REPORT

OF THE

COMMISSIONER OF EDUCATION

FOR

THE YEAR 1899—1900.

VOLUME 1.

WASHINGTON:
GOVERNMENT PRINTING OFFICE.
1901.

THE UNITED STATES
BUREAU OF EDUCATION,

Created as a Department March 2, 1867.

Made an Office of the Interior Department July 1, 1869.

COMMISSIONERS.

HENRY BARNARD, LL. D.,

March 14, 1867, to March 15, 1870.

JOHN EATON, PH. D., LL. D.,

March 16, 1870, to August 5, 1886.

NATHANIEL H. R. DAWSON, L. H. D.,

August 6, 1886, to September 3, 1889.

WILLIAM T. HARRIS, PH. D., LL. D.,

September 12, 1889, to date.

CONTENTS OF VOLUME 1.

THE COMMISSIONER'S INTRODUCTION.

	Page.
Total enrollment in schools and colleges.....	IX
The common schools.....	IX
Average amount of schooling per inhabitant.....	XVI
System of public education in British India.....	XVII
Truant schools.....	XXI
Education in Porto Rico.....	XXII
Educational extension in the United States.....	XXII
Education in central Europe.....	XXVI
Education in Great Britain.....	XXXI
The language question in Greece.....	XXXVI
Sociology at the Paris Exposition.....	XXXVII
Education in the Philippines, Cuba, Porto Rico, Hawaii, and Samoa.....	XL
Education at the Paris Exposition.....	XLII
Education in France.....	XLIV
Introduction of reindeer into Alaska.....	XLVI
City school systems.....	XLVII
Higher education.....	XLVIII
Increase in the number of law students.....	XLIX
Land grant colleges.....	LIII
Secondary schools.....	LIV
Education of the colored race.....	LVII
Topics of letters of inquiry received during the year 1900.....	LIX

STATISTICS OF STATE COMMON SCHOOL SYSTEMS.....	LXIII
--	-------

CHAPTER I.—SYSTEM OF PUBLIC EDUCATION IN BRITISH INDIA.

Introduction.....	1
Beginnings and general features of the public system of education established in British India.....	5
Educational statistics.....	8
Detailed view of progress in respect to the study of English and the extension of elementary education.....	13
Education in Mysore and Ceylon.....	25
Educational provision for special classes.....	32
Education of backward classes.....	35
Hostels or boarding houses.....	41

CHAPTER II.—THE DEVELOPMENT OF ENGLISH SECONDARY SCHOOLS FOR BOYS.

Introduction.....	45
From the fourteenth to the nineteenth century:	
The founding of the Latin schools.....	46
The original character of the foundation schools.....	52
The further development of the foundations, or so-called "public schools," until the beginning of the nineteenth century.....	55
The private schools.....	64
The century of reform:	
Dr. Thomas Arnold, head master of Rugby, and his influence.....	65
The founding of new schools.....	67
The examination system.....	69
The parliamentary commissions and their results and consequences.....	72
Further development of secondary schools (1870-1894).....	75
The commission of 1894-95 and the education bill of 1895.....	80
Chronological table of the history of English secondary schools for boys.....	82

CHAPTER III.—TRUANT SCHOOLS.

General Statement:	
Historical sketch	85
Present status	91
Equipment and organization	93
Discipline and instruction	94
Results	95
Ungraded schools	96
Truant schools in Massachusetts	97
Comparison of the Massachusetts and Connecticut systems of truancy schools	113
Truant schools in the State of New York	116
Detailed statements as to schools in San Francisco, Cal	120
New Haven, Conn	122
Chicago, Ill	124
Boston, Mass	126
Franklin and Hampshire counties, Massachusetts	135
Essex County Truant School, Lawrence, Mass	135
New Bedford, Mass	136
Middlesex County Truant School, North Chelmsford, Mass	139
Worcester County Truant School, Oakdale, Mass	142
Plummer Farm School, Salem, Mass	144
Springfield, Mass	145
Hampden County Truant School, Springfield, Mass	149
Union Truant School of Norfolk, Bristol, and Plymouth counties, Walpole, Mass	150
The ungraded school at Worcester, Mass	151
Bay City, Mich	153
Detroit, Mich	153
Grand Rapids, Mich	155
Newark, N. J	156
Albany, N. Y	157
Binghamton, N. Y	158
Buffalo, N. Y	159
City of New York, borough of Brooklyn	159
Borough of Manhattan and the Bronx	165
Rochester, N. Y	170
Syracuse, N. Y	180
Cleveland, Ohio	181
Dayton, Ohio, and Allegheny, Pa	185
Philadelphia, Pa	187
Providence, R. I	190
Laws relating to the disposition of truants and incorrigibles:	
Connecticut	193
Illinois	194
Indiana	196
Maine	197
Massachusetts	198
Michigan	201
Minnesota and Montana	203
New Hampshire and New Jersey	204

----------------------------	------

REPORT OF THE COMMISSIONER OF EDUCATION.

DEPARTMENT OF THE INTERIOR,
BUREAU OF EDUCATION,
Washington, D. C., October 1, 1900.

SIR: I have the honor to submit herewith the Annual Report of this Office for the year ending June 30, 1900.

Total enrollment in schools and colleges.—There were enrolled in the schools and colleges, public and private, during the year 1899–1900, 17,020,710 pupils, the same being an increase of 282,348 pupils over the previous year.

Of this number the enrollment in public institutions was 15,443,462.

Besides the enrollment in public and private institutions of all grades included in the above summary there were pupils enrolled in special institutions more or less educational in their character as follows:

Enrollment in special schools, 1899–1900.

City evening schools.....	190,000
Business schools.....	91,549
Schools for defectives.....	25,261
Reform schools.....	23,901
Government Indian schools.....	21,568
Indian schools (Five Civilized Tribes).....	10,499
Schools in Alaska.....	1,753
Orphan asylums and other benevolent institutions.....	15,000
Private kindergartens.....	95,000
Miscellaneous.....	50,000
Total.....	524,531

The item “miscellaneous” in the above table includes such institutions as schools of music, oratory, elocution, cookery, and the various special arts.

Adding the enrollment in these special schools to the enrollment in schools and colleges we have a total of 17,544,888.

THE COMMON SCHOOLS.

Under the designation “common schools” this Office includes public schools of elementary and secondary grades. Schools of elementary grade contain pupils in the first eight years in the course of study. Schools of secondary grade include pupils in the next four years of the course, and the instruction of the secondary grades is

usually conducted in high schools and academies. Other names also are given to schools conducting this grade of instruction, namely, preparatory schools, collegiate institutes, seminaries; State universities and professional schools supported by the State fund are not counted in the "common schools," although by reason of their receiving support from public funds they might be thus classified correctly.

The common schools are divided into two classes—graded and ungraded schools. The schools in the cities and large villages are mostly graded schools, forming one organization, with the pupils divided into classes according to their degree of advancement, each grade of pupils being taught by its own teacher. The ungraded schools are found in all sparsely settled districts of the country. Each teacher has under his control pupils of all ages from 5 or 6 years to 16 or 18 years, and of all degrees of advancement from beginners up to pupils who are pursuing studies that belong properly to the high school or secondary education, such as algebra, geometry, or Latin. In the ungraded school the text-book is the chief instrument of instruction. For the most part each pupil studies his book by himself, making such progress from day to day as he may, and reciting by himself to the teacher, there being no other pupil just at the same grade of advancement with himself. The teacher at some time in the day hears this pupil give an account of his individual work, tests him by a few questions as to the thoroughness with which he has studied, gives him some hasty advice, and assigns a lesson for the next day. It is one of the chief defects of this kind of instruction that the teacher does not have time to probe the pupil's insight into what he has learned from his book; the recitation is apt to show only what the pupil has memorized and not what he has understood. The rural teacher conducting one of these ungraded schools proves his sagacity by the ability he shows in testing the amount of understanding gained by the pupil in his individual work. The poorer the teacher of rural schools the more he requires of verbal memorizing and the less he requires of intellectual insight.

In the graded school, on the other hand, the pupils recite in classes containing from 10 to 30 pupils each, and the recitation is lengthened out to twenty or thirty minutes. In the recitation or class exercises the teacher is able to go over the entire lesson, making each pupil contribute the results of his preparation and testing the insight of his class into the meaning of the words and their grasp of the subject. A pupil may be said to grasp the subject when he is able to marshal the items of his own experience and interpret the statements of fact and principle given him in the book by observations made by himself. The teacher in a graded school, if up to the required standard, devotes most of his attention to the work which the pupils have done in testing and verifying the statements in the book. He instructs his pupils to go behind printed statements, criticise them, and verify them.

Instruction in graded schools is very much superior, on the average, to instruction in the ungraded school. But it must not be forgotten that even in the ungraded school the pupil, if a bright inquiring mind, can learn a great deal from books without the aid of the teacher, and that even a poor teacher has an influence over the pupil to make him more alert and critical than he would be if he studied at home without bringing his daily work under the supervision of a person more mature than himself.

The graded schools in the United States are on the increase constantly. Small villages grow into large villages, and the large villages into cities. The ungraded school, which is a school taught by one teacher, gives way to the graded school taught by two teachers, by three teachers, by several teachers.

In a recent movement, of which record has been made from year to year in the Annual Reports of this Office, an attempt has been made to abolish the small ungraded school and transport the children to the graded school at the nearest village in the town. Inasmuch as the central school in the village can provide for a few more pupils without an additional teacher, the salary or a large fraction of the salary is saved. The transportation of the pupils furnishes a new item of expense, it is true, but this item is not nearly so large as the expense of the salary of a teacher. Hence, in the States that have adopted this transportation system, Massachusetts, New Jersey, New York, Ohio, and several others (see the chapter in this Report entitled "Current questions") find that the transportation system makes a large average annual saving in the expense of the schools, while it increases the efficiency of instruction very greatly.

The average length of the school term the past year was 144.6 days, this being an increase of a day and a half over the school term of the previous year and an increase of $12\frac{1}{2}$ days over the length of the school term for the year 1869-70. The average length of the attendance of the pupils enrolled was 99 days and a fraction.

TABLE I.—Common-school statistics of the United States.

	1869-70.	1879-80.	1889-90.	1894-95.	1895-96.	1896-97.	1897-98.	1898-99.	1899-1900.

^a Including pupils in preparatory or academic departments of higher institutions, public and private, and excluding elementary pupils, who are classed in columns 2 and 3. ^b A classification of public and of private secondary students, according to the character of the institutions in which they are found, is given in Chap. XXXIX, vol. 2.

^c This is made up from the returns of individual high schools to the Bureau, and is somewhat too small, as there are many secondary pupils outside the completely organized high schools whom there are no means of enumerating.

^d Including colleges for women, agricultural and mechanical (land-grant) colleges, and scientific schools. Students in law, theological, and medical departments are excluded, being tabulated in columns 9-11. Students in academic and preparatory departments are also excluded, being tabulated in columns 4 and 5.

^e Mainly State universities and agricultural and mechanical colleges.

^f Including schools of dentistry, pharmacy, and veterinary medicine.

^g Mainly in schools or departments of medicine and law attached to State universities.

^h Nonprofessional pupils in normal schools are included in column 4 and 5. There are, in addition to this number, 28,749 students taking normal courses in universities, colleges, and public and private high schools. (See Chap. XXXVIII, vol. 2.)

AVERAGE AMOUNT OF SCHOOLING PER INHABITANT.

I have found it useful to reduce to figures the average number of years of schooling of 200 days each that each individual of the population is receiving. This can be calculated from the items, entire population, number enrolled, and actual number of days attended. This item is useful as giving in the most compact form the result of the school system; it shows the average result for each individual of the community. We have seen above that the actual average attendance is under 99 days and a fraction. At this rate each individual of the entire population would receive 1,000 days instruction in his school life, or five years of 200 days each. The normal length of the school year is 200 days, and cities and large villages usually adopt a school term of that number of days. In Table III, I have given a comparative view commencing with the first year in which statistics were obtained by this Office, and showing the same item for each decade later, but showing the increase by years for the last nine years. Table III takes into account public and private schools of all grades; Table IV takes into account only the public schools of elementary and secondary grades—that is to say, district schools and high schools.

At the close of the century very many new estimates have been made in one department and another in order to make clear to us a comparison of our present condition with our past condition. Upon a careful estimate, the entire schooling obtained by the average member of the community in 1800 was equal to 82 days; in 1840 and subsequently, the United States census shows the number of

persons who have attended school during the previous years. The total amount of schooling of each of the population at the rate of 1840 was 208 days; for 1850, 420 days; for 1860, 434 days; for 1870, 672 days; for 1880, 792 days; for 1890, 892 days; for 1900, 998 days. This estimate includes instruction in the common schools, and also in private schools and colleges.

STATE SCHOOL SYSTEMS.

Appended to this introduction, Mr. F. E. Upton, the specialist in State school systems and chief of the editorial staff of the Office, has presented in tables numbered 1 to 17, the results of his compilation of the returns made to this Office from year to year by State superintendents of public instruction.

System of public education in British India.—Chapter I passes in brief review the efforts of the British Government to establish systems of education in the several provinces of India. These efforts possess special interest at this time for the reason that the problem of introducing European ideas and systems of training into India has been similar in kind to that which confronts the United States in dealing with the populations of our new possessions. In India, it is true, the problem was on a larger scale and much more complicated than that with which we must deal, because of the enormous population to be reached—300,000,000—and the venerable history and high development of the native civilization.

The English Government assumed the responsibility of education in India in 1854. This was two and a half centuries after the establishment of the English East India Company and a few years before the authority of that company was set aside and the government of India taken over by the Crown.

The earliest government instructions on the subject of education, "the dispatch" of 1854, advised the largest freedom to local initiative and the application of Government funds as supplementary and proportional to local expenditure.

The importance of higher education was emphasized, both in deference to the spirit of the people and as a necessary means of preparing natives to enter to some extent upon administrative and official careers. The need of elementary education was also recognized, and its development by all possible agencies strongly urged. Subsequent instructions have been more and more explicit in respect to elementary education, but all the conditions of the country and all the tendencies of official action in India have favored the development of higher institutions. With regard to the diffusion of elementary education the results are meager and unsatisfactory to the Government.

The statistics given in Chapter I show for 1896-97 a total enrollment in all grades of scholastic institutions of 4,356,870 pupils, or a little

less than 2 per cent of the population.¹ Omitting girls, who form only 9 per cent of the total number of pupils, it appears that out of every 1,000 students 4 were in colleges, 18 in high schools which prepare for the university, 42 in an inferior grade of high schools, 118 in the upper primary schools (which introduce some notions of geography, history, and elementary science), and 818 in the lower primary schools. The relative proportion of pupils in the primary schools of all classes has increased slightly during the last five years—i. e., from 934 in a thousand to 936. The enrollment in primary schools was 3,209,823, or 9 per cent of the population of school-going age, the latter being estimated at 15 per cent of the total population.²

The slow progress of primary education led to the appointment of a Government commission in 1882 to investigate the whole range of educational work as it had developed in the several provinces. A new impulse was undoubtedly imparted to the lower schools as a result of the recommendations of the commission, adopted by the Government. In the two and a half decades from 1882 to 1897 the enrollment in supervised primary schools for boys increased by 31 per cent; further, the proportion of illiterate males, which by the census of 1881 was shown to be 909 in every thousand of the population, had fallen in 1891 to 891 in a thousand. Notwithstanding this slight improvement, the conditions are still unsatisfactory, and one of the first acts of the present administration (Lord Curzon's) was a renewed effort to ascertain the causes of the low state of popular education.

The quinquennial report, 1891-92 to 1896-97, was made the basis of this investigation, which resulted in a general condemnation of the manner in which the local authorities had carried out the instructions of the Government. The complaints were embodied in a "resolution" whose principal points, summarized from current English reviews, are presented in Chapter I. The text of the "resolution" has since been received in this Office and confirms in every particular the view presented.

The three chief points of complaint on the part of the central Government are:

The inadequacy of the inspection staff; the diversion of public funds to the support of higher and secondary education, without due regard to local provision for those grades, and to the neglect of primary education; the failure, first, to give effect to the recommendation of the commission of 1882, which urged that in the upper classes of high schools there should be two divisions, one looking toward the

¹ The statistics are taken from the quinquennial report for 1891-92 to 1896-97, prepared by Mr. J. S. Cotton, M. A., which deals with a population of 233,490,022, about 81 per cent of the whole population.

² By a typographical or clerical error the rate of increase for women in colleges appears in Table I, column 9, as 50 per cent, instead of 93 per cent. The actual increase was from 45 to 87 women students.

entrance examination of the universities, the other of a more practical character, intended to fit youths for commercial or other non-literary pursuits; and the failure, second, to give adequate support and extension to primary education.

For the better understanding of these points it is desirable to bear in mind that the main features of the system of education in India are freedom of local initiative in establishing and maintaining schools, and the application of provincial government funds and provincial supervision to all classes of schools, the amount of aid being determined largely by the results of Government examinations.

In each of the larger provinces there is an education department for the general administration of education, and in the smaller divisions a director. The efficiency of the primary schools depends chiefly upon the inspectors, who are supposed to see that the instructions of the departments and of the directors are actually carried out.

The diversion of public funds to the support of higher education to the neglect of primary education is alleged as one cause of the slow progress of the latter. The total expenditure for education in 1896-97 was 35,244,900 rupees (\$6,837,574), of which amount provincial revenues yielded 27 per cent, local public funds 20.6 per cent, fees 30.1 per cent, and other sources the balance, 22.3 per cent. Only 31 per cent of the total sum named was expended on primary schools. The rate of increase in total expenditure during the quinquennium was 15 per cent. For arts colleges (English) it rose to 16 per cent, but for primary schools it did not rise above the average rate (15 per cent).

The importance of providing for the training of teachers has been constantly urged upon the provincial education authorities, but the commission of 1882 found that only 18 per cent of the teachers in primary schools had received any training, and since that date the provision for this work has increased but slightly.

One of the most important questions that has arisen in the development of education in India under English rule is that of the place to be given to the English language, and to European as contrasted with Oriental studies. The discussions of this subject when the educational system was in its infancy are noticed. It was early determined that it was the duty of the State to spread Western knowledge among its Indian subjects and that the English language should be made the medium of the higher instruction in European literature, philosophy, and science; at the same time equal encouragement was to be given to Oriental institutions.

As regards elementary education it has been the policy of the Government to recognize and foster every local effort in this direction, whether the vernacular or English has been the medium of instruction.

The progress of English instruction in higher institutions during the last decade and the extent to which it prevails in all classes of schools are shown. From the tabulated statistics it appears that in

1896-97 of every 1,000 boys in primary schools 22 were learning English (in 1891-92, 20 in every 1,000); of boys in vernacular secondary schools, 100 in 1,000, and all boys in English secondary schools during some portion of the course. All the students in arts colleges and special schools pursue English, and it is noticeable that while the attendance upon arts colleges steadily increases that of the Oriental colleges declines.

From a somewhat detailed review of the progress of primary schools for boys it appears that in the decade 1870-71 to 1881-82 there was a large increase in the number of pupils, viz, 239 per cent; for each of the five-year periods 1886-87 to 1891-92 and 1891-92 to 1896-97 the increase was only 13 per cent. For the decade 1870-71 to 1881-82 the increase in the number of schools was much greater than in the number of pupils, but there has been a marked change in this respect, coming from the consolidation of small schools, with a resulting increase of efficiency. Schools unaided by public funds are diminishing.

Of all classes of primary schools recognized by the Government the strongest are those managed by local school boards. The statistics show also an increasing proportion of pupils in the two higher divisions of the primary schools, viz, 75.7 per cent in 1891-92, 79.88 in 1896. The efforts in respect to the education of girls have been attended with peculiar difficulties, but the statistics show advance here also. In the ten years from 1886-87 to 1896-97 the number of girls in public institutions increased from 241,568 to 360,006. The ratio of girls in schools to the total of school-going age rose from 1.97 per cent in 1891-92 to 2.34 per cent in 1896-97. It was highest in Burma (5.18 per cent) and lowest in the northwest provinces and Oudh (0.46 per cent).

Above the primary schools of India are the secondary schools and colleges, which are welded into a system quite distinct from the elementary schools through the controlling influences of the five universities. These are examining bodies which, by their matriculation and degree examinations and their power to affiliate colleges, virtually regulate the work of secondary schools and colleges.

An account of the recently constituted Indian University of Research is given. There are given also citations from Mr. Cotton's quinquennial report relative to the special provision for educating native chiefs and noblemen, and the special provision for "backward classes."

The chapter gives brief summaries of education in Mysore and Ceylon, the former showing the effect of English influence upon native States not under English administration, and the latter the comparative ease with which a foreign system can be fostered in the midst of a small, compact population.

From the survey of the work already accomplished in India it is evident that the slow progress is not wholly a sign of neglect or apathy.

Where large place is given to local activity the direct educational results are not so immediate as under the pressure of centralized authority, but they are accompanied by a diffused sense of public responsibility and a general aptitude for directing public affairs, which are important factors in social development.

English secondary schools.—Chapter II gives a brief account of the origin in the fourteenth century, the growth, the influence, and the relation to the public of the great schools of England. The names of some of them—Eton, Rugby, Harrow—are as familiar as household names even in the United States.

These schools were at first intended to be charitable institutions for the benefit of poor scholars, an object which was afterwards lost sight of. As the training ground of the leaders of England their influence has been far beyond anything that can be measured by statistics. As pointed out by the author, the internal organization of the great schools, the rigorous and sometimes cruel treatment of the students by their own political constitution, the character-forming contests which formed part of the life of the school, all were a preparation for careers which have been famous in the camp, in Parliament, and in letters, and in all parts of the world from England to India.

The change in the character of secondary instruction in England from the old exclusively classical system to one related to modern requirements is pointed out in connection with its cause—the demands of commerce and industry. The national conservatism appears in the deliberation with which the change was made.

Truant schools.—Chapter III gives in systematic shape a digest of information relating to truant schools. The evolution of this class of schools is traced at some length and their present status considered. As now viewed, they may be characterized as institutions designed on the one hand to gather apart, reclaim, and educate wayward children inclined to vagrancy and crime, and on the other to relieve the regular schools and teachers of a disturbing element.

The principles upon which these schools should be organized and conducted are not as yet fully agreed upon. A feeling exists that to segregate children from their fellows, thereby making them a class apart, and subject them to institutional influences for a considerable length of time, may be prejudicial to their welfare in certain respects, and result in a greater evil than that which the truant schools themselves were designed to remedy. Moreover, there is a diversity of opinion as to the character and degree of culpability a child should manifest before he is subjected to these special agencies.

It is owing to these considerations mainly that the establishment of truant schools has been proceeded with but slowly and that there is a great difference in the extent to which they are utilized by the communities where they exist. Of the boarding schools solely for truants there are only 13, the 6 county schools in Massachusetts, and 7

city schools, 5 of which are in New York State. These schools have a total average attendance of 690, or about 1 in 1,370 of the whole number of pupils attending school. In Lynn, Mass., this proportion runs up to 1 in 285. Besides the boarding schools there are 29 day truant schools in 13 cities distributed through 8 States. The results of each class of schools, so far as they can be determined, are summed up on pages 95 to 97.

Three representative States—Massachusetts, Connecticut, and New York—are taken up for special consideration and their several systems for repressing truancy derived historically, analyzed, and compared. Then follows a treatment of individual institutions and cities; the text of the laws relating to the disposition of truants in 17 States; and finally an account of reformatory and allied institutions in Great Britain, where, according to the official statements quoted, truant schools have had only a modified degree of success.

Education in Porto Rico.—In Chapter IV General Eaton presents a most interesting picture of the aspect of educational affairs in Porto Rico at the moment of the transfer of its allegiance to the United States, a unique moment in the national life of the island. General Eaton was called to take charge of the education of the island under the Spanish secretary of the interior before the insular government had been fully reorganized by the American military governor. He remained in the island, changing and reorganizing the system of education and encountering all the difficulties of the novel situation, until May, 1900. He was, therefore, the pioneer in the new system of education, and the originator of the changes which were found necessary to remodel the existing school system and bring it more in accordance with the American plan of organization. His observations on the situation as he found it, his study of the intelligence and social condition of the people, their needs in the matter of schools, and the conservative measures he recommended form an important chapter in the history of the island and of the United States as well.

It was a fortunate thing for Porto Rico that a man with vast experience in the matter of organizing schools in a population just emerging from the condition in which war had left them, should have been in charge of the school system.

Educational extension in the United States.—In Chapter V Dr. H. B. Adams gives a survey of the most important educational agencies outside of the formal school and college systems. Of the various instrumentalities and influences that promote popular culture which are passed in review, some are new, while others are old ones appearing under a new aspect or stimulated to renewed activity and a broader field of action through organized effort and the employment of more effective methods.

The beginnings of the agitation for the general diffusion of knowl-

edge, Dr. Adams holds, sprang from that democratic spirit to which the American and French revolutions owed their origin, and which led to the great reform movements in England. The American lyceum, the forerunner of the university extension lectures of to-day, is traced back to the early thirties, antedating by a few years the labors of Horace Mann in Massachusetts. University extension itself is treated at some length, as well as its allied agencies, such as Chautauqua and other summer schools, vacation schools, etc. Public school and "traveling" libraries receive due consideration, as well as art and music for the people, education by travel, the Smithsonian and other governmental institutions, and, finally, newspapers.

The improvement in all the processes which go to making up and printing newspapers and magazines, together with cheap postage, has resulted in their universal diffusion in the United States, rendering them an educational agency of the first magnitude. Their influence on the moral and material life of the nation can hardly be overestimated. Dr. Adams sets forth in some detail the systematic educational work undertaken by the Chicago Record, of which it is said that fully 100,000 people avail themselves.

The same causes have been at work cheapening and multiplying books as well as newspapers, so that it is now possible for a workman at the price of one or two hours' labor to purchase almost any popular standard or classical work, embracing such authors as Carlyle, Ruskin, Macaulay, Scott, Dickens, Thackeray, and the better-known poets. The circumstance that the counters of department stores are well stocked with such books would seem to prove that there is a corresponding number of readers.

All this apparatus of books and newspapers as it now exists is a new phenomenon in the world's history and one capable of exerting a potent influence on civilization.

Historical papers.—Chapter VI is made up of three memorable historical documents relating to education in the South previous to the civil war, which deserve frequent reprint and are worthy of preservation in permanent form: (1) The "Proposed plan for the organization and support of the common schools of Virginia," prepared by Henry Ruffner in 1841 and presented to the State legislature. (2) An address delivered by Henry A. Wise in 1856, on the occasion of his retirement from Congress as Representative of a Virginia district. The burden of this address is, "Tax yourselves to educate your children." (3) Letter of Dr. J. H. Thornwell to Governor Manning, of South Carolina, on public instruction (1853). After treating of higher education the writer makes an elaborate argument in favor of bringing the means of elementary education within the reach of every child in the State.

All of these utterances, so far as they relate to free public schools, are marked by farsighted views, greatly in advance of the state of public

opinion on the subject then existing in Virginia and South Carolina. They illustrate Dr. Mayo's article on the history of the common schools of the South, contained in the following chapter, and are by him edited for this Report.

Common schools in the South, 1830-1860.—In Chapter VII Dr. A. D. Mayo has traced the history of common schools in the Southern States east of the Mississippi River during the thirty years preceding the outbreak of the civil war. The social and economic conditions then prevailing in the South were not such as to favor the growth of the common-school idea, yet here and there certain far-sighted minds were alive to the importance of giving all the children of the State an elementary education at the expense of the State, and they labored zealously to that end. These efforts did not meet with any marked degree of success except in a few circumscribed localities, mostly in the decade preceding the war, where concentration of population and other circumstances made the establishment of public free schools more practicable. Dr. Mayo has collected a large amount of material on the subject, and his treatment of it is marked by a breadth of view and a grasp of the general relations of events which combine to throw light on educational conditions in the South before the war.

In Chapter VIII are reprinted a number of noteworthy papers read at the meeting of the department of superintendence at Chicago in 1900. One, by Dr. Nicholas Murray Butler, has for its subject the "Status of education at the close of the century." The nineteenth century is presented as preeminently the period of individual liberty, though it has come to be realized that the individual alone is nothing, only as a member of a society and a race is he everything. Dr. Butler presents in a striking and suggestive manner the effects upon educational conceptions of the triumph of the doctrine of evolution.

Following this paper is one on "The trail of the city superintendent," by Supt. Aaron Gove, of Denver, who examines the difficulties that confront and the qualifications required of the city superintendent. President Edwin A. Alderman, then of the University of North Carolina, now of Tulane University in New Orleans, treats of the "Obligations and opportunities of scholarship," with special reference to conditions in the Southern States.

Finally, Professor Atwater's address on "Alcohol physiology and superintendence" is reprinted entire. The views contained in this paper as to the functions of alcohol in its relations to the human body, and as to what should be taught on the subject in the schools, have awakened some adverse criticism, but being the conclusions reached by an eminent scientific authority after a course of carefully guarded experiments they would seem to be entitled to careful consideration. Mrs. Mary H. Hunt's discussion of the paper is appended.

Temperance teaching in Europe.—The subject of temperance

instruction is taken up again in Chapter IX. It is always profitable to observe how social and economical problems here pressing for solution are dealt with in other lands, and under conditions far removed from those which obtain in the United States, and to inquire whether in the study of a foreign environment some principles of general application may not be suggested that will assist us in dealing with problems here at home. The system of warfare against intemperance through the medium of the schools, projected by A. Sluys, director of the Brussels (Belgium) Normal School, and given at length in the chapter referred to, exemplifies the different point of view that may be taken by an Old World observer from that so prevalent here. The educational devices he proposes and the recommendations he makes will receive attention.

Collegiate and professional courses.—The average student who pursues full collegiate and professional courses is not ready to enter on the actual practice of a profession until the age of 25 or 26. In view of this circumstance much thought has been expended in considering the best expedients for reducing the undue length of the term of school and college life. Judge Simeon E. Baldwin, professor of constitutional law in Yale University, delivered recently an address upon the subject before a section of the American Bar Association, which is reprinted as Chapter X of this Report, and in which are discussed the various plans that have been proposed for shortening the time necessary for acquiring a complete education.

A defense of high schools.—Chapter XI is a reprint of an essay by H. H. Morgan, for many years the principal of the high school at St. Louis, Mo., on "The justification of the public high school," which originally appeared in the St. Louis school report of 1876-77.

Although the establishment of public high schools is in its full career, there is much interest in the arguments for and against such institutions. The number of public high schools increases with the growth of city populations. In 1890 there were in the whole United States 2,526 high schools, and in 1900 the number had increased to 6,005. In the Southern States there is manifest the same zeal to provide public secondary instruction, and in the same decade the number of high schools (including Missouri with the South Atlantic and South Central States) increased from 343 to 1,358.

Free high schools for rural pupils.—Chapter XII contains an earnest plea for better facilities of secondary education in rural districts. The matter has been prepared by Prof. H. R. Corbett, of the University of Chicago. He gives an account of the replies he received from noted teachers and public men on the subject of free high schools for rural pupils, and presents the results of his painstaking inquiries in a suggestive form. Since he neglects no section of the country the paper is a valuable symposium of public opinion on the question.

Relations of libraries to schools.—The report of the committee of

the National Educational Association on the relation of public libraries to public schools is reprinted in full in Chapter XIII. The report takes the form of a symposium, being made up of a number of papers, each treating a special topic. As a whole, they emphasize the need of recognizing the public library as an integral part of the system of public education, and discuss the best methods of cooperation between librarians and teachers and of systematizing and directing the reading of school children. A number of classified lists of books for pupils, or of books to be read to pupils by teachers, are given. This report is a very timely one, in view of the recent stimulus that has been given to the creation of public libraries through the gifts of Mr. Carnegie and through other influences.

In a later chapter of this Report (Chapter XVII) the statistics of libraries at present existing in the United States are given.

Education in central Europe.—Chapter XIV treats of education in central Europe. It contains, first, a discussion of the relation of popular education to national economic development, translated from the German of Prof. J. Tews in Berlin. The author attempts to show the beneficent influence of a more advanced education of the lower strata of society upon national economic development. Though he refers chiefly to conditions prevailing in Germany, his deductions are applicable elsewhere also. He first shows that civilization is dependent upon diversified industrial pursuits and highly developed skill in labor. In the second section of his essay he shows that industry is dependent upon education, general as well as special. Numerous quotations from standard writers in form of footnotes enhance the value of the dissertation. The subject has been before the German National Teachers' Association for several years, and every speaker on the subject has urged views similar to those here presented by Professor Tews. The burden of all the resolutions passed by the association always has been: Increase and intensify the general elementary education of the people and on this basis build a special industrial, agricultural, or other education, but do not lay the burden of special education upon the shoulders of children before their general elementary education is acquired. Hence he concludes that all specialization in education should begin after the child has completed his fourteenth year of age.

This is followed by a statement from the Unterrichts-Statistik in Rein's Encyclopedia of Pedagogy, in which, after an introduction on the nature and methods of school statistics, a long array of statistical tables is given to show the futility of comparison of heterogeneous elements as presented by various governments. The most interesting part is the author's exhibit of results of education, in which he shows up the methods of presenting illiteracy statistics in the published reports by the various states and countries of Europe.

A comparative exhibit of the American and Prussian expenditures

for education is given on pages 788 to 791. The purchasing value of money is so much greater in Germany that the difference of nearly 50 per cent is not so great as it would appear at first.

A detailed table of the schools of Berlin shows a surprising variety of educational agencies at the German capital. The table reveals the fact that Berlin has 103 secondary schools (52 public and 51 private) and 306 elementary schools (293 public and only 13 private). By comparing the number of students in secondary schools with the number in elementary schools it is found that the percentage of secondary students is $14\frac{1}{2}$ per cent of the total number. This percentage is so unusual that one is interested to inquire into the cause of it, and it is found that these secondary schools include pupils in the elementary school age (6-14); 24,275 of their students were less than 14 years old, 13,245 were over 14. It must be called to mind that as the classical secondary schools in Germany reach on the one hand far into the college courses, so on the other they reach down to the tenth year of age. While the high schools in this country include only pupils in the third course of four years (ninth to twelfth year's work) of the common school (four years primary, four years grammar, and four years high school), the German high school begins independently at ten years of age, and closes its course, according to its character, with the seventeenth, eighteenth, or nineteenth year of the student. If, then, we reduce to American standards the number of secondary students in Berlin, count only those over 14 years, the percentage of the sum total is found to be a trifle over 5 per cent. It is also interesting to notice what great efforts the city makes in aiding the industrial education of its youth.

The fifth section of the chapter gives an account of the expenditures for higher education in the civilized world wherever higher seats of learning exist. These expenditures are grouped so that the per capita expense for each country can be seen. A summary for Europe shows that Switzerland and Great Britain stand at the head, with 21.8 and 21.7 cents, respectively, per capita of the population, while Bulgaria stands at the foot, with 2.3 cents. Montenegro and Turkey report no higher seats of learning.

The claim of children for a free childhood development is the subject of the next section. It deals with the conditions under which wage-earning children are found in Austria and Germany. A table published in 1897 by the imperial statistical bureau at Berlin gave the total number of such children in the Empire as 214,954. This total has been considered erroneous, and a new inquiry instituted by the imperial chancellor, Prince von Hohenlohe, has since revealed the fact that the number of wage-earning children engaged in industrial pursuits only (those engaged in agricultural pursuits were purposely excluded in the new enumeration) was 532,283; hence more than twice the number found in the census of 1895. If to this is added the num-

ber of children earning wages in agricultural and forestry pursuits, to wit, about 200,000, there are upward of three-fourths of a million children between 6 and 14 years engaged in earning wages in Germany. The article quotes a number of teachers and officials who write about the dangers of child labor. While most are of the opinion that a certain very limited number of hours of responsible labor is not only not dangerous to the health of children, but advisable owing to the sense of duty which is thus awakened through regular occupation, all are opposed to the prevailing abuse of child labor, long hours, and unhygienic or immoral environments. The conditions of child labor found in the city of Berlin and in some Thuringian industrial centers are pronounced to be reprehensible.

The seventh section of this chapter contains an order of the minister of education in Prussia concerning medical inspection of schools, based upon experiences made in Wiesbaden. The order is conservative and quite as far removed from the radical measures recommended by some physicians as it is from the old-time indifference to hygienic considerations.

The annual meeting of the German "Naturforscher" (a society similar to the Association for the Advancement of Science in the United States) discussed secondary education and institutions for its promotion during the year 1899 in Dusseldorf. An account of this discussion and a review of the recent literature on the subject is found in this chapter. The burden of all the arguments advanced is that the classic languages must recede from their privileged position and make room for more realistic, that is to say, more scientific, knowledge, and better hygienic considerations must prevail in the preparation of courses of study and programmes of hours of study. Meanwhile the Emperor has decreed that English replace French as an obligatory study in classical high schools. Formerly English was only optional in such schools.

The ninth article in this chapter is a discussion of the German commercial agent. Three contributions, from Prof. J. J. Findlay, in London; Prof. Edward J. Goodwin, in New York, and Prof. W. Weinig, of the commercial college in Bellizona, Switzerland,¹ deal with this subject, each from a different standpoint, agreeing, however, in the premise that the German commercial agent is superior to his colleagues of other nationalities, and giving reasons why he is so. While the first of the three gentlemen lays special stress upon the fact that the German student has a good elementary or general education on which to build a special preparation, the second describes the excellence of German high schools, giving credit to secondary education, and the third shows that specially well-adapted professional education based

¹The statement of Professor Weinig was received by this Office through the courtesy of his excellency the Swiss minister at this capital, Mr. J. Pioda.

on good elementary and secondary education can not fail to have the results so much spoken of in England and other countries, where the German commercial agent has recently become an object of careful study.

This article is followed by statistics of the Swiss school system, which show increase in all educational institutions, from kindergartens to universities, commensurate with the increase in population.

The results of a Swiss governmental inquiry concerning the number of mentally defective or weak children of school age (6 to 14) are given in the eleventh article of this chapter. The total number is 13,155. The article shows what is done with them, and recommends further measures that will prove of interest to American readers who advocate singling out intellectually weak children from those of robust intellect and placing them by themselves under especially well-trained teachers, partly that they may be saved from discouragement and partly to relieve the regular classes of pupils who would retard their progress.

In the twelfth article of this chapter an account is given of German schools in foreign countries. Though few in number as yet, they give evidence of how persistently and consistently the Imperial Government is reaching out beyond the seas to protect its citizens and preserve their nationality. The article is a translation of Prof. J. Roux's paper on "Questions diplomatiques et coloniales."

In article thirteen of this chapter will be found a statement of the number of students in higher institutions of learning in fifteen prominent countries. The tables show, first, that the Teutonic nations—Germany, Austria, Switzerland, Belgium, and the Netherlands—are in the front rank, not only in the number of students in higher institutions, but also in the ratio of increase. Second, that the percentage of increase in students of technical institutions, such as polytechnic institutions, agricultural and mining schools, is everywhere larger during the year 1898-99 than in those of universities and colleges. We note, for instance, that the attendance in universities in Germany increased 6.5 per cent, but that of technical institutions increased 8.2 per cent. In Austria the increase in universities was 4 per cent; in technical institutions it was 7.8 per cent. In Russia the increase in universities was 1.2 per cent; in technical institutions it was 7.7 per cent. Such figures are significant, inasmuch as they indicate that the industries of Europe and America are claiming more thorough and more special preparation than formerly. The commercial interest is making itself felt, but it does not seem that the old ways of classical education required by university study are deserted, for the increase in attendance on the traditional course of study in universities is larger than the ratio of annual increase in the population.

This is followed by a statement of the efforts made by Hungary to promote industrial and commercial education. Significant figures are

given in evidence of a remarkable revival of special education in Hungary. In 1868 the department of commerce spent \$500 for industrial schools, but in 1897 nearly \$250,000. The article sketches minutely the organization, objects, and methods of industrial and commercial schools, most of which were first organized by private initiative.

Corporal punishment in the elementary schools of Prussia is discussed in its relation to the recent orders of Minister Dr. Bosse and Minister Dr. Stadt. It is gratifying to note that the latter, in formulating the new regulations, followed an American usage, which does not prohibit corporal punishment entirely but limits the practice by requiring written reports of each case, and by this means prevents excess.

The last article in this chapter is a translation of an essay of the Baroness von Bülow-Wendhausen, which reviews the tireless work of her aunt, the Baroness von Marenholtz-Bülow, in behalf of kindergartens and the spread of Froebel's ideas. In connection with this a cursory view of the kindergarten systems of all civilized countries is offered, which may prove of especial interest to American followers of Froebel. The article breathes an enthusiasm most refreshing to anyone disappointed in the seemingly slow progress of kindergartens in Germany.

Public playgrounds.—Chapter XV contains an account of public playgrounds in Germany and of a vacation school in Providence, R. I., the latter prepared by Dr. Ellen C. Putnam, who gives a description of what is being done in that city to prevent school children of the slums from lapsing into bad habits through home influence during the long summer vacation. The pathological phase of education seems to demand and receive more attention from year to year all over the civilized world. If we consider the many efforts made in rescuing children in Germany, England, the United States, and elsewhere, one can not help seeing that the people generally are becoming alive to the necessity of preventing crime and degeneracy, rather than punishing or curing it after it has become a fact. We see, for instance, spring up in large numbers special schools for intellectually and morally weak children, reform schools for both sexes, industrial and agricultural continuation schools, vacation playgrounds supervised by expert teachers, and other benevolent efforts, all of which have a pathological as well as an educational purpose. They certainly deserve to be regarded as indications of a higher civilization.

Chapter XVI gives an account of the unique experiment in Boston known as "The Old South work," inaugurated by a noble woman, who desired to promote an intelligent patriotism among the youth of the land. Mrs. Mary Hemenway had a deep feeling of personal gratitude toward the founders of New England and the Fathers of the Republic, and devoted much of her time and of her fortune to the promotion of

patriotic endeavors. One of the chief agencies in the work undertaken at the Old South Church has been a lecture course, continued from year to year, on one or another phase of history. The Old South Meeting House had been saved from destruction by a contribution of \$100,000 made by Mrs. Hemenway toward the fund for its purchase. The preservation of that landmark had a wide influence, resulting in the saving of other historic landmarks in Massachusetts and in other States.

Chapter XVII gives the statistics of public, society, and school libraries. The number of public, society, and school libraries in the United States, of 1,000 volumes and over, is 5,383, according to reports collected by this Bureau in 1900. This shows an increase of 1,357 libraries of 1,000 volumes in less than five years. The number of volumes in the 5,383 libraries was 44,591,851, as compared with 33,051,872 in the 4,026 libraries reported at the beginning of the year 1896, the same being a remarkable increase of 11,539,979 volumes, or almost 35 per cent in the five years.

Of those libraries open to the public 2,734 were entirely free, 2,375 being supported by taxation. The 3,115 reporting their income, in the aggregate received \$7,812,406. In table No. 5 the libraries are classified according to size. Four libraries have upward of 500,000 volumes each; 50 libraries have collections of more than 100,000 and less than 500,000; 283 libraries have each over 25,000 volumes and less than 100,000. Comparative statistics show the following items:

Year.	Libraries.	Volumes.
1875.....	2,039	11,487,778
1885.....	2,938	19,401,159
1891.....	3,503	25,977,643
1896.....	4,026	33,051,872
1900.....	5,383	44,591,851

Table No. 6 shows the endowments reported; 645 report an aggregate of \$25,267,643. In 1896 there were 605 reporting endowment funds aggregating \$17,570,673, the increase being 44 per cent since the last report.

Education in Great Britain.—Chapter XVIII treats of education in Great Britain, and in particular of the English system of elementary education, which has reached an important crisis in its history. This is the establishment of a new central education authority, the “board of education,” in place of the former education department and the department of science and art. To this board are also transferred the educational duties of other government agencies. This consolidation frees the public system of education from the waste and friction of duplicate agencies, which had become a serious obstacle to efficient administration. The scope of the central authority is also

increased by the authority to supervise secondary schools¹ applying for the service, and to recognize a new class of elementary schools termed higher elementary (giving substantially what the high school of the United States gives).

By this provision the board is brought at once into touch with the paramount problem of the hour, namely, the adequate supply of secondary schools—i. e., schools having work in advance of that taken up in the first seven years of school—and their adjustment to the public elementary schools and to the wants of the industrial classes.

Apart from the need of government intervention in respect to secondary education there was a necessity for reorganizing the central authority in the phenomenal, but unequal growth of the system of elementary education established by the law of 1870.

The present and antecedent conditions are set forth in Chapter XVIII by a consideration of the two problems which demand the immediate attention of the new board and by a retrospective statistical review showing, in detail, the growth of the elementary school system since its establishment in 1870.

The first of the two problems in the order followed in the chapter specified, and which precedes also in the order of development the problem of secondary education already referred to, is that of equalizing

¹The term "Secondary school" varies so much in meaning from the same term as used in the United States that I quote from the English report of the Royal Commission on Secondary Education, 1895, Vol. I, p. 41:

"Existing secondary schools.—50. The Schools Enquiry Commission distinguished three grades of secondary schools, according to the age up to which the pupils normally remain at schools. For the first grade the leaving age is 18 or 19; for the second grade, 16 or 17; for the third grade, 14 or 15. In each grade there are schools of different types, according to the time devoted to different subjects. But in every case the grade of the school depends on the head form; and the character of the head form depends on the age up to which the majority of the pupils stay at the school.

"Taking provisionally this classification, which it will be seen in the sequel can not be very rigidly applied, we find that the following kinds of existing secondary schools belong respectively to the first, the second, and the third grade.

"First grade (secondary) schools: (1) First grade endowed schools, including the seven great public schools.

"(2) First grade proprietary schools sending pupils to the universities or university colleges.

"(3) Private schools of the more advanced type.

"Second grade (secondary) schools: (1) Second grade endowed schools.

"(2) Proprietary or private schools which send in pupils for the higher classes of the college of preceptors' examinations, or for the Oxford and Cambridge local examinations.

"(3) Some day schools at technical institutes.

"(4) The highest departments of some higher grade elementary schools.

"Third grade (secondary) schools: (1) Third grade endowed schools.

"(2) Private schools in which the ordinary standard is that of the third-class certificates in the college of preceptors' examinations.

"(3) Higher grade elementary schools."

school provision, especially between the rural districts and the cities. This problem of universal interest has assumed peculiar features in England on account of the dual system of elementary schools—i. e., board and parochial. To understand this it is necessary to pass in review certain statistics brought out in the thirty years' review comprised in the chapter here considered. The statistics show an increase in enrolled pupils from 1,693,059 to 5,672,403, or from 7.6 per cent of the population to 17.8 per cent. The annual appropriations from the public treasury have steadily risen to meet the demands. In 1870 the public grant for schools was £562,600 (\$2,813,055); in 1899 it had reached a total of £8,723,538 (\$43,617,690). (See Tables VII to IX, pp. 1190 to 1192.) How far this increase has been caused by mere growth in the number of the schools and how far by their enlarged resources is suggested by a comparison of per capita expenditures. In twenty years—i. e., 1879 to 1899—the rise in private (“voluntary”) schools was from £1 14s. 6d. (\$8.60) to £2 5s. 1¼d. (\$11.25) per pupil, and in board schools from £2 2s. ¾d. (\$10.50) to £2 15s. 7d. (\$13.89). (See Table VIII, p. 1191.) The greatest factor in this development has been the new agent introduced by the law of 1870, namely, the board schools. These schools, supported in part by local taxes and managed, like our own public schools, by local elected boards, illustrate the democratic impulses from which the school law originated. Beginning at nothing in 1870, they educated in 1899 46 per cent of the enrolled pupils. Private schools, chiefly parochial, which were made a part of the system by the law, have also increased under the fostering care of the Government, but they maintain an unequal struggle against the more progressive public schools. This is indicated by the financial limitations of the parochial as compared with the board schools. Close estimates show that the average income of the parochial schools is 10s. 6d. (\$2.59) less per pupil than that of board schools.

The parochial schools are the chief and often the only school supply in the rural districts of England, and the backward state of rural as compared with urban schools, which has come to be felt as a national evil, is attributed in great part to their need of funds. In particular, their supporters complain of their exclusion from a share in the local taxes. The special grant in their favor allowed by a law of 1897 has not been adequate to their relief, and it has excited much opposition. Among other alleged causes of the inferiority of rural parochial schools are the opposition of farmers and squires to education, the indifference of agricultural laborers, the short school life, the unpractical curriculum, the sectarian monopoly, the too small area of control, and, in general, the absence of popular control.

While the improvement of rural education is largely a matter of local effort, it is expected that the new board will support some comprehensive measures looking to that end. The present state of this

interest is shown in detail by the statements in the chapter from English sources.

The growth of the school-board system has been marked by a gradual development of higher grade elementary schools, corresponding on the whole to the American public high school. They are situated in the great centers of industry and have naturally developed on the scientific and technical sides. They have met a great want, but they complicate the general problem of secondary education by increasing the number of local authorities engaged in the field and by a coordination of secondary and elementary grades, which is regarded with some apprehension by those who advocate a limited and specialized training for the masses.

Recent measures seem to indicate that the Government has been unfavorably affected toward these local developments. The situation with respect to them is made clear by articles from well-known English authorities cited in Chapter XVIII under the head of secondary education. The school boards, it is shown, have immense strength in the great boroughs, and have thus far proved amply able to protect their interests, even against a large conservative majority in Parliament. The struggle which seems imminent between conservative and liberal policies involves a principle of universal interest. A few earnest leaders in education would make this the occasion for laying broad and deep the foundations of a unified system of national education. They emphasize the ideal possibilities of human nature rather than the social and utilitarian purposes which are urged from every side.

The exhibit of education in the United States, transferred from Paris to Manchester at the expense of a local committee, was a timely object lesson in this particular. Its bearing upon the English problems was indicated by Sir John Gorst in a speech quoted in Chapter XVIII. Mr. Gorst defines the two opposing theories of education, the philosophical and the utilitarian, and, while expressing the opinion that there is much to be said for both, observes that "America is entirely in favor of general education."

Among other evidences of the development of public education reviewed in this chapter are the extension of the period of compulsory education, the age for exemption having been raised by recent legislation from 10 to 12 years; the improvement of the teaching force through the increased proportion of adult assistant teachers, and the proportionate decline in the number of pupil teachers; and the increase in salaries and improved provision for the training of teachers. In the last-named particular England is still inferior to many continental countries. The usual term at the normal school is brief—only two years, in which are comprised both academic and professional training, and with the existing provision only one-third the annual demand for new teachers can be met.

During the thirty years since the passing of the elementary school law there has been a gradual extension of the school curriculum. It is this extension which has afforded the chance for the development of the higher grade schools already considered. For a typical example of the English higher grade school see pages 1226 and 1227.

Chapter XVIII contains also a brief account of the measures taken by school boards to control habitual truancy and in cooperation with private agencies to relieve the wants of destitute children.

School dinners are provided in London, Manchester, and other large cities, and in London an organized effort is in progress for securing legal sanction for this relief work as a regular part of the elementary school operations.

The Government has already made general provision for the education of blind and deaf children, and many urban school boards have established special schools for the feeble-minded. Indeed, in respect to many serious social problems the school boards of the larger cities of England are giving valuable lessons to the world.

Under secondary education is given a summary of the work of the science and art department and a brief résumé of conditions in Wales, Scotland, and Ireland. These three divisions of the Kingdom, it appears, have advanced far beyond England in provision for the public supervision of secondary schools. The discussion of this part of the education work is comprised in Part II of the chapter.

The statistics of universities and university colleges presented in Table XVII show, in general, increases of attendance in these higher institutions during the decade 1889-1899. The noticeable decline in the number of students in the Scotch universities is attracting serious attention. It is due in part to the advanced standard of admission and in part to financial inability to provide the equipments required by modern demands. In this respect England is making rapid strides, chiefly through private and municipal activity in the establishment and endowment of local university colleges. The success of the movement for the higher education of women is attested by the very large attendance at all the university colleges and departments to which they are admitted.

The foundation of new universities and the equipment of laboratories and of new departments for research in the old universities are among the important particulars set forth in the record of university life comprised in Part III of Chapter XVIII. In the current movement toward unity of educational ideals and purposes university men are taking an active part.

The consultative committee organized for advisory service to the new board of education comprises representatives of all orders of education, and thus gives tangible expression to the impulses toward a comprehensive national system of education which are working in many minds at the beginning of this new era.

A list of educational periodicals in the United States, classified by States and by subject, is given in Chapter XIX. Chapter XX comprises a directory of State and city superintendents, presidents of universities and colleges, and principals of normal schools.

The study of temperance physiology.—In Chapter XXI is reprinted an argument by Mrs. Mary H. Hunt, who has conducted with eminent ability and success the effort to introduce the study of the evils of alcoholism into the elementary schools, in which she contends that instruction in temperance physiology should be begun when the child first enters school and continued through all the elementary grades in succession, to be finally taken up and completed in the first year of the high school.

The Hopkins Grammar School, New Haven, Conn.—In Chapter XXII Mr. H. K. Willard has detailed some of the circumstances connected with the establishment of this historical institution near the middle of the seventeenth century. The complete list of masters or rectors which he gives contains the names of many widely known educators.

The language question in Greece.—The language of all countries which possess a literature or a lettered class exhibits more or less the phenomenon of "diglossy;" the literary and the colloquial languages differ from each other. Among the Greek-speaking peoples this divergence of spoken and written language is and has been for centuries strongly accentuated. Dr. Daniel Quinn has made a study of the diglossic phases of modern Greek, and their historical derivation from the classic idioms, which appears as Chapter XXIII of the present Report. From this it would appear that the aspects of the modern Greek language are not restricted to a learned and a popular form merely, but various modifications or combinations of these have been devised by Greek writers, each of which has its zealous adherents. The matter needs more thorough investigation in order to come to a clear understanding regarding it. It is stated that some eminent foreign scholars and even educated Greeks have misconceived the relations between the spoken and written languages, the "demotic" and the "katharevousa." The paper of Dr. Quinn is a scholarly contribution to this subject that will be of peculiar value and interest not only to teachers of Greek, but to students of language in general.

Senator Justin S. Morrill.—In Chapter XXIV is given an address by G. W. Atherton, president of the Pennsylvania State College, upon the legislative career of Justin S. Morrill, the author of the acts of 1862 and 1890 endowing that class of institutions now known as the agricultural and mechanical colleges. Dr. Atherton recounts, in brief, the efforts made by Senator Morrill to promote the passage of the acts referred to, showing also the motives which actuated him and the purposes he had in view.

Chapter XXV contains (1) a valuable article by the Hon. Henry L. Dawes on Indian Territory; (2) a report on "Backward children," by the Civic Club of Philadelphia; (3) "Engineering education in the United States in 1900," by Ira O. Baker; (4) a sketch of De La Salle, founder of the Christian Brothers; (5) C. A. Cutter's account of the "Development of public libraries;" (6) the Hugo Grotius celebration at Delft; (7) Professor Woodward's discussion of "When and why pupils leave school;" (8) President Hadley: "How can the future business man be educated;" (9) Dr. W. H. Payne on "Elastic grading;" (10) President Eliot: "The expedition of Cuban teachers to Cambridge, Mass."

Chapter XXVI contains (1) an eloquent and instructive address by Hon. J. L. M. Curry, the agent of the Peabody fund, delivered before the Alabama Polytechnic Institute; (2) sermon at the dedication of Trinity College, in the District of Columbia, by Right Rev. Mgr. Conaty, D. D.; (3) sketch of President William Preston Johnston, late of Tulane University; (4) the inaugural address of President Pritchett, Massachusetts Institute of Technology; (5) sketch of life of Hon. J. B. Stallo, one of the most eminent thinkers on the philosophy of science living in the nineteenth century; (6) plea for the higher education of the negro; (7) the Texas declaration of independence, relating to education.

Consular reports.—Extracts from the Consular Reports to the State Department are inserted in Chapter XXVII of Volume 2. They are of great importance, since they refer (1) to the noted Nobel prizes for scientific discoveries, (2) to commercial education in Scotland and Saxony, (3) progress of education in Liberia, (4) medical degrees in Germany, (5) educational progress in Eastern Siberia, (6) the institute for oriental languages in Vladivostok, (7) commercial education in Saxony, (8) manual training in Germany, (9) the growth of German cities, (10) children's growth at school in Germany, (11) statistics of crime in Germany, etc.

Sociology at the Paris Exposition.—Chapter XXVIII contains a report on sociology at the Paris Exposition of 1900, by Mr. Lester F. Ward. After a brief general treatment, Mr. Ward considers at length the subject from an educational standpoint. At the Congress for Instruction in the Social Sciences, held at the Exposition during the summer, reports were made by specialists, chiefly on the status and progress of instruction in the social sciences in the various countries they represented, in different classes of schools, and in individual institutions. Mr. Ward has given extracts from a considerable number of these reports, selecting those which seemed to him to be of special importance as typical of the rest. The work of the Congress of Social Education is outlined and its scope and objects explained. Various other agencies for education in sociology are noticed. The International Institute of Sociology held a meeting at Paris during

the progress of the Exposition, to which Mr. Ward contributed a paper on social mechanics, with which he concludes his report.

Society makes possible the collection from each individual of the products of his special labor and the transfer to him in exchange of a share in the aggregate products of all mankind.¹

This function of collection and distribution is accomplished by means of the four cardinal human institutions—(1) family, (2) civil community, (3) state, (4) church.

The end and aim of all institutions is to endow the individual with the net results of the activity of his race. It may be said to be the elevation of the individual into the species.

For this each individual must be active and productive—he must produce what is good for his fellow-men; secondly, the products must be collected; and thirdly, redistributed. Hence there must be productive industry, channels of intercommunication, and commerce.

The goods which come as individual products to the world market and are again redistributed are of two kinds—material and spiritual. Food, clothing, and shelter are material and exclusive in their nature; they have to be shared or divided when distributed. But spiritual products do not have to be divided. Each individual may receive the whole. The wisdom of the race is for each individual in its entirety if he will but enter into it by his own labor.

Millions of men live lives full of adventure and experiment, full even of error—full of collision with the laws of the universe. But their life experience is as much for their fellow-men as for themselves. All life is vicarious. The experience of one man goes to all the rest and is summed up in the aggregate of ethical wisdom.

By science each man can vicariously enjoy the sum total of all sense perception and all reflection of mankind. The inventory of the world of matter and of the world of human history is taken by the joint cooperation of scientific observation. The principles that unite facts and events are discovered, and human observation, thus condensed in these principles, is served up to each individual.

The peculiarities of time and place, the habitat, the climate, soil, and productions—each limited and peculiar—by commerce are so neutralized that each place gets its share of the fruits of all places, and is thus emancipated from its local defects.

Productive industry and commerce have as their first object the collection and distribution of material products; but their spiritual purpose is far more wonderful. In exchanging food and clothing, the nations exchange ideas, and in this exchange each gets richer without parting with anything except ignorance.

Society makes possible this miracle. It is a whole which is greater than the sum of its parts. The reenforcement that each gives to the

¹ I make use in this and the following paragraphs of a report written by me in 1886 for the National Social Science Association.

whole is offset by the reenforcement of the whole given to each. Thus by society the individual is infinitely strengthened.

The object of social science is the study of the nature of human combination into institutions. Obviously it may be divided into four departments to correspond to the four cardinal institutions—family, civil society, state, church.

It first may devote itself to the question of nurture, or parental care, and this covers all phases of charitable activity; for although the family is the primary institution for nurture, or for the support of the weak by the strong, yet the family principle has in some degree to be assumed by all the higher institutions.

The principle of the family is nurture, but the principle of our second institution, the civil community, is self-help. By means of the instruments of property and contract it procures for itself through labor a participation in the fruits of nature. Thus the civil community by organization conquers nature and turns it against itself—making nature toil directly for man—making the powers of nature work to protect our bodies from the destruction produced by those powers. Property and contract we call the instruments of this civil combination.

In the state, the third institution of civilization, man attains freedom; for as citizen he gives his life for the existence of the political personality of the nation and by it is reendowed with that personality—his own little self reenforced by the aggregate of all the selves in the nation and thus rendered infinitely strong and firm.

In the fourth spiritual institution, whose function it is to furnish art, religion, and science, each man is illuminated by the light of the whole. He learns and adopts for his own the theory of the world, created by the combined vision of all the highest seers of the race and by the combined experience and observation of all scientific laborers.

Social science has for its legitimate field all these provinces—the entire civilization of man.

It strives to discover how the institutions of society are organically related to one another as productive of human welfare.

As an attempt to classify these departments of social science the following conspectus was offered in 1886 at the American Social Science Association:

1. Theory of property, real and personal.
2. Production and distribution of wealth.
3. Theory of government, national, state, and municipal.
4. Public and private corporations.
5. Punishment and reform of criminals.
6. Prevention of vice (intemperance, prostitution, vagrancy, etc.).
7. Public and private charities (care of the poor, insane, blind, idiotic, deaf-mute, foundlings, orphans, etc.).

8. Sanitation of cities and of private dwellings (water supply, ventilation, drainage, epidemics, etc.).

9. Theory of public elementary education.

10. Higher education (as furnishing the directive power of society).

Under the last two, 9 and 10, which include education, social science looks at the spiritual outcome of society—the results of religion, art, and science as embodying the theoretical view of the world.

Under the eighth it looks after the direct care of the human body—food, clothing, shelter, cleanliness, ventilation, and all matters pertaining to its environment.

Under the seventh it looks after family nurture and the methods of supplementing it by organized charity.

Under the fifth and sixth it looks after the source of the evils that attack society and their remedy, pondering means for the reform and punishment of criminals and searching for the sources of crime in vice and ignorance.

Under the third and fourth it looks after the organization of the state and its delegation of powers and functions to corporations. Under the first and second it investigates civil society by itself—the realm of individual endeavor, and the participation of each in the fruition of all through wealth.

Education in the Philippines, Cuba, Porto Rico, Hawaii, and Samoa (Chapter XXIX).—In his account of education in the Philippines the specialist who has the work in charge of studying and digesting the data received from our insular possessions has included the testimony of competent German and French scientific observers, in addition to that of Spanish authorities resident on the islands, as to the intellectual attainments of the Filipinos and the results of the education which had been afforded them. It appears from the works of the writers referred to that the Filipinos have received considerable European culture from their Spanish masters. The solid evidence to prove this is found in the production of a number of eminent lawyers and statesmen besides scientific and literary men in recent years. The conditions of the country were not favorable to independent thought or intellectual activity, and the virility of the Filipino character is shown by the perseverance that its possessors have manifested in forcing their way into the modern intellectual world in spite of discouragements and repression. Filipino writers have naturally given their attention in recent years to the disturbed political conditions of their country and to plans for its amelioration. Hence their activity in political writing and revolutionary movements. Specimens of political writings as a means of insurrectionary propaganda, especially by freemasons—for freemasonry played a prominent part in the insurrection of 1896—are given, which illustrate the literary and rhetorical skill of the writers.

A brief account is also given of the origin of the municipal and

political organization of the people, together with a short historical sketch of modern events sufficient to make the extracts from the native authors intelligible and explain the modern conditions in the islands and the cause of the revolt of 1896. This introductory and explanatory part, including the specimens of native writings before alluded to, is followed by a statistical and historical account of education at the ancient university of Santo Tomás and in the colleges (or secondary schools) and elementary schools, from which it appears that a number of former institutions like the university were founded some three hundred years ago and have continued until now, giving under the direction of the church such instruction to native boys and girls as was deemed sufficient and appropriate for them. Public elementary schools were required to be established in every village of 500 people under the Spanish law, and the evidence of American army officers shows in numerous instances that they were actually in existence in various islands when the Americans arrived. It also appears that while Spanish was required to be taught in the public schools, the law in that respect was a dead letter and comparatively few Filipinos knew Spanish. The statistics show that 1,186 degrees were granted by the university between 1645 and 1820, and 2,292 between 1800 and 1882. There were said to be over 1,000 students at the university in 1896, while the total attendance at all the colleges of the islands was 8,070, showing a large body of young men who received secondary education. Besides these it appears that there were 1,915 students at the 67 private Latin schools.

Cuba.—In consequence of the disturbed conditions of the island in recent years little activity in education was to be expected in Cuba. The census showed that in 1899 63.9 per cent of the population were unable to read. The Americans took hold of the elementary schools with vigor, and, under the management of Mr. Alexis E. Frye, the numbers increased so rapidly that by March 1, 1900, there were 3,099 schools in operation, with 3,500 teachers, and an enrollment of 130,000 children. In 1899 there had been only 200 schools, with an attendance of 4,000. A comparison of the Spanish with the recent American regulations regarding education, which are incorporated in the chapter, shows that the Spaniards were fully aware of the defective state of the school system. They had prescribed a plan of studies, based on the law of 1865, modified by that of 1880, which was admirable in theory, but was never carried into practice.

