 6,633,285 volumes, and Pennsylvania, 401 libraries with 3,974,577 volumes.

The North Central Division has 1,728 libraries with 11,211,710 volumes. Illinois has 309 of these libraries with 2,472,710 volumes; Ohio, 266 libraries with 2,055,589 volumes, and Michigan, 193 libraries with 1,298,708 volumes.

The South Atlantic Division has 421 libraries with 5,303,237 volumes. Maryland has 80 of these libraries with 1,175,253 volumes, and the District of Columbia 74, with 2,504,783 volumes, one million of these being in the Library of Congress.

The South Central Division has 374 libraries with 1,886,731 volumes. Kentucky has 76 libraries with 425,729 volumes, and Tennessee, 77 libraries with 392,221 volumes.

The Western Division has 387 libraries with 2,779,596 volumes. California has 212 of these libraries with 1,781,858 volumes, and Colorado 54, with 363,866 volumes.

The last column of table 1 shows the per cent of increase in the number of volumes in each State since 1896. The per cent of increase for the whole country was almost 35; for the North Atlantic Division nearly 33; for the South Atlantic Division 32; for the South Central Division nearly 39; for the North Central Division almost 40, and for the Western Division about 38. Oklahoma shows the greatest per cent of increase, 379. The following States and Territories show percentages of increase above 100: West Virginia, Arkansas, Indian Territory, Oklahoma, North Dakota, South Dakota, and New Mexico.

Table 2 shows that of the 5,383 libraries, 3,036 had 209,412 periodicals in their reading rooms, 3,684 had added 2,156,992 volumes during the year, and 1,455 had added 549,326 pamphlets. The number of volumes issued for home use during the year by 2,405 libraries was 48,410,128, and the number issued for use in 783 libraries was 9,609,632.

Table 3 indicates the sources of support and the classification of the libraries reporting. Only 1,040 libraries occupy their own buildings; 592 occupy rented buildings. Of the 3,751 not answering the question in regard to this item, school, college, and other libraries occupying buildings or rooms rent free comprise the greater proportion. The number of libraries supported by taxation is 2,375 and the number by subscription, 2,870. Only 138 are reported as being supported by both taxation and subscription. The number reported as entirely free to the public is 2,734, the number free for reference only 1,735, and the number of subscription libraries 914. There are 447 libraries classed as circulating, 1,148 as reference, and 3,788 as both circulating and reference.

Table 4 shows a general classification of the libraries reporting. There are 1,979 general libraries, 1,725 school, and 689 college libraries. The remaining libraries are divided among 15 classes.

In Table 5 the libraries are classified according to size. There are 4 libraries having over 500,000 volumes each, 3 between 300,000 and 500,000, and 47 between 100,000 and 300,000. The number of libraries having below 5,000 volumes is 3,654.

Table 6 is a summary of the income of libraries from various sources, their endowments, value of buildings, and the amount expended for books during the year.

Very few librarians made complete reports, but the number reporting on each item is given in the table. Of the 5,383 libraries, 988 received \$2,213,715 directly from taxation, 1,016 received \$2,349,294 from State, county, or city appropriations, 714 received \$1,198,955 from endowment funds, 962 received \$448,130 from membership fees and dues, 294 received \$50,742 from book rents, 819 received \$551,522 from donations, and 1,474 received \$1,000,048 from sources not stated. The total income of 3,115 libraries was \$7,812,406.

The aggregate of the endowment funds reported by 645 libraries is \$25,267,643, and the value of buildings owned by 710 libraries is \$47,083,805. The amount expended for books during the year by 2,972 libraries was \$2,056,675.

It is shown in Table 7 that there is one library to every 14,118 people in the United States, and that there are 59 books to every 100 population. The North Atlantic Division has a library to every 8,510 persons, and the South Central Division a library to every 37,647 persons.

The District of Columbia has 899 volumes to every 100 of population; Massachusetts, 236; New Hampshire, 176; Connecticut, 170; Rhode Island, 163; Nevada, 157; California, 120; New York, 103, and Maine, 101 volumes to each 100 population.

Table 8 is a summary of the statistics of 3,878 public, society, and school libraries of 300 volumes and over and less than 1,000 volumes. These libraries have 2,018,658 volumes. The number of libraries free to the public included in the above number is 2,611; free for reference, 684, and subscription, 619. Of the total number, 3,189 are school libraries, 88 college, 382 general, and 219 other libraries.

In Table 9 are combined the statistics of Tables 1 and 8. The number of libraries having 300 volumes and over is 9,261, and the number of volumes in these libraries 46,610,509. This is a gain of 2,077 libraries and 12,014,251 volumes since 1896.

Tables 10, 11, and 12 are comparable with Table 9, giving the statistics of libraries of 300 volumes and over for 1875, 1885, and 1896.

Tables 13 and 14 are comparable with Table 7, giving the statistics for 1891 and 1896. In 1891 the number of volumes to every 100 people was 41, in 1896 the number was 47, and in 1900 the number of volumes to the 100 population was 59.

Table 15 is comparable with Table 1. It gives the statistics for 1896, showing that from 1891 to 1896 there had been an increase of a little over 27 per cent in the number of volumes. Table 1 shows the remarkable increase of nearly 35 per cent between 1896 and 1900.

Following the fifteen tables of summarized statistics already mentioned will be found the list of the 5,383 libraries of 1,000 volumes and over reporting to this Office in 1900. It is not claimed that none have been omitted, but certainly every reasonable effort was made to obtain a complete list. The Office had a trial list of over 12,000 names of libraries. To many of these libraries a second, third, and fourth request for information was sent, requiring the use of more than 20,000 blank forms. After classifying the returns, it was found that 5,383 libraries had 1,000 volumes or over, 3,878 had 300 volumes and over, but less than 1,000, while several thousand had less than 300 volumes each. From several hundred no information could be obtained. Some libraries printed in the list for 1896 failed to make any report for 1900. In such cases letters of inquiry were addressed to the postmasters, and wherever the library was found to be still in existence its name was retained in the list and the 1896 statistics repeated.

In every Annual Report from 1867-68 to the present year has appeared information relating to college and school libraries, and periodically the Bureau has published detailed statistics of public libraries. The Annual Report for 1870 contained a list of 161 principal libraries not including college libraries. The Report for 1872 contained a list of 1,080 libraries of 1,000 or more volumes. A special effort was made in 1875 to obtain a list of all the libraries in the United States having 300 volumes and over. The list as printed in the Report for that year included 3,648 libraries, and of

these 2,039 had 1,000 or more volumes. This list was also published in the great special report issued by this Office in 1876. That report was a volume of about 1,200 pages devoted to "Public libraries in the United States of America, their history, condition, and management." The volume contained 39 chapters by as many as twenty eminent specialists in subjects relating to libraries. In the Annual Report for 1884-85 was published a list of 5,338 libraries of 300 or more volumes; 2,988 of these libraries had 1,000 or more volumes. This list was reprinted in a pamphlet of about 100 pages. A valuable chapter of about 70 pages appeared in the 1886-87 report devoted to "Libraries in the United States." The statistics of 1,779 libraries were published in seven tables, classified as follows: (1) Free public lending libraries, (2) free public reference libraries, (3) free public school libraries, (4) free corporate lending libraries, (5) libraries of clubs, associations, etc., (6) subscription corporate libraries, and (7) circulating libraries proper. In 1893 this Bureau published 20,000 copies of a circular of information of 213 pages, giving the statistics of 3,503 public libraries in the United States having 1,000 volumes and over. The statistics collected were for the year 1891. Also in 1893 the Bureau published 20,000 copies of "Catalogue of A. L. A. Library, 5,000 volumes for a public library selected by the American Library Association and shown at the World's Columbian Exposition." So great was the demand for this publication that a second edition was printed in 1896. This special report contained about 600 pages. The papers prepared for the American Library Association for its annual meeting held at Chicago in 1893, and read before the World's Library Congress at the Columbian Exposition, were printed in the Education Report for 1892-93. These papers, which were prepared by about twenty leading members of the association, occupy 324 pages of the above-mentioned Report, pages 691-1014. A small edition of the matter was reprinted in a separate pamphlet. One of the most popular publications of this Bureau is Cutter's Rules for a Dictionary Catalogue, which was published in 1876 as Part II of the special library report of that year. The third edition was published in 1891 in a pamphlet of 140 pages. The special report issued by this Bureau in 1886 on "Educational Exhibits and Conventions at the World's Industrial and Cotton Centennial Exposition, New Orleans, 1884-85," contained much valuable matter in relation to libraries. This report is now out of print, as are all the earlier reports above mentioned. In addition to the statistics of college and school libraries published every year in the Annual Reports of this Bureau since 1870, many of the Reports have contained valuable facts concerning libraries in foreign countries. This is particularly true of the Reports from 1888-89 to 1899-1900.

Increase of population and growth of libraries in 25 years.

g Also 50 evening students.

h Also 3,682 evening students.

i Average enrollment.

j In addition to pupils in elementary schools receiving grants from the departments.

k Total expenditure by department of science and art.

BRIEF CONSPECTUS OF THE SYSTEM.

From the above table it will be seen that the public elementary schools of England enrolled 5,654,092 pupils in 1899. They were distributed in 20,064 schools, under Government inspection, and maintained by the combined action of Government and local authorities. The total current expenditure reached the sum of \$58,000,000, of which Government supplied 73 per cent and local sources 27 per cent.

The current expenditure for day schools only was \$57,482,295, equivalent to \$12.04 per capita of the average attendance, viz, 4,636,938. This number is 82 per cent of the enrollment.

Origin and essential features of the system.—The organized system of public elementary schools is based upon the education law of 1870, commonly known as the Forster law, from the name of its author. Subsequent laws have fortified and extended the system but without changing at all its essential principles.

As early as 1833 Government had made an appropriation of \$100,000 for elementary schools under the management of religious societies. The policy was continued and developed from year to year but with ever-growing evidence of the inadequacy of the effort to meet the needs of the people. By the law of 1870 Government assumed the responsibility of securing school provision for all children, and, without prejudice to the existing denominational schools, created a new local agency, school boards, for the establishment of elementary schools. These boards were to be elected by the taxpayers in each rural parish and municipality, as circumstances might demand, either upon local initiative or upon the order of the Government. The existing denominational schools were to be recognized as public elementary schools in the meaning of the law and were placed upon the same footing as the board schools with respect to the Government grant.

The denominational, or "voluntary" schools as they are termed, were excluded from a share in the local taxes upon which the boards might levy for the support of the board schools. The conditions for sharing in the Government grant, which are the same for both classes of schools, are set forth in annual regulations (codes). These regulations are sanctioned by Parliament and have the same force as the law. They relate to buildings, number and qualifications of teachers, course of study, and length of school year.

The total enrollment in 1899 (5,654,092) was distributed between the two classes of schools as follows: Voluntary or denominational schools, 54 per cent; board schools, 46 per cent. The current expenditure for the "voluntary" schools was met from Government grants, 79.7 per cent; from endowments, subscriptions, and fees, 20.3 per cent. The current expenditure for board schools was met from Government grants, 54 per cent; local taxes (rates) 40 per cent, and the small balance from fees and other local sources.

The central authority.—The Government grant, which forms the chief source of income, is administered by the education department created in 1865 to manage the annual grant to elementary schools.

The distribution of the grant is made principally on the basis of the average attendance in individual schools, the rate per capita being determined by the reports of the Government school inspectors. These comprise 12 chief inspectors, 107 inspectors, 45 subinspectors, and 152 inspectors' assistants, a special inspector of music, a directress of needlework, and an inspectress of cookery and laundry work. The experiment of appointing women to serve as subinspectors, first tried in 1893, has proved eminently successful.

Local authorities.—Apart from the requirements for sharing in the grant, local authorities, whether private managers or school boards, have large powers and great freedom in respect to the management of the schools.

The school districts, or areas for which a school board should be formed under the law, are the metropolis, every municipal borough excepting Oxford, and every parish not included in the former. The number of school boards in 1899 was 2,527, representing 69 per cent of the population. In districts having no school board, comprising at present about 31 per cent of the population, school-attendance committees are appointed to enforce school attendance (law of 1876).

Free tuition.—The law of 1891 providing a special grant for all schools, whether board or voluntary, remitting fees, has had the effect of making elementary education practically free throughout the land. Of 20,064 schools on the list for inspection in 1899, it appears that 91 (against 95 the preceding year) had refused the fee grant altogether and 2,725 continued to receive such fees as the law allows (2,834 the year preceding). Of the total number of enrolled pupils, 88 per cent paid no fees whatever.

Compulsory school attendance.—Up to 1880 the matter of making by-laws compelling school attendance was optional with district boards or school-attendance committees. A law passed that year empowered the education department to make compulsory by-laws for all school districts where local authorities failed to take such action. Parents and employers violating the law are punished by fines and imprisonment. Attendance is therefore nominally enforced upon all children between the ages of 5 and 14 unless exempted under a by-law. The minimum age for exemption, which was fixed at 11 years—that is, 10 completed—by the law of 1893, was raised to 12 in 1899. The by-laws also must name a grade not lower than the fourth which the child must pass to secure an exemption certificate.

Religious instruction.—The law of 1870 provided that board schools should be strictly nonsectarian, and by a “conscience clause” prohibited private schools from forcing religious instruction upon children whose parents should object to the same. No public grants are allowed for religious instruction. The recent reopening of this question seriously threatens the prosperity of the system.

Development of curriculum.—The scope of instruction in the elementary schools, which was originally very narrow, has been extended from time to time, particularly by the codes of 1875 and 1880. Up to 1882 the Government grant was apportioned at a certain rate per capita for those who passed individual examinations in the obligatory and optional branches. This system, popularly known as “payments upon results,” was slightly modified by the code of 1882, which introduced a merit grant to be awarded at the rate of 1 to 3 shillings per capita on the basis of average attendance. The code of 1895 substituted for the system of annual formal examinations two annual visits by the inspector, to be made without notice, and recognized average attendance as the basis for nearly the whole grant. Freedom of classification and improved methods of instruction have been thus promoted. The same liberal tendency is indicated also by a change in the character of evening schools. Since 1893 these have been regarded as evening continuation schools, and a wide choice of subjects has been permitted. The result has been an immense increase in their attendance, rising from 81,068 in 1893 to 474,563 in 1899.

Teachers.—The teaching force in the day schools, numbering 139,818, was composed as follows in 1899: Certificated teachers, 44.4 per cent of the total; assistant teachers, 21.6 per cent, and pupil teachers, 22 per cent; additional women teachers, 12 per cent. The pupil teachers are regarded as teachers in training, and an additional grant is made to the school on their account.

The average annual salary of certificated teachers is, for men, \$659, as against \$457 in 1870, and, for women, \$411, as against \$279. For the training of teachers there are 44 residential colleges attended, in 1898-99, by 3,700 students, and 16 day colleges, with 1,196 students. Of the former institutions 42 are denominational and 2 are private and undenominational. The day colleges, with two exceptions, are departments or annexes of university colleges. The training colleges are all

under Government inspection and receive annual grants for "Queen's scholars," who are admitted upon proof of required attainments and who pledge themselves to adopt and follow the profession of teacher in a public elementary school or other specified schools. The expenditure for the residential colleges for 1898-99 was £210,786 (\$1,024,419), two-thirds of which was met by the Government grant. The expenditure for the day colleges was £47,459 (\$230,650), three-fourths of which was met by Government grants.

The superannuation law of 1898 provides for the retirement of teachers for age (65 years) or disability with an annual allowance. This allowance is made up partly by an annuity purchased by small sums—£3 for a man and £2 for a woman—deducted annually from each teacher's salary, and partly by a state pension calculated according to the years of actual service performed by the teacher.

The new board of education.—By a law of 1899, the administration of the system of elementary education passes to a board of education which replaces both the education department and the science and art department. The law provides also for the transfer to the new board of certain powers exercised by the charity commissioners with respect to educational trusts and endowments and for the transfer of the educational functions of the board of agriculture. Further, the law authorizes "a consultative committee to be constituted by an order in council consisting of persons qualified to represent the views of universities and other bodies interested in education for the purpose of framing, with the approval of the board of education, a register of teachers and of advising the board of education on any matter referred to them by the board." It also authorizes the board "to inspect any school supplying secondary education and desiring to be so inspected." Thus a step has been taken toward unifying in some measure the agencies of secondary and of elementary education.

PRESENT STATE AND URGENT PROBLEMS.

The English system of elementary education briefly outlined above enters upon a new era with the creation of a new central authority—the board of education. In the thirty years since the passage of the law of 1870 the progress of the system has been phenomenal. Measured by school attendance it is an increase from 1,693,059 pupils in 1870 to 5,672,403 in 1899, or an increase from 7.6 per cent of the population to 17.8 per cent under school training (see retrospective table, p. 1201).

The current expenditure from the public treasury increased in the same time from £562,611 (\$2,813,055) to £8,723,538 (\$43,617,690). The per capita expenditure from all sources (based on average attendance) increased in the last twenty years (1879 to 1899) from £1 14s. 6d. to £2 5s. 1½d. in "voluntary" schools and from £2 2s. ¾d. to £2 15s. 7d. in board schools.

The growth indicated by these figures has been accompanied by a marked increase in all the conditions that make for efficient schools. This improvement has had also the effect of disclosing certain weaknesses and limitations of the system which have led to the creation of a new central authority with enlarged scope. The present situation may be best understood by considering (1) the problems that are engaging the immediate attention of the board and (2) by a review of the chief lines of progress in the past.

The system established by the law of 1870 was not called suddenly into existence. It was the outcome of efforts begun by Christian societies for the moral and intellectual benefit of the people at the beginning of the last century. Government interest in the matter was stimulated by the spread of democratic principles. The first appropriation for elementary schools (\$100,000) was made in 1833, the year following the extension of suffrage by the reform law of 1832. The law on which the present system rests was the immediate outcome of agitations attending the passage of a second reform law in 1867.

The double system of schools recognized by the law (i. e., schools under private management educating at the present time a little more than half the school children, and board schools educating 46 per cent of the children) is the chief among several causes of the present difficulties. These are (1) the equalizing of school provision; (2) the adequate provision of higher-grade schools suitable for the industrial classes.

The inequality of school provision is chiefly noticeable in the contrast of municipal and rural districts. This widespread evil is emphasized in England by the fact that board schools predominate in the cities and denominational schools in the country. The former are under the management of elected boards, whose members are very generally actuated by liberal views and able to secure public support for progressive measures. The board schools share in the Government grant on the same terms as the parochial schools and draw the additional support required from local taxes (rates). The parochial schools are under private management, generally that of the clergy, and have no share in the local taxes. This exclusion is their peculiar grievance, but so far there has been determined opposition to all proposals for applying local taxes to the support of these schools unless public control goes with such appropriation. The situation may be best comprehended by citations from current sources, which are here reproduced without indorsement or criticism simply as a means of throwing light upon a problem of general interest.

The Schoolmaster, in an editorial on the resolution of the National Education Society to secure a Parliamentary inquiry into the facts, sums up the financial inequalities of the two classes of schools, the board and private (voluntary), as follows:

Of the 5,500,000 children on the rolls of the public elementary schools of England and Wales, 3,000,000 are on the rolls of the voluntary schools and 2,500,000 on the rolls of the board schools. The main differences in these two classes of schools are: (1) In the amount and nature of the local financial support accorded; (2) in the character of the religious instruction given, and (3) in the form of local management. Without entering into the question of the local management of board as against voluntary schools and without raising any religious question, there remains the question of the local financial support accorded to the schools, and this represents the serious point of differentiation in the financial treatment of the

two classes of schools which constitute the dual system. Now, as everybody knows, the financial aid to both board and voluntary schools is of two kinds—central and local. The central support consists of grants from the exchequer paid upon the report of Her Majesty's inspectors of schools and, generally speaking, is receivable by the voluntary schools on the same terms as by the board schools.

We may therefore dismiss the exchequer grants from the further examination of the problem as being a pretty similar factor on both sides of the inequation. Nobody imagines that this similar exchequer aid is sufficient to run either the board school or the voluntary school. Each must therefore come down upon the locality for its essential supplemental income. In the case of the board school, this supplemental income is provided from the rates, and in school-board districts this local contribution is compulsory upon all ratepayers. The voluntary school has no such compulsory local income to turn to, but must supplement its central aid from the offerings of benevolent and charitable persons. Needless to say, the voluntary local income in the latter case approaches nothing near the compulsory local income in the former. The school boards last year found it necessary to supplement their central aid by a sum equal to 23s. 9d. per child of the children in attendance in the schools. The conductors of the voluntary schools were only able to secure a local supplement to their central aid in the form of a voluntary subscription equal to 6s. 2d. per child. It is this serious difference in the local income of the schools which must in some way or other be removed before the problem can be considered to be finally settled.

Apart from the injustice upon the individual child, the thing examined in its entirety shows a grotesque state of affairs. Taking the country as a whole, it will be found that the school-board system, with its concomitant of a compulsory local contribution, covers roughly two-thirds of the area. Roughly speaking, this two-thirds of the area raises under the compulsory local rate about four and a half millions of money annually. Many of the inhabitants of this two-thirds are also contributors, over and above the sum they pay in rates, to the voluntary schools; and the total amount of voluntary contributions over the whole area of the country is roughly three-quarters of a million of money. Thus, putting the facts in a rough-and-ready fashion, and dividing the country into three equal thirds, we get the following incidence in the local support of schools:

	One-third of area.	One-third of area.	One-third of area (mainly rural).
Compulsory rate	£2, 250, 000	£2, 250, 000
Voluntary subscriptions.....	250, 000	250, 000	£250, 000
Total local support.....	2, 500, 000	2, 500, 000	250, 000

The question for educational reformers to consider is whether the last third of the country, as shown in the foregoing table, should get off with one tenth the measure of annual local support provided by each of the other two-thirds. It should be noted, too, that, whereas in the last third probably the majority of the inhabitants escape a local contribution altogether, in the former two-thirds all are compelled to contribute once and many subscribe twice.

Did space permit one could go on now to elaborate the anomalies existing in the rated two-thirds of the country. Thus, one gets school-board district A paying a rate of one-half pence in the pound, with school-board district Z at the other end paying a rate of 3s. 4d. in the pound. The whole thing—the attempt to maintain education by voluntary offerings, the policy of allowing so many districts to escape contribution, and the incidence of the compulsory local rate where levied—is grotesque in the extreme, and only needs to be put fairly before the House of

Commons—without sectarian acerbity, of course—to bring about one of the biggest educational reforms of the past thirty years. (Schoolmaster, November 17, 1900.)

Dr. Macnamara, M. P., long identified with the work of elementary education, rehearses these facts in a letter which appeared the last week of the year (1900) in a number of the leading dailies. In setting forth the financial inequalities he explains that it signifies in the main an inferior teaching force for the private schools. On this point he says:

Last year in rates and fees there was raised a local contribution of £1 4s. 2d. per child in the board schools; in voluntary contributions and fees there was raised a sum of 7s. 9d. per child in the voluntary schools; difference per child, 16s. 5d. This difference has been, in a degree, mitigated by the preferential treatment voluntary schools receive under the special-aid grant. The net difference when all sources of income are examined is 10s. 6d. per child.

Obviously, if the board-school children are not having too much spent upon them the voluntary-school children are having too little. And it is, of course, notorious that the voluntary schools are grievously understaffed, and that what staff there is is scandalously overworked and wretchedly underpaid. Indeed, of the net difference per child of 10s. 6d., no less a sum than 9s. 7d. is at once accounted for when we examine the amount of money spent per child on teaching power in the voluntary schools and compare it with the amount of money spent per child in the board schools.

The first question I desire to put is this:

Are the schools in which a majority of the children are being educated to continue in this condition, and are their teachers to continue so unfairly treated?

With respect to the questions of public control and religious instruction, which are so deeply involved with that of the development or continuance of the parochial schools, Dr. Macnamara continues:

My third, fourth, fifth, and sixth questions are:

Should the scheme of a direct local burden for education be perpetuated, or should the entire cost be borne by the imperial exchequer?

If there is to be a local charge, should that not be collected universally over the whole of the ratable value of the country, not allowing any portion of the ratable value to escape?

Could not the local margin—if it is desired to perpetuate it—be levied over counties and county boroughs at a fixed rate, say of 6d. in the pound, the imperial exchequer to be responsible for the remaining and major part of the entire cost?

In any case, is it not an anachronism, having regard to the vital importance of efficient education, to expect to maintain education in any degree from voluntary contributions?