Porto Rico.—As soon as the Americans took possession of the island, General Henry, the military governor, recommended a reorganization of the school system, a task which was placed in charge of General Eaton, formerly United States Commissioner of Education. General Eaton's account of the condition of things as he found them and the changes he proposed (given in Chapter IV) affords a clear picture of the backward situation prevailing in the island at the time.

After General Eaton's return to the United States, the work he inaugurated was carried on by his successors, Dr. Victor S. Clark, Maj. George G. Goff, and the present commissioner, Prof. Martin G. Brumbaugh. It appears from an interesting historical sketch of education in Porto Rico, prepared by Señor Enrique C. Hernandez, secretary of the insular board of education, and published in Dr. Clark's report to General Davis, that the Spanish governor in 1865 introduced salutary school reforms, which were extended by General Despujol in 1876. The latter governor sent out inspectors, whose reports showed the unsatisfactory condition of the schools, and in 1880 the organic law was published prescribing the course of study and instituting the reforms shown to be necessary by the inspectors.

In 1898, before the Americans took possession, there were (according to Spanish statistics) 380 public schools for boys and 148 for girls, with an attendance of 18,243. In June, 1899, Dr. Clark reports that there were 212 town schools and 313 country districts with schools, with an attendance of 21,873, leaving 268,630 children without school facilities. In October, 1900, according to the report of Professor Brumbaugh, there were 800 schools, of which 50 per cent were rural schools.

The census showed that 27.1 per cent of the total whites in Porto Rico could read, and 15.6 per cent of the total colored, and that 3 per cent of the whites and 4 per cent of the negroes were in school.

Hawaii.—A report of the minister of public instruction of Hawaii for 1899 shows that of the 15,490 pupils in the schools 5,043 were Hawaiian, 2,721 part Hawaiian, 601 American, 213 British, 337 German, 3,882 Portuguese, 84 Scandinavian, 1,141 Japanese, 1,314 Chinese, 30 South Sea Islanders, and 124 were other foreigners.

Samoa.—An interesting letter from a lady who had observed the system of instruction in the islands gives an account of the state of education there. She remarks that in the whole of American Samoa there is a school population of 1,500, of whom about 800 are receiving a desultory education in the village pastors' schools, and adds: "If only some good philanthropist at home would open three schools—one in each village—and try the experiment of educating the very young, I think it would be found that more could be accomplished toward the enlightenment and advancement of these people than in any other way."

Education at the Paris Exposition.—Chapter XXX comprises a report on education at the Paris Exposition by a member of the international jury on primary education representing the United States (who happens to belong to the office force of the Bureau of Education), together with appended papers from foreign sources relative to the exhibit from this country. The report describes the general appearance of the educational section, which for effective disposition and comprehensiveness surpassed any previous display from this nation,

thanks to the efficient management of the Commissioner-General for the United States and his assistant, Mr. Howard B. Rogers. A detailed description is given of the French exhibit, which, by its system of classification, furnished the standard for the other countries represented. The report considers further the educational import of the exhibits of elementary schools as brought out in the examinations and discussions of the jury. The characteristic features of national systems were very clearly marked by the exhibits, and the results of school instruction shown by pupils' work and by statistical charts afforded the basis for suggestive international comparisons. Among special features which attracted the careful consideration of the jury were the exhibits of agencies for improving the physical and intellectual condition of poor and unfortunate children and the efforts at race education. The latter formed an important part of the French colonial exhibits, and the great interest of the French Government in the subject drew special attention to those portions of our own exhibit dealing with this problem, especially to the education of the colored people.

The report of the jury on primary education, cited from the report of Hon. Ferdinand W. Peck, the Commissioner-General for the United States, treats of the composition of that body and its general methods of procedure. It was composed of specialists thoroughly familiar with the subject-matter and animated by the most candid and judicious spirit.

The appended papers comprise a comprehensive survey of the educational exhibit by Mr. Howard J. Rogers, director of education and social economy for the Commissioner-General of the United States, and appreciative articles on the exhibit of the United States by Dr. G. Compayré, who is well known to American educators, and M. Gustave Lanson. An account is given of the action of the Manchester technical committee in transferring the educational exhibit of the United States to that city, followed by extensive citations from English notices of the collection. The chapter closes with a reprint of the special catalogue of the material prepared by Mr. J. H. Reynolds, director of the Technical School, Manchester.

The visitor at the Exposition, and especially at the international congresses of education held in the month of August, could not fail to be struck with the great power that the French system of education is exercising on the fortunes of the Republic. Seeing is believing in this instance. There is no longer room for doubt that France has reached a condition of stability through the effects of universal education that is developing individuality and independent initiative, not only in the large cities but in the remotest provinces. The increasing facilities for the higher education of women and the large numbers of women who come forward as professional teachers, these indicate an ethical tendency in the instruction of the great middle classes of the

population which insures prosperity and stability to the French nation. It produces the required balance between Paris and the other provinces of France; between the rich and powerful classes and the more numerous poor and dependent classes, by building up a middle class of thinkers and workers who understand and support the national government.

Education in France.—Chapter XXXI treats of education in France, with special reference to the public system under the control of the minister of public instruction, whose province is general, as distinguished from industrial education. According to the latest reports (for the year 1897-98) there were enrolled in infant schools 744,126 children, in primary schools (elementary and higher grade) 5,535,125, or altogether in schools classed by the French system as primary an enrollment of 6,279,251 children, being 16.2 per cent of the population. The annual expenditure for the public schools, which have three-fourths of the total enrollment, has reached the sum of 214,015,250 francs (\$42,803,050), or 46 francs (\$9.20) per capita of enrollment. The State secondary schools (classical lycées and colleges) for boys enrolled 86,321 students, and private schools of the same order 100,865, or a total in secondary schools of 187,186. The public lycées and colleges for girls established in 1880 increased from the small number of 300 students in 1881 to a total in 1899 of 11,994. The public universities had 28,254 registered students in January, 1899, of which number 817 were women. The private or independent faculties (i. e., independent of State control and support) registered 1,658 students.

The centralized and comprehensive system of public instruction derives its chief support from State appropriations, which for the current year 1901 reached the total of 206,966,483 francs (\$41,393,296). Of this sum 76 per cent (\$31,426,215) was appropriated for primary education. The public primary schools, which are free schools, derive their additional income, about 33 per cent of the total, from communal appropriations.

Secondary schools and universities draw additional support from fees, gifts, and municipal funds. In its lavish endowment of public education the Republic has sought to realize the high ideal of a State sustained by intelligent public opinion, and enriched by the skill, aptitudes, and talents of a contented and industrious people, and at the same time it has sought to maintain and advance the prestige of France as a leader among the nations in art and science.

The educational service is regarded like the army, as essential to the preservation of the Republic, and for this reason the Government views with alarm every indication that other influences than those in accord with its own ideals are gaining ascendancy over youthful minds, or that the public system of education is failing in its purposes. This solicitude is shown by the immense impetus recently given to the

movement for adult education, or the continuance of popular education beyond the brief school period, and by the renewed interest in measures for increasing the regularity of school attendance and for strengthening the higher grade primary schools. These were the chief matters considered in the congress of primary education held in connection with the Paris Exposition, as set forth in the report of the congress included in Chapter XXXI.

It is particularly in respect to secondary education that the Government solicitude is at present exercised. Signs of a slight but significant movement of students from the State secondaries to those maintained by religious orders have been watched with ever-increasing apprehension during the last decade. Whereas in 1887, as shown by statistics presented, the State schools enrolled 56 per cent of all boys in secondary studies, in 1898 the State schools enrolled only 45 per cent, the total enrollment in all institutions of the religious orders having risen during the period from 160,161 to 185,267 students. The province of the French secondary schools is liberal education, considered as a means both of discipline and development. The purpose of the Government in fostering schools of this high order is to secure for the service of the State men of influence and authority, who are in sympathy with its policies and able to guide its destinies. To increase attendance on State schools, a law against the religious associations was introduced into the Chambers at the close of the year, and carried through the Chamber of Deputies after a stormy debate in which the principle of liberty of instruction was eloquently defended by the Count Albert de Mun.

Still further to accomplish this object a new measure for reforming the State secondaries was submitted by the minister of public instruction to the superior council. These two measures are the matters of supreme interest in the year's record of education in France.

In the French system the secondary classical schools (lycées and colleges) are closely coordinated with the highly specialized universities.

Chapter XXXI gives a brief résumé of the recent measures culminating in the law of 1896, which has transformed the faculties of the Imperial or Napoleonic system into organic and autonomous bodies. The inspiring effects of this measure are particularly shown in the increased attendance upon the faculties of letters and of science, viz, from 3,684 students in 1888 to 6,557 in 1899, and in local efforts for the enrichment of the reorganized universities.

Education in Alaska (Chapter XXXII).—During the year the increasing interest of adult natives in the educational work in Alaska has been especially noticeable. This is manifested by the requests which have come from several places for the establishment of night schools for adults. At Wood Island and Gravina it has been possible to comply with such requests and the results have been gratifying.

At Gravina, Saxman, and Fort Wrangel native Alaskans are efficient members of the local school committees, which aid this Bureau in the management of the schools. Extracts from the written reports of the teachers give some insight into the condition and surroundings of the schools of that arctic region. Dr. Jackson, the United States general agent for education in Alaska, has been able to obtain reports of the educational work of most of the missionary stations of Alaska which will throw additional light on the character of the people and the effect of school and church upon their welfare.

Introduction of reindeer into Alaska (Chapter XXXIII).—In October, 1900, there were in Alaska 3,323 domestic reindeer distributed among the following stations: Point Barrow, Point Hope, Cape Prince of Wales, Teller, Cape Douglas, St. Lawrence Island, Golofnin Bay, and Eaton.

Since the beginning of the introduction of domestic reindeer into Alaska, it has been steadily kept in mind that the reindeer would be of great service in the rapid transportation of mail in winter over the frozen surface of arctic and subarctic Alaska between the widely separated mission stations and isolated mining camps of that region. During the summer of 1899 the gold mines in the neighborhood of Cape Nome (a little more than 100 miles south of Bering Straits) proved so rich that a large population was attracted to that region. In order to furnish the miners with a mail service during the winter the Post-Office Department entered into a contract with Mr. William A. Kjellmann, the superintendent of the reindeer station, for the carrying of mail semimonthly during the winter (1899-1900) between Nome and Eaton Station, 60 miles northeast of St. Michael, and a bimonthly mail from St. Michael to Golofnin and Kotzebue. Both routes have been in successful operation, the reindeer having sometimes made the round trip of 480 miles on the Nome route in twelve days, including stops. For the winter of 1900-1901 the Post-Office Department has made a contract with Dr. F. H. Gambell, Mr. Kjellmann's successor, for the carrying of mail from Eaton to Kotzebue Sound, a distance of 400 miles each way.

The influx of population into the Golofnin Bay mining region requiring the presence of United States troops in order to preserve the peace, Capt. E. S. Walker, in command of the detachment at Fort St. Michael, in January, 1899, applied to the superintendent of Eaton reindeer station for transportation. In compliance with his request Lapps, reindeer, and sleds were sent from Eaton to St. Michael and transported troops, with their tents, rations, and camp equipage, from St. Michael to Golofnin Bay. When there was no longer any need for their presence at Golofnin Bay, the Lapps and reindeer returned the soldiers to St. Michael without accident or difficulty.

In order to further demonstrate the possibilities of reindeer trans-

portation, and as an act of humanity and relief to the crowd of miners that had flocked into the Cape Nome region and were short of provisions, the reindeer station transported a limited amount of food from St. Michael to Nome.

The gradual furnishing of a permanent supply for the Alaskan natives has not been lost sight of in the other phases of the development of the reindeer enterprise. Pursuing the policy of distribution which was adopted at the outset, 1,159 reindeer are now the personal property of 19 Eskimos, who have learned the management of reindeer by five years' apprenticeship at the Government reindeer stations.

It is reported by the herdsmen that the fawns born in Alaska excel those born in Lapland and Asia as to size and strength.

City school systems (Chapter XXXIV).—The list of city school systems in cities claiming populations of over 8,000, as published in the Report of 1898-99, numbered 632. The present list, prepared from the bulletins of the Twelfth Census, numbers 568. This change in the list, a loss of 64 from the number tabulated in 1898-99, brings the increase for this year over the preceding far below the normal increase, and in the case of the North Central Division, which by the revision of the list is reduced from 244 to 201 city systems, causes in nearly every item an actual decrease from the figures of 1898-99.

The total enrollment in the city school systems of the United States shows an increase of 29,094. This excess would of course be much larger if the enrollments of all the towns included last year had been retained. To give an idea of the changes made in our list of cities of over 8,000 inhabitants by the new census, I give a list of the cities of Nebraska according to last year's table:

Cities.	Population.	
	By census of 1890.	By census of 1900.
Beatrice.....	13,836	7,875
Fremont.....	6,747	7,241
Grand Island.....	7,536	7,554
Hastings.....	13,584	7,188
Kearney.....	8,074	5,634
Lincoln.....	55,154	40,169
Nebraska City.....	11,641	7,380
Omaha.....	140,452	102,555
Plattsmouth.....	8,392	4,964
South Omaha.....	8,062	26,001

The increase in private school enrollment is rather less than for several years past. Of the 144 supervising positions added, 106, or nearly three-fourths, were filled by women. Still more marked is the difference in favor of female teachers. The whole number of city teachers in 1898-99 was 82,650, in the list for 1899-1900 the total reached 85,493. Of the 843 new places for teachers only 2 were secured by men. A notable fact disclosed by the tables is the increase in expenditures, even with diminished list of cities. The

expenditure for tuition amounted to \$59,183,566, an increase of \$3,493,779 over the figures for 1898-99. The total expenditure increased from \$93,413,046 in 1898-99 to \$99,457,234 in 1899-1900, a gain of \$6,044,188.

The valuation of the school property at \$322,777,996 raises the value of the school property, per capita, of pupils in average attendance to \$109.53, which is \$2.88 above the highest figure of any previous year.

Higher education (Chapter XXXV).—The total number of undergraduate and resident graduate students in universities and colleges for men and for both sexes, in colleges for women, Division A, and in schools of technology, for the year 1899-1900, is reported as 98,923, an increase of 6,538 students over the number for the preceding year. The number of such students for each year from 1889-90 to 1899-1900 is as follows:

Year.	Universities and colleges for men and for both sexes.		Colleges for women, Division A.	Schools of technology.		Total number.	
	Men.	Women.	Women.	Men.	Women.	Men.	Women.
1889-90.....	38,056	8,075	1,979	6,870	707	44,926	10,761
1890-91.....	40,089	9,439	2,265	6,131	481	46,220	12,185
1891-92.....	45,032	10,890	2,636	6,131	481	51,163	13,507
1892-93.....	46,689	11,489	3,198	8,616	843	55,305	15,530

Increase, per cent.	62.4	153.3	146.2	50.6	103.7	60.6	148.7

These figures show that the rate of increase in women students has been much greater in the past ten years than that of men students, the increase of men students being 60.6 per cent, while that of women students is 148.7 per cent.

The total value of property possessed by institutions for higher education amounts to \$360,594,595, a gain of \$17,706,234 over the amount for the preceding year. Benefactions reported as having been received during the year amount to \$11,995,463. Of this amount \$6,246,676 were received by institutions in the North Atlantic Division; \$642,002 by institutions in the South Atlantic Division; \$587,128 by institutions in the South Central Division; \$3,956,355 by institutions in the North Central Division, and \$563,302 by institutions in the Western Division. This statement shows that the institutions in the South are not as fortunate in the matter of benefactions as the institutions of other sections of the country. New buildings were reported as having been erected during the year by 102 institutions at a cost of \$5,684,663. The total income for the year, excluding benefactions, amounted to \$28,558,463, of which amount the sum of

\$11,171,127, or 39.1 per cent of the total, was derived from tuition and other students' fees, the remainder coming from endowment funds, various appropriations, and miscellaneous sources.

Brief mention of new courses of study or changes in existing courses, so far as reported, is made in this chapter. The changes in the curriculum of Yale University to go into effect in 1901 are given quite fully, and show that all of the work above the freshman year is made wholly elective within certain limits, and that it will be possible hereafter by extraordinary effort and ability to complete the course of study in three years.

In the Report for 1897-98, pages 2441-2445, was given a statement concerning the movement for higher commercial education in the United States. Since that time the establishment of courses in commerce by higher institutions of learning has made considerable progress, and in this chapter the courses of instruction in commerce offered by six institutions are given. In nearly all cases it is stated in the catalogues of the institutions that as this line of work is entirely new the courses of study outlined are merely tentative, subject to such changes as experience and the needs of students shall show to be necessary. The Amos Tuck School of Administration and Finance was established at Dartmouth College, on an endowment of \$300,000 given by Mr. Edward Tuck of the class of 1862. It is essentially a graduate department for the education of young men intending to enter business life.

Professional schools (Chapter XXXVI).—With the exception of theology, the number of students in professional schools continues to increase. In the 96 law schools there was an increase of 642 students, making the whole number for the year 1899-1900, 12,516. The growth in the number of law students is better realized when we consider that it is now one-half larger than the number in theology—12,516 in law, 8,009 in theology. Ten years ago, 1889-90, there were 7,013 in schools of theology and 4,518 in schools of law. Again, the number of law students is now about one-half as large as the number in medicine (12,516 in law and 25,213 in medicine), while ten years ago it was not one-third as large (4,518 and 15,484), and this notwithstanding the fact that the number of medical students has continually increased, the whole number now being 25,213, an increase of 1,435 over the previous year.

In the enrollment for the past year there were 151 women students in law. In the previous year there were 167 women to 11,707 men—about 1 in 70. The increase in the last quarter of a century of all students in law schools has been 343 per cent. In France the number of women studying law has increased in twenty-five years from 6 to 147. In former times it happened that the larger portion of persons under preparation for the practice of law were to be found in lawyers' offices reading law and practicing the drudgery connected with it. In later years it appears from statistics that a much larger number pursue

their preparatory study in regularly established law schools. This accounts in part for the increase of attendance.

But I think that there is another cause for the growth of attendance on law schools. The lawyer of the present day finds the most lucrative field to be that of counsel or expert in some special province of jurisprudence. Business men placed at the head of great interests have to advise constantly with their lawyers, and the enormous growth of business combinations creates a demand for a larger number of experts in law.

There are reasons why the ratio of women law students may be expected to increase in the future.

It has been asked whether the profession of law is not already overstocked. Are there not more lawyers than can make a living at their profession? The answer to this question calls attention to the increase of great business combinations and to the utter necessity of professionally skilled legal advice in every new experiment in trade and transportation. This creates a need for greater specialization and more expert skill on the part of the legal counsel. Here is woman's opportunity. She will not be so much required as lawyer in criminal cases as lawyer in civil cases. She will not be required so much in actual control of civil cases in the courts as in the office giving professional advice in advance, giving advice which will prevent lawsuits, for the business man needs to keep clear of lawsuits, and he needs advice that will enable him to do so. It is not to his purpose to employ a lawyer only to extricate him after he has been so unfortunate as to be brought into court. He would be ruined on that line of procedure. He needs the lawyer to warn him in advance against the danger of trespass on others or of others on him in any given line of business policy. This would seem to be a much more useful function of the profession of law. The lawyer of the future is to find his or her chief function in preventing lawsuits.

One reads now and then in the newspapers of a wealthy man in America, in fact, of some great captain of industry, who had the habit of expressing himself on all occasions as opposed to higher education in colleges and universities. One may call him a very unconscious sort of person, for he does not seem to be able to recognize the product of higher education when he comes in contact with it. Every week and perhaps every day of his life he has had a host of legal advisers in his employ. In one case of this kind it is known that more than 100 lawyers in one State alone were in the employ of his company.

There are multitudes of business managers in this and other countries, each of them handling the interest of vast trusts, defending each the property of his own corporation, who are able to make their action legally safe only by constant recourse to skilled legal advice. When we hear a great business manager sneering at higher education

because he himself has become the head of a great business, and this, too, without a higher education or even a secondary education, it provokes the retort that it is through and by means of higher education that he is able to adopt measures of action and policies of management that are safe from legal attacks. In other words, the captains of industry depend on higher education to keep themselves out of jail, for great business combinations involve collisions of all kinds with other interests, and their managers must adopt legal precautions to avoid civil and criminal liabilities.

Nearly all of the great industries require the services of experts in other provinces of learning as well as in the law, who have been trained, and who can be trained, only in institutions of higher education. Take, for instance, the steel industry, and think of the utilization of the higher studies in chemistry and in optics which have made the Bessemer process possible.

It does not need a long argument to show that higher education means education in directive power and that directive power comes from two elements: First, a knowledge of principles and moving causes; secondly, a knowledge of human nature and an ability to create confidence in one's leadership. These two elements are quite apt to be separate, one person having knowledge of human nature and an ability to create confidence in his fellows without the scholarly knowledge of forces through mathematics and physics, or of the sources of historic development in national ideals, such as one gets through higher education in literature. On the other hand, many persons get a higher education who lack a sympathetic knowledge of humanity at large and have small capacity to interest others in their aims and purposes. But it always happens that the great social leaders, whether educated or uneducated, have to avail themselves of the services of the class who have received higher education. These act as secretaries, superintendents of labor, architects, engineers, professional advisers—especially legal advisers—and as one or another sort of purveyors of the accumulated wisdom of the past.

These reasons for the present and future increase of lawyers may be seen to better advantage by considering the great increase of wealth-producing power in this country and throughout the world. The total annual production of the United States one hundred years ago is estimated at less than 10 cents a day for each man, woman, and child. The introduction of steam during the next fifty years increased the production to about 30 cents a day per inhabitant, and, with the manifold applications of all kinds of motive power and the improvement of machinery, the production has increased in 1900 to about 55 cents a day. This increase means not only creature comforts and even luxuries for the wealthier half of the population and a fair supply of food, clothing, and shelter for the poorer half, but it means, also, that there is more demand for alertness and versatility

of intellect than for mere brute strength and persistency.' Hence, again, this means increased combination of man with man and of each locality with all other localities. Combinations always involve possibilities of collision. The future progress of man in the conquest of nature is beset with pitfalls of litigation and even of war.

To avoid this enormous waste of friction and mutual destruction, it becomes more and more necessary to have a class of experts devoted to the study of laws and customs, for laws and customs contain what has been discovered necessary for self-preservation and the avoidance of waste in life and property. Hence we see that the trend of civilization leads irresistibly to the increased importance of the study of jurisprudence.

This has an obvious bearing on the choice of law as a profession for women.

There is, however, another consideration to be noted, and it is a very important one in the problem of the diversification of employment for woman. The natural characteristic of the feminine temperament is not favorable to the legal consideration of a subject. Sentiment and impulse predominate in her mind rather than a cool and deliberate investigation of the forms of justice which protect society as a whole. An interest in legal studies is less likely to be a feminine than a masculine trait. One would say therefore that the study of law is desirable on the part of many women. It has been often remarked by philosophers in politics that the United States has succeeded in the experiment of self-government because of the services of its lawyers. For lawyers have been found not only in the courts of justice but in the legislative chambers. The lawyer serves his country not only in helping interpret the law in the court, but also in the legislature in making a law that does not contradict itself or subvert the fundamental law of the State.

It will add an element of strength to the mind of woman to acquire the judicial way of looking at human deeds and actions, to acquire what is called "a legal mind." And it will not be at the expense of the high traits of character which are recognized as feminine.

Schools of dentistry, of nurses, etc.—In the 54 schools of dentistry there were 7,928 students, an increase of 574 over the previous year, and in the 53 schools of pharmacy there were 4,042 students.

In the table of schools for training nurses 432 names are given, with 11,164 pupils, and the names of a considerable number of schools have been added to the list since this table was closed. It is true that several of these schools have only a small number of pupils, but in the preparation of the table it was not deemed necessary or advisable to draw a line of demarcation between larger and smaller schools, but rather to give the items that speak for themselves, such as the number of pupils, the capacity of the hospitals with which the schools are connected, etc.

Land-grant colleges (Chapter XXXVII).—These institutions, established under the provisions of an act of Congress approved July 2, 1862, granting lands to the several States for the establishment of colleges of agriculture and the mechanic arts, and further endowed by an act of Congress approved August 30, 1890, are constantly extending their sphere of usefulness. The past few years have witnessed the establishment of short courses of study in agriculture, dairying, mechanic arts, household economy, etc., for the benefit of such persons as can not spare the time to take a regular course. These courses are well patronized, thus showing that they supply a real need. Another line of work in which these institutions are engaged and through which their influence is widely spread is farmers' institute work. A description of the work done in this line during the year is given in this connection.

Three of the land-grant colleges in Southern States (Mississippi, North Carolina, and South Carolina) have recently established courses of study in textile industry, with special reference to the manufacture of cotton goods. These institutions have provided buildings of regular cotton-mill design, equipped with machinery and apparatus for textile work. The establishment of these courses should result in a few years in the graduation of persons well equipped to take charge of the cotton mills being erected throughout the Southern States, which enable these States to sell more and more of the finished product instead of the raw material alone.

The several States and Territories appropriated during the year for the support of the land-grant colleges the sum of \$2,916,837, while the amount received under the two acts of Congress above mentioned was \$1,844,177. The number of institutions has been increased by one through the establishment of the Colored Agricultural and Normal University of Langston, Okla.

Chapter XXXVIII presents the statistics of normal schools. The growth of schools organized expressly for the training of teachers is illustrated in the following table:

	1889-90.			1899-1900.		
	Institu- tions.	Normal students.	Normal graduates.	Institu- tions.	Normal students.	Normal graduates.
Public normal schools	135	26,917	4,413	172	47,421	9,072
Private normal schools.....	43	7,897	824	134	22,172	2,321
Total	278	34,814	5,237	306	69,593	11,393

In addition to the 306 institutions reported above as normal schools for the school year 1899-1900 there were 1,170 other institutions having departments or courses for the training of teachers, and in these schools there were 28,749 normal students. These students were distributed as follows: In public universities and colleges, 2,004; in

private universities and colleges, 7,520; in public high schools, 10,703; in private high schools, 8,522. Thus there was a grand total of 98,342 students pursuing training courses for teachers in institutions of various classes.

A significant fact, made prominent in the chapter dealing with normal schools, is the increase of State appropriations for public normal schools in the past decade. For 1889-90 these schools received from public funds for running expenses \$1,312,419 and for 1899-1900 the aggregate appropriations for the same purpose were \$2,769,003.

Chapter XXXIX gives the statistics of secondary schools and is one of the most interesting collections of data to be found in this Report. The increase in the number of high schools and in the number of students enrolled in them is something phenomenal. It would seem as if the people of all cities and villages had determined to provide high-school accommodations for their children. More than this, there is now a movement to furnish accommodations for all qualified children in county high schools where the population is too sparse and the wealth too small to provide town high schools.

The number of high schools reporting the past year is 6,005, being an increase of 510 over the previous year and of 3,479 in ten years. The number of students has increased correspondingly. An inspection of the following table will show that this increase is noticeable in each of the great census divisions of the country. It is of especial interest to note that in the South Atlantic Division the number of high schools increased from 115 to 449, and in the South Central from 158 to 675, and that the number of students in those two divisions increased from 18,021 to 66,682. In the last ten years the number of students has increased from 202,963 to 519,251. The following table exhibits the details:

Number of public high schools and secondary students and per cent of increase.

	1889-90.		1899-1900.		Per cent of increase—	
	Schools.	Students.	Schools.	Students.	In schools.	In students.
United States	2,526	202,963	6,005	519,251	137.73	155.84
North Atlantic Division	786	77,642	1,448	169,405	84.22	118.19
South Atlantic Division	115	9,203	449	27,013	290.43	193.52
South Central Division	158	8,818	675	39,669	327.22	349.86
North Central Division	1,376	100,646	3,163	254,816	129.87	153.18
Western Division	91	6,654	270	23,348	196.70	335.03

The number of private secondary schools reporting has increased slightly from the previous year, namely, 21 schools. Ten years ago the number was 1,632, and the past year it had arisen to 1,978, being an increase of 21 per cent. The number of students increased in the decade from 94,931 to 110,797, being 16 per cent increase. This increase in private secondary schools has been uniform in the central and

eastern divisions. In the western division there has been a falling off of 18 per cent in the number of schools and of 46 per cent in the number of students, as shown by the following table:

Number of private secondary schools and secondary students and per cent of increase.

	1889-90.		1899-1900.		Per cent of increase—	
	Schools.	Students.	Schools.	Students.	In schools.	In students.
United States.....	1,652	94,931	1,978	110,797	21.20	16.71
North Atlantic Division.....	510	34,238	669	40,776	31.19	19.06
South Atlantic Division.....	362	16,166	400	20,202	10.49	25.03
South Central Division.....	325	15,448	417	22,041	28.30	42.67

Western Division.....	156	11,470	128	6,204	<i>a</i> 17.94	<i>a</i> 45.91

a Decrease.

Besides public high schools and private academies there are 89,193 secondary pupils in the preparatory departments of colleges and normal schools and in manual-training schools. The following table shows the grand total of secondary students:

Summary showing all students receiving secondary instruction in public and private high schools and academies and in preparatory departments of colleges and other institutions.

	1889-90.			1899-1900.			Per cent of increase.		
	Public.	Private.	Total.	Public.	Private.	Total.	Public.	Private.	Total.
United States..	221,522	145,481	367,003	530,425	188,816	719,241	139.45	29.79	95.98

a Decrease.

Of still more interest is the record of studies pursued. Ten years ago this Office began to ask for statistics regarding the studies pursued by students said to be in the secondary course of study. The schedules required will be found filled out in the chapter under consideration. Latin, Greek, and mathematics are the chief items required in preparation for colleges and universities. The two modern languages, French and German, as being necessary to original investigation on the part of students, are more and more required in the conditions for admission to higher institutions, especially to institutions which furnish technical education in engineering, commerce, and the industries.

Physics is an important requirement, inasmuch as it furnishes the

student with a knowledge of the forces which pervade nature and the machinery with which those forces are controlled for the use of man. General history also is necessary for any just survey of civilization. In the public high schools ten years ago there were 70,411 students in Latin. The number had increased to 262,767 in the past year. Greek had increased during the same period from 6,202 to 14,813—a large absolute increase, but really a slight decrease in the ratio of all secondary students. Students in French and German show in each a considerable increase, something over 30 per cent each. The number studying algebra and geometry has always been large, and has sensibly increased during the past ten years. Strange to note, the number in physics has decreased somewhat in its ratio to the entire number. The same will be noted of chemistry. I think that this decrease is due to the attempt to introduce advanced laboratory methods into the high school, a thing by no means advisable, inasmuch as the first studies of nature should be rather of a qualitative nature than exclusively mathematical. Mathematical calculations should begin, but should not be carried far until the student reaches the university. In general history there is a noteworthy increase, namely, from 27 per cent to 38 per cent of the entire number. The following table gives these particulars in detail:

Students in certain studies in public high schools in 1890 and in 1900.

	1889-90.		1899-1900.	
	Students.	Per cent of total.	Students.	Per cent of total.
Latin.....	70,411	34.69	262,767	50.61
Greek.....	6,202	3.05	14,813	2.85
French.....	11,858	5.84	40,395	7.78
German.....	21,338	10.51	74,408	14.33
Algebra.....	92,150	45.40	292,287	56.29
Geometry.....	43,294	21.33	142,235	27.39
Physics.....	46,184	22.21	98,846	19.04
General history.....	55,427	27.31	193,125	38.16

Of equal interest is the number of students in different studies in private high schools and academies, as given below. It is seen that while Latin is now pursued by more than one-half of all the students in public high schools it reaches only 47 per cent in the private high schools. But the relative increase over 1890 in Latin students in the latter class of schools is quite as great as in the former. A much larger ratio of students in Greek is found in private high schools than in the public high schools. So also of the modern languages. But in algebra the public high schools enroll 56 per cent of their students, while private high schools enroll 49 per cent. It will be noticed that the number of students pursuing the study of physics has slightly increased in private high schools in the ten years. General history also enrolls more students, but the increase in this topic has not been

quite so large as in the public high schools. The following table gives the details:

Students in certain studies in private high schools and academies.

	1889-90.		1899-1900.	
	Students.	Per cent of total.	Students.	Per cent of total.
Latin	29,733	31.32	52,089	46.92
Greek	6,667	7.02	10,056	9.77
French	16,174	17.03	25,269	22.83
German	12,870	13.55	20,465	18.47
Algebra	35,247	37.12	51,726	49.40
Geometry	16,487	17.36	26,283	23.72
Physics	17,460	18.39	20,090	18.87
General history	27,482	28.98	40,609	36.11

I give a summary of all secondary students in certain studies in public and private high schools. It is interesting to know that nearly 315,000 students are pursuing the study of Latin outside of colleges and universities, that 25,000 are studying Greek, that nearly 350,000 are studying algebra, and nearly half that number studying geometry; nearly 250,000 are studying the history of the great nations that constitute what is called the civilized world.

Students in certain studies in public and private secondary schools.

	1889-90.		1899-1900.	
	Students.	Per cent of total.	Students.	Per cent of total.
Latin	100,144	33.62	314,856	49.97
Greek	12,869	4.32	24,869	3.95
French	28,032	9.41	65,684	10.43
German	34,208	11.48	94,873	15.06
Algebra	127,397	42.77	347,013	55.08
Geometry	59,781	20.07	168,518	26.75
Physics	63,644	21.36	118,936	18.88
General history	82,909	27.83	298,134	37.80

The total number of students in higher education as reported for the year has been mentioned above as 98,923, the same being an increase in ten years of 43,236. The number of students in secondary work in public and private high schools and preparatory schools for the past year was 719,241, the same being an increase of 332,238 over the number for 1890. This very large increase in secondary students has had its effect on the increase of students in higher education, but we can see that the full effect of this increase has not yet been reached. It is safe to predict that there will be a much larger increase in the number of students in colleges, universities, and schools of technology during the coming decade than in the past decade.

Education of the colored race.—Chapter XLII deals with the statistics of education of the negroes of the 16 former slave States and the District of Columbia. The number of colored children 5 to 18 years of age in the South in 1899-1900 was estimated at 2,991,100, or

32.88 per cent of the total number of all children between those ages in the same States. The number of children enrolled in the colored schools was 1,539,507, or 51.46 per cent of the total number of school age in the colored population. The percentage of enrollment for white children was 68.28. The colored schools showed an average daily attendance of 957,160, or 62.17 per cent of the enrollment, while the white schools had an average daily attendance of 65 per cent of their enrollment. The expenditures for common schools for both races in the South was \$35,594,071 for the year 1899-1900, an increase of \$2,744,179 over the preceding year. The expenditure for the colored schools is estimated at \$7,118,814.

Included in the number enrolled in the public common schools as given above there were 5,232 pupils in 92 public high schools for the negroes—1,540 boys and 3,692 girls. The number of private institutions for the secondary and higher education of the colored race known to this Office is 145. These schools have 1,826 teachers, 22,043 pupils in elementary grades, 13,267 in secondary and 2,386 in collegiate grades, or a total of 37,696 not included in the public common school enrollment. The total income of 123 of the above 145 institutions was \$1,182,365 for the scholastic year 1899-1900.

For comparison between the white and colored enrollment in secondary and higher education, I have added together the enrollment in high schools and secondary schools with the attendance on colleges and universities, not being quite sure of the actual grade of the work done in the colleges and universities. The work done in the secondary schools is reported in such detail in this Office that there can be no doubt of its grade.

In 1880 the population of the entire country had 4,362 persons in each 1,000,000 enrolled in schools of secondary and higher grade, but in that year, 1880, the colored people had only 1,289 pupils out of each 1,000,000 enrolled in secondary and higher education. This means that the general average of the whole country showed three and one-half times as many pupils in schools of secondary and higher education as the general average for the colored people. In 1890 the number of colored persons in high schools and colleges had increased slightly, namely, from 1,289 to 2,061 in each 1,000,000 of the colored population, and in the year 1900 they had reached 2,517 in each 1,000,000. But in the meantime the general average for the United States had increased from 4,362 to 10,743 per 1,000,000. While the number in colored high schools and colleges had increased somewhat faster than the population, it had not kept pace with the general average of the whole country, for it had fallen from 30 per cent to 24 per cent of the average quota. Of all colored pupils only 1 in 100 was engaged in secondary and higher work and that ratio has continued substantially for the past twenty years. If the ratio of colored population in secondary and higher education is to be equal to

the average for the whole country, it must be increased to five times its present average.

CORRESPONDENCE DIVISION OF BUREAU OF EDUCATION.

In the division of correspondence of this Office a record is kept of the topics of the letters written in reply to inquiries. I have thought that a table showing the number of letters on the more important topics would be of interest, and I append the same in a note to this report.

All of which is respectfully submitted.

W. T. HARRIS,
Commissioner of Education.

Topics of letters of inquiry received during the year 1900.

[The numbers indicate the number of letters written in reply.]

Wherever a letter was answered simply by sending out a document it is not entered in this index.

Adolescence, 1.	Blind, International Congress of the, 4.	Clark University, tenth anniversary, 2.
Age, school, 2.	Boer question, 55.	Coeducation, 1.
Ages of employees in Government service, 1.	Books ordered, 7.	Coins, old, 2.
Agricultural college fund, 136.	Botany, 1.	College-bred men, 2.
Agriculture, instruction in, 3.	Boys, punishment of, 1.	Colleges and universities, general matters relating to, 5.
Alabama, education in, 2.	Brussels, Conference of the States of the Union for protection of industrial property, 1.	Colored race, education of the, 11.
Alaska, 105.	Building (for Bureau of Education), care of, 2.	Commercial education, 6.

STATISTICS OF STATE SCHOOL SYSTEMS.

TABLE 1.—The total population, the school population, and the adult male population.

NOTE.—The population of each State, in this table, is given for the same year as its school statistics in the following tables.

The total population for 1900 is given as reported by the United States Census of that year. All other figures are approximate, but very close to the true values.

State or Territory.	Total population in 1900.	The school population.			Percent- age of boys.	Estimated number of male per- sons 21 years and over in 1900.
		Estimated number of children 5 to 18 years of age in 1900.				
		Boys.	Girls.	Total.

a Certain States report their school term in months; these months have been reduced uniformly to days by multiplying by 30.
b In 1897-98.
c Approximately.

d In 1898-99,
e In 1891-92.
f In 1896-97.
g In 1893-94.

Observations on ascertaining the average school term.—The “aggregate number of days’ schooling given” to all pupils (see column 6), which is the same thing as the aggregate number of days attended by all the pupils, has been computed for those States which do not make an explicit report of this item by multiplying the average daily attendance of pupils by the average length of school term in days.

Conversely, the average length of school term (column 5) for the United States as a whole and for each of its geographical divisions has been obtained by dividing the aggregate number of days attended by the average daily attendance.

By this method the school term of each State, in computing the average term for a number of States, is in fact given a weight proportioned to the school attendance of the State, as should be done under a correct interpretation of the expression “Average length of school term.” The result might more properly be called “Average length of attendance,” which is essentially what it is desired to know.

A method which has been in use in some States for finding the average school term of a county, for instance, is to weight the different school terms of the towns or districts the county is composed of by the number of schools in each. In other words, the total number of days (or months) all the schools of a county were kept is divided by the total number of schools to get the average time each one was kept. So, in finding the average term for the State, the school is taken as the unit instead of the pupil. When the schools differ much in size (number of pupils), as they do in all mixed urban and rural systems, varying from some half a dozen to 500 or more pupils each, the average term obtained by this method varies considerably from that obtained by the Bureau’s method. The long terms of the large city schools not being given their proper weight, the resulting average is too small. The same objection applies still more forcibly to weighting the school terms of the different counties or towns by the number of school districts in each.

Another method is to divide the total number of months or days taught by the number of teachers. This is better than the preceding method, as it takes some account of the size of the schools—that is, an eighth-grade school with eight teachers has eight times the weight, in determining the average term, that a district school with one teacher has. This is manifestly as it should be. If every teacher taught the same number of pupils, the result would be the same as by the Bureau’s method. Care must be taken in working by this method to use the number of teachers’ places (or number of teachers necessary to supply the schools) for the divisor; for if a teacher teaches a school or grade part of the term, and is replaced by another for the rest of the term, the two should obviously count as one teacher for the combined period of service. The liability to overlook this distinction in practice, as well as the inequality in the number of pupils to a teacher, makes this method generally objectionable.

Still another and most faulty method is to add together the school terms of the different counties or towns and divide by the number of such counties or towns—i. e., the simple arithmetical mean is taken. An example of this occurs in a school report, where it is stated that 14,193 pupils in one district attended 185 days and 856 pupils in another district attended 160 days, while the average time the whole 15,049 pupils attended is computed at 172½ days, although nearly all (16 out of every 17) attended 185 days. This method, if it can be so called, gives altogether too short an average term, and nothing can be said in defense of it. It is as if, wishing to get the population per square mile of Minnesota and Dakota combined, we said, Minnesota, 9.86; Dakota, 0.92; average number of persons per square mile in the combined territory $(0.92 + 9.86) \div 2 = 5.39$, instead of dividing the total population of the two States by the combined area in square miles.

The “aggregate number of days’ attendance” is a statistical item of the utmost simplicity and of great value, about the meaning of which there can be little or no

difference of opinion. Every teacher's register that records the number of pupils present each day in school, as they all presumably do, contains the data for ascertaining it for that school for the school year by the simple process of addition or summing up.

There are a few States that make no pretense of ascertaining how long their schools were taught, and others that use methods so faulty that they also are totally in the dark in the matter. Yet this is one of the most necessary and fundamental items of information in determining their educational status.

TABLE 8.—(1) Length of school term. (2) The aggregate number of days' schooling given compared with the school population.

Year.	Average length of school term, in days.						Average number of days' schooling given for every child 5 to 18 years of age.

a Approximately.

b State appropriation for colored schools.

c In 1897-98.

d Not reported.

e \$8,182,527 in 1899-1900.

f Includes receipts from bonds sold.

g One-half the income of two years.

h Includes some local funds.

TABLE 13.—The school revenue analyzed.

State or Territory.	Average amount raised per taxpayer (i. e., per adult male).				Total amount raised per taxpayer.	Amount this will provide for each child 5 to 18 years of age.	Amount required from each adult male to provide \$1 for each child 5 to 18 years of age.	Per cent of the whole revenue derived from—			
	From permanent funds and rents.	From State taxes.	From local taxes.	From all other sources.				Permanent funds and rents.	State taxes.	Local taxes.	Other sources.

CHAPTER I.

SYSTEM OF PUBLIC EDUCATION IN BRITISH INDIA.

The British Empire in India comprises a total area of 1,700,000 square miles, of which 750,000 square miles are under native and the remainder under British administration. The population, according to the census of 1891, was 288,350,000, of whom 66,750,000 belonged to the States under native control.

For previous articles on Education in British India, see Commissioner's Report, 1882-83, pp. ccxxvi-viii; 1883-84, pp. ccxxxviii-xlvi; 1892-93, Vol. 1, Chap. VI, pp. 261-278; 1897-98, Vol. 1, Chap. X, pp. 339-354.

TOPICAL OUTLINE.—Introduction: Scope of chapter and salient facts presented.—Public education in British India: Beginnings and general features of the system; control and classification of universities, colleges, and schools; official statistics, current and comparative.—Detailed view of progress in respect to (1) the study of English and (2) the extension of elementary education: Antecedent conditions; English at the arts colleges and in university examinations, and in secondary and primary schools.—Elementary schools: Management and increase of; educational standards in, proposed and attained; the training of teachers; the education of girls.—Influence of the English system upon native States, progress in Mysore.—Influence over small, concentrated populations, as in Ceylon.—Movement of university education as indicated by comparative statistics of university examinations.—Educational provision for special classes: (1) Native chiefs and noblemen; (2) backward classes; (3) hostels or boarding houses for European and for native children.

The purpose of this chapter is to pass in brief review the efforts of the British Government to establish systems of education in the several provinces of India. The efforts of missionary societies in the same direction are not touched upon, save incidentally, for effective and far-reaching in their consequences as these efforts have been, they differ radically in aim and in method from the work of secular and civic education promoted by the Government.

This work is impressive because of the enormous population dealt with—nearly 300,000,000—and the venerable history and high development of the native civilization and culture. The problem of introducing a European system under the conditions existing was also the problem of supplanting old systems deeply interwoven with the religious beliefs and social institutions of a proud people. The English Government assumed the responsibility of education in India in

1854. Its action has necessarily been limited to instructions as to the general policy to be pursued, the practical development being left to the authorities in India. The instructions have followed the traditional policy of England in advising the largest freedom to local initiative, and insisting that Government aid for education should simply supplement and be proportioned to the local expenditure. From the first the importance of higher education was emphasized both in deference to the spirit of the people, and as a necessary means of preparing natives to enter in due proportion upon administrative and official careers.

But the earliest instructions showed also a deep sense of the importance of elementary education and advised its development by all possible agencies; subsequent instructions have been more and more urgent in this respect, and the better to insure the accomplishment of this purpose, an education department was organized at the outset in each of the larger administrations, a director of education appointed in the smaller charges, and a service of school inspection created.

All the conditions of the country and all the tendencies of official action have, however, favored the development of higher education. The four universities, examining bodies whose constitutions were modeled on that of London University, have controlled and unified the work of colleges, and the anticipated advantages of a diploma have proved a powerful incentive to students. The influence has extended to the secondary schools, especially to those which prepare candidates for matriculation. Primary education, on the other hand, has had slow development and has by no means met reasonable expectations. The commission appointed in 1882 to examine into the workings of the system, exposed the shortcomings in this respect and made many recommendations for strengthening and extending this part of the educational provision. The report of the commission gave a new impulse to the work, but still the results are not satisfactory. The purpose of Lord Curzon to reform and strengthen the educational administration is indicated by his demand for detailed reports from the separate provinces and by the resolution adopted by his Government in view of the conditions set forth in the recently published quinquennial report. The resolution is declared to be a sweeping indictment of the local authorities in charge of education. The text of the resolution has not yet been received in this office. The most serious charges it makes, as set forth in current reviews, are as follows:

The inadequacy of the inspection staff; the diversion of public funds to the support of higher and secondary education without due regard to local provision for these grades and to the neglect of primary education; the failure to give effect to the recommendation of the commission of 1882, which urged that in the upper classes of high schools there should be two divisions, one leading to the entrance examina-

tion of the universities, the other of a more practical character, intended to fit youths for commercial or other nonliterary pursuits; and the failure to give adequate support and extension to primary education.

The statistics of primary education are declared to be entirely unsatisfactory. They show that "the percentage of the male population of school-going age attending primary schools is barely 18 (an increase of not quite 4 per cent in ten years). The figures for expenditure indicate disregard of the accepted attitude of the Government toward primary education. The increase in total expenditure has been 15 per cent for the quinquennium; in colleges it has been 14, in secondary schools 16, and in primary schools 15."

The expenditure for education in 1896 was \$6,837,514, or about 3 cents per capita of the population. Local resources contributed 73 per cent of this amount, and of the total only 31.4 per cent went for primary education, while secondary schools absorbed 32 per cent. This meager expenditure—for even on the basis of values in India it is meager—explains, it is urged, in great measure the small results that have been accomplished.

In regard to the education of girls, progress is exceedingly slow. "The proportion of girls in public institutions to girls of school-going age," as stated in the resolution, "was 1.58 (in 100) in 1886-87, 1.80 in 1891-92, and 2.10 in 1896-97."

The provision for training teachers is found to be entirely inadequate, and this is regarded as one of the chief causes of the meager results of primary education. It is also urged that the tendency of the system of examinations seems to favor cramming rather than sound educational work.

It is noticeable that the resolution places the responsibility for the evils complained of upon the local governments. Native papers are not backward in declaring that the supreme government of India is equally at fault in the matter. However this may be, the present government is undoubtedly in earnest in its purpose to accelerate the progress of the work.

In spite of the complaints of weak administration and poor results above noted, it is still of great interest to consider what has been actually achieved by the efforts of the past.

According to the quinquennial report, 1892-93 to 1896-97, there were under instruction in public institutions of all grades in the last-named year 3,788,382, or about 1½ per cent of the population covered by the report (about 81 per cent of the total population of India). Of these pupils a small proportion (360,006) were girls. The enrollment in private institutions, under which head are included all schools that have not accepted the government standards or submitted to public tests, adds to the above total 568,488, making a grand total of 4,356,870

under instruction, or a little less than 2 per cent (1.8) of the population. Estimating the population of school-going age at 15 per cent of the total population the number of male students is 22.29 per cent of the male population of school age¹ and the number of female students 2.34 per cent of the female population of school age,¹ or altogether a school enrollment equivalent to 12.5 per cent of the school population.

The independent private institutions have been stimulated, indirectly at least, by the government, and even the imperfect reports of their work which the departments are able to secure are of some value, but these schools can not be properly included in an estimate of results achieved by British administration, and are not to be here further considered.

The number of girls attending school is so small, and their social conditions so peculiar, that their inclusion in a general survey of education gives a totally false impression of its extent. Confining our attention to boys, we observe that out of every 1,000 under instruction 4 are in college, 18 in high schools which prepare for college, 42 in an inferior grade of high school, 118 in the upper primary schools which introduce some notions of geography, history, and very elementary science, and 818 in the lower primary stages. According to the latest census, that of 1891, for every 1,000 males there were 109 literates, including pupils under instruction, and 891 illiterates, the corresponding numbers for 1881 being 91 and 909.

As to women, the census of 1891 showed only 5 literates in 1,000. There are, however, evidences of progress in respect to the education of girls, especially in Bombay, where it is estimated that 10 women in 1,000 can read. In 1893 a young Indian woman passed with honors the examination for the degree of bachelor of arts at the Calcutta University and 6 have since passed the matriculation.

Gauged by numbers, the education of girls in India seems to have merely begun, but considered in its social and moral bearings this beginning is a matter of great significance. The same may be said of the indications here and there seen that caste lines are yielding as a consequence of the desire for the advantages which the public school offers.

As to the success of the policy pursued in creating a demand for the English language and in assimilating higher education to European standards, the official reports furnish some interesting statistics. Of boys in primary schools 22 in every 1,000 were learning English in 1896-97, and the demand for English increases in schools of this low grade.

Of the boys in secondary schools, 31 per cent (158,753) were in ver-

¹In the corresponding ratios quoted from the "resolution," comparison is made with the whole population of India instead of the 81 per cent covered by the report.

naacular secondary schools and above two-thirds (339,834) in English secondaries.

In the vernacular secondaries 100 in 1,000 were studying English as against 70 in 1,000 five years ago. Practically all boys in the English secondary schools study English, although it is not obligatory in every class. In the year named 87½ per cent were taking English as against 85½ per cent five years earlier. All the students in arts collèges and special schools pursue English, and it is noticeable that while the attendance upon arts colleges steadily increases that of the oriental colleges declines.

The results that can not be reduced to statistics are even more important. The era of tentative experiments has passed; a system of education has been established in each province, the whole field has been thoroughly surveyed, and certain principles that give stability and flexibility to a system have been firmly engrafted upon educated native public opinion. Among these are the principles of local initiative, of the cooperation of local and government agencies, of public control and guarantees where public funds are applied. That these principles are gradually permeating the whole of India is shown by the fact that the native states under their hereditary chiefs are voluntarily adopting the system of education established in the British administrations.

The system is educative beyond the mere acquisitions imparted by the schools; a sense of public responsibility and solidarity grows out of local efforts to maintain schools. The slow rate of progress should not be regarded as merely a sign of neglect or of apathy. It is in part the outcome of the policy which gives large place to the free activity of communities.

BEGINNINGS AND GENERAL FEATURES OF THE PUBLIC SYSTEM OF EDUCATION ESTABLISHED IN BRITISH INDIA.

The education of the people of India, as already stated, was definitely accepted by the English Government as a state duty in 1854; prior to this time, however, schools of modern learning had been established by the government, by missionary enterprise, and by corporate or private agencies. In the Bombay presidency an excellent foundation for a public system of education had been laid through the combined efforts of missionaries and private societies. These efforts were first directed to the establishment of independent schools; gradually the need of united action and centralized control was recognized, with the result that a board of education was created, charged especially with the extension and management of elementary education. In Burma the missionary influence had been specially successful in exciting private efforts for the maintenance of schools. The development of the work since 1854

in these two provinces has continued along the lines already well defined before the government assumed the responsibility. In Bombay three-fourths of all pupils are now enrolled in public schools supported by public funds. Burma, on the contrary, is characterized by the large number of native schools, aided and unaided, which, started by private effort, have sought the stimulus of government supervision. The first general instructions with respect to education in India issued by the English Government—the “dispatch” of 1854—announced a general policy of which the principal features were: (1) The constitution of departments for the administration of education; (2) the institution of universities at the presidency towns; (3) the establishment of training schools for teachers for all classes of schools; (4) the maintenance of the existing government colleges and high schools, and the increase of their number when necessary; (5) the establishment of new middle schools; (6) increased attention to vernacular schools, indigenous or other, for elementary education, and (7) the introduction of a system of grants in aid.

All of these purposes have been reaffirmed in subsequent instructions, but with ever-increasing recognition of the fact that the chief concern of the government must be the maintenance of elementary schools. The education department organized in each of the larger provinces has general control of education, and in some cases the management of public schools, although as a rule these are under the immediate control of “district,¹” rural or municipal² boards. The supervision of the department is exercised by means of inspectors, of whom the larger proportion are recruited in England, and the remainder in the provinces. The principals of the government colleges and a certain proportion of the professors are also recruited in England.

At the head of the system of education there are the five universities of Calcutta, Madras, Bombay (incorporated by acts of the Indian legislature, 1857), Allahabad (incorporated, 1887), and the Punjab (1882, especially for oriental studies). These universities are not government institutions, but autonomous bodies similar in constitution, as already said, to London University. Their function is chiefly that of examination, but through this service and their power to grant or to refuse affiliation to colleges they really control the whole system of higher education.

¹ The unit of administration in British India for the central government is the “district” under the general control of a deputy commissioner. There are about 250 such districts. Local self-government is maintained through the agency of elected boards, rural and municipal.

² In March, 1897, there were 754 municipal towns, with a population of 15,729,458. By the local self-government acts of 1882 and 1884, the elective principle has been extended in a large or in a small measure all over India.

Public institutions are divided according to the standard of instruction into (1) colleges, (2) secondary schools, (3) primary schools, and (4) special schools. These various institutions are characterized by the official reports as follows:

Colleges are those institutions in which the instruction aims directly at a university degree. They are subdivided into (*a*) arts colleges, of which the vast majority are English and a few oriental, and (*b*) professional colleges, for law, medicine, engineering, teaching, and agriculture, though some of these latter are more properly departments of arts colleges. Secondary schools can only be defined as those institutions which are intermediate between colleges and primary schools. Their upper limit is roughly fixed by the matriculation standard of the universities. Their lower limit is quite indefinite. A further source of confusion arises from the fact that secondary schools may have, and usually do have, primary departments. They are subdivided into (*a*) high and (*b*) middle schools, the former being those that teach up to the matriculation standard. Another subdivision is into (*a*) English and (*b*) vernacular, according as English or a vernacular language is the medium of instruction. All high schools belong to the English class, but middle schools are pretty equally divided between the two. Primary schools have no subdivisions, except into upper and lower, and need no definition. Of special schools the most important and the most widely spread are those for the training of school masters and mistresses; others are for technical teaching, such as art, law, medicine, engineering, surveying, handicrafts, etc. Where the subject is the same as in professional colleges, special schools are distinguished by not teaching for a university degree.

Public institutions are again divided, according to system of control, into those under public and those under private management. But it must always be borne in mind that those under private management are not identical with private institutions. Those under public management are subdivided into (*a*) those managed by government, i. e., directly by the several departments of public instruction; (*b*) those managed by district, or local, and municipal boards, and (*c*) those maintained by native States, which (for some purposes) are classed with those managed by government. Public institutions under private management are subdivided into: (*a*) aided, which receive grants of public funds either from the government or from boards, and (*b*) unaided, which receive no public assistance whatever, and differ from private institutions mainly in being recognized by the department.

Expenditure is classified according to sources, into: (1) Provincial revenues; (2) local or district funds; (3) municipal funds; (4) fees, and (5) "other sources." For some purposes the first three of these headings are collectively styled public funds, and the last two private funds, but this is not an official description. Provincial revenues properly consist of that portion of general taxation allotted to a province which the local government devotes to education. In accordance with the system of decentralization that now prevails in Indian finance, certain items of imperial revenue (or rather, shares in certain branches of revenue fixed for a term of years) are handed over to provincial administrations to be expended at their discretion. * * *

Local funds, again, properly consist of that portion of local taxation which district or local boards devote to education. The system of local taxation varies greatly in the several provinces. In some cases there is a fixed cess, or rate, on agricultural lands for education; in others, a proportion of the general land tax (cess) must be devoted to education; in others, tolls and similar levies take the place of a land tax. But, in all cases alike, the expenditure of these local funds is largely at the discretion of the district boards, who also have under their management such important matters as roads and bridges, sanitation, water supply, etc., so that education sometimes suffers when other demands become pressing. Local funds, whether

swollen or not by transfers from provincial revenues, represent the amount spent on education by district boards. Municipal funds simply consist of that portion of municipal taxation which is devoted to education by the municipalities. Fees need no explanation, except that they include payments for examination as well as for teaching. "Other sources" are as miscellaneous as their name; they comprise not only subscriptions from individuals, from missionary ladies, and native associations, as well as income from permanent endowments, but payments for boarding charges which form a growing item in the educational budget. Grants from the revenues of native States, and even contributions to special objects from imperial revenues, are also included under this head.

EDUCATIONAL STATISTICS.

The status of the several classes of public institutions for 1896-97 and their progress during a half decade are set forth in the recent quinquennial report above referred to,¹ from which the following statistics are derived. This report deals with an area of 1,074,268 square miles and a population of 233,490,022, about 81 per cent of the whole population of India. It includes the eight great provinces of British India, viz, Madras, Bombay, Bengal, the Northwest provinces and Oudh, the Punjab, Burma, Assam, and the Central provinces; also one of the four minor charges, Coorg, and Berar, which is only nominally under British administration. For convenience of reference the statistics of population (censuses of 1881 and 1891) precede the educational statistics:

Population of British India.

Province.	1881.	1891.
Madras	30,827,113	35,630,440

¹ Progress of Education in India, 1892-93 to 1896-97, Third Quinquennial Review, by J. S. Cotton, M. A.

TABLE I.—*Summary of educational statistics, 1896-97.*

	Institutions for—		Scholars.		Percentage of increase or decrease, 1896-97, compared with 1891-92.			
	Males.	Females.	Males.	Females.	Institutions.		Pupils.	
					Male.	Female.	Male.	Female.
<i>Public institutions.</i>								
Colleges.....	155	5	18,653	130	+11.5	+150	+15	+53
General education:								
Secondary.....	4,827	440	495,132	40,023	+9	+1	+13	+13
Primary.....	97,881	6,039	2,892,264	317,561	+7	+15	+13	+17
Special education:								
Training colleges (normal schools) and other special schools.....	507	66	22,327	2,292	+7	+40	+9	+78
Total.....	103,370	6,550	3,428,376	360,006	+7		+13	
<i>Private institutions.</i>								
Advanced.....	5,179	1	64,390	991	-7	-6	+179
Elementary.....	35,501	1,458	461,945	41,161	+9	+40	+13	+21
Total.....	40,680	1,459	526,335	42,152	+8		+12	
Grand total.....	152,059		4,356,870		+8		+13	

For the five years compared in columns 6-9 of the above table the total number of public institutions increased by 7 per cent and the number of pupils by 13 per cent. During the previous five years the corresponding rates were greater, i. e., for institutions 11 per cent and for pupils 15 per cent. The fact that the decline in the rate of increase is less in the case of pupils than in that of institutions shows that each institution has a slightly larger average strength. If the comparison be carried back five years more, or to 1881-82, the rate of decline appears greater, but the indications of increased strength in individual institutions more marked. In respect to this showing the reporter observes that "the chief characteristic of the last quinquennium has been consolidation."

TABLE II.—*Classified view of institutions and pupils, by provinces, 1896-97.*

Province.	Public institutions.							
	Colleges.		Secondary schools.		Primary schools.		Special schools.

Berar	5	157	1,361	54,343	+3	+6
Total	42,139	568,488	152,025	4,356,870	+7	+13

The above table shows at a glance the relative educational status of the several provinces included in the report and their relative growth during the five years ending 1896-97. The reporter observes, in discussing this table, that—

“There is actually no increase whatever in Bengal in number of institutions, though pupils have increased by 9 per cent, thus emphasizing the improvement in average strength. The increase is highest in Burma, as might be expected from the recent pacification of the upper portion of that province. The rate of increase there is 32 per cent in institutions and 30 per cent in pupils. In the preceding period the corresponding rates of increase were 109 and 70 per cent. After Burma follow the Central provinces (increase in pupils 27 per cent), the Northwest provinces (25 per cent), and Assam (24 per cent). At the other end of the scale come the Punjab and Coorg, each with an increase of only 2 per cent, but it will presently be shown that this calculation does injustice to the Punjab. The effect of the plague in Bombay is shown by a decline in the rate of increase to 6 per cent from 16 per cent in the preceding period. The exclusion of private institutions would not make much difference except in the cases of the Punjab and Burma, where it operates in contrary directions. In the Punjab private institutions are being steadily brought within the departmental system. Consequently the number of pupils in public institutions has increased by 31 per cent, being the largest increase for any province in India. In Burma, on the other hand, many primary schools have fallen from the status of public institutions, with the result that the number of these has actually decreased by 15 per cent, while the pupils have increased by only 4 per cent, being the lowest rate for any province except Coorg.”

TABLE III.—*Proportion of total pupils to population of school-going age (percentages), allowing for increase of population, in 1886-87, 1891-92, and 1896-97.*

Province.	Percentage of total pupils to population of school-going age		
	1886-87.	1891-92.	1896-97.
Madras	9.9	12.9	14.2
Bombay	14.2	15.8	15.6
Bengal	12.9	14.0	14.7
Northwest provinces and Oudh	4.7	4.0	4.7
Punjab	9.4	8.3	8.1
Central provinces	5.7	6.0	7.3
Burma	18.0	17.3	20.3
Assam	9.0	10.3	11.5
Coorg	14.6	19.3	19.9
Berar	10.4	11.8	12.0
Total	10.0	11.1	11.7

From a further analysis of the statistics it appears that “the proportion of boys at school has increased during the whole period of ten years from 19.3 to 22.3 per cent of those of school-going age, the proportion of girls from 1.7 to 2.3, and the proportion of all children from 10.7 to 12.5. The variations between the different provinces are remarkable. Burma stands easily first, with more than 1 child out of every 5 at school. At the other end of the scale are the Northwest provinces, with only 1 child at school out of 20. The rate of progress for both boys and girls has been most rapid in Madras. In the Punjab there appears a positive decline, but this is to be explained by the incorporation of private institutions in the departmental system. Bombay would show much better had it not been for the plague (the corresponding figures for 1895-96 were 29.6, 4.4, and 17.4). Bengal, Assam, and Berar each exhibit steady improvement. Taking girls only, Coorg holds the first place, with 1 out of every 14 at school; then follows Burma, with 1 out of 20; and Madras and Bombay, each with about 1 out of 23. The Northwest provinces again bring up the rear, with only 1 girl at school out of 200, while the Central provinces have 1 out of 100 and the Punjab has 1 out of 66. The most rapid rate of progress is again shown by Madras; the decline in the Punjab is only apparent; Bombay would not have been passed by Madras had it not been for the plague; Bengal, Assam, and Berar exhibit their usual steady improvement.”

TABLE IV.—*Proportion of total pupils, male and female, in public institutions in each grade of instruction at the beginning and end of the half decade.*

Grade of instruction.	Percentage of totals.			
	1891-92.		1896-97.	
	Male.	Female.	Male.	Female.
Collegiate.....	0.43	0.02	0.42	0.03
High.....	1.90	.30	1.81	.33
Middle.....	4.14	1.99	4.20	2.01
Upper primary.....	11.39	6.19	11.83	6.38
Lower primary (A).....	60.31	58.64	63.39	61.86
Lower primary (B).....	21.83	32.86	18.35	29.39

TABLE V.—*The pupils of each class of public institutions in 1896-97 classified by race or creed (in percentages).*

Race or creed.	In total population.	In arts colleges.	In professional colleges.	In secondary schools.	In primary schools.	In special schools.
Europeans and Eurasians.....	0.09	1.33	5.46	4.49	0.11	4.51
Native Christians.....	.55	3.20	3.30	5.28	2.41	11.62
Hindoos.....	71.29	85.39	81.16	72.29	71.55	53.93
Mohammedans.....	21.81	7.00	6.67	14.20	20.16	25.06
Others.....	6.26	3.08	3.41	3.74	5.77	4.88

It will be observed, says the reporter, with respect to the foregoing table, "that Hindoos exceed their proportion in every class of institution, except in special schools, and that they are particularly strong in colleges. Mohammedans, on the other hand, fall below in every class except special schools—in colleges by as much as two-thirds—though they very nearly reach their proportion in primary schools. Europeans are strongest in professional colleges, special schools, and secondary schools. Native Christians are everywhere far above their proportion, particularly in special schools; while 'others' are everywhere somewhat below. If the natural course of instruction be taken to extend from primary schools through secondary schools to arts colleges, Hindoos show the best standard, Mohammedans the worst, and native Christians the most uniform."

TABLE VI.—*Statistics of expenditure, 1891-92 and 1896-97.*

Year.	Total expenditure.		Per cent of increase, 1891-92 to 1896-97.
	United States currency.	Rupees.	
1891-92.....	\$5,920,806	a 30,519,632	} 15
1896-97.....	6,837,510	a 35,244,900	

a Rupee reckoned as 19.4 cents. (Treasury circular, April, 1898.)

The amounts above given were derived as follows:

	1891-92.	1896-97.
	<i>Per cent.</i>	<i>Per cent.</i>
Provincial revenues.....	28.8	27
Local funds.....	17.7	16.3
Municipal funds.....	4.6	4.3
Fees.....	29.1	30.1
Other sources.....	19.8	22.3

The total expenditure is equivalent to 3 cents per capita of the population covered by the report (233,490,000). The whole population evidently is not considered in the per capita estimates given in the report, which, for all India, is stated to be 2 annas 5 pies, or $7\frac{1}{4}$ cents, an increase of 1 cent above the rate for 1891-92. Of this increase, three-fourths is from private funds and one-fourth from public.

The highest average rate is reached in Bombay, $13\frac{1}{4}$ cents, and here also the increase in five years has been greatest, viz, 2 cents. The lowest average rate is in the Northwest provinces, $3\frac{3}{4}$ cents, with an increase of one-half cent.

TABLE VII.—*Expenditure classified by grade of institutions, 1896-97.*

Institutions, by grade.	Expenditure.	Increase 1896-97 compared with 1891-92.	Percentage of total expenditure.
Universities	\$130,154	41.7	1.9
Arts colleges (English)	452,264	16	6.6
Secondary schools	2,221,730	16	32
Primary schools	2,151,238	15	31.4
Special schools	373,910	13	5.4
Other objects (administration, buildings, etc.)	1,508,214	15	22.7
Total	6,837,510	15

TABLE VIII.—*Expenditures according to Provinces, 1896-97.*

	Total expenditure.	Percentage of increase or decrease 1896-97 compared with 1891-92.
Madras	\$1,297,302	+16
Bombay	1,430,348	+17
Bengal	2,127,915	+17
Northwest Province and Oudh	706,141	+9
Punjab	596,106	+15
Central Provinces	204,244	+22
Burma	252,867	+19
Assam	126,267	+26
Coorg	8,056	+6
Berar	88,268	-3
Total	6,837,514	+15

DETAILED VIEW OF PROGRESS IN RESPECT TO THE STUDY OF ENGLISH AND THE EXTENSION OF ELEMENTARY EDUCATION.

Antecedent conditions.—The summarized view of education in India here presented is important in a survey of the movement for universal education, but the history of what has been accomplished has at this time additional interest for us because of the lessons which it offers in respect to the matter of imparting to one race or nation the educational methods and ideals of another.

In order to understand this particular aspect of the history, certain facts must be borne in mind. Education had high development long before the English occupancy. It was inseparable from the religious systems that successively held sway in the land, and its aims and processes were well defined. Although under the Brahmins education in any large sense of the term was confined to a select class, under Buddhists and Mohammedans it had wide popular extension. Upon

this subject the royal commission, appointed in 1882 to inquire into the workings of the system of education, say, in brief:

The East India Company found the four ancient methods of education still at work; in the instruction given by the Brahmins to their disciples, in the tols or seats of Sanskrit learning, and in the maktab and madrasas, or schools and colleges of the Mohammedans, and in the large number of humbler village schools which also existed. These village schools gave an elementary education to the trading classes and to the children of the petty landholders and well-to-do families among the cultivators. (Report of Indian Education Commission, p. 8.)

Dr. Leitner, in his history of indigenous education in the Punjab, says:

Respect for learning has always been the redeeming feature of "the East." To this the Punjab has formed no exception. Torn by invasion and civil war, it ever preserved and added to educational endowments. The most unscrupulous chief, the avaricious money-lender, and even the freebooter, vied with the small landowner in making peace with his conscience by founding schools and rewarding the learned. There was not a mosque, a temple, a dharmshala that had not a school attached to it, to which the youth flocked, chiefly for religious education. There were few wealthy men who did not entertain a Maulvi, Pandit, or Gurm to teach their sons, and along with them the sons of friends and dependents. There were also thousands of secular schools, frequented alike by Muhammadans, Hindus, and Sikhs, in which Persian or Urdu was taught. There were hundreds of learned men who gratuitously taught their coreligionists and sometimes all-comers, for the sake of God—"lillah." There was not a single villager who did not take a pride in devoting a portion of his produce to a respected teacher. In respectable Muhammadan families husbands taught their wives, and these their children; nor did the Sikhs prove in that respect to be unworthy of their appellation of "learners and disciples." In short, the lowest computation gives us 330,000 pupils (against little more than 190,000 at present) in the schools of the various denominations who were acquainted with reading, writing, and some method of computation; whilst thousands of them belonged to Arabic and Sanskrit colleges, in which Oriental literature and systems of Oriental law, logic, philosophy, and medicine were taught to the highest standards. Tens of thousands also acquired a proficiency in Persian, which is now rarely reached in Government and aided schools or colleges. Through all schools there breathed a spirit of devotion to education for its own sake and for its influence on the character and on religious culture; whilst even the sons of Banyas, who merely learnt what they absolutely required in order to gain a livelihood, looked with respect amounting to adoration on their humble Pandhas, who had taught them the elements of two "r's." (Report of Indigenous Education in the Punjab, p. 11.)

Under the conditions thus described the endeavor to introduce a new system of education or to turn at once the existing system into new channels would have been futile, and neither the East India Company (1757-1784) nor the English Government, after it assumed direct control, attempted any violent change. When, in 1854, the Government entered seriously upon the work of education in India, its efforts were chiefly directed to the establishment of an administrative machinery in each presidency and to the promotion of higher education. In respect to the latter interest, beginnings had already been

made, but under different conceptions as to the sort of education which it was desirable to encourage. In the Madras High School, established in 1826, stress was placed upon English. At Benares, in the North-western Provinces, the Government established a Sanskrit College as early as 1791.

Policy with respect to English defined.—In 1857, in accordance with the instructions in the dispatch of 1854, the three universities of Calcutta, Madras, and Bombay were incorporated by the Indian legislature. As already said, they controlled the work of colleges and secondary schools, and it was in respect to their policies that the conflict was waged between the opposing advocates of English and of Oriental education. The former party, say the commissioners—

urged that all instruction of the higher kind should be given through the English language and should be in accordance with modern ideas. The latter, while admitting that what was then taught as science had no right to that title, wished to maintain the study of the Oriental classics in accordance with the methods indigenous to the country. Both parties broadly and prominently admitted the claims of the vernacular languages. Among the Orientalists were many distinguished officers of Government, and for some time their views prevailed in the general committee of public instruction. But the minority gradually became more and more powerful; and when in 1835 the two parties were so evenly balanced that things had come to a deadlock, it was Macaulay's advocacy of English education that turned the scale against the Orientalists. His famous minute was immediately followed by a resolution of the governor-general, which plainly declared for English as against Oriental education. A few years later the Orientalists made several efforts to rescind this resolution and to revert to the previous policy in favor of the classical languages of India. They received, however, no encouragement from the Government, and in 1839 Lord Auckland published a minute which finally closed the controversy. The purport of this minute was "that although English was to be retained as the medium of the higher instruction in European literature, philosophy, and science, the existing Oriental institutions were to be kept up in full efficiency and were to receive the same encouragement as might be given to the students at English institutions. Vernacular instruction was to be combined with English, full choice being allowed to the pupils to attend whichever tuition they might individually prefer." Since that time education in India has proceeded upon the recognition of the value of English instruction, of the duty of the State to spread Western knowledge among its subjects, and of the valuable aid which missionary and philanthropic bodies can render in the task. (Report of Indian Education Commission, pp. 8, 9.)

There was a reason for fostering the study of English in high schools and colleges that did not apply to elementary education. Those who pursued the higher studies would naturally seek to enter upon official careers for which the knowledge of English was necessary. This was so clearly foreseen that it was thought the prospect thus opened would insure a large measure of local support for the higher schools. On the other hand, elementary education was intended for the masses, who are ever in danger of misprizing its benefits. The early dispatches emphasized the importance of the elementary schools, but experience was necessary to show by what means they could be

best maintained. The commission of 1882 were convinced that Government action was most required in this primary stage. It may be distinctly laid down, they say: "That the relation of the state to secondary is different from its relation to primary education, in that the means of primary education may be provided without regard to the existence of local cooperation, while it is ordinarily expedient to provide the means of secondary education only where adequate local cooperation is forthcoming; and that, therefore, in all ordinary cases secondary schools for instruction in English should hereafter be established by the State preferably on the footing of the system of grants in aid." As to colleges the commission recommend "that the rate of aid to each college be determined by the strength of the staff, the expenditure on its maintenance, the efficiency of the institution, and the wants of the locality."

It will be of interest, then, to inquire, first, what is the extent and what are the evidences of progress in English instruction in the high schools and colleges of India under British control; second, what is the progress and what are the main characteristics of elementary education—that is, the education of the masses of the population—under British influences. The report here considered enables us to carry this investigation through a half decade only. Progress during this period, however, is the result of efforts which date back even beyond the dispatch of 1854, but which had scarcely passed the tentative stage up to 1886, when the unifying effects of the work of the Government commission of 1882 began to be manifest.

Status of the arts colleges.—The actual attendance upon the arts colleges given for a particular day (March 31) for each year of the decade 1886-87 to 1896-97 shows that the number of students steadily increased until 1895-96, rising in the nine years from 8,060 to 14,219. The year following there was a slight decline to 13,993, though this was an increase of 72.8 per cent above the number enrolled in 1886-87. These are advanced students who seek the English language and Western learning in preference to Oriental studies.

The university examinations for the B. A. degree, for which English is a requisite, afford also a measure of the interest in this study.

For the five years 1887-88 to 1891-92 the number of candidates offering themselves for the B. A. examination was 10,708 and the number who passed 4,661; in the following five years (1892-93 to 1896-97) the number of candidates was 14,213 and the number who passed 6,223, a gain of 33 per cent in candidates and of 34 per cent in passes. It is interesting to observe in this connection that in the second period considered, as compared with the first, the attendance upon the Oriental colleges declined from 561 students to 487, or 13½ per cent.

English in schools of secondary and primary grades.—The number of English secondary schools for boys rose in the decade (1886-87 to

1896-97) from 2,301 to 2,962 and the number of pupils from 271,654 to 339,834. The proportion of pupils learning English rose in the same time from 85.5 to 87.5 per cent of the total number. With respect to this study the quinquennial report states that in four provinces all, or practically all, the pupils in English schools are actually learning English. But in the Punjab the proportion is as low as 65 per cent, though it was still lower (62.6 per cent) five years ago. In the Northwest the proportion has fallen from 99.2 to 92 per cent, showing that the increase in the total number of pupils is deceptive. But in every other province where the proportion is low it has risen considerably during the five years; in Madras it has risen from 93.7 to 97.1 per cent.

In order to obtain the total number of pupils who are learning English it is necessary to add to the above those to be found not only in vernacular secondary schools but also in primary schools, for in some provinces, notably Madras, English is an optional subject in primary schools. The following table gives the total number of pupils learning English, according to provinces, in all public institutions for boys, except colleges and special schools, together with the proportion of boys of school-going age (15 per cent of the male population) learning English. It should be observed that a few girls in boys' schools are included, but, on the other hand, boys in girls' schools are omitted.

Pupils learning English in secondary and primary schools for boys, 1896-97.

Province.	English secondary schools.	Vernacular secondary schools.	Primary schools.	Total.	Number of boys of school-going age to one learning English.
Madras	58,705	7,021	58,916	124,642	23.
Bombay	32,872	462	33,334	63
Bengal	130,572	10,342	1,706	142,620	38
Northwest Provinces and Oudh.....	22,449	3,426	25,875	141
Punjab	25,772	1,346	27,118	62
Central Provinces	6,736	4	412	7,152	136
Burma.....	9,174	1,398	10,572	55
Assam.....	6,700	531	7,231	58
Coorg.....	647	252	899	15
Berar.....	3,717	324	4,041	55
Total	<i>a</i> 297,344	<i>b</i> 17,367	68,773	383,484	46
Total for 1891-92	261,895	9,697	54,174	325,766	54.

a Total pupils in English secondary schools for boys, 339,834.

b Total pupils in vernacular secondary schools for boys, 158,753.

Percentage of total pupils in schools specified, learning English.

	1891-92.	1896-97.
English secondary schools for boys.....	<i>Per cent.</i> 85.5	<i>Per cent.</i> 87.5
Vernacular secondary schools for boys.....	7.07	10.9
Primary schools for boys	2.02	2.27

The total number of boys learning English has increased in five years from 325,766 to 383,484, or at the rate of 18 per cent, and the proportion of boys of school-going age learning English has increased by about 12 per cent. It is only in Bengal and Madras that English is taught in vernacular secondary schools, but here the numbers are considerable, and it is notable that in Madras more boys are learning English in primary schools than in the English secondary schools. In the column showing the relative position of the several provinces, if we exclude Coorg, Madras stands easily first with 1 boy in 21 of school age learning English, followed by Bengal with 1 in 38. Bombay would have a much larger proportion were it not for the plague. As it is she is passed by Burma, Assam, and the Punjab. The Northwest Provinces, as usual, come at the bottom with a proportion nearly seven times lower than that of Madras.

Elementary schools, management and increase of.—With regard to elementary education, the developing policy of the government and its outcome are suggestive.

The first instructions issued by the government with respect to education (dispatch of 1854) indicated a disposition to leave elementary education chiefly to local effort. Experience soon showed that this would not suffice for the work. The dispatch of 1859 declared that the native community failed to cooperate with the government in promoting vernacular education, and strong doubts were expressed as to the suitability of the grant-in-aid system, as hitherto in force, for the work of educating the masses. Vernacular instruction, it was suggested, should be provided by the direct instrumentality of the officers of government, on the basis of some one of the plans already in operation for the improvement of indigenous schools, or by any modification of those plans which might suit the circumstances of different provinces. The policy of incorporating and improving the existing indigenous schools was advised rather than efforts to induce the people to set up new schools under the grant-in-aid systems then in force, but the establishment of new schools by direct departmental agency was also sanctioned. Accordingly, the local governments considered themselves free to adopt whichever system seemed to be best suited to local circumstances.

The commission of 1882 emphasized the need of increased provision for elementary education and the use of all native agencies in this work. "All indigenous schools, whether high or low, should," they say, "be recognized and encouraged, if they serve any purpose of secular education whatsoever." They urge special efforts in respect to the education of girls, and recommend a policy of local control over primary schools, with a view to fostering and extending native interest in the work. "Primary education should," they say, "be declared to be that part of the whole system of public instruction which possesses

an almost exclusive claim on local funds set apart for education, and a large claim on provincial revenues." The general control over primary school expenditure should be vested in the school boards, whether municipal or local, which may now exist or may hereafter be created for self-government in each province, and they recommend that the first appointment of schoolmasters in municipal or board schools (public schools) be left to the town or district boards, with the proviso that the master be certificated or approved by the department, and their subsequent promotion or removal be regulated by the boards subject to the approval of the department.

The elementary schools recognized by the government are those under public control and supported by public funds either provincial or local, aided schools and nonaided schools subject to government inspection. Outside of these there are the indigenous schools which have not yet sought government inspection or aid.

From the report of the government commission it appears that in 1882 there were about 324,000 pupils in indigenous elementary schools that had not been incorporated into the departmental system. The status of the schools comprised in the departmental or public systems at specified dates, as set forth in the reports of the commission and in the quinquennial report 1892-93 to 1896-97, was as follows:

Comparative statement of the number and enrollment of primary schools for boys under government supervision at specified dates.

	1870-71.		1881-82.		Increase.	
	Schools.	Pupils.	Schools.	Pupils.	Schools.	Pupils. ^a
Government, local fund, and municipal.....	9,056	383,754	13,637	663,915	<i>Per cent.</i> 50.85	<i>Per cent.</i> 73
Aided.....	6,336	181,834	57,341	1,141,844	805	527.96
Unaided.....	1,081	41,732	11,938	255,782	1,058	512.94
Total.....	16,473	607,320	82,916	2,061,541	403.34	239.45

	1891-92.		1896-97.		Increase.	
	Schools.	Pupils.	Schools.	Pupils.	Schools.	Pupils.

Total.....	91,881	2,680,424	97,881	3,023,203	7.21	12.97

^a The corresponding statistics for 1886-87 are not given, but only the ratios of increase or decrease between that year and 1891-92, which, for pupils, are as follows: Government schools, — 56 per cent; district and municipal, + 15; native States, + 22; aided, + 10; unaided, + 28; total + 13.

In the decade 1886-87 to 1896-97 the number of Government schools decreased from 948 to 370, the rate of decrease being 49 per cent in the first half of the decade and 24 per cent in the second.

With regard to the aided schools the quinquennial report states that

this class of schools now educates 54 per cent of the total number of pupils in primary schools. The aided system has reached its highest development in Bengal, where it is responsible for no less than 81 per cent of the total number of pupils. It is also very strong in Madras, Burma, and Assam, and has recently made a start in the Northwest, the Punjab, and the Central provinces. The rapid advance made by Bombay in the earlier half of the decade has not been maintained in the later half owing to the plague. Berar is the only province that shows an actual decline in the later period.

As regards unaided schools, it is shown that in the decade closing with 1896-97 there was a diminishing rate of increase, 28 per cent in the first half and 14 in the last. The diminution is due to the exclusion from the list of a large number of schools of this class in Burma, where they now appear as private institutions. The converse process, on a considerable scale, has lately been taking place in the Punjab. Unaided schools now educate 14 per cent of the total number of pupils in primary schools, the proportion in Burma, despite the reduction, still rising as high as 35 per cent.

During the same decade "the average strength of a primary school has steadily increased from 28 pupils to 31, the rate of increase having been accelerated in the later period. Government schools show an exceptional decline from 55 to 46 pupils for reasons already given. The strongest schools have been handed over to boards, while those remaining are chiefly in backward tracts. Board schools show a uniform growth from 46 to 50. In schools in native States the rise is from 56 to 60 pupils, the diminishing rate of increase in the last half of the decade being due to the inclusion of weaker schools in the Central provinces; but it is remarkable that these schools should be the strongest of any class in India. The strength of aided schools has risen from 25 to 29, almost entirely in the later period, while unaided schools have practically remained stationary."

Educational standards.—The character of primary schools in respect to management and the relative strength of each class are sufficiently shown by the particulars here reviewed. As to the education which they impart, its purpose, as stated in the report, "is to provide every child that can be brought under its influence with some knowledge of reading, writing, and arithmetic and such other simple and useful subjects as may be possible. On the other hand it is intended to include courses for those whose means, inclination, or ability enables them to proceed to higher steps of the ladder. These two objects roughly correspond to the two recognized stages of primary instruction—the lower and the upper—while they are carried into effect by different means in the several provinces." These differences are thus characterized in the report:

In Bombay, where the Government was the moving spirit and is still the guiding hand, the whole of education is organized on a system that extends continuously

from the primary school to the university. The primary school is there essentially a lower stage of the secondary school, mainly distinguished by the fact that English is not taught in it at all. In Bengal, where indigenous instruction has always been popular and widely spread, the Government has for the most part been content to develop the existing pathsalas or village schools by grants of money and by departmental inspection. Here the majority of primary schools are elementary ones for boys of the agricultural class, who are intended to follow their father's occupation after they have obtained sufficient knowledge to save them from being imposed upon. Those with higher ambitions are generally to be found in the primary departments of secondary schools. In Madras the influence of the Government, of missionaries, and of indigenous traditions has combined to produce a system of great elasticity. Simple subjects form the groundwork; but there are also a number of optional subjects, among which English is conspicuous. In the other provinces the system varies between these three dominant types except in Burma, where Buddhism has fostered a system of religious instruction universal and gratuitous, extending even to girls. The different systems have produced different types of schools. In Bombay the representative school is one maintained from the Local Cess, but entirely managed by the department, with a strength of about 70 boys. In Bengal the representative school is an aided or unaided one, largely dependent upon the popularity of its teacher, who can rarely collect more than 25 pupils. It stands to reason that the efficiency and stability of these two extreme types of school must vary greatly, as is indicated by the proportion of pupils each has in the upper primary stage. But from the statistical point of view every school counts as one; and the number of pupils likewise is counted, not weighed. Indigenous schools, it may be remarked, differ little in character from the lowest class of primary schools which have grown out of them.

Under conditions so varied the relative enrollment in the different classes of primary schools only serves to indicate in a very general way the proportion of pupils who pass beyond the merest elements. It should be observed that, in addition to the division of the primary schools into upper and lower, there is a further division of the lower primaries into Section A, which is intended to be an initial stage for a small minority who will pass eventually into higher schools, and an inferior section, B, which is intended for that great majority whose formal instruction ends with this grade.

The distribution of pupils in the three divisions of the primary schools at the beginning and end of the half decade was as follows:

	Upper primary.		Lower primary.			
	Number.	Per cent of total.	Section A.		Section B.	
			Number.	Per cent of total.	Number.	Per cent of total.
1891-92	346,037	11.7	1,887,364	64	703,355	24.3
1896-97	406,557	12.23	2,245,760	67.65	669,570	20.12

The corresponding statistics by provinces show that more than two-fifths of the total number in the upper primary stage were in Bombay alone, where there is no middle vernacular stage. But there were increases in Madras, the Punjab, Burma, and Coorg. In both Bengal and the Northwest the increase was very small.

The enrollment in the three stages, comprising also the pupils (boys) in the elementary departments of secondary schools, bore the following ratios to the school-going population:

	Per cent.
Upper primary stage.....	2. 29
Lower primary A.....	12. 78
Lower primary B.....	3. 78

The lower primary course is very elementary, including as obligatory subjects reading, writing, and arithmetic taught in the vernacular of the pupils, which may be English in schools for European boys. A large number of optional branches are allowed, such as kindergarten occupations, object lessons, free-hand outline drawing, a second language, elementary science, geography, singing, hygiene, and (for upper primary schools only) history of India, agriculture, and mensuration. The second language may be either English or one of the seven recognized vernaculars. In general, little is attempted in the lower primaries beyond the three R's, and it is only the pupils who advance to the upper primary stage who get the simplest notions of geography, physical science, and history.

The training of teachers.—The earliest instructions of the Government with respect to education (dispatch of 1854) called for the establishment of training colleges for teachers of all classes. Subsequent instructions and regulations have emphasized the importance of this provision, but the practical outcome of these efforts is meager.

The commission of 1882 recognized that the number of training schools should be greatly increased, and they recommended that the first charges on provincial funds assigned for primary education should be the cost of its direction and inspection and the provision of an adequate supply of normal schools. At that time about 18 per cent of the teachers in primary schools had had some degree of training.

The quinquennial report (1892-93 to 1896-97) says on this subject:

With regard to the character of so-called training schools the widest divergencies prevail. Some of them are called colleges, but their only title to that name is that a few of the students in them may have passed the matriculation examination. The name is properly restricted to two Government institutions in Madras which prepare candidates for a special diploma in teaching at the Madras University. Most of the training schools represent normal schools, established by Government for the better education and training of vernacular schoolmasters. Many of them are merely classes attached to institutions for general education where the degree of training that can be given is necessarily of the smallest. In Assam, but not in Bengal, "guru" classes are included, in which selected masters of middle schools are authorized to give instruction in educational methods to "gurus" (masters) of primary schools.

* * * * *

Going back for ten years, the total number of training schools for masters has apparently increased from 113 to 141 and the number of pupils in them from 4,451 to 4,607. During the earlier quinquennium the number of institutions remained almost stationary, and the number of pupils slightly decreased. During the later

quinquennium institutions increased by 22 per cent and pupils by 4 per cent. The increase in institutions is confined to Madras and Assam. In both cases it is mainly due to the opening of a larger number of sessional schools and guru classes, which represent the very lowest stage of training. The increase in pupils is found mainly in Burma, the Northwest, and the Central provinces, in all of which training schools are weakly organized. Madras, Bombay, and Bengal each show a decrease in pupils, and Berar a large decrease. The great majority of training schools are maintained by Government. Madras is the only province that now has any under district or municipal boards, those formerly existing in Assam having been transferred to the department. Aided and unaided both show a slight increase, but the total for each is small.

There are also 45 training schools for women teachers, with 1,118 students, an increase in five years of 8 schools and 325 students.

The expenditure for these schools amounted in 1896-97 to \$150,495, of which 68 per cent was borne by the provincial treasuries.

It is evident from these particulars that the provision for training teachers is utterly inadequate for the supply even of the existing schools.

The low state of the teaching force is in itself sufficient to account for very meager results from the school instruction.

The education of girls.—The most difficult educational problem with which the British Government has had to deal in India is that of the education of girls. This part of the work has been emphasized in all instructions on the general subject, though no special directions could be given with reference to a matter so complicated. By reference to Table I, pages 11-13, it will be seen that a small number of girls (2.3 per cent of those of school-going age) are under instruction, and that the increase has been considerable during the last five years.

It appears from the report that in the ten years 1886-87 to 1896-97 the total number of girls in public institutions increased from 241,568 to 360,006, or by nearly one-half. The rate of increase fell from 27 per cent in the earlier period to 17 per cent in the later period, but in each case it was considerably higher than the rate of increase for boys. It was fairly well maintained throughout each of the last five years, being apparently little affected by plague or famine.

The practice of coeducation or mixed schools for boys and girls is common throughout India, and about 40 per cent of the girls under instruction are in schools for boys. If private institutions be included, in which little more is taught than the Koran, one-half of the girls under instruction would be found in mixed schools.

The following table shows the status of each province with respect to instruction for girls:

Classification of pupils in girls' schools and of girls under instruction, 1896-97.

Province.	In public institutions for girls.			In public institutions for boys.		Total girls in public institutions.	Girls in private institutions.	Total girls under instruction.	Percentage of school age.
	Total pupils.	Boys.	Girls.	Girls.	Percentage of total girls. ^a				
Madras	53,982	2,525	51,457	56,008	52	107,465	9,282	116,747	4.32
Bombay	46,526	1,524	45,002	26,051	37	71,053	11,110	82,163	4.19

Percentage of increase	14	28	14	22	17	33	19

^a For totals see next column.

With respect to the subject of mixed education, or the coeducation of boys and girls, which is plainly indicated by the above table, the report says:

While the total number of girls in schools for girls has increased by 14 per cent, the number in boys' schools has increased by 22 per cent and the number in private institutions by 33 per cent, clearly showing that the progress of female education generally has been much greater than the progress of public girls' schools. It is also noticeable that even in girls' schools the number of boys, though still small, is increasing at a more rapid rate than the number of girls. The popularity of "mixed education" can be tested by the percentage of girls in public boys' schools in the several provinces. In Coorg, where female education may be said to be common, though not carried to a high stage, out of every 7 girls at school 6 are found in an institution for boys. In Burma, which easily holds the second place, out of every 4 girls at school 3 are found in an institution for boys. Next comes Madras, with more than one-half of its girls in boys' schools, and then Assam, with exactly one-half, and Berar, with nearly one-half. Bombay and Bengal have more than one-third and the central provinces nearly one-third. At the other end of the scale stand the Punjab and the northwest, where the proportion of girls in boys' schools falls to 1 and 2 per cent. These extraordinary differences are no doubt due to the varying strength of traditional prejudice, but they seem to indicate the probable line of future expansion. The education commission condemned "mixed education," at least for children above 7 years of age, and recommended that the attendance of girls in boys' schools should not be encouraged, except in places where girls' schools could not be maintained. This opinion of the commission met with opposition in Madras and Burma. Though at first accepted in the central provinces, an opposite policy ultimately prevailed and has recently been adopted also in Berar. There can be but little doubt that boys' schools are both cheaper and more efficient than girls' schools. They evade the supreme difficulty of the deficient supply of female teachers. They can not of course pretend to give the most appropriate education for girls; but if only parents can be induced to allow their little girls to attend them, they will achieve something toward removing the most conspicuous blot on the educational system of India.

The distribution of the girls in schools by race or religion is given as follows for the decade 1886-87 to 1896-97:

Pupils in secondary and primary schools for girls according to race or religion, 1886-87 to 1896-97.

Race or religion.	1886-87.					
	Secondary English.		Secondary vernacular.		Primary.	
	Number.	Percentage.	Number.	Percentage.	Number.	Percentage.

EDUCATION IN MYSORE AND CEYLON.

The English influence in education has not been limited to the territory under English rule. Many chiefs of the native States which own allegiance to England but are subject to its control only in matters affecting the general welfare of the Empire have established school systems modeled on those of the British provinces. Mysore affords a striking example, and in educational efficiency, as shown by the official report from that State, ranks well with the British administration.

On a total population of 4,843,523 (census of 1891) this State had in 1897 an enrollment in public schools of 97,845, and in private schools of 20,542, or a total enrollment of 118,387, equal to 2.4 per cent of the population. The ratio of boys under instruction to the male population of school-going age was 26.16 per cent, and the ratio of girls to the female population of school-going age 4.29 per cent. In the British provinces, taken as a whole, the corresponding ratios were—for boys, 22.3 per cent; for girls, 2.3.

The distribution of pupils in Mysore among the different classes of schools is shown in the following table:

Educational statistics of Mysore, 1897-98.

	Number of institutions for—		Number of pupils.	
	Males.	Females.	Male.	Female.
<i>Public institutions.</i>				
Colleges.....	(6)		583	
General education:				
Secondary	181	20	24,972	2,687
Primary.....	1,679	164	51,333	8,982
Special education:				
Training colleges (normal schools) and other special schools.....	(50)		(1,871)	
<i>Private institutions.</i>				
Advanced.....	(8)		(201)	
Elementary.....	(1,687)		(20,341)	

The population of Mysore comprises the same religious sects as the British provinces. The extent to which the different sects avail themselves of the school provision is reported as follows:

	Percentage of pupils to population of school-going age.
Hindoos	13.346
Mohammedans.....	39.776
Native Christians.....	60.564
Jains	7.159

The total expenditure on public institutions was 987,430 rupees, equivalent to \$191,561. This amount was derived as follows:

	Amount.	Percentage.
	<i>Rupees.</i>	
State funds.....	563,017	57.02
Local funds.....	211,694	21.44
Municipal funds.....	33,254	3.37
Fees.....	98,912	10.01
All other sources.....	80,553	8.16

The expenditure on elementary education, including primary, middle, and high schools, was \$106,216, or 55.44 per cent of the entire expenditure for education.

The study of English is naturally less extended than in the British provinces. With respect to this branch the official report for Mysore says:

“English is excluded from all primary schools. In English middle schools with primary departments attached to them it is allowable to teach the English alphabet and a primer of English in the third ver-

naacular class. But the amount of English learned in that class is so little that some head masters do not avail themselves of the concession, and prepare their pupils for the lower secondary examination in English in four years' time after they have passed the third vernacular standard—that is, after they have received a purely vernacular education for a period of at least four years. While the questions of making primary education purely vernacular and using the vernacular as the only medium of instruction in lower secondary classes are still hotly discussed in Madras, both these questions were settled in Mysore in 1892, when it was ruled that the study of English should commence after passing the third vernacular standard. There was a great deal of opposition to the new rule from some head masters and parents at the time, and the concession of making a beginning in the teaching of English in the third vernacular standard was made in 1893. Instruction in all subjects has been imparted since 1892 through the vernacular not only in all primary classes but also in the lower secondary classes, and at the Mysore lower secondary examination questions have been set and answered in the candidates' vernacular in all subjects except English and mathematics since December, 1891."

The extent to which English is pursued by pupils above the primary grade is indicated by the following statistics, showing the number and proportion of students taking this subject in secondary and higher institutions on the 30th of June, 1897-98:

	Total number of students.	Number taking English.	Per cent of total.
University education:			
Arts colleges and professional schools	583	452	77
Secondary schools.....	27,659	7,779	28

By comparison with the corresponding statements for the British provinces (pp. 19, 20) it will be seen that in these the proportion of pupils taking English is much greater than in Mysore; in secondary schools 63 per cent, as against 28 per cent in Mysore.

The matriculation examinations of pupils from secondary schools show poor results in English. The percentages of failures in this branch for three successive years, from 1895 forward, have been 60.2, 63.3, 60.9. With a view to improvement in this study the curriculum of the secondary schools has been recently revised.

In comparing results in this state with those of the larger provinces it should be remembered that its population is much less than the smallest of these, Assam, and only one-seventeenth that of the largest, Bengal.

Under any circumstances it is much easier to extend an educational system over a small state than over a vast, densely populated empire.

The relative facility with which the work may be accomplished in the smaller state is more apparent where caste distinctions prevail, as in India. The comparative advantage of dealing with a small, compact population is shown in the case of Ceylon, which came under British control in 1815. This island, with a population of 3,391,443, has been well supplied with schools, which are either Government schools, aided schools, or unaided but supervised. According to the official report for 1897 there were 184,506 youths, or 1 in 18 of the population, under instruction. Travelers are struck with the large number of natives who understand and speak English. Many of the natives practice medicine and surgery, which they have acquired at the Ceylon Medical College, founded in 1870. The study of law has a special fascination for the natives, and high-class Ceylonese have been members of the supreme court.

As an offset to the influence thus acquired by natives it is noticed that the natural passion of the people for litigation has been greatly increased under the new influences.

Movement of university education.—The general survey of educational progress would be incomplete without some consideration of the outcome of higher education in the British provinces. By reference to Table 1 it will be seen that the colleges registered about 19,000 students in 1896-97, and professional schools (law, medicine, and engineering) about the same number. The movement of higher education is very clearly indicated by the statistics of university examinations presented in the following table:

Results of university examinations, etc., for the two quinquenniums 1887-88 to 1891-92 and 1892-93 to 1896-97.

With respect to the above table, the official report says:

Taking the whole period of ten years, it appears that the total number of candidates for the matriculation or entrance examination was 157,775, of whom 57,919, or 36.7 per cent, were successful. Low as this average of success seems, it is based upon wide variations, both between different universities and between different years at the same university. These variations, indeed, are too large to be accounted for by any other explanation than a want of uniformity in the standard.

The total number of candidates for matriculation decreased from 81,086 in the earlier period to 76,689 in the later period, or at the rate of 5 per cent. This decrease is confined to Madras, where it amounts to no less than one-half. At Bombay the number of candidates is practically unchanged, though the average of success has risen from 27 to 31 per cent. At Calcutta also the number of passes has increased at a greater rate than the number of candidates. The Allahabad and Punjab universities are both comparatively new institutions, where it is natural to find the number of candidates rapidly increasing, and also the standard becoming somewhat more severe. Here, as elsewhere, the rate of progress in the Punjab is remarkable, the number of matriculations having passed those at Allahabad and almost equaling those of Bombay. Altogether, though the total number of candidates for matriculation has fallen by 5 per cent, the total number of passes has risen by 15 per cent, showing either an improvement in the teaching of affiliated schools or possibly a reduction in the standard of examination.

* * * * *

The total number of candidates for the B. A. (including also the B. Sc., at Bombay) appears to have been 24,921, of whom 10,884, or 43.7 per cent, passed. It is noticeable that the average of success is higher than in the previous examinations, and also that it is constant during the two periods. But there are notable variations between the different universities. Comparing the latter with the earlier period, the total number of candidates has increased by 33 per cent and the number of passes at a slightly higher rate, which would seem to show that the proportion of

students who proceed with their studies is steadily increasing. At Madras, in particular, it is noticeable that the number of passes for the B. A. has increased from 1,765 to 2,401, and the average of success from 54.5 to 60 per cent, which seems to afford a justification for the strictness of the standard at the matriculation and F. A. At Bombay, on the other hand, the number of candidates has fallen heavily, though the average of success has risen from 48 to 67.9 per cent. At Calcutta the number of candidates has largely increased, supplying nearly one-half of the total, but the average of success has fallen from 33.1 to 27.3 per cent. Here, again, there are wide variations from year to year. The number of passes, which was 273 in 1891-92, rose to 484 in 1893-94, and dropped again to 294 in 1895-96. The two new universities of Allahabad and the Punjab naturally show a smaller proportion of B. A's. though their numbers are steadily increasing when compared with the F. A's., and the average of success is maintained at a uniform rate.

The B. A. is the ordinary limit of university education in India, as it is also in the University of London. But the most notable feature in the recent history of Indian universities is the growing number of students who continue to work for the severe M. A. course, which usually requires two years of additional and advanced study. During the ten years the total number of candidates for the M. A. degree was 2,012, of whom 917, or 45.6 per cent, passed. Comparing the later period with the earlier, the number of candidates has increased by 60 per cent, and the number of passes by 63 per cent. Calcutta, while still standing easily first, no longer preserves the practical monopoly. At both Madras and Bombay the number of M. A's. has doubled, though each of them can only show about 8 a year, compared with 66 at Calcutta. The large number at Allahabad seems to be dearly purchased by a reduction in the standard of examination, the average of success there being as high as 65.9 per cent, contrasting with 35.7 per cent at Madras. The Punjab can show 51 M. A's. during the last five years, against only 41 at Bombay, while the average of success was the same at both universities.

It is not worth while to submit the results of examinations in law, medicine, and engineering, as given in this table, to a minute analysis, for the statistics have manifestly not been compiled on a uniform basis. It is impossible to believe that the number of passes in law has increased from 158 to 859 at Bombay while it has decreased from 855 to 627 at Calcutta; or that the number of passes in medicine has decreased from 420 to 416 at Bombay while it has increased from 351 to 925 at Calcutta. Enough that the general tendency evidently has been toward progress, and that the average of success seems to be fairly uniform.

A new research university.—The latest measure affecting higher education in India is the constitution of a research university, at the instance of and on the basis of a liberal endowment by Mr. J. N. Tata. In accordance with the act of incorporation, this university is to be known as the Indian University of Research. It will have its seat in or near Bombay, and is empowered, so far as the funds and opportunities at its command permit, from time to time, to institute or subsidize chairs and lectureships in science, art, and literature, specially with a view to the promotion of original investigations in all branches of knowledge, and to provide or assist in the provision of suitable libraries, laboratories, and museums, and all other necessary appliances, and to take over from government and other public bodies or private persons willing to transfer the same, any and all such libraries, laboratories, museums, collections, together with any endow-

ments and other funds, properties, and benefits belonging to such institutions, respectively, with the attendant obligations and engagements, if any.

It also has power, upon examinations or such other tests of competency as it may from time to time approve, to confer fellowships upon persons whose preliminary qualifications to be admitted to such examinations or tests shall be determined by by-laws as hereafter provided; and, further, to apply its funds to all objects which have for their aim the advancement or diffusion of learning.

The governing bodies of the university, subject to the powers reserved to the government of India, are (a) a university court and (b) a university council.

His excellency the viceroy for the time being, shall be ex officio the visitor of the university, and the governor of Bombay shall be ex officio the chancellor.

The chancellor shall appoint a vice-chancellor, who shall hold office for two years.

The prospectus of the university sets forth that its primary aim is to teach and not to examine.

The diplomas, therefore, will be conferred on those who have completed a certain course of higher education.

This work of higher instruction will be conducted on the principles followed now in Europe, e. g., in the German Seminaria, the French conferences, and the English and American research classes. These courses will be the beginning of a purely specialist training.

In order not to interfere with the existing agencies, the new institution will take up teaching where the colleges of the existing universities leave off. The new courses will be post graduate.

New specialist courses, which are post graduate, will naturally be professional and technical rather than simply liberal. A school of sanitary science and practice for qualified medical men, a school of pedagogics for those intending to be higher secondary teachers (inspectors, head masters, etc.), and a school for higher technical studies are some of the obvious directions of development.

It is not proposed to take all these up at once; the order in which they may be proceeded with will be best arranged by a committee.

It is not intended to cut off post-graduate students from education in Europe. It is contemplated to select the best for further training in Europe or America with a view to their future return to their country.

It will be necessary to make ample provision for scholarships and fellowships both for the students in the institution and for those who proceed from it to Europe or America.

The following are the requirements for admission, as announced: For admission to the research institute (or university), students who have graduated in arts, with mathematics or physics and chemistry as

optional subjects; graduates in science, engineering, and medicine, and students who have passed the intermediate examination for the degree of B. Sc., and diplomates in agriculture should be eligible.

It has also been decided that the curriculum shall include the following subjects:

(a) *Physics*.—Advanced courses in all departments, including mathematical physics and electric engineering.

(b) *Chemistry*.—(1) Advanced inorganic chemistry; (2) organic chemistry; (3) analytical chemistry; (4) agricultural chemistry.

(c) Technological chemistry applied to different arts and industries.

EDUCATIONAL PROVISION FOR SPECIAL CLASSES.

The quinquennial report by Mr. Cotton presents, in addition to the general survey of education, detailed accounts of special provisions necessitated by the caste system of the country. These are here reproduced in full.

EDUCATION OF NATIVE CHIEFS AND NOBLEMEN.

No special institution exists in Madras for the education of native chiefs and noblemen. A proposal to establish such an institution at Guindy, near Madras city, was brought forward by the then director in 1888, but was rejected by the Government on financial grounds. The court of wards, however, maintains a small establishment at Madras, consisting of a European tutor and a native assistant, to whom is intrusted the education of the more wealthy zamindars, under the care of the court. A few of the other zamindars have private tutors, and some attend the ordinary schools. Statistics are given for the five years ending 1895-96 showing the number of children of zamindars who were known to be receiving some sort of education. In 1895-96 the total was 60, of whom 6 were girls. Only 3 were under the European tutor of the court of wards, 38 were attending secondary schools, and 1 was at college. Six minors were receiving instruction in revenue law and the details of estate management. During the last five years a few passed the F. A. and B. A. examinations of the university. Three princes of the Cochin State attended the Presidency College at Madras during this period, of whom one passed for the B. A. and another for the F. A., while the third joined the College of Agriculture, at Saidapet.

In Bombay the special institutions maintained are the Rajkumar College, at Rajkot, in Kathiawar; the Girassia School, at Wadhwan, also in Kathiawar, intended for a less wealthy class; the Scott College, at Sadra, in the Mahi Kantha Agency, and a talukdari school at Vajeria, in the Rewa Kantha Agency. All of these are in Gujarat. The thakore of Gondal (in Kathiawara) has recently opened a special school

under an English head master for the bhayats of his family, and at Kolhapur (in the southern Mahratta country) there is a special class in the Rajaram High School for the sons of sardars and jagirdars. In Sind there are two special schools for the descendants of the Mirs (the former rulers of the country). The opening of one central school for this class at Hyderabad has been determined upon, but postponed for financial reasons. Of these institutions it may be said that the Rajkumar College and the Girassia School are successful and popular and effectively serve their special purpose. The Scott College also does useful work. Vajeria School is very small, and the two Sind schools are not altogether satisfactory. Apart from special institutions a large number of children of talukdars, jagirdars, and zamindars attend the ordinary schools. In 1896-97 no fewer than 553 boys and 50 girls of this class were returned for the northern circle alone (Gujarat, excluding Kathiawar). It may be stated generally that from year to year the chiefs and talukdars recognize more fully the necessity for education and allow the residence of their children at special schools without alarm or distrust. I can remember the early days of the Rajkumar College, when a constant struggle was waged with parents who would not let their sons rejoin after vacations and who sought for every pretext to withdraw them altogether. In a report received since the close of the year I notice that out of 41 boys on the rolls only one had been absent more than fifty days out of one hundred and seventy-six and two more than forty days. It need hardly be said that under such circumstances education becomes really profitable and the healthy influence of school life can be adequately developed.

“The number of boys at the Rajkumar College remains at 41, of whom 21 are in the high stage. Their ages range from 8 to 18. In 1896-97 the total expenditure was 48,845 rupees (\$9,440), of which 40,733 rupees (\$7,902) was derived from fees, the average cost of each pupil being 1,286 rupees (\$249.48), compared with 848 rupees (\$165) five years ago. After recording the appointment of a barrister on the staff to teach the elements of law to the first class it is thought worthy of record in the report that ‘the physical side also was strengthened by the appointment of Mr. N. C. Bapasola, the famous Parsi cricketer, as cricket coach.’ It was this college, it may be added, that produced Kumar Shri Ranjitsinhji. ‘The college may be said to be thoroughly efficient and under sympathetic management, and the only note of anxiety struck by the principal is as to the future of some of the kumars, who leave college full of activity and eager for suitable employment, which they can not always obtain in their own States.’ At the Girassia School at Wadhwan, the number of pupils has risen from 57 to 60, of whom 14 are in the high stage. In 1896-97 the expenditure was 10,472 rupees (\$2,030), entirely derived

from fees, the average cost of each pupil being 166 rupees (\$32.20), compared with 148 rupees (\$29). This school is also very popular and efficient and plays an important part in educating the sons of the lesser talukdars of Kathiawar. At the Scott College the number of pupils has risen from 30 to 34, of whom 9 are in the high stage. In 1896-97 the expenditure was 3,155 rupees (\$612), of which 2,303 rupees (\$447) was derived from fees, the average cost of each pupil being 96 rupees (\$18.62), compared with 95 rupees (\$18.40). None of these institutions receive any aid from public funds.

“In Bengal the only institution of this class is the nawab’s madrasa, at Murshidabad, for the descendants of the late Nawab Nazrin. Though classed as a madrasa, this is really a high school with six English masters, but no pupil has ever passed the matriculation. The number of pupils has risen from 59 to 60, of whom 22 are boarders, but the expenditure has fallen from 15,219 rupees (\$2,952.48) to 11,873 rupees (\$2,303.36). In accordance with an agreement entered into in 1882, when the pension of the nawab was reduced, the entire cost is borne by provincial revenues. Regarding the native chiefs of the tributary Mahals of Orissa the commissioner writes: ‘When they are minors they are educated at the Ravenshaw College, Cuttack; otherwise they can hardly be said to be educated, which accounts for the appallingly bad chiefs some of them are.’ It should be added that English tutors are frequently employed in Bengal for the education of wealthy minors under the court of wards.

“In the Northwest the only institution of this class is the Colvin School, at Lucknow, for the sons of oudh-talukdars. This is not mentioned in Mr. Nash’s review, possibly because it was not then in existence. In 1896-97 the number of pupils was 32, all of them boarders, 18 being Hindus and 14 Muhammadans. There was no matriculation class, but two were sent up for the English middle examination, of whom one passed. * * *

“In the Punjab a very suitable provision for the education of the native chiefs and gentry of the province exists in Atchison College at Lahore. Its aim is to give, as far as the circumstances will permit and without interfering with hereditary customs, a healthful and gentlemanly training on the lines of an English public school. Unfortunately the advantages of such a training are not as yet appreciated by those who might be expected to be the warmest supporters of the institution. The number of pupils has fallen from 86 to 60, of whom 7 attend lectures in the Government college and 13 are in the high stage. Nothing is said about expenditure or its sources. The report of the inspector is very favorable generally, though a number of minor defects are noticed. At the middle-school examination all the 8 candidates passed, and at the matriculation 3 out of 6. ‘The bearing of the boys is described as excellent; physical training is amply provided

for; the class in boarding equipment is very satisfactory, and the organization and discipline are creditable to all concerned.' Apart from the Atchison College the degree to which gentlemen of rank in the Punjab are taking to education becomes more apparent every year, and this fact was emphasized in 1896-97 by the wish of the heir of one of the ruling States to appear at a university examination. According to returns submitted by the inspectors, out of 660 boys of family rank and school-going age only 13 (some of whom are very young) are not receiving instruction of some kind, while 541 are at ordinary schools. 'The number attending the Atchison College from all the circles except Lahore is very small, especially from Rawalpindi and the Derajat; and it would, without doubt, be of great advantage to the families themselves as well as to the province if more of those who are now content with the ordinary schools were to receive a gentleman's training along with their equals at the Atchison College.'

"The Rajkumar College, in the Central Provinces, was transferred in 1895 from Jubbulpore to Raipur, where it is more accessible to the numerous States of the Chhatisgarh division. The number of pupils has risen from 8 to 23, the expenditure from 3,410 rupees (\$661.54) to 12,769 rupees (\$2,477.18), and the average cost of each pupil from 426 rupees (\$82.64) to 555 rupees (\$107.67). In 1896-97 the receipts from fees produced 61 per cent of the expenditure, the remaining being met from an endowment subscribed by the ruling chiefs of Chhatisgarh, who are represented by six members on the governing body. The aim of the school is to give a sound English education up to the middle standard, and eventually to qualify boys for admission to the university. One pupil passed the middle-school examination in 1895-96. The progress made under the new principal has been highly satisfactory. The instruction is sound, and care is taken, by the encouragement of such subjects as physical science and drawing, not to make it too bookish. To moral and physical training much attention is given, every effort being made to foster a manly spirit by means of games and athletic sports. The boys play cricket and football, and all of them ride. With sanitary surroundings and daily exercise, the physique of the pupils, as might be expected, improves from the time they join the institution." (Quinquennial Report, pp. 350-352.)

EDUCATION OF BACKWARD CLASSES.

"The backward classes that receive special attention under the educational system of Madras are the Panchamas, the aboriginal or hill tribes, and the Mappillas. The word Panchama means, literally, the 'fifth class.' It has recently been brought into use, not only for the sake of brevity, but also to take the place of the terms Paraiya (pariah), outcast, etc., with all of which some idea of degradation is

associated. In 1893 the Government sanctioned a series of eight proposals for encouraging education among the backward classes, which has been considered by missionary and other philanthropic bodies as the Magna Charta of Panchama education:

(1) Panchama students in training schools under public management should be given an additional stipend of 2 rupees (\$0.39) a month;

(2) Panchama students who seek admission into training schools under private management should be granted the higher rates of stipendiary grants under the grant-in-aid code;

(3) Local boards and municipalities should be required to open schools for these classes in all large Panchama villages and suburbs where such schools do not exist;

(4) Paramboke lands [Government waste] should be granted free as sites for Panchama schools;

(5) For Panchama pupils attending "salary results" schools, "results stipends" should be paid at the maximum rates;

(6) The night-school system, which is eminently suited for the education of these and other laboring classes, should be specially developed and encouraged.

(7) "Results grants" for Panchama pupils in "results schools" should be paid at 50 per cent in excess of the standard rates; and

(8) Refund of building grants should not be claimed, if the buildings have been used for school purposes for six years.

"In addition to the above concessions, 19 Government scholarships for boys and 15 for girls are reserved for pupils of the backward classes on the results of the prescribed examinations, and a preference is given to them in awarding the F. A. scholarships. A training school for Panchama teachers has been opened at Madras City. The necessity for a special inspecting agency has not been felt as yet, nor can funds be spared for the purpose. Moreover, the employment of such an agency for the supervision of Panchama schools would, I apprehend, have the effect of perpetuating the idea of the social degradation of these classes, and would prove a serious obstacle to the gradual disappearance of the existing prejudices against them.

"During the last five years the total number of institutions wholly or chiefly intended for Panchamas has steadily risen from 1,437 to 2,468, or by 72 per cent, and the number of pupils in them from 31,659 to 57,894, or by 83 per cent. The number of Panchama boys has risen from 20,970 to 34,527, and of girls from 3,648 to 4,961. The number in the higher stages is still infinitesimal. In 1896-97 the proportion of pupils to the population of school-going age was 8.3 per cent for boys, rising to 49.4 per cent in Madras City, and 1.1 per cent for girls. It should be stated that these figures do not include native Christians, a majority of whom are Panchamas by race. The total expenditure on Panchama schools in 1896-97 was 227,870 rupees (\$44,206.78), of which 39 per cent was borne by public funds and 54 per cent was derived from 'other sources,' indicating the extent of missionary contributions.

"In Bombay special measures have been taken for many years for spreading education among the aboriginal and backward races. The

number of them to be found at school is returned annually for each district, and it may be remarked that their attendance at once falls off when scarcity begins to prevail. Though the number of aborigines proper is not large, those of them that remain in the hills are still practically without education of any kind, and they will only be reached when teachers of their own race can go and live among them. But where the Bhils and Kolis and the Kaliparaj (dark races) have descended into the valleys and taken to a sedentary life, there special schools have been opened for them.

“The district board of Broach spends 1,000 rupees (\$194) on scholarships for Talavias and other aborigines; in Surat government has given a grant in aid for the extension of education among the Kaliparaj, and in the native States of the Rewa and Mahi Kantha agencies special schools are numerous and successful.

“As regards the depressed races whose caste is a bar to their education, our system does not vary. Public schools are open to all castes, and special schools for low castes are permitted, but the department does not force upon the people the consideration of a question as to which its powers are uncertain. While the last Quinquennial Review gives an interesting account of the success of measures taken in Berar some years ago to place the low-caste boys on a level with others in a school, I can quote an experience in the Kaira district where too hasty action on the part of local officers led to five or six large schools being closed for years, to the huts and crops of the depressed people being burned in one village, and to the imposition of a heavy punitive post on that village for two years. A principle generally accepted by district boards is that the children of depressed castes shall be so placed as to have shelter from sun, rain, and cold, and that they shall receive a due share of the teaching of the school.”

“In Bengal the educational returns only distinguish the aboriginal races, which they subdivide into Christian and non-Christian. No information is available about the progress of education among the low castes generally, whether they are Hindoos, Mohammedans, or (in Chittagong) Buddhists. The home of the aboriginal races is chiefly in the Chota Nagpur and Bhagalpur divisions, the Orissa tributary Mahals, the South Lushai Hills, the Birbhum and Bankura districts of the Burdwan division, and the northern part of the Mymensingh district of the Dacca division. In all these places special efforts have been made for the encouragement of primary education. The special board schools in Mymensingh and the special departmental schools in Orissa have already been referred to. There are extensive missionary organizations in all the districts of Chota Nagpur, whose efforts to spread education among the wild tribes of Bengal have been conspicuously successful. There is besides a strong committee at Giridih, the center of coal-mining industry in those parts, which, with liberal

grants from the department and from the East India Railway Company, has done much to educate the children of the numerous colliery laborers, who are mostly of aboriginal or semiaboriginal descent. The Government high school at Rangamati, the Dublin University mission high school at Hazaribagh, and the German mission high school at Ranchi are chiefly intended for aboriginal races. The two latter were started during the period under review. A special deputy inspector is employed for the inspection of Southal schools in the Southal Parganas. The inspecting pandits for the supervision of primary schools intended for aboriginal tribes should, as far as possible, be aborigines themselves; but the director fears that this requirement has not always been attended to. The usual limitation of age in the award of Government scholarships is not strictly applied to pupils of aboriginal descent. The Bhunyas of the tributary Mahal of Keonjhar in Orissa are quoted as an example of the aversion to education evinced by some wild tribes. After the late disturbance they ceased to allow their children to attend school altogether, so that in 1896-97 the whole State returned only four pupils of aboriginal descent. They burned the schoolhouses in the disturbance, and are said to regard police and education as equal forms of oppression.

“During the five years the total number of aboriginal pupils in Bengal has risen from 29,663 to 37,870, or by 28 per cent, compared with an increase of 9 per cent for pupils generally. In the last year the number fell by 1,099, owing to the prevailing scarcity. Those in the collegiate stage have risen from 7 to 22, of whom 15 are Christians; those in high schools from 223 to 400; those in middle schools from 911 to 919. Christians have risen from 4,005 to 6,567; non-Christians from 25,658 to 31,303. Nearly 23,000 of the total are to be found in Chota Nagpur, compared with about 18,000. Passes at the matriculation have risen from 2 to 6; at the upper primary examination from 51 to 59, and at the lower primary from 313 to 627. At the middle school examination alone is there a decrease from 33 to 13, chiefly on account of the elevation of the German mission school at Ranchi from the middle English to the high English grade.

“In 1896-97 the number of schools managed by five different missions in Chota Nagpur was 203, attended by 6,271 pupils, of whom 1,208 were girls. The total expenditure was 49,604 rupees (\$9,623), of which only 9,679 rupees (\$1,877.72), or 20 per cent, was borne by public funds. The number of schools for the children of miners in the district of Hazaribagh managed by the committee at Giridih was 32, attended by 1,383 pupils. One of these is an industrial school, where the boys learn enough English to understand the technicalities of the work of fitters, carpenters, and blacksmiths. The total expenditure was 2,487 rupees (\$482.47), of which 1,124 rupees (\$218), or 45 per

cent, was borne by provincial revenues. The results of the primary examinations were not satisfactory.

“In the report for the Northwest nothing is said about any special measures for the education of backward classes, nor of the number of them to be found at school.

“In the Punjab the special schools existing for the education of low-caste children are mostly aided elementary schools, which fall under the head of ‘Other schools’ in the table of indigenous schools examined for grants. Though mainly intended for this class, the attendance is yearly becoming more and more mixed. In the Delhi circle these schools consist entirely of those maintained by the Society for the Propagation of the Gospel and the Baptist mission. Their number has risen from 10 to 21 and the pupils in them from 276 to 548. Scholarships are awarded in the Gurgaon district to induce boys of the Mina tribe to attend school, but less attention than formerly appears to be paid to this matter. In the Jullundur circle 4 schools of this class are said to have been opened recently by the American mission, and the inspector returns 130 low-caste children in attendance at ordinary schools. In the Lahore circle the schools of this class have fallen from 35 to 18, and the pupils in them from 531 to 287; but the ordinary aided elementary schools largely meet the requirements, and the inspector remarks that the strong feeling against associating with low-caste children is slowly but surely losing ground. In the Ramalpindi circle schools of this class comprise the native Christian training institute at Sialkot, with 149 pupils, which has recently been raised to the grade of a high school; 14 elementary schools in the Sialkot district, with 205 pupils, and 3 such schools in the Gujrat district, with 52 pupils. Included among these are 3 so-called Sansi schools in Sialkot, but less is now being done for the education of this tribe than was formerly the case. In the Derajat circle no special schools exist either for low-caste children or for the predatory tribes.

“In the Central Provinces the aboriginal tribes returned in the census of 1891 under the head of ‘Animistic religions’ number 2,081,721, or 16 per cent of the total population. During the last five years the number attending school has risen from 1,957 to 4,436, or by more than twofold; but the proportion to the population of school-going age is still only 1.4 per cent. Living, as they do, in the wilder tracts in small villages or jungle huts, it is difficult to establish schools for them, and still more difficult to get them to attend. The director thinks, however, that the extension of ‘combined-system’ schools has been the means of bringing a larger number of them to school, as the double rates offered for pupils of these tribes have doubtless been appreciated by schoolmasters, who find their education a paying busi-

ness. The increase of Gonds in the 'combined-system' schools of Raipur was attributed to this cause in the report for 1892-93:

Every schoolmaster tries to admit as many Gonds as possible. Promotion in this district means the transfer of a master to a school where aborigines abound.

Boys of low caste are to be found in some of our schools, but the degradation of their position and the fact that they are not allowed to live in the village, but are quarantined in little hamlets of their own, form a bar to their progress. Separate schools for low castes under low-caste schoolmasters exist in some districts. Seven schools for Dhers have been established in Chanda, and a school for Dhers under a Dher teacher was opened in 1893 at Sironcha. A Dher boy obtained last year a scholarship tenable in an Anglo-vernacular school situated in one of the largest cities of the province. The school committee requested me to remove him, as his presence was calculated to offend the susceptibilities of his schoolfellows and would injure the attendance. I declined to do as they wished, and I have not found the attendance at the school decline.

In Burma special schools are maintained for Karens, Kachins, and some other tribes, as well as for the immigrant Tamil population from Madras. Karen schools, which are confined to Lower Burma, are mainly conducted by the American Baptist Mission. They have made much progress during the quinquennial period, and it has been noticed that the Buddhists among them are beginning to follow the example of their Christian brethren. Anglo-vernacular education is steadily advancing, but the following statistics apply only to primary schools: During the last five years the number of Karen schools has risen from 474 to 516, and the pupils in them from 14,584 to 15,582, of whom a large proportion are girls. Passes in the primary standard have increased at a yet higher rate. In 1896-97 the total expenditure on them from the public funds was 45,476 rupees (\$8,822.34). The Karens enjoy special concessions as to teachers. A Karen schoolmaster on passing the primary test is entitled to pay at the rate of 10 rupees (\$1.94) a month, and on passing the secondary test to 15 rupees (\$2.91). There can be no doubt that much of the efficiency of Karen schools is due to this system. As a rule, Karen schools are of a higher grade than Burmese schools, because several teachers in a school may be receiving Government pay under these rules. The condition of education among the Karens of Burma is satisfactory. The schools are liberally supported by the people, who take a great interest in them through their village committees. They tax themselves very considerably for their schools and missions. Teachers appear earnest in their work and to be making steady efforts to improve themselves. The Karen teacher is more domesticated. He prefers to work for 10 rupees (\$1.94) in his native village rather than to go 20 miles away for three times the amount. This tends to greater stability among Karen schools. The American Baptist Mission has also established two schools for Chins at Sandoway and Thayetmyo, a school for Kachins at Bhamo, and an Anglo-vernacular school for

Shans and Burmese at Bhamo. It is only from the Kachin school at Bhamo that teachers can be procured for the Katchin villages, which are very numerous. There are many private institutions attended by mixed races, including Kachins, in the Bhamo and Myitkyina districts. A few private institutions exist for Manipuris only, Burmese being the language taught, but the majority of this race attend Burmese schools. Pupils classed as Chinese are usually the offspring of a Burmese mother and attend Burmese schools. Chinese, however, is taught at two Roman Catholic schools at Mandalay. In 1896-97 there were 49 Tamil schools, with 1,173 pupils, on which the expenditure from public funds was 3,035 rupees (\$588.79). Anglo-vernacular education progresses among them, but the condition of primary education is not satisfactory. The majority of the Tamil and Telugn immigrants from Madras are either laborers or agriculturists, scattered in small hamlets, so that it is difficult to collect enough children to form a permanent school. The attention of the department has recently been turned to the Talaing schools in the Amherst and Thatôn districts, and text-books for elementary instruction in Talaing are now under preparation. In 1896-97 there were 174 such schools, with 3,125 pupils." (Quinquennial Report, pp. 355-358.)

HOSTELS OR BOARDING HOUSES.

The following summary of the condition of the hostels or boarding houses for students is given by Mr. Cotton in the introduction to a detailed account of the same:

"The rapid growth of hostels or boarding houses demands that the subject should have a chapter to itself, though the materials are not very ample, nor do the statistics extend over a long period of time. Some accommodation for resident pupils has always existed under various forms. One example is the Lawrence asylums for the children of European soldiers at hill stations in the Punjab and Madras. Another is to be found in the necessity which missionaries have felt for maintaining as well as educating their converts. Yet a third may be called indigenous to India, where it has ever been recognized as the duty of a religious teacher to feed the disciples that come to him for instruction. The earliest boarding houses in connection with government schools were started in the Northwest and the Punjab, quickly followed by Assam. This movement preceded the education commission of 1882, which confined itself to approving the extension of boarding houses for collegiate students. The strongest stimulus came from a letter of the government of India on discipline and moral training, which was addressed to all the local administrations in December, 1887. Among other recommendations, this letter expressly suggested that hostels and boarding houses should be established at

the larger schools and colleges in large towns and cities for the accommodation of students whose families are not resident in the place where they are being educated.' * * *

“The total number of hostels increased from 993 in 1895-96 to 1,270 in 1896-97, and the boarders in them from 35,857 to 40,573, while the expenditure increased from 1,696,391 rupees (\$329,099.85) to 1,804,996 rupees (\$350,169), toward which public funds contribute less than 11 per cent. But this increase did not extend to all provinces nor to all classes of institutions. It is most conspicuous in Burma and Madras, where the boarding houses largely consist of missionary institutions for the accommodation of native Christians under primary instruction. The Central Provinces show a considerable decrease, which is presumably due to famine. The slight decrease in Bengal confined to primary and special schools is less easy to explain. The increase in Bombay, despite the plague, is entirely under primary schools.