Then at once arises the question of the local management of the voluntary schools. And here I suggest we should look to the municipal authorities, town and county. Given that the great bulk of the cost is to come from the imperial exchequer, and that the local margin is to be the result of a universalized and equable rate—

My seventh and eighth questions are:

Should not the denominational schools admit to their management representatives of the municipal authorities, which would raise the local margin of public aid and through which all the financial support might reach the schools?

As a condition of receipt of money from the municipal authority, ought not the voluntary schools in addition to conform to a series of regulations as follows:

(a) Securities for the proper staffing and equipment of the schools.

(b) Securities for keeping the fabric of the schools, the lighting, the ventilation, the draining, and the warming of the buildings in proper condition.

(c) Securities for the teachers against undesired extraneous duties and the establishment of means of appeal against unjust dismissal.

Finally, there remains the religious question. Personally I am sorry to enter upon it. Three years of theological squabbling at the London school board will last me my lifetime. But I suppose it must be raised. As to the towns, I see no difficulty. The number and variety of the classes of elementary schools give plenty of choice, and under the conscience clause hardship should be out of the question. The case of the villages is different. Here you have, in most cases, a Church of England school attended by the children of parents of other denominations. As a matter of fact the religious instruction in the village school is much more nearly undenominational than most people imagine. With great tact and discretion the teachers have fitted the instruction to the tender capacities of the children and the not less tender susceptibilities of the parents. Why not frankly admit the undenominational character of the religious instruction for four mornings a week, giving teaching in the Church catechism on the fifth to those of the children on whose behalf the same is desired? The suggestion is crude, I know. But what are we to do? Schools are languishing, teachers are shabbily treated, and the nation is suffering. Surely we can not safely fold our hands and mutter an inept non possumus.

Profoundly convinced as I am that the time is ripe for a new compromise on this education question, and determined as I am to try and get Parliament to think so too, I place these facts before your readers, respectfully soliciting their expressions of opinion and your powerful assistance in this effort to put our intellectual defenses upon the same sound footing as that upon which we all desire to see our physical defenses placed.

The grievances of Nonconformists in districts where there are only parochial schools were urged upon the attention of the Duke of Devonshire, president of the board of education, by a deputation which waited upon him soon after the board was organized. Rev. Hirst Hollowell, in behalf of a large body of Nonconformists, set forth that there are 8,000 parishes in England in which there is only a Church of England school, and he instanced two cases as evidence of the fact that the "conscience clause" of the education law, providing for the withdrawal of dissenting children from religious exercises, and the "Cowper Temple clause," forbidding sectarian instruction, do not suffice to protect either the consciences of parents or the feelings of children who are withdrawn from the religious exercises. One case which he cited was an occurrence in the borough of Flint, "where a number of persons asked that a number of children should be withdrawn from Church of England teaching." "What happened," he admits, "is almost unparalleled, even in the history of educational persecution." To quote Mr. Hollowell:

The rector of the parish, who was the correspondent of this school and chairman of the managers, read from the pulpit on the following Sunday the names and addresses and occupations of the parents. From his pulpit he held them up to public notice and public derision. He did not stop at that, but either he or someone in his name wrote to the various companies employing these workmen. I am in a position to produce a letter from the Northwestern Railway Company, and another company involved, showing that a correspondence, intended to

damage these workmen, was entered into by someone in the confidence of the managers of the school. Well, we thought our first business was to come to this office, and a number of us, including the honorable member for Flint, waited upon the education department here and submitted the whole case in writing. Subsequently the matter came before the House of Commons on two occasions, and we expected that the representative of the education department in the House of Commons would have stood up manfully in defense of the parents who had been subjected to that persecution. Judge of our feelings when we found the representative of the department in the lower house declared that the whole thing was an ecclesiastical squabble—a matter with which the department had no concern—and he declined to interfere. Well, we are here to represent to your grace that this is not an ecclesiastical squabble, and we say that in all such cases the department over which your grace presides would only do what we feel to be their duty if it threatened the withdrawal of the parliamentary grant. But that was not done.

The second case cited by Mr. Hollowell was as follows:

I believe your grace will concur with me in my statement when I say that the Cowper-Temple clause was intended to get rid of denominational catechisms altogether. Now, Mr. Gladstone and Mr. Forster, and the representatives of the then Government in 1870, were, I think, decisive upon this point—that it was intended that denominational catechisms and formularies be swept out of the board schools. We have had statements in the House of Commons that a portion of such catechisms might be allowed in a school—not the whole, but a portion thereof. That was the case which occurred at Church Coppenhall, near Crewe. The rector of the parish is the chairman of the school board, and the rector allowed to be exhibited on the walls of the board school an almanac which contained 34 paragraphs dealing with ecclesiastical doctrine and ecclesiastical announcements. Among the paragraphs was one denouncing Protestantism, and another invited the children of the school and neighborhood to confess to him at certain times and at certain places. If I were to encroach upon your grace's time by quoting more of it, you would say a more sectarian instrument was never exhibited at a school. That particular question was raised by the honorable member for the county of Flint, and the reply with which Mr. Samuel Smith was met is one of the reasons why the deputation is here. The vice-president of the council, to our extreme regret, said that such an almanac did not come within the limits or the intention of the Cowper-Temple clause, which aimed at catechisms and formularies, and that an almanac was neither. We respectfully submit to your grace that this was trifling with the act of Parliament. It was trifling with the most solemn feelings and rights of the community, and we look to your grace, with the record you have, to put these matters right. And may I say, in conclusion, that we are met at a time when immense sacrifices are being imposed for the sake of the Empire upon all classes of Her Majesty's subjects. Nonconformists are sharing in those sacrifices of money and suffering, of anxiety and of blood, and we ask that at a moment like this Nonconformists, who are contributing so much for the safety of the state, should not be treated as they have been treated and are still treated in thousands of the school districts of the country.

On behalf of the Primitive Methodists Rev. J. Pickett, of the same deputation, said:

Your grace, having in view the time occupied, I will confine myself to the statement of one or two facts. I have the honor of speaking in the interests of a church in this country which, next to the great Wesleyan Church, affects the rural life of the land more than any other church in the Kingdom. The peculiar disability,

therefore, that is consequent upon the application of sectarianism thus affects that church in a singular way, and that will become clear when I state one or two figures which I venture to lay before your grace. The Primitive Methodist Church has between 4,000 and 5,000 preaching stations in the United Kingdom, and at least 3,500 of these are in rural districts. And in a great proportion of these cases the only school to which Primitive Methodist children can go is the Anglican school. That fact, we venture to believe, is a somewhat significant one. Returns have recently come to my hands—returns coming in within the last three months bearing on this particular question—and I am able to state here to-day, in the presence of your grace, that no fewer than 33 cases of distinct disability as it relates to young people desirous of entering upon the teaching profession have come under my notice. In one particular instance a girl who was anxious to become a pupil teacher was refused admission at four distinct denominational schools in rotation unless she would leave the church of her forefathers and undergo the initiatory rites upon entering the Church of England. And that case, while it is a somewhat extreme case, because it was repeated in four distinct instances with the same person, is an illustration of cases particulars of which have come into my hands. I am bound also to say that the returns, while they are perfectly complete as far as they have gone, have only come from one-third of the places to which I have alluded; and, bearing that fact in mind, I venture to believe that my statement at the opening is not exaggerated, but that the church for which I have the honor to speak is peculiarly related to this question of disability. We therefore have no hesitation in cordially joining in the prayer of this deputation—that something should be done to remove what is so glaring a disability to the young people of our particular connection.

Finally is cited here the address of Mr. W. Muscott, president of the National Federation of Rural Teachers, delivered at the annual meeting of that body in April, 1899. Mr. Muscott, it will be seen, considered the question of rural schools from a general standpoint rather than from that of a partisan or antagonist of the dual system peculiar to England. He said:

I wish to call attention to the inferiority of rural schools throughout the country. "The farmer and the squire are no friends to elementary education. On the other hand, the agricultural laborer has not learned the value of education." Those were the words uttered and quoted by Sir John Gorst in the House of Commons in last June, and it was a most deplorable statement to make after nearly thirty years of so-called compulsory education. Now, as elementary education is the key by which the child may unlock further the gates of knowledge, the question at once arises, Why are rural schools inferior? And if so, the fault must lie either with the children and parents, or the curriculum and code, or the teachers, or the managers and subscribers. Examining the code, it must be allowed that, owing to the greatly altered articles and regulations, the compulsory literary and optional subjects can now be made suitable to the needs of the children from the age of 3 and up to 14. Elementary education is free and cheap to the agricultural laborer. Does he value it? How do the children attend? Compulsory efforts secure about 80 per cent of attendance; a higher percentage of attendance is secured only by bribery; i. e., by prizes and teas, etc. His children leave at the earliest—11 years of age, if possible. Evening continuation schools are scarce and, as a rule, very poorly attended and opened but for a short period; and attendance here is secured by means of social and convivial attractions and promises of supper and prizes. Why this indifference? It will be agreed that it mainly arises from the blunders of the past—the cast-iron system of payment by

results, ill-adapted schoolrooms, poor apparatus, insufficient staff, and, above all, insufficient pecuniary support, both local and imperial. Much of this has, happily, been altered; still much remains to be improved in some of these matters. But the chief reason for this indifference and unsatisfactory state of rural schools is the early age at which children have left and now leave the rural school. Numbers have left at the ages of 8, 9, and 10; numbers still leave at the age of 11. These are the brightest, of which the rural school is robbed. The better class go off to the neighboring town school, and, as Sir John says, the louts remain for the dunce's certificate. The effect is, in a very short time, as evening schools loudly testify, all that has been learned is quite or nearly forgotten, and these children soon assume all the indifference of their forefathers to all educational and enlightening effort. Thus the indifference has been, and continues to be, hereditary; managers and subscribers lose hope, and I am afraid I must add that teachers are becoming disheartened. County council classes, reading rooms, and evening schools are badly attended; the public house and the street corner are the chief village attractions; order at various kinds of public meetings is often wanting; while attendance at public worship is often at a discount, and "dodging the devil" (vide Sir J. Gorst) is altogether out of the question. It will be gathered from the foregoing, and freely admitted, that though the rural school makes an excellent beginning for the child's good, yet it breaks down completely when its fostering influence is most needed; i. e., at the child's age from 11 and upward. There is a very marked difference in the behavior of those who leave school at an early age and the few who remain longer under its influence, for the latter, as a rule, rarely forget or neglect their obligations and duties to themselves and neighbors. Therefore, in the forefront of rural educational reform a lengthened school life should take the first place. If, as is true, an educated man can turn out better work and without wasted energy in the factory and elsewhere, the same rule must apply to the laborer on the farm. Moreover, a more solid education would fit the latter to take his part in the parish council and in all village social efforts. The past system has produced a laborer dissatisfied with everything but himself, while his sons, with their bicycles, go off to where better wages are obtainable. But if school life is prolonged, what should be done to secure the hearty cooperation of child, parent, farmer, teacher, and taxpayer?

The curriculum should be revised, and manual instruction in woodwork, cottage gardening, cookery, and dressmaking introduced. The literary lessons would then have a practical and technical side, and the reproach that elementary education was too much of the head and too little of the hand would be swept away. If these subjects of instruction are good for the city and town child, they must also be useful and important to rural children, and to secure such instruction being given the technical-education act requires modification to enable county councils to award grants to rural schools. Lessons could be given on or off the school premises by the qualified permanent teachers or by peripatetic ones. Much of the money now expended by county councils in the holding of classes in various villages for instruction in these subjects is more or less wasted by reason of their short duration and spasmodic character. Moreover, this absurdity goes on: A child of 11 giving up the day and evening school may attend such a county council class, but a child of 14 keeping to school may not attend. The money expended in the carriage of plant, hire of rooms, and traveling would be saved, and in a few years each rural school could be supplied with the necessary workshop and equipment. Then, as regards Sir John Gorst's proposal of closing rural schools during busy seasons, no one can deny that, owing to our changeable climate, many of the children could be usefully and occasionally employed. But this does not apply to all, as the younger ones are a hindrance to their parents and a nuisance to others when not at school. To close the village school longer than it now is would soon make it in a worse position than it is,

unless the British public would submit and enforce regularity when the school was open. It must also be remembered that it is necessary there should be three vacations during the year, and generally vacations are given at Christmas, Easter, or Whitsuntide, and in August and September. Such holidays meet the needs of the corn and hop districts, but they do not cover the needs of the hay, fruit, and potato districts. But, provided a regular attendance had been made at other times, there is no reason why the elder children desirous of so doing should not be allowed leave of absence at these periods, and if such liberty made for regularity the schools would not suffer so much as they now do from intermittent absence. (Schoolmaster, April 15, 1899.)

The National Educational Association in its annual meeting of 1899 presented through its secretary, Mr. A. J. Mundella, the chief causes of the existing difficulties of rural schools, under the form of a review of ten years.

With respect to elementary education the secretary said:

The close of the year 1898 completes ten years of the existence of the association. During the whole of that time there has never been a majority in the House of Commons heartily in accord with the act of 1870, much less one which could be asked to give a further extension to the principles which this association exists to promote and defend.

Increase of popular control.—Notwithstanding many opposing influences, our principles have during the ten years made real progress. The number of public elementary schools provided by the school boards has increased 25 per cent. The number of scholars being educated in them has increased over 80 per cent. The population of the country under the jurisdiction of school boards has increased nearly 25 per cent.

One-third of the population, however, are still without a local public authority charged with the care of the general education of the people and armed with power to meet educational deficiencies. One significant feature of the ten years under review has been a vast and highly organized extension of local self-government. The whole country is now divided into about 2,000 areas of local government, wherein the ratepayers are generally able to provide themselves with water, light, drains, workhouses, baths, libraries, etc. The power to provide elementary schools is, however, still denied to nearly one-third of the population, covering more than half the area, and, even where allowed, is subject to many vexatious restrictions.

The sectarian monopoly.—In spite of this preliminary difficulty the universal creation of school boards might have been practically complete before now but for two special hindrances. The first is the local monopoly given to existing schools provided by "voluntary" agencies. We are constantly in correspondence with ratepayers who, being dissatisfied with the present provision for education in their district, desire to have a school board and a board school. They are usually not aware that so long as a so called voluntary school, with bad buildings, inadequate staff, a low standard of instruction, and an avowed intention to proselytise the children of other creeds, can keep its doors open, the ratepayers and public authority are not allowed by the education department to provide another school in competition with it. The apparent futility of creating a board which may for years have no power to provide schools has prevented more rapid growth. It is to be noted that this restriction was no part of the settlement of 1870; it was, indeed, emphatically rejected by the House of Commons in 1870 and 1873.

The need for a revised area.—The second serious hindrance to the further creation of school boards is the unsuitable area prescribed by the act of 1870. The ecclesiastical system of education which predominated before 1870 was organized

in parochial areas, in town and country. Almost every reformer throughout the century urged that the area of the parish was too small for efficient and economical provision of education and management of schools. The act of 1870 made the municipal area the school district in towns, but the parish was made the school district in other portions of the country. Experience has justified the assertion that the parish area is too small. Mr. Forster promised in 1870 that the education department would use freely the power given to it to group parishes when forming a rural school board, but it has not done so, and the fact that the further extension of the school-board system on present lines means the creation of a vast number of small school boards, has impeded progress. The extent of this evil is shown by the fact that although 2,500 boards cover about two-thirds of the population, it will on present lines require about 11,000 more boards to cover the remaining third.

There are over 12,000 rural parishes. They have an average population of only 576. They are now grouped into 660 rural districts for all municipal purposes except education, the boundaries being carefully adjusted. The rural district areas contain an average population of 10,345. The rural district councils are the recently created municipalities of the rural population. Their areas have been chosen as those best adapted for local municipal work, in which local public opinion and local patriotism may grow to be effective. Areas suitable for all these purposes are also suitable for the local administration of elementary education, and when the rural parishes' area is abandoned for the district council area, instead of having to create thousands of small school boards, with generally one small school to manage, there would be a few hundred substantial boards, working in suitable areas, with an average population larger than nearly half of the municipal boroughs, and each on an average maintaining from 15 to 20 schools.

The reform is urgent, for small boards are still being created. The evil of the present system is acknowledged by all parties, and has been condemned by no one more strongly than the present vice-president of the education committee. The remedy has been urged for very many years. It has always been one of the first planks in the platform of the National Educational Association. We have waited whilst the claims of the large towns took precedence of those of the villages, but now the time has arrived when the condition of elementary education in the villages is one of the most urgent educational problems of the day.

The standard of education.—As regards the efficiency and the progressive character of the education provided, there has been considerable advance during the past ten years.

The system established in 1870, of frequent appeals to the electors in the election of local bodies for the purposes of public education, has stimulated and educated public opinion, and in those areas in which public opinion has been invested with administrative power the people have generally outgrown the notion that their public educational duty was limited to teaching the three R's to the children of the poor.

Supported, nay, rather forced, by public opinion, the school boards have compelled the department to enlarge the sphere of public education; but from top to bottom the system is incomplete and defective, hampered by statutory restrictions and crippled by administrative tradition.

Some managers of voluntary schools are not favorable to improvements in education, teachers, or buildings. In districts where local public opinion is not allowed to influence local education, the education department is unable even to insist that schools shall rise to their minimum standard of efficiency on account of the outcry which is immediately raised in Parliament when pressure is put on an inefficient voluntary school. The standard, therefore, remains low, and many schools are recognized as technically efficient which are far below it. Such

increased efficiency as has been obtained during the ten years under review has been secured by a lavish increase of grants which are little less than extravagant, and often ineffectual, bribes to the managers of voluntary schools to allow the extent and quality of the instruction given to be improved. These grants have necessarily been an infraction of the settlement of 1870, which provided that the cost of maintenance should be shared equally by the locality and the State. How far this principle has been departed from during the past ten years is seen in the fact that the annual grants to voluntary schools have increased by £2,300,000, and the annual voluntary contribution by only £100,000, a proportion of 23 to 1. During the same period the local contributions from the rates to the maintenance of the schools under popular control has increased by more than £1,000,000. The difference between this £100,000 increase of subscriptions to voluntary schools and the £1,000,000 increase of rates for the maintenance of board schools, is not only a measure of the breach of the settlement of 1870, but it is also an indication of the comparative inefficiency of the schools thus inadequately supported. The interests of education demand that steps should be taken to put an end to the recognition of any school which does not satisfy reasonable requirements as to efficiency and adequate income from voluntary sources. To quote the words of the present archbishop of Canterbury, "There is no security for efficiency without interested local supervision; there is no security for economy without the vigilance of those who bear a substantial share of the burden of the cost." (1888.)

The increase of clerical influence.—There has been during recent years a distinctly retrograde movement in regard to the unsectarian character of the teaching in the public schools. There are now on many school boards members who are there as the open foes of undenominational education, and whose main endeavor is to force the doctrines of one communion upon the children and teachers of different denominations. In voluntary schools, which are avowedly denominational, the sectarian element has become more and more pronounced. The clergyman of the parish is the ex-officio irremovable manager of the national school. Fifty years ago the Government of the day secured to the subscribers the right to elect managers from the laity. But latterly the gradual disappearance of subscriptions is leading to the disappearance of that constituency of independent lay subscribers, and in many parishes the clergyman is again in sole control. This fading away of the lay element has been accompanied by the creation of diocesan and other associations, clerical inspectors and organizers. All of these have brought into existence new forces alien to the parish, which are mainly directed toward making the public schools more definitely sectarian.

Owing to these and other influences there is also a marked change in the clergy. In past times a clergyman finding himself in control of a school containing children of different denominations was frequently liberal and tolerant, careful to respect the religious convictions of others. In the past many church schools were church schools only in name. But this has changed. Many of the clergy of to-day belong to a new type of men, and use their power ruthlessly. We receive appeals for help from villages in all parts of the country, the burden of the complaint being, "We had no trouble in the past, but now there is a new clergyman, or the diocesan board has interfered, and the village school is made intolerable to Nonconformists." The clergy, if elected to serve on school boards, might be, and often are, valuable managers of the schools, but a clergyman in despotic control of the village school, independent of the public opinion of his own parish, whether Nonconformist or Anglican, is an unsuitable manager of the only school of the district which is supported by public funds, and which all denominations are compelled to use.

Summary.—This brief review of ten years shows that although the principle of popular control has made progress, it has been almost disastrously slow and has

been purchased at a great cost of continued inefficiency and squandered public funds. The one great obstacle has been the claim of ecclesiastical organizations to establish a monopoly of national education, a claim which was distinctly set aside by Parliament in 1870, and which the latest developments of ecclesiastical policy has made increasingly distasteful to the nation.

The interests of national education, the just grievances of Nonconformists, and the elementary rights of the people to local self-government demand that the reforms suggested above should be effected at once.

School boards should be made universal, the area in rural districts should be enlarged, and the board everywhere should have power to provide a board school within reasonable distance of a sufficient number of ratepayers who are dissatisfied with the existing accommodation.

The second and most pressing problem with which the education board must deal is that of the adequate supply of higher-grade public schools, and more particularly that of the local authorities to which this interest shall be intrusted. Two public local authorities are now engaged in this work, namely, the county councils (created by law of 1888) and the school boards. The county councils were brought into the field by the law of 1890, which intrusted to them the surplus of the liquor duties—about \$3,000,000 annually—and empowered them to apply the same to technical education; a previous law (1889) authorized them to levy a tax (not exceeding 1 d. in the pound) for the same purpose, but it has been generally disregarded.

The school boards of the large cities have developed higher-grade schools with the approval and aid of the Government.¹ Recent measures have led to the apprehension that future Government action will cripple the school boards in this respect. To this end apparently tend (1) the minute withdrawing from these schools aid from the science and art department, (2) a recent decision against the London board denying their right to draw support from the local taxes for the higher-grade classes, and (3) a minute, approved by Parliament, authorizing the board of education to recognize a new class of public elementary schools, termed higher elementary. The strength of the opposition which this adverse policy is likely to encounter may be estimated by a view of the populations represented by the municipal boards. The entire population under school boards in England (Wales omitted) is 18,838,630, or 68 per cent of the total (27,489,128). More than half the population under school boards is concentrated in cities or towns. Besides the London board, which deals with a population of 4,232,118, there are 170 school boards in county and municipal boroughs comprising, altogether, 9,260,330 inhabitants. Of these boroughs 58 have populations exceeding 50,000 each. In this number are included Leeds (population² 423,899), Liverpool (634,212), Manchester (543,902), Nottingham (239,384), Sheffield (361,169), West Ham (300,241). The school board

¹ For an illustration of these schools see the account of the Leeds Higher-Grade School, pp. 1226-27.

² Estimated populations for 1899, Statesman's Year-Book, 1900, pp. 18, 19.

system is, in general, admirably adapted to these great industrial communities and may count upon their support, as was shown by the defeat of the Gorst bill of 1896.¹

On the other hand, it is generally admitted that the rural district as now constituted is too small for the support of higher-grade schools or even for the successful management of the elementary schools. There are 1,223 boards, which represent each less than 1,001 inhabitants, and of these 536 have each less than 500 inhabitants.

There are also serious objections against intrusting the interests of higher-grade schools to the county councils. It is urged in particular that they represent areas too large for educational administration and also that they are elected primarily for other purposes.

While the question of the local authorities excites at the moment chief attention, there is another and deeper question which, in the minds of many, is vastly more important and which, if properly dealt with would simplify the matter of local management. This more important consideration is that of the general conception of secondary education.

In order to present the conditions as they now exist in England, articles are cited in the second division of this chapter from well-known leaders in the educational field.² It will be seen from these that a broad distinction is made between higher-grade schools for the industrial classes and secondary education as it is maintained for the higher classes. This distinction reaches down into the elementary grades also.³ The conception differs radically from that which prevails among us and which has powerful advocates also in England, namely, the conception of education as an integral process, alike in its beginnings for all people. This idea, stamped upon our exhibit at Paris, deeply impressed all foreign students of the exhibit, and it was as a signal object lesson in this respect that the collection was conveyed to Manchester and there placed on exhibition at the expense of the local technical committee. The timeliness of the lesson it conveys is illustrated in the following comments by Sir John Gorst, vice-president of the board of education, as quoted in the *Manchester Courier*:

Sir John Gorst said that people who went to the American exhibition in Manchester with their hearts full of political controversy, desirous of finding in that exhibition material with which they could illustrate their controversies and confound their adversaries, would come away disappointed, because it was not an exhibition of the educational systems of a single nation. It was an exhibition of

¹For account of this bill see Report of Commissioner of Education for 1895-96, Vol. 1, Chapter II.

²See pp. 1210-17, article by Lyulph Stanley, vice-chairman of the London board; pp. 1217-23, article by Sir J. G. Fitch; p. 1225, citation from speech of Professor Jebb, M. P., on the minute relative to the new higher-grade elementary schools.