“Government hostels, which include the Lawrence asylums and one or two similar institutions for European children, are found chiefly in the Northwest and Bengal. The average strength of each hostel is 37 boarders, ranging from 76 in the Punjab to 21 in Assam. District and municipal hostels are almost confined to the Northwest and the Punjab, their average strength being 10 boarders in the former and 23 in the latter. Aided hostels are more evenly distributed and have a more uniform number of boarders, the average being as high as 52. Unaided also are pretty widely distributed, but their average strength of 25 is a mean between 60 in the large missionary institutions of Madras and 12 in the small missionary institutions of Burma.

“Hostels for girls almost all belong to one of two classes—either asylums for European children maintained by Government or missionary institutions. None are managed by district or municipal boards. The former have the high average strength of 68 boarders; the latter hardly ever fall below 50 or rise above 60. * * *

“The hostel system has been most developed in the Punjab, which has 7,113 boarders, or nearly one-fourth of the total. Here nearly one-half of all the students in arts colleges and just one-tenth of all the pupils in secondary schools are to be found in hostels. Then follow Bengal and the Northwest, both of which also are well represented under arts colleges and secondary schools. Madras and Burma resemble one another in having the majority of their boarders in primary schools. Bombay is conspicuous for its small number of boarders, none of whom are in arts colleges.

“Of the total expenditure, provincial revenues contribute less than one-tenth. The high figure for Madras includes the cost of the Lawrence Asylum, which in the Punjab is paid from imperial revenues. Local and municipal expenditure is almost entirely confined to the Punjab and the Northwest, showing the popularity of hostels in these

provinces. Fees provide 46 per cent of the total expenditure, the proportion rising to 70 per cent in the northwest and falling to 30 per cent in the Punjab. Subscriptions, endowments, etc., provide 40 per cent. The high expenditure under this head for the Punjab includes 47,048 rupees (\$9,127.31) from imperial revenues, and the still higher figure for Madras indicates the predominance of missionary hostels in southern India.

“There are 215 hostels for girls with 11,504 boarders, of whom nearly one-third are to be found in Madras, where returns show that almost all are either Europeans or native Christians; and it may safely be assumed that the same applies more or less to other provinces for which details are not available. In the Punjab, for example, out of 1,388 boarders, no less than 837 are Europeans. In this case, subscriptions, etc., including 51,330 rupees (\$9,958) from imperial revenues in the Punjab, provide more than half the total expenditure, while the contribution from local and municipal funds is insignificant.” (Quinquennial, pp. 370-371.)

CHAPTER II.

THE DEVELOPMENT OF ENGLISH SECONDARY SCHOOLS FOR BOYS.¹

By DR. PH. ARONSTEIN.

INTRODUCTION.

The reform of secondary schools in England occupies to-day a leading place in the public interest.

The report of the royal commission upon secondary schools appeared in November, 1895. In that year the Conservative party in control of the Government attempted to reorganize the secondary schools, and reform the elementary schools in accordance with clerical views, by a new education bill. Unfortunately the first object, which was acceptable to all parties, was defeated on account of its union with the second, which aroused the liveliest party passions. But although the bill was withdrawn provisionally, the measures affecting the secondary schools may be resumed very soon. The requirements of commerce and industry demand a change, and especially has the reawakened fear of German competition in the markets of the world, whose success in this direction the English ascribe to the better schools of Germany, given rise to such a demand.

At such a moment it is interesting to give a review of the history of secondary schools in England and trace their beginning and growth. Such a task is not only instructive for educators, but especially so for the English philologist who desires to enter into the spirit of English culture and understand the individuality which is characteristic of the race and which is manifested in such manifold ways, and yet in such a uniform and definite manner.

I confine myself at present to the education of boys, because the history of the secondary education of girls is of much later date, being hardly two generations old, and would require a special treatment.

The material for a historical treatment of the subject is extraordinarily rich and almost inexhaustible. The monographs upon the celebrated schools and teachers are especially numerous. Notwithstanding this abundance of material, there is still wanting an impartial and connected history of the development of secondary schools in England, and this lack is the reason for writing the present work. The following list contains the books I have used:

B. Ackermann. *The History of the Colleges of Winchester, Eton, Westminster, etc.* London, 1816.

Howard Staunton. *The Great Schools of England.* London, 1865.

Great Public Schools, by various authors. London, 1875.

A. C. Maxwell Lyte. *A History of Eton College (1446-1875).* London, 1875.

¹The substance of a lecture delivered at the seventh meeting of neophilologists at Hamburg in 1896, enlarged and rewritten.

- T. F. Kirby. *Annals of Winchester College*. London, 1892.
Winchester College, by old Wykehamists. London, 1873.
 Frederic H. Forshall. *Westminster School, Past and Present*. London, 1884.
 A. G. Bradley. *A History of Marlborough College*. London, 1893.
 Charles Eyre Pascoe. *A Practical Handbook of the Principal Schools of England*. London, 1877.
 C. P. Stanley. *Life of Dr. Arnold*. London, 1844.
 Tom Brown's *Schooldays, by an Old Boy (Thomas Hughes)*. London, 1857.
 Ch. Wordsworth. *Annals of My Early Life*. 2d ed. London, 1891.
 Frederic Seebohm. *The Oxford Reformers of 1498, John Colet, Erasmus, and More*. London, 1867.
 Quick. *Essays on Educational Reformers*. London, 1890.
 Royal Commission on Secondary Education. Vol. I, Report of the Commissioners. London, 1895.
 Ernst Gottfr. Fischer. *Über die englischen Lehranstalten in Vergleichung mit den unserigen. Programm des Gymnasiums zum grauen Kloster*. Berlin, 1827.
 C. W. Krause. *Betrachtungen über den Zustand des englischen Erziehungs- und Unterrichtsanstalten im Jahre 1836*. Elberfeld, 1837.
 Gustav Petri. *Über die Public Schools in England, verglichen mit den deutschen Gymnasien. Programm*. Elberfeld, 1862.
 J. A. Voight. *Mitteilungen über das Unterrichtswesen Englands und Schottlands*. Halle, 1863.
 Ludw. Wiese. *Deutsche Briefe über englische Erziehung*. Berlin, 1852. 2 Bd. Berlin, 1877.
 Hegenbarth. *On the Discipline in English Schools. Programm. Neubrandenburg, 1856. (Worthless.)*
 Athanasius Zimmermann (S. J.). *Englands öffentl. Schulen von der Reformation bis zur Gegenwart*. Freiburg i. Br., 1892. (Thorough, but influenced by the author's tendency.)
 J. Demogeot et H. Mantucci. *De l'enseignement secondaire en Angleterre et en Écosse*. Paris, 1870.
 Max Leclerc. *L'éducation des classes moyennes et dirigeantes en Angleterre*. Paris, 1894.
 Max Leclerc. *Les professions et la société en Angleterre*. Paris, 1894.
 Besides the foregoing, English writers and periodicals afford much material—e. g., Boswell's *Life of Johnson*; Addison's *Spectator*; the works of Smollett and Goldsmith; Adam Smith's *Wealth of Nations*; Huxley's collected essays; Ward's *Reign of Queen Victoria*, and the *Contemporary Review*, the *Nineteenth Century*, *Blackwood's*, etc. Also, papers upon English schools in communications to *Anglia*, Vols. I and II, are very valuable.

PART I.

FROM THE FOURTEENTH TO THE NINETEENTH CENTURY.

I.

THE FOUNDING OF THE LATIN SCHOOLS.

Schools in which Latin was taught have existed in England since the introduction of Christianity, but they were, for the most part, only appendages to the cathedrals and monasteries, and therefore were devoted solely to the needs of the church, the education of the laity being entirely incidental. Therefore those schools exerted no directing influence upon secondary education. They declined in the later Middle Ages on account of the Wars of the Roses and later through the decline and dissolution of the monasteries. The founding of Winchester College by William of Wykeham,

bishop of Winchester, in 1386¹ marks an epoch in the history of secondary schools. Wykeham was not merely an ecclesiastic, but preeminently a diplomat, a statesman, an architect, and a man of the world, and he founded New College at Oxford in a determined spirit of opposition to monachism,² and he likewise established a preparatory school for this college in the old capital of the Anglo-Saxon kings and of his own see. His original plan was to have a warden as director of the school, with 10 fellows, 1 principal, and 1 assistant teacher, 70 poor³ scholars, 3 chaplains, and 16 choristers. In addition to these, 10 paying scholars, the sons of noble and wealthy men who were friends of the institution, were to be admitted.⁴ This was the first independent educational institution in England and has served as a model, in its principal features, for all subsequent secondary schools. The first of these characteristics was its external relations. As already remarked, the school was annexed to a college of the university. Every year some of the 70 "poor and needy" scholars who were taught in it free of expense went to fill scholarships at Oxford. But the internal organization was of supreme importance. Wykeham was the first to establish the monitor system, which is to-day a characteristic of the English public schools. Certain duties and rights are intrusted to the 18 oldest and most advanced scholars, who were called propositors, and later præpositors, for the maintenance of order.⁵ Some of them also gave instruction to the younger boys—a feature which was peculiar to Winchester—so that they held a middle place between teachers and pupils.⁶ This arrangement owed its origin to economical considerations.

Wykeham was also the first to regard schools as national institutions, and he made it one of their prime functions to promote an esprit de corps among the scholars. By means of sports and intellectual competition and all the pleasures and interests of a life in common, he sought to make his institution—unlike the old Benedictine

¹ He obtained the papal sanction on May 9, 1380, and the royal permission October 6, 1382. On May 26, 1386, the corner stone was laid. (Kirby.)

² Monks were excluded from Wykeham's foundations as they were from Eton afterwards. (Maxwell Lyte, pp. 3 and 491.)

³ The college shall consist de numero septuaginta pauperum et indigentium scolarium clericorum collegialiter vivencium in eodem. [The college shall consist of 70 poor and needy scholars living together as comrades.] It is called Sancte Marie Collegium, vulgariter Sainte Marie College of Wynchestre. (Kirby, p. 442.)

⁴ Latin original of the words of the text in Kirby, p. 495. (Statutes XVI.)

⁵ Statutes CXXXIV (Kirby, p. 495). In cameris sint ad minus tres scolares honesti ac ceteris scolaribus maturitate, discrecione, ac scientia provectiores qui aliis suis consociis superintendant et eosdem diligenter supervideant, et de ipsorum moribus et conversacione studiisque profectu custodem, vice-custodem et magistrum instructorem de tempore in tempus, quociens causa sui opus fuerit, sub ipsorum debito juramenti Collegii prestiti supradicto, cum requisiti fuerint, veraciter certificent et informant, ut hujusmodi scolares defectum in moribus patientes sin in suis studiis desides castigationem, correccionem et punicionem recipiant juxta eorum demerita debitas ac eciam competentes. [There shall be at least 3 scholars of good repute in the chambers, who shall be older and more discreet than the others and further advanced in their studies, who shall superintend and oversee their fellows, and shall truly certify and inform the warden, vice-warden, and master of the morals, manners, and progress in study of the scholars, from time to time, as occasion arises, or when required, in accordance with their oath to the head of the college, in order that by this means those scholars who fall into bad ways or neglect their studies may receive the castigation, correction, and punishment suited to their demerits.] See also the Tabula legum pædagogicorum, where it says: Qui plebeius est, præfectis obtemperato. Qui præfectus est, legitime imperato. Is ordo vitio careto; ceteris specimen esto. [Let the plebeian obey the prefects [prepositors]. Let the prefect rule justly. Let that order be free from faults and be a model for the others.] In a poem of the head master Johnson, De Schola Collegiata Wiccamica, occur the following lines (Kirby, p. 87): Præfecti octodecim seniores rite vocantur [The 18 oldest boys are properly called prefecti]; and again:

Sex cameræ pueris signantur et una choristis,
Ut magis hic mores servantur, et ordo decorus
Præfecti camera tres proponuntur in una.

[Let six chambers be assigned to the scholars and one to the choristers. In order to maintain good morals and decorum 3 prefects are placed over each chamber.]

⁶ The institution known as "boy-tutors" still exists at Winchester in a more restricted form.

and cathedral schools—a nursery of patriotism, and to awaken a consciousness of mutual dependence and of devotion to the general welfare among his pupils. He expressly exhorts them at a later date to feel like comrades toward one another.¹ But eventually this mediæval bishop clearly recognized the view that education does not consist in training the understanding and gaining knowledge alone, or even principally, but that it should be the development of the whole man—the formation of character. His fundamental maxim that “manners make the man” shows this. He regarded the sciences as in the widest sense the promoters of culture,² and added to them the cultivation of a religious but by no means a monastic spirit. But that he was fully in accord with his followers in regard to the means of instruction is shown by the arms of his school (mitre and crosier, pen and ink bottle, sword and long rod) with the legend: *Aut discite, aut discedite; manet sors tertia cædi*. [Either learn or leave; the third alternative is to be flogged].

In 1440 the pious King Henry VI founded a school after the model of Winchester, in sight of his castle of Windsor, which has remained until the present day the leading educational institution of England, and which shows most clearly the advantages and failings of the so-called public schools—Eton College. This institution originally combined the character of a collegiate church, a poorhouse, and a school for “poor and needy” children.³ The poorhouse soon fell into disuse, while the church and school have lasted more than four hundred years. The provost and fellows were required to be priests and unmarried,⁴ but could not be monks.⁵ Like Winchester, which gave it its first provost and scholars,⁶ Eton was annexed as a preparatory school to a college at the university, to which it sent its best scholars every year. This was King’s College, Cambridge, which was also founded by Henry VI. Like Winchester, Eton received besides its 70 scholars a number (20) of the sons of noblemen and friends of the college as pupils, but they were required to pay their own expenses. They were called *commensales* and later *oppidani*. Besides them there was another class of *commensales* provided for, who ate at the same tables with the scholars and choristers and paid less than the first class.⁷ At a later period these two classes were distinguished as “gentleman commoners” and “commoners,” and both increased in numbers greatly after the Reformation.⁸

The school survived the storm of the Reformation, but not without temporary danger. Henry VIII threatened its existence several times, but finally contented himself with an exchange of estates which resulted in his favor.⁹ In 1535 the school was so rich that its property was estimated to be worth £1,000.¹⁰

The golden age of founding schools was the epoch of the renaissance and the Reformation, the sixteenth and the beginning of the seventeenth centuries. One of the

¹ Pro perpetuo tanquam personæ collegiales ac collegiate simul conversentur ac collegialiter stent et vivant. (Kirby, p. 332.) [Let them associate with each other always as colleagues and comrades and remain and live as such.]

² In the charter occurs the fine passage: Per literarum scientiam justitia colitur et prosperitas humane conditionis augetur. [Justice is cherished by the cultivation of letters and human prosperity is increased thereby.] (Kirby, p. 441.)

³ The college shall consist of a provost, 70 poor scholars, 10 fellows, 10 chaplains, 10 clerks, 16 choristers, a head master, an under teacher, and 13 poor and sick men, so-called bedesmen. (Maxwell Lyte, pp. 7, 21, 489.)

⁴ After the Reformation this requirement naturally ceased. The first married provost was Sir Thomas Smith.

⁵ A fellow taking the vows of a religious order shall ipso facto vacate his post. (Maxwell Lyte, p. 491.)

⁶ William of Waynflete, a teacher of Winchester was the first provost of Eton. He brought 5 fellows and 35 scholars with him from Winchester.

⁷ Statutes XVI and XVIII, in Maxwell Lyte, p. 496.

⁸ *Id.*, pages 428–461.

⁹ Hence the saying, “Henricus Octavus took more than he gave us.” (See, upon this exchange, Maxwell Lyte, p. 105 ff. and p. 120 f.)

¹⁰ Maxwell Lyte, p. 107.

first,¹ and by far the most important of the schools which were established at this period was St. Paul's School, founded by John Colet, dean of St. Paul's Church. John Colet was one of the most distinguished members of the circle of Oxford humanists which inaugurated the advancement of classical learning in England. He was wealthy and well born, coming from a genteel commercial family,² had learned Greek in Italy together with Thomas Linaere and William Grocyne, and after his return to Oxford had given lectures on the Bible, particularly the epistles of St. Paul. There young Thomas More and the great Erasmus joined him. In 1505 he became dean of St. Paul's Church in London and acquired great influence by his sermons. Upon the death of his father he inherited great wealth, which he decided to devote to the founding of a school, and in 1509 he established a Latin school in the churchyard of St. Paul's Church for 153³ children, with two teachers and a chaplain. It was opened in 1512. After he had built his school, says Erasmus, he intrusted the care of the property and the conduct of the school not to priests, not to the bishop, not to the chapter, nor to a great minister of the court, but to the married laymen of the silk mercers' guild, men of uprightness and repute. And when he was asked why he made this disposition of his property he answered as follows: That there is no absolute certainty in human affairs, but that as far as his experience went he believed there was less corruption in such a body of merchants than in any other condition or order of men. The merchant's son here speaks in the pride of his unaided efforts.

The first head master of the school was William Lily, who was, like Colet, a humanist of note and a Grecian. He had traveled even as far as Jerusalem, had spent a considerable time in Rhodes, had visited Rome, and after his return to England had opened a private school in London where he taught until Colet induced him to take charge of his newly-founded institution.⁴ With Colet and Erasmus as joint authors he wrote a Latin grammar, for which Cardinal Wolsey wrote a preface and directions for use, and which, under the name of Lily's Latin Grammar, and later as the Latin Grammar of King Edward the Sixth, has been of almost canonical authority in English schools for centuries.⁵

The school regulations drawn up by Colet (June 18, 1518) breathe a spirit of real piety and learning. The school was to be open to the children of all nations and lands without distinction, a provision which shows how entirely Colet was a son of the renaissance. The children were to be instructed "in good manners and knowledge" without charge.⁶ The head master must be a man of sound health and good morals and reputation, and familiar with good and pure Latin literature, and Greek also, "if such can be found." He may be married or single, or a priest without a parish or any position which would interfere with his duties as master. He must not be absent from the school longer than thirty days in the year and must undergo an annual examination at Candlemas by the trustees of the school, who had the

¹ Cardinal Wolsey's school at Ipswich was founded somewhat later (1525), but its income was later mostly withheld by Henry VIII, so that Elizabeth was compelled to reestablish it in 1565. (Zimmermann, p. 6.)

² His father, Sir John Colet, was twice lord mayor of London. John was the oldest of twenty-two children, but he alone survived his parents and so inherited his father's wealth. (See Frederick Seebohm, *The Oxford Reformers*.)

³ The number of fishes caught by Peter. (John xxi, 11.)

⁴ He occupied the position from 1512 until 1522-23, when he died.

⁵ See for the history of this grammar *Anglia*, Vol. I, p. 275 ff., 292 ff., 330 ff., and the *Dictionary of National Biography*, article upon Lily by Lupton.

⁶ Colet writes of Lily: *Nihil enim æque mihi cordi est in præsentia quam ut parvuli Christi quam plurimum apud te proficiant, cum litteratura, tum bonis moribus. Ad quod si enitiris et Jesum puerorum præsidem tibi tuo studio demereberis et me plane fœlicem reddideris.* [For nothing is so near my heart at present as that the little Christs should progress as much as possible under your care, both in learning and good manners. Which if you strive for you will both deserve well of Jesus, the guardian of the boys, by your zealous efforts, and will render me happy.]

power to dismiss him if he had been remiss in his duties. Similar provisions were made for the surmaister or submagister, who was appointed by the head master and had the first chance of succeeding to his position.¹

The catechism was taught in English and instruction was given in Latin both in the classical authors and in the works of the best Christian writers, and, for the first time in an English school, Greek was taught. As to Latin, Colet expressly and emphatically declared that only "pure and chaste Latin" should be taught, while he took pains to banish all barbarous and bad Latin from the school.² He drew up a list of books which he deemed suitable for reading in school,³ although he declined to lay down any hard and fast rule.

At the end of his grammar he reminds the teachers that the best way to learn Latin is by reading and not by the study of the grammar, by examples and not by committing rules to memory. Colet's writings show all through a fine pedagogical tact and a care for the mental and moral welfare of youth which is free from all pedantic affectations. "Lyft up your lytell whyte handes for me," he says in the preface to his grammar, "which prayeth for you to God to whom be all honour and imperyale maieste and glory. Amen."⁴ And still more humanly near to us does this great and free spirit seem to be by his retention of certain old symbols and customs. It has already been mentioned that the number of free places in the school corresponded to the number of fishes caught by St. Peter at the miraculous draft. The old custom, which was also preserved at Winchester and Eton, by which the choristers elected a boy bishop at Christmas, who held office until the eve of the feast of the Innocents (December 28), was expressly established at St. Paul's School as well. The scholars were obliged to listen to a sermon by their bishop on the feast of the Innocents and at its close each scholar gave him a penny. On the other hand, cockfights and other similar sports, as well as disputations on St. Bartholomew's Day, "which is only foolish talk and a waste of time," were strictly forbidden. Nor could the head master grant other holidays besides those regularly appointed, under a fine of forty shillings.⁵

Colet made an ample provision for his school. Its income from its estates was some £120 at the start, and is now a hundred times as much.⁶ It was a seat of the "new learning," of the renaissance, and therefore aroused the enthusiasm of the humanists, while it excited the anger of the adherents of the old scholasticism. More compared it to the wooden horse in which the armed Greeks were concealed who were to destroy barbarian Troy. Bishop Fitzjames of London, on the other hand, called it a temple of idolatry.⁷ Its constitution, as far as instruction is concerned, became the model for a great number of similar institutions, so that Colet, together with Wykeham, is to be regarded as one of the founders of secondary instruction in England. As this diplomat and statesman established a standard for the formation of character among boarding scholars, so did the day school of the great humanist become a model for intellectual culture and religious education.

¹ The statutes are given in full by Howard Staunton.

² The passage deserves to be given literally. At the end of the statutes Colet says: "I saye that fylthyness and all such abusion which the later blinde worlde brought in, which more rather may be calléd blotterature than literature, I utterly abannyshe and exclude out of this Scole."

³ The writers he recommends are: Colet's *Accidens*, Erasmus's *Institutiones Christiani Hominis* and *Copia*, Lactantius, Prudentius and *Proba*, Sedulius, Juvencus and *Baptista Mantuanus*, Cicero, Sallust, Vergil, Terentius, etc.

⁴ The whole fine passage runs: "Wherefor I pray you all lytell babes all lytell chyldren lerne gladly this lytell treatyse and commende yt dylygently unto your memoryes. Trustyng of this begynnyng yt ye shall procede and growe to parfyte lyterature and come at ye last to be great clarkes. And lyft up your lytell whyte handes," etc.

⁵ See the statutes in Howard Staunton, p. 183 ff.

⁶ To-day the income is over £12,000. The school has been removed to West Kensington. It has 580 scholars, of whom only 153 pay an admission fee. Other schools for boys and girls have been established on Colet's foundation, so that about 3,000 children are being educated through his liberality.

⁷ Seebohm, *Oxford Ref.*, pp. 182, 183. The words of More are: "The enemies of good learning perceive that just as there came forth from the Trojan horse Greeks who laid waste barbarian Troy, so from your school are coming forth scholars who refute and overthrow their ignorance."

In the following decades guilds of merchants and wealthy individuals rivaled kings and princes of the church in founding secondary schools. Henry VIII devoted a part at least of the confiscated church property to this purpose, although the greater part fell to the share of his favorites. More than 50 schools are said to have been founded during his reign,¹ although only a very few were established by him personally. The founding of schools reached its highest point under his successor, the young King Edward VI, some twenty schools taking his name, among them being the Birmingham,² Christ's Hospital or Blue Coat,³ and Shrewsbury schools.⁴ In all, 39 schools were founded during his short reign.⁵

During the bloody Catholic reaction under Queen Mary the practice of founding schools decreased but did not cease entirely,⁶ while the long and peaceful reign of Elizabeth was very favorable to the development of secondary schools, over 75 free grammar schools dating from her time, the Queen herself being the gracious founder of 22. Four of the great "public schools," Westminster, Merchant Taylors', Rugby, and Harrow, date from this period.

Westminster school, to be sure, derives its origin from Anglo-Saxon times,⁷ but it was newly established in 1540, after the suppression of the abbey and monastery of St. Peter, by Henry VIII, and was endowed with the proceeds of the sale of church property by Elizabeth in 1560. It furnished instruction to 40 poor scholars free of cost, and received besides eighty *pensionarii*, *oppidani* or *peregrini*. Every year at least 6 of its scholars went to take scholarships at Christ Church, Oxford, and Trinity College, Cambridge. Among the earliest teachers of this school the learned William Camden⁸ was the most eminent. He wrote a Greek grammar which has enjoyed the same esteem in English schools as Lily's Latin Grammar.

Merchant Taylors' school dates from 1561 and was founded by the rich guild of merchant tailors for 250 scholars, and was endowed by one of the members of the guild, Sir Thomas White, who had shortly before founded St. John's College, Oxford, with 43 scholarships, at that college. The regulations of the school follow almost word for word those of St. Paul's school, of which it is a copy.

Of the other schools which were founded in Elizabeth's time, the free school at Rugby, founded in 1567 by Laurence Sheriff of London, merchant, and that at Harrow-on-the-Hill, founded by John Lyon, yeoman, in 1571, have been of special importance on account of their proximity to London, and other circumstances. The former owes its wealth to a small piece of land in Middlesex which then yielded an income of £8, but which now lies in the middle of London and yields £5,000 a year; the latter, which was originally intended by the worthy yeoman only for the benefit

¹The royal schools were Canterbury for 50 free scholars, Worcester for 40, Durham for 18, and Rochester for 24. Oldham founded the Manchester grammar school upon the exact pattern of St. Paul's school. (See Leclerc, *L'Education*, etc., p. 153 ff.)

²Birmingham school was originally endowed with land yielding £20 a year. In 1881 its income was £22,000. It is hoped by the end of the century this will increase to £50,000. (Leclerc, p. 131.)

³The income of Christ's Hospital was £70,000 in 1877. (Pascoe.)

⁴This school was founded in 1551 from the funds of a suppressed abbey, but was first opened under Elizabeth in 1562.

⁵Among them were Tunbridge school, founded by Sir Andrew Judde in 1552; Norwich, King Edward Sixth's school, founded in 1547; Bedford grammar school (1552), and King Edward's school at Bromsgrove (1553).

⁶According to Zimmermann, 18 schools were founded during her reign, of which 4 were founded by the Queen herself.

⁷William Fitzstephen relates in his *Life of Archbishop Thomas à Becket* that the scholars of three great London schools were accustomed to challenge each other to make verses and contend in grammar on certain days every year. Stowe, the chronicler, believes that these must have been St. Peter's Westminster, St. Paul's, and St. Peter's Cornhill, and he adds that he had witnessed such contests when he was a boy, in which the teachers and scholars of St. Paul's and Westminster participated. The custom of challenges at Westminster, which was still in existence a few years ago, dates back to this contest.

⁸Ben Jonson was one of his scholars and acknowledges his indebtedness to him (see epigram XIV, Works, Vol. III, p. 22):

Camden, most reverend head, to whom I owe
All that I am in arts, and all I know.

of his own parish, owes its success to the circumstance that the teachers were allowed by the school regulations to admit "foreigners"¹ and take from them such pay as they could get. Advantage was taken of this provision for a century after the founding of the school, which became at first a kind of accessory to, and then a rival of, Eton.¹ The income from the original landed property of the school is still comparatively small, but the bounty of its friends has endowed it richly, especially in the present century, with scholarships and prizes.²

Of other schools founded in Queen Elizabeth's time, that at Uppingham, founded in 1584 by one Archdeacon Johnson, has recently acquired especial importance through the work of the distinguished pedagogue, Dr. Edward Thring.

Under James I the ardor for founding schools decreased considerably, yet several important institutions date from his reign. The first of these in importance is the Charterhouse school, which was founded in 1611, together with a hospital, by Thomas Sutton, a wholesale merchant and an industrial, whom the rise of England after the defeat of the armada had enriched, and who, as he was childless, applied his wealth to works of benevolence.³ The income of this institution, which was originally intended for 40 free scholars and 80 needy and meritorious men, amounted even in Sutton's time to £4,500. It is now some £29,000. The school was removed in 1872 from the densely populated Charterhouse Square to Godalming in Surrey.

It remains to mention Dulwich College, founded in 1619 by Edward Alleyn, the well-known actor and theater director, and the associate of Shakespeare and Ben Jonson. The endowment, consisting of 300 acres of land, which to-day represents an immense value, was for a long time completely wasted, the income was squandered, and a dozen teachers, almost without scholars, lived upon it. This condition has been changed since 1865. To-day Dulwich College has 570 scholars and the excess of its income is applied to charitable purposes.⁴

Thus England was covered at the beginning of the seventeenth century with a network of grammar schools which gave the youth of the country a knowledge of classical antiquity. Let us now consider more closely the original organization of these schools.

II.

THE ORIGINAL CHARACTER OF THE FOUNDATION SCHOOLS.

All foundation schools were originally intended for poor children of talent. Their statutes contain this provision, and in many cases it was expressly added that children whose parents possessed an income above a certain amount could not be admitted to these schools.⁵ At the same time there was from the outset the arrangement allow-

¹Of the six head masters of Harrow between 1660 and 1771, five were Etonians. In the beginning of the eighteenth century the school took advantage of the political attitude of Eton, whose head master was suspected of Jacobitism. Therefore the Whig nobility sent their sons to Harrow instead of to Eton, as previously.

²Between 1819 and 1829 £5,000 were collected for the school, and between 1829 and 1889 some £120,000. (Great Public Schools, by various authors, p. 78.)

³Yet his character had its shady side also. It is related of him that he used to accept gifts from covetous friends on the understanding that they were to be his heirs. Ben Jonson is said to have castigated him in his "Volpone."

⁴By the regulations of this school the head master must always be named Alleyn, a requirement that was not done away with until 1858. (Leclere, p. 113 ff.)

⁵The Winchester statutes declare (Kirby, p. 458): *Nullus habens terras tenementa vel alias possessiones spirituales vel temporales, quorum proventus quinque marcarum sterlingarum valorem annum exceesserint, in ipsum collegium . . . eligatur, consanguineis nostris duntaxat exceptis* [no one having lands, tenements, or other possessions, spiritual or temporal, the income wherefrom exceeds 5 marks sterling a year, shall be elected to the college itself, our own relatives excepted]. A mark was equal to 13s. 4d. There are similar provisions in the statutes of Westminster, Rugby, Harrow, Merchant Taylors', etc.

ing pay scholars (the *commensals* or commoners), whose numbers and importance soon exceeded those of the free scholars (collegers, King's scholars, Queen's scholars, or foundation scholars).

Another feature was the local character which the founders usually gave their schools. Winchester gave a preference to the relatives of the founder, the inhabitants of the diocese and the neighboring counties taking a second place.¹ Westminster was intended chiefly for choristers and boys of the cloisters, while Harrow and Rugby were originally designed for the inhabitants of the localities of the schools and the neighborhood. Only St. Paul's school and Merchant Taylors' school, which was modeled after it, differed from the others in this respect.

The pay of the teachers was very small, considering the condition of affairs at the time. The head master of Winchester received £10 sterling besides his house, board, and cloth for clothing, the under teacher receiving 5 marks, or £3 6s. 8d.² At Eton, a half-century later, the head master received 24 marks, or £16, besides free lodging and £3 18s. for board and £1 for clothing. The pay of teachers at Rugby, Harrow, etc., was on a similar scale.³ Colet endowed his head master very liberally by assigning him a salary of £35, a sum which amounted to more than a fourth part of the income of the lord chancellor of the realm.⁴

In all the schools instruction was given in a large hall, which was only divided by a curtain into two parts for the so-called upper and lower schools.

The scholars for the most part slept in a great chamber, as at Eton⁵ and Westminster,⁶ often, as at Winchester⁷ until 1540, upon bundles of straw or the bare stone floor. They had to make their own beds, clean the chambers, and wash themselves

¹ Statutes II (Kirby, p. 457): Volumus quod in omni electione scolarium futuris temporibus in dictum nostrum collegium prope Wyntoniam facienda principaliter et ante alios quoseunque omnes illi qui sunt et erunt de consanguinitate nostra et genere, si qui tales sint, ubicunque fuerint oriundi seu moram traxint, per viam specialis prerogative absque difficultate qualibet, in dictum collegium . . . recipiantur ac etiam admittentur. [We desire that in every election of scholars to be held in future for our said college near Winchester, principally, and before all others whatsoever, all those who are and shall be of our blood and family, if any such there be, wherever they may have been born or wherever they may live, shall, by way of special prerogative and without any difficulty, be received and admitted into the said college.] Compare the following: Statuimus preterea quod post dictos consanguineos nostros pauperes indigentes scolares de locis et parochiis in quibus possessiones spirituales et temporales ipsius Collegii prope Wyntoniam ac nostri Collegii Oxonie existant; deinde oriundi de dioc. Wyntonie, ac deinceps seriatim de comitatibus Oxonie, Berk., Wiltes., Somerset, Buk., Essex, Midd., Dorset, Kam., Sussex et Canturbury, etc. [We have decreed, moreover, that after the said our relatives, poor and needy scholars from the places and parishes where there are temporal and spiritual possessions of the college itself near Winchester, and of our college at Oxford, next those born in the diocese of Winchester, and then seriatim those from the counties of Oxford, Berks, Wilts, Somerset, Buckingham, Essex, Middlesex, Dorset, Cambridge, Sussex, and Canterbury shall be received.]

² See Kirby, page 84. The salary of the warden was £20 and that of the fellows £5 each.

³ We must, of course, take into consideration the rapidly decreasing value of money, which was twelve times its present worth in the fifteenth century, but at the end of the sixteenth was only four times.

⁴ Seebohm, page 151: In 1625, more than a hundred years later, the teacher of Charterhouse School received only £30 salary, with board and lodging. Compare with that figure the present salaries of the head masters of Eton, Harrow, etc., which amount to between £5,000 and £6,000.

⁵ This was the famous Long Chamber, in which 52 scholars slept, while the remaining 18 were placed in small rooms. See for Eton the so-called *Consuetudinarium* of Head Master Malim, 1561, which describes both the peculiar customs of the school and the daily life of the scholars. (Maxwell Lyte, p. 142 ff.)

⁶ See, for Westminster, Blackwood's Magazine, vol. 100, page 62 ff. Howard Staunton says (pp. 136, 137): "Up to 1846 there was one large dormitory, in which all the 40 Queen's scholars lived by day and slept by night, without any provision whatever in the shape of private rooms for study."

⁷ In 1540 Dean Fishmonger introduced bedsteads and put in board floors. (Howard Staunton, p. 82.) Christopher Johnson, or Jenson, head master from 1550 to 1571, describes the customs of Winchester in his Latin poem called *De Schola Collegiata Wiccamica*. (See Kirby, p. 255.)

under a pump.¹ The food was very plain, often poor and scanty. As the number of teachers was small, the supervision of the scholars was almost exclusively in the hands of the prefects and monitors, and the smaller boys, known as "fags," had a hard position. A minister who wrote his recollections of school life at Westminster at the beginning of the seventeenth century complains as follows: "During my servitude as junior of seven months and two weeks I was frightfully ill-treated by the monitors and had to perform the menial duties of a servant. In this way I was diverted from my studies and could not, even after I was freed from this slavery, return to them again, but gave myself up to idleness."²

The instruction was confined to Latin³ and Greek almost exclusively, to which Hebrew was added later, and even Arabic and Chaldee were studied by some of the scholars of Westminster.⁴ The method of instruction seems to have been thorough, and the teachers were not content with superficial or half knowledge.⁵ Much attention was given to writing verses⁶ in Greek as well as Latin and to learning by heart. The teachers of the great schools were men of ability. I need only mention Nicholas Udall, who was head master of Eton in 1534, and was the author of a work on Latin style as well as of the first regular English play, *Ralph Royster Doyster*;⁷ William Camden, the great historian and antiquarian, who was made head master of Westminster in 1593;⁸ Richard Mulcaster, who was made head master of Merchant Taylors' school in 1591 and occupied the same position at St. Paul's School in 1596, and who was one of the earliest English writers upon pedagogics;⁹ and, finally, Richard Busby, who reigned over Westminster school from 1638 to 1695.

Discipline was maintained by corporal punishment. Dr. Busby's¹⁰ doctrine that his "birch was the sieve that winnowed the wheat from the chaff of the scholars"

¹ Johnson says:

"Surgite" Præfectus clamat; num stertitis? Ohe
Jam campana sonat; vos surgite, surgite pigri.
Surgendum est; vestes, caligæ, solæque petuntur;
In classem properant; et si campana taceret,
Distincti inciperent psalmum cantare Latinum.
Postea sint versæ cameræ, pexique capilli.
Sternuntur lecti, facies sit lota manusque.

["Get up!" cries the prefect; are you still snoring? The bell is ringing; get up, you lazy ones! You must all get up and put on your clothes and shoes. They hasten to the class, and when the bell ceases sing a Latin psalm. Afterwards let the rooms be cleaned, the hair combed, the beds be made, and hands and faces washed.] (See Maxwell Lyte, p. 144.)

² See Blackwood's Magazine, vol. 100, p. 71.

³ In Eton Latin was almost the only subject taught in 1560. Greek grammar was only begun in the sixth and seventh classes. (Maxwell Lyte, pp. 146, 147.)

⁴ Evelyn, who was present at an examination at Westminster, writes in his diary May 13, 1661: "I heard such exercises in Latin, Greek, Hebrew, and Arabic in themes and extraordinary verses, with such readiness and will, as wonderfully astonished in such boys."

⁵ See Blackwood, vol. 100.

⁶ Samuel Pepys, who visited Eton in 1665, the year of the great plague of London, writes in his diary: "I went to the hall and there found the boys writing verses *de peste*, it being their custom to make verses on Shrovetide. I read several, and very good they were, better I think than ever I made when I was a boy, and in rolls as long or longer than the whole hall by much."

⁷ Nicholas Udall was afterwards found guilty of a serious breach of morals and was imprisoned and deposed from his position. About the year 1534 he became head master at the newly founded Westminster school. He died soon after. He wrote numerous works. (Maxwell Lyte, p. 119.)

⁸ Author of the *Britannia* and of a Greek grammar which, under the name of the *Eton Greek Grammar*, was used even into the present century.

⁹ He wrote two pedagogical treatises: "Positions wherein those primitive circumstances be examined which are necessary for the training up of young children, either for skill in their book or health in their bodie." And another, entitled "The First Part of The Elementarie, which entreateth chiefly of the right writing of the English Tung." (See Quick, *Essays on Educational Reformers*; Ellis, *On Early English Pronunciation*, III, p. 910 ff.)

¹⁰ Of this celebrated school potentate, who exercised his office during the troubled times of the Revolution and Restoration with vigor and skill, a great number of stories are told in all books upon English schools.

was generally accepted, and no small portion of a teacher's powers was exerted in the use of the rod.¹

In these schools vacations were short and holidays rare, and sports and bodily exercise did not occupy the prominent place which they held later in the life of the school. The boys played at quoits, ball, and football. At Harrow, even as late as the end of the eighteenth century, there were archery contests, in compliance with the will of the founder, John Lyon, which took place in July or August, and the victor received a silver arrow as the prize. In 1771 Dr. Heath abolished this custom, which had become a nuisance, and replaced it by public speaking, which still exists. At Eton was the ancient custom of the "montem," when the scholars repaired to Salt Hill and there initiated the new scholars with ceremonies of various kinds. At a later period money was collected from the visiting lookers on with the cry of "salt! salt!" and as much as £1,000 has often been taken up in this way. This custom was abolished in 1847² and was replaced by a school anniversary at which speeches and declamations were delivered. This is the so-called June 4 of Eton.

It would lead us too far to describe all the different customs and usages which the schools preserved for centuries, even long after their original meaning had disappeared. Many of them were barbarous sports, such as cock fights,³ throwing stones at the head of a live cock buried to the neck in the ground,⁴ the sheep chase at Eton,⁵ the badger hunt at Winchester, and the like. Others, like the "challenge" at Westminster,⁶ which is a trial of knowledge or eloquence by alternate speakers, date back to the monkish disputations of the Middle Ages.

The theatrical exhibitions are noteworthy. They were especially favored by Queen Elizabeth, who expressly directed that the plays of Terence should be acted at Westminster schools in order that the young men might better acquire an easy appearance and a good delivery and pronunciation. Plautus was also acted, and more rarely English dramas, e. g., the "Cleomenes" of Dryden, which was acted in 1695.⁷ The scholars of Merchant Taylors' School acted before Elizabeth several times, once on March 18, 1573-74, when the head master, Richard Mulcaster, received 20 marks, besides 20 marks for his board, and again on March 11, 1575-76, when the same teacher received £10.⁸ So at Eton, where the first English comedy, "Ralph Royster Doyster," was produced, theatrical exhibitions, mostly of Latin plays, were given for a long time. This feature fell in with the English custom of the period by which boys acted the part of women on the stage.

III.

THE FURTHER DEVELOPMENT OF THE FOUNDATIONS, OR SO-CALLED "PUBLIC SCHOOLS," UNTIL THE BEGINNING OF THE NINETEENTH CENTURY.

The history of the development of secondary schools in England, from the middle of the seventeenth to the beginning of the present century, does not present a gratifying picture. The aristocracy, which came into power after the revolution of 1688,

¹ Blackwood, vol. 100, p. 64. In the Spectator, No. 329, Sir Roger de Coverley cries out, before the tombstone of Dr. Busby: "Dr. Busby! a great man! he whipped my grandfather; a very great man! I should have gone to him myself if I had not been a blockhead; a very great man!" Udall and Malim at Eton, Mulcaster at Merchant Taylors' school, and others, all whipped in the same way.

² See Malim, *Consuetudinarium*, in Maxwell Lyte, p. 452. The custom did not begin, as Zimmermann (p. 105) thinks, in the eighteenth century. Disraeli describes a "montem" in *Coningsby*, Vol. I, ch. 2.

³ The teachers derived an income from this sport, the scholars being compelled to purchase permission to witness it by paying the so-called cock-pennies. (Zimmermann, p. 46, f.)

⁴ Id. and Maxwell Lyte, p. 149.

⁵ Id., p. 283.

⁷ Id., p. 128, f.

⁸ Id., p. 243

not only did not increase the inheritance which the enthusiasm of the renaissance and of the Reformation had transmitted to the English people, but even dissipated it. The founding of new schools almost entirely ceased with the beginning of the seventeenth century. In the following century and a half there was scarcely one new institution which could be reckoned among the "great public schools."¹ Moreover, the existing schools became transformed from educational institutions for the people into exclusively aristocratic nurseries by making the blessing of free education illusory and closing the schools to the poor.

In Eton, for example, the weekly board of a free scholar was put at 10d. by the statutes, the same statutes giving an annual income of £10 to a fellow, the teachers receiving a corresponding amount. When the income of Eton became greatly increased through the rise in value of property while the purchasing power of money declined correspondingly, the school authorities held to the letter of the statutes but managed to avail themselves, not always in the most honorable way, of the increased income of the institution.² Other statutes, such as those forbidding the holding of curacies with the cure of souls, were often disobeyed.³ And yet the statutes declare⁴ that they "are to be taken in their simple grammatical sense. The provost, fellows, and scholars shall solemnly swear that they will not accept any dispensation therefrom. If anyone, at the instance of the old serpent, shall endeavor to invalidate the statutes, he shall be deemed guilty of perjury." But why should one who is in the enjoyment of a good income trouble himself about the wording of mouldering parchments? At Winchester the head of the school early diverted a great portion of its income to himself. In 1636 Archbishop Laud, after a visit to the institution, issued an order against this proceeding,⁵ but, as it appears, without permanent result. In 1710 a complaint of the subwarden and bursar against the warden declares that so little care was taken of the scholars that they had become a burden to their friends, and that, while the college was willing to make better provision for them, the warden demanded so much that the income of the institution was not sufficient to meet both requirements, the warden appropriating more for his own use than all the seventy scholars together. The teachers, who also received nothing of the increased income, helped themselves in other ways. By the statutes of Winchester they were expressly forbidden to exact, ask, or claim any pay whatever for instruction, either from the free scholars, their parents, or their friends. Nevertheless £10 was charged in the scholars' accounts for masters' gratuities, with the saving clause, "if allowed," inserted to quiet the conscience of the recipient. This irregularity was suppressed by Dr. Goddard, head master from 1793 to 1810, who bequeathed £25,000 to the college for the benefit of the teachers. Very similar conditions in this respect existed at Eton also.⁶

Harrow and Rugby were designed at first, as already remarked, to be schools for children of the inhabitants of the neighborhood, but when they had become wealthy and famous, on account of their situation and other circumstances, the village chil-

¹ Whitaker's Almanac enumerates 55 great public schools. Of these none were founded between the establishment of the Bradford Grammar School, 1662, and Haleybury College, 1806.

² One way in which this was done was as follows: In renewing the leases the provost and fellows of Eton made the tenants pay large sums, which represented the increased value of the rent, and they divided this money among themselves. In the twenty years preceding 1862, £127,700 were received in this way. (Howard Staunton, p. 12.)

³ In taking the oath the fellow simply said when he came to this command: "I can not keep this," or, "I beg to pass over this," and believed in this way to save himself. (Contemporary Review, vol. 4, p. 153).

⁴ Maxwell Lyte, p. 500.

⁵ Kirby, p. 320 ff.

⁶ At Eton every collegier was compelled to pay the head master £6. Dr. Hawtrey (1834-1853) was the first to renounce this sum, which was devoted to adding a new wing to the college. (Maxwell Lyte, p. 421.)

dren were excluded from them, while the requirements of the statutes were complied with by parents removing to Harrow or Rugby in order to obtain cheaper instruction for their children.¹ The provision that only poor children should have an entirely or partly free education is to-day explained in all these schools as applying to the property of the children themselves and not to that of their parents.

When we further consider what was provided for the free scholars for whom the institutions were founded a sad picture is presented to us. As early as 1635 it was said of Eton scholars on the occasion of a disturbance: "They have been deprived of breakfast, clothing, bedding, and even the barest necessaries, which the statutes accord them abundantly, and have been compelled to be content with scanty food of bad quality and a coarse short gown, whilst the revenue of the college has been divided amongst a few individuals."² I have already spoken of the sleeping rooms provided for the scholars. They were not only not improved, but were left as they were—without furniture and with broken windows; in short, in a lamentable condition. In these bare rooms the boys were left to themselves without the slightest supervision from 8 o'clock in the evening until the next morning.³ The food was altogether insufficient. There was no breakfast, as that meal had not been provided for in the statutes.⁴

The dinner at noon was without variety and was often insufficient, so that the smaller boys had to content themselves with the bones left by the others;⁵ there was no tea, and supper was also a very scanty meal, consisting usually of a kind of gruel.⁶ Then there were fasts and half-fast days, which were strictly observed even long after the Reformation. Sydney Smith, who was at Winchester, says of his life there that the whole system was one of misdirected economy, neglect, and vice, and the small boys had to manage as best they could.⁶

Under such circumstances a liberal education was out of the question. Most of the boys had private rooms in boarding houses, where they breakfasted and made up for the insufficient nourishment provided by the school. "Boys whose parents were not in a condition to pay for a private room had to endure privations which a cabin boy could not have borne, and which it would have been considered inhuman to inflict upon galley slaves."⁷ For this reason, "free" education cost £60 a year at Winchester at the end of the last century, and £80 at Eton, and it was about the same at other schools. It is therefore easy to understand that the free scholarships were not

¹ Dr. Vaughan, head master of Harrow from 1845 to 1859, established a day school for the village children, at which the instruction cost only £5 a year, and which is connected with the public schools. The same was done at Rugby.

² Maxwell Lyte, p. 231.

³ "If the menial services enforced were incompatible with the position and unfavorable to the training of a gentleman, the want of privacy was quite as injurious to the moral feelings. A boy who passed unscathed the ordeal of a collegier's life must have been gifted in no common degree with purity of mind and strength of will." (Maxwell Lyte, p. 418.)

⁴ "But, as at Eton, there was no special ordinance about breakfast, that meal being a less formal one amongst all classes in old times than in the present . . . no breakfast at all was provided for the King's scholars at Westminster for many generations up to the year 1846." (Blackwood, vol. 100, p. 318.)

⁵ The following epigram was written at Westminster:

Carnem prima vorat classis sine jure; Secunda
Jus omne; omne sibi Tertia sumit olus.
Interea mensæ qui accumbit Junior imæ
Vix aura infelix vescitur ætherea.

[The first class devours meat without soup; the second eats the soup; the third finishes the vegetable. Meanwhile the juniors at the bottom of the table must live on air.] (Idem.)

⁶ Winchester College, by Old Wykehamists, p. 88.

⁷ Maxwell Lyte, p. 419.

coveted. In 1840 only 35 of the 70 at Eton were filled.¹ It is only since that period that a gradual and thorough improvement has taken place.²

As to the admission to the advantages of the foundation schools—the free scholarships in the schools, foundations at Oxford and Cambridge, stipends, and fellowships—a system of patronage and favoritism in appointments prevailed throughout. To be sure, there was generally an examination, but it was simply a form or a farce. At Winchester the free scholars were required by the statutes to know singing (in *plano cantu competenter instructos*). Consequently scholars who had received appointments to foundations were asked whether they could sing, to which they responded, as previously instructed, by singing the line: “All people that on earth do well,” with which the examiner declared himself satisfied.³ If a scholar at Westminster wished to be elected to the college or the university he was absolutely compelled to have or to gain a friend among the seven electors. “There was no dissimulation or secrecy about it; appointments were sought and promised as an entirely natural thing.”⁴ Foundations at Eton were much sought in the last century because they were usually followed by foundations at Cambridge and fellowships, i. e., places for life. We therefore read that the provost used to receive letters of recommendation from influential persons, and even from the King himself, on the eve of every election, and that ministers obtained these valuable sinecures for their brothers and cousins.⁵ Such places were handed down in families, so that many families regarded foundations in Eton and fellowships in Cambridge almost as a birthright.⁶ That state of things lasted until nearly the middle of our century, when it was abolished, and real examinations, open to all, took the place of nominations and sham examinations.

The number of teachers in the schools was entirely insufficient until the beginning of this century. In 1651 Westminster had only 3 teachers for 300 scholars; at Winchester, under Dr. Warton (1766-1793), there were also only 3 teachers, the scholars, to be sure, numbering only 157, and when Dr. Keate came to Eton as head master in 1809 he found 9 teachers to 570 scholars. There were classes of 170 and even 198 scholars.⁷ Under such circumstances discipline suffered in the greatest degree. It was difficult for the head masters to keep the wild boys in order with so little help. Therefore the annals of the schools are full of rebellions in which the scholars left school in a body, and they sometimes even came to blows with their teachers. These rebellions generally ended with the flogging or dismissal of the guilty ones.⁸

The traditional means of punishment remains the same in the English public schools to-day as in the time of Colet and Busby, and consists in chastisement with the rod or whip, which is administered by the head master or the second teacher. At Eton no boy was regarded as properly initiated who had not knelt thrice at the celebrated block and there felt the rod. The head masters were extraordinary per-

¹ Contemporary Review, vol. 4, p. 149 ff.

² To-day the commissariat of the public schools is notable, and the expense for free scholars is relatively small. At Eton, Winchester, Westminster, and Charterhouse they need pay nothing. At Harrow, Rugby, Shrewsbury, and St. Paul's their tuition fees are remitted, or in part.

³ See Charles Wordsworth, p. 218 ff.

⁴ Blackwood, vol. 100, p. 324. At Merchant Taylors' and St. Paul's schools the nominations lay entirely in the hands of the trustees.

⁵ Maxwell Lyte, p. 224, 269 f. At Winchester the Crown long assumed the right to appoint scholars. Charles II, for example, appointed two or three boys every year; but this system of royal letters ceased in 1726, when the electors were put upon oath to choose the worthiest.

⁶ Maxwell Lyte, p. 308.

⁷ Maxwell Lyte, p. 368 f. “Dr. Keate found himself the sole teacher in a school of about 170 boys, and the number continued to increase. Mr. Edward Coleridge remembers being one of 198 boys in the head master's division, and, as we might expect, he was only called up to construe twice in the course of a half.”

⁸ At Winchester rebellions took place in the years 1774, 1793, and 1818. At Eton in 1768, 1773, 1798, 1810, 1818, and 1832. In 1818 there were similar rebellions at Harrow, Charterhouse, and Shrewsbury. (See Kirby and Maxwell Lyte.)

formers in thrashing. Dr. Keate, of Eton (1809-1834), must have been the champion. He took a real pleasure in his execution, and on one occasion thrashed eighty boys, one after the other,¹ yet he was loved and respected by his pupils. It was the same at other schools.² The scholars themselves did not regard bodily chastisement as in any sense a disgrace. In 1818 Dr. Russell, head master of Charterhouse, wished to introduce fines in place of the rod. The scholars looked upon this penalty as unworthy of gentlemen, and requested that the rod might be reintroduced. Dr. Russell yielded, and the following morning a bundle of birch rods stood in the school, while he was busied with their use for two hours.³ Men were of the same opinion as the boys in regard to whipping. Dr. Samuel Johnson had attended the school at Lichfield, the teacher of which, one Mr. Hunter, used to thrash the boys unmercifully and often unreasonably. Nevertheless Johnson remarked to Boswell upon his school experience: "My teachers whipped me well, otherwise nothing could have been made of me." And on another occasion he expressed himself as follows: "I would much rather that the rod should be a general terror to all, to make them learn than that one should say to a child, 'if you do thus or thus, you will be more esteemed than your brothers.' The rod produces an effect which ends in itself. A child fears a whipping and does his task, and there the matter ends, whereas by exciting competition and a comparison of superiority the foundation of lasting mischief is laid, and even brothers may be brought to hate one another."⁴ Other writers, on the other hand, such as Steele and Smollett, condemned flogging in the sharpest terms as barbarous.⁵ Dr. Arnold upheld bodily punishment in principle, "since it is adapted to the natural subordination of the boy's age and emphasizes it, and can not, therefore, be especially humiliating for persons of that condition;" but he would restrict it to moral transgressions, and seek to encourage the boys to rise above the naturally low tone of such a punishment.⁶

Nothing has been so often described and deplored as the misuse of the fagging system. This system was the supplement of the monitorial or prefect system, i. e., of the government of the boys by themselves. Inasmuch as the boys of the highest class undertook certain duties and responsibilities they had a right to the service of the smaller boys. The system, as already remarked, was introduced by Bishop Wykeham, and was initiated in all the other schools, especially, indeed, because their narrow means at first forbade them to pay servants, and later, when they became richer, because the authorities appropriated the income. What was a discipline of manliness for youth under proper supervision degenerated into tyranny without it. The shadowy side of the system appears most sharply defined in the eighteenth century. The condition of the foundation scholars was the worst, because, as before observed, they slept together in great chambers with no supervision; the commoners were a little better off. Long descriptions of the sufferings of a fag are given by all writers who have described life at the public schools. At Winchester a small boy in this position had to endure slavery of the worst kind. He had to

¹ Maxwell Lyte, p. 372 ff.: Many anecdotes are told of this original, some of which, to be sure, are only good inventions. He is said to have commented as follows: "Blessed are the pure in heart! Mind that; it's your duty to be pure in heart. If you are not pure in heart I'll flog you."

² See Blackwood, vols. 91 and 100; also Winchester, by Old Wykehamists.

³ Zimmermann, p. 84.

⁴ Boswell's Johnson, Malone's ed., 1821, I, 18; II, 233, 236. Also, Johnson and Boswell defended a Scotch teacher who had been dismissed for cruelty.

⁵ Spectator, No. 168, where it is said of Eton: "Many a white and tender hand which the fond mother had passionately kissed a thousand and a thousand times have I seen whipped until it was covered with blood; perhaps for smiling, or for going a yard and a half out of a gate, or for writing an O for an A or an A for an O. These were our great faults! Many a brave and noble spirit has been there broken, others have run from thence and were never heard of afterwards." (See also Roderick Random, by Smollett, Ch. II.)

⁶ Life of Dr. Arnold, by Dean Stanley, p. 114 f.

awaken his "masters," kindle the fire, make coffee or tea, run errands, etc., and moreover had to be an ambulatory "variety store" with an inexhaustible supply of pens, pencils, ink, rubber, and paper, and, in short, he had no rest and found no time for study. He was constantly in fear of cruel bullying, cuffs, kicks, and blows, and his life was one detailed system of martyrdom. There were fags of the first and second classes, so that many boys were at once tormenters and tormented.¹ There were the same conditions at Charterhouse,² Harrow,³ Eton,⁴ Rugby,⁵ and Westminster.⁶ The scene in Tom Brown's School Days where little Tom is roasted before the fire is said to have actually taken place at Rugby under Dr. James (1778-1794).⁷

This cruelty of the school youth, however, was in harmony with the general manners of the time and therefore excited no astonishment. As long as there were from 154 to 160 crimes punishable with death, including the theft of an article worth 5s. from a shop, and as long as 150,000 men in each generation, according to Dr. Johnson's calculation, died in prison, people concerned themselves very little about the sufferings of the school youth. And, perhaps, these trials were not always a bad preparation for life for the average boy. On the one hand there was something democratic and advantageous for their future lives in a system which compelled young aristocrats to perform for once in their lives the services of hired servants, and, on the other hand, a legally regulated power like the fag system would or ought to prevent the much more severely felt tyrannical and arbitrary dominion of the stronger over the weaker, a view, however, which was not always realized. Finally, the fagging system seemed to many English pedagogues inseparable from the monitorial or prefect system, which was an object of pride as the characteristic mark of the English public-school system. In fact, the experiences of school life tended to strengthen the character of the average boy if it did not ennoble it, but to tenderer natures it did irreparable injuries. The poet Cowper, who became melancholy and finally insane, was a victim, according to his own avowal, to the rough fagging system at Westminster.⁸ Nor did the life at Eton exert a good influence upon Shelley's sensitive poetic nature.⁹ But public institutions are not intended for such exceptional natures. To-day the abuses have been reformed, and a fag's duties are restricted for the most part to helping on the ball ground, while servants attend to the household work.

Battles between scholars and outsiders (barbarians, plebeians, called *skies* at Westminster—Volskies, from the Volsci who fought against the Romans) have also ceased. They used to occur at Westminster, Eton, and elsewhere.¹⁰

The instruction given in these schools remained upon the standpoint of the Renais-

³ Zimmermann, p. 89.

⁴ Maxwell Lyte, 337, 397, 417: "New arrivals went by the name of Jews, and had to submit to a terrible amount of bullying. The custom of tossing them in blankets to the line: *Ibis ab exeuusso, missus ad astra*, sago, was given up about the year 1832, in consequence of an accident which nearly proved fatal to the late Rowland Williams."

⁵ Blackwood, 62, p. 550: "Warming two or three cold beds by one's own natural caloric was not a pleasant process, neither was running 2 miles and back at 4 o'clock in the morning to take up the night lines which the præpostor had set in the evening the best preparation for first lesson at 7. Blacking shoes, cleaning knives and forks, and carrying up the water from the pump to the dormitory would be thought hard measure by a schoolhouse fag of the present day."

⁶ Kirby, p. 406 f.: Where a case of tyranny is described by the victim in a letter to his father, the latter's letter to Dr. Warton is given, together with an investigation and consequent dismissal of the boy.

⁷ Tom Brown's School Days, ch. 8.

⁸ See the *Tirocinium*. "The rude will scuffle through with ease enough, great schools suit but the sturdy and the rough."

⁹ Lord Chatham said the same to Lord Shelburne. "That he scarce observed a boy who was not cowed for life at Eton; that a public school might suit a boy of turbulent, forward disposition, but would not do where there was any gentleness." (Maxwell Lyte, p. 349; id., p. 397-398.)

¹⁰ Blackwood, 100 p., 307 f.; Maxwell Lyte, p. 336; see also Dickens, *David Copperfield*, Ch. XVIII.

sance during the whole of the seventeenth and eighteenth centuries and the early part of the nineteenth. Classical studies had absolute sway. All the acquirements of the human mind in mathematics and the natural sciences, the whole modern world with its different languages, literatures, and history, even English literature and history, remained a terra incognita at the nurseries of the English aristocracy. At Eton in the last century the younger boys learned a little writing and arithmetic on holidays; those of the fifth class studied a little geography, according, however, to Pomponius Mela, Cornelius Nepos, and Cellarius, and those who stayed long enough took a little Euclid.¹ Even at the beginning of this century the writing master at Eton also gave instruction in mathematics, but his position was inferior to those of the other teachers in authority and dignity.²

At Eton the scholars slept late Sunday morning, and at 2 or 3 o'clock in the afternoon attended a singular harangue called "prose," which consisted in the reading of a book (Blair's Sermons or a pagan writer like Epictetus), during which they made a frightful noise, so that the ceremony was a standing cause of offense to the teachers and was certainly not edifying to the scholars.² Similar conditions existed at Winchester, Harrow, and other schools.²

Even in the classical studies, which held the field alone, the performances were quite insignificant. The so-called Eton grammars, which were the old Lily's and Camden's grammars deteriorated, were used as text-books, besides very defective chrestomathies of Latin and Greek poets and prose writers.³

The works of Homer, Virgil, and Horace were completely read, but the instruction was rather external, and there was no thought of entering into the classical spirit and culture. The boys "construed," as it was called, learned by heart, and made verses, and they became very skillful in preparing Latin and Greek verses. A false quantity or an inaccurate quotation in a speech in Parliament was immediately pounced upon. Dating from the last century, instruction at Eton, and afterwards at most of the other public schools, was not given by the teachers in the school, but privately by tutors. Only recitations were heard in the school, while the lessons were prepared under the supervision of a tutor, who was usually also a teacher at the school and keeper of a boarding house for his pupils. This system, the so-called tutorial system, which is now common to all the public schools, arose from circumstances. With the large classes and the custom of teaching in one room, which was usually sufficiently noisy, any effective instruction, in our sense, was hardly possible. The custom of private instruction, too, was in keeping with the aristocratic character of the school, and was moreover profitable to the teachers. Pupils of rank or wealth would even bring their private tutors to the school with them, who had had charge of their studies.⁴ The system is naturally very expensive and induces lazy scholars to become dependent, while it gives opportunity to industrious and aspiring ones, under the guidance of a capable teacher, of exceeding the limits of the school curriculum. In this connection a letter of the late Bishop Wordsworth, while a scholar at Harrow, to his brother Christopher (Feb. 13, 1824), is very interesting.

¹ Maxwell Lyte, p. 319.

² Id., p. 371 f.

³ There was in particular a collection of extracts to be committed to memory called *Epigrammatum Delectus*, besides collections under the titles *Scriptores Romani et Græci*; *Poetæ Græci*; *Selecta ex Ovidio, Tibullo, et Propertio*; *Pentalogia* of Dr. Burton (five Greek dramas, mostly in extracts). Maxwell Lyte says of the *Poetæ Græci* that it was "a book then very meagre and insufficient;" of the *Scriptores Græci*, "a wretched compilation;" of the *Scriptores Romani*, "an odd but interesting compilation, bearing, up to the last edition, the impress of a mind which contemplated not merely elegant scholarship, but the training of young men for a Parliamentary career, for it contained a good deal of fine, hard Latin about oratory and public virtue, and, though it was woefully inadequate as a thread of beads to illustrate Roman history, it betokened a lofty purpose corresponding to Lord Chatham's ideas, and it was a great relief to the intellect." (Maxwell Lyte, p. 364 f.)

⁴ Peregrine Pickle brings his tutor to Winchester with him. (Smollett, *Peregrine Pickle*, Ch. XV.)

"It is now," he writes, "Saturday evening, and I have finished the busiest week of my life. I have done 120 Latin hexameters (subject, a bull fight), a Latin exercise (50 lines), a translation (lyric verses, 19 strophes), besides construing and learning by heart 30 lines of Juvenal every day. The boys are determined to work hard this quarter. Some do six or seven chapters of Thucydides, others Herodotus, others Greek drama, besides Juvenal, Livy, Tacitus, etc., every day extra. Some have ascended so far into the clouds that they read Aristophanes, and always the *Nubes*, on account of the jokes."¹

Another time he writes his brother triumphantly that he has read two Greek dramas and learned by heart a section of Virgil's *Georgics* in one quarter.² In fact, boys who wanted to learn found ample opportunity at their school, but the majority learned very little. Eton was the worst in this respect.³ And the teachers only gave attention to the gifted scholars, who would take prizes and scholarships at Oxford or Cambridge and bring credit to the school, while they allowed the mediocre and dull to go their own way.⁴

The time given to teaching had been much curtailed since the sixteenth century, while that allotted to sports had correspondingly increased. In summer little work was done, on account of cricket, but in winter those who were so disposed worked somewhat harder.⁵ The number of holidays had greatly increased. Tuesday was a holiday at Eton; so was Thursday afternoon and Saturday after 4 o'clock, and there was only four hours' teaching on the other days.⁶ To these must be added the great number of religious holidays and those devoted to games.

It was not, therefore, simply a consequence of the *laissez-faire* theory when Adam Smith, discussing in his *Wealth of Nations*⁷ the question whether public foundations are beneficial to education, decides in the negative for the universities and secondary schools. He is rather of the opinion that they lessen more or less the necessity of industry and individual effort on the part of the teachers and therefore pervert the schools and universities. He therefore deems that it would be better if teaching were left to free competition, and would only allow a small subsidy from the state for the elementary schools.

But that, with all their faults, the public schools have had great merits, is shown by the long line of great statesmen, generals, parliamentarians, poets, and men of learning who have come from them. It is shown in a much clearer way by the testimony of these great men themselves and their attachment to the scenes of their early studies. Poets like Gray⁸ and Byron⁹ have celebrated their schools. Wel-

² Id. Letter of Mar. 21, 1825.

³ Maxwell Lyte, p. 318. See, also, the *Contemporary Review*, 111, p. 557 ff: "If a boy of parts chooses to work at Eton, Eton will do him justice, and he will do Eton justice. * * * We fear, however, that we must own that these brilliant specimens are, when compared with the numbers of the school, rare aves. The characteristic which popular opinion attributes to Eton is, alas! inveterate idleness, an utter want of any obligation to work, the utter fruitlessness of years of nominal education; and popular opinion scarcely goes beyond the truth of the matter. It is a melancholy fact that most boys leave Eton ignorant of the very elements of what they have been learning for periods varying from three to six years."

⁴ Zimmermann, p. 76.

⁵ Ch. Wordsworth, p. 19.

⁶ Maxwell Lyte, p. 312.

⁷ Book V, Ch. II, Part III, art. 3.

⁸ Gray sings in the *Ode on a Distant Prospect of Eton College*:

Ah, happy hills! ah, pleasing shade!
Ah, fields below'd in vain!
Where once my careless childhood stray'd,
A stranger yet to pain!

⁹ Byron, *Hours of Idleness: The Tear*:

Sweet scene of my youth,
Seat of friendship and truth,
Where love chased each fast-fleeting year.
Loth to leave thee I mourn'd,
For a last look I turn'd,
But thy spire was scarce seen through a tear.

lington,¹ according to the well-known story, declared that the playground of Eton was the place where Waterloo was won, and the renowned statesman Canning, also an Etonian, expressed himself as follows upon the value of the public schools: "Strangers often ask by what means an uninterrupted succession of men, qualified more or less eminently for the performance of parliamentary and official duties, is secured. First, I answer (with the prejudices perhaps of Eton and Oxford) that we owe it to our system of public schools and universities. From these institutions is derived (in the language of the prayer of our collegiate churches) 'a due supply of men fitted to serve their country in church and state.' It is in her public schools and universities that the youth of England are, by a discipline which shallow judgments have sometimes determined to undervalue, prepared for the duties of public life. There are rare and splendid exceptions to be sure, but in my conscience I believe that England would not be what she is without her system of public education, and that no other country can become what England is without the advantage of such a system."²

In these words the principal merit of the public schools is well expressed; it consists not in the training of the intellect, but of its character. The system of self-government by the scholars, the esprit de corps which, as Bishop Wykeham long ago intended, outlasts the school and makes ties for life, the open-air sports, all these are calculated to train the scholars to be free citizens, to inspire them with courage and independence, and produce in them self-restraint and the feeling of responsibility to the State and society. With all their roughness and abuses the English schools, unlike the German, never lost sight of the proper object of school education, which is to lead the boys not to knowledge but conduct, and they preserved, even in times of their worst degeneracy, a wide path and held themselves free from pedantic one-sidedness.³ Indeed, even the restriction of teaching to the classics and verse making had its advantages from the point of view of character building, because it kept the young fellows from superficiality and conceit, and those studies are always good mental gymnastics. Especially were the schools nurseries of the national spirit, and

¹ To the foregoing verses of Gray and Byron ought certainly to be added the following lines by the Duke of Wellington. To those who read these beautiful and feeling verses for the first time they will be a revelation of an unsuspected side of the character of the great warrior. It was by his own express desire that he was buried at Eton, and he composed these lines for his epitaph:

"Fortunæ rerumque vagis exercitus undis,
In gremium redeo serus, Etona, tuum.
Magna sequi, et summae minari culmina famæ,
Et purum antiquæ lucis adire jubar,
Auspice te didice puer, atque in limine vitæ
Ingenuas veræ laudis amare vias.
Sî qua meum vitæ decursu gloria nomen
Auxerit, aut si quis nobilitarit honos,
Muneris Alma tui est. Altrix da terra sepulchrum,
Supremam lacrymam da memoremque mei."

These lines have been translated into English verse more than once, the most graceful rendering of them being that given by another eminent Etonian, who, like the Marquis Wellesley, was at once a scholar and a statesman, the late Earl of Derby:

Long tost on fortune's waves, I come to rest,
Eton, once more on thy maternal breast.
On loftiest deeds to fix the aspiring gaze,
To seek the purer lights of ancient days,
To love the simple paths of manly truth—
These were thy lessons to my opening youth.
If on my later life some glory shine,
Some honors grace my name, the meed is thine.
My boyhood's nurse, my aged dust receive,
And one last tear of kind remembrance give!"

(Maxwell Lyte, p. 449.) Tr.

² Maxwell Lyte, p. 349.

³ This explains the admiration which is extorted from German observers (see Ernst Gottfr. Fischer, and particularly L. Wiese); the latter says: "In knowledge our secondary schools are far ahead of the English, but their education is more practical because it gives a better preparation for life."

as such an effective antidote to the powerful modern centrifugal tendencies which would effect the atomizing of society. The only real aristocracy of modern times has come out of them—an aristocracy which was as selfish as it was proud, and as obstinate for its own privileges as it was liberal minded for the greatness of its country, which made England great abroad but neglected her at home. Characters like the Duke of Marlborough, Sir Robert Walpole, and Warren Hastings might stand, both in their brilliant virtues and their great defects, as characteristic products of the old aristocratic schools.

IV.

THE PRIVATE SCHOOLS.

Although the endowed schools, the largest and best of which—the so-called public schools—had been unjustly appropriated by the aristocracy, had always maintained a certain intellectual elevation, the education of the middle classes, to say nothing of the lower, was in a lamentable condition. On this point authentic information is of course wanting, but instead we have credible witnesses among contemporary observers. Oliver Goldsmith, who was himself for some time an usher at a private school, draws a not very favorable picture of the masters of most boarding schools of the kind. “Is any man unfit for any of the professions,” he says, “he finds his last resource in setting up school. Do any become bankrupts in trade, they still set up a boarding school, and drive a trade this way, when all others fail; nay, I have been told of butchers and barbers who have turned schoolmasters; and, more surprising still, made fortunes in their new professions.”¹ And how lamentable was the position of the usher. “He is generally some poor needy animal, little superior to a footman either in learning or spirit, invited to his place by an advertisement, and kept there merely from his being of a complying disposition and making the children fond of him.” He is the butt of the whole school and leads a wretched life.² “I have been an usher at a boarding school myself,” says his London cousin to George Primrose,³ “and may I die by an anodyne necklace, but I had rather be an underturnkey in Newgate. I was up early and late; I was browbeat by the master, hated for my ugly face by the mistress, worried by the boys within, and never permitted to stir out to meet civility abroad. But are you sure you are fit for a school? Let me examine you a little. ‘Have you been bred apprentice to the business?’ ‘No.’ Then you won’t do for a school. ‘Can you dress the boys’ hair?’ ‘No.’ Then you won’t do for a school. ‘Have you got a good stomach?’ ‘Yes.’ Then you will by no means do for a school. No, sir; if you are for a genteel, easy profession, bind yourself seven years an apprentice to turn a cutler’s wheel, but avoid a school by any means.’”

Smollett, Disraeli, and Dickens have also described such private schools. The head teacher in *Peregrine Pickle* is an uneducated German quack whose previous occupation had been to attend to the corns of the people of quality, and sell rouge, tooth powder, hair dye, elixirs of life and the like, to ladies. He has a competent usher, however, who does the teaching for a wretched pittance.⁴ On the other hand, Disraeli complains in *Vivian Gray* (1826) that the principal disadvantage of private schools is that boys are intrusted to the care of the ushers, who are mostly persons of low character, and often veritable blackguards.⁵ Finally, Dickens has embodied

¹ Oliver Goldsmith. *The Bee*, No. VI, on Education, Nov. 10, 1759.

³ Vear of Wakefield, chapter 20.

⁴ *Peregrine Pickle*, Ch. XII.

⁵ *Vivian Gray*, Book I, Ch. IV: “Certain powers were necessarily delegated to a certain set of beings called ushers. In the necessity of employing this horrible race of human beings consists, in a great measure, the curse of what is called ‘private education.’ Those who, in all the fullness of parental love, guard their offspring from the imagined horrors of a public school, forget that in having recourse to an academy for young gentlemen they are necessarily placing their children under the influence of blackguards.”

his views of English private schools in the characters of Mr. Squeers, the proprietor of Dotheboys Hall and Nicholas Nickleby's principal, and of Mr. Creacle, the proprietor of Salem House, under whom David Copperfield received his first unhappy experiences. To be sure, he sketches the better side of the picture in Dr. Strong's school at Canterbury. Notwithstanding such exceptions, however, generally speaking, private education in England up to the middle of the present century was beneath all criticism.

PART II.

THE CENTURY OF REFORM.

I.

DR. THOMAS ARNOLD, HEAD MASTER OF RUGBY, AND HIS INFLUENCE.

At the opening of the present century, immediately after the end of the great war against Napoleon, a lively reform movement began in all departments of public life in England. This new spirit was specially active in matters of education. The appointment of the charities commission in 1818, for the purpose of examining the administration of endowed schools, the founding of a nonsectarian university at London in 1828, and the grant of the first government aid to elementary schools in 1833, were the first indications of the newly-awakened interest in popular education. Secondary schools were not taken up until much later. But the intervention of the state marks, in a characteristic English fashion, only the conclusion of a long series of reforms which owed their origin to the initiative of individuals or corporations.

The labors of Dr. Thomas Arnold, who was head master of Rugby from 1828 to 1842, were of great importance for the great "public schools." Dr. Arnold was a reformer in the noblest sense of the word, a creative reformer, not a merely negative subverter. His activity as such was exerted in many directions, but particularly as a religious and historical writer. He was a champion of the more liberal—the so-called broad church—movement in the English church, and a historian who introduced the German researches of Niebuhr into England. His success in education was due to his knowing how to modify the traditional system in accordance with modern requirements and inspire old forms with new life through his own religious and moral spirit. His character was fundamentally conservative. A deep but not superstitious reverence for the past and for historical growth guided him in all his measures.¹ He was unwilling to introduce anything absolutely new, but chose to develop the old. "Another system," he said, "may be better in itself, but I have been appointed to this one and must see what I can make of it."² He therefore retained the monitorial and fagging systems. "He decided to make use of the existing machinery of the sixth class and of fagging, and to improve it as far as possible."³ Nor would he abolish the right of punishment of the smaller boys by the præpositors, since he regarded it as essential for the maintenance of good order.³ His views upon whip-

¹ Stanley, *Life*, I, p. 108 ff.: "There is," he said, "or there ought to be, something very ennobling in being connected with an establishment at once ancient and magnificent, where all about us and all the associations belonging to the objects around us should be great, splendid, and elevating. What an individual ought and often does derive from the feeling that he is born of an old and illustrious race, from being familiar from his childhood with the walls and trees which speak of the past no less than of the present, and make both full of images of greatness, this, in an inferior degree, belongs to every member of an ancient and celebrated place of education. In this respect every one of us has a responsibility imposed upon him, which I wish that we more considered." This feeling, adds the biographer, dictated the preservation of the old school institutions as far as it was possible, and he was very careful not to break through any customs which connected the institution, however slightly, with the past.

² *Id.*, p. 110.

³ *Id.*, p. 117.

ping have already been given. On the other hand, he opposed energetically the roughness and barbarity which prevailed at Rugby,¹ and exerted himself to infuse a new moral spirit into the school. "What I would like to see in the school, but can not find," he used to say, "is an abhorrence of evil." He regarded the spirit of associations and societies among the boys, when directed against lawful authority, as the principal cause of this lack.² To this spirit he showed no indulgence, and dismissed every scholar who was not a suitable person to be in the school or who exerted a bad influence upon the others. "It is not necessary," he used to say, "that this should be a school of 300 or 100 or 50 boys, but it is necessary that it should be a school of Christian gentlemen."³

His aim was directed first to giving the scholars a religious education. The business of a schoolmaster was to him, like that of the clergyman, the care of souls.⁴ Therefore he used every means to exert a religious influence upon the boys. He himself gave religious instruction and preached every Sunday in the school chapel, of which he was made rector in 1831 without salary. In these sermons he gave the boys his best, and made a lasting impression upon even the most hardened.

Moreover, he endeavored to elevate the moral tone of the school and to educate the boys, especially the older ones, through whom he reached the younger, to a sense of manliness and of responsibility. He treated them like reasonable beings and inspired them with self-respect by showing them respect on his part and by appealing to their sense of honor and their understanding. Above all, he showed confidence in them and taught them to disdain a lie as an act of cowardice. "A general feeling grew," says Stanley, "that it would be a shame to lie to Arnold, because he always believed what one said." It was precisely in this connection that his example exerted such a wholesome influence upon the other schools and through them upon society.

In teaching he laid the principal stress upon his ability to form character. He felt only contempt for mere intellectual acumen without some great and comprehensive object. The Greek combination of the *ἀρετὴ γυμναστική* with the *ἀρετὴ μουσική* seemed to him an ideal one, and he therefore favored the cultivation of outdoor games.

He upheld the classical languages as the foundation of education in the plan of studies. The classical writers seemed to him the best adapted to teach the principles of all political, civil, and church questions with full freedom, attractive eloquence, and deepest wisdom. He therefore treated the classics less from a grammatical-philological than from a historical standpoint. Versifying, which he had at first declared to be one of the most useless forms of intellectual trifling, he afterwards came to regard as useful and allowed the custom to stand. He also introduced Latin and Greek grammars in English, but finally returned to the old Latin text, as he believed that the Latin rules made a deeper impression.

Meanwhile he yielded to modern requirements sufficiently to introduce for the first time in an English public school modern history, mathematics, and modern languages in a limited amount and as subordinate subjects. He contented himself, to be sure, as far as languages were concerned, with a very superficial grammatical acquaintance, and deferred skill in oral use of foreign languages to later life. For the sake of discipline only English masters were employed to teach these languages.

Arnold endeavored to live in a friendly relation with his teachers as colleagues. He held regular conferences with them, in which school matters were discussed. He also endeavored to have the boys change their boarding places from the so-called

¹See Tom Brown's School Days, and also Great Public Schools, p. 150 ff. It is there described how the boys, on his arrival, still adhered to their races, hunting, fishing, etc., and how he introduced one reform after another with decision and wisdom.

²Id., p. 117.

³Id., p. 113.

⁴Id., p. 106.

“Dames’ houses” to boarding houses in charge of teachers, as has been the practice at Eton. So, too, following the model of Eton, he introduced the tutorial system into Rugby.

Arnold’s influence was unusually great. He aroused strong enthusiasm in his scholars, as the writings of the most distinguished among them, such as his biography by Arthur Stanley, later dean of Westminster, and the story *Tom Brown’s Schooldays*, by Thomas Hughes, show. His spirit was also seen in the more earnest, and especially the more religious, character of the students who came from Rugby.¹ Particularly stimulating, too, was his example upon a number of distinguished men, who, in turn, influenced their own students. I only mention Dr. Moberly and Charles Wordsworth, of Winchester; Dr. Vaughan, of Harrow; and above all, Edward Thring, the reformer of Uppingham School.²

II.

THE FOUNDING OF NEW SCHOOLS.

Notwithstanding the progress they had made, the older schools soon showed that they were no longer sufficient for the demands of modern life. By the peaceful revolution of 1832, the so-called first reform bill, the autocracy of the aristocracy was broken, and the industrial and commercial classes became emancipated politically. There was now a pressure upon the public offices which it had previously always been the privilege of the aristocracy by birth to fill. The old public schools were no longer sufficient, either in number or character, to meet the new demands, and the need was felt of new institutions which, while not dispensing with the advantages of the old, should manifest a less sovereign contempt for practical and useful knowledge, and should adapt themselves, in the plan of studies and subjects taught, more to the requirements of the new period. Thus there began a movement in the thirties and forties for the founding of new great schools, which should be cheaper, and therefore less exclusive, than the older ones. The first of this kind were the King’s College School (1829) and the University College School (1833), in London, which were connected with King’s College and University College, and they were followed by the City of London School (1837), which was established on an old endowment. In the following decades a great number of schools were opened in all parts of England, some by stock companies and some upon a system whereby anyone could purchase the right, for a certain sum, to send a boy to the school at a reduced rate. These proprietary schools, as they were called, soon overtook the older schools. The most important among them are Cheltenham College (1841); Marlborough College, for the sons of clergymen (1843);³ Wellington College (1853), intended especially for the sons of dead officers; Lancing College (1848), a specifically Anglican institution, the creation of the corporation of Sts. Mary and Nicholas;⁴ Rossall School (1844); Hayleybury College (1862);⁵ Clifton College (1862); Malvern

¹ Stanley, p. 186, Letter from Dr. Moberly, head master of Winchester.

² Thring raised the old grammar school at Uppingham to the grade of a public school. He has explained his principles in the book *Education and School*, Cambridge, 1864. (See, in regard to him, the *Contemporary Review*, I, p. 80 ff.)

³ Cheltenham College was founded upon the proceeds of the sale of stock; Marlborough College upon a system of appointments whereby any one, by the payment of £50, can become a “governor,” and has the right to send a boy to the school at a reduced rate.

⁴ This corporation has also founded Hurstpierpoint School for the middle classes (corresponding to a German *realschule*), and Ardingly School for the poor (corresponding to a German higher *bürger-schule*), in connection with Lancing College, in Sussex. It has, besides, established other institutions in other parts of England.

⁵ Hayleybury College was the preparatory school for officials of the East India Company until that company was dissolved. It then ceased its operations and was reestablished as a public school.

School (1863); Bath College (1876), and others.¹ They imitated the older schools in the principles of their education, and used to take their head masters from them. Rugby was especially preferred by the founders of the new schools on account of its reputation, which was then at its height, thanks to the labors of Dr. Arnold.² They are somewhat cheaper than the older schools. At Marlborough College, where all the boys eat together in a large chamber, the board costs £80, and for sons of clergymen £50. Those living with the teachers pay 100 guineas. At Wellington College board costs £110, and for sons of officers £80; at Clifton College board is £60 to £70; at Malvern College £80 to £90, etc. These are rather high figures, but they are smaller than those for Eton, Harrow, or Rugby.³ Through the benevolence of friends, these institutions, like the older ones, are endowed with prizes, stipends, and scholarships, and in time they will become endowed schools.⁴

Besides their cheapness, these schools differed from the older at the start in their plan of study. Together with the ancient languages, provision was made for mathematics and natural sciences, history, and modern languages in such a way that, together with the "classical side," corresponding to German gymnasial klassen, a "modern side" was organized, corresponding to the German real klassen. The former prepared its students for the university, while the latter fitted them for official and commercial life.

In most of these institutions the modern department is less well attended than the classical, and also does not have the best scholars.⁵ One of its main objects is to prepare for the competitive examinations which were introduced gradually between 1855 and 1870 for entrance into the military and civil service in the colonies and at home,⁶ and which have replaced the old system of favoritism and appointments by influence, such as was adapted to the nature of a country where caste prevails. Many of them, such as Cheltenham, Clifton, and Marlborough, have special classes for scholars who intend to go to the cadet schools at Woolwich and Sandhurst, or wish to enter the Indian or home civil service. They ought to replace the "crammer," in whose hands alone the business of preparing for examinations has lain for a long time. But the spirit of the public schools, the spirit of sport and bodily exercises, is still far too strong in these institutions to make it probable that this consummation will be reached in any but a limited degree. Many young boys still attend a public school until they are 15 or 16 years old in order to learn the life there, and then intrust themselves to the hands of such a specialist.⁷ That this condition indicates some defect in the system of examination, or in the schools, or, which is probable, in both, there is no doubt. We will return to this point later.

Besides the new public schools, which stood for the higher callings, there arose great institutions with a more commercial-technical course, intended to provide use-

¹ According to Whitaker's Almanac, 21 of the 53 great public schools have been founded since 1820, and only 3 in the period between 1620 and 1820.

² Great Public Schools, p. 204 f.

³ At Eton the expenses of board and instruction, with incidentals, amount to over £200 (about £30 for free scholars). At Rugby they amount to £150. At Harrow board amounts to £90, and instruction costs £47 18s., but there are many extras.

⁴ Clifton College, for example, has been independent since 1877, and is incorporated (Leclerc, p. 195).

⁵ Leclerc, p. 92 ff.

⁶ Parliament first decided to introduce examinations for the Indian civil service in 1853, and in 1854 a commission was appointed for preparing a scheme of examination, of which Lord Macaulay was chairman. The first examination was held in 1855. Soon after similar examinations were introduced for the military schools of Sandhurst and Woolwich, and in 1870 for the English civil service. (Leclerc, *Les professions et la Société en Angleterre*, p. 116 ff.)

⁷ At Woolwich, in 1888, 112 candidates out of 251 were prepared by "crammers," nearly all of whom had attended a public or grammar school up to their fifteenth or sixteenth year. In 1892 there were only 80 out of 234 who had been prepared in this way. At Sandhurst the share of the "crammers" was much greater, viz, 201 out of 307 in 1888; 236 out of 361 in 1890; 222 out of 330 in 1892. (Leclerc, p. 114; see also Escott, *England*, p. 258; *Nineteenth Century*, November, 1880, *Evils of competitive examinations*.)

ful knowledge for the benefit of the shopkeepers and mechanics, the so-called lower middle class. They are all day schools and the fee varies from £2 to £8 a year. One of the best of these is the Cowper Street Middle Class School, founded by the corporation for middle-class education in the metropolis and the suburbs, and which corresponds nearly to our [i. e., German] realistic high schools. Instruction is given in English, geometry, mathematics, arithmetic, writing, bookkeeping, chemistry, drawing, French, physics, singing; and in special classes, which pay a special fee, Latin, German, Hebrew, freehand drawing, and the violin. The fee is 25s. a quarter.¹ The old city guilds have established similar schools, and so have city boards or stock companies in the business and industrial centers in Manchester, Birmingham, Liverpool, Leeds, Bristol,² etc. They differ from the public schools in their utilitarian spirit, which often forgets education in the eagerness to gain knowledge, and with Philistine-like shortsightedness keeps only practical use in view. Aside from these institutions, the most still remains to be done for the education of the lower middle class. For this class private schools still hold their position.

III.

THE EXAMINATION SYSTEM.

Simultaneously with this activity in founding schools began the first attempts at an organization of the school system itself. It was becoming clearer to all that the education of the middle class as well as the lower should no longer be left to the soulless play of demand and supply. Above all things it was important to find some standard of judging the thousands of private schools throughout the country.³ On the one hand parents ought to have expert assistance in protecting themselves against the swindling advertisements of the Squeers and Creacles⁴ of their "academies" and "high schools," and on the other it was important to provide means by which meritorious schools could lay proof of their performances before some recognized authority. Here, too, in a strictly and characteristically English manner, people shrunk from a direct interference of the Government, and the initiative was taken by private individuals and corporations, who adopted the plan of examinations after the model of the elementary schools as the means desired. In 1846 several principals of private schools met and founded the College of the Preceptors, a corporation whose object was to "promote sound learning and advance the interests of education, particularly in the middle classes," and this object was to be reached by raising the standard of acquirements of the teachers by means of examinations set both for teachers and scholars.⁵ In 1849 this society was incorporated by royal charter and has exerted an annually increasing influence ever since.⁶ Its sphere of action is applied specially to the so-called schools of the second grade, i. e., schools which prepare their pupils for active life and graduate them at 15 or 16 years of age. Since 1854 the college has granted titles and diplomas to teachers (as associates, licentiates, and fellows of the College of Preceptors) who have undergone an examination in pedagogics and other branches of science. It examines scholars in semiannual

¹ See details in Leclere, *L'éducation*, p. 119; also Wiese, p. 62.

² Leclere, V-IX.

³ According to the report of the Royal Commission of 1894, their number varies between 10,000 and 15,000, but is hard to estimate.

⁴ Schools like those which Dickens described certainly could not be found now, but the private schools are still often in the hands of utterly unqualified persons, who pay their teachers worse than servants.

⁵ The statute reads that the society was formed "for the purpose of promoting sound learning and of advancing the interests of education, especially among the middle classes, by affording facilities to the teacher for acquiring a knowledge of his profession, and by providing for the periodical session of a competent board of examiners to ascertain and give certificates of the acquirements and fitness for their office of persons engaged or desiring to be engaged in the education of youth."

⁶ Since 1887 it has occupied its own great building in Bloomsbury square.

examinations, for which it grants certificates, and it also undertakes the visitation of entire schools. Its certificates of the first class—there are three grades or classes—are recognized as sufficient certificates of general education by the Incorporated Law Society and the General Medical Council. The examinations are only in writing and are not too severe. At the most they set questions like those for one-year volunteers in Germany. Since 1873 the college has given lectures on the theory and practice of education, and it has recently opened a teachers' seminary in London (Day Training College) for teachers of secondary schools, in which an opportunity for practical exercise in teaching is given. How great its activity is is shown by the fact that 3,233 private schools undergo its examinations. In 1893 it examined 16,672 scholars of all kinds of schools, principally, to be sure, private.¹ These examinations have certainly contributed very much to elevating the character of the teaching in private schools. The universities have performed a no less great service for the reorganization of secondary instruction. In 1857, at the suggestion of Dr. F. Temple, head master of Rugby since 1858, of T. D. Acland, Rev. J. L. Brereton, and Professor Max Müller, so-called middle-class examinations were instituted, first by Oxford and then by Cambridge, which were to be held semiannually in two divisions, one for junior boys (up to 15 years of age) and the other for senior boys (up to 18 years of age). Permanent corporations were formed at Oxford and Cambridge, called the "Oxford delegacy" and the "Cambridge syndicate," which undertook the examination of schools at a given place at the request and expense of a local committee, sent out printed questions, appointed an examiner, and corrected and passed upon the papers. In this case, too, the examinations were only written. From the outset they have included all departments of knowledge, such as modern languages, natural science, English literature, and modern history. In selecting subjects for examination great freedom is allowed the candidate; only the most elementary knowledge is obligatory.²

For a long time the efforts of the universities met with little acceptance. The title "middle-class examinations," which has been changed into the colorless name of "local examinations," frightened away many of the leading schools, the competition of the two universities had a paralyzing effect, and the great schools which gave tone to the whole secondary system held stiffly aloof.³

Then (in 1873) the two university corporations combined to form the Oxford and Cambridge school examination board, commonly called the joint board, whose object was to examine particularly so-called schools of the first class, i. e., such as send their graduates to the universities and have a public character. From that time on the success of this step of the old universities was assured. London University and the newly founded Victoria University in Manchester adopted a similar course. To-day the famous old schools Eton and Rugby undergo these examinations, as well as Clifton, Marlborough, and many others. These examinations qualify for the study of medicine, law, architecture, technics, veterinary surgery, pharmacy, etc., and dispense with the entrance examination at Oxford—the "responsions." The universities also undertake the examination of entire schools.⁴

¹ Report of the Royal Commission, p. 51, 58. In 1875 there were 150 scholars and 2,500 examined. (Wiese, II, p. 156.)

² The following subjects are obligatory for the younger scholars: English (reading, dictation, grammar, composition), arithmetic (four rules, decimal system, simple interest). The candidate must take at least three of the following subjects: Greek, Latin, history, geography, French, mathematics, physics, German, Shakespeare, chemistry, botany, and zoölogy. For older scholars the following subjects are obligatory: Arithmetic, English, foreign languages, mathematics, and physics. In individual divisions the candidates have the choice between several. Thus, in English they may take history and literature, grammar, geography, national economy. In languages the knowledge of one is sufficient, and in mathematics the candidate is examined either in algebra, or geometry, or mechanics. Examinations are also held in religion, drawing, and music. (Leclerc, p. 282 ff; see also Wiese, II, appendix, p. 357 ff.)

³ In 1865 Oxford examined 301 scholars for the higher and 920 for the lower grade. Cambridge examined about the same number.

⁴ Cambridge since 1862, Oxford since 1877.

Statistics best show what great results the magnanimous intervention of the old, rich, universities has produced in promoting popular education.¹ They have, by this descent into the people, by this patriotic labor for the intellectual welfare of men, shown themselves worthy of their famous names and have earned the thanks of their country.

It was practical considerations that first led the English Government to interest itself in secondary education. The great industries which sprang up after the beginning of our century needed technically skillful men and draughtsmen, and such were wanting in England because, as all inquiries showed, there were no schools for training them. Therefore Parliament in 1836 granted an annual appropriation of £1,500 for a drawing school to be held in Somerset House, and from this small beginning gradually² grew the science and art department, i. e., a department for science and art in their relation to industrial life, which to-day has a budget of £745,470.³ The object of this board, which has its seat at South Kensington and maintains the great museum there, is to promote the study of practical science and art in the widest sense. This includes geometry, physics, mechanics, chemistry, geology, mineralogy, zoology, botany, machine drawing, banking and finance, bookkeeping, singing by note, instrumental and orchestral music, economics, seamanship, theoretical and practical pedagogics, veterinary surgery, etc. This board has established a number of model institutions, especially for training teachers, in London, but it usually proceeds in an indirect way by subventioning schools and classes in which these subjects are taught. The pupils must be children of the "industrial" classes, i. e., sons or daughters of parents whose income does not exceed £400, or, as it now is, £500. There are regular inspections and examinations, and according to the results of these £2 to £8 per head support is paid; the board also pays for regular attendance.⁴ There are also prizes for scholarships, contributions for buildings, physical apparatus, museums, etc. The work of the board is very great. According to the forty-third report, in 1896⁵ the number of assisted scholars in the scientific department was 2,673, the number of classes 9,545, and the number of students 193,404. In the art department are 19,838 schools with 2,192,253 scholars, mostly elementary, who take drawing.

The work of the science and art department has been of great value. As Huxley remarked, it has brought the means of instruction to the doors of factories and workshops.⁶ But this great energy has its dark side. The science and art department

¹ In 1893 Oxford examined 1,198 older scholars (372 boys and 826 girls), of whom 827 (259 boys and 568 girls) passed, and 2,539 younger scholars (1,505 boys and 1,034 girls), of whom 1,936 (1,117 boys and 819 girls) passed. The same year Cambridge examined 1,825 older scholars (564 boys and 1,261 girls), of whom 1,269 (374 boys and 895 girls) passed; 6,992 younger scholars (4,961 boys and 2,031 girls), of whom 5,118 (3,349 boys and 1,769 girls) passed. The large proportion of girls is very interesting. Oxford and Cambridge together have examined 147 schools, of which 18 [78] were boys' and 69 girls' schools. In 1893 the joint board examined 146 schools partly or wholly, of which 89 were for boys and 57 for girls; and 1,345 out of 2,547 candidates obtained certificates. Report of commission for secondary education, pp. 57, 58.

² The individual steps of this development are as follows: In 1836 a normal drawing school was established in Somerset House. In 1840 Parliament appropriated £10,000 for the establishment of similar schools in the provinces. In 1845 the Normal School of Science and in 1851 the Royal School of Mines were founded. In 1846 a department of practical art was added to the board of trade. In 1853 the science and art department was organized. In 1856 the science and art department of the newly organized department of education was instituted and installed at South Kensington. (Leclere, 221 ff., and elsewhere.)

³ The Times, weekly edition, Aug. 14, 1896.

⁴ Rep., p. 27: At the day organized science schools £1 is paid for every scholar who attends 250 times a year. At the evening schools 10s. is paid for an attendance of 60 times a year.

⁵ The Times, weekly edition, Aug. 14, 1896.

⁶ Collected Essays, II, No. 16, p. 419 ff., where he also says: "I dare say you have heard of that proceeding, reprobated by all true sportsmen, which is called shooting for the pot. Well, there is such a thing as teaching for the pot—not teaching that your scholar may know, but that he may count for payment among those who pass the examination."

was the first (viz, in 1859) to introduce the system of paying according to the results obtained, which soon afterwards prevailed in elementary schools. This system, which has been characterized as "free trade in instruction," may stimulate the schools, but not in the proper way. It leads to partiality, mechanical finish, and spiritless "cramming." Many schools live upon the allowances of the board and regulate themselves accordingly. They teach only or principally those subjects which will bring in something, and therefore neglect languages, history, geography, and English, and do not give instruction so much as they prepare individual boys for the examinations, who are consequently overworked and often injured for life.¹ Upon the whole, the examination system, which was the normal outcome of the utilitarian Manchester spirit of a former period, has been overdone and has consequently introduced a feverish restlessness and unmethodical haste into the school system which can not be beneficial to it in the long run.² In recent years a general conviction has been growing that this condition is an unhealthy one. The more recent directions of the science and art department, in 1894, breathe a freer and more judicious spirit. They include the so-called "literary" subjects, languages, history, geography, etc., in their scope, partly replace written by oral examinations, and so raise the department to the position of a kind of board for secondary instruction in general.

IV.

THE PARLIAMENTARY COMMISSIONS AND THEIR RESULTS AND CONSEQUENCES.

Parliament first took a hand in the reform of secondary instruction in 1861. Public opinion had long been busy with the abuses which prevailed in the government and conduct of the great endowed schools, and finally, in 1861, a royal commission was appointed, with Lord Clarendon at its head, which investigated the nine greatest public schools—the seven boarding schools, Eton, Winchester, Westminster, Charterhouse, Hanover, Rugby, and Shrewsbury, and the two day schools, St. Paul's and Merchant Taylors'. Marlborough and Wellington colleges were also drawn within the scope of the investigation. The task was not made easy for the commission. The head masters of the old schools, except Rugby and Shrewsbury, declined to allow them to examine the boys or even to attend the lessons. One of them, Dr. Moberly, of Winchester, expressed his apprehension that such a step would only be the beginning of a regular Government examination, and he opposed the proceeding from the outset, since he believed it would prove to be the ruin of the school.³ The commission was consequently compelled to seek information by indirect means. It sent circulars of inquiry to the teachers of the schools, to former scholars, university professors, etc., and later subjected these and other witnesses to a rigid cross-examination. The report of this commission was published in 1864 in four volumes. It exposed the worst abuses in the management of the funds, as well as great one-sidedness in instruction, with very slight performance. The university teachers of Christ Church and Balliol College, Oxford, expressed their opinion of the acquirements of the graduates, who were sent up to them, as follows: "Only a few can explain properly a passage from Virgil or Homer which they have read before. We never examine them on passages which are new to them, since there would be no use in doing so. Good Latin prose is a very rare thing with them. Perhaps one piece out of four is free from gross errors, but there is never a good style. The answers to simple grammatical questions are very inaccurate."⁴ The conclusion of

¹ At a school at Bradford one scholar stood 19 examinations on 19 different subjects in May, 1888, three scholars stood more than 18 examinations, and several more than 16 and 17. The school reputation is based upon this compulsory work of the best scholars. (Leelere, p. 227.)

² See on this point Wiese, II, p. 180 ff.

³ Contemporary Review, IV, p. 168.

⁴ Report of 1864, in Demogeot and Mentueei, p. 172.

the report is condemnatory of the instruction in the highest degree. It says: "The best scholars have never learned to translate an easy Latin or Greek passage without the help of a dictionary, or to write a composition which is grammatically correct. Nearly all of them know nothing of geography or natural sciences, and little of arithmetic and geometry. They know no language but their own, and they can not write that correctly; and they have not learned either drawing or music. As they have no intellectual cultivation and no desire to learn, and are destitute of the faculty of observation, we can not avoid the conclusion that their education is a failure."¹ While the rod was thus broken² over the teaching and management of these schools, yet their great educational importance was spoken of with praise. "Among the services," the report concludes, "which the public schools have rendered, is doubtless to be reckoned the maintenance of classical literature as the foundation of English education, a service which is not outweighed by the mistake of having adhered to them too exclusively. A second and greater is the creation of a system of government and discipline for the boys, the excellence of which has become generally recognized, and which has had the most lasting influence upon the character of the people and social life. It is not easy to estimate the degree to which Englishmen owe to these schools the qualities upon which they pride themselves—their power of governing others and ruling themselves, their talent for combining freedom and order, their patriotism, their strength and manliness of character, their deeply imprinted but not slavish respect for public opinion, and their love of healthy sports and bodily exercises. These schools have been the most important nurseries of our statesmen. In them men of the most different stations in life have been educated upon the common ground of social equality, have entered into lasting friendships, and have formed some of the ruling habits of their lives. These public schools have, perhaps, had the greatest part in forming the character of an English gentleman."³ The commission made general recommendations for the reform of the public schools with particulars applicable to each. By the public schools acts of 1864 and 1868, that part of these recommendations relating to the external management of the schools became law. Reform in teaching took place gradually of its own accord. Verse making was restricted by ceasing to be a required subject, although it remained as a recommended one. Modern languages, natural history, physics,⁴ modern history, and English literature were also introduced into the course of study, although the ancient languages retained the leading place. Usually a "modern side" was organized in addition to the "classical side," and received, it must be confessed, a somewhat stepmotherly treatment. The old schools are still preeminently classical schools and will remain such, at least as long as a knowledge of Greek shall be obligatory at the universities. Lord Clarendon's commission had illuminated only the highest summits of education which are visible from afar. But in the lower regions which were inhabited by the mass of the citizens in town and country, caprice and anarchy prevailed under cover of darkness as much after the report of the commission was published as before. In order to improve this condition a second commission under Lord Taunton was appointed on December 28, 1864, to make a thorough examination of the whole domain of secondary instruction

¹ Report of 1864, in Demogeot and Mentucci, p. 172.

² The abuses of administration have been mentioned before.

³ Rep. of 1864. How Englishmen regard "public education" to-day is shown in the following notice in the Times (weekly ed., July 10, 1896): "The chief speaker on speech day at Shrewsbury school last week was Professor Jebb, M. P. He said that the English ideal of manliness, in some respects so much higher than that recognized abroad, was largely a product of public-school training. The cessation of duelling, the decrease of intemperance among the upper classes, and the philosophic work carried on in our great cities were all instances of the development of this ideal."

⁴ In 1869 Huxley said (Essays, III, p. 112): "I say it with gratitude and respect for these eminent persons that the head masters of our public schools, Eton, Harrow, and Winchester have addressed themselves to the problem of introducing instruction in physical science among the studies of these great educational bodies with much honesty of purpose and enlightenment of understanding."

and compare it with that of other countries. This School Inquiry Commission, as it was called, which was composed of a number of distinguished men,¹ published the results of its labors in twenty volumes in December, 1867, and they form a veritable mine for the historian of culture. The commission found that the great majority of endowed schools had degenerated for want of sufficient funds;² that the education they gave was defective and was very unequally distributed over the country.³ The private schools, in which four-fifths of the children received their education, were still worse. With some praiseworthy exceptions, swindling, sham, and arbitrariness prevailed in them. "The majority of the private schools are as bad as they can be,"⁴ said the commission. The newly founded proprietary schools were still too few, although ably conducted, to fill the gap in the educational system. Upon the whole, secondary education in England, in 1867, was (1) insufficient in quantity, (2) mediocre in quality, and (3) without any organic connection with the universities on the one hand and the elementary schools on the other. The condition appeared to the commission to be an injustice to all efficient schools and teachers and a disgrace to the country.⁵

It was no wonder, therefore, that the education of the lower classes in England stood at a lower level than in other countries, especially Scotland and Prussia, whose systems of instruction appeared to the commission in many respects worthy of imitation. This state of things it was clear would have to be improved or England would sink to a second-rate power—a kind of greater Holland—in spite of her wealth and energy. The commission, therefore, proposed a number of reforms, which affected partly the management of the income, partly the course of study, and, finally, partly the uniform regulation of the entire secondary school system, including the non-endowed schools. Of their recommendations, which it would be of no interest to discuss in detail now, since another commission has gone over the same ground, only a very small part—that relating to endowed schools—was embodied in a law by the endowed-schools acts of 1869, 1873, and 1874. The endowed schools were, with certain exceptions, placed in charge of a commission styled the Endowed Schools Commission,⁶ which was united in 1874 with the Charities Commission, and the business of this combined commission was to prepare reforms for the individual endowed schools, upon the final acceptance of which the committee of council on education was to decide. Up to 1894 this commission had worked out and carried through reforms for 902 of the 1,448 schools in its charge.⁷ Its work has been very successful. It has, above all, done away with the monopoly of the Established Church over the endowed schools and opened them to dissenters of all denominations. The question of religion, which has been such an obstruction to the development of elementary schools, no longer exists for secondary schools. Most of them give undenominational religious instruction, which is ordinarily attended by all the scholars voluntarily,⁸ although anyone can be excused. But the work of the commission is

¹ Dr. Temple, head master of Rugby, made bishop of London in 1885 and archbishop of Canterbury in 1896; Sir Thomas Acland, Sir James Bryce, Lord Roseberry, afterwards prime minister, Matthew Arnold, the son of Dr. Thomas Arnold, and a celebrated critic and poet, Fitch, Fearon, and others.

² While Christ's Hospital had nearly £5,000, 7 schools more than £2,000 each, 13 more than £1,000, 55 at least £500, and 220 at least £100, the income of the great majority (more than 2,409) was under £100 each.

³ Lancashire had £9,000 endowment and Cornwall only £400. Of 532 cities 228 had no endowment schools. The entire income of the endowed schools, if equally distributed over the country, would not amount to more than £1 per head of the boys who attend secondary schools. (Rep., pp. 283, 434.)

⁴ Of 255,000 children 200,000 attended private schools.

⁵ See Matthew Arnold in Ward's *Reign of Queen Victoria*, II, 270 ff, where he remarks: "The reason why no effective remedy is applied to this serious evil is simply . . . because the upper classes amongst us do not want to be disturbed in their preponderance, or the middle classes in their vulgarity."

⁶ The exceptions were the seven great boarding schools, besides all endowed schools which were founded after 1819, fifty years before the passage of the law. (Rep. of 1894, p. 24.)

⁷ Id., p. 8 and p. 25.

⁸ Leclere, p. 212, ff.; Wiese, II, p. 254, ff.

too cumbersome and slow to expect from it a regeneration of secondary instruction. Its plans of reform for the most part only touch the outer side of the schools, and its projects are not uniform and systematic. A single committee on education at the head of local or provincial boards, as the commission proposed, would have been of assistance, but none such was created. After the efforts which Parliament made, as expressed in the laws above mentioned, the subject rested again for two decades. It is a disadvantage of parliamentary government that questions of public welfare, however urgent they may be, are easily set aside by others of much less importance which are party questions and therefore appeal to the passions.

V.

FURTHER DEVELOPMENT OF SECONDARY SCHOOLS (1870-1894).

However, the last decades have not been fruitless for the cause of secondary education. On the contrary, the seed which was sown at the earlier period has developed, and the foundations have been laid for a flourishing organization of secondary instruction.

Such a foundation, and in a certain way a model one, was the regulation of elementary instruction provided by the laws of 1870 and 1876, of which Mr. W. E. Forster was the originator. The newly organized school boards even reach the secondary schools directly through the higher grade elementary schools which they have organized. These schools exist especially in the cities.¹ Their instruction is mostly, if not exclusively, confined to scientific and technical branches, and they are consequently under the science and art department, upon which they are also financially dependent.² Their field of work has hitherto been somewhat limited, but it is hoped that it will expand and that they will be called upon to fill a great gap, namely, the want of secondary schools of the third grade, i. e., schools intended for small shopkeepers, farmers, and mechanics, and corresponding nearly to our secondary burgher schools or *rectorat schulen*.

As the regulation of the elementary schools operated from below, so did the sudden growth of university studies exert its influence from above. Oxford and Cambridge are to be mentioned in this connection first of all. After they had gradually opened their doors to all the sciences and after all religious distinctions had become matters of indifference (in 1871) the spirit of reform seized powerfully upon these time-honored representatives of learning. As they did formerly, in the thirteenth century, in Roger Bacon's time, and again in the sixteenth century, the age of Erasmus, Colet, and Thomas More, so they now became the champions of culture, and especially the promoters of secondary education. How they affected education through the medium of examinations has already been described. Of even greater importance is the university extension movement (since 1873), which, by means of courses of lectures in connection with correspondence classes and examinations, extends education to those who could not obtain it otherwise. We can not follow here the development of this movement, which now has two fixed seats, in Exeter and Reading, and had among its students in 1893-94 60,000 persons, men and women, including workmen and shopkeepers, clerks and petty officials, elementary school teachers, and scholars of secondary schools.³ Its significance for secondary schools consists

¹ In 1894 there were in England, outside of London, 60 such schools and 14 so-called "ex-standard classes." Of these 60 schools 48 were in the large cities and 12 in smaller cities. They gave instruction to 4,606 boys and 2,023 girls. In London there are 3 secondary elementary schools and 60 schools with "ex-standard classes" (which the Germans call *Fortbildungs classen*), which give instruction to 1,016 scholars. (Rep., pp. 52-54.)

² Of the 60 secondary elementary schools in England (outside of London), 39 are "organized science schools." Almost all send candidates to the examinations of the science and art department. Forty-nine have chemical laboratories; 9, physical laboratories; 46 have lecture rooms on natural history; 48 have drawing rooms; 49, workshops; 54, kitchens; and 7, laundries. (Rep., p. 53.)

³ Leclerc, p. 291 ff.; see also Rep. of 1894, pp. 55 f., 249 ff.

partly in the fact that it has awakened a need of education and has aroused English philistinism from its intellectual sleep of two centuries, and partly in the fact that the lectures, from a want of preparation on the part of the "students," can not follow a university standard, but are compelled to do the work of the secondary schools. The same remark holds good, at least in part and provisionally, of the numerous university colleges which have sprung up since the middle of the century, particularly in the industrial centers of the middle and north of England, and which are compelled to instruct their scholars—mostly boys of 15 or 16—the first year in the elements of knowledge instead of teaching science.¹ The first of these university colleges was Owens College, Manchester (founded in 1851), which was incorporated as Victoria University in 1880, and has since been united with Liverpool University College, and Yorkshire College, Leeds. Similar institutions arose at Bristol, Birmingham, Nottingham, Newcastle-on-Tyne, Sheffield, etc. In 1891 eleven such colleges received £15,000 from the Government.

One point upon which the commission of 1865 commented with energy, but, unfortunately, without result, is the improvement in the position and organization of the teachers of secondary schools. In this respect complete anarchy did and does still prevail in great measure. Anyone can be a teacher, and a situation is obtained in many cases, especially in the great number of private schools, through agents, who, if they are not out-and-out swindlers, yet know nothing of schools or the school system. There can therefore be no teaching as a profession under such circumstances. Many look upon teaching not as a permanent calling, but only as a temporary makeshift until they can find some more lucrative employment.² At the better public schools, indeed, most of the teachers have had an academic training and are graduates of the universities.³ But this is far less frequently the case at the public schools of the second and third grades and the private schools.⁴ Almost nothing has yet been done to prepare teachers properly for secondary schools. The college of preceptors alone gives lectures, as already mentioned, upon education and examinations; gives diplomas, and lately, also, gives teachers a practical training. On the other hand, the attempts of the universities in this direction have fallen through for want of support on the part of the authorities of the public schools.⁵ The preparation of female teachers of secondary schools is far better in this respect.⁶

The reason of this want of support lies for the most part in the prejudice which exists, especially in the public schools, against a systematic training for the calling of teacher. In this is seen the reverence for the opinion that only scientific training and natural pedagogical gifts are required in a teacher of secondary schools and that the art of teaching and training must be inborn and can not be learned any more than the art of writing poetry.⁷ The clerical element among the teachers has diminished a good deal in recent years. Formerly the best positions in secondary schools in England almost seem to have been regarded as intended for clergymen, but to-day that is not the case to the same degree. According to Whitaker's Almanac for 1895, out of 961 teachers at the 53 largest schools 185 were clergymen. To be sure, 38 of the directors were clergymen and only 15 laymen; and of these the majority (10) were at day schools. Dr. Arnold was of the opinion that the head of

² Rep., p. 209.

³ At 465 public schools in England and Wales 63 per cent of the teachers are graduates. (Rep., p. 193.)

⁴ At the private schools only 27.86 per cent of the teachers are graduates. (Id., p. 238.)

⁵ Rep., p. 71.

⁶ Id. Training colleges for women are: Maria Grey College and Bedford College, London; Cambridge Training College; Cheltenham Ladies' College; St. George's College, Edinburgh; Datchelor Girls' School, Camberwell, etc.

⁷ Rep., p. 198. In Oxford and at Mason's College provision is now made for training secondary teachers. (Id., p. 71.)

a public school ought to be a clergyman, but to-day this tutelage is felt to be an injustice.¹

There is no fixed position in the teacher's profession in England in the German sense. The head master is appointed by the governing body and in turn selects his assistants, whom he can dismiss with notice or summarily at any time. The assistant masters have for a long time desired to secure the right of appeal to the governing body² against this power.

The salaries of the teachers are, as a rule, especially when measured by English standards, very small. There are some choice positions the incomes of which, especially through the right of taking boarders, reach an amount which is unheard of among us, but the others are so much the worse. The average salary at the 10 best schools is £242.77 and at the 190 others £105.19. The average of all is £135.22. At many schools the assistant teachers only get £60 to £70 and do not rise above £100 to £120. For this reason many only teach as an auxiliary means of support or as a step to something better. The salaries in the smaller private schools are of course particularly low, and the most unscrupulous exploiting often prevails in them. There are no pensions, generally speaking, in England, but at Eton and some of the other endowed schools the old fellowships have been converted into pensions. Elsewhere everyone must prepare for his old age as best he can.³ In order to improve this condition and to organize the body of secondary teachers as a profession the teachers have followed the same path which the lawyers and doctors took before them, namely, that of combining into societies. The object of these societies is to promote professional feeling, to exclude unworthy elements, and conduct the business of securing places. The smallest but most distinguished of these societies is the Head Masters' Conference, which was established in 1870, which numbers among its members the head masters of the 89 most important public schools in the kingdom. Others are the Private Schools Association, established in 1883; the Teachers' Guild, established in 1885, a society which extends all over England and is composed of both men and women and has developed great activity; the Incorporated Association of Head Masters, established in 1890; the Association of Assistant Masters, which is especially occupied in finding places, established in 1892; the Association of Head Masters of Preparatory Schools; the Association of Head Masters of Higher Grade Elementary and Organized Science Schools, established in 1892,⁴ and the Modern Language Association, which has for its special object the promotion of the study and teaching of modern languages. All these societies aim at an official registration of teachers as the foundation of an organization of the whole body; that is, they ask for a law providing that no one shall teach in a school who has not obtained a certificate of his scientific and practical qualification to teach, granted by a recognized authority.⁵ This would be the surest safeguard against the employment of unfit persons and of such as only turn to teaching as a transitory means of support.

Of greater importance for the further development of the secondary schools was the formation of county councils or boards by the law of 1888. The plan of reform of 1867 was not the least foiled by the circumstance that there were no suitable popular boards to which education could be intrusted. A bureaucratic centralized authority after continental models is a thing that is repugnant to the English mind, and to create newly elected bodies simply for the sake of secondary schools also seemed to be impracticable, judging from the many recent elections. But now the people had in the county councils popular local parliaments, to which the care

⁴ *Rep.*, p. 14. Of course there are many associations for women also.

⁵ As far back as 1879 a bill to this effect was proposed by Sir Lyon Playfair, but did not pass.

of secondary instruction seemed to belong as a matter of course. This showed itself the next year when the question of technical education came up, which was agitating England at that time. The actuating motive in this case as usual was a practical one. At the end of the seventies and the beginning of the eighties a fear of foreign and especially German competition suddenly seized English merchants and manufacturers. It was recognized that a new and powerful rival of England in the markets of the world had appeared, and fears were felt for the continuance of English supremacy. Even in England itself the competition of young German merchants and skilled laborers who, in consequence of their better training and low salaries, excluded their English colleagues, was severely felt. The German clerk, who works for £1 a week, corresponds in six languages, and, after he has learned the English business, goes home to set up a dangerous competition with it, became a favorite character in novels—I need only refer to Walter Besant's stories¹—and the newspapers, the street speakers, and the music halls all pointed out with a thousand variations the dangers of a "German invasion." The cause of this state of things it was thought could only lie in the defective expert training of the English. A commission was therefore appointed in 1880 to examine into the condition of technical instruction and its influence upon the economic situation of the country. The report of this commission in 1884 did, in fact, show that England was behind the continental nations in technical matters, and that this was a consequence of less education in general and of a want of acquaintance with modern languages, economic geography, and other practical branches in particular. Also, compared with the continent, it was found that there was a great need of technical and industrial schools.² The consequence of this report and of the agitation which preceded and followed it showed itself first in a great enthusiasm for the enlargement of the existing and the founding of new day and evening schools for "technical education." This education, according to the definition of one of its most distinguished advocates, Professor Huxley, was to be simply a good education with greater attention to natural sciences, drawing, and modern languages than is usually given.³ It was not the intention to make the school a substitute for practical teaching, but only to give the mechanic a better preparation for his business than he had had before.⁴ In short, the ideal of this education corresponds nearly to our "realschulen" and "gewerbeschulen."

Thus there sprang up in London, thanks to the generosity and public spirit of the old city guilds, the Cowper Street School, already mentioned; the City and Guilds of London Institute (established in 1880); a polytechnic school; a technical school; and a drawing school. Prizes were provided and scholarships established, and diplomas were granted for scholars in provincial technical schools.⁵ Similar schools arose in Birmingham, Manchester, Bradford, Huddersfield, etc., partly upon the ruins of the old mechanics' institutes which had flourished for a short time at about the middle of the century, but had afterwards decayed. The generosity and public spirit of rich individuals also, of a stamp which has never been wanting in England, manifested themselves in a striking manner in founding these schools.

But private benevolence was not enough. In order to obtain lasting results the machinery of the State had to be set in motion. This was a matter with which the "society for the promotion of technical education," founded by Prof. Sir Henry Roscoe and Arthur D. Acland, with the Duke of Devonshire as chairman, busied

¹ Herr Paulus: His Rise, his Greatness, and his Fall, and Catharine Regina.

⁴ Id., p. 412.

⁵ Leclerc, p. 252 ff., and elsewhere.

itself.¹ After a lively agitation and many unsuccessful attempts,² the society finally succeeded in persuading the Government to introduce a measure known as the technical institution bill, which became law on September 19, 1889. This law intrusted the newly created county councils with the initiative with reference to the organization of technical instruction. Under the law the councils had the right to impose a tax of 1 penny for this purpose. This law, however, would have remained a dead letter, as only a very few county councils made use of their authority,³ if it had not been supplemented the following year by a new one, which provided the means as well as the authority for furthering secondary education. This was the local taxation act of 1890, by which the excess of the beer and spirit tax was turned over to the county councils for the purpose of furthering secondary education. In this way the 48 country county councils disbursed £396,143 in 1893-94; the London council £57,000, and the 61 city county councils £160,084, which are very considerable sums,⁴ and were expended for technical and secondary education generally, and, upon the whole, with the best results. To be sure, the want of uniformity and of strict organization made itself often felt, a misfortune which results in waste of money and partiality.⁵ At all events, England has been covered with a network of industrial schools in the last few years, and has by that means become better equipped for competition in trade and industry.

At this same time appeared the first attempt at a uniform regulation of secondary schools in a smaller territory—namely, in Wales. The situation there was particularly unhappy. The country was poor, and the endowments which had come down from former times were insufficient in number and value, and, besides, were appropriated for the benefit of the English Church people, who differed from the Welsh and Methodist population both in language and religion.⁶ Lord Aberdare's commission in 1880 discovered this state of things and published a report upon it in 1882. Seven years later the Welsh intermediate education act was passed, by which an education committee of five members (three of whom were appointed by the county councils and two by the lord president of the privy council) was created for every county in Wales (including also Monmouthshire), and the care of the organization of secondary schools was intrusted to these committees. They were to take charge of the existing endowments and distribute new ones, and, with the consent of the county or city councils, they impose a tax of one-half penny on the pound for education purposes, the government binding itself to make an equal con-

¹ Huxley, III, No. 1, and elsewhere.

² Bill of July 19, 1887, which was withdrawn, and the bill of Sir Henry Rescoe, of February, 1888.

³ In 1893-94 only 6 out of 39 country county councils and only 7 out of 62 city county councils availed themselves of this right. The entire tax levied that year amounted to £6,044 in the country and £8,656 in the cities, a very small sum. (Rep. 428 ff.; tables.)

⁴ Report, 1894, p. 32 ff., and the tables, p. 232 ff. As an example of the distribution of the money, the following table is given. In 1893-94 the country county councils distributed:

	£	s.	d.
For secondary schools	17,168	17	10
For prizes and scholarships	40,047	19	6½
For evening and "ex-standard" classes	13,921	14	10
For classes for elementary teachers	22,781	9	6
For technical institutes and drawing schools	56,433	11	8
For classes for special industries	73,851	7	10½
For other classes	60,726	13	11
For apparatus	2,934	..	5
Board, etc.	33,657	9	5
Total	321,523	5	..

⁵ Report, p. 65.

⁶ With a population of 1,570,090 there were only 2,896 positions in grammar schools, and only 1,540 filled—i. e., hardly 1 to 1,000 of the population, much less than in England. See Contemporary Review, 1882 (vol. 41).

tribution with the parishes. The law has worked extraordinarily well, notwithstanding the short time it has been in operation.¹ The Welsh people, who are famous for their intellectual quickness, have done honor to their reputation by their generosity. The committees have met, and in a short time have carried through a thorough reform.² They have given a practical demonstration—an object lesson, as they say in England—of what a systematic organization can do.

VI.

THE COMMISSION OF 1894-95 AND THE EDUCATION BILL OF 1896.

After these different partial attempts the time seemed at length to have come to undertake a reorganization of the entire department of secondary education and to do for the secondary schools what Forster's law of 1870 had done for the elementary schools. The Liberal party, which has always taken the initiative in matters of education, was also anxious to complete this work. In 1892, Arthur Acland introduced a bill which empowered the English counties to organize secondary education, but the bill did not pass. But in that year the Liberals came into power, and Acland was made vice-president of the education office. He appointed a new commission in March, 1894, "to discover what would be the best methods of introducing a well-organized system of secondary education into England, taking into account the existing needs and local sources of income, and to draw up plans in accordance therewith." James Bryce, who had already been a member of the commission of 1864-65, and who is an eminent student and political writer,³ was the chairman of this commission. The commission consisted of sixteen members, including representatives of the universities, of the secondary and elementary schools, clergymen, county commissioners, and, for the first time in English history, three women.⁴ The commission began to publish the fruits of its labors toward the end of 1895, a short time after the overthrow of the Liberal cabinet, and the report, with the preparatory matter and documents, fills nine volumes. The report is expressly restricted to the question of external organization, touching only occasionally upon the course of study and methods of teaching. Within these limits it is very complete and gives an exhaustive picture of the present condition of secondary education, with a discussion of the necessary reforms. The proposed plan of reform we will briefly sketch.

It is based upon that of the commission of 1864-65. Radical changes are rejected, while the proposed reform is built upon existing conditions and endeavors to develop the unconscious tendencies contained in the latter into a national system. The essential features of the plan are substantially as follows:

There shall be a minister of education at the head of the entire system of education who shall be responsible to Parliament. Little initiative, however, shall be given him. His prime function shall be to supervise the action of the local boards, advise them, and give them support, and protect the private and society schools against their encroachments if necessary. The minister shall be assisted by a council of educa-

¹ Report, p. 13: "Although the act has only been four years in operation, enough has already been achieved by it to show the importance of concentrating and correlating the various local forces and influences that can be used to promote education, and in particular to demonstrate the gain to be expected from the establishment of representative authorities charged with functions in that behalf."

² According to Leclerc, p. 225 and elsewhere, the Welsh have expended £100,000 in four years for secondary education. Seventy schools are to be founded, and it is estimated that by the end of the century instead of 1,540 children, as in 1888, 8,000 children (5,000 boys and 3,000 girls) will be receiving secondary instruction. In the report the following estimates are made for 1893-94 for seven counties of Wales: Endowments of £14,634; from the science and art department, £2,274; one-half the tax and equal contribution from the government, £22,976; local taxation act, £23,779; total, £73,655, for a population of 1,203,576 souls.

³ His two principal works are *The Holy Roman Empire and the German Empire*, and *The American Commonwealth*.

⁴ Lady Frederick Cavendish, a lady of the highest aristocracy; Dr. Sophia Bryant, directress of a secondary school for girls; and Mrs. Henry Sidgwick, head of Newnham College, Cambridge.

tion to consist of twelve members, of whom four shall be appointed by the Government, four shall be chosen by the universities, and four shall be cooptated. This council shall keep the register of the teachers and decide in contested cases.

The initiative in secondary education shall be taken principally by the local boards for that grade, who supervise the secondary schools both in the country and towns of the different counties. They shall have the disposal of the money appropriated for this purpose, can impose new taxes, and superintend the existing secondary schools. Private and society or association schools shall be under their authority only in so far as they desire to be publicly "recognized." In that case they must comply with the public requirements with reference to plan of studies, installation, dismissal, and salaries of teachers, and shall, therefore, be admitted to compete for scholarships and prizes. The hygienic supervision of the boards shall, however, extend to all secondary schools.

With reference to the internal organization of the schools the commission declines to make any fixed rules. It desires no schematic uniformity like that which prevails in continental countries. It only recommends that more weight shall be laid upon a solid general education than upon the acquisition of convertible knowledge, and that the endowments, prizes, and scholarships shall be applied rather to making the benefits of education more accessible to the poor than, as has often been the case hitherto, making them cheaper for the well-to-do. An official register of teachers is required in which anyone may be entered who can bring certificates of his scientific and practical qualification to teach. Teachers also are to have better pay and have the right of appeal against arbitrary dismissal.

The overthrow of the Liberal ministry in August, 1895, seemed likely to postpone the reform indefinitely, but the Conservative Government, in which Sir John Gorst represented education, took up the work again, and on March 31, 1896, brought an education bill before Parliament, besides a teachers' registration bill. The education bill was defeated in June after a stormy debate. The cause of this failure was the attempt of the Government to combine a revolution in the elementary schools with the plan for regulating secondary schools. It united questions which are far removed from partisanship with the contest between denominational and church schools and, like the Zedlitz bill in Germany, inflamed the religious prejudices and so brought to naught those provisions of the law which relate to secondary schools. It is still hoped, however, that the registration provision may yet be saved. In spite of the defeat of the last Government proposal, a speedy solution of the question of secondary schools is certainly to be expected. The conviction of the necessity of Government control of this affair, which is national in its character, has become generally impressed upon the public and is growing daily in strength. Nevertheless, there is in no wise a disposition to break with the past and turn to the Government as an all-powerful preserver. The English system of the future will rather take a middle course between the former anarchy and the French or German state or government school. It will not check the initiative of private citizens, societies, and corporations, which has accomplished so much in the past, but rather stimulate, guide, and superintend it. It will not introduce a complete equality nor regulate every minute detail from an office desk, but will leave room for the individuality of the executive authorities and the benefactors and teachers to display itself. It will not be a centralized bureaucratic system, but will base its strength chiefly upon locally elected authorities, and so join in with the new system of self-government which has sprung up in England within the last decade. Finally, it will keep in view, above all, the teachings of the past and never forget, even in the hurry of modern push and enterprise, the old principle of the public schools that instruction and education can never be separated, and that of all methods of education only that can be the right one which takes into account the whole man, not simply his understanding, but his will and emotions as well.