³The board of education has published a volume on the schools which prepare pupils for the secondary schools. In all, 400 of these preparatories are reported.

the educational system of about fifty nations, all absolutely independent of one another, and so far as there was any unity of purpose in the exhibition it was because of the fact that the minds of the citizens of America had been brought quite independently to the same conclusion. The United States Government did not interfere with education at all. It was not like our Government here at home. It left the initiative, the cost, and the management absolutely in the hands of the States themselves. They passed all the laws they pleased; they voted what money they pleased; they had all the systems they pleased, and what was seen in the exhibition was the result. Another reason why the political visitors could find no subject for his consideration was that the institutions of one nation never fitted another. People told us we ought to learn from foreign nations. So we ought, but what we had to learn from them was that which would best fit our own nation. The institutions of France and Germany, and even of America, would not fit us, and we had to find out from foreign methods those which we could best carry into execution.

PHILOSOPHICAL AND PRACTICAL EDUCATION.

Instead of going with the hard heart of a politician into the exhibition, if they went with the friendly feeling of one who desired to see the young people of this country educated they would find abundant material for reflection, and they would come out improved in their mind. He wished to put before them two considerations—the first philosophical, and the second, homely and practical. The philosophical consideration was, that in the great world of civilized education there were two rival and distinct systems at present before the world. One was the system of giving a general education, adapting all lessons to developing the character, and the mind and the body of the pupil, whatever might be the future course in life, and not to begin to attempt to specialize, or to teach anything which was wanted for the particular course which the student was going to adopt until a very late stage in education. The other system was to have from the outset an idea of what the child was going to become, and to educate the child for that particular calling or profession, and, in vulgar language, to teach something useful. There was a great deal to be said for both those considerations, and many experienced men took opposite sides upon them, but America was entirely in favor of general education.

The most remarkable thing about the exhibition was that every boy and girl had his or her natural gifts and natural qualifications developed, and developed in the same way by the same general methods, and that it was only when the mind had been developed that any attempt was made to give special instruction. That was the system which was adopted generally in the present day by the Teutonic nations; it was the system of Germany, of Denmark, of Sweden, of Norway, and of Holland, and it was the system mostly adopted in the British colonies. The other system was the system chiefly of the Latin races. France was our nearest neighbor, and she had carried her education to a very high condition of perfection and had adopted the principle at an early stage of specializing the instruction of the children. He was told that the French particularly were beginning to distrust their own system; that what they saw in the American and English section of their exhibition had led them to reconsider their position and rather to lean to the doctrine that the true method of education of the people was to develop general intelligence, and that it was a mistake to begin too early to teach what was only specially useful in some special trade or calling. It was not that the Germans or the Americans neglected technical education. The exhibition in the Central School and the great technical institutions of Germany would show that in these countries technical instruction was carried to a very high point, but it was a fundamental principle of their system that technical instruction could only be based upon sound general education, and that to attempt to impose technical

instruction upon the people until they had established a sound system of education upon which to found it, was only throwing money away and disappointing expectations. What he wished to urge upon them was that in looking upon that American exhibition to observe how throughout the kindergarten, the elementary school, the secondary school, and the university, persistent and continuous was the effort of the American teacher to develop to the full all the faculties of body and mind which would be useful in the study of technical instruction and of the active processes of life to follow. * * *

The general moral of his discourse and of the action of the technical instruction committee was this—here we had a very eminently practical people, people who had an eye to what was called the “main chance,” who did not throw away their dollars, and we had these practical people telling us that the best way to bring up the rising generation was to give them sound general knowledge before we attempted to bring anything else upon it. If we would lay to heart that lesson and consider how important it was in this country that this general knowledge should be accessible to every boy and girl; if we could bring about a state of things where every boy and girl obtained the same chance, we should find the general character and the general powers of body and mind of our English fellow-citizens enormously increased, and we might then become a real imperial people and exercise a beneficent influence upon the history of the world.

The problems here considered are themselves signs of the progress in public education which is so significant a part of the history of the century just closed. The main lines of this progress may be seen from the following review, chiefly statistical, drawn from official sources.¹

Table II shows the comparative growth of board and “voluntary” schools, chiefly denominational, as indicated by average attendance for successive years from 1870 to 1899, inclusive. The relation is emphasized by the accompanying diagram. Table III shows the accommodation and enrollment in the different classes of schools for the year 1899.

The progress of the school boards is the most significant fact in the history of the school system, because the boards were called into existence by the law of 1870 and illustrate the democratic impulses from which it arose. As already stated, they are elected bodies formed upon the initiative of their respective districts, or by the order of the department, if necessary.

The following table shows the number of boards and the nature of their election (England and Wales):

TABLE IV.—*Status of school boards.*

London	1	-----	1	4,232,118
County and municipal borough	193	55	138	9,604,587
Unincorporated towns and rural parishes	2,333	a 1,289	1,044	6,230,772

a Of these 203 ordered because of the closing of private schools.

School boards v. compulsory school attendance.—The principle of compulsory school attendance was introduced with the school boards, which were empowered by the law of 1870 to make compulsory by-laws. After six years' experience with this purely permissive measure, it was found that only 55 per cent of the population was under school boards and only 46 per cent subject to compulsory by-laws. The law of 1876 was enacted specially to extend and to enforce this principle. This law first declared that it "shall be the duty of the parent of every child to cause such child to receive efficient elementary instruction in reading, writing, and arithmetic;" parents failing in this duty were liable to the penalties provided in the local by-laws. The law also rendered an employer liable to a penalty who took into his employment a child "(1) under the age of 10 years; or (2) if of the age of 10 years and upward, who had not obtained the required certificate

of proficiency in reading and writing and elementary arithmetic or of previous due attendance at a certified efficient school.”

It was also ordered by the law of 1876 that in all districts where there was not a school board a school attendance committee should be appointed. The committee was charged with the duty of keeping watch over the matter of school attendance and reporting all cases of the violation of the compulsory law.

The whole population of England and Wales was thus brought under the jurisdiction either of school boards or school attendance committees; it was, however, still optional with the local authorities to make by-laws respecting school attendance. In districts where no by-laws were in force, children, in order to qualify for employment, had only to meet the very modest requirements specified in the law of 1876, viz., “to pass examination in the fourth grade or give proof that they had attended school for 250 times in each year for five years after the age of 5, in not more than two schools.”

It was not until 1881 that by-laws became universal under the elementary education law of 1880, which “empowered the education department to make by-laws for all school districts where local authorities had by the 31st of December, 1880, failed to make them.”

The following table shows the extension of school boards for the successive years 1872 to 1899, and also the spread of the compulsory policy during the same time:

TABLE V.—Population of England and Wales under school boards and school-attendance committees; also the population subject to by-laws until the elementary education act of 1880 made by-laws universal.

Year ending Apr. 1—	Total population of England and Wales.	Under school boards.		Under by-laws of school boards.		Under school attendance committees.		Under by-laws of school attendance committees.		Percentage of population under by-laws.

a Census of 1871.

b Census of 1881.

c Census of 1891.

d This population is under the jurisdiction of 2,527 school boards, viz. the London school board, 193 municipal borough boards, and 2,333 parish boards.

e This population is under the jurisdiction of 792 school attendance committees, viz. 119 in municipal boroughs, 92 in urban districts, and 581 in unions.

Although the law of 1880 extended compulsory laws to the whole country, the requirements for either partial or total exemption from the obligation to attend school were still left to the action of local authorities, excepting that the minimum limit of age was fixed at 10 years (raised to 11 by law of 1893) and the school limit fixed at the fourth grade. The wide diversity under by-laws in respect to the latter requirement is shown by Table VI.

TABLE VI.—*Showing how the population of England and Wales was distributed with regard to the school grades (standards) for total and for partial exemption at the dates specified.*

a At this date 17 per cent of the population were under by-laws making school attendance compulsory only between the ages of 5 and 10 years.

b In a few cases included in the statistics for 1895 attendance is only compulsory up to 10 years of age.

The most important measure affecting school attendance is the law of 1899, which raised the age for total or for partial exemption to 12 years.¹

This law did not affect children already exempt under the by-laws of their respective districts. In the case of children to be employed in agriculture the law provided as follows:

The local authorities may make 13 the minimum age for exemption from school attendance, and the children so employed who are over 11 and under 13 years of age and who have passed the standard fixed for partial exemption from school attendance by the by-laws of their respective districts, are not required to attend school more than 250 times in any year.

Finally, a law of 1899 empowers local authorities to raise the by-law age for full exemption from school attendance to 14 years. This law also increases the maximum penalty for violation of the compulsory-attendance laws from 5s. to 20s. Partial exemption may be allowed

¹ For particulars of the conditions which led to the passage of this law, see Report of the Commissioner of Education for 1898-99, Vol. 1, pp. 13, 14.

in the case of a child who has attained the age of 12 years, if such child has made 350 attendances in not more than two schools during each year for five preceding years, whether consecutive or not.

The arrangement for partial exemption from compulsory school attendance has given rise to a system of half-time attendance,¹ for which special registers are kept in the schools.

Finances.—The increase in the annual expenditure for schools since 1870 has been as marked as the increase in their number and their enrollment. Besides the demand for larger resources, arising from the mere growth in numbers, there has been an added demand to meet the constant improvement in the schools. Hence the financial statistics serve as a measure both of the increased number and the advancing standard of the schools.

In considering these data it should be recalled that the income of the public elementary schools is derived from two sources—government grants and local funds. The latter are derived as follows: (1) For schools under private managers (chiefly denominational), from voluntary contributions, endowments, and fees; (2) for board schools, from local taxes and fees. Table VII shows the total annual expenditure, current and capital, classified by sources for succeeding years from 1871 to 1895, inclusive.

Table VIII presents a comparative view of the per capita current expenditure for board and voluntary schools, and Table IX, the total income for maintenance only, classified by sources for the years 1894–1899, inclusive.

¹See line 24, Table XV, pp. 1201–1202. According to the latest official regulation an attendance means attendance at secular instruction during one hour and a half in the case of a scholar in a school or class for infants; during two hours in the case of a scholar in a school or class for older children, and during one hour and twenty minutes in the case of a half-time scholar. The attendance of a half-time scholar for less than two consecutive hours is not recognized, but such two consecutive hours are reckoned as an attendance and a half.

TABLE VII.—Expenditure on public elementary education (England and Wales), 1871–1895 (current and capital).

Year.	(a) Paid from rates (Local taxes board schools only).	(b) Voluntary subscriptions and income from endowments.	(c) Total of columns (a) and (b).	(d) Fees of scholars in elementary schools and students in training colleges.	(e) Total of columns (a), (b), and (d).	(f) School board loans for building purposes.*	(g) Estimated subscriptions for voluntary school buildings.	(h) Grand total of columns (a), (b), (d), (f), and (g).	(i) State expenditure (education department and science and art department).

* The law of 1870 authorized school boards to borrow money on the security of local taxes (rates) for the building of school houses. Up to the 1st of April, 1899, the education department had sanctioned loans to the amount of £37,150,310 (\$185,751,550). The new accommodation thus furnished is sufficient for 2,595,254 children. The estimated cost per child is thus about £14 6s. (571). The department has also sanctioned loans to the amount of £85,967 to 8 school boards for providing accommodation for 508 blind and deaf children.

By reference to Table VII, column 10, it will be seen that the Government grants or state expenditure, which in 1872 amounted to £927,324 (\$4,637,620), had increased in 1895 to £6,963,279. In 1899, as will be seen by reference to columns 10-13, Table IX, the grants for maintenance only amounted to £7,831,204. If to this sum be added grants for training colleges, administration, pensions, etc., the sum total of £8,723,538 (\$43,617,690) is reached—about ten times the amount in 1872. The increase in the appropriations from the public treasury is a striking proof of the growing sense of national responsibility and of national concern in respect to the intelligence of the masses. State aid, consisting originally of the annual grant, has been augmented by grants from the science and art department, by the fee grant, and in private schools by the special aid grant. Grants from the science and art department were allowed for drawing as early as 1854; subsequently grants from the same source were allowed for science instruction and for manual training, and thus the extension of the course of study was specially encouraged; the fee grant provided by law of 1891 for all schools remitting fees has had the effect of making elementary education gratuitous for nearly all children. The aid grant for voluntary schools only, allowed under a law of 1897, was a discriminating measure which has caused much discontent and has not so far accomplished the purpose of raising the denominational schools to the level of the board schools. The amounts received from these several grants in the successive years 1894-1899 are shown in columns 10-13, Table IX, and an analysis of the several grants showing source and purpose for 1899 in Table X.

The annual grant which was originally distributed on the results of individual examinations is now allotted chiefly at a certain rate per capita of average attendance—in infant schools at the rate of 17s. or 16s. per capita, and in schools for older scholars at the rate of 22s. or 21s. per capita. In the case of both classes of schools the inspectors' reports, which determine the rates allowed, must be explicit in respect to the following points:

(a) The suitability of the instruction to the circumstances of the children and the neighborhood.

(b) The thoroughness and intelligence with which the instruction is given.

(c) The sufficiency and suitability of the staff.

(d) The discipline and organization.

Special grants are still allowed (1) for girls who meet the requirements in cookery, laundry work, or household economy, and (2) for boys who meet the requirements in cottage gardening or manual training.

This simplified basis replaces a complicated scheme of fixed and variable grants which was a serious hindrance to efficient instruction.¹

Improvement in the teaching force.—The progress of elementary schools in England has been marked by great improvement in the qualifications of teachers and in their living conditions. Progress in this particular, so far as it can be shown by statistics, appears (1) in the increase in the proportion of teachers to the number of enrolled pupils—an increase from 1 teacher for every 60 pupils in 1870 to 1 for every 40 pupils in 1899; (2) in the increase in the proportion of adult as compared with pupil teachers, the ratio in 1870 being 49 per cent to 51 per cent, and in 1899 78 per cent to 22 per cent; (3) in the increase of average salaries. Tables XI and XII give a comparative view of the status of the teaching force at specified dates in the period 1870 to 1899, inclusive.

¹ For details of the former system of fixed and variable grants, see Report of the Commissioner of Education for 1888-89, Vol. 1, pp. 101-103; also Report for 1889-90, Vol. 1, p. 245.

1899	62,085	30,233	33,349	125,667	49.4	24.1	26.5

a Not including additional women teachers first employed in 1880.

The change in the relative proportion of certificated, assistant, and pupil teachers, as indicated in Table XII, deserves special attention.

The requirement that a school sharing in the Government grant must be in charge of a certificated teacher antedates the Forster law, and the proportion of certificated teachers remains about the same as in 1870, viz, 44 per cent. The marked change in the character of the teaching personnel has been the decline in the proportion of pupil teachers from 51 per cent of the total to 23 per cent, with an accompanying increase in the proportion of older assistant teachers, viz, from 4½ per cent to 24 per cent of the total (omitting the new class of additional teachers).

Candidates for position as assistant teachers must be above the age of 18 and must have passed a Government examination.¹

The increase in the proportion of women teachers is a noticeable fact in the history of the school system. With respect to this subject the board of education in its first report says:

In 1869, for every 100 teachers of each class 48 certificated teachers, 60 assistant teachers, and 57 pupil teachers were women and girls. These proportions increased in 1880 to 58 certificated teachers, 66 assistant teachers, and 68 pupil teachers; and in 1899 to 61 certificated teachers, 84 assistant teachers, and 80 pupil teachers.

The number of girl pupil teachers in 1869 was 7,273; they now number 24,702, an increase of nearly 240 per cent. The boy pupil teachers, who numbered 5,569 in 1869, now number 6,081.

Taking all classes of teachers—certificated, assistant, additional, and pupil teachers—we find that whereas in 1869 the women and girls were not 53 per cent of the total, they now number nearly 75 per cent.

Table XIII gives the average salary of certificated teachers at stated dates from 1870 to 1899, inclusive.

TABLE XIII.—Average salaries of certificated teachers.

Year.	Masters.					Mistresses.				
	Average salary of—			Percentage in receipt of salaries over £300.		Average salary of—			Percentage in receipt of salaries over £200.	
	Principals.	Assistant teachers.	All teachers.	Principals.	All teachers.	Principals.	Assistant teachers.	All teachers.	Principals.	All teachers.

1899	144	102	125	3.54	1.97	94	76	84	3.95	1.85

The financial status of teachers has been improved also by the recent passage (1898) of a superannuation law. Under this law retirement is compulsory for teachers who have reached the age of 65 years, save under exceptional circumstances. In the year ended March 31, 1900, superannuation allowances amounting to £6,304 4s. 2d. were awarded to 196 teachers (134 men and 62 women). The certificates of 92 teachers over 65 years of age (60 men and 32 women) were extended on account of special fitness.

In the same period “disablement allowances” amounting to £4,882 8s. 2d. were awarded, as shown in the following table, to 167 teachers under 65 years of age who had become permanently incapable, owing

¹ For full particulars relative to the pupil-teacher system, see summary of the report of a special committee on the subject.—Commissioner’s Report, 1897-98, Vol. 1, pp. 160-165.

to infirmity of mind or body, of being efficient teachers in public elementary schools:

Between the ages of—	Men.	Women.	Total.

a Day training colleges were first opened in 1890.

b Includes 138 day students.

c Or 124.6 per cent.

The provision for the training of teachers has been greatly extended and a new spirit imparted to the work by the day training schools attached to university colleges. Prior to the establishment of these schools (1890) the only training schools were the residential colleges, 44 in number. Of these, 35 are church schools and apply a doctrinal test to applicants for admission. The unsectarian day colleges are conducted in a more liberal spirit and under conditions more stimulating to the mind and to the social sympathies. The importance of securing persons of broad, liberal culture for the service of elementary education is further recognized by permitting candidates for admission to training colleges to offer in lieu of the entrance examination the certificate of a university examination. Graduates or persons who are qualified by examination to become graduates in arts or science of any university in the United Kingdom may also be recognized as certificated teachers, provided that they hold a certificate of proficiency in the theory and practice of teaching issued by a university or collegiate body and approved by the department.

The recent experiment of sending selected students from the training colleges for a third year of professional study in France and Germany has proved highly successful.

With all the development that has taken place, the provision for the training of teachers is neither in quantity nor quality equal to the

requirements of an efficient school system. It is estimated that the existing training colleges would supply the annual waste in a staff of 42,000 teachers, but the English schools employ 62,000 certificated teachers, and, including all classes of teachers, a total number of 140,000, so that the training colleges could supply only one-third of the new teachers annually required. The duration of the college term—two years—is evidently too brief, considering that it comprises both the academic and the professional training of the future teachers.

Course of study.—The extension of the programme of studies is also a marked feature of the general progress of the elementary schools of England. Under the regulations that prevailed from 1870 to 1875, the obligatory subjects were reading, writing, arithmetic, and (for girls) plain needlework and cutting out. Choice was also allowed of two studies from a given list for pupils in the three higher grades (IV–VI) and extra grants allowed for all pupils passing examination in the same.

These “specific” subjects, as they were called, were geography, history, algebra, language, elements of Latin, French, or German, physical geography, and animal physiology. In 1875 the programme was divided into obligatory, class, and specific subjects, and geography, history, and grammar were transferred to the second category. The class subjects remained optional, but if taught at all were to be taught throughout the school and to be judged and paid for according to the proficiency of classes as a whole and not like the specific subjects on the results of the examination of individual pupils.

By the regulations of 1882 a great advance was made in the scheme of instruction. A seventh grade (standard) was added to the six already existing, which themselves underwent certain modifications. English, or literature, and physical geography, the latter of which had proved to be among the most popular of the specific subjects, disappeared from the list, and a portion of their matter was incorporated in the class subjects of English and geography. Meanwhile the schedule of specific subjects was enlarged and arranged under twelve heads, but instead of being accessible as before to a pupil in the fourth grade, specific subjects were thenceforth limited to those who had passed that grade. Subsequently one class subject was made obligatory for all older pupils in any day school.

Complaints that the schools were too literary in their tendencies led generally to the introduction of domestic arts for girls, and drawing, manual work, and cottage gardening for boys. Finally, as shown in the following extract from the regulations of 1900, specific subjects have been abolished.¹

¹ For a detailed statement of the extent to which pupils have availed themselves of the provision of specific subjects see Table XVI, page 1228.

COURSE OF INSTRUCTION AS PROVIDED IN THE REGULATIONS FOR ELEMENTARY DAY SCHOOLS FOR 1900.

THE DAY-SCHOOL CODE (1900).

The course of instruction in infant schools and classes should, as a rule, include suitable instruction in the elementary subjects, simple lessons on common things, appropriate and varied occupations, needlework (or drawing for boys), singing and physical exercises.

The course of instruction in schools for older scholars is as follows:

To be taken as a rule in all schools: English, by which is to be understood reading, recitation, writing, composition, and grammar in so far as it bears upon the correct use of language; arithmetic; drawing, for boys; needlework, for girls; lessons, including object lessons, on geography, history, and common things; singing, which should as a rule be by note; physical exercises.

N. B.—It is not necessary that all these subjects should be taught in every class. One or more of them may be omitted in any school which can satisfy the inspector and the department that there is good reason in its case for the omission.

One or more of these is to be taken when the circumstances of the school, in the opinion of the inspector, make it desirable: Algebra, Euclid, mensuration, mechanics, chemistry, physics, elementary physics and chemistry, animal physiology, hygiene, botany, principles of agriculture, horticulture, navigation, Latin, French, Welsh (for scholars in schools in Wales), German, bookkeeping, shorthand, according to some system recognized by the department, domestic economy or domestic science.

For girls: Cookery, laundry work, dairy work, household management.¹

For boys: Cottage gardening, manual instruction.¹

Where manual instruction is taken, it is desirable that suitable occupations leading up to it should be taken in the lower classes.

Any subject, other than those mentioned in article 15 may, if sanctioned by the department, be included in the course of instruction, provided that a graduated scheme for teaching it be submitted to, and approved by the inspector.

Instruction may be given in other secular subjects approved by the department, and in religious subjects, but no grant is made in respect of any such instruction (elementary education act, 1870, sec. 97 (1)).

The regulations include examination schedules arranged for each grade (I-VII) and for every subject. These schedules practically determine the grading of the school years.

The progress of this system of schools which has here been reviewed is summarized in the following table. The financial showing is incomplete, comprising only the appropriations from the treasury, made under the head of annual grants:

¹Special grants are allowed for these subjects.

a In Table II will be found separately the average attendance in board and voluntary schools.

b Men teachers and women teachers are given separately in Table XI.

c Annual grant only. The total grant from the public treasury, including fee grant and special grants, amounted to £8,723,533.

Special adjustments for backward children.—One of the most important outcomes of the system of elementary education as it has been maintained in England is the conviction it has produced of the need of special adjustments for children suffering from vicious propensities, from poverty, or from physical infirmities. The efforts to which this conviction has given rise have generally been of local origin and confined to particular cities or districts. In some instances these local efforts have led to a general provision sanctioned by law.

The most difficult of all the problems relating to the welfare of backward children is that of habitual truancy, an evil which affects chiefly the large cities. It is estimated that in London, with 758,337 children enrolled in the schools 142,000 are absent every time the schools are open. Of this number 100,000 are classed as unjustifiable absences, and according to official estimates 50,000 are the same children every time. Other cities show similar conditions. The problem excites at this time widespread attention because of flagrant acts of lawlessness committed by bands of vicious youths. Public meetings have been held, the press is full of the subject, and everywhere remedial measures are discussed. The endeavor made in some

quarters to charge this evil to the influence of nonsectarian schools signally fails wherever the facts are investigated. A committee of representative citizens of London, among others the chairman of the London county council, the Bishop of Stepney, and Dr. Macnamara, M. P., was appointed to inquire into the rowdyism, or as it is popularly termed, the "Hooliganism," which has been terrorizing certain parts of the city. After a searching investigation, the committee submitted a report in which the following conclusions are presented:

Overcrowding in the homes or neglect by parents, which prevents the healthy development of family life, rendering the presence of the younger members in the house at once distasteful to themselves and inconvenient to their parents. Boys and girls in such houses break loose from authority, and their departure from home is a welcome release.

The irregular attendance at school of a large proportion of the children of the poorest class, who thus fail at any time to come under the healthy discipline of school life or to reap the advantages of education and training. Over 140,000 children are absent from school every day out of a total number of 755,940 children on the registers of the public elementary schools of London. It appears that some 12,000 never attend at all, and inquiries show that these form the nucleus of some of the notorious gangs of street roughs.

The absence of adequate opportunity for healthy exercise and organized amusement. Children of school age and still more older lads and girls too often use the streets as their only playground in which to romp or play or obtain their necessary recreation.