Events in the history of secondary schools for boys.	Contemporary events connected with them.
1771. The annual archery contest at Harrow abolished by Dr. Heath. Substitution of speeches.	
1778-1794. Dr. James head master of Rugby.	1808. British and Foreign School Society founded by J. Lancaster.
1793-1810. Dr. Goddard head master and warden of Winchester. He bequeaths £25,000 to the school as a teachers' fund.	1811. National Society for Promoting the Education of the Poor in the Principles of the Church of England founded by A. Bell.
1809-1854. John Keate head master of Eton.	1818. Institution of the Charities Commission for investigating benevolent endowments.
1810, 1818, 1832. School rebellions at Eton.	1820-1830. Reign of George IV.
1818. School rebellions at Winchester, Harrow, Charterhouse, and Shrewsbury.	1828. University College founded.
1828-1842. Dr. Thomas Arnold head master of Rugby.	1828. King's College founded.
1829. Kings College school founded.	1829. Catholic emancipation.
1833. University College school founded.	1830-1837. Reign of William IV.
1834-1853. Dr. Hawtry, head master of Eton. Reform in administration.	1831. Durham University founded.
1836. £1,400 appropriated by Parliament for technical education. Normal drawing school founded in Somerset House.	1832. First Parliamentary reform.
1837. City of London school founded.	1833. Appropriation of £20,000 for elementary schools.
1840. £10,000 appropriated for establishing drawing schools in the provinces.	1837. Beginning of Queen Victoria's reign.
1841. Cheltenham College founded.	1837. University of London endowed.
1843. Marlborough College founded.	1839. Committee of Privy Council for Education organized as a superior board or council of education.
1844. Rossall School founded.	1851. Owens College, Manchester, endowed.
1845. Normal School of Science endowed.	1853. Introduction of competitive examinations for the Indian civil service decreed.
1845-1859. Dr. Vaughan head master of Harrow.	1854. Appointment of a commission for elaboration of a system of examinations with Macaulay as chairman.
1846. College of Preceptors founded.	1855. The first examination.
1847. "Montem" anniversary at Eton abolished.	1856. Establishment of an education department with a vice-president responsible to Parliament.
1848. Lancing College founded by the corporation of Saint Mary and Nicholas.	1867. Second Parliamentary reform.
1849. College of Preceptors incorporated.	1869. Girton College, Cambridge, the first college for women, founded.
1849. Department of "practical art" added to board of trade.	1870. Forster's elementary education act.
1851. Royal School of Mines endowed.	1870. National union of teachers formed.
1853. Wellington College founded.	1870. Introduction of competitive examinations into the English civil service.
1853. Science and Art Department organized.	1871. Removal of all religious disqualifications at the universities of Oxford and Cambridge.
1854. College of Preceptors grants titles and diplomas to teachers.	1871. Newnham College, Cambridge (for women), founded.
1856. The Science and Art Department is joined to the committee of council on education.	
1857. Oxford, and later Cambridge, institute middle-class examinations (later called local examinations).	
1859. The Science and Art Department introduces the principle of "payment according to results."	
1861. Appointment of the public schools commission under Lord Clarendon.	
1863. Hayleybury College founded.	
1863. Clifton College founded.	
1863. Malvern School founded.	
1864. Report of the commission under the public schools act.	
1864. Dec. 18. Appointment of the schools inquiry commission under Lord Taunton.	
1866. Corporation for middle-class education in the metropolis and the suburbs formed. It founds Cowper street middle-class and many other schools.	
1867. Report of the schools inquiry commission.	
1868. Second public schools act.	
1869. Endowed schools act. Appointment of endowed schools commission.	
1870. Head master's conference is formed.	

Chronological table of the history of English secondary schools for boys—Continued.

Events in the history of secondary schools for boys.	Contemporary events connected with them.
1873. Oxford and Cambridge school examination board, so-called joint board, formed.	1873. University extension begun.
1873. The College of Preceptors institutes lectures on the theory and practice of teaching.	
1874. The endowed schools commission is united with the charities commission.	1874. Yorkshire College, Leeds, founded.
1876. Bath College founded.	1875. Mason College, Birmingham, founded.
	1876. Bristol College founded.
	1876. Second elementary school law.
	1879. Teachers' Training Syndicate, at Cambridge, founded for examining women teachers.
	1879. Somerville College } Colleges for women, Lady Margaret Hall } Oxford, founded.
	1879. Firth College, Sheffield.
1880. Commission for intermediate education meets in Wales.	1880. Victoria University founded.
1880. Appointment of commission on technical education.	
1880. City and Guilds of London Institute formed; it founds a number of technical schools.	1881. Liverpool University College founded.
1882. Report of commission for Wales.	1881. Nottingham College founded.
1883. Private Schools Association founded.	
1884. Report of commission on technical education.	1883. University Association of Women Teachers founded.
1885. Teachers' Guild founded.	1884. Association of Assistant Mistresses.
1886. Association for the Advancement of Technical Education formed.	1884. Third Parliamentary reform.
1889. Welsh intermediate education act.	1886. Holloway College for women founded.
1889. Technical instruction act.	1888. County councils appointed.
1890. Local taxation act.	1891. £15,000 appropriated by Parliament for eleven university colleges.
1890. Association of Head Masters founded.	1891. Elementary instruction made gratuitous.
1892. Association of Assistant Masters founded.	1891-1895. Liberal government of Gladstone-Roseberry. Sir Arthur Acland in charge of education.
1892. Association of Head Masters of Higher Grade Elementary and Organized Science Schools formed.	
1894. March. Appointment of royal commission on secondary education, under Sir James Bryce.	
1895. Opening of a day training college in London by the College of Preceptors.	
1895. Modern Language Association formed.	
1895. November. Report of royal commission on secondary education.	
1896. March 31. Sir John Gorst's education bill introduced.	
June 26. Bill rejected.	

CHAPTER III.

TRUANT SCHOOLS.

- I. GENERAL STATEMENT.—Historical sketch; present status; equipment and organization; discipline and instruction; results; ungraded schools.
 - II. THREE REPRESENTATIVE STATES.—History of truant schools in Massachusetts; comparison of Connecticut and Massachusetts systems of truancy control; sketch of truant schools in New York.
 - III. INDIVIDUAL INSTITUTIONS.—Statistics; detailed statements relating to cities or schools, as follows: San Francisco, Cal.; New Haven, Conn.; Chicago, Ill.; Boston, Mass.; Truant School of Franklin and Hampshire counties; Essex County Truant School; Middlesex County Truant School; New Bedford, Mass.; Worcester County Truant School; Plummer Farm School; Springfield, Mass.; Hampden County Truant School; Truant School of Norfolk, Bristol, and Plymouth counties; Worcester, Mass.; Bay City, Mich.; Detroit, Mich.; Grand Rapids, Mich.; Newark, N. J.; Albany, N. Y.; Binghamton, N. Y.; Buffalo, N. Y.; borough of Brooklyn, New York City; borough of Manhattan, New York City; Rochester, N. Y.; Syracuse, N. Y.; Cleveland, Ohio; Dayton, Ohio; Allegheny, Pa.; Philadelphia, Pa.; Providence, R. I.
 - IV. LEGISLATION.—Text of laws relating to the disposition of truants in Connecticut, Illinois, Indiana, Maine, Massachusetts, Michigan, Minnesota, Montana, New Hampshire, New Jersey, New York, Ohio, Pennsylvania, Rhode Island, Utah, Vermont, and Wisconsin.
 - V. REFORMATORY AND ALLIED INSTITUTIONS IN GREAT BRITAIN.—Reformatories; industrial schools; truant schools; day industrial schools.
-

I. GENERAL STATEMENT.

HISTORICAL SKETCH.

The beginnings of the present-day truant school are to be found in the agitation for prison reform initiated and led by the famous John Howard in the latter part of the last century. Not that reformatories for children were unknown before the time of Howard, or that he was the first English prison reformer. Neither claim would be justified; work in behalf of juvenile delinquents began in Germany with the Reformation, and the abuses of prisons have been the subject of investigation and legislation in England at least as far back as the time of Charles II. But it was Howard who first aroused the public to an appreciation of the evils at their doors and brought about the popular interest in the conditions of criminals, convicted or suspected, that has continued to this day. The prison reform associations and allied organizations that have labored so zealously and in the main effectively in behalf of the amelioration of the undue hardships of malefactors are the lineal successors of Howard and his associates and owe their inspiration to him.

Some of the descriptions that have come down to us of the state of prisons in the eighteenth century almost challenge belief. In the utter lack of sanitation and the impositions practiced upon the unfortunate inmates by those in whose custody they were, the conditions were revolting to the last degree. Overcrowding to an incredible extent was the rule rather than the exception, and any classification of prisoners

beyond that of sex was practically a thing unknown. Even the separation of the sexes was usually a figment of the imagination and was but nominally enforced in most prisons. Men, women, and children, convicted of minor offenses or merely imprisoned for debt, were thrown into close and constant contact with the most hardened of criminals and the vilest of wretches. No employment was provided, and low games and conversation of debasing character were the occupations in which prisoners passed their time. In many cases the wives and children of imprisoned debtors were permitted to live with their husbands and fathers, and thus innocent women and tender children were exposed to the same degrading influences. It was not to be expected or hoped that any would come from such a place with propensities other than criminal. A blasted character for those who emerged was as inevitable as sickness and death were for those who remained. The matter of classification, therefore, was found by the reformers to be as urgent a need as the improvement of physical conditions.

In working so earnestly and so successfully for the complete separation of women prisoners, and for the general betterment of their surroundings, Elizabeth Fry made a place for herself among the most worthy of English philanthropists. Others, less conspicuously, perhaps, but just as earnestly, undertook a similar task in behalf of the children. Mrs. Fry's brother and two brothers-in-law, Mr. Joseph John Gurney, Mr. Samuel Hoare, and Sir T. F. Buxton, were among the most prominent of those who interested themselves in juvenile criminals, and they were leading spirits in the London Philanthropic Society, which had been organized in 1789,¹ and whose object was "to afford an asylum to the children of convicts and those trained to vicious courses, public plunder, infamy, and ruin." They sought for children in the nurseries of vice and iniquity in order to draw them away from contamination and to bring them up to the useful purposes of life. Prisons, bridewells, and courts of justice afforded materials upon which the society displayed its bounty.² And there was ample need for such work. The English criminal records of the early part of this century indicate a deplorable prevalence of juvenile depravity. There were in a single year 3,000 inmates under 20 years of age in the various London prisons. Nearly half the number were under 17, and 1,000 of those had been convicted of felony.³

The Philanthropic Society maintained an institution for the reformation of its wards, and for their instruction in some trade by which they might be enabled to earn an honest livelihood. This institution still exists as the Farm School, at Redhill, Surrey, the oldest and one of the most famous of the juvenile reformatories.

In the prisons themselves further efforts were made to secure the separation of children from the older criminals; and in some cases, as in Newgate, this was, at least for a time, satisfactorily accomplished. Prison schools were established for young convicts,⁴ and in many other ways marked improvements were made in their surroundings.

England was not alone in such work. John Falk founded, in 1813, the Society of Friends in Need and the reformatory at Weimar, Germany, for criminal children and children of criminals; and an asylum for neglected orphans and children of vagabonds and convicts was established by Count Adalbert von der Recke Volmerstein, near Düsseldorf, in 1819. Another institution of similar character was founded in Berlin about the same time.

The progress of the work in "child saving" in Europe was known in America, and the institutions mentioned had been visited by many philanthropically disposed persons from this country. Prominent among them was the Quaker scientist

² Memoirs of John Griscom.

³ Chronicles of Newgate, Griffiths, vol. 2, p. 45.

⁴ *Ib.*, p. 129.

and teacher, John Griscom. In connection with Thomas Eddy, John Pintard, and others, he had previously established in New York City the Society for the Prevention of Pauperism, and his visit to Europe was devoted largely to the investigation of institutions whose object was to rescue unfortunate youth from the contaminations to which they were exposed.

Under the influence and guidance of Mr. Griscom the Society for the Prevention of Pauperism was, in December, 1823, merged into the Society for the Reformation of Juvenile Delinquents, and as such its work was directed toward a definite end, namely, the establishment and subsequent maintenance of a house of refuge, which should "afford to young offenders an asylum where they could be received with open arms and friendly hearts."¹ The necessary steps were taken to collect funds by public subscription and to secure legislative sanction. These being obtained, the House of Refuge for Juvenile Delinquents was opened January 1, 1825. Its original site contained 4 acres of land "about a mile from the habitable portion of the city," as it was then described, but which is now Madison Square.²

Public attention had already been directed to the evils of promiscuous incarceration of criminals without classification in regard to the seriousness of the crime committed, and the establishment and work of the New York House of Refuge attracted notice from far and near. Governor De Witt Clinton in an official message pronounced it "the best penitentiary institution which has ever been devised by the wit and established by the beneficence of man," and other encomiums equally as enthusiastic were showered upon it.

Steps were at once taken in other cities to secure the benefits of like institutions. Boston was then engaged in extending and improving her penitentiary system, and the example of New York came opportunely. An unused building erected in South Boston for a house of correction was available and was utilized in the establishment of a house of reformation for juvenile offenders, which was opened in 1826.³ A house of refuge was opened in Philadelphia in 1828, and a similar establishment in New Orleans in 1847. The first State reform school was that at Westboro, Mass., which was opened in 1848. Since that time the establishment of new schools has been rapid, and now there is at least one in nearly every State in the Union. The total number of such institutions in 1897-98 was 87, with 25,308 inmates.

At the very beginning the only idea in view was the separation of children from those older in crime. But it was soon apparent that however beneficent it might be to prevent further contamination from association with the vicious, corrective measures must be taken to eliminate criminal propensities already imbibed, if the child were to be "saved to society." Then it was but a step from the idea of reformation to the idea of prevention; to remove exposed children from surroundings which threatened to lead them into careers of crime were better than to await the commencement of such a career, involving additional difficulties and responsibilities for those who undertake to save them.

In New York conviction for vagrancy or the commission of a criminal offense has always been a requisite for commitment to the house of refuge, but the idea of protection was uppermost in the plan of some of the institutions established about the same time. This was particularly true of the school at Düsseldorf, and the same idea seems to have been in the minds of those who framed the scheme for the house of reformation at Boston. Among those who might be sent to it were enumerated "stubborn servants and children," and "children who live an idle or dissolute life, whose parents neglect to provide any suitable employment for or exercise any salutary control over them." The legislative act under which the Philadelphia institu-

² The old quarters having become too small, the institution was removed in 1854 to its present location on Randalls Island.

³ Municipal History of Boston, Josiah Quincy, p. 106.

tion was established also emphasized its protective function. It is not likely, however, that in practice there has ever been any considerable difference in the character of the children sent to the New York, Boston, and Philadelphia institutions.

The reformatory institutions were first brought into requisition as an aid to school discipline in Boston. Soon after the establishment of the house of reformation there, some of the schoolmasters perceived in the expression "stubborn servants and children" an opportunity for an excellent means of dealing with refractory pupils, and for several years incorrigible truants were complained of by teachers as "stubborn children," and as such were committed by the courts to the house of reformation. This was not done systematically, but frequently. A few of the masters, it seems, did it habitually; others not at all.

Truancy, with its relation to crime, was a frequent topic of discussion in Boston in those days, and many were the means suggested for dealing with it. Among the rest, the use of the reform school was brought up, and the practices of some of the teachers attracted public attention. As a result, it was held by those in authority that there was no proper justification for considering truancy as "stubbornness" in the meaning of the law, and after 1833 no more truants were permitted to be sentenced unless they were guilty of some offense that brought them clearly within the law. But the idea had taken root.

Compulsory education was the rule in Prussia, and some of the more advanced American educators, prompted by that example, began to advocate compulsory universal education for this country as soon as the public-school idea had been fairly launched and the State school systems were well under way. Related topics, like vagrancy, naturally shared in the discussions. Truancy and idleness were thorns in the flesh of the Massachusetts school men, and the old Boston plan of confining truants only awaited a favorable opportunity to demand renewed consideration. At last, in 1850, the urgings of Horace Mann and the active efforts of John D. Philbrick, Mayor Josiah Quincy, and others bore fruit in the passage by the Massachusetts legislature of a law specifically permitting the punishment of truancy by confinement.¹

Such things are not done in Massachusetts in secrecy and retiring, and the educational world speedily heard of the new law. It excited wide interest and comment. In Maine the school code was even then undergoing revision, and the Massachusetts truant law was bodily engrafted upon it when it passed in August, 1850. New Hampshire passed a similar truant law in 1852, and New York did so in 1853. In the same year a bill to like effect was introduced in the Rhode Island legislature; it failed to become a law then, but did pass in 1856. Connecticut adopted a measure of the same sort in 1865.

In Maine, New Hampshire, Rhode Island, and Connecticut these laws have scarcely been more than evidences of good intentions.² In New York the cities of Rochester and Brooklyn framed regulations and established truant schools which have played a conspicuous part in the history of compulsory education in that State. Naturally, Massachusetts made more of her law than any other State, being the seat of the conditions that most favored such action and the home of the men whose devotion to the cause of universal education evolved it. Many changes and amendments were necessary before the law was entirely satisfactory to the judicial authorities, but the legislature did not withhold the needed assistance and after some thirteen years of trial a workable law was produced. A number of cities, particularly Boston, New Bedford, Lowell, and Worcester, were prompt in taking measures to put the law into effect and earnest in its enforcement afterwards. But the provisions made for the disposition of truants after conviction were far from satisfactory as a rule. Boston,

¹ See page 102.

² See State school reports as follows: New Hampshire, 1868-69, p. 14; Rhode Island, 1883, pp. 10 and 116; Maine, 1860, p. 10, and 1887, p. 48; Connecticut, 1871, pp. 12 and 13, and 1872, p. 28, etc.

Lowell, Worcester, Salem, and Lawrence all had local reform schools, and mischievous boys who had shirked the restraints of the schoolroom were sentenced to the constant companionship of youthful criminals, guilty of such offenses as assault, burglary, malicious mischief, larceny, and playing cards on the Lord's day.¹

Other cities and most of the towns that adopted regulations according to the law, ordained that truants be sent to the local almshouse, with its unedifying surroundings of misery, shiftlessness, and poverty, at the very least. So objectionable in some instances were the arrangements made, though they were the best that seemed practicable, that school officers refused to enforce the penalties provided, feeling that the remedy would be worse than the disease. The time had passed when public sentiment would permit the consignment of even the worst malefactors to loathsome prisons, and still more was the condition of children scrutinized when the law had laid its hand upon them.

So general was the complaint of the almshouse truant schools, and so difficult did it seem to provide suitable means of confinement for offenders in the smaller cities and in the towns, that in 1873 the Massachusetts legislature required that each county should establish and maintain a county truant school upon the demand of a specified number of towns or cities. Years passed before anything was done under this law, but a beginning was at last made in 1880, and now each county either has a truant school of its own or has joined with some other county in maintaining one.

Boston continued to utilize the House of Reformation for its truants until 1895, when the Parental School was opened in response to a mandate of the State legislature and the persistent demands of the Boston school committee. For many years the use of the reform school presented no incongruity to the minds of the school officers. The principles of classification had made progress, but not to the extent of creating a demand for the separation of truants. But as time passed the ideas of the Boston school men changed as to the relative seriousness of the offenses which the laws punished by confinement, and the absence of the element of criminality in truancy was more clearly seen. Then, too, the location of the reform school in proximity to the city prisons brought about an attitude of the popular mind which attached to a term in the reform school a stigma far greater than a mere truant deserves. These reasons were potent in the end, and the separation of truants from those guilty of criminal offenses was secured after years of effort.

Massachusetts passed a compulsory-attendance law in 1852 providing for the education of all children, but it failed at first to excite the attention that the truant law had received. It lay upon the statute books for years practically unnoticed even in the State and was rarely heard of outside. But after a time the school systems of the several States reached a plane on which questions of organization and means of support were less pressing, and matters of internal improvement and expansion could be the better considered. Free education had been provided for all; the next thing to be secured was that all should take advantage of the privileges offered. Compulsory school attendance, therefore, began to be widely discussed, particularly after the close of the civil war.

Massachusetts amended her laws from time to time, constantly increasing their strength and widening their scope, and her example was a constant stimulus to other States. A compulsory-attendance law for the District of Columbia was passed in 1864 and one for Vermont became operative in 1867.

The agitation was more widely spread during the seventies, and half the States which now have compulsory laws first adopted them during that decade. The dates of adoption in those States were as follows: New Mexico, 1870; Michigan, Washington, and New Hampshire, 1871; Connecticut, 1872; California, Kansas, and New York, 1874; Maine and New Jersey, 1875; Wyoming, 1876; Ohio, 1877, and Wisconsin,

¹ Report of the superintendent of the Lowell House of Reformation for Juvenile Offenders, 1872, p. 11.

sin, 1879. In 1876 the South Carolina legislature passed a compulsory-attendance law to apply to Charleston and Columbia,¹ which is probably the only instance of such legislation in the States that seceded in 1861.

It is probable that in all these States the discussions attending the consideration of the laws both before and after their passage had the effect of stimulating school attendance for a time; but the laws themselves proved to be exceedingly defective, and in only a single instance, namely, that of Connecticut, was any general and permanent result secured.² New York City took up the work of compelling school attendance during that period, and the work of Brooklyn was strengthened, but in the remainder of the State of New York the law of 1874 had little effect.³

A marked similarity exists in all the new compulsory laws passed between 1870 and 1880. All were based, directly or indirectly, upon the Massachusetts "attendance law," and all inflicted the penalty for violation upon the parent or guardian of the delinquent child. In New York and the New England States which had previously passed truant laws, those laws remained in force as originally passed or were incorporated in the new laws in somewhat modified form. With the exception of these States there was no provision anywhere for legal action against the incorrigible child for habitual truancy or any other school offense, even though the child might be entirely beyond parental control. This was, to be sure, a serious defect, but since still graver defects existed in the provisions relating to the enforcement of any part of the laws, the other deficiencies were of no practical importance save as showing the degree of advancement, or lack of advancement, which the ideas of the time had reached.

During the decade of years beginning with 1880, nine other States and Territories adopted compulsory laws, namely, Rhode Island in 1882; Dakota, Illinois, and Montana in 1883; Minnesota in 1885; Idaho and Nebraska in 1887, and Colorado and Oregon in 1889. The story of similar legislation during the seventies must be repeated in regard to all these laws. Aside from a probable temporary stimulating influence they were without direct result.⁴ All of them were alike in that they held parents and guardians responsible for the nonattendance of children in their charge, without any punishment for the incorrigible child. All were failures in practice, because no effective means were provided for enforcing them.

But a law with a laudable purpose once passed prepares the way for a better one, even if the first is in itself a failure, so that during the eighties there were numerous revisions and amendments of the old attendance laws. Separate truant laws have not been in favor since the sixties, but the tendency in the last twenty years has been, after the first futile experiments that have seemed inevitable in every State, to incorporate the principles of the truant laws with the attendance laws and to make a single statute cover the entire ground. We find, therefore, that the revisions of the eighties frequently contained clauses requiring the arrest and committal to some reformatory institution of children guilty of school offenses. The provision of the Michigan law in regard to the establishment of ungraded truant schools⁵ and the sentence of incorrigible pupils to the State reform schools was passed in 1883 and amended in 1885.⁶ In the latter year New Jersey legally classed habitual truants as "juvenile disorderly persons," to be sentenced, on conviction, to a reformatory insti-

⁵ Such schools have been maintained under this law in Detroit, Grand Rapids, Bay City, and East Saginaw. The first three still exist.

⁶ It was again revised in 1895. See text of law in section IV of this chapter.

tution. During the same period Ohio, Wisconsin,¹ and other States enacted similar legislation. The law of Illinois, passed in 1889, commanded the arrest of truant children, but provided merely that they be put in school. That example has been followed in Wisconsin and Montana, and such is still the law of those States as well as of Illinois.

It is not necessary to dwell upon the legislation of the last ten years, since the events connected with it are still fresh in the public mind. As the most noteworthy instances, however, it may be well to recall the Pennsylvania law of 1897, her initial effort in the field; the laws of New York, Massachusetts, and Connecticut, more fully described on subsequent pages; the Utah law of 1897; and within the year just passed (1899) the Minnesota statute, similar to that of Michigan, and the truant school law applying to Chicago, Ill. All these, so far as they relate to the treatment and disposition of truants and incorrigibles, are given in detail in this chapter. The laws of those States² which have on their statute books compulsory attendance laws, but which make no provision for the judicial punishment of the child for truancy, are not included, since they have no bearing on the subject under consideration.

PRESENT STATUS OF TRUANT SCHOOLS.

It must be admitted that notwithstanding the long history of truant schools in this country, the list of existing institutions is by no means imposing in its length. Of the regular "boarding schools" for truants only, the 6 county schools in Massachusetts and 7 city schools, 5 of them in New York, 1 in Massachusetts (Boston), and 1 recently established in Illinois (Chicago), comprise the entire number—13 in all. The average daily attendance in all the schools of the municipalities³ maintaining them is 945,403 pupils, while the average attendance in the truant schools is 690 at one time, or 1 in about 1,370 of the whole number of children attending school.

This, however, like most statistical statements, requires a good deal of verbal explanation to give it its proper relation. It does not mean that the value of truant schools is so circumscribed that only 1 in 1,370 children is considered a proper candidate for commitment. In some cases, as in Chicago and the borough of Manhattan, New York City, though the school enrollment is very large, the truant schools have been but recently established and are still in the tentative and experimental stage.⁴ In the borough of Brooklyn the school established is sufficient to receive but a part of those whom the school officials wish to commit, and in Massachusetts, though a truant school is available for every city and town in the State, only a comparatively small proportion of the municipalities utilize them.

These circumstances explain in part the almost infinitesimal proportion of the truant-school population, but even after all allowances have been made, the proportion of those actually committed is very small, and varies greatly in different localities. In Boston the ratio is 1 to 438 children in average attendance; in Rochester, 1 to 739; in Buffalo, 1 to 1,166; in Syracuse, 1 to 1,213, and in Brooklyn under present conditions, 1 to 1,801. Some of the Massachusetts cities use the county truant schools very freely. Lynn, for example, with an average attendance of 8,549 in 1898, had 30 representatives in the Essex County Truant School, or an average of 1 to each 285 children attending school.

The differences which appear in these figures are due to a variety of causes. On the one hand, insufficiency of truant-school accommodations or an inadequate num-

¹This reference is to the famous "Bennett law," passed in 1889, but repealed in 1891. A substitute for it was enacted soon after.

²Namely, California, Colorado, District of Columbia, Idaho, Kansas, Kentucky, Nebraska, Nevada, New Mexico, North Dakota, Oregon, South Dakota, Washington, West Virginia, Wyoming.

³With the State of Massachusetts, since the truant schools are available for the entire State.

⁴The present arrangement in Chicago is considered only temporary.

ber of truant officers prevents a full enforcement of the laws in some cities; in others the surroundings in which the truant school is located deter school officers from prosecuting many who might otherwise be committed. On the other hand, an undue proportion of "unassimilated" foreigners of the lower class in the population of any city tends to favor the increase of school offenses as compared to other places in which the population is more homogeneous and more accustomed to American institutions.

But the most potent cause for the differences in the proportion of children committed is to be found, probably, in the wide divergence in opinion and practice as to the degree of culpability which should be reached by a child before he is placed in a truant school. There are those who hold that the influences of family life, even when the family is far from ideal, are more important in character building than those of the best-managed institution; that a term of any considerable length in any such establishment tends to "institutionize" the child, and by so much to unfit him for life among his fellows; that the segregation of all the mischievous and unruly elements of the schools produces in the end in the individuals so segregated a worse condition than that which it is expected to cure; that the stigma attaching to a judicial sentence is bound to have a blighting effect in many ways throughout all his life upon every child so dealt with, no matter what pains may be taken to divest the institution of its penal character. Men holding such views are not apt to send a child to a truant school for much less than actual crime or because of home associations that are actually criminal coupled with criminal tendency in the child.

On the contrary, many believe that the steady habits and wholesome regimen enforced in a proper truant school are, on general principles, beneficial to a boy whose parents neither exercise nor attempt to exercise proper restraint or control upon him, and that such a child should be retained long enough to imbue him with a love of order and a respect for authority which will last him through life; that if no criminals are sent to the truant school, no "taint of criminality" will attach to it and no stigma will rest upon the inmates; and, finally, that it is due to the teachers, to the other children, and to society to take from the ordinary schools any child who by his nonobservance of school regulations is a bad example and a disturbing element. These men are inclined to call upon the truant schools to care for boys who would be classed as simply "troublesome" by those holding the opposite views.

Just as great a divergence of opinion prevails as to the proper length of the sentence. On one side the attitude seems to be that the sentence is a punishment for a specific offense, and its length is made to depend on the gravity of the offending. In this view the term must necessarily be short, since none of the purely school offenses are in themselves essentially serious. That may or may not be the prevailing view in those cities, but in New York (borough of Manhattan) the average term of detention is from four to six weeks, and in Allegheny the usual term is twenty days.

The opposite party see in a truant-school commitment not retribution for an offense so much as an effort to prevent the formation of vicious habits by changing at once the course of life of the child who is in danger. They believe that the child should be taken in the hand of the law in the beginning of his wrongdoing and so trained as to supplant with good his evil propensities before they have had time to become rooted. The upholders of this doctrine consider that a reasonably long term of detention is absolutely essential to the end in view and urge the adoption of the indeterminate sentence, release being conditioned upon satisfactory improvement in the child's conduct or upon the completion of the period of compulsory attendance prescribed by law.

The Utah truant-school law, in fixing as the maximum limit of sentence the completion of the child's fourteenth year and providing for possible release prior to that time by the school authorities, in effect sanctions the indeterminate sentence. The new law applying to Chicago, Ill., definitely provides that children convicted of

truancy shall be kept in the truant school until they reach the age of 14 years unless sooner discharged upon parole under certain conditions. There is no truant school in Utah, and the present arrangement in Chicago scarcely constitutes a satisfactory truant school; so these two laws do not yet possess great significance except as the first instances of legislative recognition of an approved principle as applied to truant schools.

In Massachusetts the maximum sentence under the law is two years; the majority of terms are for one year, though many are for the full two years. In New York no sentences may be for longer than the current school year. In both these States provisions are made for granting paroles under proper regulations.

EQUIPMENT AND ORGANIZATION.

It seems to be almost universally conceded that the proper plan of organization of a truant school is the "cottage system."¹ In this the inmates are divided into groups of about thirty, the classification being according to character. A separate house is provided for each group, every house having its own "house father" and "house mother," its own sitting room, playground, and dining room. In the school proper all the inmates come together as in any other school, the classification there being presumably according to advancement in studies.

This system affords good opportunities for classification and produces a style of discipline and training more closely akin to that of the family than is possible in the old "congregate plan" of housing all the children in a single building.

There are objectors to the cottage plan, of course. They say that the "family" idea is an empty sham, for genuine family feeling can not be produced under such artificial conditions even in the most favorable circumstances; that it is difficult, if not impossible, to get enough employees of the ideal sort to make the system operate successfully; that the superintendent has no proper opportunity to make his own personality felt; and, finally, that the duplication of work and the multiplication of buildings involve expense out of all proportion to the benefits claimed, even if any do exist.

Nevertheless the sentiment in favor of the cottage organization is largely in the ascendant. That is, in theory. In practice it has made very little difference whether the projectors of the existing truant schools believed in the cottage system, the congregate system, or no system at all. Most of the schools are small. If one wishes to think that the congregate system predominates he can call them congregate institutions, because all the inmates are under the same roof; if he favors the cottage plan he may find the truant schools according to his ideas, because not more than 30 or 40 are lodged in the same building.

Very few of the buildings used for the purpose were constructed specially for truant schools, according to latter-day ideas. Generally the friends of projected institutions have not been in a position to make large demands, and have been content to take what they could get. Unused schoolhouses have been remodeled, dwellings have been purchased, buildings erected for reform schools of a generation ago have been utilized—"anything available" has been the motto which necessity prescribed.

The building of the Worcester County Truant School at Walpole, Mass., at the time of its erection was considered a model, but it has been surpassed by the newer school at North Chelmsford. The latter is now frequently mentioned as the finest

¹The "cottage system" or "family plan," as applied to reformatory institutions, originated with Dr. J. H. Wichern, who established in 1833 what became famous as the "Rauhe Haus" near Hamburg, Germany. With the purpose of founding "a house for the sole object of rescuing children from sin and disbelief," he and his mother took twelve of the worst boys in Hamburg and with them occupied an old cottage upon a very rough farm. The worthy pair devoted themselves to the interests of the charges with parental solicitude and with salutary effect. As other cottages were added to meet the demands of growth the same idea of family organization was applied. The plan thus devised has been followed in institutions in nearly every civilized country.

institution of the kind in the country. When the Boston Parental School was authorized it was hoped that it would embody all the latest and best ideas. But departures from such ideas were early made in the interest of economy, and latterly the number of children sentenced has been so much greater than the buildings were originally intended to accommodate that some of the most cherished plans of the managers have had to be abandoned. All these schools are described in detail on subsequent pages.

DISCIPLINE AND INSTRUCTION.

The internal discipline of a truant school is the most important question of all. Upon it depends the success or failure of the whole undertaking—the reformation or the further degradation of the inmates.

Originally the methods were essentially those of the prison. Barred windows and high walls prevented escape, and the lash and the dungeon preserved order inside. Stern and rigorous treatment little short of cruelty was considered a matter of course. This was to be expected in view of the ancestry of these institutions, for it will be remembered that they were descended first from the prisons and then from the reform schools, in response to the ever increasing demand for better classification. It was natural that the traditions of the older classes of institutions should be associated with the newer. Attempts to break away from these traditions were in isolated cases made early, but milder methods were not the rule until a comparatively recent day.

The ideal now accepted as the correct one is that the discipline of the truant school should approximate that of a well-ordered family, but only “approximate,” for even if it were possible to make a pleasant home in the best sense of the word of such an institution it would not be considered wise to do so. After all has been said of the elevating influences of a true home and its advantages in the work of reformation, the fact remains that the truant school must be an undesirable place in the eyes of the children outside. If it were otherwise all its deterring effects, its most important feature, would disappear. If a child simply needs a good home, an institution established for disciplinary purposes is not the place for him. Only those whose character and conduct make them unfit for the ordinary schools, though without a record or evidences of criminality, should be committed to the truant school, and such commitment must in the very nature of things be looked upon as a punishment. That essential necessarily precludes the complete fulfillment of the conditions of the home.

But family discipline is properly marked by considerate and kindly treatment, little recourse to punishments, and a certain feeling of community of interests between children and adults. All this may unquestionably be realized in a truant school under judicious management. In the construction of buildings and in ordering the domestic arrangements the family idea may be still further carried out by the adoption of the “cottage system,” to which reference has already been made.

For the rest, almost constant work and confinement to the institution, nearly as strictly enforced as in a prison, must be the lot of the inmates. School work, manual training, and labor in the field or garden are the favored means of keeping the pupils busy. Nearly all the truant schools have sufficient land attached to afford opportunity for a reasonable amount of farm work, and several of them have satisfactory provision for manual training. The latter is, however, the great desideratum in most of the schools, as the detailed statements show.

In regard to the school work proper, the subject-matter must necessarily be that of the ordinary schools. The aim of the truant school is to fit its inmates to return to the schools whence they came, and that without loss of class standing. The same studies must therefore be pursued in both classes of schools. But experience has shown that widely different methods must be employed. The ordinary schools

plainly failed to interest the children that had to be sent to the truant school, and the ordinary teachers failed to arouse their ambition. The conclusion immediately apparent is that a high order of teaching is demanded for the special school. The teacher must be chosen with great care and with reference solely to fitness for that particular work. The best teacher for the graded school is not necessarily the best for the truant school, and vice versa. The successful truant school-teacher is not "made" any more than the poet; success depends upon natural aptitude joined with study and experience, but aptitude is the main thing.

With the exception of the few larger institutions but little in the way of grading can be done, and the schools proper are substantially similar in organization to the ordinary country ungraded school. This necessitates small classes, and is an advantage to that extent, since much individual instruction is desirable; but the multiplicity of classes required is of course a serious drawback.

In the means of retaining children in the institution after their arrival there is a great difference in the practices of to-day and those of ten years or more ago. Then, high walls and bars were relied upon to make escape a physical impossibility. Such means are still used in some of the schools, but advanced opinion is unfavorable to them. The theory now is that the knowledge that escape is easy will lessen the desire to run away, and that by being trusted the boys become worthy of trust. It is admitted that some of the inmates will probably get away, but it is held that the strengthened character that comes to those who feel that they are considered worthy of confidence will more than counterbalance any of the troubles that come from an occasional absconder.

Without question it would require a very high type of man and one extraordinarily gifted with the power of reforming to carry out this theory in its full intent. The complete confidence implied would mean an absence of espionage as well as of bolts and bars. The practice, however, does not follow the theory to that extent. Newcomers and those who give evidence of restlessness are closely watched as long as the necessity exists, and all are kept under a wholesome but unobtrusive observation—"paternal oversight," as it has been expressed.

Some experiments have recently been made in the self-government of pupils according to the plan of the well-known George Junior Republic, which have promised a satisfactory degree of success.

RESULTS.

The statements of the managers of individual truant schools do not seem to be sufficient for accurate generalizations as to the results of truant school treatment. No extensive or satisfactory records are available of the subsequent lives of former inmates, but general and somewhat vague statements are very common.

All the boys that are sent to such an institution are presumably in a bad way, or else they would never have been sent there. If left to themselves many of them would undoubtedly straighten up later in life anyway and become good citizens. How many would do so can only be a matter of conjecture. But it is reasonable to suppose that the great majority would be led into lives of crime, at the worst, or would grow to manhood with insufficient education to creditably take part in life's battle, at the best. If even half, therefore, as the result of their truant school experience, receive a sound elementary education and are so strengthened in character and principle as to be enabled to withstand temptation, then the truant school has done a work which should be entitled to the widest recognition and the most cordial support.

There can be no doubt that it does this and much more. The estimates as to the number "cured" run from 75 per cent to "nearly all." Even if we allow for the well-known optimism of such statements, the showing must still be regarded as satisfactory. Conservative managers of reform schools generally estimate that three-fourths of their pupils become good citizens, and in exceptional cases the claims have

gone as high as 96 per cent. The truant schools should succeed equally as well. Reform schools keep their inmates longer, but they are as a rule much more difficult cases to begin with than the truant-school boys.

All this applies only to those actually sentenced. The real effect of the truant schools, however, is only in part shown upon actual inmates. In the deterrent effects upon those simply inclined to waywardness is to be found the most valuable work of such institutions. The certainty that a boy feels of being deprived of his liberty if he fails in his duties is a most powerful stimulant to which all who have had experience with truant schools and their effects abundantly testify.

UNGRADED SCHOOLS.

Besides the boarding truant schools there are 29 day truant schools, or "ungraded schools," in 13 cities distributed through 8 States.

The terms and hours in which they are in session are usually identical with the ordinary schools; but when two buildings are close together and the truants are likely to mingle with other children on the way to and from school, the hours of the truant school are changed slightly to prevent it. That is about the only exception to the rule, and it does not affect the actual length of daily school time.

Children are ordinarily transferred to the ungraded schools by the superintendent of schools without legal proceedings, though usually with somewhat more formality than would be used in the customary routine transfers from school to school. The pupils transferred naturally come from all the grades; and as the number in one disciplinary school is always small, the organization of the ordinary rural school is the only kind practicable. Hence the name "ungraded schools."

Their history is neither a brilliant nor an encouraging one.¹ Their path has been beset with difficulties even more trying than those that have surrounded the boarding truant schools. If it requires a man of unusual tact and skill to be successful as principal of an institution in which bad boys are lodged, fed, and taught, always under the eye of an employee, it requires a person doubly tactful and skillful to succeed with the same kind of boys when he is with them but five hours a day and they are free to roam the streets at will during the other nineteen. Precepts learned in school are apt to be nullified by the example of vicious associates outside, and injunctions with good intent are in constant danger from temptations that the school-master cannot reach.

Removed from association with well-behaved children in school, the boys in the day truant classes are not removed from contact with those whose influence presumably first prompted truancy or other misbehavior. The work of the teacher must be done under the most unfavorable and discouraging circumstances. It is no wonder that such schools have repeatedly proved unsuccessful, and that a change in the office of superintendent of schools has so often meant a radical change in the policy toward the ungraded schools. But there are teachers who seem to have been specially created to manage such schools, and when they can be found there is no doubting the usefulness of their work.

The idea is certainly plausible. It is not always advisable to shut up a boy for his misdeeds. He may be too bad for the regular schools, but not quite bad enough to make confinement necessary. His home associations may be reasonably good, and to sunder home ties is not a thing to be lightly considered. Then, the cost of day schools is trifling as compared with that of boarding schools, and the interests of sordid economy, even if no higher consideration were involved, demand that the former be utilized when practicable.

Nearly all truants justify their conduct by the complaint that "the teacher was down on them." Whether true or not, and whether deserved or not if true, this

¹ See the historical sketches of individual institutions in this chapter.

idea in a youthful mind is a fruitful cause of trouble. It often happens that the simple transfer of a pupil possessed of this notion to another regular school will bring improvement, even if the new teacher is no more skillful than the other. Change of atmosphere frequently means as much for a troubled child as for a delicate woman. Transfers of this sort are regularly practiced in some cities, and there have been instances in which the same child has been sent to six or seven schools before he could find a teacher that he could "get along with." Such a change implies neither disgrace nor triumph for the pupil transferred. When there is a probability that it may be successful it has proved to be the simplest and best thing to do from every point of view. No rule as to district lines need be so strict as to prevent it.

There are children of all shades of character, good and bad, and in the gradations of the bad there next comes a class who are not improved by a simple transfer to another teacher of the ordinary sort with the ordinary duties, or by a series of such transfers. They may be amenable, however, to the discipline of one who has naturally greater aptitude in handling unruly children, and who has better opportunities for dealing with them individually. Unquestionably there are many pupils in every school system who would be benefited by instruction under such conditions, and who, after a reasonable amount of it, would resume their places in the regular schools without giving any more serious trouble. That is the justification of the ungraded school.

But the experience of the past goes to show that when it is attempted to make any day school do the work of the boarding truant school, or of the reformatory, disappointment is inevitable. Each has its proper sphere. The first must be supplemented by the second to receive those beyond its scope, just as the second requires the third. To either class of institutions the one next higher, if it may be so called, is essential; those lower in the scale are important in themselves but not necessary to the success of those above. Some of the worst troubles of the ungraded schools in the past have been due to disregard of this principle. They have undertaken too much, or too much has been imposed upon them. Only a very limited and mild class of offenders can be profitably kept in ungraded schools as they have heretofore been organized in this country. That has been clearly proved by repeated trials. The detailed statements are full of lessons for those who seek to establish new institutions.

The "day industrial schools" of England contain features that might be profitably adopted here. They are more highly organized than our ungraded schools, but do not retain the children at night, as our truant schools do. They are at least worthy of careful study.

II. TRUANT SCHOOLS IN MASSACHUSETTS, CONNECTICUT, AND NEW YORK.

TRUANT SCHOOLS IN MASSACHUSETTS.

The history of compulsory education and of its auxiliary agencies in the State of Massachusetts must in its first stages be written in the history of Boston, so influential has that city been in the conception and development of the system. The discussions relating to the House of Reformation of Boston prior to its opening in 1826, and its work afterwards, turned attention to the general conditions of juvenile offending. Truancy from school received its due share of attention as one of the factors, for it was observed that truancy generally meant vagrancy, and vagrancy generally meant crime. Special efforts were early made, therefore, "to check vice at its fountain by securing a more general and more regular attendance of children at school."¹

¹Special Report on Truancy and Compulsory Education, by John D. Philbrick, 1862, p. 176

Similar efforts were made in other cities also, but such was the inchoate state of the school systems that little seems to have come of them. Compared with later standards there were but few public schools of any sort in existence, and even if their facilities had been ample the public-school idea was too young for the development of a public sentiment favoring obligatory attendance. But the school system of Massachusetts has always been of a thoroughgoing character. The oft-quoted statute of 1642 ordered that "the selectmen of every town in the several precincts and quarters where they dwell shall have a vigilant eye over their brethren and neighbors, to see, first, that none of them shall suffer so much barbarism in any of their families as not to endeavor to teach, by themselves or others, their children and apprentices so much learning as may enable them perfectly to read the English tongue, and knowledge of the capital laws, upon penalty of twenty shillings for each neglect therein."

This law was copied by Connecticut a few years later. It may or may not have been enforced for a time after its passage, but it certainly fell into disuse. Nevertheless, it is an indication of that popular conception of the attitude of the State toward the individual which has always prevailed in that section of the country more than in any other. And it is not surprising that in the modern development of public education compulsory attendance found the most favorable soil for its growth in Massachusetts and Connecticut. Arguments for compulsion have never, or rarely, been met by outbursts of popular disapproval there such as have greeted such suggestions in other sections of the country until a comparatively recent period.

This attitude on the part of the public made possible in Boston early steps for the suppression of truancy, namely, sentencing truants to the House of Reformation, that could not have been carried out anywhere in the United States outside of New England at that time. The fact that this practice was discontinued after being in use for seven years after the institution was founded detracts nothing from its significance in indicating official opinion, even at that time, that truancy was a semicriminal offense.

In 1831 there were at least 53 out of 93 of the inmates of the house of reformation who were sentenced for truancy.¹ It was the custom of some of the teachers habitually to take incorrigible truants to the police court and by complaining of them for "stubbornness" secure their commitment.² This practice was not strictly according to law and there were frequent complaints of it, but the statutes relating to the institution were by no means specific in their provisions, and it was not until 1833 that the court ceased to commit for simple truancy under the guise of "stubbornness." It was stopped then not because of any prohibitive legislation, but in consequence of an effort to secure a more definite law, which attracted attention to the looseness of the practice in vogue.³

It does not appear that the school committee formally and directly secured the commitment of truants to the house of reformation. It seems that the teachers acted upon their own responsibility in the matter, for they were allowed much greater latitude in those days than they are now. But the school authorities undoubtedly favored it. An elaborate report was made in October, 1831, upon "the daily absences of the pupils of the several English grammar schools, and upon the application of some proper remedy," and the principal conclusion reached was: "In the application, then, of a remedy against truanting in our public schools, your committee do not hesitate unanimously to recommend the legal removal in all instances of children of an incorrigible character as fast as they occur to the school of reformation at South Boston."⁴

¹ Philbrick's Second Report on Truancy and Compulsory Attendance, 1862, p. 185.

² *Ib.*, pages 184 and 186; also Public Education in the City of New York, Boese, p. 122.

³ Philbrick's Second Report on Truancy, 1862, p. 187.

⁴ *Ib.*, p. 179.

The same report also advises the appointment of "some municipal officer with whom the names of all cases of truanting, and in some cases of other absences, might be lodged by the instructors, and whose duty it might become to visit the family of such truant and endeavor, by mildness and persuasion, to restore the child to the school, and where every other measure was found to fail of the desired effect that then, after this, the proper steps should be taken for the removal of the individual to the school at South Boston, and let this act be considered that of kindness rather than of partaking at all of a criminal character. To this officer might be assigned, under the direction of the mayor, the duty of looking after the idle, vagrant, and vicious children of the city." In this the work of the present-day truant officer is substantially described.

Still another idea which has since become common appears in the same report, unobtrusively hidden in a letter from Cornelius Walker, one of the four masters who wrote of their experiences for the benefit of the committee. The special day classes for truants which now play an important part in the treatment of the subject were foreshadowed by Mr. Walker, for he says: "Convinced that it is not in my power to prevent the evil, I have not latterly adopted any course respecting it except to receive the truants into the school and place them in a separate class."¹

Here, therefore, as early as 1831, are suggested or in operation in Boston the three agencies which are now considered of such importance in the work of reclaiming truants, namely, truant officers to seek out absentees, special day classes, and the confinement of the worst cases in a separate institution. One can never say with confidence that any occurrence was the first of its kind, nor in this case can it be said certainly that these measures were the germs from which the present ideas grew, for they soon fell into abeyance and may or may not have been responsible for later practices even in the same locality. But they show that the attitude of the men in Boston toward truancy was essentially the same seventy years ago as to-day, and under similar conditions similar remedies are apt to suggest themselves.

After 1833, when the practice of committing truants to the house of reformation ceased, the teachers were left again to their own devices in the treatment of truancy. The printing of annual reports on the condition of the schools was not begun in Boston until 1845, and before that time the documents published were of an occasional and special character. None of these indicate that the school committee took any action on the question of truancy between 1833 and 1845. The only reference to it in the report of 1845 is not of a kind that would indicate that the question had been the subject of noteworthy investigation and experiment. It was stated by the committee which made the annual examination of the "writing schools" that "the schools suffer severely from the inconstant attendance of the pupils. The absence each day is about one-fifth of the whole school. * * * The committee know no remedy for this evil except by an appeal to the parents and by making the school a more agreeable place for children."²

The tone of helplessness about the last sentence does not indicate aggressive activity previously, nor was it calculated to provoke such activity in the future. Far more vigorous were the utterances of Horace Mann in his eighth annual report as secretary of the State board of education, which also appeared in 1845. In his own forceful style, the author of the Massachusetts school system showed in a way bound to attract attention that fully one-third of the schooling of the children of the State was lost each year by absenteeism, and that the waste was greater than would result if every third year the State should provide and pay the full complement of teachers but without the attendance of a single pupil.³ In the ninth annual report he discussed truancy equally as vigorously, dwelling particularly on the moral effects upon

¹ Philbrick's Second Report on Truancy, 1862, p. 182.

³ Eighth Annual Report of the Board of Education of Massachusetts, page 58.

the truant himself. Such a showing could not fail to stimulate effort to cure the unhappy conditions described. Prompted directly or indirectly by it, Mayor Josiah Quincy, of Boston, early in 1846, requested the school committee to cooperate with the city council in an attempt to check the "alarming evil" of truancy. The school committee at once referred the request to a special committee under Prof. Theophilus Parsons, who submitted a report in which they inveighed against the evils of truancy, but concluded that the laws then existing were sufficient if properly executed.¹

It was stated that children who would not attend the schools provided for them could be sent to the House of Reformation. As a matter of fact, the offenses for which children could be sentenced to that institution were the same as they had been since its beginning, and it was no more available for truants in 1846 than when it was found necessary to discontinue such commitments because of legal hindrances in 1833. This, however, either escaped notice or was disregarded, and an elaborate plan was devised for compelling attendance by the aid of city policemen. Grammar-school masters were required to report to the mayor monthly the names of pupils incorrigibly stubborn or habitually truant. Policemen were then sent to bring in the truants. Legal prosecution was threatened if they did not attend regularly, and in some cases boys were locked up for a short time. This, however, was soon stopped as illegal.²

On the whole, the aid of the policemen had a good effect at first, but in time the bad boys became accustomed to dealing with policemen and paid no more attention to their threats than they had paid to the flogging of the teachers, and it became necessary to make the threats good. Accordingly, complaints were made against some of the worst truants under the provision of the law which permitted "stubborn children" to be sent to the House of Reformation. But the judges refused to consider truancy and absenteeism as a species of "stubbornness" in the meaning of the law, and the prosecutions came to naught. With them failed the plan of police assistance in the management of the schools. The names of delinquents continued to be reported to the mayor, however, and when it was found that they had also committed some minor offense which brought them within the law, the threat of prosecution was held over them, but not carried out as long as they were regular in their school attendance.³ But few pupils were thus reached, however, and the offense of truancy steadily increased, in spite of those measures which it was possible to use in breaking it up, namely, consultation of teachers with parents, requiring truants to make up lost lessons, whipping, etc.⁴

The visiting committee of 1847 devoted five pages of their report to a discussion of vagrant children and truancy. They showed that about 1,600 children were not attending any city school and that many of them were in a course of education for worthlessness and crime. At that time there were 74 inmates of the House of Reformation, and during the previous year 456 minors had been sent to jail. The committee urged not only that provision be made for the proper education of all, but that means be used to make that provision effective.

It is a serious defect in the organization of this board [they say] that there is now no person connected with and acting under direction of the board to ascertain what children of legal school age are not in the schools and to use measures to bring them there. This board is the only one which has, officially, a knowledge of the numbers of children in the schools and of those who ought to be there. It is the one whose duty it is to provide means for the education of all the children. It would be well if it could have authority not only to use means to bring wandering children into the schools, but to provide for the instruction of those portions of the adult population who are without, and who desire, elementary instruction.

⁴ Reports of the annual visiting committees of the public schools of the city of Boston, 1846, p. 156.

These suggestions came opportunely, for such was the general interest in the "perishing classes," as they were so frequently called, that the time was favorable for work in their behalf. The "Rauhe Haus," established by Dr. J. H. Winchern, near Hamburg, in 1833, and the "Agricultural Colony," of Mettray, founded by Frederic Auguste Demetz and Viscount Bretignières de Courteilles in 1839, had both achieved remarkable success and had received wide attention because of new and peculiar systems of organization. The House of Refuge at New Orleans, La., was opened in 1847, and the work of organizing the Massachusetts State Reform School¹ was even then in progress.

The bruit of such occurrences could but arouse interest in the general subject of juvenile crime and its conditions. Horace Mann again put his shoulder to the wheel and in his eleventh annual report, dated December 16, 1847, he argued long and earnestly for universal education, secured by compulsory measures when necessary, as the sovereign means of "redeeming the State from social vices and crimes."²

Josiah Quincy was still mayor of Boston. His interest in popular education was unabated, and his belief in the necessity of stringent compulsory measures had evidently been strengthened by his experience of the previous two years. In his inaugural address for 1848 he adverted to the subject thus:

Universal education, both in moral and intellectual nature, being the only solid basis on which our institutions can rest, I hold that the State has a right to compel parents to take advantage of the means of educating their children. If it can punish them for crime it surely should have the power of preventing them from committing it by giving them the habits and the education that are the surest safeguards. There are daily hundreds of children of both sexes who are kept from school to support their parents, often in idleness and drunkenness, by pilfering about our wharves, or any other profitable form of vice, and who are regularly educated for the brothel and dramshop, for the poorhouse and the jail. Their position calls loudly for public and individual exertion, and I recommend that application be made to the legislature for such power as shall enable the city to be in *loco parentis* to such children, and that some asylum be provided where such as are morally too weak to be at large may receive the peculiar training that their habits and association may make necessary.³

As Mayor Quincy's ideas were in advance of those of the school committee in 1846, so they were also in 1848, for in their report for that year the committee on the examination of grammar schools say:

The evil [of absences and truancy] is a great one, tending in various ways to disturb the order and interrupt the progress, not only of the delinquents, but of the school. The only remedy which is in the power of the teacher consists in admonition and punishment. Nor do we see that it can be prevented by any further regulations of this board except such as would do more injury than good. The only effectual remedy consists in the power of parents, in the home influences which may be used in discouraging absences and enforcing attendances. Those influences, it is to be feared, are not now properly exerted, especially among the poorer classes of our population.⁴

If that had been the general attitude, no effective measures to check the "evil of truancy" would ever have been taken. But fortunately other officials than the writer of that report had clearer ideas on the subject as well as a more aggressive disposition in taking measures to accomplish a desired end. Mayor Quincy detailed an officer from the regular police force for the special duty of looking up children not in school and to induce them to attend if possible. This officer, Oliver H. Spurr, proved to be very efficient in the performance of his duties, specially investigating each case that came to his attention through the teachers or through his own searches in places where idle children were wont to congregate, and using such means to induce

¹This institution originated in a gift of \$72,500 from Hon. Theodore Lyman, and was the first of the kind to be organized and managed by officers of a State.

them to go to school as each individual seemed to require. Admonitions to parents, persuasion, threats of prosecution, and in some cases temporary confinement of delinquent children (although this was not warranted by law) were the only means at his command. But he used these intelligently and with good effect. Nevertheless there were at the end of the year 1848, by a very incomplete count, 1,066 truant and vagrant children in the city, 184 of them being girls.¹

At length the school committee became aroused, and in January, 1849, passed an order inquiring of the mayor, "what had been done to secure the steady attendance of children at school, and authorizing him to apply to the legislature to secure the attendance of scholars."²

An elaborate report from Officer Spurr was submitted in response to this request, was published in the newspapers and widely discussed, legislative action being generally demanded. The school committee, in the March following, formally requested the city government to immediately "devise such measures as shall secure the regular attendance in our public schools of all the idle and truant children of the city."

THE FIRST TRUANT LAW.

Subsequently a bill was introduced in the legislature to give towns power to punish truancy by imprisonment, but it failed to pass the senate, the objections urged against it being that the evil was of a nature to be corrected by domestic discipline rather than by penal law, and that it was inexpedient to bring that law into such close connection with the common-school system, etc.³ Public sentiment had not then crystallized in a demand for compulsory education, but the occurrences and developments of the time were fast preparing the way for it. The State Teachers' Association indorsed the defeated bill, and appointed a committee to urge its passage at the next meeting of the legislature. That committee presented a memorial to the legislature⁴ and brought to bear all the influences in favor of the bill which they could muster. The result was that the following law was passed May 3, 1850:

AN ACT Concerning truant children and absentees from school.

SEC. 1. Each of the several cities and towns in this Commonwealth is hereby authorized and empowered to make all needful provisions and arrangements concerning habitual truants and children not attending school, without any regular and lawful occupation, growing up in ignorance, between the ages of six and fifteen years; and also all such ordinances and by-laws respecting such children as shall be deemed most conducive to their welfare and the good order of such city or town; and there shall be annexed to such ordinances suitable penalties, not exceeding for any one breach a fine of twenty dollars: *Provided*, That such ordinances and by-laws shall be approved by the court of common pleas for the county and shall not be repugnant to the laws of the Commonwealth.

SEC. 2. The several cities and towns availing themselves of the provisions of this act shall appoint, at the annual meeting of said towns, or annually by the mayor and aldermen of said cities, three or more persons who alone shall be authorized to make the complaints in every case of violation of said ordinances or by-laws to the justice of the peace or other judicial officer who, by said ordinances, shall have jurisdiction in the matter, which persons thus appointed shall alone have authority to carry into execution the judgments of said justice of the peace or other judicial officer.

SEC. 3. The said justices of the peace, or other judicial officers, shall in all cases, at their discretion, in place of the fine aforesaid, be authorized to order children, proved before them to be growing up in truancy, and without the benefit of the education provided for them by law, to be placed, for such periods of time as they may judge expedient, in such institution of instruction, or house of reformation, or other suitable situation as may be assigned or provided for the purpose, under the authority conveyed by the first section of this act, in each city or town availing itself of the powers herein granted.⁵

CITIES AND TOWNS ADOPTING THE TRUANT LAW.

As this law was passed at the instance, primarily, of the Boston officials and for the benefit of that city, it was incumbent on them to adopt its provisions without undue loss of time. Accordingly the school committee in July, 1850, requested the city council to take action in the matter, and that body on October 21, 1850, passed an ordinance, which was approved soon after by the court of common pleas for the county of Suffolk, adopting the provisions of the act, giving jurisdiction under it to the senior justice of the police court, and assigning the House for the Employment and Reformation of Juvenile Delinquents as the place of confinement of the children sentenced according to the third section of the act.¹ Three policemen were detailed January 31, 1851, by the mayor and aldermen to act as truant officers under the second section.² One of these was the same Oliver H. Spurr who had already been acting in substantially the same capacity for nearly three years and who was at that time city marshal.³

Even before Boston had moved in the matter of the adoption of the truant law the school committee of Lowell had taken action with the same thing in view. At their meeting of June 29, 1850, a committee was appointed to consider and report on the subject. The report, made at a subsequent meeting of the school committee, was strongly in favor of the adoption of regulations by the city, and in conformity with it the mayor was requested to present the subject to the city council and ask the passage of the necessary rules and regulations.⁴ During the following year (1851) the ordinance requested was passed by the council and was duly approved by the judicial authorities. It imposed a fine of not exceeding \$20, or imprisonment, not only in cases of acknowledged truancy, but on every child between the ages of 6 and 15 years who did not attend school and who engaged in no regular and lawful occupation.⁵ Children sentenced under these regulations were committed to the House of Employment and Reformation of the city of Lowell, which had previously been established at the almshouse in accordance with the act of the legislature of March 26, 1845.⁶ Four children, the first reported, were so committed in 1852.⁷

Concord was almost as prompt in taking action, for at the town meeting of November 10, 1851, the truant law was adopted and regulations were made, which were approved by the justice of the court of common pleas during the December term of that court. The almshouse was assigned as the place of confinement of truants under the third section of the act.⁸

At Framingham the chairman of the school committee in 1850 was Birdsey G. Northrop, who was afterwards the agent of the Massachusetts State board of education and secretary of the Connecticut State board. The qualities which recommended him for those higher positions were developed in his Framingham experience, and he had already given evidence of that clear perception of educational needs and that intelligent understanding of the proper remedies which in later years made him one of the most prominent school men of his day. The actions of the Framingham school committee bear unmistakable evidence of his influence. In March, 1850, two months before the passage of the truant law, the irregular attendance of pupils was brought to the attention of the town meeting, and a committee was appointed to inquire into the expediency of adopting by-laws and provisions respecting truant children and absentees from school. Pending the report of this committee the State truant law

was passed, and at the town meeting of May 26, 1850, the committee proposed a set of by-laws adopting the law and designating the State reform school as the place of confinement for offenders. Some doubt being expressed about the admission of truants at this institution the matter was postponed for further inquiry, and at the meeting of July 7, 1851, the regulations were adopted by the town.¹ Repeated changes were necessary to satisfy the justice of the court, and the final approval of the judicial authority was not given until 1853.²

But little time was required to develop defects in the law of 1850, and supplementary legislation was soon found to be necessary. Accordingly, in 1852, an act was passed limiting the time of detention of convicted truants to one year, and providing that in case a fine was inflicted and not paid the delinquent might be committed to a suitable institution as in cases of nonpayment of other fines.³

THE COMPULSORY ATTENDANCE LAW OF 1852

At the same session of the legislature a general compulsory education law was passed, which did not depend upon the ratification of any local authority for its effectiveness, as did the truant law. This was the first law of its kind passed in America since the obsolete laws of the seventeenth century and deserves to be quoted in full. It was as follows:

SEC. 1. Every person who shall have any child under his control between the ages of eight and fourteen years shall send such child to some public school within the town or city in which he resides during at least twelve weeks, if the public schools within such town or city shall be so long kept, in each and every year during which such child shall be under his control, six weeks of which shall be consecutive.

SEC. 2. Every person who shall violate the provisions of the first section of this act shall forfeit, to the use of said town or city, a sum not exceeding twenty dollars, to be recovered by complaint or indictment.

SEC. 3. It shall be the duty of the school committee in the several towns or cities to inquire into all cases of violation of the first section of this act, and to ascertain of the persons violating the same the reasons, if any, for such violation, and they shall report such cases, together with such reasons, if any, to the town or city, in their annual report; but they shall not report any cases such as are provided for by the fourth section of this act.

SEC. 4. If, upon inquiry by the school committee, it shall appear, or if upon the trial of any complaint or indictment under this act, it shall appear that such child has attended some school not in the town or city in which he resides, for the time required by this act, or has been otherwise furnished with the means of education for a like period of time, or has already acquired those branches of learning which are taught in common schools, or if it shall appear that his bodily or mental condition has been such as to prevent his attendance at school, or his acquisition of learning for such a period of time, or that the person having the control of such child is not able, by reason of poverty, to send such child to school, or to furnish him with the means of education, then such person shall be held not to have violated the provisions of this act.

SEC. 5. It shall be the duty of the treasurer of the town or city to prosecute all violations of this act.⁴

This law, important as it was in its final results, did not cause a ripple at the time of its passage, and no attempt was made to enforce it, apparently, for years afterwards. It was not even mentioned in the reports of the State board of education or of its secretaries until 1857—five years after its passage.

In fact, Barnas Sears, the successor of Horace Mann, although he continued the work of the first secretary in many lines for the upbuilding of the Massachusetts school system, absolutely ignored in his reports the efforts making in the State looking to compulsory school attendance. Not once did he mention the passage of the laws of 1850 and 1852 or any action taken under them, although in the nine-

teenth annual report (1856) he enumerated a number of other methods employed to overcome irregular attendance.¹ In the report of the board of education itself for 1856, it was stated that the operation of the truant law in towns adopting it had been gratifying; but no reference appears to the general law even there.

OTHER ADOPTIONS OF THE TRUANT LAW.

From time to time other cities and towns adopted the truant law; New Bedford did so in 1852,² Springfield early in 1853,³ Charlestown in 1855,⁴ Chelsea in 1855,⁵ Lawrence in 1858,⁶ Rockport in 1859,⁷ Roxbury in 1859,⁸ and North Andover in 1860.⁹ An ordinance to the same effect was passed in Salem in 1853, but it did not receive judicial sanction.¹⁰

In nearly all these places efforts were made to enforce the law in earnest. At New Bedford a truant school was at once established at the almshouse and a mixed school was organized for the less incorrigible truants.¹¹ No truant school was available in Springfield until 1866,¹² but in some of the districts there was a more or less effective enforcement from the adoption of the law.³ A place was provided at the almshouse of Charlestown for convicted truants, and 21 boys were sentenced in 1855, with "a very salutary effect" upon the schools; the school committee objected later to the arrangement for the disposition of truants, but no other institution of reform was provided by the council.¹³ A "truancy class" was organized in Lawrence and an elaborate plan was devised for the treatment of truants soon after the passage of the ordinance of adoption.¹⁴ An almshouse school was organized for truants in Roxbury in 1859, and for a number of years was an effective aid in securing regular attendance. It was discontinued in 1861,⁸ but truancy increased immediately and in four years the school was reopened with the same gratifying results that attended its first establishment.¹⁵ In Lowell enforcement of the law has been earnest and consistent from the first, and the reform school has been freely used and to good effect.¹⁶

LEGAL DIFFICULTIES IN BOSTON.

In Boston the first years of the operation of the truant law were marked by difficulties with the law itself. The amendment of 1852 had scarcely been passed, and machinery provided for the enforcement of the act, when an unexpected difficulty developed in the decision of the police-court justice having jurisdiction in truancy cases to the effect that the law applied only to members of the schools absent without proper permission. He refused to consider absentees not enrolled in the schools as coming within the scope of the law.

This decision offered a loophole of escape for a large class of offenders and seriously interfered with the efficacy of the law. The short term of the sentence specified was also a disadvantage. Under the belief that the other justices would not agree with their brother of the bench in his narrow construction of the law, additional acts were secured from the legislature giving jurisdiction in truancy cases to any justice of the

police court and extending the maximum term of sentence to two years.¹ But those who drafted the new acts had not reckoned with the force of precedent in legal decisions. All the other justices followed the reasoning of the first, and still another act had to be secured in 1862 before the right was conceded to bring forcibly into school children wandering about the streets and not attending school.² An act had already been passed³ amending the original truant law by making its enforcement compulsory instead of optional, and the new law largely followed the wording of the old one as amended. A change was, however, made in the ages of required attendance, they being made from 7 to 16 instead of from 6 to 15, as before.

The new law did not satisfy the police justices any more than its predecessors, for it was held to be defective in that it failed to specify precisely who had jurisdiction under it. Recourse was again had to legislation, and still another amendment was passed in 1863 providing that "either of the justices of the police court of the city of Boston, and any judge or justice of any police court, and any trial justice in this State shall have jurisdiction within their respective counties of the offenses described in chapter 207 of the acts of the year 1862."⁴

Thus it required thirteen years to secure a truant law which might be, in the view of the local authorities, thoroughly workable and effective.

But it is not to be supposed that in all this time the truants were having things all their own way in Boston, even if the law were not perfect. Enough law existed all along to make their lot a very unpleasant one. As I have stated, three policemen were detailed for duty in 1851 in connection with the enforcement of the truant law, and from 1852 truant officers—three at first and four later—were formally appointed as such by the mayor and confirmed by the board of aldermen. Cases of truancy in the schools were reported to them and truants were closely watched. Repeated instances of dereliction were apt to lead to commitment to the House of Reformation. Children in the absentee class were often arrested and sentenced for offenses other than absenteeism, though that was the real offense which attracted the notice of the officers and which they desired to punish.

The law of 1863, however, brought about the conditions in Boston hoped for and expected at the adoption of the original law in 1850. Its administration was attended with increasing efficiency and success, the judicial officers and truant officers cooperating harmoniously and effectively. The inclusion of absentees in the scope of the law more than doubled its value. The number of vagrant children in the street was speedily diminished and the school attendance was correspondingly increased.⁵

AMENDMENT OF 1862 GENERALLY INEFFICIENT.

It does not appear from the records that the passage of the laws of 1862 and 1863 requiring, instead of permitting, the enforcement of the truant law was followed by any great change in the manner or extent of its application throughout the State. A general compulsory attendance law already existed and no attention had been paid to it. If a community was disposed to compel school attendance there was sufficient authority for it in the permissive law, while if there was not such a disposition no higher authority had the right or power to step in and compel the observance of the new law.

Judging from the tenor of the local school documents of the time, the conclusion is justified that the greatest single agency that brought about compulsory education in Massachusetts was the series of "graduated tables" in the reports of the State board of education, devised by Horace Mann. These tables showed the relative

attendance of children in school for every city and town in the State, and then gave to each community a relative rank in the State and in the county with reference to its percentage of pupils to school population. The great secretary had inveighed against nonattendance with all the vigor and force of which he was master, both in his official reports and in his addresses throughout the State. He awakened the people to the loss that the State suffered through the ignorance of its inhabitants, and to the loss to the taxpayers through failure to take advantage of the educational facilities they had paid for. Then having awakened them, the graduated tables which he bequeathed to the State kept them awake. Not only did they foster a spirit of emulation in each community to do as well as their neighbors educationally, but they constantly stimulated the desire of the thrifty New England heart to get as much for money spent as anybody else. To this day the graduated tables are regularly consulted and quoted throughout the State, but they were still more so in the earlier days. And the trenchant arguments and vigorous statements of Horace Mann were repeated, with or without credit, in school reports by the score, and molded public opinion for years after he had relinquished the office that he had made and adorned. Their influence still survives, though naturally it is not as direct and easily traceable as thirty years ago. The school literature of Massachusetts in the sixties teems with discussions of truancy and nonattendance, but references to the necessity of enforcing either of the compulsory laws for purely legal reasons are rare; Horace Mann's reasons are constantly in evidence.

In the case of Lynn, Mass., the school committee had been urging the passage of truant by-laws prior to the passage of the act of 1862, and that law came opportunely. With its aid the committee were able to induce the city government to take the desired action, and the by-laws were passed August 20, 1862.¹ This was as near to a direct result as the law of 1862 could boast. Other places passed by-laws during the years immediately following, but of their own volition, and without legal pressure. Cohasset did so in 1862;² Newton, March 3, 1863;³ West Stockbridge, about 1863;⁴ Milford, November 21, 1864;⁵ Winchendon⁶ and Somerset⁷ March, 1865; Newburyport,⁸ Georgetown,⁹ Natick,¹⁰ and Dalton¹¹ about 1865, and Groton¹² April, 1865, etc.

In the majority of places the by-laws received but little attention after they were passed. The almshouses in the respective towns were generally designated as the places of confinement for violators of the law, and the impropriety of sending children guilty of truancy only to such a place was so evident that in some cases the school officers flatly refused to enforce a law that would lead to such action.

In some cities, however, reasonably satisfactory provision was made for truants at the almshouses. A "reform school" was put in operation in 1863 at the almshouse in Worcester, after the model of that in Lowell.¹³ It was controlled by a committee composed of the superintendent of city schools, the city marshal, and the chairman of the committee on the city farm, and continued to receive truants until the opening of the county truant school at Oakdale. The official reports available indicate that its work and general conditions were satisfactory, and no complaint is made in them of the unwholesome surroundings which were such a source of trouble in the almshouse schools generally. At Roxbury the appointments of the almshouse school

were in themselves comfortable, clean, and sufficient,¹ and the same thing was true of other such schools. But it seems inevitable that the same objections urged so strenuously against an almshouse as a site for a school of detention must have applied to a greater or less degree to all of them.

Unquestionably in many instances the conception of the function of these schools was in many cases that they were to be juvenile prisons and no more. In Newton, for example, the by-laws adopted by the town in 1864 provided that "the selectmen of the town shall provide a suitable lockup or institution for instruction or house of reformation, or some other suitable place in the poorhouse belonging to the town, or some other place in the town * * * which shall be assigned and used for the confinement of persons convicted and sentenced to confinement under said acts."²

This emphasis upon confinement rather than upon instruction and reformation is to be seen in many, if not most, of the early local ordinances, and the board fence, "carried a little higher than the ambition or agility of the boys will permit them to climb," was regarded as an essential part of the equipment of a truant school.

LIMITED ENFORCEMENT OF TRUANT LAWS.

Only a few years' experience was necessary to disclose difficulties in the way of a satisfactory and general execution of the truant law. In some of the cities, as in Boston, Lowell, and Worcester, there has been no important cessation in its administration.³ It has been enforced with increasing efficiency since it was put in operation. But in the smaller places this has not been true. The secretary of the State board of education, Hon. Joseph White, gave in his twenty-ninth annual report (1865)⁴ a list of 77 cities and towns, out of 334 in the State, which had chosen truant officers and presumably enforced the laws. This number had increased to 98 by 1866.⁵ Local reports show clearly, however, that in the great majority of the places named in the list there was no enforcement worthy of the name.

The conditions in the following places may be taken as typical of the entire State outside of a half dozen cities: The operation of the law at Newburyport was very successful at first. A truant school was established in 1864, and such was its effect that not a truant was to be seen upon the streets or wharves of the city.⁶ But the school was expensive and was discontinued in a short time; the truant officer was "not sufficiently induced" to perform his duty,⁷ and truancy became as great an evil in the community and as great a hindrance to the schools as ever.⁶ The by-laws passed in Lawrence in 1853 and reenacted in 1864 were reported as practically inoperative in 1865,⁸ and so continued until 1873 when the industrial school was established. The school committee of Groton reported in 1866 that no good results could be seen from the adoption of truant by-laws, and they regarded them as a failure.⁹ Concord started off with by-laws early in the history of the truant law, but in 1860, nine years afterward, Supt. A. Bronson Alcott stated that there had been a few cases of truancy, but they could not be reached by any means known to the committee.¹⁰ The very existence of truant by-laws had actually been forgotten, or was unknown to the principal school officer. The superintendent in 1876, Rev. Edward Waldo Emerson, complained that he was powerless against truancy in the absence of truant

¹ Thirty-first report Massachusetts board of education, p. 256.

² Twenty-eighth annual report Massachusetts board of education, p. 72.

³ By an unexpected and unexplainable action of the State legislature in 1866 the truant law, so far as it related to Boston, was repealed, but it was restored within a year.

laws.¹ The chairman of the school committee of Haverhill stated in his report for 1869² that the system of managing truancy by sending confirmed truants to the town farm was "very defective," and urged that some better plan be devised. Holyoke was another town included in Secretary White's list of 98, but there was no truant school there and no truant officer before 1875.³

Mr. White said that "the chief obstacle in the way of a successful administration of the truant law has been, and still is, the difficulty of securing proper places for the confinement and proper instruction of the youthful delinquents."⁴ But in the light of later developments and experience it is plain that as great as that difficulty was the principal trouble lay elsewhere. The lack of proper truant schools occupied the second, not the first, place in the category of hindrances. School officers, though loyal to the compulsory laws in an abstract way, in too many cases became weary of well-doing after a brief attempt to perform the disagreeable duties required, and without the spur of a legal penalty or stimulus from higher authority gradually relapsed into their former *laissez faire* attitude.

Hon. Jacob Batchelder well expressed the situation in his report as chairman of the school committee of Lynn for 1872.⁵ He said:

Our school statutes have the appearance of the keen-edged blade, but it is left to repose in its sheath, for no official feels authorized, or rather compelled, under penalty, to draw and test its quality. The town or city is empowered to make its own by-laws regulating school attendance and truancy, and appoint at annual meetings or by the agency of mayor and aldermen, three or more persons, who alone shall be authorized, in case of violation of such by-laws, to make the complaint and carry into execution the judgments thereon. The agents to investigate and prosecute for violation of the laws are to be appointed by their own neighbors to prosecute other neighbors, and all are aware of the influences that, under these circumstances, are wont to paralyze the arm of power.

This state of affairs continued without improvement for several years. If there was any difference toward the latter sixties and early seventies the difference was in the direction of still greater laxity. The agent of the State board of education asserted in 1871 that the Massachusetts law was compulsory in its letter and intent rather than in its actual execution, and that no very decided benefit was derived from it.⁶ At the same time Secretary White pronounced the law and practice in regard to truancy and absenteeism the weakest and least defensible point in the school system. The several enactments, he said, were ill adapted to their purpose, discordant, and incapable of execution, and a thorough revision was required.⁷ Such a revision was given to the laws by the general court at its session of 1873. A new truant law was passed and approved May 2, 1873, and a new attendance law was approved ten days later. The two laws applied to the same general subject, and its division was not based on any logical reason, but on precedent only. The "truant law" treated of the offense of failure to attend school and the punishment therefor inflicted on the child, and the attendance law covered precisely the same offense and the punishment to be meted out to the parent of the offender.

TRUANT LAW OF 1873.

The new truant law⁸ provided that each city and town make all needful provisions and arrangements for habitual truants and children between the ages of 7 and 15 years of age not attending school and growing up in ignorance, make proper by-laws

concerning them, and provide suitable places for the confinement, discipline, and instruction of such children, the by-laws to be subject to the approval of a justice of the superior court or of the judge of probate of the county.

The several school committees were required to appoint two or more truant officers to investigate all cases arising under the by-laws, and in cases of violation thereof to make complaints and execute the judgments rendered. In this was an important departure from the previous law, as it placed the truant officers under the control of the school rather than of the municipal authorities.

Minors convicted under the by-laws were to be committed to the "institution of instruction of suitable location" provided for a term not exceeding two years, and upon proof of amendment, or for other sufficient cause, might be discharged by the court which had passed the sentence. Jurisdiction was given to justices of police or district courts, trial justices of juvenile offenders, and judges of probate.

County commissioners were directed to establish county truant schools upon the demand of three or more cities or towns in their respective counties. Any city or town might assign such truant school as the place of confinement for offenders under the act, paying not over \$2 a week for the support of those committed. This provision was the origin of the county truant-school system, and was in imitation of the act of 1866, which gave to county commissioners the right to establish county reform schools. Secretary White had long urged the establishment of truant schools by and for the counties;¹ but it seems that the final adoption of this provision was due to the efforts of Rev. Joseph Osgood, a member the legislature from Cohasset.²

The State primary school at Monson³ was made by the act available for convicted truants, provided the State board of charities assented. Such assent was given to a few towns, but was soon withdrawn, and that institution was never a considerable factor in the treatment of truants.

COMPULSORY-ATTENDANCE LAW OF 1873.

The new "attendance law"⁴ extended the time of annual required attendance at school to twenty weeks, but reduced the ages between which attendance was required to from 8 to 12 years. The enforcement of the law was charged upon truant officers and school committees instead of upon the several town treasurers. Jurisdiction under the act was given to the same justices specified in the "truant law," and the maximum fine to be inflicted upon the neglectful parent was fixed at \$20.

SLOW AND GRADUAL IMPROVEMENT.

The passage of these laws awakened interest in the subject anew, and many school committees gravely resolved to enforce the laws, which were declared to be at last perfect, but which had been incapable of being executed before. These resolutions

¹ Twenty-ninth annual report Massachusetts board of education, p. 63; thirtieth report, p. 74, etc.

² Fifty-ninth report Massachusetts board of education, p. 570.

³ The State primary school was originally designed for the children of paupers in the three State almshouses, and was the outgrowth of a school maintained for the children in the Monson almshouse. Its separate existence began September 3, 1866. Association with adult paupers being deleterious to the children, the former were gradually withdrawn and the almshouse department was finally closed May 1, 1872, leaving the primary school in full possession of the field. In 1870 the school began to be used also for young delinquents, more properly classed as dependent than as criminal, and from 1882 it was made to receive children committed to the care of the State board of health, lunacy, and charity because of criminal neglect of their parents. In time the school came to wear the aspect of a reformatory, the majority of its inmates being of the delinquent class. In 1894 the institution was given over to juvenile offenders only, and the dependent and neglected children were withdrawn and boarded out. During the next year (May 1, 1895) the institution was closed and the 110 inmates then remaining were variously disposed of, the worst being sent to the State reform school and most of the others being sent to their homes or boarded out. The greatest population of the institution was reached in 1882, when there were 448 inmates.

⁴ Massachusetts acts of 1873, p. 279.

may have had some good results, but the extent of the real execution of the law broadened but slowly.

One noticeable difference in the immediate results of this law from previous similar ones was that it was not followed by any strengthening of existing local truant schools or by the establishment of new ones worthy of the name. The Lawrence Industrial School was opened in a few months, but that can scarcely be credited to the law, since the school had been in contemplation for several years and the act of incorporation was passed in 1872. The provision for county truant schools naturally prevented efforts that might have been made for local institutions. Petitions to the county commissioners were made instead. Several towns, in adopting new by-laws, designated as the place of confinement "the county truant school when established," which under the circumstances meant nothing at all. And the fact remains that in spite of mandatory provisions covering the whole State, only 130 out of 341 cities and towns made even a formal attempt to execute the truant law.¹ Secretary White earnestly sought to impress school committeemen with a sense of their duty, and urged them to appoint truant officers whether formal by-laws had been adopted or not. He held that such appointment was a direct legal command and was not contingent upon any action of the town.²

One hundred and fifty-seven towns and cities claimed to have truant officers in 1878.³ The cause of compulsory education appeared to be gaining ground, but the progress was slow, and the conditions were satisfactory in but few of the 157 places. Concerned at this poor showing, the State board of education, with the purpose of calling special attention to the subject, published and sent to each town a copy of an approved form of by-laws for truant officers, and, what was decidedly more to the point—certainly toward securing a nominal compliance with the law—they secured an act of the legislature prohibiting any of the income of the State school fund from being apportioned to any city or town "which had not complied with the laws relating to truancy."⁴ It was made, furthermore, the duty of the school committees to report annually to the secretary of the board of education whether their respective cities or towns had made the provisions and arrangements relating to truant and absentees as required by law. At last an argument had been found which promised to be as powerful as some of those of Horace Mann. His most effective appeals were through the pocketbooks of his constituents, and here was a law which used the same principle in behalf of compulsory education and in a very direct way. Thereafter it meant dollars in the treasuries of those towns which enforced the law either in fact or on paper.

Hon. J. W. Dickinson assumed the office of secretary of the board of education in 1877, and by persistent and well-directed efforts he called attention to the next essential, namely, county truant schools. But success came slowly. The first institution of that class was not established until seven years after the passage of the act requiring them. Towns and cities repeatedly petitioned for truant schools according to the law, but without result, the reply usually being that there was no money available for the purpose.⁵ Nevertheless, constantly increasing attention was given to the truant law in general, and in 1886 there were very few school committees which did not report compliance with its provisions.⁶ Much of this was of a purely formal and perfunctory character, to prevent loss of school money under the law of 1878, but there was undoubtedly a fair share of conscientious work done. Of 45 cities and towns, all having superintendents, investigated in 1886 by Mr. George A. Walton, agent of

⁶ Fiftieth report Massachusetts board of education, 1885-86, p. 169.

the board of education, 27 reported full compliance with the law. Of the remaining 18, nearly all indicated some action of account.¹ Even if these 27 places were the only ones in the State at that time in which a satisfactory state of affairs existed—and it is likely that this was true—a considerable gain would have been indicated by that much of enforcement; and the fact that something was done in nearly every town in the State, however bare of results it might have been, meant a great deal, for it was impossible before 1878 to induce the major part of the town officers and school committees to take any notice of the truant law at all.

The investigation of Mr. Walton, just mentioned, was the basis for the first of a series of three important special documents that have been issued by the State board on the subject of attendance and truancy. The second was also prepared by Mr. Walton, in accordance with a legislative resolution,² and appeared in March, 1896.³ The third related especially to county truant schools, and was made in accordance with the legal provision that those institutions should be subject to the visitation of the State boards of education and of lunacy and charity, and that those boards should report annually on them to the legislature. This report was prepared by Hon. Frank A. Hill, secretary of the board of education, and was based largely on the reports of the three State agents. It formed a part of the sixty-second annual report of the Massachusetts board of education.⁴

The value and influence of these special reports have been incalculable in attracting attention to existing conditions and pointing the way to improvement. And they have been effectively supplemented by the active efforts of the secretary and agents of the board. At no time within the last twenty years has the matter been allowed to rest or public interest to lapse. As a result, the general sentiment has grown constantly more favorable to compulsory laws, the legal enactments have been strengthened from time to time in places where they have been found to be weak, and the extent of their genuine and hearty enforcement has steadily increased.

RECENT LEGISLATION AND PRESENT STATUS.

In 1881⁵ and 1884⁶ the provision relating to county truant schools was amended so as to permit two or more contiguous counties to unite in maintaining truant schools. Encouraging truancy by employing truants was made punishable by a fine of from \$20 to \$50 in 1885.⁷ Truant officers were formally authorized in 1889 to apprehend and take to school without warrant children discovered in the act of truancy,⁸ and in the same year children who persistently violate the reasonable rules of the common schools were included in the category of those who might be sent to a truant school.⁹ The then existing laws relating to school attendance, truancy, and the care of neglected children¹⁰ were consolidated, with but few changes, into one law and reenacted in 1894.¹¹ Finally, the law now in force was passed in 1898.¹²

¹ Fiftieth report Massachusetts board of education, 1885-86, p. 169.

⁸ Massachusetts acts and resolves, 1889, chap. 422. ⁹ *Ib.*, chap. 249.

¹⁰ In 1866 cities and towns were authorized to make all needful provisions for "children under 16 years of age, who, by reason of orphanage or of neglect, crime, drunkenness, or other vice of parents, are suffered to grow up without salutary parental control and education, or in circumstances exposing them to lead idle and dissolute lives." In the provisions relating to the adoption of by-laws, appointment of officers to execute the act, jurisdiction, and the disposition of such neglected children, this act closely followed the truant law. In 1878 it was made obligatory on all cities and towns of over 5,000 inhabitants to take action as provided by the law, and the agents of the Massachusetts Children's Protective Society were authorized to make complaints under it. In practice, truant officers and truant schools were usually named by the towns for the enforcement of the neglected-children law, and there has always been a close relationship between it and the truant law. Hence their consolidation.

¹¹ Massachusetts acts and resolves, 1894, chap. 498. ¹² See text of law in Section IV of this chapter.

Secretary Dickinson and the State agents had for several years urged a general revision involving the elimination of several features of the old law which had proved stumbling blocks and the addition of new agencies to make it more effective. Accordingly, as stated in a previous paragraph, the legislature in 1895¹ called on the State board of education for a report on the general subject of school attendance and truancy, with special reference to means for suppressing the latter. This report was prepared by Mr. George A. Walton, with the cooperation of Mr. Charles W. Birtwell, of the Boston Children's Aid Society, and was an exhaustive and able document. In response to further legislative requests, and after three years of active and painstaking study, much revision and submission to legal and educational experts, three bills, relating respectively to school attendance and truancy, the employment of children at labor, and neglected children, were drawn by Messrs. Walton and Birtwell and submitted to the legislature. As finally passed, some of the important features recommended were omitted—notably the provision for State control of truant schools and State truancy agents. But these seem to be directly in the line of the evolution of the Massachusetts compulsory system, and manifestly would be of such usefulness that their adoption can not be long delayed. The new law is a great advance over the old one; its application will undoubtedly be more general, and a few years under it will prove, without question, the complete desirability of a more centralized management of the whole question.

One of the greatest improvements in the law of 1898 is that the requirement of the adoption of local by-laws is omitted. While compulsory attendance was a matter of local option, special legislation by the several towns was not inappropriate. Deliberate and formal action in town meeting had its use in bringing the subject into general notice and in securing more cordial popular cooperation in its enforcement if adopted. But after compulsion was made an absolute duty, formal action by the several towns, with the necessity of judicial approval, became not only useless, but a serious and troublesome complication that often of itself completely nullified the law. There was no good reason for its continuance, and the only explanation for it is to be found in the habit common to legislatures of building new laws on the wrecks of old ones.

COMPARISON OF THE MASSACHUSETTS AND CONNECTICUT SYSTEMS OF TRUANCY CONTROL.

The Connecticut system of compulsory school attendance was developed under very different influences from that of Massachusetts, and in essential respects it is now markedly different. The Massachusetts system began and grew according to the needs of the Boston schools. Its initiation was the result of efforts of Boston school officials and with a few exceptions the amendments that have been made were those suggested by the experience of a great city. Notwithstanding recent changes it is now and always has been a system specially applicable to cities and difficult of enforcement outside of them. It was constructed for a municipality willing and anxious to enforce its provisions; all its traditions and its present character bear the impress of its origin.

In Connecticut, on the contrary, there is no great city to dominate the ideas and formulate the laws of the State according to its own conditions and ideals, as Paris does in France and as Boston does in Massachusetts. New Haven, the largest city in Connecticut, has only about 100,000 inhabitants; Hartford is not far behind in size, and the rivalry between the two places is a part of the history of the State. The ambition of other Connecticut cities, with the presence of several neighboring cities at least equally important, like Providence, Worcester, Fall River, and Lowell, and, above all, the overtowering municipalities of New York and Boston near by,

¹Massachusetts acts and resolves, 1895, chap. 47.

all prevent either New Haven or Hartford from assuming colossal proportions in the eyes of the inhabitants of the towns and tend to lessen the influence of those cities in the affairs of the State. The effect of this is to be seen distinctly in the legislation on school attendance.

In 1865 the Massachusetts "truant law," as it then stood, was copied and enacted by the Connecticut legislature.¹ At the very beginning of the act was a proof of what has just been written in the last paragraph; the cities were entirely omitted from the provisions of the law and the omission had to be remedied the next year.

Massachusetts had another law on the statute books, the "attendance law," which inflicted a fine on the parent of a truant from school, but that law was then a dead letter, while the "truant law" was enforced with some success in a number of places. It was natural, therefore, when the Connecticut legislators determined to enact compulsory school legislation that they should copy the only law in the country which had attained any measure of success.

No result came directly from the law in Connecticut, and in the revision of the code in 1875 it was practically nullified by making its enforcement optional with the towns and cities instead of obligatory.²

The law authorizing policemen and constables to arrest truants loitering in the streets and directing the committal of incorrigible offenders to a city house of reformation or to the State reform school (see text of the law in this chapter) was passed originally in 1869. But the real beginning of the Connecticut compulsory system dates from 1872, when the law was passed throwing upon the parent the responsibility for the failure of his child to be at school; and time has shown that the principle of the "attendance law" is better suited to the conditions of Connecticut than that of the "truant law," and the present laws are chiefly along the lines of the former. As Mr. Giles Potter, the agent of the State board, expressed it: "Formerly our laws seemed to assume that it was demand on the part of employers for the services of children that kept them from school; then the truancy of children; but lastly, we have come to the true plan, of enforcing parental responsibility."³

At the time this sentence was written the provision of the Massachusetts law imposing a fine upon the parent for failing to send his child to school was almost entirely inoperative,⁴ and even now it is comparatively seldom brought into requisition.

In this, then, lies the essential difference between the Massachusetts and the Connecticut systems: In the one the child suffers the penalty for absence from school; in the other, the parent.

It is reasonable to ascribe this difference to the different influences already described as having surrounded the growth of the two systems. In a city, when a child is seen "wandering about the streets and public places," the one apparent fact is that that child is on the way to ruin, and the first impulse is to save him by restraining him. His home influences do not so readily appear as a factor. His parents are indefinite quantities that are in the background of thousands of other men and women, and their relationship to the boy does not appear until it is sought out. But the wayward child stands forth unmistakably. He it is who first attracts

¹ The law as amended in 1866 required that each city and town should make all needful provisions concerning habitual truants and children wandering about the streets, having no lawful business nor attending school, and growing up in ignorance. Suitable by-laws respecting such children were required, the said by-laws to be approved by the superior court.

Minors between 7 and 16 years of age convicted of habitual truancy might be fined not over \$20 for each offense or committed to an institution of instruction, house of reformation, or other suitable situation for a term not exceeding two years. The several cities and towns were directed to appoint three or more persons (truant officers) who were alone authorized to prosecute for violation of the by-laws. Jurisdiction was given to any justice of the peace or police judge of the proper city or town.—(Conn. Rev. Stats., 1866, Title XIII, Chap. IV, secs. 56-59.)

² Conn. Rev. Stat., 1875, p. 127.

³ Report Connecticut Board of Education, 1888, p. 33.

⁴ Fiftieth Annual Report Massachusetts Board of Education, p. 171.

attention, and it is toward him that remedial or preventive measures are most naturally directed.

In less populous communities, on the contrary, the conditions and relationships of families are more generally and fully known. The father is known before the child. Neglect and ill treatment at home excite attention before their legitimate results, and consequently the measures that first suggest themselves are those that bear on the parent. The confinement or punishment of the child is thought of only when the first steps have proved of no avail or are manifestly useless.

Precisely these characteristics mark the Massachusetts and Connecticut systems, respectively.

As a result, we see in the one State that the establishment of truant schools has all along been insisted upon as a prime necessity and their development has reached a more advanced stage than in any other State in the Union. They are intended for a class of offenders in whom there is yet no taint of criminality and undoubtedly receive many children who, under the opposite policy, would remain at home.

In the other State there has never been a regularly organized truant school, the nearest approach to it being the "ungraded schools" of New Haven, which will be presently described.¹ The parent is held to account for his child's misdeeds until he declares that the child is beyond his control. Then only is the offender removed to an institution under State control for his reformation. Even an indifferent and inefficient parent over whom the hand of the law is held will control his child unless the spirit of lawlessness is rife within him, and in that case he is none too good for the reform school. Such is the theory of the Connecticut law.

In the machinery of enforcement the provisions in Connecticut are more effective in the towns than in the cities, while the opposite is true of Massachusetts.

Of the latter State it may be said with truth that until within a few years the attendance laws were of little account outside the cities, and the difficulties are yet greatest in the small towns. "The truant officers in the small towns are nearer to the families that may be concerned in violating the law. It is difficult for them to enforce the law against their neighbors."² The Massachusetts plan has been well called a "local-option system,"³ since no State officer is charged with its enforcement. For its effect it must depend entirely upon local officials, and unless these officials are faithful, earnest, and unmoved by feelings of friendship and self-interest the system must fail.

On the contrary, it is in evidence that the enforcement in the towns in Connecticut is less difficult than in the cities, because in the thickly populated places absentees and truants escape notice easier. The difficulties experienced in Massachusetts towns are not felt in Connecticut, because of the employment of State agents to cooperate with local officers and hold them up to their duties. These agents were first authorized and employed in 1869,⁴ and there are now six in the service of the State. Their work is the most conspicuous feature of the Connecticut compulsory system, as the county truant schools are of that of Massachusetts.

Finally, it is to be noted that the tendencies in both these States are in the direction of obliterating the differences between their system by the adoption by each of the successful features of the other. The appointment of State truancy agents has long been urged in Massachusetts, and more frequently since 1898 are parents arraigned for the absenteeism of their children. The demand for truant schools in Connecticut is not so urgent as that for State truant officers in Massachusetts, but the need is felt and frequently expressed.

It is not necessary to trace the history of the Connecticut attendance laws in this paper, for truant schools find no place in them except to the extent which has already been described.

TRUANT SCHOOLS IN THE STATE OF NEW YORK.

The history of compulsory education in New York is marked by three epochs, beginning, respectively, in 1853, 1874, and 1894. The first epoch was ushered in by the passage of the truant law of 1853, and might be called the period of preparation. There was just enough of enforcement to show what might be done and to prepare the way for better things. The law of 1874 was not brought about by the school men of the State, and the time during which it was in force is characterized largely by indifference or antagonism on the part of the very men upon whose support the law depended for its value. But this also was a period of preparation. In 1894 was the beginning of real compulsory education in New York.

The truant law of April 12, 1853, is said to have been the outcome of efforts of the Juvenile Reform Society of Rochester,¹ and as such it was a direct result of the movement initiated by John Griscom and his associates in the formation of the Society for the Prevention of Pauperism.²

The law itself was modeled on that of Massachusetts, and provided that if any child between the ages of 5 and 16 years be found wandering in the streets of any city or incorporated village, idle and truant, without lawful occupation, any justice of the peace, on the complaint of any citizen, should cause such child to be brought before him for examination. If the complaint be established, the parent or guardian of the child should be required to enter into an engagement to restrain him from wandering about, to keep him in some lawful occupation, and to cause him to attend school at least four months each year. If no parent or guardian be found, or if no engagement be given, or if it be violated if given, the child should be committed to a suitable place to be provided. Every city and incorporated village was required to provide a place for the reception of children so committed, and for their instruction and employment in some useful occupation, and for their proper support and clothing. Such children were to be kept until discharged by the proper officers, or they might be bound out as apprentices. All police officers and constables were enjoined to make complaint of any child found wandering in the condition described.

But little came of this law in the State as a whole, and it appears that Rochester and Brooklyn were the only municipalities that ever took any serious action under it, though there might have been a few isolated cases of prosecution in other localities. There was little sentiment favoring compulsory education and no general demand for it. Even among school men the feeling was that such laws were opposed to the spirit of free institutions, and therefore undesirable in this country.

The matter of a general compulsory law was brought up in the State legislature in 1866 and again in 1871, and each time the measures proposed were antagonized by the then State superintendent of public instruction. On May 11, 1874, however, a compulsory attendance law was finally passed, though the State school officers were still opposed to it and few of the local officials on whom it depended for effect favored it. In the act were combined an "attendance law," an "employment law," and a "truant law," and it was largely copied from the Massachusetts statutes then in force.³

¹ See "Rochester" in Section III of this chapter.

² See p. 87.

³ In substance it was as follows:

All parents having children between 8 and 14 years of age were required to send them to school at least 14 weeks each year, 8 weeks at least of that time to be consecutive. No child under 14 years of age might be employed to labor during school hours unless he had attended school 14 weeks during the preceding year, under a penalty of a fine of \$50, to be inflicted on the employer. The school trustees of every district or their officers were required to examine all manufacturing and other establishments under their jurisdiction at least twice each year, to discover violations of the law.

School-district trustees and presidents of union schools or such officers as may be duly designated by boards of education were authorized to see that the provisions of the act were enforced. Violations were punishable by fines of \$1 for the first offense and \$5 for each subsequent offense, each week of

The reception met by this law was peculiar. The State superintendent, Hon. Neil Gilmore, was opposed to compulsory education in principle, and to this particular act because it was, in his opinion, loosely drawn and obscure in meaning. But as a State official it was his duty to enforce it, and as an honest man it was his intention to do it as fairly and as fully as he could. The circulars he prepared in this frame of mind for distribution among school officers are remarkable documents, and give ample evidence that his heart was not in the undertaking. "Those who were instrumental," he said in one of his circulars, "in procuring the passage of the compulsory education act believe that great good will result from its prompt and strict enforcement. It is, at any rate, a law of our State, and certainly entitled to a fair trial. I urge that each and all of you do what you reasonably may to give it such a trial, and that you report to me any defects which you may discover in the practical workings of the law."¹ The recipients of the circular for the most part believed as did the sender, and the replies that he received to a special inquiry a year afterward were just as he evidently expected. The law was reported almost universally as unenforced and unenforceable.²

Amendments were made in 1876, more circulars were sent out, and more special reports called for. The result was the same as before, though it was conceded that the moral effect of the law had been good.³ Reports for the next few years indicate substantially the same state of affairs. New York and Brooklyn were the only two cities in which serious and aggressive action had been taken, and the school superintendents of both those cities at that time wrote disparagingly and unfavorably of the effects.⁴ In 1880 Superintendent Gilmore was able to say that the compulsory education act was practically a dead letter.⁵

In time a new set of superintendents came on the scene, and the attitude of the new men was decidedly favorable to compulsory attendance. Draper in the State superintendency, Jasper in New York City, Maxwell in Brooklyn, Ellis in Rochester, Crooker in Buffalo, and Cole in Albany, the men holding the most important educational positions in the State, were all earnest believers in the principle and expediency of compulsion, if necessary, to enforce universal education, and it is not surprising that under such leadership the sentiment among the school men of the State gradually assumed the same aspect.

At the meeting of the council of school superintendents in Rochester in November, 1887, a committee was appointed, under the chairmanship of Supt. C. W. Cole, of Albany, to draft a new compulsory education law and urge its passage by the legislature. The law proposed by this committee differed from that of 1874 in its providing very stringently for its own execution by withholding public moneys from districts in which its provisions were not enforced; in providing a State institution to which incorrigible truants might be committed until reformed or discharged by proper authority, and in providing for a longer compulsory period of school attendance each year. A bill containing these provisions was introduced in the assembly in 1888, but it failed to pass.⁶

failure to send his child to school being a separate offense for the parent. If the parent state in writing that the child was beyond his control, it was provided that the parent should be relieved of penalties and the child should be dealt with as an habitual truant.

Local boards of education were directed to make all needful arrangements, rules, and regulations concerning habitual truants and to provide suitable places for the discipline, instruction, and confinement of such children, said provisions to be of no effect until approved by a justice of the supreme court of the proper judicial district. Jurisdiction for the trial of cases under the act was given to justices of the peace, civil justices, and police justices. (Act of May 11, 1874.)

⁶ Albany, N. Y., school report, 1887-88, pp. 23 and 24.

The council of school superintendents met in Utica in November of the same year, resolved to continue their efforts, and reappointed the same committee, with instructions to press to its passage a new bill which had been agreed upon at the meeting. This bill passed both houses of the legislature at the session of 1889, but it was not approved by the governor, one of his principal objections to it being the large appropriation it carried for the establishment of a State truant school.¹

Having come so close to success, the friends of the measure were by no means disposed to accept this failure as final. The agitation was continued, and an influential ally was found in Governor Roswell P. Flower. His messages to the legislature in 1893 and 1894 contained strong recommendations for compulsory education, and on May 12 of the latter year the bill providing for it became a law.²

As was to be expected, defects in the law soon developed, and in 1896 amendments were made requiring an affidavit to the notice of the parent that he is unable to compel his child to attend school; requiring common school districts containing incorporated villages and every township to appoint truant officers; authorizing any school district to establish a truant school; authorizing the parole of inmates of truant schools; permitting the State superintendent to employ assistants in his discretion to carry out the law and to fix their salaries, the whole amount appropriated for the purpose being \$12,000.³

Four inspectors are now employed under the compulsory education statutes. A large majority of the cities and larger villages enforce the law satisfactorily, and the attention of the State officers is given almost entirely to the rural districts.⁴ It is their practice to visit each district, compare the list of children shown by the census with those on the school records, demand explanations relating to absences, and then commend or admonish the teachers and members of the board of education as the circumstances seem to require.⁵ Circulars of instruction are issued, reports are required, and meetings of attendance officers are held from time to time to familiarize all concerned with the requirements and operations of the law. All of these measures have had good effects.

As to the general results of the law in the State as a whole, it may be said that in a year while the number of children of school age (5 to 18 years) increased by 17,091, the number attending school during some portion of the year increased by 27,125, and the average daily attendance by 48,200. The last item is considered the most significant and encouraging feature of the work.⁶

¹ Albany school report, 1888-89, p. 42.

² By this law children between 8 and 12 years are required to attend school during the entire school session between October 1 and June 1; those between 12 and 14 must attend at least 80 days, and during the remainder of the school term if not employed; those between 14 and 16 must attend when not employed. Private instruction equivalent to that of the public schools may be accepted in lieu of attendance upon the latter.

Persons in parental relation to a child between 8 and 16 years must cause such child to attend school or give notice to the school authorities of his inability to do so. Violation of this requirement is punishable by a fine of not over \$5 for the first offense and not over \$50 for each subsequent offense, or by imprisonment not exceeding 30 days, or both.

Employment is forbidden of children between 8 and 12 years old during the school term and of children between 12 and 14 years unless they have a proper certificate of 80 days' school attendance. A penalty of \$50 fine is attached for violation of this section. Accurate records of school attendance are required of teachers. Provision is made for the employment of truant officers by cities or union school districts, the arrest of truants, and the maintenance of truant schools in cities or union school districts.

The State superintendent of public instruction is authorized to employ an assistant, at a salary of \$2,500 a year, to investigate and report upon the extent to which this act is complied with throughout the State. The State superintendent is authorized to withhold one-half of all public-school moneys from cities or districts which omit or refuse to enforce the provisions of this act. (Laws of 1894, chap. 671.)

⁶ *Ib.*, 1896-97, p. 922.

In New York, even more than in Massachusetts, there is a general demand from school men for the establishment of truant schools under State control. In Massachusetts the county truant schools are as much for the rural districts as for the cities, while in New York there is as yet no adequate provision for delinquents in the smaller districts. It is obviously impossible for a small country town to support a truant school of its own. Rural districts may, it is true, make contracts with schools of other places to receive their truants, but that involves inconveniences, formalities, and bargaining that would in any event frequently prevent action. Even if this were not true, there is a dearth of proper schools with which to contract.

Of the public truant schools, that at Rochester is the only one whose accommodations are sufficient to receive children from outside sources; some of the others are inadequate for even local needs. This condition has brought about what is now a marked feature of the New York system, namely, the utilization of institutions under private control in the commitment of truants and the milder offenders. These institutions are in most cases not well adapted to the care of truant children.¹

State truant schools seem to offer the only available solution of the difficulty. Their establishment is considered the most urgent necessity in connection with the proper execution of the compulsory law.² State Superintendent Skinner desires that they "should be established and conducted along lines that should entirely eliminate any tendency to stamp those in attendance as belonging to the criminal classes. They should be, in fact, schools and temporary homes, not prisons or reformatories. They should provide, as far as possible, the training found in good homes, and the pleasures, pursuits, and interest of home life. To this end it were better that such home schools should be located in the country, where their pupils would be less exposed to excitement and temptation than in large communities, and where pure water, pure air, and opportunity for healthful exercise tend to promote a vigorous physical development."²

Another particular in which the New York law has been found to be defective in practice is the provision that commitments to truant schools may be for not longer than the remainder of the school year. This is obviously too short a time for the reformation of a great proportion of the children sentenced; and the undue shortening of the possible term toward the end of the school year makes the formalities of legal action and trial appear absurd when the sentence can be for only a few days. It would seem, therefore, that the effect of this provision would be to practically let down the bars and license truancy for an important part of the school year. Many suggestions have been offered as to the proper change to be made. The realization of the principle of the indeterminate sentence would require that all commitments be for the full period of compulsory school attendance, and that the truant-school authorities exercise a wise discretion in the matter of paroles. This idea is the one which finds the most favor with those most interested in the execution of the law, the shape in which the proposition is definitely made being that the truants under 14 be committed up to that age, and those over 14 be committed until they reach the age of 16 years.³

DETAILED STATEMENTS RELATING TO INDIVIDUAL CITIES OR SCHOOLS.

[NOTE.—The arrangement is alphabetical according to States, following the order of the preceding table. Sketches of certain defunct institutions not represented in the table appear in their proper alphabetical position.]

SAN FRANCISCO, CAL.

The following is one of the sections of an "Act to provide for the support of the common schools of the city and county of San Francisco, and to define the powers and duties of the board of education thereof," approved April 1, 1872:

SEC. 9. The board of education of the city and county of San Francisco are hereby authorized to establish in some central locality of said city a school, to which shall

be admitted only those pupils who shall have been found, upon satisfactory examination and trial, too depraved to be permitted to associate longer with the pupils of other schools; but such pupil or pupils may be restored to any school under charge of said board upon satisfactory evidence of thorough reformation of conduct.¹

This law is still in force, and the present superintendent of city schools, Hon. R.H. Webster, has recently urged the establishment of a truant school under it.² In the past the subject has several times been broached, and at one time such a school was actually maintained, but it did not live long.

The San Francisco system of school organization is peculiar in one respect, namely, that the superintendent is elected by the people every two years. Frequent changes have resulted, and the list of men who have filled the office is a long one. Changes of policy have been as numerous as changes of persons. No two men have the same set of ideas; what one superintendent considers of prime importance is not apt to be so considered by his successor, and continuity of purpose for a series of years in the conduct of the office is not to be expected.

This is particularly applicable to truant schools. Before Mr. Webster, one only of the superintendents has given the matter any considerable attention, and his ideas have not been followed up after he left the office. That gentleman, Mr. James Denman, was several times elected superintendent, but his length of service was short in every case. During each incumbency he advocated with earnestness the provision of special means for dealing with unruly and truant children, but was never in office long enough to accomplish what he desired in this respect.

During his first term, in 1860, he suggested a floating "reform school" to supplement the city industrial school already in operation.³ In 1868, being once more superintendent, Mr. Denman urged that the board of supervisors authorize the appointment of "proper officers to put a stop to truancy and vagrancy, which are corrupting and demoralizing the youth of our city."⁴ His recommendation was put into effect, and an extra police officer was appointed "to look after the truant children from the public schools, and to visit the homes of all such as are leading vagrant and dissolute lives, in order to induce their parents to assist in reforming and educating them."⁵ There was no truancy or compulsory attendance law, but seven incorrigible truants were sent to the industrial school for reformation during the first year of the truant officer's service. The knowledge that an officer was constantly searching the city for absentees from school exercised a salutary influence in deterring truancy.⁵ Later experience has been to the same effect, and truant officers have been constantly employed since.⁶

The measurably successful work of the truant officers spurred Mr. Denman to further efforts in the same line. In 1871 he made a special report to the board of education, in which he recommended, "with no ordinary feeling of earnestness," the establishment of a school for the reformation of refractory boys. The plan which he considered most practicable was to have one or two central classes in different parts of the city, at which all the most unmanageable pupils be compelled to attend until

¹ Acts relating to the government of the city and county of San Francisco, Cal., 1887, p. 175.

² Annual report of public schools of the city and county of San Francisco, Cal., 1897-98, p. 10.

⁵ Sixteenth annual report superintendent, 1868-69, p. 29.

⁶ The San Francisco truant officers have never been clothed with the legal authority necessary to make their work of the highest usefulness. According to the report of Superintendent Webster for 1897-98, the officer now employed "adapts his work to the circumstances of the case." Generally he investigates the character of the boy of whom complaint is made, then visits his parents and endeavors to secure their cooperation and assistance. He next admonishes the boy and takes him back to school. In case of repetition of the offense he sometimes locks up the offender for a few hours. This is enough in most cases, but it is not always sufficient by any means. Some boys after being taken to school two or three times and finding no further punishment inflicted, lose all fear of the policeman's badge of authority; for them the only remaining resource is expulsion from school.

reformed and willing to submit to the authority of the school without recourse to the rod.¹

The insertion in the law of April 1, 1872, of the paragraph quoted at the beginning of this sketch was plainly due to the influence of Mr. Denman, since the wording of the statute is similar to that employed in his special report.

Within a month from the passage of the law a school of two classes was opened in the basement of a church on Washington street. Fifty-four pupils were transferred to it by the 1st of May, 1872, and 232 during the next year. But the school was a failure and was abolished. Superintendent Denman's term of office had come to an end in the meantime and the management of the school was in other hands throughout. He returned to the superintendency for the third time, however, in 1873, and tried to rehabilitate the school. He claimed that the failure was due to imperfect organization and supervision, and held that if properly reorganized under able teachers the institution would prove a great blessing to the city.²

He was not successful, and the futile experiment of 1872 and 1873 remains the nearest approach to a truant school that San Francisco has had.

NEW HAVEN, CONN.

The reports of Supt. Ariel Parish from 1866 contain references to the prevalence and effects of truancy and absenteeism, and he repeatedly urged that provision be made for truant officers and special schools for truants. No result came of his recommendations, however, until 1871.

The school report for 1869-70 showed the number of truants during that year to have been 350, or one in 20 of the entire membership of the schools. The whole number of cases of truancy was 580.³ The magnitude of the evil seemed to demand immediate attention, and the board of education directed the superintendent and secretary to investigate the subject and suggest a remedy.⁴ These gentlemen in reply made a well-considered report suggesting: (1) A school to which scholars exceptional in conduct or attendance can be sent and qualified as speedily as possible to return to the regular schools. (2) The efficient cooperation of trustworthy police officers, under direction of the police commissioners, to whom the names of children guilty of misdemeanors of which the law takes cognizance can be sent. (3) A place for the detention of ungovernable boys, habitual truants, and confirmed vagrants, to be provided by the town.⁵

The board was determined to take effective action to break up truancy, but the inevitable "committee stage" had to be passed first. A committee was appointed to confer with the town authorities, and another was sent to visit the truant schools at Springfield and Worcester, Mass.

The latter committee, after their visit, reported favorably upon the idea of truant schools, but declared that no truant school whatever would be preferable to one established as a part and parcel of a poorhouse as were the two they had inspected. They stated also that "one or more sensibly managed ungraded schools to which children who are irregular from necessity or from occasional truancy, or who are quite young and yet unmanageable can be sent, is a first necessity," and that "the cooperation of the police, as alone having authority to make arrests, is necessary."⁶

The three committees having done their full duty only one more was necessary. The fourth committee outlined definitely a plan of campaign and presented

⁶ *Ib.*, p. 14.

the following resolutions giving it effect, which were unanimously adopted by the board:

Resolved, That the committee appointed to confer with the town authorities be requested to call the attention of the police commissioners and the police magistrate to the necessity of an immediate enforcement of the truant laws.

Resolved, That the committee on schools be directed to establish one or more ungraded schools.

Resolved, That the children who can not be well instructed in the graded schools in consequence of irregular attendance, whether resulting from necessity or otherwise, may be sent to such ungraded school or schools.

Resolved, That children whose conduct is habitually subversive of good order may, after proper admonition, be sent to such school.

Resolved, That in cases of truancy, vagrancy, and other offenses, which by law are misdemeanors, the offender shall be placed on the following course of discipline, subject to such modification as the committee on schools may from time to time direct, viz: For the first offense, in addition to the ordinary school discipline, the name of the offender shall be given to such officer of the board as may be appointed for the purpose, whose duty it shall be to see the parents or guardians of the offender, make himself acquainted with the circumstances of the case, and notify them of the consequences of such conduct if persisted in.

For a repeated offense the name of the truant shall be given to the police officers, who may be appointed by the police commissioners to enforce the law provided for such cases.

Whenever a pupil shall prove to be incorrigible under the ordinary discipline of the schools, the police magistrate shall be notified of the same.¹

These measures were conscientiously carried out to the immediate improvement of the attendance and benefit of the schools.

An ungraded day school was opened September 1, 1871, under a competent teacher, and the general enforcement of the new rules was given to the secretary of the board, who was a man especially competent for the work.² Seventy-five boys were sent to the truant school during the first year, the greater part of them being mischievous and neglected and woefully deficient in their studies rather than vicious. A few cases of persistent truancy and vagrancy were taken to the police court, but in all these cases, with a single exception, the complaints were made by parents themselves.³ The police authorities cooperated cordially, one officer being specially detailed for truant service and the others being instructed to warn vagrant children from the streets during school hours and to return them to their homes or to the schools from which they were truants.⁴ Substantially the same plans and methods laid down in 1871 have been continuously followed since, excepting that the superintendent and not the secretary is now charged with the supervision of the details. The location of the original ungraded school has been changed and others have been established, some of them differing from the first in character. But the essential features of the New Haven plan have remained the same.

There are now five of the ungraded schools in all, one for truants and incorrigibles (boys only), three for young children who can not speak English, or who are irregular in attendance, and one for all these classes. To four of these five schools children are sent who for various reasons are unable to do the work of their grade. One is strictly a school for incorrigibles, and children who are simply backward in their studies are not sent to it.⁵

No truant is transferred to an ungraded class for his first offense unless it is very serious; the parents are first notified and the offending pupil is put on probation.

The length of the sentence is varied, but is usually for a period of two or four

weeks. The truant officer visits the truant schools, and if a pupil of one of them fails to attend regularly his parents are brought into court and he is sentenced to the State school at Meriden.¹

Following are the statistics from the last report of the truant officer:

Calls on families having children attending schools with reference to their nonattendance	1,947
Children, boys and girls, found on the streets of the city and at their homes not attending school.....	585
Boys and girls transferred to ungraded schools for truancy and other misconduct.....	250
Promoted from the same for good attendance and conduct.....	95
Withdrawn from ungraded schools to go to work	44
Sent to high school.....	4
Boys presented before the honorable city court sitting in chambers, for reproof and correction for persistent truancy and disobedience to parents.....	40
Boys committed to the State School for Boys, at Meriden, by the honorable city court, parents present and consenting, for inveterate truancy, vagrancy, and disobedience to parents.....	17

CHICAGO, ILL.

[Statement of Theodore J. Bluthardt, M. D., superintendent of compulsory education, April 24, 1899.]

The board of education of the city of Chicago has a thoroughly organized department of compulsory education since 1899 consisting of one superintendent, salary, \$2,500; 1 clerk, salary, \$1,100; 16 truant agents, for ten months in the year, at a salary of \$75 per month, \$12,000; total, \$15,600.

We have only one ungraded class room for truants in one of the schools as an experiment. It works well and gives general satisfaction.

The new law² will give us power to establish one or more parental or truant schools for both boys and girls.

I believe in a year or two we will have a very good system to control and prevent truancy in this city.

[From the Chicago Inter-Ocean, October 27, 1899.]

As the result of a second conference yesterday between W. Lester Bodine, superintendent of compulsory education, and Judge Tuthill, of the juvenile court, the John Worthy School at the bridewell is to do duty temporarily as a parental school for truants.

Although a law on the subject of parental schools has been secured, there is such a shortage of money in the treasury of the board of education that it is not likely a parental school can be provided in less than a year. What to do with habitual truants in the meanwhile has greatly exercised Superintendent Bodine and the members of the board. But it is now believed that the problem has been satisfactorily solved by Judge Tuthill.

Under the juvenile court law the judge has the power to appoint a probation agent for every delinquent child, and there is no limit on the number he may appoint. A probation agent has parental authority over the child, and has the court at his back to inflict penalties when the probation agent recommends it. But the law is so drawn that the only penalty that can be inflicted is a sentence to the John Worthy School.

Judge Tuthill, who is greatly pleased at the operation of the law in this respect, offered yesterday to appoint Superintendent Bodine's truant agents probation agents as fast as may be necessary for all the incorrigible truants with whom they have to deal, and his offer was at once accepted. The result will be that if a truant does not obey his probation agent he will be arraigned in the juvenile court and sentenced to the John Worthy School.

This course has been resorted to on account of the discovery of the close connection in this city between truancy and crime. It is found that when boys refuse to attend school they generally run away from home, herd under the sidewalks, read dime novels, and eventually become pickpockets and burglars. So that to send them to school is as necessary for the purpose of saving them from crime as from ignorance.

¹ Letter of Hon. C. N. Kendall, superintendent city schools, New Haven, May 16, 1899.

² See page 194.

The police have long known that the most desperate criminals in the city were the juvenile criminals, but they have now waked up to the fact that truancy is the cause of juvenile crime.

There are those already who express surprise and disapprobation at Judge Tuthill's scheme. If the John Worthy School can be used to punish truancy, they say, it ought to have been used for that purpose long ago, and there is no need for a parental school. But they say it will be impossible, as well as highly improper, to use it for that purpose. Only boys who commit crimes and misdemeanors can be sent to the bridewell, and they have always been sent there. As to boys whose only offense is truancy, it would be an outrage and an evil to disgrace them by a bridewell sentence, and they would all be released on a writ of habeas corpus.

REPORT OF THE PRINCIPAL OF THE JOHN WORTHY MANUAL TRAINING SCHOOL.

[From the Forty-fourth Annual Report of the Board of Education of Chicago, 1897-98, pp. 69 et seq.]

A. G. LANE, Esq., *Superintendent of Schools.*

DEAR SIR: Replying to your request, I would state that we had 913 different boys at the John Worthy School from July 1, 1897, to July 1, 1898.

The average number belonging during the year was 97, but the average for the month of July, 1897, was only 55, while the average for July, 1898, was 121, showing that the school has increased over 100 per cent during the past year.

The average length of time of each pupil is now thirty days.

Regarding your question as to range of work done, etc., I would say that the method of treatment seeks to fit these boys for free life again by physical, mental, moral, and industrial training.

The school includes instruction classes in the 8 grades of the elementary public schools, but the educational life in the John Worthy School presents a striking contrast to that of ordinary schools. The attendance at school exercises is emphatically compulsory. Every boy committed to the school is on his arrival straightway examined and assigned to school work suited to his present capacity. He has no choice about this. He must belong to the school and do some educational task from the time he enters till he leaves. When it is considered that out of every 100 arrivals about 80 have good natural capacity, and none have education above the merely ordinary, it will be seen that with these boys the voluntary system has been a failure. In this school what a boy can do he must do, and what he must do he does do.

The boys of the John Worthy School are not only assigned to their school work by the best of careful individual examinations, but from time to time they are reclassified. As the instruction seeks to reach the lowest needs of the weakest mind in the group, there is no need of giving to any boy any help that is not given to all alike. Indeed, the most valuable lesson the boy can learn in any study is that he can and should advance abreast with others like himself, who labor under the same conditions and are beset by the same difficulties.

As the average period of detention is about thirty days, time is lacking to pursue the regular course of study as prescribed by the board of education. The course of those boys who remain with us for six months does not require everything given, even in the so-called practical arithmetics and language lessons. Such omissions are made not only on account of lack of time, but for the reason that the knowledge that would be gained by the study would be of comparatively little value to the boys, and the peculiar discipline afforded by a study is obtained in the thorough mastery of a part of that study.

In addition to the regular classes, each pupil is obliged to devote five hours per week to free-hand and mechanical drawing, which are both essential to a mechanic. To be unable to make a free-hand sketch of a piece of machinery, and to make a correct working drawing from that sketch, or to be unable to interpret a working drawing which has been given him from which to make an object, places a mechanic at a great disadvantage—in fact, he lacks one of the qualities which go to make up a skilled workman. There is also an educational value attached to the study of drawing apart from its utilitarian advantages. It assists to complete and clear conception; it cultivates a habit of careful and accurate observation. Recognizing this value, drawing, both free-hand and mechanical, is taught in all the grades. As far as practicable, the boys are required to draw from objects, not models, and in the mechanical, working drawings of parts of machinery and tools are required, as soon as pupils can use instruments properly.

All the boys of the institution receive manual training in woodwork, including bench work and wood turning. The shop is equipped with 40 single benches, 25 wood-turning lathes, a hand-planing and grooving machine, a circular saw, an emery grinder, a surface planer, a pattern-maker's lathe, and 2 grindstones, which

give accommodation for about 65 boys in each period. Should the school continue to grow as rapidly as it has during the past year it will be necessary to equip one or more additional shops, in order to accommodate the boys, and I should advise that steps be taken in the near future to install a forge and sheet-metal room.

Elementary shopwork reaches all the pupils; the advanced course is taken by scarcely one-eighth. Promotion to the advanced course rests upon ability and attainment; boys who receive it give some promise of becoming good mechanics. It is not attempted to carry all the boys through the elementary course; each one gets as many lessons as the time of his imprisonment will permit. The more capable can complete the elementary course in about thirty lessons of two hours each. The poorer fail at the seventeenth lesson. The dovetail joint is the quietus of many a boy. He has by this time tried to gain the mastery of some twenty tools. Although he may never make a skilled mechanic, he has gained much in hand skill and learned invaluable lessons of a moral nature.

The advanced course consists in more difficult carpentry and in wood turning.

The skill and love of tools called forth in our manual-training classes is turned to practical account in a multitude of ways. The boys have made 85 wand racks and 400 sets of arithmetical ratio blocks, 52 to a set, for use in the public schools of the city.

The boiler room of the institution is also used as a means of instruction, and here a few of the stronger boys have been taught all that is necessary to know about the care and firing of steam boilers, the care of pumps, economy of fuel, etc.; an accurate account is kept of the amount of coal consumed in each boiler, the steam pressure maintained, etc. In this way the boys are taught to fire economically.

As I have already stated, the average term of these boys is thirty days. This does not give them an opportunity to learn much, either in the academic or manual-training departments. No sooner has he learned the routine of the place and gained some rudiments of the work to which he is apprenticed than his time is out or he is released by having his fine paid or by the pardon of the mayor. I should like to see larger fines imposed on the boys so that they should be obliged to remain at the school long enough to accomplish some good to themselves, or, better still, have an indeterminate-sentence law covering their cases, whereby they would be released from the school at the option of the authorities when they have proved themselves worthy of being trusted.

There should be a juvenile court with a special and most painstaking judge, and legislative enactments should also be had giving such a judge power to send boys to the John Worthy School on an indeterminate sentence.

Very respectfully,

ROBERT M. SMITH, *Principal*.

PARENTAL SCHOOL, BOSTON, MASS.

Though the idea of treating truancy by confining the truant originated in Boston, certainly so far as this country is concerned, and though the most approved and most effective practices in securing universal school attendance are due to the suggestion or initiative of that city, a separate and independent institution for truants did not exist there until 1895. The Parental School of Boston was the last of the Massachusetts truant schools to be established.

The part played in the early history of the subject by the House of Reformation and Employment of Juvenile Offenders has already been detailed. This institution has never been controlled by the school authorities, though it might properly be called a part of the educational system of the city. At one time it was determined to make it distinctly an adjunct of the schools; the board of directors, by a vote passed in 1861, decided to exclude all but truants—to make it a truant school solely.¹ This determination was not adhered to, but the truant school appears to have been maintained as a separate department thereafter. At that time (1861) there were 136 boys in the institution, and during the year 66 had been sentenced for truancy. The employments of the boys out of school were farming, domestic work, and knitting. The school time was three or four hours a day, the rest of the time being given to work or recreation.²

¹ Boston School Report, 1861, p. 266.

² *Ib.*, p. 267.

It has been repeatedly stated in late years that the reform schools of forty years ago were boys' prisons, pure and simple, into which the idea of reformation entered but little, if at all. Such statements are but partly true. Much, of course, depends upon the individuality of the superintendent in any institution at any period. The kind of discipline practiced and the measure of success reached in different places varied then just as it varies now, but the aims of reformatory managers of to-day are not higher or nobler than those that animated Supts. Nathaniel C. Hart, of the New York House of Refuge, E. M. P. Wells, of the Boston House of Reformation, and their contemporaries. So far as the declarations of the managers have shown, there has been no diminution at any time in the intent to bring about the reformation of those of their charges who required reformation and the protection of those who needed protection from contamination. According to Superintendent Philbrick, of the Boston public schools, the aim of the managers of the House of Reformation (in 1861) was to render that institution "so much of a penitentiary that a sentence to it would be considered a punishment, and yet to surround the inmates with such influences as would tend to enlighten their minds, to develop their moral natures, to cultivate in them habits of industry, a love of order, a manly self-respect, and a determination to lead the life of a useful and intelligent citizen."¹ The aims of the best reform school or truant school of to-day would not be stated in terms materially different. As to the success in reaching these aims the reports were favorable in the main—as much so as later accounts.

Ten years later, in September, 1871, Superintendent Philbrick wrote:²

The institution to which convicted truants and absentees are sent is the House for the Employment and Reformation of Juvenile Offenders, on Deer Island. This reformatory is under the direction and control of the board of directors for public institutions of the city of Boston, the board which has the charge of all the penal and charitable institutions maintained by the city. The whole number of inmates, May 1, 1871, was 307—38 girls and 269 boys—of whom something less than half were committed for truancy and absenteeism. The number committed during the last year for these causes was 79, while the number committed for other offenses, chiefly that of vagrancy, was 135. The girls constitute a separate school in a separate building; the boys for the purpose of instruction are classified in four schools.

In my visits to this institution I have been well pleased with its management. The boys and girls are well taught by efficient and faithful teachers in all the branches of an elementary education. So far as their progress in book learning is concerned they are quite as well off here as they would be in the public schools, even if their attendance were regular. Boys in the higher classes, of more mature age, are employed for six months of the year on the farm and other outdoor work, and for the other six months they are in attendance at school, while the younger boys are retained in the school throughout the year. * * * For my part I believe this alternation of labor and study is no less beneficial intellectually and morally than as a sanitary provision. Indeed, I regard it as one of the best reformatory instrumentalities of the institution. In addition to their regular school instruction the girls of the institution are taught the different branches of housework. * * *

Of the reformatory success of the system pursued, the superintendent makes this important statement: "In regard to the children, we have one fact to record which is very encouraging. It is seldom that any of them ever return to this island." This we attribute not only to the moral and religious influences exerted over them, but to the common school training they receive.

If there was then any serious objection to the truant department of the House of Reformation as a place for truants no hint is given of it in records available here. It is certain that the educational authorities were satisfied with the institution, for the school reports up to less than twenty years ago contained no adverse criticism and much of praise concerning it. In view of recent statements and criticisms, it is fair to presume that "Deer Island" had not then so opprobrious a sound to the popular ear as it had later; that the smaller number of persons in the institutions on that

¹ Boston School Report, 1861, p. 268.