The insufficient police control in many districts and inadequate lighting of many streets. Street corners and cul-de-sacs become established centers of gambling, frequently with a boy sentry posted to give warning of any likelihood of interference.

The early age at which the working-class boys and girls go out into the world and become wage-earners, and thereby to a great extent independent, except during the hours of their employment—an age when children of the upper and middle classes are still at school.

An improvident industrial system, under which boys are employed in various forms of unskilled labor during the years when they should have an opportunity of learning trades, and as they approach manhood are cast on the streets to swell the ranks of the casual laborers or to settle down in despair as permanent loafers.

An atmosphere of vice and crime surrounds a certain proportion of the poorest class from infancy, an atmosphere from which other children are jealously guarded. Children of this class are almost educated in a contempt for law and order and become active centers of evil influence among the youthful population of the streets.

One of the most serious hindrances to school attendance and to efficient school work on the part of the children of the poorer classes is their enforced labor. A Parliamentary Return recently issued shows that more than 30,000 of the children on the roll of London elementary schools are known to be working for wages, or employed for profit. The evil affects children of the tender age of 7; no less than 23,945 are 12 years old or under; 23,295 work from 10 to 60 hours per week; 26,463 are paid at rates varying from under 6d. up to 3s. Many have to be out in the streets in the early morning, midday, and again late at night. They get little time for meals and still less for recreation,

often coming to school wet and in a state of hunger and weariness which entirely unfits them for receiving instruction. All joy is crushed out of their lives by slavish toil.

This evil may be partially reached by an improvement in the laws relating to child labor, but poverty, to which in part the enforced labor of children is due, would still remain. Practically the problem of the school attendance of the poorest children is one to be solved by local authorities, and the school boards of the great cities have shown a deep sense of their responsibilities in this matter.

Arrangements for feeding poor children are made in many cities, either by benevolent associations acting in unison with the school boards, as in London, or by means of voluntary subscriptions placed at the disposal of the boards, as in Manchester.

The experiments in London, although conducted on a liberal scale and with great persistence, have led to the conviction that public funds should be appropriated for this work and that it should be a recognized feature of the elementary school administration. A committee of the London board appointed in 1898 to investigate the matter, after a year's consideration, submitted a report in which the following conclusions were announced:

It should be deemed to be part of the duty of any authority by law responsible for the compulsory attendance of children at school to ascertain what children, if any, come to school in a state unfit to get normal profit by the school work—whether by reason of underfeeding, physical disability, or otherwise—and that there should be the necessary inspection for that purpose.

That where it is ascertained that children are sent to school “underfed” it should be part of the duty of the authority to see that they are provided, under proper conditions, with the necessary food.

That the authority should cooperate in any existing or future voluntary efforts to that end.

That in so far as such voluntary efforts fail to cover the ground the authority should have the power and the duty to supplement them.

That where dinners are provided it is desirable that they should be open to all children and should be paid for by tickets previously obtained which parents should pay for, unless they are reported by the board's officers to be unable by misfortune to find the money, but in no case should any visible distinction be made between paying and nonpaying children.

That where the board's officers report that the underfed condition of any child is due to the culpable neglect of a parent (whether by reason of drunkenness or other gross misconduct) the board should have the power and the duty to prosecute the parent for cruelty, and that in case the offense is persisted in there should be power to deal with the child under the industrial schools acts.

The vice-chairman of the Manchester board, Mr. E. J. Broadfield, who has had charge of the school board free meals, in an interview on the subject with a representative of the press expressed the opinion that the work can be carried on successfully in Manchester without special legislation. The maximum number of dinners provided in that city was 103,200 in 1894-95; the following winter only 95,399 were required. Severe winters naturally increase the demand. Mr.

Broadfield believes that there is no difficulty in raising the funds or in determining the necessitous cases. The teachers have a general knowledge of the circumstances of the children, and the school attendance officers supplement that with the necessary inquiries. The meals are served entirely by the teachers whose devotion and interest are beyond praise. The enterprise, in fact, could hardly be carried on without their aid, for they not only help in the work, but they obtain many subscriptions, and also augment the income by jumble sales, etc.

In reply to a question as to the probability of the free meals being abused, Mr. Broadfield said he had no fears of this. Many of the children might have worthless or drunken parents; but his colleagues were hardly likely to allow these to suffer for the short-comings of their parents, besides they invariably found that as the weather became more open or trade improved there was a diminished demand upon the charity.

Mr. Broadfield stated further that there was not the slightest doubt as to the undertaking being a beneficial one. Not only had they an assurance that a good substantial meal was served once a day to a multitude of children who would otherwise have but "short commons," but they had seen that the physical condition of the children was greatly improved by the regular meals and sensible food they received. With regard to the contributions, the only appeal made to the public he said, was through the press, every winter, and by sending out copies of the annual report they endeavor to retain old subscribers. Though the work is in the hand of a committee all the members of the board are deeply concerned in the success of the scheme; they are all equally responsible for its continuance, and no section has a monopoly of interest in it. Apart from the special aid to poor children, the educational authorities, both central and local, recognize the need of making the schools attractive to the children and of adjusting the training to their aptitudes and demands.

Legislative provision has been made for the training of blind and deaf children (law of 1893) in day and in boarding schools which are under the supervision of and receive grants from the education department.

In 1899 there were 1,167 blind pupils in boarding schools, and 290 in day schools, or a total of 1,457 in both classes of institutions, and the same year 1,629 deaf children in public boarding schools and 1,030 in public day schools—total 2,659. By this provision it is possible to give these unfortunate children the special attention which they require.

The school boards of the chief cities have carried this shifting process still further, and maintain special schools for defective and backward children. London, which led in this work, reports 2,030 children in 43 centers, under the supervision of the eminent specialist in this work, Mrs. E. M. Burgwin.

The importance of this provision was so clearly demonstrated by the success attending the work that a law was passed in 1900 authorizing school authorities throughout the country to make special provision for defective and epileptic children, and specifying the conditions upon which grants in aid of such special classes or schools may be secured.

Thus the educational authorities are becoming constantly more and more involved in the work of social reform.

PART II.—SECONDARY EDUCATION IN GREAT BRITAIN AND IRELAND.

The extended scope of the English education department is emphasized in the first report of the new board by a special volume on secondary education.

This volume deals chiefly with the work of the science and art department (now merged into the board) for the year ending December 31, 1899.

Under the head of science instruction and of art instruction the report presents the following summary:

I.—SCIENCE DIVISION.

AID GIVEN TOWARD THE PROMOTION OF INSTRUCTION IN SCIENCE.

Science schools.

The following table gives the number of schools, classes, and pupils under instruction in science for the decennial period from 1890 to 1899. In this table each institution in which instruction was provided in science, whether it was in several branches of science or only in one, is counted as a science school. Up to and including the year 1897 the table deals with the schools in England and Wales, Scotland, and Ireland; but thereafter the schools in Scotland are not included, having been transferred for their grants to the Scotch education department. Making allowance for this, there has, during the period referred to in the table, been a considerable increase in the number of pupils under instruction. The fact that the table does not show a corresponding increase in the number of schools is doubtless due to the absorption of the smaller schools in the larger and better equipped schools maintained or established by local authorities under the technical instruction acts.

Year.	Schools.	Classes.	Students under instruction in schools eligible for grants.
1890.....	2,063	7,756	133,821
1891.....	2,164	8,568	148,408
1892.....	2,553	10,352	180,410
1893.....	2,754	10,341	193,431
1894.....	2,602	9,433	183,120
1895.....	2,673	9,545	193,404
1896.....	2,583	10,500	194,354
1897.....	2,424	9,102	197,796
1898.....	2,023	11,723	158,370
1899.....	2,056	12,580	174,670

In 1899 there were 169 schools of science, with 23,450 students. This is a considerable increase on the preceding year, when the number of these schools was 159 with 21,193 students. Schools of science in Scotland are not included in these figures.

Two thousand and fifty-nine of the schools examined in 1899 were in England and Wales and 861 in Ireland. This is an increase on the previous year of 115 in England and Wales and an increase of 7 in Ireland. The number of individual students who came up for examination from these schools was 78,496. Besides these, 13,227 self-taught students and pupils from classes ineligible for grants presented themselves for examination.

The day examinations in certain of the science subjects, which were commenced in 1897, have been continued. They were held in June, and were confined to the elementary and advanced stages of subjects chiefly taught in day schools and training colleges, the papers set being as nearly as possible of the same standard as those at the evening examinations. The number of papers worked at the day examinations in 1899 was 44,245, an increase of about 6,000 on the previous year.

The following table gives, for the same ten years as in the preceding table, the results of the annual examinations. It shows the number of students examined, the number of papers worked, the number of papers which were passed in one class or another, and the number which obtained a first class in the elementary or in the advanced stage. This table includes pupils in Scotch schools who were examined by the board of education:

Year.	Individual students examined.	Papers worked.	Papers passed.	First classes in elementary and advanced stages.
1890	86,318	162,853	114,245	31,027
1891	93,659	179,549	115,610	28,448
1892	108,858	208,347	136,778	35,932
1893	119,398	201,597	83,511	46,099
1894	103,396	188,773	82,406	49,990
1895	113,398	202,868	85,303	49,861
1896	99,818	152,630	62,886	41,419
1897	101,526	151,212	62,261	43,073
1898	103,997	150,401	94,475	39,800
1899	104,500	153,616	98,549	41,319

* * * * *

For the year 1899 the grants to science schools in England, Wales, and Ireland, exclusive of those made to training colleges, amounted to £195,245 15s. 9d. The grants for 1898 amounted to £169,604 3s. 3d. The former sum was made up as follows:

(a) £94,667 15s. 7d. to science schools for attendance grants and £1,617 8s. 8d. on results of examination (honors only); total, £96,285 4s. 3d., as against £86,476 16s. 1d. the previous year.

(b) £98,849 12s. 4d. to schools of science for capitation and attendance grants and grants on results of examination, the amount in the previous year being £82,998 15s. 10d.

(c) £110 19s. 2d. to one navigation school (Plymouth) for attendance grants under the special rules applying to these schools. In the previous year the amount under this head was £128 11s. 4d.

The figures under (a) show an average payment in 1899 of 12s. 8½d. for each individual student under instruction in science schools, while the average payment per student under instruction in schools of science (b) was £4 4s. 3d.

Until the session 1896-97 the grants, except to organized science schools (now

schools of science), were computed on the results of the individual examinations of the students. In that session the managers of schools were allowed to elect whether they would receive their grants under the rules for payments on results, or under the rules which had been promulgated in 1896 by which the grants were made mainly on attendance. Under the new rules, which were made compulsory in all schools in the session 1897-98, grants are made for each registered attendance (up to a certain maximum) in each subject. In honors payments continue to be made on the results of examination.

II.—ART DIVISION.

AID GIVEN TOWARD THE PROMOTION OF INSTRUCTION IN ART.

Art instruction in local schools of art and art classes.

The number of art schools and classes (including 40 science schools which take art subjects) examined in art in 1899 was 1,745, as against 1,700 (which included 66 science schools) in 1898, showing an increase of 45. The number of students under instruction was 130,126 in 1899, as compared with 120,771 in 1898. These numbers are exclusive of schools of art and art classes in Scotland, but these continue to participate in the national competition and other examinations in art under this board. Of the 1,745 art schools and classes which were examined in 1899, 263 art schools and 1,370 classes are in England and Wales, and 12 art schools and 60 classes in Ireland. The number of students who sat for examination in 1899 was 76,494, as compared with 81,809 in 1898, for which year the number in respect of Scotland is included.

In 1899, 163,739 exercises were worked by students of schools and classes, 39,682 being worked at the day examinations in June. Of these exercises 127,652 were in elementary stages (including 13,267 exercises in geometrical drawing) and 35,701 in advanced stages, or in subjects not divided into stages, the number successful being 84,256 (including 8,614 in geometrical drawing), or 66 per cent for the elementary stage (including geometrical drawing), and 25,789, or 72.24 per cent, for the advanced stage, while in the honors division 386 exercises were worked, of which 152, or 39.38 per cent, were successful. But in addition to the papers worked by these students, 11,668 papers were worked by external candidates and candidates from classes not receiving payments on results, of which 7,730, or 66.25 per cent, were successful.

In 1899, 101,492 works executed in the schools and classes during the session by 24,808 students were submitted for examination at South Kensington. In 1898, 101,492 works by 25,038 students were sent up.

Local scholarships (art), royal exhibitions (art), national scholarships (art).—There were 172 competitors for the 20 local scholarships and the 10 royal exhibitions. Of these local scholarships 4 are held at the Royal College of Art, 3 at the West Bromwich School of Art, 2 at the Aberdeen (Grays) School of Art, 2 at the Glasgow School of Art, and 1 at each of the following schools of art: Brighton, Bristol (Merchant Venturers), Bristol (Queen's road), Cardiff, Chester, Croydon, Dover, Edinburgh (female), and Nottingham. The 10 royal exhibitions are held at the Royal College of Art, to which 9 new national scholars were also admitted.

Local exhibitions (art).—Four local exhibitions—toward each of which the board provides £25 per annum on the locality contributing a similar amount—were awarded in 1899. These are being held at the Royal College of Art.

The payments on results and attendances for England, Wales, and Ireland amounted in 1899 to £77,794 10s. 6d., as against £72,128 in 1898. From April 1, 1898, the payments of grants to Scottish schools has been transferred to the Scotch education department. The average payment per student under instruction in England, Wales, and Ireland for 1898 was 11s. 11½d., while in 1899 it was 11s. 11¼d.

According to the returns to the board the fees paid by students in schools of art and art classes in the last three years have been as follows:

Years.	Schools of art.		Art classes.		Total.	
	£	s. d.	£	s. d.	£	s. d.
1897.....	40,260	8 7	16,581	15 7	56,842	4 2
1898 (England, Wales, and Ireland only).....	29,489	8 1	16,181	13 2	45,671	1 3
1899 (England, Wales, and Ireland only).....	28,389	2 0	13,244	1 3	41,633	3 3

The county council scholarships.—The county council for the county palatine of Lancashire has awarded 7 scholarships, the county council for the West Riding of Yorkshire 5, the London county council 5, the county council for Surrey 4, the county council for Chester 2, the county council for the North Riding of Yorkshire 2, and the county councils for Carmarthen and for Gloucester have each awarded 1 scholarship, the 27 scholarships being held at the Royal College of Art.

Tasmania, New Zealand, and the Isle of Man, Jersey, and Guernsey, have submitted works and examination exercises from their schools to the board for examination, while Natal and Barbados have submitted examination exercises only, and South Australia has submitted works only for examination. As the vote for the board does not apply to these places, the expenses for examination are borne by the local authorities.

The facilities hitherto possessed by the colonies for obtaining specimens of art works have this year been extended. In March, 1899, the colonial office, on the initiative of the department of science and art, issued a circular to colonial governors offering to the colonies, upon certain terms, collections of works which had been submitted for competition, and of exercises done at the personal examinations. The Cape of Good Hope, Natal, New Zealand, and Malta have already availed themselves of this offer, and cases of works have been dispatched to them, the cost of the works and carriage being borne in each case by the colonial governments. The colonies of Ontario, Ceylon, and Mauritius have also applied for similar collections of works.

Three hundred and fifty-one art class teachers' certificates were issued during the year, besides 138 art masters' certificates of the first group, 13 of the second group, 2 of the third group, 5 of the fourth group, 3 of the fifth group, and 7 of the sixth group.

The question of the adequate supply of high schools for the industrial classes, already considered under the head of elementary education, may properly be regarded as a part of the general problem of secondary education. The current English views on this subject are shown by the appended articles from well-known leaders in educational affairs.

The chaotic state of secondary education in England is in striking contrast to the aspect of the same interest in other divisions of the Kingdom.

Under the Welsh intermediate education law (1889) there is constituted for the inspection and examination of secondary schools in Wales and Monmouthshire an intermediate education board. This board consists of 80 members appointed by the county and county borough councils, the school-governing bodies, and other interested bodies. By the agency of this board the extent and the character

of the provision for intermediate education have been ascertained, the various classes of schools have been to a great degree systematized and unified, and the public appropriations for secondary and technical education judiciously applied. The number of schools examined in 1898 was 88, being 20 for boys, 20 for girls, 41 dual, and 7 mixed. The permanent teaching staff numbered 408 (219 male and 189 female), exclusive of 178 visiting teachers. The number of pupils examined was 6,912, of whom 3,274 were girls.

The education law of Scotland (1872) placed the administration of the burgh schools of various names, i. e., grammar, high schools, etc., under the school boards. In 1885 the education department of Scotland undertook the inspection and examination of all secondary schools seeking the service. Subsequently, as in England, secondary education was granted increased support from public funds (i. e., under the customs and excise act of 1890 the surplus of the liquor duties, and under the local taxation account act of 1892 an annual sum of £60,000). Thus the secondary education of Scotland is well organized and liberally fostered by government.

The education department (Scotland) reported in 1899 the number of secondary schools under inspection to be 86. Of these, 32 were high-class public schools, 25 endowed schools, and 29 under private management. The number of candidates examined for the Leaving Certificate was 16,262, as against 972 in 1888.

For Ireland there is an intermediate education board, with a yearly income from public funds of "£33,049 in 1898, besides local taxation revenues amounting to £54,175." Its functions are to examine all candidates who present themselves. In 1898 the number was 9,073 (6,705 boys and 2,368 girls), as compared with 8,877 in the previous year and 6,952 in 1881. In 1898 grants on the results of the examination amounting to £49,455 were paid to the managers of 371 schools.

The development of high-grade schools under the managers of elementary schools and the relation of these schools to the general problem of secondary education is presented in the following articles from current English sources:

HIGHER ELEMENTARY SCHOOLS.

[Article by Hon. E. Lyulph Stanley, vice-chairman of the London school board, in *Contemporary Review*, November, 1900.]

A question which has lately excited a great deal of attention is, What are the limits of elementary education, and where, if at all, should the line be drawn between elementary and secondary education? Another question, closely related to the first, is whether managers of elementary schools, and specially the great urban school boards, have violated the law and are giving instruction beyond that which the law allows them to give.

There is a third question as to the action of the board of education and their policy in refusing, at any rate, as far as Parliamentary grants are concerned, public aid to the more advanced range of popular education.

If a limited and narrow view of what should be brought within the reach of the

industrial class should prevail—if both the range of knowledge and the age of the scholar should be limited and cut down—there will be a tendency to say that whatever the law may be now it should at any rate be made clear for the future that the expansion of popular education shall not be permitted, and those who are in favor of limiting the range of popular instruction will sympathize with a board of education which uses its administrative power in this direction. But in reference to the working class and to the lower middle class, who are those who almost entirely fill our elementary schools, what, if any, should be the upward limit to which they should be encouraged to send their children to school?

The law now establishes the presumption that the age of compulsory attendance should extend up to 14.

School boards, by their by-laws, can prescribe the seventh standard as the standard of exemption, and 14 as the age up to which the by-laws shall apply.

There seems to be a notion floating in the air in the neighborhood of Whitehall that henceforward the obligations imposed on the unwilling parent shall be the measure of the rights of the self-denying parent who desires to extend his child's educational opportunities.

The law gives a parent the right to demand free education for his child up to the age of 15, and imposes on school boards the duty of supplying that free education. But there is no doubt that there are indications of policy in the present board of education which show that this legal right and this legal obligation are in danger of being undermined.

Certainly we can not hope that in the present state of public opinion and in the present social and material condition of the working class a large percentage of scholars will stay beyond 14. But is it desirable to close the door of the school in the face of those who continue to seek admission?

It is generally recognized that in the skilled trades the age either for apprenticeship or for the informal entry into the lower stages of the craft is at youngest 15, and generally nearer 16.

If a boy is turned out of school at 14 he rapidly loses in the two critical years that follow the knowledge and the aptitude which might have been strengthened and developed. The parent's desire for the boy's earnings encourage him to let the boy drift into the class of errand boys or find himself perched at the end of a van, and so as his age and strength increase the boy goes to swell the ranks of unskilled labor.

It certainly seems reasonable that we should welcome and encourage those who will make an effort to secure a brighter future for their sons.

In the case of the girls there is rather more readiness to keep them at school, and it is certainly quite as desirable that they should stay on.

Our teaching staff is more and more as years go by composed of women who enter the profession as pupil teachers. These must be over 15 when they are accepted (except in rural districts), and as they are almost entirely recruited from the elementary schools, they should be encouraged to continue as scholars until the time comes for them to be indentured.

In London the board pupil teachers are mainly recruited from the board's higher-grade schools, where girls desirous of this career have been in the habit of staying up to the age of 15 or 16.

It seems difficult to argue this question of the retention in school of those who wish to stay and study, because it is hard to imagine any reasonable person wishing to turn them out. And hitherto the policy of the education department has in this respect been fairly friendly to the prolongation of education. But we now have intimation, in official documents and in the speeches of officials, that this policy is being reversed.

If we look to Scotland, the popular education in which is under the same Duke

of Devonshire who is the titular head of the English department, we find that the Code for Elementary Schools (art. 6. c. d.) lays down (art. 25) that attendances are reckoned for scholars from the age of 3 to 18, and, moreover, very liberal grants are provided for scholars who have passed the "merit" certificate examination—equal to the work of Standard VI—that is for scholars from about the age of 12 up to 18.

And for many years the English code also recognized attendance of scholars in the day school, and paid grants for them, whether working in the standards or beyond the standards, up to the age of 18. This year, for the first time, it is declared by the code that the attendance of a scholar over 14 who has worked for a year in Standard VII, is not to be recognized, and the education act of 1890 further deprives the managers of the fee grant to which they were entitled for such scholars up to the age of 15. Undoubtedly these enactments and the substitution of the block grant for the previous grant, while largely aiding the more backward and rural schools where children leave early and are principally in the lower standards, have tended to inflict serious financial loss on the better town schools, especially those managed by boards, and the general operation of the changes is to accentuate the more strictly elementary side of our popular education. Much dissatisfaction was roused by these proposals, and it is no secret that an active opposition organized in the northern counties, and led by Conservatives, caused serious apprehension to the Government. Mr. Balfour and the whips had to come into action and check the zeal of Sir John Gorst, who openly makes the boast that as he failed by legislation to supersede school boards by county councils, he will do administratively what he can not do by law.

The consequence of the intimations of defection from Parliamentary supporters led to the sudden production of what is known as the Higher Elementary Schools Minute.

This minute, though it contains many matters needing amendment, and though it cuts down the liberty hitherto enjoyed by school boards in the higher sections of their work, was welcomed as an indication that the Government did intend to some extent to compensate for the injury which their new code inflicted upon higher elementary education.

It had long been felt by many that the organization of a "School of Science," which was the form in which most school boards had sought for more liberal State aid for their higher grade schools, was not the best way to prepare the industrial classes for active life. It might suit some industrial towns, but it was not generally applicable to the country, and it was especially unsuited for the higher education of girls.

When the subject came on for debate in the House of Commons, Professor Jebb was put forward, we might almost say put up, to give a conciliatory exposition of the minute, in which he spoke of the projected schools as of a new type, and indicated that the board of education would be open-minded in considering practical criticisms.

Sir John Gorst took occasion to say that after the clear exposition of the minute by his friend and colleague he had nothing to add, and peace and harmony united with declarations of confidence in the Government to smooth the way.

But waiving other criticisms on the scheme indicated by the new minute, two serious drawbacks revealed themselves as soon as the danger of Parliamentary opposition was passed. (1) It was announced that the schools to be recognized must be closely similar to the elementary course of a school of science, and before recognition must be fully equipped with laboratories. (2) That the number of schools to be recognized would be strictly limited. A full analysis of the correspondence between the board of education and numerous school boards shows that the department are not only construing their own minute most narrowly, as

against those who would set up these schools, but are actually importing into the minute matter which is not there.

Thus the minute asks for the time-tables to be submitted, and states that the inspector, who, by the context, would naturally be taken to be the Government inspector for the district, shall report and make a recommendation on the suitability of the instruction to the circumstances of the scholars and the neighborhood. And yet we are now told that for boys and girls alike in commercial towns, manufacturing towns, residential towns, there must be one curriculum of a dominant scientific type.

The board of education have even gone beyond their own directory, and are asking for more time to be spent on practical science than the directory requires in a school of science.

This conduct is the more extraordinary in the case of London, when it is remembered that only about a year ago the board of education urged upon the school board for London, in the case of the district of Hammersmith and Fulham, that they should organize their higher grade school, not on the lines of a school of science, as suggested by their South Kensington section, but with a more modern curriculum, giving more prominence to languages and literary subjects.

This suggestion led to a conference between the school board and the chief inspector of the board of education, who was authorized to attend it, and as a consequence the school board adopted the recommendations of the board of education.

When the school board forwarded applications, with time-tables framed on this agreement, they were surprised to be told that these were not the schools which the department intended to encourage. The excuse then given was, that as such schools were not as costly as schools of science, the grants were out of proportion to the probable expenditure.¹

This excuse could easily have been disproved, for, in fact, the cost of these schools will be determined by the quality and number of the staff, and the school board for London could have shown very soon that these modern schools of theirs are better staffed and cost more per head than many schools which will be allowed recognition.

Since then the Duke of Devonshire has been encouraged to put forward another excuse, which will no more bear examination than the other. In his speech at Manchester, at the opening of the Central Higher Grade School, he said that Parliament had recognized science teaching. It had recognized elementary teaching, but it had not recognized commercial teaching, and it would be an improper thing for his board to go beyond the indicated desire of Parliament.

As a matter of fact, Parliament has imposed no such limitations, and the education department has never hesitated by its minutes to vary the previous indications of Parliamentary sanction.

Some years ago "schools of science" were much more scientific than they are now. The science and art department thought fit by a minute, which is not even laid before Parliament as a preliminary to its operation, materially to alter the conditions under which grants are paid to schools of science (see Directory LVII): "A school of science must provide a thorough and progressive course of education in science, combined with literary or commercial instruction, adapted to students whose education is such as would fit them to enter Standard VII of the English Code for a public elementary school," and further on it is provided "not less than ten hours must be given to literary subjects." A stroke of the pen might have varied the proportions between science and literature, as they have been varied before.

But if we want further to test the worthlessness of the statements, which appar-

¹Answer of Sir J. Gorst to Mr. Lough, M. P., House of Commons, July 27, 1900.

ently are furnished to the Duke by the permanent officials, who ought to know the facts of their department, let us turn to Scotland, where, as has been said before, the Duke is also the titular head of the education department. In Scotland higher grade elementary schools for scholars from 12 to 18 are liberally subsidized by the State. This has been done by departmental minutes, and all that Parliament has to do is to vote the money. Private members may try to refuse the money if they disapprove, but the initiative as to its application rightly rests with the executive.

I quote from the most recent report for 1900 of the Scotch department, signed "Devonshire," and I find there, page 15, that these higher grade schools or departments "are intended to provide systematic training in science or in subjects appertaining to commerce or specially suited to girls, or to special classes of pupils on a liberal scale." Here we have at least four optional courses of study, and I read on the same page: "In the framing of courses for advanced departments a large discretion has been left to managers." It would be cruel to comment on the state of things shown by the Scotch Code and the South Kensington Directory and then revert to the utterances at Manchester of the official head responsible for the above official action. Much further information bearing out the above quotations may be found in the same report, especially in chapter 9 of the Scotch Code, where the important and useful provision will be found (art. 138) that a higher grade school may be recognized as giving two or more alternative courses, a provision most essential, especially in mixed schools. But it is needless to prove further what has already been demonstrated.

Let me now turn to the legality of the action of school boards in carrying popular education beyond the standards. The Duke of Devonshire, in his later phase of life as president of the council, in an administration which he tells us will do nothing unfavorable to the denominational party, suggests that school boards have gone beyond their legal powers in giving education such as is found in their higher grade schools. He is careful to limit his remarks to day schools.

Now, the range of teaching of school boards is limited by the fact that their schools must be public elementary schools, and we find the definition of an elementary school in the act of 1870. It is there defined as a school at which elementary education is the principal part of the education given and where the ordinary payments from each scholar do not exceed 9d. a week.

Thus there is an element in the school which need not be elementary. How far this may go we see by previous English codes and the present Scotch code, which aids elementary education up to the age of 18, and clearly the higher elementary school minute, by aiding schools where scholars may remain up to an age between 15 and 16, shows that these schools, with their curriculum, satisfy the definition of the act. The fact that the board of education are reluctant to spend public money on aiding more than a few of them can not affect the fact that the range of teaching does not go so high as to make the principal part of the teaching higher than elementary. The Government for the time being has an absolute right to give or to withhold grants other than those secured by act of Parliament, but should they withhold all grants for scholars over 12 and studying beyond Standard V, that would not make it illegal for school boards to educate them, though they might impose a heavier burden on the locality. What is happening is not that school boards are going beyond their legal rights, but that the board of education are endeavoring from year to year, by alterations in the code and in the directory, to introduce illegality where none existed.

We are told now that it is illegal to provide education for scholars aided by the science and art department. No one dreamt of this in connection with elementary schools at the passing of the act of 1870. Thus in the directory of that year, pages 16, 17, there will be found provisions for founding elementary school scholarships for scholars between 12 and 16, worth £5 a year, and tenable at an elementary day school on condition that the holder obtain at least a second class in the elementary

stage of some one or more branches of science at succeeding May examinations, and on the same page other scholarships of £10 a year, to be held in elementary schools on somewhat stricter conditions, are also mentioned.

It is notorious, if the Duke of Devonshire attaches so much importance to the intentions of Parliament, that the science and art department and its grants were founded and maintained for many years for the benefit of the industrial classes, and the limits of income for those who took advantage of it were closely restricted. Now all those limits have disappeared, and these grants are being converted into the endowment of secondary and middle-class education. They even go to swell the dividends of trading companies. But if anyone would know what was the former conception of the function of that department, let him read the following quotations from Mr. T. Huxley, so long a conspicuous official of that department. In volume 3 of Huxley's Collected Essays, page 131, will be found notes of a speech delivered by him in 1869 at the Liverpool Philomathic Society. He there says: "In advocating the introduction of physical science as a leading element in education I by no means refer only to the higher schools. On the contrary, I believe that such a change is even more imperatively called for in these primary schools, in which the children of the poor are expected to turn to the best account the little time they can devote to the acquisition of knowledge. A great step has already been made in this direction by the establishment of science classes under the department of science and art, a measure which came into existence unnoticed, but which will, I believe, turn out to be of more importance to the welfare of the people than many political changes over which the noise of battle has rent the air." I should like to quote more of this passage, but space forbids. The following quotation is also important. In 1876 Mr. Huxley delivered a formal address on the opening of the Johns Hopkins University at Baltimore. He then said (Essays, vol. 3, p. 252): "There is not the slightest difficulty in giving sound elementary instruction in physics, in chemistry, and in the elements of human physiology in ordinary schools. * * * I am not saying this without full practical justification for the statement. For the last eighteen years we have had in England a system of elementary science teaching, carried out under the auspices of the science and art department, by which elementary scientific instruction is made readily accessible to the scholars in all the elementary schools of the country."

If we turn to the code of 1871, at the outset of the school-board system, we find, article 21: "No grant may be claimed for specific subjects on account of any scholars for whose proficiency in the same subject grants are made by the science and art department." These subjects included algebra, geometry, natural philosophy, physical geography, animal physiology, etc.

The misfortune in connection with this question of higher elementary education is that the board of education in the last two or three years has been rapidly drifting into a position of dogged hostility to school boards, and consequently takes up a position of hostility to all expansion of elementary education.

In 1897, when the question of delimitation between elementary and secondary education was coming to the front, an important conference was held at the education department, under the presidency of Sir George Kekewich, where representatives of the head masters of secondary schools and of the head masters of higher-grade schools and schools of science met. They came to the conclusion that the elementary school system should include higher-grade schools, where the course of instruction might include three years' work beyond the standards—that is, up to the age of 16 at least; that these schools should have varied curricula, not necessarily that of a school of science. They held that the discrimination between these schools and secondary schools would be found partly in the fact that these higher-grade schools would grow out of the elementary school, and would therefore handle the subjects taught more with a view to practical life, whereas secondary schools would aim more at general culture. Secondly, they

desired these schools to be free, so as to reach the social class who mainly frequent the elementary schools.

Had the Government given effect to this agreement they might have done much for popular education.

They may yet redeem the past by granting to the industrial classes of England what the same classes enjoy in Scotland—the free expansion of the popular school into a higher section wherever there are found scholars ready and willing to stay on. The narrower limitations of the minute will have to disappear sooner or later; but it is grievous that those who should encourage and foster education should be those who by illusory minutes and strained interpretation keep the word of promise to our ear and break it to our hope. Whatever may be the illusions fostered by a large Parliamentary majority, the Government will find that the nation can not afford to have the popular education, on which so much of the superstructure must rest, crippled, hampered, or degraded.

The Trades Union Congress has passed a weighty resolution on this education question, in which they specially deal with the attacks on higher-grade education. No doubt working-class opinion is not easily moved on this question, but if roused it will be unanimous in demanding that the laboring classes shall not be robbed of their best and almost their only inheritance, the right to the best education that can be given to their children wherever they will cooperate to receive it by foregoing the wages of child labor. The school boards are their representatives, and are generally willing to go forward and secure for them this free gift, and no glamour from South African victories will long blind them to their domestic interests and their best aspirations.

Might I, in conclusion, address an appeal to the president of the council?

Twenty-four years ago he took an active part in an educational debate in Parliament, and if he has forgotten what he then said others have not. Let him cast his eyes over the forgotten pages of Hansard and refresh his memory with what he then said and may still find to have weight. Even more recently he has had flashes of sympathy with education, but his flashes are intermittent and serve chiefly to make the darkness visible.

But at Derby on January 19, 1899, he said that we could not have technical, scientific, or artistic training to any great extent or in any valuable degree except as a part of a sound general system of secondary education. We could not graft scientific or artistic education upon the stunted stem of deficient elementary education; and on January 5, 1900, when he opened the exhibition of works from elementary schools in the presence of the Prince of Wales at the Imperial Institute, he said that—

“We must, one and all, fulfill our due part in the great national duty of providing, not for own sons and daughters only, but for all the sons and daughters of our country, the noblest education, the best training, and the finest discipline that the wit of man and the love of God can together produce and inspire.”

These sentiments are generous and even noble. But it is not phrases but actions by which we must be judged.

There is a fable recorded in the later part of the Republic of Plato, telling how we carelessly choose our lot in life, and how one who had been nurtured by tradition in good principles, but lacked philosophy, chose hastily a position of power and authority; but he failed to take heed and notice that with the lot was coupled this fate, that he should ultimately devour his own children.

It is no doubt a good thing to be nurtured in the traditions of a great Whig house, to have known from one's infancy that for generations one's ancestors have invoked the principles of peace, retrenchment, and reform, civil and religious liberty throughout the world.

They do not sum up the whole of human duty, but if well assimilated they are

good guiding principles. But tradition will not suffice. We have to make these hereditary principles our own; otherwise the day may come when, as the price of high political station, we devour our own offspring, the generous thoughts and convictions that issued from our heart and brain at a time when principles had a firmer hold and popular sympathy was keener.

There are many who are glad to see men of high social station step naturally into a position of political leadership, and they rejoice to see such men inspired by an hereditary belief in the people, in liberty, in popular self-government, and in progress. But a line of patriotic ancestors should be a call on the living to emulate them rather than to rest upon them. "*Miserum est aliene incumbere fame.*" Those who have received the torch of progress and who have once accepted its sacred responsibility are in honor and in duty bound to keep it alight and to transmit it unquenched to those who shall come after them.

THE HIGHER GRADE BOARD SCHOOLS.

[Article by Sir J. G. Fitch in the *Nineteenth Century*, February, 1901.]

The recent decision of two judges of the high court in the case of the *Queen v. Cockerton* is a very significant fact in the history of popular education in England. Whether that decision is sustained or overruled on appeal to a higher tribunal, further legislation will become necessary in order to determine how far and under what conditions the work now performed by the higher grade board schools in London and in the great industrial towns shall be continued in the future. Meanwhile it seems expedient that the public should consider on its own merits, and apart from the technicalities of codes, judicial decisions, and acts of Parliament, the question: What is meant by a higher elementary school, and what, if any, is its claim to public aid and recognition?

Perhaps the former question may be best answered by a brief reference to the higher elementary schools in France. In a memorandum which I was instructed to prepare in 1890, and which was presented to both Houses of Parliament in the following year, the following passage occurs:

"Besides the primary school proper, which is not designed to carry education beyond the fourteenth year, the French system comprises a class of schools (*écoles primaires supérieures*) to which the nearest analogue is to be found in one or two of our own great towns under the name of higher grade board schools. In some respects, also, they resemble the *Real-Schulen* of Germany. They receive scholars from the age of 13 to 16, and give advanced education suited to that age. No scholars are admissible to them who have not passed successfully through the ordinary primary course and obtained the leaving certificate. They are officially described as 'designed for those scholars for whom elementary education, properly so called, is not sufficient, and for whose needs secondary instruction would be inappropriate.' They are not, in fact, secondary schools, but they form an integral part of organized primary instruction. No Latin or Greek is taught in them, they stand in no relation to the lycées or the colleges, and they form no part of a scheme providing a 'ladder' from the kindergarten to the university. Their aim is not to lift the pupil out of the ranks of the industrial class, but to enable him to occupy a higher and more honorable place within that class. They seek to provide education specially fitted for the skilled artisan or merchant's clerk, and their chief attention is given to drawing, to account-keeping, to science, especially to physics, chemistry, and mathematics, to the acquisition of one modern language, and to advanced exercises in French composition. In several of these schools special attention is given to manual training, to the use of tools and instruments, and to the learning of trades.

"The total number of these higher primary schools in France is 239, and the number of pupils in them is 22,696. In places not large enough to sustain a separate school of this kind, a *cours complémentaire* or higher department is attached to the ordinary elementary school, in which the pupils are retained for one or two years after reaching the age of 13. The returns enumerate 320 such departments, with an aggregate number of 11,384 scholars."

From the fuller and more recent account of the French system of higher primary schools, contributed by Mr. R. L. Morant to the volume of *Special Reports on Educational Subjects* in 1897, I take the following extract descriptive of the scope and purpose of schools of this exceptional class.

"The function of the true higher primary school has become limited to providing an education suitable for the still considerable proportion of ex-elementary

scholars who do not require specific trade teaching, but rather a general education on practical lines, to develop their faculties, to sharpen their dexterities, and to render them ready, quick, and apt in whatever direction employment may open out to them. In fact its object is to provide a good general primary education bearing directly on the more practical branches of knowledge, and of such a character as to be readily assimilated by ex-elementary scholars, and to be completed within the very limited time that its students are likely to remain at school."

The demand for continued instruction of this type on the part of English parents who avail themselves of the public elementary schools is comparatively recent, and is a direct product of the excellence of those schools, and of the desire for advanced instruction which has been fostered in them. In board and voluntary schools alike, it is found that there are many scholars who, at the age of 14, having successfully passed through the "standards," and completed the ordinary course of elementary instruction, are willing to stay to pursue their studies for a year or two longer. That at a very critical age, just when the work of a good elementary school is beginning to tell on the character and intellectual tastes, yearly increasing numbers of the parents are ready to forego the earnings of their children in order to give them a better start in life, is one of the happiest and most promising signs of our times. Another year of serious application after "reaching" the seventh standard means far more in the right development and equipment of the future citizen than the routine lessons of any two previous years. And it is of the highest national importance that the number of such scholars should be multiplied, and that the sacrifice so honorably made by their parents should be encouraged.

But for this class of learners it is manifest that transference to a grammar school, or other of a purely secondary type, is neither appropriate nor practically useful. The true secondary school has its own aims and its own curriculum fashioned from the first on the hypothesis that the learners will remain at school till 16 or later, and that some of them will proceed to universities or other places of advanced education.

To derive the full advantage from such a school, the pupil should enter not later than the twelfth year, and should receive all his elementary instruction in full view of the wider and more comprehensive course of which that instruction is to form a part. To introduce into such a school at the age of 14 a boy who has completed the ordinary elementary course, in the expectation that a year or two's "finishing" would serve his purpose, would be a grave mistake. It would be to break the continuity of his studies and to give him a mere fragment of a larger scheme for which his previous training furnished no adequate preparation. The terminus a quo relatively to the secondary school is not identical with the terminus ad quem of the primary-school course. On the other hand, the higher grade primary school, which takes the pupil who has successfully passed through all the classes to the age of 14, and gives him what is called in Belgium instruction à programme développé, and on the same general lines as before, is exactly suited to meet his needs. For it does not aspire to lead directly up to a university, although it may not unfrequently lead to a science college or a technical school. And it ought to be regarded mainly as an institution for continuing the work of the elementary school up to 15 or 16, and not strictly either as a primary or a secondary school.

Some confusion exists in what is called the public mind as to the strict meaning of primary and secondary instruction, and as to the line of demarcation which separates them. But if any such line is to be drawn, it can not be determined by considering the nature and extent of the "subjects" of such instruction. The true distinction, pointed out thirty years ago by the schools inquiry commission, depends mainly on the age to which the education is or is intended to be prolonged. A course designed to be completed at the end of the fourteenth year is an elementary course; a course contemplating the stay of the scholar till 16 or 17 is a secondary or intermediate course. A school fitted to receive boys or girls beyond that age and intended to be in close relation to the universities is educationally an academic institution of the first grade. But the "subjects" which can best fulfill these primary conditions can not be positively prescribed. They must be determined by many local and personal conditions, by the needs and probable destination of the scholars, and in part the special aptitudes of the teachers. This view has been long adopted by the education department, which has offered for the discretionary use of teachers in the higher classes of elementary schools a varied and abundant list of "specific subjects," from which a selection may be made. In the official instructions to Her Majesty's inspectors the following significant passage has during many years been included:

"In large schools, and where the circumstances are favorable, the scholars of

Standard V and upward may be encouraged to attempt one or more specific subjects appropriate to the industrial and other needs of the district.

“It is not the intention of my lords to encourage a pretentious or unreal pursuit of higher studies, or to encroach in any way on the province of secondary education. The course suited to an elementary school is practically determined by the limit of 14 years of age, and may properly include whatever subjects can be effectively taught within that limit. It may be hoped that year by year a larger proportion of the children will remain in the elementary schools until the age of 14; and a scholar who has attended regularly and possesses fair ability may reasonably be expected to acquire in that time, not only a serviceable knowledge of reading, writing, and arithmetic, of the words he uses, and the world in which he lives, but also enough of the rudiments of two higher subjects to furnish a solid foundation for future improvement.”

It is in full conformity with the conception thus formed of the true character of elementary education that during the last ten or twelve years managers, both of board and of voluntary schools, have made special efforts to extend their curricula beyond the strict limit of the elementary subjects, and by means of evening continuation schools, ex-seventh standard classes, organized science schools, and higher elementary schools, have succeeded in retaining many of their most industrious and persevering scholars, and prolonging their period of study. In all such efforts they have received generous sympathy and substantial aid from the heads of the education department. And whatever may be the future official relations between such managers and the newly constituted board of education, it is manifest that under some name or other these facilities for advanced education should continue to exist. The higher primary school supplies a real need, and a permanent place must be found for it as an integral part of our national system.

The problem, however, is rendered somewhat intricate and difficult by reason of two or three facts which do not affect its abstract merits, but are the result of the tentative and somewhat incoherent fashion in which English legislation has dealt with the subject of popular education. The act of 1870 defines an elementary school as “a school or department of a school at which elementary education is the principal part of the education there given.” Such a school is further defined as one “conducted in accordance with the conditions required to be fulfilled by an elementary school in order to obtain a parliamentary grant.” Now the code, as modified from year to year, prescribes as one of these conditions that “no attendance is as a rule recognized;” that is to say, no grant is paid “for any scholar who has been under instruction for more than one year in the three elementary subjects in Standard VII, and is upward of 14 years of age.” Thus, the ordinary grant from the central department ceases to be paid in the case of children above 14. But the science and art department which was created in 1864, and is empowered to make special grants for technical and scientific instruction, has been subject to no such limitation. Hence the special aid which that department administers is for that particular kind of instruction only, and managers desiring to give their best scholars opportunities of prolonged education have been impelled, simply for financial reasons, to give that education a scientific character.

Experience may have led those managers to believe that a “continuation school,” in which language, history and literature, and the “humanities” are cultivated *pari passu* with technology and the elements of science, would be more useful to the majority of their elder pupils than a purely science school. They may desire that the higher grade school should have the same liberty to frame its own curriculum as the ordinary elementary schools have under the Whitehall code; but they have not been at liberty to give effect to their own wishes on this point, because no other knowledge than that described in the South Kensington directory as science and art has been recognized as establishing a claim for a grant. Now, nothing is more surely fatal to the unity of a school, or to the working of a wise general scheme of instruction, than the practice of making separate grants, by separate examining authorities, for special subjects of instruction. The education department has of late done much to correct this evil and to estimate the worth of a primary school rather by its work as a whole than by the performances of individual pupils in particular branches of knowledge. The same principle is evidently intended by the board’s minute of the 6th of April to apply to the higher elementary school, although some of the restrictions respecting age and conditions of admission in that minute obviously need to be revised.

A second and serious difficulty has arisen owing to the fact that the London and some other school boards have determined to make the instruction in their higher schools and their evening continuation schools gratuitous and to charge the whole expense not already met by the South Kensington grant upon the local rates. We ought not to withhold a full acknowledgment of the zeal of Mr. Lyulph Stanley

and the progressive members of the board, and of their genuine interest in the progress of intelligence among the working classes, when we read in the lucid judgment of Mr. Justice Wills a condemnation of this policy. They were conscious of a great public want; they saw that hundreds of young people just released from the primary schools sorely needed opportunities of self-improvement; that no existing machinery was adequate for the purpose; and that, with the practical concurrence of the ratepayers, it seemed possible to supply the needed education by means of a fuller development of the board school system. They knew that in the matter of education, unlike that of commerce, supply often creates and precedes demand; that the appetite for advanced knowledge among our young artisans needs to be stimulated; and they therefore sought to render both the day and evening continuation schools attractive by making them gratuitous. Some considerations on the other side are, however, too important to be overlooked. Parliament has provided, by means of the fee grants, the means of releasing parents from the payment of fees up to the fourteenth year, which is the limit of compulsory attendance. But at present Parliament has not deliberately sanctioned the principle that instruction beyond that limit, whether in evening schools, higher primary schools, or in secondary schools proper, shall be provided wholly from public funds. Some day perhaps the legislature may assent to this principle; but meanwhile it is, as the judges have pointed out, most undesirable that this assent should be anticipated, and that school boards or other local bodies should, on their own motion and in an indirect way, settle a fundamental question of national policy on which neither statesmen nor the public are yet agreed.

Hence the problem would have been greatly simplified if, from the first, moderate fees had been charged in both the evening and day continuation schools. There are other than merely economical reasons in favor of such a course. While the law compels attendance, it is reasonable that schools should be free, but after the age of compulsion is reached, and young people, some of whom are presumably able to earn something for their own support, join evening or other advanced classes, the public has a right to expect them to make some effort to pay for what they receive. It is a substantial part of their own education in manliness and self-respect that they should not be wholly dependent in their efforts after self-improvement on the help of others. They value more that which they pay for, and although exact statistics are wanting, it is generally found that attendance at gratuitous classes is more desultory than that in institutions in which fees are paid. The recreative element in the programme of such classes is often encouraged to a disproportionate extent. But we ought to be able to assume that the learners are bent on serious application and that the arrangements should be made mainly, if not exclusively, in view of the requirements of such learners. The effect of making the board continuation schools and classes free to all comers is often seriously embarrassing and in some cases disastrous to other institutions. Polytechnics, mechanics' institutes, young men's and women's Christian associations, and the evening continuation schools attached to voluntary schools are often giving, with excellent effect, help and guidance to students of the same class and age. But the managers of all those institutions find it necessary to impose fees. They could not exist otherwise, since none of them have command of the funds derived from rates. The school board alone enjoys this privilege, and is therefore able to undersell, and pro tanto to hinder and discourage, all institutions which receive no subsidies from the rates. This unequal competition between schools which are doing the same work under such different conditions is not for the public interest. The remedy needed is the general adoption of a moderate scale of fees for all ordinary students. At the same time it should be within the discretion of the board to make a generous provision of free places and scholarships for all scholars who at the elementary school or otherwise had shown exceptional diligence and promise. Higher and advanced education would then assume its true position in board schools as a privilege, to be partially paid for by the rank and file of scholars, but to be offered as a boon to those who were specially qualified to appreciate and to use it.

It follows from these considerations that we need in every district one local authority which shall have cognizance of all the educational agencies of that district. If school boards are to limit themselves to the care of elementary schools, while county and county borough councils administer the funds available under the excise act, or if a new local authority, such as is recommended by the royal commission, is formed to concern itself with secondary and technical education only, friction, overlapping, and waste of power are inevitable. In particular, the position and control of the higher and technical schools, already much disputed between the advocates of school boards and county councils, respectively, would continue to present to the local administrators some difficult problems. What is

needed in every educational area is a body of responsible men and women possessing the public confidence, well acquainted with the needs and resources of that area, and exercising in the first place the powers now possessed by school boards, and also such other powers as Parliament may intrust to them in relation to local scholarships and endowments, and to technical and secondary education generally. This body should be largely representative of the ratepayers, but should be composed in part of such qualified persons as are described in sections 46 to 66 of the royal commissioners' report of 1895. An excellent precedent for such a measure of consolidation exists. The board of education act of 1899 was the result of the experience of the Government in dealing with such separate authorities as the education department at Whitehall, the science and art department at South Kensington, the charity commission, and the board of agriculture. This bold and valuable measure sought the unification of all these different departments by placing them in due correlation under one central authority. A corresponding policy is needed in dealing with the difficult problem of the local authority. That authority should be one and undivided, although, as in the case of the board of education itself, it might with advantage create within itself separate subordinate committees for dealing with specific classes of work. Exact lines of demarcation between elementary, secondary, technical, and higher education and manual and intellectual training have not been laid down, and are, indeed, at our present stage of experience, not easy to trace. But it is certain that whoever undertakes to control any one of these departments ought to know something of them all and to perceive how each of them ought to be related to the others. The ideal school board of the future therefore, with a wider area and larger responsibilities, should, though not concerning itself with nonlocal institutions such as Eton and Harrow, be so constituted as to represent the best attainable experience and the fullest knowledge of the educational wants of each district.

Such a simplification of the machinery employed in local administration would greatly facilitate the solution of some problems which must in the near future demand the attention of statesmen. One of the first of these is concerned with what is called the "religious difficulty," and with the relations which ought to subsist between the churches on the one hand and the municipal and State authorities on the other. We should find it necessary, if the due simplification of local authority were effected, to divest ourselves of some of the associations which we have already formed with the name "school board," and to use that term in a wider and more general sense. It would then become desirable to establish school boards everywhere, though not necessarily board schools. It would also be desirable to give to the school boards, under certain conditions, the power to subsidize efficient denominational schools by means of the rate fund. This was the intention of the framers of the act of 1870, and from the first it has been the desire of those who have administered that act to enlist, on behalf of national education, the sympathy and the services of educated and religious people who supported schools in connection with Christian churches. Mr. W. E. Forster, in introducing that measure, said, in reference to the powers to be intrusted to the boards:

"We give them the power of either providing schools themselves or of assisting the present schools. * * * We do not think it right to insist on the school board assisting the present schools. We give them, however, power to do so if they please. They have a certain educational destitution to supply. They may do it either by setting up their own public elementary schools, or by assisting the present public elementary schools; those schools, I need not remind the House, being efficient up to a certain standard of secular efficiency and having the conscience clause, as I have described."

It is well known that the clause embodying this wise and generous provision was ultimately withdrawn, owing to the pressure brought to bear on the Government. To many members of the Liberal party, and especially to some prominent Nonconformists, it appeared then that though there was no objection to give aid to denominational schools from the imperial taxes it would be a grave departure from principle to allow any aid to be afforded from the local rates. Thirty years have wrought a great change in public opinion, and in particular have shown that this somewhat illogical objection is no longer tenable or consistent with the facts of later experience. At the end of the century the average attendance of scholars in the schools of the Church of England was 1,893,824; in Wesleyan schools, 126,361; in Roman Catholic schools, 251,768, and in school board schools, 2,144,118.

Mr. Forster, in the speech just quoted, said in reference to his proposal to grant a year's grace to managers who might desire to increase the supply of denominational schools: "Here for a time we shall test the voluntary zeal of the district. Not only do we not neglect voluntary help, but, on the condition of respecting the rights of parents and the rights of conscience, we welcome it." Later legislation

has shown the willingness of Parliament to make special grants for the sustenance of voluntary schools, and the public has now learned to acquiesce in the general conclusion that although the ratio of scholars in the board schools has a decided tendency to increase year by year, yet the denominational school is an integral part of our national system and has made good its claim to full recognition. Effect would be given to this view if the reconstituted and universal school boards were permitted to grant out of the money raised from the ratepayers to every efficient denominational school in the district an annual subvention equal in amount to the sum raised by the voluntary managers and their friends, provided that such contribution did not exceed a certain fixed sum per head on the average attendance. A further condition would be necessary, that whenever such grant was made out of local funds, the board should have the power to nominate persons, not exceeding one-third of the whole number on the managing committee of the aided school. Those who pay have the clear right to control. It is not to be supposed that Parliament will long continue to leave to private management the sole administration of large and increasing sums of public money. In 1870 it was roughly computed that of the total cost of public elementary education one-third was borne by the parents in the shape of fees, one-third was provided by voluntary subscriptions, and one-third by the Parliamentary grant. The statistics for 1900 show that while the total grant administered by the education department for the previous year amounted to £8,723,538, and the total sum accruing from the rates and administered by the school boards to £2,704,564, the amount derived from voluntary subscriptions was £787,231, or about one-sixteenth of the whole sum devoted to elementary education. It is obvious that this enormous proportionate increase in the sum derived from public sources ought in equity to be attended with a corresponding increase in the amount of influence exerted by those who represent the public. Some very substantial advantages would be the consequence of such an arrangement. The managers of good voluntary schools would gain substantial help and a new guaranty for the permanence of those schools. They would retain the power to give the distinctive religious teaching to which they attach the highest importance, and the choice of the teachers would practically remain with them. They would, it is true, no longer be able to leave the entire management in the hands of one man who could claim the institution as "my school," and they would be obliged to accept the cooperation of some of their neighbors with whom they had not been accustomed to work, while one or two of these nominees might possibly, though not very probably, be members of other communions than their own. But this would be in some respects a clear advantage, for it would make a larger number of the inhabitants cognizant of the real merits of the school, would help the denominational managers to become better acquainted with the feelings and wishes of the inhabitants, would secure more of the public confidence, and above all would entitle the institution more truly to the name and character of a "national school." The condition of a closer and more active cooperation of the State with the churches is not that the State shall make itself more denominational, but that the denominations shall make themselves more national and shall vie with the school boards in interpreting the true intellectual needs of the community, in providing generally for the supply of those needs, and in maintaining a high and constantly improving ideal of what a good school ought to be and to do.

The technical difficulty which has arisen in determining the legal status of the higher primary and evening continuation schools will prove to have had salutary effects if it brings into greater prominence the indispensable importance of maintaining those schools by some means or other in unimpaired efficiency, and if it makes Englishmen more conscious of the inadequacy of our present provision for carrying forward the best work of the elementary schools and enabling it to bear its legitimate fruit. We must not, however, rely too confidently on legislative machinery for the attainment of this object. A great step will be taken, it is true, if, after the present lawsuit shall have ended, regulations are made which will legalize the advanced work of the board schools and place it on a stable foundation. But this alone will not suffice. Law and government can, after all, do little more than give expression to the best public opinion of the time, and become the instruments for giving effect to the highest national ideals. And it is the formation of that public opinion and of those ideals which constitutes the chief task of reformers and philanthropists, of statesmen and public instructors.

The great need of our time is a stronger conviction of the value of trained intelligence in all departments of our social, professional, civic, and national life.

The comfortable optimism which leads us to assume that British pluck, British industry, and British patriotism will in the long run carry everything before them has received some rude shocks of late, and will need to be superseded by a truer

estimate of ourselves and of our national deficiencies. The theory that brain power and scientific training are of less practical value than the dogged persistence which enables Englishmen to "muddle through" the problems of life, is not yet extinct among us, although daily experience is doing much to discredit or at least to modify it. We have reached, at the beginning of the twentieth century, a Pisgah height whence we can look across the Jordan of sectarian and political controversy to the fair land of promise which stretches out beyond it. It is an animating prospect. In it we may descry a great department of the state, representing all the noblest aspirations of the community, knowing how to take

Occasion by the hand, and make
The bounds of freedom wider yet;

giving aid and guidance to those who need it, leaving full liberty to those who know how to use it, and placing itself in such relations to churches, municipalities, universities, and voluntary helpers as will coordinate their work, prevent confusion of authority and waste of power, and obtain from each of them the best public service it is capable of rendering. And concurrently with improved administration in government, in philanthropy, and in local agencies we may hope to witness a steady growth in the popular conception of true education—one which will keep ever before parents and teachers the right relation between the pursuit of learning and the claims of active life; so that, without prematurely considering the requirements of a trade or a profession, they shall seek first of all to cultivate the seriousness of purpose, the mental breadth, the strength and beauty of character, and the love of truth which lie at the basis of all real success in trades and professions alike.

It is because the newly devised continuation schools promise to play a very important part in the educational development of the future, and because they are calculated to do eminent service to a class of young persons for whom otherwise little or no provision has hitherto been made, that any question which affects the usefulness and the permanence of these institutions deserves for the moment to be regarded as one of exceptional public interest.

The present attitude of the Government with respect to the problem of secondary education for the industrial classes is indicated by the following provision:

[Minute of the board of education, April 6, 1903, establishing higher elementary schools.]

A public elementary school may be recognized by the board of education (hereinafter called the board) as a higher elementary school under the following conditions:

1. The school must be organized to give a complete four years' course of instruction approved by the board.

2. No child shall be admitted into a higher elementary school unless he (*a*) has been under instruction at a public elementary school other than a higher elementary school for at least two years, and (*b*) has been certified by an inspector of the board to be qualified to profit by the instruction offered in the higher elementary school.

3. The fitness of any child to continue, or be promoted from one year's course to another, in a higher elementary school shall be certified by an inspector of the board.

4. (*a*) Attendances may not be recognized in a higher elementary school for any scholar who is upwards of 15 years of age, and (*b*) no scholar may remain in a higher elementary school beyond the close of the school year in which he or she is 15 years old.

The average attendance for any period is found by dividing the total number of attendances made during that period by the number of times for which the school has met during such period. For the purpose of reckoning the average attendance at a higher elementary school an attendance shall mean attendance during two and one-half hours.

5. (*a*) The school year of every higher elementary school is the year ending on July 31, and no scholar may be admitted for any year's course later than Novem-

ber 1. (b) After November 1, 1900, scholars newly admitted into a higher elementary school must commence with the first-year course.

6. *Temporary article.*—Up to August 1, 1901, the qualification for admission to the first-year course shall, as a rule, be competency to pass Standard IV of the code as shown to the satisfaction of an inspector of the board.

7. (a) The school must be shown to the satisfaction of the board to be necessary in the locality, and (b) the premises must be recognized by the board as suitable for the purposes of a higher elementary school.

8. The teaching staff of the school must possess such qualifications as may be laid down from time to time by the board for the purposes of a higher elementary school.

In the first and second year courses there shall be a teacher, accepted as qualified by the board, for every 40 scholars (or less); in the third and fourth year courses there shall be a teacher so qualified for every 30 scholars (or less) in average attendance.

The grant may be reduced at the rate of not more than 10s. per annum for every unit of annual average attendance above the number for which the school staff is recognized by the board. This reduction will as a rule be one-twelfth of 10s. for every month during which the staff has been insufficient for the annual average attendance.

9. The managers of any school who desire such school to be recognized as a higher elementary school must submit for the approval of the board before July 1 in any year proposals for a curriculum and time-table and such other information as may be required by the board.

10. The grants made to higher elementary schools are as follows:

Principal grant.

	Higher scale.	Lower scale.
First year	s. 27	s. 23
Second year	35	30
Third year	47	45
Fourth year	65	55

The board shall decide which, if either, of these grants shall be paid in the case of each year's course after considering the report and recommendation of the inspector upon each of the following four points: (a) The suitability of the instruction to the circumstances of the scholars and the neighborhood. (b) The thoroughness and intelligence with which the instruction is given. (c) The sufficiency and suitability of the staff. (d) The discipline and organization.

The inspector will recommend the higher grant unless he is unable to report favorably upon the school under these heads.

Grant for practical work.

	Higher scale.	Lower scale.
First year	s. 8	s. 6
Second year	12	10
Third year	18	15
Fourth year	25	18

This grant will only be awarded where special provision for such work, as regards premises and equipment, is made to the satisfaction of the board. The board shall

decide which, if either, of these grants shall be paid in the case of each year's course after considering the report and recommendation of the inspector upon each of the points named in paragraphs (a) to (d) of this section.

11. No grant may be received from the board of education by any higher elementary school in addition to the grants named in section 10 of this minute, with the exception of the fee grant.

12. No member of the teaching staff may undertake duties not connected with the school which may occupy any part whatever of the school hours.

13. Separate registers and separate accounts must be kept for the higher elementary school.

14. No scholar may attend a higher elementary school who is attending an evening school or class under the regulations of the board. This does not apply in the case of a scholar attending an art class above group 1, under the regulations of the board.

In a debate in the House of Commons, Professor Jebb, representing Cambridge University, and deeply interested in measures for reorganizing the secondary education of the country, explained the scope of this minute, as follows:¹

That minute made provision for establishing a new type of higher grade school, which must be organized to give a complete four years course of instruction approved by the board. That course would begin from a point represented by Standard V, but would thenceforth be on a higher plane than that of the ordinary elementary school. No scholar would be allowed to remain in such higher grade school after the close of the school year in which he or she was 15 years old. This minute had nothing directly to do with secondary education. It created a type of school which was to crown our system of primary education. But the minute necessarily raised this question: What was the proper relation of primary to secondary education? What was the general conception, the principle, which underlay this minute of the board? What view did it imply as to the manner in which primary and secondary schools should be coordinated?

Coordination of education.—That principle, that conception, might be stated somewhat as follows: He was not merely giving his own view, but one which was embodied in 1897 in a very instructive and important document—a memorandum drawn up by representatives of masters of secondary schools on the one part and of head masters of higher grade schools of science on the other part. Their concordat marked the most definite step that had hitherto been taken toward formulating the main principles on which primary might be delimited from secondary education; and it had a most important bearing on the board of education minute which they were now considering. The difference between primary and secondary education did not depend chiefly on the subjects taught; certain subjects must be common to primary and secondary schools. It depended on the aim of the school and on the general character of the instruction given. And in determining these the most important factor was the leaving age of the pupil. For most children day school training ended at 14 or 15 at latest. These usually took up manual or industrial employments. Primary education, ordinary and higher, was, broadly speaking, that which was planned for a leaving age of 15 at the latest. In secondary education there were two main classes of schools: (1) Those in which the normal leaving age was 16 or 17, and (2) those in which it was 18 or 19. The pupils of such schools might take up the higher industrial employments, or commerce and business, or scientific and professional pursuits. They pass on to a technical college, a university college, or university. A child

¹ From School Board Chronicle, May 12, 1900, p. 509.

in an ordinary elementary school had, or should have, three choices open to him— (1) to stay in that school till he had completed the standards; (2) after passing Standard IV to pass to a higher elementary school; (3) to pass to a secondary school at the same break. Now, the higher grade school set up by the minute answered to the second of these choices. It was to be a higher primary school, not a lower secondary school, and so its course was planned to end at the age of 15 at latest. Primary education aimed at training the mind as well as giving useful knowledge; but on account of the limited time it was more practical and gave a larger place to immediate utility than secondary education did, where the foremost object was a liberal training of the mind.

The general character of higher grade schools established by school boards is shown by the following account of the higher grade school of Leeds, taken from the official report of the school board:

The career of the [Leeds] Central Higher Grade School has been one of development and success. In the higher section, which consists of children who have passed all the standards, and which is recognized by the board of education as a school of science, the average attendance has risen from 402 in 1897 to 560 in 1900, an increase of 39 per cent; and the number on the books has increased from 576 to 677. The instruction in the higher section is by no means confined to science; it embraces also English literature, grammar and composition, history, geography, bookkeeping and business methods, shorthand; Latin, French and German; the pianoforte, gymnastics, in addition to manual instruction in woodwork for boys, and cookery and dressmaking for girls. In this way the foundation of a broad system of education is being laid.

The grant in the school of science is calculated upon the average attendance, and is upon a sliding scale of payment determined by the board of education after considering the report of its inspectors upon visits paid during the year and the results of the annual examination of the more advanced pupils. The grant may be taken, therefore, as the board of education's estimate of the educational value of the work done in the school. It is gratifying, therefore, to be able to state that the grant this year was £3,663 16s. 1d., which is at the rate of £6 10s. 10d. per head, and is £1,271 6s. 5d. in excess of the grant earned at the close of the last triennial period, showing an increase of 58 per cent.

In the elementary section the scholars are taught in standards. The continued efficiency of this department is attested by the award of the higher principal and discipline grants, and the higher grants for class subjects, specific subjects, singing, and manual instruction. The boys in the elementary section have earned a grant of £1 11s. 11d. per head, and the girls £1 9s. 5½d., the highest amounts ever earned in any of the elementary schools under the board.

Owing to the smaller number of pupils in one class permitted to teachers in the school of science, and the more advanced and specialized character of the instruction, the teaching staff is considerably larger in proportion to the number of pupils than in the ordinary schools, and is of a higher quality. In addition to the principal, who holds the degrees of D. Sc. and M. A., there are on the staff 1 D. Sc. and M. A., 12 who hold the degree of B. Sc., 5 B. A., 3 A. R. C. S., and 1 LL. A. Four teachers devote all their time to the teaching of chemistry, 4 to the teaching of physics, 4 to mathematics, 4 to English, 3 to modern languages, and 1 to Latin. There are 3 manual instructors, a shorthand teacher, a teacher of dressmaking, 2 cookery teachers, and an instructor of physical exercises and gymnastics. The number of trained certificated teachers in the school is 41, some of whom are included under the heads already mentioned.

The board have continued to provide free exhibitions (scholarships) for seventh standard scholars from board and voluntary schools. There are 283 of such free

exhibitioners at the present time. Each exhibition is estimated to be worth £1 10s. per annum.

The school has not only proved a preparatory training school for those who require, for professional, commercial, and industrial purposes, a higher education, but it has proved itself to be a secondary school of a high type, in so far as a considerable proportion of the pupils have taken the university examinations. During the past three years 43 pupils have passed the matriculation examination of the University of London, and 45 have passed the preliminary examination of the Victoria University. In open competition 31 pupils have taken scholarships tenable at the Yorkshire College, of the aggregate value of £3,102. One pupil has gained, in competition, open to all the science and art schools in the British Isles, a national scholarship of the value of £300. There are at present in the various departments of the Yorkshire College 56 students who received their preliminary training in this school. That such students have fulfilled the expectations formed of them is evident from the rich harvest of university honors they have reaped. In the Yorkshire College, during the past three years, former pupils of this school have gained advanced scholarships of the value of £855, 20 prizes, and 1 gold and 1 silver medal.

During the same three years the following university honors have been gained by former pupils:

University of London.—One B. A., 4 B. Sc. (1 with honors), 3 Inter. B. Sc. (1 with honors and 1 with honors and medal), 1 Inter. M. B., 2 Prelim. Scientific M. B.

Victoria University.—Four M. Sc. (2 with honors), 12 B. Sc. (2 with honors), 13 Inter. B. Sc., 4 B. A., 4 Inter. B. A., 1 medical second examination, 1 Inter. LL. B.

Such a record abundantly proves that the curriculum of the school not only enables boys and girls to pass creditably the entrance examinations to the universities, but gives such a training as enables them to take, in their university course, a distinguished position.

Much of the usefulness of this school, in the matter of higher education, is threatened by the attitude of the board of education in its minute of April last on higher elementary schools. By its provisions all higher education in this school would terminate at 15 years of age, at the very period when education is of supreme value to talented pupils. At the end of last session (May, 1900), there were in attendance 303 pupils who were either 15 years of age or would have been in this session, and who would not have been allowed to be in attendance. This session there are in attendance 441 pupils either over 15 years of age, or who will be over 15 during the session, and these, if the minute were accepted by the school board, would cease to be recognized pupils.

The following table shows the development in elementary schools of studies generally recognized as secondary under the provisions of the school law and annual regulations from 1872 to 1899, inclusive:

TABLE XVI.—Day scholars qualifying for grants in the various specific subjects, from the time when extra grants were first offered for every scholar passing a satisfactory examination in these subjects to 1899, inclusive. *a*

Year ending Aug. 31—	Number of scholars presented for examination (1872-1898) or qualifying for grant (1899).															Total scholars qualified for special subjects to the total number of scholars on register.

^a By the minute of February 20, 1867, incorporated into the Code of 1868, extra grants, limited to £8 a school, were offered, provided inter alia that the time-table of the school provided "for one or more specific subjects of secular instruction beyond" reading, writing, and arithmetic. The Code of 1871 first offered "a grant

of 3s. per subject for every day scholar "presented in Standards IV-VI who passes a satisfactory examination in not more than two of such subjects." In the four months ending August 31, 1871, 19,485 scholars were presented in specific subjects.

b Elementary science, experimental mechanics, fruit culture, geology, history, horticulture, hygiene, manual instruction and applied drawing, natural philosophy, navigation, physiography, practical science, political economy, and social economy.

c By the Code of 1875 grammar, history, and elementary geography were, from March 31, 1876, to be considered class subjects. Algebra, Euclid, and mensuration became "mathematics." The grant for specific subjects was raised to 4s. per subject, and children who had passed Standard VI were allowed to take up three subjects.

d By the Code of 1882 English and physical geography were, from April 30, 1883, added to the class subjects. Any scholar in Standards V-VII was allowed to be presented in not more than two specific subjects." Mathematics were divided into "algebra" and "Euclid and mensuration."

e By the Code of 1890 Euclid and mensuration were recognized as separate subjects.

f By the Code of 1892 the grant for specific subjects was, after August 31, 1892, "2s. or 3s. for each scholar presented in any specific subject." No scholar could be presented in more than two specific subjects, and the department was to decide "which, if either, of these sums of 2s. or 3s. shall be paid, after considering the report and recommendation of the inspector."

g For any school year beginning after August 31, 1897, in place of the grant payable on examination of individual scholars "all the hours during which any registered scholar has received instruction * * * shall be added together, and a grant of 1s. or 6d. shall be paid for every complete twenty-four hours." (Code of 1897.)

h Of these about 90,000 are estimated to be in organized higher grade schools.

PART III.—HIGHER EDUCATION IN GREAT BRITAIN AND IRELAND.

Higher education is provided in Great Britain and Ireland by universities and detached colleges, and professional education by special schools of medicine attached to the principal hospitals and by schools of law and of theology.

The number of students in the universities and university colleges for the successive years of the decade 1889-1899 is shown in the following table:

TABLE XVII.—Attendances at universities of Great Britain, 1889-1899. *a*

a The statistics are taken from the Statesman's Year-Book for the dates specified.

b The unusually high attendance this year seems due to excess of evening students.

c Decrease from 1892-1899.

UNIVERSITY NOTES.

Oxford.—In 1891 the University of Oxford instituted the degrees of bachelor of letters and bachelor of science, which are intended to promote and recognize the value of study and research. The requirements for these degrees are a course of special study or research and a residence of two years.

As a logical result of this first measure a doctorate in letters and in science has been recently created. Candidates for the same must submit published papers or books containing an original contribution to the advancement of learning or of science. [For an interesting account of salient characteristics of Oxford, see citations from an article by George Brodrick, D. C. L., warden of Merton College, appended, pp. 1237-41.]

Cambridge.—The University of Cambridge also admits persons as advanced students. A student of this class who has kept by residence at least six terms and has obeyed the regulations as to examinations, etc., may proceed to the degree of B. A., as also may an advanced student who has obtained a certificate of research.

The total amount received by the university (as distinct from the colleges) in response to the appeal of the Duke of Devonshire for a minimum of half a million sterling had reached £82,000 in November of this year. [For an account of increased facilities in the engineering department of Cambridge, see citation from *Nature*, appended, pp. 1241-43.]

Oxford and Cambridge have both suffered severe loss during the year by the death of distinguished professors. Prof. F. Max Müller, who died October 28, was the most widely-known scholar recently identified with Oxford. His special professional work is thus summed up by an English authority: "By a combination of knowledge, literary power, and unexampled command of a language not his own, he, more than any other man, established and maintained an interest in the young science of philology throughout the whole of the cultivated classes in the country."

Prof. Henry Sidgwick, of Cambridge, who died August 28, 1900, was identified with every recent effort for the development of higher education in England; and, in particular, the cause of university education for woman is indebted to him for invaluable service.

Of his university relations an English authority says:

His lectures were distinguished by intellectual sympathy, insight, close reasoning, and excellence of literary form, and also by comprehensive grasp and sense of perspective. He never left out of account anything important and always kept to the point, and his examination papers were models of philosophic questioning—each question fresh, stimulating, going to the heart of things; each paper as a whole having a sort of artistic excellence and completeness; each allowing possibilities to the dull, while opening splendid opportunities to the most brilliant. His individual interest in his pupils, unfailing consideration, and generous help are a living memory to Cambridge moral science students, who, although a small

company contrasted with the hosts of candidates in more ancient and endowed triposes, will, for quality, compare favorably with the philosophical output of any other university in the world.

The same writer adds:

His philosophical works are comprised in his three systematic treatises—on ethics, political economy, and politics—which, together, cover the ground in moral and political philosophy, and combine to form a coherent whole. His influence over students was intensified by the charm of his manner, the fine flower of courtesy making the most shy and helpless feel at ease, while himself most brilliant in the most brilliant company. And all of his grace and readiness and considerateness were simply the unforced and appropriate expression of a rare and exquisite nature, the keenest and most sensitive intellect, the most unselfish heart, the sunniest temper, the most pure and generous will, an unfailing gentleness, and a delightful humor.

The new University of London.—The efforts of the association for promoting a teaching university for London, maintained with varying prospects for sixteen years, have at last reached the stage of positive results. The statutes and regulations drawn up for the university by the commissioners appointed for that purpose were approved by Parliament and received the royal sanction in April of the present year (1900). The governing body was subsequently formed and the work of organization is in progress. The schools of the university, as named in the statutes, are as follows:

(1) University College and King's College (admitting in all the faculties), (2) the 10 medical schools, (3) the 6 theological colleges, (4) the Royal College of Science and the Southeastern Agricultural College (in agriculture only), (5) the City and Guilds Institute (in engineering), (6) the London College of Economics, (7) the Royal Holloway College and Bedford College. To this list the senate may add at its discretion any public educational institution within the prescribed limits. All schools will be open to visitation, and are liable to be removed from the list.

The "Inns of Court," which at first refused to consider the proposal of the commissioners, have since come into the scheme, which insures the organization of a faculty of law.

The *Journal of Education*, in a review of the work of the commission, says:

Two new faculties are created: (1) Engineering and (2) economics and political science (including commerce and industry). Students in these subjects are not granted distinct degrees, but the diploma of their degree in science will be, so to speak, earmarked. We confidently anticipate that the reconstituted university will be differentiated from the older universities by the growth and expansion of these two faculties. No city in the world can offer the same opportunities as London for the pursuit of these studies, and a vigorous beginning on both sides has already been made.

Pedagogy is left out in the cold, not being thought worthy to rank as a faculty, and no training college being admitted as a school of the university. As a sop, a board of studies is recommended for the theory, practice, and history of education, and a hope is entertained that the university will, at some future time, be enabled to establish courses of lectures and create a professorship.

It is worthy of note that three women have been appointed in the senate of the reconstituted university.

Among the enlarged faculties of the university may be noted the new scientific laboratories of King's College, which were opened with impressive ceremonies in October of the present year. (See description cited from *Nature*, pp. 1243-44.)

University colleges and the new universities.—The rise of university colleges in the great centers of industry is the most important event in the recent history of higher education in Great Britain. These colleges are characterized by their liberal provision for science instruction and for technical training, and also by the admission of women on the same terms as men. Private and public resources have combined in their support, and the last and most striking phase of their development is their ascent into university organization. Owens College, Manchester (dating from 1851); Yorkshire College, Leeds (1874), and University College, Liverpool (1881), are comprised in Victoria University, incorporated in 1880. The three colleges of Wales—Aberystwyth, Bangor, and Cardiff—pertain to the University of Wales, incorporated in 1893, and Mason College, Birmingham, is the nucleus of Birmingham University. The development has been stimulated also by a parliamentary grant which has been appropriated annually since 1889 to be shared by the university colleges¹ of England on the condition that they submit reports to the education department.

The grant which began at £15,000 was raised to £25,000 in 1897. Upon similar terms the three university colleges of Wales receive each annually £4,000 from the treasury.

Victoria University.—The court of Victoria University recently decided, after consultation with the head masters of many secondary schools in Lancashire and Yorkshire, to accept a leaving certificate obtained by examination at the schools as equivalent to a matriculation test. The character of the examination will of course be determined by the university.

The appointment of a professor of the theory, art, and practice of education by Owens College marks the progressive spirit of this institution. The hope is expressed that Oxford and Cambridge will soon follow this example. Scotland has for many years had two professors of education—one at Edinburgh and one at St. Andrews—and both have made valuable contributions to the literature of education.

¹Mason College, Birmingham; University College, Bristol; Dundee University College; Yorkshire College, Leeds; Liverpool University College; Bedford College, London; King's College, London; University College, London; Owens College, Manchester; Durham Science College, Newcastle-upon-Tyne; University College, Nottingham; Sheffield University College; three university colleges in Wales (Aberystwyth, Bangor, and Cardiff). The two London colleges, University (1826) and King's (1828), affiliated with the University of London, are of earlier origin and belong to a different phase of university life.

Both Oxford and Cambridge have undertaken the training of elementary teachers, and it is probable that before long they will undertake the training of secondary teachers also. The Cambridge syndicate has had courses of lectures for teaching and examinations for teachers for many years.

The new chair of education at Owens College has been accepted by Mr. H. L. Withers, since 1893 principal of the Borough Road Training College, at Isleworth. Mr. Withers was elected to a classical scholarship at Baliol College, Oxford, in 1882, and he obtained a first class in classics both in moderations and in the final honors school. He was assistant master at the Manchester Grammar School, and afterwards at Clinton College, and has been an examiner under the Oxford and Cambridge schools examination board. He will have a seat in the senate of the college and on the board of studies of the Victoria University. An assistant and the trustees of method in the women's college will be associated with the professor in the work of the department.

The governors of Owens College have recommended that women should be admitted to the courses qualifying for medical degrees, but subject to provision for separate instruction in some particulars. The Victoria University in adopting this recommendation would come into line with Aberdeen amongst the Scottish universities. The Women's Medical School in London, which Mrs. Garrett Anderson was largely instrumental in founding, is an alternative mode of preparing women for a medical degree. A new physical laboratory is being erected for Owens College, at the cost of £32,000. The Liverpool University College is prepared to spend £35,000 on a similar laboratory. In view of the approaching jubilee of Owens College (1901), a committee, of which the Duke of Devonshire is chairman, has issued an appeal to the public to raise £150,000 to complete the endowment and equipment of the college. More than £20,000 is asked for to extinguish existing debts, especially on the medical buildings, and a considerable sum is required to make the yearly income of the college balance its expenditure. But the committee has also before it the necessity of extending the work of the college in various directions. Among the special objects for which money is sought are the establishment of new chairs in English literature, Hebrew, and architecture, and generally for a further development of the arts side of the college; the establishment of an institution for bacteriological investigation and hygiene; the further increase of research fellowships, and the creation of a pension fund. Owens College, says the appeal, was the first institution outside London set up to supply the great cities of England with a university education. It is still the largest of them, both as regards the number of its teaching staff and students and the size and completeness of its buildings.

The appeal goes on to lay special stress on the number of eminent

men among its old students and the large output of original work from its members, not only in natural science, but in medicine, history, literature, and philology. (Athenaeum, March 2, 1901, p. 276.)

The legal faculty in the Yorkshire College at Leeds is now in working order, with a professor and three lecturers on law and lectures on ancient history and logic. The courses are calculated for the Victoria degree in law and the examinations of the Council of Legal Education and the Incorporated Law Society.

Birmingham University.—Birmingham University starts on a foundation of half a million sterling, with the prospect of rapid increase of resources. In preparation for the plans of the new institution a deputation was appointed to visit the United States and Canada, with the view of inquiring into the working of some of the leading universities. When Mr. Andrew Carnegie made his donation of £50,000 he suggested that some of the features of the American universities should be incorporated in the proposed Birmingham University, and Mr. G. H. Kenrick, Professor Poynting (professor of physics), and Professor Burstall (professor of engineering at Mason College) were deputed to make the necessary inquiries. They left Birmingham November, 1899, and visited Cornell University, the Massachusetts Institute of Technology at Boston, McGill University at Montreal, and all the leading colleges and schools in Chicago, Baltimore, Pennsylvania, and the United States generally, concluding their tour at New York. The deputation will present a report to the university committee embodying their views.

Universities of Scotland.—The report of the Scottish universities commission, appointed under the universities (Scotland) act of 1889, has just been issued. It offers a very complete survey of the recent history of the universities and in particular of the conditions that have led to the changes authorized by the commissioners. The most important of these changes are summarized, with comments, in the London Journal of Education as follows:

1. An entrance examination common to the four universities, or some examination accepted as equivalent, is now the indispensable preliminary to a course qualifying for graduation. "Junior" or nonqualifying classes in Latin, Greek, and mathematics are still allowed to exist because of the very inadequate provision for secondary education in many districts of Scotland. The commissioners, however, distinctly say: "We do not think it desirable that the junior classes should be a permanent part of the university equipment."

2. The course of the M. A. degree has been made less rigid and more varied by the permission of a choice of subjects within certain definite limits, and graduation with honors has been encouraged.

3. The institution of a common fee fund in each university, with the payment of professors by fixed salaries instead of mainly by class fees, is a great reform and removes the old obstacle of "vested interests" to the recognition of new subjects and more varied courses of study.

4. Where funds do not admit (as is, unfortunately, too often the case) of the establishment of professorships for the teaching of new subjects, lectureships may

be established for short periods without committing the university to a permanent expenditure on what may not prove a successful experiment.

5. By a special ordinance the commissioners gave power to the universities to admit women to graduation. All the four universities have already availed themselves of this power in the faculties of arts, science, and medicine. In these faculties men and women are now students on the same conditions and a revolutionary change has been very quietly carried out and accepted.

The commissioners regret that they have been able to do nothing directly for the better equipment of the libraries, which they admit to be far below those of the universities on the Continent and in America and very far below the requirements of the Scottish universities themselves.

Many pages of the report are filled with an account of what is generally but inaccurately spoken of as the dispute between St. Andrews and Dundee. The commissioners explain the principles on which they proceeded in dealing with the relations between St. Andrews University and Dundee College. "We were of opinion that the resources of St. Andrews should be applied mainly to the development of the faculty of arts, and that the subjects which might be taught most usefully at Dundee were law, medicine, and applied science, for the teaching of which St. Andrews affords no proper facilities." Due condemnation is bestowed on the old St. Andrews system of conferring medical degrees on qualified practitioners who might never have been students of the university or of any university. "There can be no question that it has subjected the university to unfavorable observation." The evil system has been happily abolished by an ordinance of the commissioners.

Ireland.—The question of a Catholic university for Ireland continues to excite discussion, agitation, and effort with no apparent sign of a satisfactory settlement.

The existing provision for higher education in Ireland comprises the University of Dublin and the Royal University, an examining body to which are affiliated the three Queen's colleges. The University of Dublin (Trinity College) was chartered by Queen Elizabeth. Besides the arts faculty, schools of law, divinity, medicine, and engineering are comprised in this foundation. Roman Catholics were not permitted to take degrees in the university until 1793, when the disability was removed by an act of Parliament. Eighty years passed before they were allowed recognition in the election for fellowships or for scholarships on the foundation of the college. Meanwhile, in 1854, a class of nonfoundation scholarships was established, which were not restricted to any religious denomination. The final abolition of "tests," excepting in the case of professors and lecturers in the faculty of theology, was accomplished by act of Parliament in 1873 through the direct efforts of Mr. Fawcett, at that time postmaster-general.

Until 1850 the University of Dublin was the only body in Ireland authorized by law to confer degrees.

Higher education for women.—The university education of women in England is generally regarded as dating from 1879, in which year were given the first lectures under the auspices of the association for promoting the education of women in Oxford. In the same year one college lecture was open to women students. The association and the

older women's colleges appropriately celebrated their coming of age in 1899.

The London Journal of Education calls attention to the fact that the present year the women's colleges and the departments for women in the universities are filled to overflowing. All the Scotch universities have provided halls of residence for women students. At Alexandra College, Dublin, large additions are being made to accommodate more than 300 students. The London School of Medicine for Women also shows an unusually large attendance, the session of 1899-1900 having opened with 208 students. The school building is now being remodeled and extended at an estimated cost of more than £30,000.

The honor degree courses of Trinity College (Dublin) have, since 1895, been open to any woman who passed the college examinations for women, and the freshman honors examination opened at the same time. So far, however, no women seem to have made use of this concession, as the whole course was almost unmanageable and neither teaching nor degrees were granted. This year, for the first time, a woman presented herself for examination in the modern literature moderatorship. In the middle of the examination she withdrew, but the papers she had done in French were so good that the examiners offered to set fresh papers for her if she would complete her examination. This was done and the candidate awarded the rank of gold medalist and senior moderator. It is believed that this case will lead to a more generous and reasonable course for women being opened in the college in the future.

The following table shows the attendance of women upon university courses in 1899:

Women's colleges and departments, 1899-1900.

UNIVERSITY OF OXFORD.

[Citation from an article by George C. Brodrick, D. C. L., warden of Merton College, in the Nineteenth Century for August, 1898.]

The profound change which has come over the face, and even the spirit, of the university during the present century has been partly due to legislation, parliamentary or academical, and partly to causes affecting the whole of English society. "The studies of the university were first raised from their abject state by a stat-

ute passed in 1800." Such is the deliberate testimony of a royal commission appointed half a century later, and it is amply justified by the facts. This first examination-statute, for which the old hebdomadal board deserves some credit, established an effective pass examination for the B. A. degree, as well as an honor examination which has since been infinitely developed by a series of later statutes. The impulse thus given to undergraduate industry quickly made itself felt, but there was little activity of thought among the senior members of the university until the ice was broken at last by the neo-Catholic revival, popularly known as the "Oxford movement." This movement was essentially reactionary in its origin, as well as Romanistic in its tendency. It discouraged liberal studies and stimulated an unhealthy craze for dogmatism. Still it was a movement, and stirred into activity many ardent spirits, impatient of academical stagnation, who had little sympathy with its ecclesiastical character. Meanwhile the rising tide of Whig policy which carried the reform bill, with other Liberal measures, the Hampden controversy of 1836, the growth of a new theological school represented by Dr. Arnold, and the general advance of ideas both at home and abroad, exercised a marked influence on the Oxford mind. When the commission of 1850 was appointed by Lord John Russell's government, the university authorities had already begun to set their house in order, and sanctioned very comprehensive amendments of the examination system. The report of the commission recommended much larger reforms, most of which, though not all, were subsequently embodied in an act of Parliament (1854), and a series of "ordinances" framed by a new body of commissioners nominated under that act. Before all these reforms had fully taken root, a third commission was issued (1872) to inquire into the financial resources of the university and colleges. Parliament again intervened in 1874 to abolish university tests; and a fourth commission, instituted by another act of Parliament (1877), effected a sweeping confiscation of college revenues for university purposes, remodeled the whole academical system in various important respects, and seriously restricted the power of self-government theretofore vested in the colleges. The university, however, now endowed with a representative constitution, soon vied with the legislature in its zeal for innovation, and the new life of Oxford as it exists to-day is still more the result of forces working from within than of any impulse applied from without.

After all, however, the manifold contrasts between the university in 1798 and the university in 1898 are less the result of any legislation, either external or internal, than of the feverish and progressive movement in every branch of human activity which has marked the present century, and especially the reign of Queen Victoria. * * *

If we now look at the university as it is, with the eye of a foreign observer, we shall at once be struck by the fact that it is still essentially collegiate; that is, that a vast majority of its members belong to some one of its twenty-one colleges and regard their colleges in every sense as academical homes. This peculiarity is due to what may justly be called the invention of the college system by the founder of Merton, and is fully shared by Cambridge alone among the universities of Europe. It is true that the university now has a constitution of its own, more or less independent of colleges; that it maintains a large staff of professors bound to instruct all students who may frequent their lectures, and that for the last thirty years it has received a body of noncollegiate students at present exceeding 200, making special provision for their discipline and tuition. But the noncollegiate body, though it represents the original Oxford "clerks" before colleges were established, forms an insignificant element among some 2,500 undergraduates, especially as the more promising noncollegiate students are constantly drafted into the colleges. The heads of colleges, it is true, no longer monopolize the administration of the university, but nearly a third of the seats on the university

council are still reserved to them, and by far the largest share of university teaching continues to be carried on by college tutors. Indeed, since the introduction of "intercollegiate lectures"—that is, of college lectures open to all comers from other colleges without payment of a fee—the function of university professors has been to a certain extent superseded. These lectures, often attended by very large classes, including young ladies, can not of course be catechetical; but they can be supplemented by private tuition, and one strong proof of their general merit is that "coaching for honors," which is still thought so necessary at Cambridge, has become very rare at Oxford. There is one notable exception to the predominance of college over university teaching. Natural science in all its branches demands a costly equipment of laboratories, collections, and apparatus, with an organized staff of teachers, which can only be provided in some central institution like the University Museum. The consequence is that students of natural science gain almost all their instruction at the museum, and are, so far, removed from college influences. The same applies in some degree to the infant schools of Oriental studies and English, but it may safely be said that Oxford classmen as a body are mainly indebted to college tutors for guidance of their studies in classical literature, history and philosophy, both ancient and modern, political economy, and theology, if not in mathematics and law.

It must be confessed, however, that a foreign observer, examining closely the institutions of Oxford in the practical working, might find much to surprise him. For instance, the university holds no entrance examination, and imposes no intellectual test whatever on those seeking admission to it. If a youth ignorant of his letters could persuade a college, or the delegates of noncollegiate students, to accept and present him, he would be entered on the books of the university as a matter of course, and might remain upon those books for the rest of his life (with the consent of his college) without passing any examination. The consequence is that no common basis of attainments can be assumed among those who have not passed responsions; and little more can be said of passmen who have scraped through responsions, for the contemptible minimum of Latin, Greek, and mathematics then required might be expected from any boy of 15, in addition to an elementary knowledge of French, history, and geography, of which responsions take no account. Again, it would not be self-evident to a foreigner, or perhaps to an English engineer, why the whole educational staff and plant of the university and colleges should remain idle for more than half the year. * * *

But to propose the slightest abridgment of vacations is now the rankest heresy at Oxford, and men who differ from each other on politics, religion, art, and every other subject, including even the admission of women to degrees, are unanimous in holding that, whereas nature intended all other occupations to be carried on for nine or ten months in the year, there is some occult reason forbidding university education to be carried on for more than six months, divided into three spells of eight weeks each. A like origin or perversity of academical policy is to be traced in the marvelous restlessness and inconsistency of its legislation, especially in regard to the examination statutes. Since the large and beneficial changes introduced into these statutes above forty years ago, scarcely a single term has elapsed without their being tinkered afresh; and, as this has often happened twice in the same term, they must have undergone, on a moderate computation, at least 150 amendments. The consequence is that, although experienced tutors steer their way through all these mazes with tolerable confidence, mistakes are constantly occurring, and no one could pretend to give a clear exposition of the examination code as a whole. * * *

It is now time for us to consider the influence actually exercised by Oxford in 1898 upon national education. That influence, shared by Cambridge, is far greater than is commonly supposed, and is no more to be measured by the mere number

of its resident members (estimated at 3,000) than the influence of Parliament on national policy is to be measured by the number of Lords and Commoners. Even when the number of students at Oxford and Cambridge was much smaller than at present, Oxford and Cambridge virtually governed the whole course of higher education throughout England. College scholarships, with the prospect of succession to college fellowships, were the most substantial rewards open to aspiring schoolboys; and since these, as well as university degrees and honors, were to be won by proficiency in classics and mathematics alone, classics and mathematics were the staple, if not the exclusive, subject of teaching in public schools and grammar schools. Every school of reputation still professes above all to prepare boys for the universities, however liberally it may provide for the requirements of nonacademical careers, such as the army and civil service. On the other hand the universities, by wisely extending their old narrow curriculum, are rapidly bringing the new studies within the sphere of their control, while by undertaking the office of examining boards on a very large scale, they have strengthened to an extraordinary degree their former hold on secondary education. It had long been the habit of the more eminent public schools and grammar schools to invite the aid of university examiners in awarding exhibitions or testing the results of school work in the higher forms. But the indirect and irregular influence thus exercised by the University of Oxford through irresponsible examiners was as nothing compared with the influence now acquired by means of the inspection and examinations of public schools which it conducts jointly with Cambridge, and the local middle-class examinations which it conducts independently, and of the lectures organized by the delegates for the extension of teaching beyond the limits of the university in a large number of populous centers. To all this must be added the experiment, yet in its infancy, of affiliating not only provincial colleges, but Indian and colonial universities, through a system of privileges and exemptions which facilitate the incorporation of their students; the experiment, also new, of superintending the practical training of teachers, and the generous arrangements made for the academical examination of women, upon which the claim for degrees has been somewhat ungratefully founded. It is not too much to say that by forming this widespread network of educational control, and occupying the center of it, the Universities of Oxford and Cambridge have virtually made themselves arbiters of learning over a very large proportion of schools above the elementary grade, and assumed some of the most important functions exercised by the ministry of education in other countries.

There is another cause of the vast educational power wielded by the University of Oxford in common with that of Cambridge. This is the fact that so many of those destined to guide the educational movements, directly or indirectly, have themselves passed under the discipline and teaching of the older universities. All the head masters of the leading public schools, nearly all the head masters of the metropolitan and provincial grammar schools and high schools, and most of the classical assistant masters in these schools are graduates of Oxford or Cambridge, while the academical element largely preponderates among the masters of private schools and private tutors of the superior class. If a university education is no longer the one avenue of approach to the two learned professions which contribute most powerfully to fix the general standard of culture in society, still the great body of clergymen and of barristers, nearly all the English bishops, and a large majority of the judges are alumni of Oxford or Cambridge. By virtue of their connection with the Established Church these universities are specially responsible for the guidance of national education to an extent which it is hardly possible to exaggerate. It is clergymen there educated who are not only the sole representatives of learning in thousands of country parishes, but chiefly manage the great mass of parochial schools which are not under school boards, and where school

boards have been established are frequently among the most active and influential members of them. The predominance of the older universities in the direction of national education is still more conspicuous in the personnel of the education office itself. The whole indoor staff of that office, consisting of secretaries and examiners, has been recruited from Oxford and Cambridge, the former having a certain preponderance. More than half of the school inspectors for England and Wales are drawn from Oxford, and the rest from Cambridge with the exception of a few who have been promoted from the rank of subinspectors. Not less marked is the prevalence of Oxford and Cambridge graduates on the staff of the civil service commission, which now superintends the examinations for every branch of the public service. All the commissioners, secretaries, and examiners, with rare exceptions, have been selected from one or other of the older universities. It was Oxford and Cambridge men who originated and shaped the open competitions for the civil service of India, and the head masters of the great public schools—all Oxford or Cambridge men—have been consulted at every turn in constructing the scheme of army examinations. It may be added that of the last 11 governor-generals of India 7 have been Oxford men, and if we could follow the same line of inquiry into the whole administrative and political service of the State we should find graduates of our two older universities filling high positions in a ratio out of all proportion to their numbers, even as compared with the wealthier classes of the population. For instance, of the last 9 prime ministers 5 were educated at Oxford and 1 at Cambridge. In the present cabinet 11 ministers out of 19 are Oxford men and 3 Cambridge men; in the last cabinet 7 ministers out of 16 were Oxford men and 6 Cambridge men. The House of Commons perhaps contains less of academical culture than it did in former days, as it contains more of the ability represented by success in business, yet above one-fifth of its present members are known to have been educated at Oxford and above one-eighth at Cambridge, besides many who have graduated in other universities. But perhaps the most potent of all agencies in a country like our own is what is known as the press, with its infinite varieties of daily, weekly, monthly, and quarterly publications. If the secrets of anonymous journalism could be unlocked, if it could be ascertained how largely newspapers, as well as periodical literature, are indebted to Oxford and Cambridge men for their special characteristics and how largely English habits of thought are molded by English newspapers and periodicals, it would furnish a crowning proof of the all-pervading influence exercised by those universities in national life.

Engineering at Cambridge.—A professorship of mechanism and applied mechanics was founded at Cambridge in 1875, and the first holder of the chair, Prof. James Stuart, established workshops, which afterwards became the property of the university. In these practical instruction was given in pattern making, forging, turning, and fitting. About the same time an examination in mechanism and applied science was established as one of the special avenues to the ordinary B. A. degree.

Professor Ewing was appointed to succeed Professor Stuart in 1890, and at once took up the task of forming an engineering laboratory and of organizing a more complete school of applied science. A site was granted by the university; a sum of £5,000 was raised, largely by the efforts of a strong committee of prominent engineers; and this, with an additional £1,000 granted by the university, was applied to adapting and extending the buildings of the old Perse School. At the same time a great impetus was given to the work of the department when the university sanctioned the granting of honor degrees by the establishment of the mechanical science tripos. The new laboratory, which was opened by Lord Kelvin in 1894, though sufficient for the 70 students then in attendance, soon became overcrowded until, during the last few years, a considerable proportion

of the lectures have been delivered in rooms borrowed from other departments. The growth of the department may be seen at a glance at the following table:

Year.	Stu- dents.	Paid in fees.	Year.	Stu- dents.	Paid in fees.
1892.....	39	£546	1897.....	103	£2,338
1893.....	71	1,269	1898.....	112	2,534
1894.....	73	1,541	1899.....	123	2,915
1895.....	84	1,766	1900.....	<i>a</i> 150	-----
1896.....	88	2,043			

a Now in attendance.

The work of the department has been carried on mainly on the lines of the syllabus for the mechanical sciences tripos examination as established in 1893. Regular courses of lectures are given in mathematics, mechanics, principles of mechanism and machine dynamics, strength of materials and theory of structure, heat and heat engines and applied electricity. Instruction is also given in geometrical and mechanical drawing and in graphic statics. In the laboratory there are regular courses in mechanics, elasticity, heat, the testing of steam, gas, and other heat engines, applied electricity, and hydraulics. In the summer term there are lectures and field work in surveying. Practice in the use of tools for wood work and metal work forms a regular part of the course, and at the same time the workshops, in which a considerable staff is employed, constitute a very useful adjunct to the laboratory.

During the past few years research has been taking a more prominent place in the work of the department, and with the larger space and special rooms now available further development in this direction may be looked for. At present a number of research students are at work in the elasticity, the electrical, and the steam laboratories. Evidence of the value of this work may be found in the current volume of the Royal Society's transactions, where two papers, one from Professor Ewing and Mr. Rosenhain, on "The microscopic structure of metals" (the Bakerian lecture), the other by Mr. J. Muir on "The recovery of metals from overstrain," deal with work which has been entirely carried on in the department.

The university grants an annual sum of between £1,200 and £1,300, from which are paid the salaries of the professor and the two university demonstrators (£1,000 in all), part of the wages of the workshop staff, and some other expenses. From the students' fees, which form the main source of revenue, are paid the salaries of four or five assistant demonstrators and lecturers, as well as the greater part of the wages of the workmen and laboratory attendants.

Many valuable gifts of apparatus have been made to the department during the past six years and many pieces of heavy machinery have been supplied by engineering firms on specially favorable terms. A high-speed compound combined engine and dynamo set, on which regular tests are made, was presented by Messrs. Mather & Platt in 1894. Recently a coupled set of two dynamos, arranged for the Hopkinson test, has been given by Messrs. Siemens Bros. & Co., and a gas engine of about 10 horsepower by the Forward Engineering Company, of Birmingham. A very valuable microscope, specially designed for the microscopic study of metals, was lately presented by Mr. Thomas Andrews, F. R. S. Among other recent additions are a 5-ton testing machine by Messrs. Buckton & Co., presented by past and present pupils, and a set, comprising turbine, motor, and pump, supplied by Messrs. Mather & Platt. Toward the further equipment of the laboratory a sum of £1,200 has recently been subscribed, and there is now on order from Messrs. Rabey & Co. a compound horizontal engine of about 50 horsepower, specially arranged for testing purposes. This will form a very useful addition to the steam laboratory.

There can be no doubt that the engineering department has established for itself, under Professor Ewing, a firm foothold among the scientific schools of the university. At the same time, if it is to take, as it may reasonably aspire to do, a foremost place among British schools of engineering, it must look to provide a wider curriculum. The laboratories necessary for the proper teaching of such subjects as mining, metallurgy, and naval architecture, as well as for keeping abreast of the latest developments of the subjects already represented, can not be founded or maintained without an endowment of an amount far exceeding the sums already so generously contributed.

While it is admitted that the establishment of the department was looked upon by some with misgiving as an encroachment on the more purely academic studies of the university, it is certainly time now, as the vice-chancellor said on Friday last, that the great majority of resident members welcome the establishment of the department and rejoice in its flourishing and successful state; and it is also true that the growth of this cordial recognition is due in no small degree to the support which has been so freely given by the engineering world outside the university. This view of the matter is supported by the Times when it says, in reviewing the inauguration we have just described, that "it is pleasant to see one of our old universities, while remaining faithful to all the traditions of its venerable past, at the same time displaying an intelligent appreciation of the wants of the future and affording to the most modern forms of learning the nurture and support which for many centuries it has afforded to those forms with which alone our forefathers were familiar." (Nature, Feb. 8, 1900, p. 346.)

THE NEW LABORATORIES OF KING'S COLLEGE.

The following account of the new laboratories is quoted from Nature:

"The laboratories are a result of a comprehensive scheme of extension and improvement of the teaching accommodation of the college, resolved upon by the council in the summer of 1899, and now practically completed. The biological, architectural, anatomical, and mechanical departments have all benefited to a considerable extent by the new works, especially the departments first mentioned. The whole south wing of the college has been raised by an additional story, which includes the new geological, comparative anatomy, and botanical departments, while the second story of the north wing, comprising the physiological and bacteriological departments, has been largely reconstructed, as has also the very fine room on the first floor now allotted to the architectural department. The reconstruction of the anatomical department and medical museum is also approximately complete; equipment is at present in progress.

The department of physiology comprises (1) a spacious central laboratory, seating over 100 students; the work tables are suited either for microscope work or for practical work in chemical physiology. There are in addition sixteen separate tables, provided with shafting and all the necessary electrical apparatus for the study of experimental physiology, a branch of the science which is becoming every year of greater importance; (2) a large room for investigations in chemical physiology; (3) a spacious and well-fitted room for experimental physiology; (4) a dark room for photographic and galvanometer work; (5) a private work room for the professor. These, with the necessary storerooms and accommodations for the laboratory attendants, make up a very complete suite of rooms.

In the anatomical department the dissecting room has been nearly doubled in size, and all the accessory rooms necessary in a well-equipped anatomical department are now provided. The section of the college museum which relates to pathology will also be housed in part of the old physiological rooms in the basement, and a new room has been built for the anatomical portion of the museum.

The department of bacteriology contains a practical class room devoted to the

technical education of post-graduate and other students from all parts of the world. Every student with his own hands goes through the whole practical course, and is further assisted by lectures and practical demonstrations. Several students have been especially trained with a view to investigating plague, cholera, yellow fever, madura, and other tropical diseases, as well as the diseases of farm stock which are prevalent in our colonies and in foreign countries. In the technical laboratory research work has been undertaken for the board of agriculture and for colonial governments, while a number of workers have published researches on various bacteriological subjects. The new research room and library is used by advanced students and by the professor. A new feature is the bacteriological library of about 1,000 volumes and pamphlets, lent by the professor for the use of the bacteriological and physiological departments, and which will accommodate about 200 students.

The general geological laboratory and lecture room will accommodate 50 students. The room is fitted both for lecturing purposes and practical work, gas, water, and the electric light being laid on. In the practical class the engineering students are divided into several sections; one set of students use the petrological microscope, another set make blowpipe and chemical examinations of minerals, a third draw sections from geological maps, while a fourth set examine and draw fossils. The work of each class follows a regular schedule. The geological research laboratory is used by the professor and the more advanced students who wish to do original research. The room is fitted up similarly to the large laboratory and contains a portion of the teaching collection and the nucleus of a library of geological works and reports. The botanical laboratories consist of two rooms; the general laboratory, for elementary work, and the research laboratory, for advanced work and private research. The general laboratory provides table accommodation for 24 students, and is equipped with all the necessary appliances for the practical study of plants, either fresh or dry. The botanical research laboratory provides accommodation for 12 students. In this laboratory provision is made for the practical study of the chief physiological processes of plants and for chemical investigations.

The materia medica and pharmacological collection of specimens used in teaching is contained in the upper part of the corridor, and is open to students for purposes of study. The lectures are given in another part of the building.

The Wheatstone Physical Laboratory is well equipped for delicate balance work, heat and electrical measurement, and the determination of the general physical constants. A new dark room for spectroscopic work has been specially constructed and a room set apart for magnetic work. (Nature, Nov. 8, 1900, p. 48.)

CHAPTER XX.

EDUCATIONAL DIRECTORY.¹

I.—CHIEF STATE SCHOOL OFFICERS.

Name.	Address.	Official designation.
J. W. Abercrombie.....	Montgomery, Ala.....	State superintendent of education.
Sheldon Jackson.....	Sitka, Alaska.....	General agent of education.
Robert L. Long.....	Phoenix, Ariz.....	Superintendent of public instruction.
J. J. Doyne.....	Little Rock, Ark.....	State superintendent of public instruction.
Thomas J. Kirk.....	Sacramento, Cal.....	Do.
Mrs. Helen L. Grenfell.....	Denver, Colo.....	Do.
C. D. Hine.....	New Britain, Conn.....	Secretary of State board of education.
.....	Dover, Del.....	Do.
A. T. Stuart.....	Washington, D. C.....	Superintendent of District schools.
W. N. Sheats.....	Tallahassee, Fla.....	State superintendent of public instruction.
Gustavus R. Glenn.....	Atlanta, Ga.....	State school commissioner.
Miss Permeal French.....	Boise, Idaho.....	State superintendent of public instruction.
Alfred Bayliss.....	Springfield, Ill.....	Do.
John D. Benedict.....	Muscogee, Ind. T.....	Territorial superintendent of schools.
Frank L. Jones.....	Indianapolis, Ind.....	State superintendent of public instruction.
R. C. Barrett.....	Des Moines, Iowa.....	Do.
Frank Nelson.....	Top-ka, Kans.....	Do.
H. V. McChesney.....	Frankfort, Ky.....	Do.
J. V. Calhoun.....	Baton Rouge, La.....	State superintendent of education.
W. W. Stetson.....	Augusta, Me.....	State superintendent of public schools.
E. B. Prettyman.....	Baltimore, Md.....	Secretary of State board of education.
Frank A. Hill.....	Boston, Mass.....	Do.
Delos Fall.....	Lansing, Mich.....	State superintendent of public instruction.
J. W. Olsen.....	St. Paul, Minn.....	Do.
Henry L. Whitfield.....	Jackson, Miss.....	State superintendent of education.
W. T. Carrington.....	Jefferson City, Mo.....	State superintendent of public schools.
W. W. Welch.....	Helena, Mont.....	State superintendent of public instruction.
W. K. Fowler.....	Lincoln, Nebr.....	Do.
Orvis Ring.....	Carson, Nev.....	Do.
Channing Folsom.....	Concord, N. H.....	Do.
Chas. J. Baxter.....	Trenton, N. J.....	Do.
M. C. de Baca.....	Santa Fe, N. Mex.....	Superintendent of public instruction.
Charles R. Skinner.....	Albany, N. Y.....	State superintendent of public instruction.
C. H. Mebane.....	Raleigh, N. C.....	Do.
J. M. Devine.....	Bismarck, N. Dak.....	Do.
Lewis D. Bonebrake.....	Columbus, Ohio.....	State commissioner of common schools.
S. N. Hopkins.....	Guthrie, Okla.....	Superintendent of public instruction.
J. H. Ackerman.....	Salem, Ore.....	State superintendent of public instruction.
Nathan C. Schaeffer.....	Harrisburg, Pa.....	Do.
Thomas B. Stockwell.....	Providence, R. I.....	Commissioner of public schools.
John J. McMahan.....	Columbia, S. C.....	State superintendent of education.
E. E. Collins.....	Pierre, S. Dak.....	State superintendent of public instruction.
M. C. Fitzpatrick.....	Nashville, Tenn.....	Do.
J. S. Kendall.....	Austin, Tex.....	Do.
A. C. Nelson.....	Salt Lake City, Utah.....	Do.
Walter E. Ranger.....	Montpelier, Vt.....	State superintendent of education.
Joseph W. Southall.....	Richmond, Va.....	State superintendent of public instruction.
Frank J. Browne.....	Olympia, Wash.....	Do.
Thos. C. Miller.....	Charleston, W. Va.....	State superintendent of free schools.
L. D. Harvey.....	Madison, Wis.....	State superintendent of public schools.
Thomas T. Tynan.....	Cheyenne, Wyo.....	State superintendent of public instruction.

¹ Corrected to May, 1901, in so far as changes have been reported to the Bureau.

CHAPTER XXI.

TEMPERANCE PHYSIOLOGY.

By MARY H. HUNT, in the *School Physiology Journal*, April, 1901.

* * * Nearly all the States, and Congress for all schools under Federal control, require this branch to be taught and studied by "all pupils in all schools." The reason for this is self-evident. It is the object of this temperance education legislation, which is now national, to insure that the schools shall teach all the future men and women of this country, with other laws of health, the dangerous character and effects of alcoholic drinks and other narcotics, and to provide that such instruction, by beginning before appetite for these substances is formed, shall be in reality preventive.

WHEN AND WHERE THIS STUDY MUST BE PURSUED IN TIME TO SHAPE HABITS.

The latest Report of Dr. W. T. Harris, National Commissioner of Education, states that in 1899 the average time during which children in this country remained in school was not quite five years (4.96). The average in the North Atlantic States was a little less than six and three-quarters years (6.70).¹ If six and three-quarters years is the highest average, then a considerable proportion must get less than six and three-quarters years, for a goodly number of pupils pass up through the grades above the sixth, and some take the entire thirteen years' course. Those who go into the seventh and higher grades would raise the average above six and three-quarters years if a larger proportion of the children did not have less than this number of years in school. Therefore, according to Dr. Harris's figures, if the study is excluded from the lower grades many children will fail to get any instruction in this subject, because they will have dropped out of school before they reach it.

The fact that compulsory-attendance laws in some of the North Atlantic States may insure that a larger number of pupils reach grades higher than Dr. Harris's figures imply would not insure that wrong hygienic habits, including cigarette smoking, cider and beer tipping, may not have been formed before the sixth or seventh years are reached. The task in the case of such pupils would become the difficult, sometimes impossible, one of reformation rather than the hopeful work of prevention through education.

CHILDREN IN THE PRIMARY GRADES.

This instruction is needed in the primary years, even for those who remain longest in school, to guide constantly-forming habits and to create aversion for wrong habits during these most impressible years of child life. "Most of the cigarette smokers in my schools," writes a superintendent, "are in the fourth and fifth years." Faithful instruction through the primary grades and continued in succeeding years might have prevented this state of affairs.

Even in the States with the highest educational ranking some children leave school at the expiration of the third year. If instruction in physiological temperance is excluded from the first three primary years this class will receive no instruction at all on that subject.

Such children are often from homes where there is little either of temperance teaching or of example. Children of the immigrant are often among these. To deprive them of this school instruction is a wrong to them and a menace to the public. We tempt with the open saloon these people who have come to America

¹Page XIV of the Report of the Commissioner of Education, 1898-99. [The writer has overlooked the circumstance that the average time of schooling is given in the Commissioner's Report in years assumed to be of two hundred days each. If the time were stated in years containing the average number of days actually attended (in the case of the whole country about 140), the number of years given in the text would have to be increased in due proportion.—ED.]

as to the land of hope. In addition, to shut off from their children in these primary years the instruction of the school against what the saloon has to sell would be a double wrong which would come back to smite us as these children become a part of this government of the people. To take oral instruction in temperance physiology out of the three primary public-school years, where of course instruction must be oral, is to provide for the perpetuity of a slum class to be the slaves of alcohol, narcotics, and kindred vices, and a consequent peril to society.

THE FOURTH-YEAR PUPIL.

Throughout the country regular text-book instruction in other studies, like arithmetic and geography, ordinarily begins in the fourth year of school life. Why should it not in this study? There are important truths to be learned on this subject which relate to the pupil's physical, mental, and moral development. The fourth-year pupil comes up from the primary with a sense of growth that resents what he terms baby methods. He wants a book, because older pupils have a book for a study that means anything, and he should have a book. He is old enough to take in by the eye gate what he reads in the text, as well as through the ear gate what the teacher says.

Neither he nor the fifth or sixth year pupil is very responsive to mere exhortation. They do not like to be preached at. Truth put into language they can understand, found in their text-books, illustrated by the teacher may be impressed by her with permanent moral effect because they can understand the reason for it. This is a critical year for the child, when careful instruction that respects his consciousness of his own development may save him from temptations which closely beset him at this age. No subject which the school teaches is of more importance to the pupil than that of modern hygiene, including the nature and effects of alcohol and other narcotics, because it touches life, health, and constantly-forming habits. If we were sure that all the children would remain in school up to and during the higher school years, and that before that time they would form no unhygienic habits, including those that relate to alcohol and tobacco; that their minds on these subjects would remain a perfect blank until the time we were ready to give the instruction; that they would possess no inherited tendencies which should be warned against, or be surrounded by no temptations, the question of the time for the introduction of this study would be unimportant. But with life and its environments what they are to-day, to take graded text-book instruction on this topic from pupils of the fourth year is to do them an irreparable wrong.

METHODS ARE LEFT TO THE TEACHER.

A text-book in the hands of the pupil where other branches are thus studied is only one source of information, and does not, as has been claimed, limit the teacher to any special method, inductive, deductive, objective, illustrative, or experimental. She may teach by any method she chooses. The book helps a poor teacher and her pupils, especially in a subject in which she has had no training, as is often the case in this one. The good teacher shows the pupil how to use any book in such a way as to get the best from it. Thorough, systematic study of this branch in grades above the primary calls for text-books in the hands of the pupils.

Keep definite text-book instruction on this subject out of the public schools until some of the pupils have left school, and until many of those who go into the upper grades have a cigarette, cider, or beer-drinking liking already established, and the saloon will have as its allies, to vote for and support it, those who were deprived of this instruction. No one who would save the children from this fate and the State from its consequences, or who believes with Webster that it is "the right and bounden duty of government to provide for the instruction of all youth" on matters essential to personal well-being and to good citizenship, could consent to any neglect of the study in this grade, or to its being left to the haphazard methods of so-called incidental teaching.

THE FIFTH AND SIXTH YEARS.

In these days of child study we have learned that a method that does not take into consideration those moods of the child which are due to his progressive development, and adapt itself to them will fail of the best results. The child is ever looking to the future with an expectant pride in the more advanced things he is to do and learn, and to the year and its lessons just passed with a kind of contempt, as to a period of infantile studies and immaturity. To do as the big boys and girls do, and to study what they study in the higher classes is the attractive goal for children as they emerge from the fourth year.

The simple lessons and book that interested and taught the fourth-year pupil to obey the laws of hygiene he could understand will not hold him another year, if he stays in school, unless these lessons are enlarged and presented in a form adapted to his increased intelligence. Give the child that reaches the fifth and sixth years a larger treatment of the subject, more facts concerning the structure of his body in which he is always interested, and the subject will lose none of its freshness. He can at this age understand more clearly the laws that are written in his own body, laws which must be obeyed to secure a good mental and moral as well as a sound physical development and that success in life which every child craves. Let the appeal come through the intelligence to the reason and moral nature, and the study will not pall on pupils of this age, but will make that warning and restraining impression which truth can be relied upon to make when pressed home in this way. A good text-book, adapted to his development, in the hands of the pupil as one help in his study is an essential in this branch as well as in others.

Three or four lessons a week at most, for ten weeks each year during the fifth and sixth years, will cover so much of the subject as is adapted to these grades. About this amount of matter is ordinarily covered in an elementary text-book on this subject.

If five years are a little more than the average school attendance in this country as a whole, and if six and three-quarters years are a little more than the attendance in the older and more advanced States, to neglect to have this study pursued to the best possible advantage in the fifth and sixth years is to fail to continue the warning instruction when temptations thicken about the child; it is also to relegate the future majorities of our country to that ignorance concerning the laws of health, including the nature and effects of alcoholic drinks, which will give the saloon the right of way in the future as it destroys our people and their Government.

SEVENTH AND EIGHTH YEARS AND THE HIGH SCHOOL.

As these years are reached pupils begin to leave school in large numbers to join the industrial ranks. Compared with those who enter the primary classes, the number who go on through the seventh and eighth years is small. But the more education a man or woman has received, other things being equal, the more influence for good or bad they will subsequently be able to exert; hence a continuance of this progressive study is urgently needed to enable the pupil to resist the luring temptations that press hard upon him during these years, and to equip these comparatively few scholars to go out into life strong in intelligent conviction for a future of abstinence for themselves and for their countrymen from enslaving alcoholic drinks and other narcotics.

Where there are nine years below the high school, pupils who have successfully passed tests or examinations in this study from grade to grade can well drop it in the ninth year, leaving it to be taken up and completed during the first year of the high school, where a full and more technical treatment can be easily mastered.

TOO MUCH TIME OR STUDY IS NOT ASKED.

The impression that this scheme of study asks for too much attention is dispelled when an estimate is made of the time it really calls for.

The maximum of four text-book lessons per week for ten weeks per year, from the beginning of the fourth school year through the first year of the high school, makes only 240 lessons in all, distributed through six years, and these lessons are in the whole subject of physiology and hygiene, with only enough temperance matter to cover that portion of the subject.

But there is too much temperance matter, the critics are saying. In the indorsed manuals of instruction for high schools the physiology and general hygiene occupies all the text except twenty pages, and four-fifths of all the matter in the books for the grades below the high school. Twenty pages in high-school books and one-fifth of the space in manuals for the lower grades, devoted to the nature and effects of alcoholic drinks and narcotics, is barely enough to cover these important facts of the study. Whoever objects to such amount either does not want this subject taught at all, or has given no study to the question of how much truth should be presented to correct popular fallacies and to present such a progressive body of facts from year to year as will make the pupil intelligent on this question.

WHY DIFFUSE THE SUBJECT THROUGH THE WHOLE SCHOOL COURSE.

We have shown that to reach all classes, and thus to preempt all the future men and women of this country for an intelligent sobriety, and to guide them to the for-

mation of right habits before wrong ones get the right of way, this study must not only begin in the primary classes but continue as a progressive branch throughout the grades; that such a scheme takes only a reasonable amount of time in the school course, and that when properly graded it is not a repetition, but the presentation of fresh matter in a progressively developing subject.

TEXT-BOOKS.

"Why are you so insistent upon text-books in the hands of pupils?" is asked. Because, as we have shown, books rightly used as one source of information are essential to the success of any study, especially when teachers have had no special training as to facts to be taught or to methods of teaching these facts. If the diffusion of the truths contained in geography would prevent the formation of an appetite that supports a great moneyed interest, the friends of geography would have to watch insistently lest text-books on geography should be taken out or left out of the schools.

ACTION TAKEN BY THE DEPARTMENT OF SUPERINTENDENCE.

The department of superintendence of the National Educational Association, at its meeting at Chicago in the early part of the year 1901, adopted the following report relating to temperance instruction in the public schools:

"The department of superintendence agrees cordially with the special advocates of the temperance cause in holding that everything which public instruction can do in the battle against intemperance ought to be done, and that both physiology and hygiene should be so taught as to leave in the minds of children and youths an adequate and proper knowledge of the effects of alcoholic drinks, stimulants, and narcotics on the human system.

"Since the last meeting of this department there has been considerable discussion of the question as to whether alcohol under any conditions is properly to be defined as an article of food. Medical authorities are quoted in support of both sides of this question, but no authority has been found to maintain that alcohol is a food in the ordinary sense of that term. The question of the supposed food value of alcohol is a technical one for medical experts to determine, and not one which needs to concern the man and woman who are engaged in the work of public instruction of children and youth. For them it is enough to know that its use as a beverage is injurious and that all authorities agree in deprecating the formation of the drinking habit and in commending all practicable efforts through public instruction to promote the cause of temperance.

"The questions of highest importance for teachers and superintendents of schools to consider are those which relate to the methods by which temperance instruction shall be imparted, the extent to which it shall be carried, and the subject-matter to be presented.

"The educational side of this question is vitally important and demands thorough and systematic study.

"We therefore recommend that a body of educational doctrine be formulated which may guide temperance instruction in the schools throughout the country, and we further recommend that the scope of the investigation be so enlarged as to cover not only the topics already suggested, but also the whole field of personal hygiene, so far as this is a practicable matter for school instruction.

"We also recommend that this investigation be conducted under the direction of the National Council of Education, in accordance with the regulations of the National Educational Association."

schools reporting to this Bureau in 1899-1900. Table 44 shows the number of public and private high schools for boys only, for girls only, and the number of coeducational secondary schools in each State.