² *Ib.*, 1871, p. 235.

island made it practicable to more nearly maintain entire separation of the inmates of the several classes; and that the boys whom it was thought desirable to send to a truant school then did not include a certain class of "beginners" now committed, so that whatever there was of contact with "hard cases," if any, was not so apparently objectionable. It is inconceivable that such palpably inappropriate surroundings as those described more recently should have existed in 1871 and escaped the vigilance of such an alert and enlightened officer as John D. Philbrick.

The first note of serious complaint on the part of the school authorities was uttered in 1880 by the Committee of the School Board on Truant Officers. The delay in the trial of truancy cases often made it necessary to detain truants in the city prison for two nights and parts of three days. The prison van, the only means provided by the city for the transportation of persons sentenced, carried hardened criminals at the same time as truant children, and the latter were obliged to listen to the debasing conversation of the former. These particular evils grew up, it appears, after the abolition of the juvenile court in 1877.¹ The committee sought to mitigate them by arranging to have truancy cases tried more expeditiously, providing a special carriage for children, and by securing accommodations for them when detained other than the cells used for criminals.²

Palliative measures did not remove the difficulties, and in 1883 the same committee determined to urge a radical change. In their report to the school committee at the meeting of November 27, 1883, occurs the following:

The committee, with several members of the board, visited the truant school and other institutions at Deer Island, and were convinced of the necessity and wisdom of providing some other place for the retention of truants and absentees. At present the children committed to Deer Island are compelled, more or less, to see, hear, and mingle with criminals. Their transportation and commitment are attended by objectionable associations. It is, in the judgment of your committee, unwise and unjust, and of lasting injury to the children, to have their offenses classified or connected in any way with the crimes of those who are committed to these institutions. The stigma of having been to Deer Island, associated as it must be with the idea of crime, should be entirely and forever removed from the thoughtless truant, the unaccountable absentee, and the helpless, neglected child. Your committee are so thoroughly satisfied of the imperative demand for a change in this regard that they have appended an order asking the city council to provide accommodations in some other locality than Deer Island, and where, it is hoped, the baneful influence of vice and crime may be removed, as far as is possible, from the children committed to the truant school. The committee also recommend that an industrial school, properly fitted, be added to the new truant school, so as to enable the children to receive, in addition to their mental training, some practical knowledge, which will prove of lasting service to them, and prepare them to better pursue some useful and honest occupation after leaving the institution.³

The order mentioned was passed by the school committee, but the city council failed to comply with the request, or with three others during the next year to similar effect, but more vigorously worded.⁴ The truant committee and the superintendent, Mr. Edwin P. Seaver, who had become interested in the subject, did not allow the matter to rest, however. Superintendent Seaver's report for 1885 urged

¹In 1872 the governor was authorized to commission justices for the special purposes of trying juvenile offenders. Chapter 258, Massachusetts acts and resolves of 1874, provided that the trial justices of juvenile offenders in Suffolk County (which includes Boston) should have exclusive jurisdiction of all offenses committed by minors under 17 years of age, and that one of the justices should be in attendance every week day at 10 o'clock for the trial of such offenders. Chapter 210, acts of 1877, abolished this court and gave jurisdiction in such cases once more to "the several district, police, and municipal courts." It was provided that juvenile offenders should be tried separate and apart from the trial of other criminal cases at suitable times designated.

²Boston School Report, 1880, p. 260.

⁴Ib., 1884, pp. 49, 128, and 217.

that the school be located on the mainland, and that it be placed under the management of the school committee.¹

In January, 1886, it was resolved to appeal to the legislature,² and that body, in response, passed an act requiring the city council, on the demand of the school committee, to provide a "parental school," on the mainland at some place removed from institutions for criminals. The school was to be under the general charge of the directors of public institutions, but the school department was to be subject to the visitation and inspection of the school committee; the teachers were required to hold certificates of qualification from the school committee, and the studies and examinations were to be under the joint control of the school committee and the board of directors of public institutions.³

The school committee lost no time in making the demand specified in the law, the order to that effect passing at the very next meeting of the committee after the passage of the bill. But the city council was not so prompt in doing its part. It was the duty of that body to provide the funds—which made its share of the work a much more complex matter than the mere passage of an order.

The council urged one reason after another for delay. Objection was found to the provisions of the law for joint management of the proposed school on the ground that misunderstandings, bickerings, and mismanagement would be apt to follow. It was said that as a class the convicted truants were in reality no better morally than the inmates of the reform school, that many of the former were actually more criminal in their natures than other boys who had been convicted of crime, and that, therefore, division of effort and greater expense to secure further classification were unnecessary. It was attempted to induce the legislature first to strike out the requirement of location on the mainland, and then to permit the truant school and the House of Reformation to be continued together, but located on the mainland. In December, 1890, an ordinance was passed nominally separating the truant school on Deer Island from the House of Reformation by formally assigning the truant school instead of the House of Reformation as the place of confinement of convicted truants. All the arguments, propositions, and ordinances of the council tending to prevent the complete fulfillment of the law were antagonized and defeated by the school officials, but the council gained valuable time, nevertheless.

In 1891 the school committee, through its committee on schoolhouses and the superintendent, made an extensive investigation of reformatories and truant schools, and formulated a complete plan for the proposed parental school. For carrying out this plan they asked the council for an appropriation of \$125,000 for a school for boys and \$25,000 for a school for girls.⁴ A strongly favorable report on the request was made by a committee of the board of aldermen, in which it was asserted that "any further delay in the matter is not only inexcusable but discreditable to the city."⁵ But the council would not give in without one more struggle, and they again proposed to maintain a reform school and a parental school in conjunction on the mainland. The school committee promptly objected that such action would be in direct opposition to the law,⁶ and the appropriation of \$150,000 was forthwith voted—after a delay of just six years.

The parental school for girls for which \$25,000 were appropriated has never been established, and such a school is still considered by the superintendent to be one of the educational desiderata of the city. A few girls have been sent to the boys'

⁶ Minutes Boston school committee, 1892, p. 106.

parental school, but there were no proper accommodations for them, and now, by the law of 1898, the State Industrial School receives all girls convicted of truancy.

Equipment.—A site was purchased for the boys' truant school, or, as it is now known, the Parental School, in July, 1892. It consisted of $27\frac{3}{4}$ acres in West Roxbury, fronting on Charles River. A wooden dwelling, barns, and outbuildings were on the place when it was purchased, and the erection of other buildings was begun at once. The institution was finally ready for occupancy in August, 1895, and the first boy was committed September 11, 1895.

The buildings of the school and their condition are thus described in the Annual Report of the Children's Institutions Department for 1897:¹

1. The school building, 94 feet 4 inches by 34 feet 8 inches. This building was constructed for use as a graded school building containing four schoolrooms, but the overcrowding of the school has necessitated the taking of the two upper schoolrooms for dormitories, thus crowding the school work into two small, poorly ventilated cottage sitting rooms.

The boys sleeping in the large school building are obliged to go for their meals to the kitchen building described below.

2. The laundry, kitchen, and boiler house, 53 feet 8 inches by 62 feet 6 inches. This building is used as a bakehouse, laundry, kitchen, and boiler room.

3. Ice house, 41 feet 6 inches by 32 feet.

4. Two cottages known as No. 1 and No. 2. These are alike in construction and are 114 feet by 27 feet. Each building provides for a family of 40 boys. The upper part of the building has 40 separate sleeping rooms. The first floor has a kitchen, pantry, dining room, two sitting rooms—one for the boys and one for the officers. The basements are used for play rooms, bathrooms, closets, etc.

5. Farmhouse, 36 feet by 20 feet. The lower floor is used as a manual training school, the upper used for rooms, the basement for storerooms.

6. Hospital, 117 feet by 30 feet. (Now used as a dormitory.)

7. Superintendent's house, 32 feet by 32 feet, with an L 41 feet by 15 feet.

From this it will be seen that this institution is fitted, as far as cottage accommodation goes, to properly accommodate and instruct some 80 boys, residing 40 in each of two cottage dormitories and attending school in a central school building, where they could be properly graded and physically cared for in well ventilated and lighted and furnished schoolrooms. It has, however, been impossible to carry out the original plans, because of the excessive pressure of numbers. Therefore we found in June last the two upper schoolrooms in the central school building in use as dormitories, with boys sleeping, in some instances, three together in two beds pushed side by side. To supply the place of the two schoolrooms used as dormitories, schools have been improvised in the utterly unsuitable little hall sitting rooms of the cottages, where ordinary chairs and large tables serve in place of suitable seats and desks. The boys sleeping in the central building have to go to the kitchen building to take their meals, an arrangement which makes it impossible to use a carefully built brick oven opening into the room now used as a dining room, thus crippling the bakery.

The number in June at the close of the school year was already 182; during the summer, with releases and no new admissions, the number fell to 168; but with the reopening of the school numbers rose rapidly, till now the situation is very serious. The sleeping in bed together has been put a stop to, but the hospital has been invaded and beds placed in the space over the manual training school, in an old outbuilding, an entirely unsuitable place. The matter is aggravated by the fact that we have in charge three truant girls, who must all the time be kept carefully apart from the boys, and who can not be properly dealt with under present conditions.

Perhaps the most deplorable crowding is in the schoolrooms, where too many pupils are necessarily gathered.

A similar condition of overcrowding existed in 1898. According to the superintendent of the school,² this was the situation:

An institution equipped to house, feed, and properly care for less than 100 boys has an attendance of 175, with a certain prospect that the number will increase to more than 200 before the summer vacation (of 1899.) Owing to this crowded condition, there is not one proper schoolroom on the premises. To make room for the classes the cottages have been invaded, and a room which should bear the charm of

¹Boston city document No. 6, 1898, p. 8.

²City document No. 6, 1899, p. 40.

a sitting room and study is taken for a schoolroom, and thus robbed of its charm as an assembly room for the family. The classes in clay modeling are conducted in a basement, which is the only play room of 95 boys. Two of the schoolrooms are equipped with double desks, and two have no desks at all—tables being used instead. There is not on the premises an assembly room in which all the boys can be assembled. Any one conversant with the handling of boys in numbers will appreciate this deficiency. About 30 boys, though in good health, are obliged to sleep in a building provided for the sick, viz, the hospital. In case of epidemic this arrangement would be impossible. For about 100 boys there is no assembly room whatever, aside from a basement or the schoolroom. About 100 boys are obliged to take their meals in the room designed for a bakery, or in the kitchen over the boiler room, and to sleep in overcrowded dormitories in the school building. These boys, of course, do not have the advantages of family life which are found in the cottages, where good manners and habits of neatness are more likely to be acquired. * * * The institution manifestly needs at once three cottages for boys, an administration building, including storerooms, offices, an assembly hall (which could be used temporarily for a gymnasium), and apartments for officers.

Daily routine.—The daily programme of the institution is as follows: Rise, 5.30; recreation and preparation for breakfast, 5.30 to 6.20; breakfast, 6.20; work, 6.50 to 8.30; recreation and preparation for school, 8.30 to 9; school, 9 to 10.30; recess, 10.30 to 10.45; school, 10.45 to 11.30; recreation and preparation for dinner, 11.30 to 12; work, 12.30 to 1.30; recreation and preparation for school, 1.30 to 2; school, 2 to 3.30; recess, 3.30 to 3.45; school, 3.45 to 4.30; recreation and preparation for supper, 4.30 to 5; supper, 5; recreation 5.30 to 6; preparation of lessons for next day, 6 to 7; reading and preparation for retiring, 7 to 7.30; retire, 7.30.¹

The school.—The teaching force in the fall of 1898 included a supervisor, 5 grade teachers and 2 special teachers of sloyd, and of drawing and clay modeling.

The course of study and apportionment of time prescribed for the Boston city schools are followed as closely as possible, but many modifications are necessary. During the winter the boys have two hours of sloyd and one and a half hours of drawing each week. The higher classes have also one hour, and the lower classes forty minutes, per week in clay modeling.²

Occupations of the boys.—About half the boys are employed at the domestic duties, in the boiler house, barn, laundry, etc. Those of the others who have sufficient strength do the outside work, including gardening, raking, and clearing up, mowing the lawn in summer, and shoveling paths in the winter. A boy is taught how to work, not so much for the sake of the work itself, but that he may be thoughtful, industrious, careful, faithful, honest, and helpful.³

Bill of fare.—The following dietary was prescribed December 1, 1898:⁴

SUNDAY.

Breakfast: Oatmeal, with milk and sugar or molasses, hash, bread, butter, cocoa. Dinner: Baked beans, brown bread, pudding, bread. Supper: Gingerbread or buns, bread, butter, milk.

MONDAY.

Breakfast: Baked beans, cocoa, bread, butter. Dinner: Roast beef, vegetables, bread. Supper: Oatmeal with sugar and milk or molasses, bread and butter.

TUESDAY.

Breakfast: Hash or warmed-up meat, bread, butter, cocoa. Dinner: Mutton stew, with vegetables, pudding, bread. Supper: Brown bread, sauce, milk, bread, butter.

WEDNESDAY.

Breakfast: Fried mush, molasses, bread, butter, milk. Dinner: Corned beef, vegetables, bread. Supper: Gingerbread or buns, bread, butter, milk.

¹ Report of superintendent of Parental School, in Boston City Document No. 6, 1898, p. 46.

² Report of principal teacher, in City Document No. 6, 1899, p. 43.

³ Report of the superintendent, in City Document No. 6, 1899, p. 38.

⁴ Boston City Document No. 6, 1899, p. 46.

THURSDAY.

Breakfast: Hash or corned beef, bread, butter, cereal coffee. Dinner: Roast beef or meat pie, with vegetables. Supper: Rice or hominy, with milk and sugar or molasses, bread, butter, milk.

FRIDAY.

Breakfast: Oatmeal, with sugar, milk, or molasses, bread, butter, cocoa. Dinner: Fresh or salt fish, vegetables, bread, pudding. Supper: Bread, butter, cracked wheat, milk, sauce.

SATURDAY.

Breakfast: Fish hash or fishballs, bread, butter, cereal coffee. Dinner: Pea soup or bean soup, meat pie, bread. Supper: Corn mush, molasses, bread, butter, milk.

Cost.—The average expense per week per child in 1898 was \$3.27.¹

The expenses in detail were as follows:

Salaries.....	\$12,498.51
Food.....	6,432.46
Clothing.....	1,602.28
Furniture and bedding.....	653.37
Fuel and lights.....	2,918.78
Repairs and improvements.....	1,728.44
Library and school supplies.....	891.59
Medical, household, and agricultural supplies.....	1,508.96
Miscellaneous expenses.....	1,058.61
Total.....	29,293.00

Inmates.—The number of boys in the school February 1, 1898, was 169, and at the corresponding date in 1899, 175. The average daily attendance was 171. One hundred and eighty-nine were committed during the year and 162 discharged. Thirty-four releases on probation were granted, and 13 of them were revoked and the pupils returned to the school.² The average age of boys at commitment during 1898-99 was 11 years and 4 months. The average time of detention of those discharged or released was 12 months, 5 days.³ No less than one-fifth of the boys in the school have been charged with or convicted of such offenses as breaking and entering, picking pockets, petit larceny, etc. Several have previously been in reformatories.⁴

The presence of this element in the school is distinctly contrary to the wishes and ideals of the school authorities, whose leading motive in so persistently urging the establishment of the school was to bring about an entire separation of simple truants from all contact with those of criminal habits or tendencies.⁵

Paroles from the parental school.—The law governing the release of pupils on parole is as follows:

SEC. 1. The institutions commissioner of the city of Boston, with the approval of the superintendent of schools of said city and of a justice of the court which imposed the sentence, may at any time permit any child now or hereafter committed to the parental school of said city to be at liberty upon such terms and conditions as said superintendent of schools and said institutions commissioner shall together deem best.

SEC. 2. If any child who is permitted to be at liberty, as provided by the preceding section, violates, in the opinion of said superintendent of schools and said institutions commissioner, the terms and conditions of his release, so that he is, in their judgment, a fit subject to be returned to said parental school, said institutions commissioner, at any time previous to the expiration of the term for which such child shall have been committed to said parental school, may revoke such permit.

SEC. 3. Said commissioner, when any such permit to a child has been revoked,

³ *Ib.*, p. 48.

⁴ *Ib.*, p. 38.

⁵ See for example the report of Superintendent Seaver for 1895 (School Doc. No. 4, 1895), p. 61.

shall issue an order directed to a truant officer or police officer of said city to arrest such child and return him to said parental school; and any such officer holding said order shall arrest such child and return him to said parental school, where he may thereupon be held, subject to the provisions of this act, for the unexpired portion of the term of the original sentence. All costs and expenses incurred by such officer in the arrest and return of such child to said school shall be paid to said officer by the city of Boston, when approved by a justice of the court which imposed the sentence.¹

In regard to the operation of this law, Superintendent Seaver writes:

The course of procedure under this law has been, first, a petition to the institutions commissioner signed by the parent or guardian of the boy whose release is sought and by others interested in the case; secondly, an investigation of the case by the superintendent of public schools, for the purpose of ascertaining the proper reasons for giving or withholding his consent to the release; thirdly, a reference of the case to the judge who imposed the sentence, for the purpose of obtaining his consent to the release; fourthly, release by the institutions commissioner, notice of which act is at once sent to the superintendent of public schools, who takes measures to secure the released boy's regular attendance in a public school. This regular attendance in a public school is the usual condition attached to the release. Sometimes, when the boy is over fourteen years of age, the condition is that he enter and remain in the employ of some suitable person, who will exercise a proper care over him. If a boy so released fail to attend school, he is remanded to the parental school to serve the remainder of his term. Of the 15 boys released up to the present time, four have been returned to the parental school for failure to comply with the condition of their release, two have left the city with their parents, and nine have attended the public schools regularly. This seems like a good beginning in the administration of a useful law.

In this connection it may be desirable to set forth the principles which have governed me in the exercise of the power intrusted by the law to the superintendent of public schools. First and most important is the principle that release from the parental school is a reward to be earned by the industry and good conduct of the boy himself. It is not a favor to be procured either by parental appeal or by friendly intercession. The second principle, an immediate consequence of the first, is that the boy shall have remained long enough in the parental school to make a record for industry and good conduct worthy of consideration. To release a boy committed for two years at the end of two weeks would be absurd; at the end of two months, somewhat less so; at the end of six months on a good record, not at all so, but quite reasonable. The third principle is that the condition of the home shall be such as to make regular school attendance possible and to a degree probable. This principle imposes an unfortunate limitation on the operation of the other two. On a recent visit to the school I took from the records the names of a considerable number of boys with the intention of recommending their release without petition on the ground that their records for industry and good conduct were excellent or nearly so; but after learning the condition of the homes I recommended release in only one case. The other boys would be decidedly safer in the parental school, and their release could not wisely be recommended. The fourth and last principle is that failure to comply with the condition of the release shall be followed immediately by the boy's return to the parental school. Four boys have been returned, much to the surprise of the other boys; but the effect on them will be wholesome. In order that a close watch may be kept on all the released boys' school attendance, each master having such a boy in his school has been requested to send me every Friday a postal card stating that the boy's attendance for the week has or has not been regular.²

BOSTON TRUANT OFFICERS AND THEIR WORK.

The use of officers specially employed to look after school attendance may be fairly conceded to have been first developed in Boston. Such officers are indispensable to the enforcement of compulsory laws, but they are not intended as a substitute for the time-honored means of securing attendance by parental authority, attractive schools, and tactful teachers, but as an aid and supplement to those means. In Boston, the truant officers are credited with having contributed very largely to the creation of a sentiment among the more ignorant classes that absence of their children from school

¹ Massachusetts acts of 1896, chap. 514.

² Seventeenth annual report superintendent public schools of Boston, 1897, p. 89.

except for good cause is not only a disgrace but a crime. They accomplish more through their moral influence than by the exercise of their legal authority.¹

The force at present consists of 18 men, one of whom is chief.² They are carefully selected, judgment and tact being essential requisites. Their salaries are sufficient to secure an excellent class of men, namely, \$1,800 a year for the chief, and \$1,300 for the others.³ The city is divided into districts and an officer is assigned to each.

During the year ending August 31, 1898, 22,256 "cases" were investigated by the truant officers, and 6,700 of them were found to be truants, 270 were complained of as incorrigible, 86 of them were put on probation, and 134 were sentenced to the parental school. When a child is transferred from one school district to another a notification is sent to the truant officer and through the chief to the officer of the district to which the pupil removes. The latter officer must see that the child promptly joins his new school. Six thousand seven hundred and twenty-five of these transfers were looked after during 1897-98. In addition, 448 new pupils were brought into the schools, 7 neglected children were placed in proper institutions, and 13 complaints were made of children for criminal offenses.⁴

The system under which the truant officers operate has developed from years of experience. To detail the annoyances that have arisen to necessitate each of the regulations now in force would be to fill a volume. In general, the plan of procedure is as follows:

A teacher suspecting an absent pupil of being away without the consent of the parents fills out a "truant card," furnished for the purpose by the school committee, entering thereon the name of the pupil, his age, name of parent, residence, and dates of suspected truancy. These cards are collected by the officer in charge of the district, on his daily visit, and the cases immediately investigated by him. If an absent child is not suspected of truancy, but is supposed to be detained or allowed to remain at home without reasonable excuse, the teacher fills out an "information card," which is an inquiry as to the cause of the pupil's absence. In order that the time of the truant officer may not be consumed unnecessarily, the regulations prescribe that the "information cards" shall be examined and signed by the principal of the district before any investigation is made. It often happens that the truant officer is able to state the cause of the pupil's absence immediately. In such cases the information is at once sent to the teacher, and the card destroyed, and the officer proceeds to investigate the remaining cases referred to him for attention.

The work of a truant officer demands intelligence, patience, and tact to a marked degree. It frequently extends into the evening, as it often happens that more can be accomplished by their efforts with the fathers than with the mothers. The performance of this part of an officer's duty is often exceedingly difficult of successful accomplishment. The interest and sympathy of the parents in the welfare of the children must be aroused and stimulated, and their cooperation enlisted in seeing that their children are regular and punctual in their school attendance. The result of the truant officer's investigation is entered upon the back of each card referred to him, and stated to the respective teachers on the day following that on which the card was received by him. If the officer finds that an absentee has returned to the school, he notes the date of the return on the back of the card of such child and signs his name. If a truant has not returned, the officer keeps the card for future investigation. The completed cards are then taken to the principal of the district for examination. If satisfied with the results of the investigation, he affixes his signature as evidence that the truant officer has performed his duty, and the cards are then transmitted weekly to the chief truant officer. The truant officer retains the cards of pupils who have not returned to school and calls daily at the home and school until the child returns to the school, or until a satisfactory explanation of the absence is obtained, when the facts and the number of sessions absent are recorded on the card, which is then handed to the principal as described above. The truant officers are also alert and watchful for truants upon the streets, and, finding such, take them to school and turn them over to the charge of the principal.

In the case of a persistent or incorrigible truant, after it has been demonstrated that the persuasive efforts of the truant officers are of no avail, a record is obtained

³ Letter of Hon. E. P. Seaver, March 6, 1899.

⁴ Boston school document, No. 13, 1898, p. 10.

from the teacher of the dates of suspected truancy for the preceding three months, which the truant officer presents, together with the result of his investigation, to the chief truant officer, who may then give his consent to the case being brought before a court having jurisdiction. The truant officer then brings the matter to the attention of the court, procures a summons, and notifies the parents to bring the child into court on a certain day. If they fail to comply, the child is arrested on sight and brought before the court. Except in extreme cases, a truant is placed on probation, and if after the expiration of a few weeks it appears that reformation has taken place the case is placed on file. If otherwise, the truant is again brought before the court and sentenced to the parental school for a term of not exceeding two years, in the discretion of the court.¹

TRUANT SCHOOL OF FRANKLIN AND HAMPSHIRE COUNTIES, GOSHEN, MASS.²

The home and farm of Mr. W. A. Barrus in Goshen were assigned as the truant school for Franklin and Hampshire counties, October 15, 1889. Only five truants have been sent there since that time, and little, if any, change has been made in the appointments of the place since it was constituted a "truant school." It remains an ordinary "hill-town" farm of about 200 acres. When there are any boys in the "school" they are taught by the matron, and do the work ordinarily expected of a farmer's boy. Mr. Barrus receives \$350 a year. Board of pupils costs \$4 a week.

ESSEX COUNTY TRUANT SCHOOL, LAWRENCE, MASS.

[Statement of Mr. H. E. Swan, superintendent, March 7, 1899.]

The Essex County truant school was organized and established by the board of commissioners July 1, 1891, at Lawrence, Essex County, Mass., by the purchase of a farm, with buildings thereon, which had been occupied by the city of Lawrence as a reform school, a special act of the legislature transferring the inmates to the truant school during the remainder of the term for which they were committed. The officers or administration of the school consist of superintendent, assistant superintendent, and seven subordinates. These officers, with all the pupils, reside at the school.

We have an ungraded but a regularly organized boarding truant school.

Habitual truants are complained of before trial justices or judges of police courts by truant officers of cities or towns in which they reside and are committed to the county truant school.

Terms of sentence are variable, not to exceed two years.

Paroling is under control of the board of commissioners, and paroles must be approved by the committing officer, board of school committee, or superintendent of schools.

Buildings are of convenient size to accommodate the needs of the county. A farm of 33 acres is connected. Vegetables, fruits, and milk are produced for the needs of the school, and the surplus is disposed of at the neighboring city for cash.

Pupils are boarded, clothed, and lodged at the school, the county receiving \$1 per week from cities and towns making commitments, the county defraying the balance of expenses. Gross cost (1898), including salaries, \$9,307.57; receipts (board, sales, boys' earnings), \$5,598.51; net cost to county, \$3,709.06.

Daily programme.—Rise, summer, 5 a. m.; winter, 6 a. m.; breakfast, 6.30 a. m.; dinner, 12 m.; supper, 6 p. m.; work, 7 to 11.30 a. m., 1 to 2 p. m.; recreation, 11.30 a. m. to 12 m., 12.30 to 1 p. m., 6.30 to 7.30 p. m.; school, 2 to 6 p. m.

Studies in school are the same as same grades of public schools, as nearly as possible.

As pupils are all residents of the school, daily attendance is considered a duty.

Number of pupils sentenced, January 1 to December 31, 1898, 33. Highest number in school at one time, 48. Seventy per cent of the pupils do well; 5 per cent have been sent to reform schools.

Truant girls are taken in charge by the State board of charities. They are not sent to truant schools, but to the State Industrial School for Girls.

¹ Boston school document No. 15, 1897, p. 11.

NEW BEDFORD, MASS.

The city of New Bedford maintained a truant school from 1853 to 1891, in spite of earnest protests of the school board and of successive superintendents.

The establishment of the school did not result from a matured design. At the beginning two or three boys were committed under the truant act to the almshouse, simply because there was no other place to which they could be sent. At that time there was no school whatever there. There were a score or more children of the paupers at the institution who had been attending country schools in the neighborhood, and to accommodate these two classes of children a teacher was appointed to the charge of the "almshouse school,"¹ and this subsequently developed into the truant school of the city of New Bedford. At first there were 26 pupils, and 4 of them only were under sentence for truancy; but in the course of two years the proportion was reversed, and four-fifths of the number were truants.²

At first the incongruity of the location did not appear, for a reference to the institution in the report of the school committee for 1854 indicated their satisfaction with it.³ But before the next report was written the impropriety of the association of paupers and truants had dawned upon the authorities, and a separate "farm school" for the latter was urged, though the existing condition was excused on the ground of necessity. By 1856 complaints had been so frequently made by parents and others interested that the chairman of the school committee for that year refrained from prosecuting truants as far as possible.

The teaching of the school was said to be excellent, and during school hours the children were surrounded by the best of influences. But at other times, with no regular employment and without proper oversight, they associated freely with the pauper inmates and with each other. Subject to such contaminating influences, many, it was said, left the place at the expiration of their terms morally no better certainly than when they entered.⁴

A temporary improvement was noted in 1858, when the school underwent a "complete and thorough change." In pursuance of a recommendation of the city council, made with the purpose of diminishing as far as possible the evils arising from constituting an almshouse as the place of confinement for truants, the school committee placed the school in charge of a male teacher in order that the pupils might have constant care and training. Rapid progress was reported on the part of the boys, and lively satisfaction was expressed at the evident improvement in affairs.⁵ But the improvement was short-lived. In less than two years the school committee found it necessary to say that the almshouse school, in its relations and conditions as they then existed, was as a reform school a sad and serious failure. "The association of boys already viciously inclined," they said, "with persons and characters whose habits of intemperance and vagabond life have blunted their moral sensibilities and developed tempers and attributes at war with virtue and morality does neither reform nor elevate them; and in such an atmosphere they will only sink lower and yet lower in the scale of human degradation." To this arraignment, however, they add: "But as a precautionary measure, to render society safer and property more secure, and as a penal school for truancy, it unquestionably exerts a salutary influence, restraining some from leaving school who otherwise would be found in the streets, while in reference to others it affords a cheap method of having their children boarded at public expense. Simply on the ground of prudence we justify its continuance."⁶ The usual appeal, always so vainly made, for a separate truant school followed this utterance.

¹New Bedford City Document No. 6, 1853, p. 102.

²Ib., No. 7, 1855, p. 23.

³Ib., 1854, p. 25.

⁴Ib., 1856, p. 24.

⁵Ib., No. 9, 1859, p. 38.

⁶Ib., No. 8, 1860, p. 11.

In consequence of the revision of the State law it became necessary in 1861 to revise the city ordinance relating to truancy in general and to the truant school. The name of the school was changed to the "Farm School," and it was placed under the direct control of the mayor and aldermen, although the teacher of the school proper was to be employed and paid by the school committee.²

According to a statement made December 22, 1863, by the police justice in charge of the trials of truants, 36 delinquents had been sentenced to the truant school since the new ordinance went into effect (i. e., October 1, 1861). Of the sentences, 10 had been for six months, 8 for one year, 7 for three months, 4 for four months, 2 for seven months, 2 for nine months, and 1 each for two months, five months, and eight months. From the number of boys returned to the school under a second sentence this officer was of the opinion that the efficiency of the system was to be found in its check on incipient truancy through fear of prosecution rather than in the reformatory influence of the school. He regarded the first consideration, however, as sufficiently important to justify the continuance of the school.³

In January, 1869, the "Farm School" contained over 50 pupils, the increase being due to the action of the statute of 1866 relating to neglected children and to the fact that the sentences were longer than formerly. The unsatisfactory conditions as to associations and lack of complete oversight outside of school hours still prevailed.⁴

The disinclination of the school officials to have boys committed to such an institution caused the number of inmates to fall off from time to time, and twice it was temporarily discontinued altogether, once in 1875 and again in 1878. In the meantime repeated demands upon the county officials for the establishment of a county truant school under the law of 1873 were disregarded.

In 1879 the schoolhouse of the institution was removed from the inclosure of the almshouse and put in better repair, and commitments were resumed after having ceased for a year or more.

Authority was secured in 1885 to employ a male teacher to have charge of the boys at all times, and who should be competent to give daily lessons in the use of mechanical tools. The right man could not be found, however, and a woman was employed as teacher, and a competent workman was engaged to give one lesson a week in tool work. The results did not justify the expense, and after an experiment lasting two years the industrial feature was abandoned.

After many efforts and disappointments the Union Truant School of the counties of Norfolk, Bristol, and Plymouth was established at Walpole and opened in 1891. It was with an evident sigh of relief that Supt. W. E. Hatch announced the closing of the city truant school in his report for that year.

Just what the condition of the New Bedford school was in its latter days may be gathered from the following extracts from the report of Supt. H. F. Harrington for 1882, which is merely a specimen of the utterances of nearly every one of the school officials when they had occasion to write of the school:

As things now are, I will not give my assent to the arrest of any boy who has not already crossed the line "to the bad" so far as to be beyond injury by ordinary vicious influences. A boy who is only a confirmed truant, who has not become as yet a mischief-loving petty criminal, we watch, plead with, take to his regular school again and yet again, anything—except to send him to the truant school. * * * The boys, when not in the schoolroom proper under the eye of the teacher, are in charge of a man whom no one will pretend to have been selected for the position with any defined purpose beyond ministering to their necessities and keeping them under orderly control. * * * He has repeatedly said to the committee and the truant officer "he wished he might have at least one boy sent to him who had

² Annual report of the school committee for 1861, p. 28.

³ Annual report of superintendent of schools for 1863, p. 47.

⁴ *Ib.*, 1868, p. 25.

some good in him." No good is likely to be educed where the germs of it are not supposed to exist. There is good in the boys, however vicious they may be; experience elsewhere with such a class proves it. The most of them are wayward, not because they are born base, but because they have been the victims of misuse and neglect. I am afraid that the mistaken spirit of the superintendence of the school is exemplified by the bolted gate, barred windows, the solitary cells, the well-worn cowhide. These appurtenances may be necessary as occasional persuasives; I dare not assert the contrary; but they are revolting to me when taken together as exponents of the spirit of the management, and in view of what I believe might be the contrasted condition of things. The school is virtually a prison.

THE "MIXED SCHOOL."

New Bedford had also for many years an ungraded or "mixed school" which served as an intermediate step between the regular schools and the truant school. Its establishment (September, 1851) antedated the beginning of the latter by two years. As the regulations provided, the school was for "pupils of any age whose continuance in any primary, intermediate, or grammar school shall, by reason of dullness, insubordination, or from any other cause, be deemed prejudicial to the same school." "Habitual truants" were later specified as another class to be provided for. It was commenced as a school for both sexes, but the number of girls being inconsiderable, the committee deemed it expedient to limit the school to boys only.

The selection of a teacher was a fortunate one, and many gratifying instances were observed of changed manners and sudden mental quickening on the part of the pupils in his charge. The school committee gave evidence of their appreciation of his work by repeated advances in salary till his rank and pay were equal to those of a grammar school principal.

The chairman of the school committee said of the school in 1856:

The labor of instructing and disciplining scholars of the character here brought together is by no means one inviting in its nature; yet, judging by the standard of success, the teachers of no school are more deserving of praise, especially when it is considered that it is only by the most patient and indefatigable exertions that success to them is possible.

Like most schools of a similar kind, the quarters assigned to it at first were very unsatisfactory in character, and the location, on Market square, was particularly objectionable. The conditions continued thus—excellent teaching amid unwholesome conditions—until the summer of 1859, when the school was discontinued, by the unanimous vote of the school board, for no other reason than that the building was wholly unfit for school purposes. The city government had not heeded the repeated appeals for the removal of the difficulties, and the close of the school was the necessary consequence. Its principal was assigned to one of the regular grammar schools.

The pupils, however, were not turned upon the streets or sent back to their former schools. A room was set apart for them in a new building, and a competent female teacher was provided. This arrangement was considered only a temporary one, and never fully met the ideals of the committee. A return as soon as practicable to its former organization as a separate school under a male principal was always contemplated, and was effected as soon as the necessary quarters were available. The original principal, Mr. Nehemiah Lincoln, was once more assigned to the school upon its second removal, and the number of pupils was gradually enlarged until in 1867 there were 98 registered, with an average belonging of 78 and an average attendance of 66. At that time Mr. Lincoln was aided by two female assistants.

The same efficiency which marked the former administration of the school was apparent after its rehabilitation. As the superintendent stated in his report for 1865, Mr. Lincoln "has not only governed and taught with success, but has supplemented

the labors of the schoolroom by calling on the parents of his scholars at their homes and conversing with them about the welfare of their children. By this means he has smoothed over many difficulties and induced the regular submissive attendance of some who otherwise might have been fractious absentees."

When he first assumed the superintendency, Superintendent Harrington seemed doubtful of the wisdom of culling out and bringing together the vicious element in all the schools,¹ but a few years more of experience convinced him of the entire propriety of such a policy. In his report for 1869 he gave evidence of his complete conversion to belief in the segregation of vicious pupils by the following paragraph:

In every large, compact community like our own there will be an element among its youth that can not be consistently sent to its ordinary schools to mingle at will with their as yet uncontaminated members, and drop in the innocent paths of others the slime of their unfortunate depravation. * * * The corrupting element I have spoken of must not remain in the regularly constituted schools. What then? Shall it be left uncared for, to run at large in the streets, undisciplined, untaught? By no means. It must be gathered into a school by itself, to be subjected to such oversight as will accustom it to wholesome restraint, teach it what it ought to learn, and start it, if possible, in a course of reformation and virtue. * * * We have realized * * * that of all the correlative instrumentalities of our school system, none is more important than the ungraded school.

Even stronger is his comment in the report of 1870, the concluding sentence of which was: "My convictions have undergone no change as to the indispensable importance of this school to our school system."

The enrollment in the school showed a steady decline after 1867, notwithstanding the support of the superintendent and the favorable attitude of the majority of the school committee. The question came before the committee in July, 1871, for a change of its organization, and when it was proposed during the discussion to abolish the school entirely for a time, the proposition received the assent of the majority of the committee.²

There had been from the first a minority of the school committee who opposed the school because of the lack of sufficient classification of pupils on the basis of morals. It was held by these members that the better class of pupils in the school were so injured by their enforced association with the more vicious that the aggregate result was more harmful than if all were retained in the regular schools. But this consideration had been counterbalanced by the manifest advantage of ridding the regular schools of these same vicious persons, and it was only when the number of pupils fell to a low point that the ungraded school was discontinued.

Some of the pupils were returned to the schools, but the others passed out of the notice of the school authorities. It was thought at the time that the discontinuance was only temporary and that it must again be instituted in some form, but it has never been reestablished.

MIDDLESEX COUNTY TRUANT SCHOOL, NORTH CHELMSFORD, MASS.

Like the officials of all the other counties, the commissioners of Middlesex refused, or failed, for many years to comply with repeated requests to establish a county truant school. But they finally did take such action, and the school they established is said to be, by the secretary of the State board, the finest institution of its class in the State, if not in the country.³

The legislature of 1892 authorized the county commissioners to borrow \$50,000 for the erection and equipment of a school, and \$6,000 of the money thus obtained was used to purchase a lot of 18 acres in Chelmsford, near Lowell, overlooking the Merrimac River. It was intended at first to establish two schools, the other being

¹ Report for 1865, p. 68.

² Report of the chairman of the school committee for 1871, p. 19.

³ Sixty-second annual report, Massachusetts board of education, p. 489.

near Cambridge,¹ but that plan was never carried out. The first buildings were completed and the school put in operation in 1894. The accommodations were designed for sixty boys, but the growth of the school was such that that point was soon passed, and provision must now be made for twice that number. The secretary of the State board of education and one of the agents of the board visited the school officially recently, and their reports upon it include the following paragraphs:²

Buildings and land.—The school is located at North Chelmsford, just above the city of Lowell, and overlooks the Merrimac River. There are three buildings, two of them cottages or dormitories, each with its company of boys, its schoolroom, dining room, sleeping hall and other accommodations, and the third a kind of industrial building, where provision is made for laundry work, sloyd and kindred things. There are 18 acres of land, 8 of which are under cultivation. The rest is used for a playground, roads, lawns etc. The grounds have been made useful and beautiful in many ways, all the work having been done by the boys, under supervision.

The buildings are substantial and modern. The new building, in particular, illustrates how much can be done with the judicious expenditure of a comparatively modest sum. Extreme simplicity characterizes all the furnishings. It was not forgotten that this school is no place for luxury or extravagance. Chairs, tables, beds, all such things are substantial and durable, but reduced to their lowest terms. To one accustomed to the thousand and one things that gradually work into a home to make it attractive and come in time to be thought of as necessities, it is astonishing to note how they can be about all parted with in a home like this with manifest advantage to the cleanliness, health, and comfort of the boys.

Working organization.—To carry on the work of the school requires the following staff of officers and employees: A superintendent, an assistant superintendent and head matron, an assistant matron, a caretaker of the boys, a laundry matron, a kitchen and dining-room matron, a sewing matron, a cook, a master in charge of the cottage building, a matron at the cottage building, a teacher at the main building, a teacher at the cottage building, a music teacher, and a teacher of manual training.

Superintendent's report.—From the report of Moses A. Warren, superintendent of the school, for the year ending December 31, 1898, the following extracts are made:

There were 93 boys in the school December 31, 1897.

Admitted during the year.....	64
Discharged during the year.....	51
Remaining December 31, 1898.....	106
Average number for the year.....	101

Of those committed, 50 were habitual truants, 12 had wandered about the streets, 1 had violated the rules of school, and 1 was a neglected child. Of those released, 42 were discharged at expiration of sentence, 5 by order of the court, and 4 on probation. Of the number committed, 48 could read and write, 4 could only read, and 12 could neither read nor write.

The current expenses for the year amounted to \$15,857.99, or \$3 per capita per week. The amount collected and paid to the county treasurer from cities and towns for support of truants was \$8,954.26, and from sundry receipts, \$10.80; amount due from cities and towns, \$149.28; the total income was \$9,114.34. By act of the last legislature, the amount charged cities and towns for support of pupils was cut from \$2 to \$1 per capita per week, reducing the income derived from this source by one-half.

The act also obliged the State board of education to visit the truant schools of the State, and annually report to the legislature their condition. This act is heartily approved by your superintendent, as it gives us the benefit of advice and criticism from trained and experienced educators, putting us more in touch with the public schools of the State.

The family building, which was in process of erection at the time of my last report, was completed and occupied in March last. At the opening exercises there were present the committees on education and counties from the legislature, and many invited guests. They were welcomed by your chairman, Levi S. Gould, and addresses were made by Hon. Alfred S. Roe, chairman of the committee on education; Mr. Bosworth, and others. The building was completed within the appropriation, and is occupied by a family of 50 boys.

We close the year with 106 pupils,—a gain in number of 13 pupils for the year. In

¹ Cambridge, Massachusetts, school report, 1892, p. 45.

² Sixty-second Massachusetts board of education, p. 482 et seq.

my opinion, the increase for the time to come will be at least 10 per cent annually, and the condition of additional room will soon have to be met. I recommend that the unoccupied land lying west of the school, and extending to Princeton street, be taken by purchase or otherwise. It is needed for tillage purposes and in the future, if it should be considered wise to add to the capacity of the institution, the extra space would be necessary.

I would also recommend the erection of a central heating plant, with sufficient storage room for a year's supply of coal. At the present time the buildings are heated by a boiler in the basement of each. The saving in labor and fuel would be large, and a lower price for coal obtained could we purchase a year's supply, instead of, as now, having to take from time to time only the amount we can store.

We were enabled upon the completion of the new building to grade the schools. Another teacher was employed, and more time given to individual work. When you consider that 18 per cent of the children admitted during the year could not read a simple sentence, you will recognize the need of such work.

The health of the children has been uniformly good throughout the year. We have had but one serious case of illness, that of pneumonia, from which a good recovery was made.

Owing to the wet season the crops upon our most productive land were largely failures, particularly root crops. A larger quantity of berries was raised than ever before.

The boys have been employed through the season in the necessary farm work and in grading the ground around the new building. Many cubic yards of earth have been moved in wheelbarrows, gutters paved, ditches excavated, etc. If more land is not acquired, there will be but little outside work for so many boys after this year.

Classes in sloyd have been maintained throughout the year with good results.

Our annual excursion day was celebrated by a boat ride to Nashua. All holidays have been observed in the usual manner.

Religious services have been held each Sabbath. Protestant services have been conducted by various clergymen, and Catholic services by Rev. J. J. Shaw, of Chelmsford.

Educational conditions.—The two main buildings have each a schoolroom, one for the lower division of the boys and the other for the higher. These schoolrooms are well heated, lighted, and ventilated. They are commodious and attractive. The desks are good. The blackboards are excellent. The appliances for teaching are

fair; perhaps as good as can be expected at present. The same wisdom that dominates the school as a whole will doubtless insure a steady improvement here. The teaching is reported to be "fair to good in both rooms." There is a commendable appeal, so far as it goes, to the self-activity of the boys. The impression gathered from a single visit leads to the suggestion that probably there ought to be a little less reliance in the text-book, a little greater stress placed on the practical side of the various studies. This trend toward a certain bookishness is a natural and common one in the public schools, for which teachers are not wholly responsible. It would help them to counteract this tendency if they were supplied by the public with an abundance of judiciously selected appliances to engage the activities of the pupils and afford them facilities for learning things in their applications. Far more even than in a public school is it important in a truant school to enlist the motor side in the educative process. The provision for manual training at North Chelmsford is an admirable one for this purpose—a good room, a special teacher, benches where 15 boys can work at a time, and all in constant use. Moreover, it is gratifying to note that the general policy of the school is to make the boys do for themselves in all feasible directions. They wash their own clothes, they scrub the floors, they make their own beds, they do the gardening, they keep the grounds in order, they clear up the wild lands. All this they do under competent direction, the work being done by groups, and the work for a group being frequently changed to give variety of experience and to break the weariness of monotony.

The discipline of the school seems to be excellent. No disorder of any kind was noticed and no means of repression were visible. The behavior of the boys is carefully noted from day to day, but how much use is made of the record, how much the fear of a low mark and its consequences has to do with keeping the boys in order is not reported. There was no "dodging" or evasion on the part of the boys; they seemed natural and happy. The order, regularity, healthfulness, and employment of life at this school ought to be the saving of most of the boys. When assembled to listen to addresses from various speakers, the boys appeared to excellent advantage. Among them were many bright faces. Their singing was hearty, expressive, and enjoyable. It embraced a variety of styles and pieces; every boy of the 60 present joined in it. If they do their other work in school as well as they sing they can not but meet any reasonable school demands upon them.

Miscellaneous.—The superintendent endeavors to follow up the boys after their discharge. As most of them come from Lowell and Cambridge he is able to keep informed about them through the truant officer and other officials of those cities. He thinks it is a conservative statement to make that 80 per cent of the discharged cases get into no trouble.

Boys arrested on criminal charges are not sent to North Chelmsford. In some instances, doubtless, where crimes have been committed by truant boys they are complained of as truants and not as criminals and treated accordingly. Several of the boys in the school have been before the courts on criminal charges, and either released or fined, to be subsequently complained of as truants.

WORCESTER COUNTY TRUANT SCHOOL, OAKDALE, MASS.

This school was opened in 1891. For several years petitions had been received by the county commissioners requesting the establishment of such a school, but "lack of available funds," the usual hindrance, for a long time prevented compliance.¹ The provision finally made, however, was in advance of anything that had been done up to that time, and the Worcester County Truant School was considered a model institution, and as such was held up for imitation by the secretary of the State board of education.²

The building is of brick with stone trimmings. It is 60 feet wide by 90 feet deep, and on each side is a wing 34 by 25 feet. There are two stories, with an attic and basement. On the ground floor are the superintendent's office, reception room, library, schoolroom, dining rooms, kitchen, pantry, refrigerator, sewing rooms, and attendants' rooms. On the floor above is a commodious dormitory, provided with a separate bed for each boy, with woven-wire springs and hair mattress. Adjoining this and connected with it is a sleeping room for an attendant, and also a room in

¹ Fifty-third annual report Massachusetts board of education, p. 297.

² Fifty-fifth annual report Massachusetts board of education, p. 260.

which the boys hang their clothing upon retiring. A large room devoted to manual training is also on this floor. The attic is used principally as a play and drill room. In the basement are the laundry, boys' lavatories, 16 individual bath rooms with hot and cold water and lockers for clothing. A large tank in the attic supplies the water used in the institution, and in the basement is a modern gas machine and heating apparatus. Electric bells, etc., have been installed throughout the house.

The farm consists of 36 acres and the necessary farm buildings have been constructed. A baseball field and a skating pond are provided for the use of the boys.¹

The present value of the plant is about \$75,000.² The running expenses of the institution are about \$5,000 a year. Of this \$3,080 go to the employees, as follows: Superintendent and matron, \$1,500; 1 teacher, \$500; 1 farmer, \$360; 3 domestics, \$240 each.³

The number of children in the school varies from 30 to 40. Occasionally, though not often, a child is let out on parole, and if he promises especially well he is discharged outright. There is no fixed rule and no uniformity in the practice, however.³

The daily routine is: Rise, 5.30 a. m.; breakfast, 6.30; school, 9 to 12; dinner, 12.30 p. m.; school, 2 to 4; supper, 5.30; retire, 7.30. There is no fixed rule as to the division of the remaining time between work and recreation.³

The boys assist in the house and farm work, and the school continues the entire year. The course of study is as nearly as possible like that of the regular schools.

The majority of the boys are from the city of Worcester, and of the effects of their commitment Hon. Clarence F. Carroll, superintendent of the Worcester schools, writes, under date of March 7, 1899: .

Children come back to us from the truant school uniformly improved in manner, and I believe a great many of them are decidedly benefited by the experience. In other cases we find it necessary to repeat the sentence. As an estimate I should say that 90 per cent are permanently "cured" of the "disease" of truancy, for which they are committed.

We have sent a few girls to the truant school, but under the law passed last year our judge rules that we can not send any more to this institution. It is possible to send them to a State institution. This is occasionally done. I should add that there is a difference of opinion on this matter between the court and the State authorities, and that the secretary of the State board of education still believes that we can commit girls to the county truant school.

It is my judgment that such a school as the one at Oakdale is capable of doing the very best things for a city system. As you of course know, Massachusetts has a statute which provides for such schools in all parts of the State. I think only one or two of the other schools compare at all with ours in point of efficiency. Mr. Johnson, the principal, is a master of his art and does much to build up and reconstruct the weak characters that are sent to him.

The agent of the State board of education who visited the school in 1898 reported the "educational conditions" to be as follows:

The schoolroom in all that respects size, desks, blackboards, heating, lighting, and ventilation is satisfactory. There is a fair supply of teaching apparatus. The supplementary reading is of a good kind. The work done by the boys on the farm is of a useful kind; it seems to be strictly manual—that is, there is no formal teaching of agriculture or allied subjects in connection with it. There is no shop work or manual training. The teaching in the school appeared to be of good average quality. The boys were orderly and attentive. The discipline of the school was good, but not severe. When rules were disobeyed deprivation of privileges is a common penalty. Concert movements were noticed in many things—in washing the face and hands, in saying grace at meals, in beginning to eat—the boys responding to the tap of a bell or a pencil.⁴

¹ The description of the buildings is based on documents furnished by Mr. F. L. Johnson, the superintendent of the school.

PLUMMER FARM SCHOOL, SALEM, MASS.

Miss Caroline Plummer, of Salem, Mass., died in 1855, and in her will, dated July 23, 1853, was a clause by which the sum of \$18,000, together with the residue of her estate after the payment of her debts and other legacies, was bequeathed for the founding of a farm school of reform for boys for the city of Salem, on a plan similar to that of the State reform school. It was directed that the money be paid to trustees chosen by the mayor and aldermen of Salem and duly incorporated by the State legislature. If the amount of the bequest were inadequate for the intended purpose, the trustees were authorized to place the money at interest until it amounted to a sufficient sum.¹ The amount available was not at first sufficient, and the establishment of the institution was postponed for several years.² It was finally opened for the reception of inmates in 1870, the city authorities assisting with an appropriation.³

The city of Salem had not had a truant ordinance because of the lack of a suitable place to which delinquents might be sent;⁴ but that desideratum having been filled by the Plummer School, an ordinance was passed early in 1871.⁵ From that time to the present the Plummer Farm School has received all truants convicted in the city of Salem.

In cases that threaten a confirmed habit, the truant is brought before the district court on complaint of the truant officer, and as a result of the first hearing the offender is usually "put on probation." This is sometimes continued after a second hearing, but a further continuance of the offense almost always results in the commitment of the truant to the Farm School for two years, which is the term uniformly inflicted.⁶ No paroles are given.⁷ Three truants were sentenced during 1898, the average number in the school for the offense being 5.⁷ The whole number in the school December 31, 1898, was 28, of whom 5 were truants; 7 were children of paupers, 6 were boarders, and 10 had been sentenced for minority.⁸ Three hundred and sixty-six boys have been in the institution since its establishment, and of those that have gone out the most are doing well in the various pursuits of life.⁹ The employees are the superintendent, matron, assistant matron, female teacher, and male general assistant.¹⁰ The gross weekly cost per capita was \$3.80 and the net cost \$2.43.¹¹

The daily routine prescribed for the winter months is as follows: 5.45 to 6.15, rise, make beds, wash, etc.; 6.15 to 6.45, breakfast; 6.45 to 7, recess; 7 to 9.15, work; 9.15 to 9.30, recess; 9.30 to 11.30, work; 11.30 to 11.45, recess; 11.45 to 12.15, dinner; 12.15 to 1, play; 1 to 2, work; 2 to 2.30, recess; 2.30 to 4.30, school; 4.30 to 4.45; recess; 4.45 to 6, school; 6 to 6.30, supper; 6.30 to 7.15, play room; 7.15 to 7.30, devotional exercises; 7.30 to 8, retire.

The school-room work is said to be of a high order. The boys when admitted are backward, dislike to go to school, and are not inclined to study except under compulsion. To interest them requires a teacher of the highest talent.¹²

The boys work on the farm during the proper season and the sales of farm products amounted to \$1,527 during 1898.¹³ The larger boys are instructed in the use of carpenters' tools, and cane-seating is the occupation at which all the boys are kept when outdoor work is impracticable. The earnings for seating chairs during the last year amounted to \$438.¹⁴

The school is located in the harbor of Salem, on Winter Island, $1\frac{3}{4}$ miles from the center of the city and within the corporate limits. The island is connected with the mainland by a good road.¹ The main building is a substantial three-story frame structure, 42 by 92 feet in its dimensions.²

SPRINGFIELD, MASS.

In many respects Springfield has been one of the most progressive of American cities educationally. It was one of the first places in the country to employ a superintendent, Mr. S. S. Greene having been so engaged in the autumn of 1840, his services continuing for two or three years. After him there was no one so designated for a long time, but the chairmen of the school committee in the meantime happened to be men with unusual qualifications, and they took great interest in their work. This is especially true of Dr. Josiah Hooker, who was the first chairman after the place was incorporated as a city in 1852, and who continued to occupy that position until 1868. The reports of the school committee during all that period were written by him, and they show in a marked degree an intimate acquaintance with the schools, an understanding of their needs, and a spirit of progress in urging plans for their improvement. Mr. E. A. Hubbard was elected superintendent in January, 1865, and served to April, 1873, when he was succeeded after a brief interval by Mr. A. P. Stone, whose service in this capacity continued until April 1, 1888. These changes in personnel had an important bearing on the policy of the city toward the truant schools.

From the very first the subject of truancy has received earnest attention from the Springfield school authorities, and nearly all the early reports contained recommendations for abating it. In 1842, while the schools were still under the district system, the teacher of one of the schools became discouraged at the lack of parental support in his efforts to secure proper discipline and regular attendance, and resigned. A meeting of the district was immediately called, and the teacher was requested to state his grievances. A full discussion of the situation ensued, regret was expressed at the apathy existing on the part of parents, and a resolution was unanimously passed pledging to the teacher support and cooperation. Subsequently the resolution was printed, together with new regulations of a stringent sort, and a copy was sent to each family in the district. The superintendent said in commenting upon the matter in his annual report: "The effect in giving to the children an increase of vital action and arousing to greater speed their locomotive powers was truly gratifying. The impossibility of playing the truant without detection has contributed much to the constancy and regularity of attendance. The influence of these regulations enforced by a vigilant board of overseers, created by their provisions, has been as might be expected, most salutary in reducing to order and system these heretofore troublesome though now quiet and submissive schools. It is a fit example for other districts to follow."

This incident shows not only an early example of official action to reduce truancy, but in the creation of a board of overseers specially for the purpose of enforcing attendance it antedated the appointment of truant officers in Boston by several years, and constituted, apparently, the first instance in America of the employment of special attendance officers. In this case, however, it was only a temporary need that brought about such action, and the board of overseers then organized probably went out of existence in a few months at most.

In the same report Superintendent Greene estimated that the actual pecuniary loss to the town through nonattendance or irregular attendance of children amounted to not less than one-third of the whole amount spent.

The numerous recommendations and discussions of which these are examples do

¹ Report of Plummer Farm School, 1893, p. 8.

² Letter of Supt. C. A. Johnson, March 9, 1899.

not imply that the conditions were any worse in Springfield than in other towns at that time, but they do indicate on the part of the officials a recognition of the evil and an earnest desire to abate it.

In the report of the school committee for 1852, Chairman Hooker suggested the establishment of a special school for habitually truant or disorderly pupils, to be called a "reform school." This should be, he said, under a teacher of peculiar tact in managing such children, and should receive all pupils from other schools who should be adjudged by the committee to belong to this class of delinquents.

In the next report, i. e., for 1853, the same recommendation occurs in a somewhat different form. Dr. Hooker in that advocated a "miscellaneous school" for backward pupils who could not be suitably classed in any of the existing grades of schools, and for "all others who are found in any way to be troublesome and difficult to manage. * * * This should be supplied by pupils from the different districts, the assignment to be made by the school committee." He cited New Bedford as a city in which such a school was successfully conducted.

These recommendations did not result at once in the establishment of the special school which Dr. Hooker had in mind, but the constant agitation of the general subject of truancy had its effect and caused various means to be adopted to reduce it. The city council in 1853 passed an ordinance under the State law providing for compulsory attendance, but little result seems to have come of it at the time, as no truant officers were provided and no general enforcement of the law took place. There had been employed in the city, however, for a number of years a class of officers peculiar to Springfield, called "schoolhouse agents," whose principal duties related to the oversight of the buildings, purchase of fuel, supplies, etc. The duties of truant officers in no way fell upon them, but some of them voluntarily assumed such duties with excellent results. The "missionary work" of one of them, Col. Warriner, was especially commended by the school committee.

With the advent of a superintendent of schools in 1865 the subject of a truant school was again taken up. Mr. Hubbard's plan of treatment for truancy was the result of a visit to Worcester, and was as follows: *First.* The teachers in the ordinary schools to search out absent pupils and seek to bring them back to school. This does not, he said, secure the desired result for the worst class, nor does it reach those whose names are not on the register, who are simply children in the street. *Second.* A truant school to be established not only for truants, but the turbulent, the disobedient, and refractory from any of the schools are to be sent to it, till they redeem their characters and are permitted to return to their proper school. The master of this school should be made an officer with the right to enter houses in search of a truant. *Third.* A school to be established a little out of the city proper, with a school yard and a fence that can not be scaled, and with other required means of security. The mayor, the marshal, and the superintendent of schools to constitute a commission, and when a boy can not be reached by former "steps," this commission to make complaint before the police judge, and he is to be sent up to this school.

In his report for 1865 Mr. Hubbard stated that the "first step" was already taken; that the school committee itself was competent to establish the school contemplated in the "second step," and that the favor with which the city officials had received his plans encouraged him to hope that the means for the "third step" might be forthcoming.

The next report (1866) chronicles the fruition of his plans. The city government provided a place at the city almshouse, remote from the other inmates, for the "reception, confinement, and instruction" of truants and other vicious, idle, and vagrant children. This institution was "under a kind and efficient female teacher," and was called the truant school. Commitments to this school were by the police court, and pupils were detained during the term of their sentence, or until the court, being satisfied of their reformation, discharged them.

For pupils of the irregular class a special school was assigned, styled the ungraded school, in the State street schoolhouse. This was placed in the charge of a competent man teacher, who was also made truant officer, and who was aided in the school itself by a woman of long and successful school experience. Whenever children in this school became uniformly regular in their attendance and commendable in their behavior they were allowed to return to the graded schools; but if their conduct was such as to make such a step necessary, they were sentenced to the truant school. Transfers to and from the ungraded school were by order of the superintendent.

Both Chairman Hooker and Superintendent Hubbard wrote in enthusiastic terms both of the success of the new schools and of the competency of those in charge of them, and it was said that the invariable testimony of the graded-school teachers was that the effect of the new departure had been excellent upon their own scholars.

It became evident almost immediately that the almshouse was no place for the truant school, and earnest endeavors were made by the school committee and the superintendent to have it removed. It appeared, however, that the city had no other place available, and the school continued in its unsatisfactory surroundings as long as it existed. In the new almshouse, which was built in 1873, its quarters were much improved, but much was still lacking which was necessary to the highest state of efficiency.

The objections to the location were thus stated by the superintendent in his report for 1869: "It is an annoyance to the aged and the infirm poor to have 25 or 30 boys in the same building with them. The accommodations are not such as to allow as long a sentence to the boys as would be for their greatest good. There is no regular system of labor by which the boys shall learn to work and in part defray the expense incurred for them. There is no provision for girls, and girls are sometimes truants. The expense for food and clothing is now charged to the pauper department, an injustice to that department."

Mr. Hubbard considered that no great institution or expensive building was necessary; what he desired was a series of family houses capable of accommodating from 20 to 30 pupils, a farm adapted to the purposes required, a workshop for winter work, a matron and teacher, and all under one general supervision.¹

One of the great needs of the school was supposed for a long time to be an inclosed space for a playground. While the city authorities were deliberating upon the matter, the teacher, Miss Bascom, put the boys upon their honor and allowed them, apparently for the first time, the privilege of playing in the open ground near the building. Her confidence was but little abused and the effect was salutary upon the boys. After that the demand for a fenced playground ceased so long as that teacher continued in charge.²

Notwithstanding the unfavorable conditions in the main surrounding the truant school, only good reports were made of its work and of its teachers. The latter were selected with great care, and were always women who had had previous successful experience in institutions somewhat similar. It was stated repeatedly that the boys were well fed, well clothed, well taught, and as orderly and well behaved as any 20 boys could be expected to be. One of the greatest causes of regret in regard to them was that they must return to unwholesome home influences at the expiration of sentences too short to strengthen them sufficiently to withstand evil associations.

The ungraded school was equally as fortunate as the truant school in the selection of teachers, and, like the truant school, was an object of especial solicitation on the part of Superintendent Hubbard during his incumbency. Truants who could be held there could be taught at less expense than at the truant school, but not alone for truants was it considered valuable; some pupils who were compelled by circumstances to be too irregular in their attendance to keep up with the regular classes

¹ Report for 1870.

² Report for 1875.

could be well cared for in the ungraded school and were sent there by their parents through preference.

The attendance averaged about 25 at first, but it increased to about 50, with a total registration of over 100, after a few years. Its location was changed twice, and its final home was in the old high school building on Court street, a place without objection for the purpose. For a short time the first ungraded school was located inconveniently in Auburn street, and during that time a second school of a similar kind was established in East Union street, to serve for the southern and eastern sections of the city. Both were consolidated, however, when the Court street site was occupied.

Upon his arrival and assumption of the duties of superintendent, Mr. Stone seems to have been favorably impressed with both the truant school and the ungraded school, for in his first report (1873) he speaks in high terms of the tact and efficiency of the teachers and of the beneficial and salutary reflex influence of these institutions upon the schools at large.

His subsequent reports, however, contain but scant reference to the ungraded, and little more to the truant school. The following paragraph from his report for 1878 indicates, finally, that his estimate of the value of the ungraded school was decidedly lower than that of his predecessor:

Much of the truancy which ultimately brings boys to the truant school could be better checked in its incipency if the truant officer could give his entire time to looking after this class of boys. * * * The surest remedy for the evil of truancy is prevention, and prevention is best secured by two agencies—a school in which the pupil has such an interest and enjoys with such a keen relish that he shall feel no inclination to absent himself from his daily work; and a sagacious truant officer, ever on duty, and ready to return to school the early wanderers from its duties.

Since the truant officer was also the principal of the ungraded school, this recommendation as it stood meant nothing more nor less than the discontinuance of that school. One is not surprised, therefore, to find in the next annual report (1879) the following paragraphs in the statement of the chairman of the school committee:

Owing to the crowded state of the city almshouse, the few boys in the truant school kept in that building were discharged by the proper authorities. The new county truant school building will probably be opened in the spring and offer greatly improved facilities for the teaching and industrial training of this class of children.

The ungraded school in the old high-school building was discontinued in April. This school at a certain transition period was of great value, gathering in a class of children whose irregular habits of attendance were a great embarrassment to the graded schools. But owing to the hearty cooperation of parents and teachers, and wise modifications in grading, the committee were able to dispense with the school at a saving of expense. In the same building a new primary school of two rooms has been opened.

The superintendent in the same report stated that the suspension of the truant school was followed by an increase of truancy, but expressed the hope that the contemplated county truant school could be made available to furnish a wholesome check to the vicious habit. He also says that "since the discontinuance of the ungraded school in Court street, Mr. Clark, its principal, as well as truant officer, has given all his time to the subject of truancy. * * * Mr. Clark has performed his duties with good judgment and fidelity, and I have no doubt that many more cases of truancy would have occurred had he given but a portion of his time to this subject, as in former years." The last sentence is evidently by way of justification of the recommendation in the former report.

The Hampden County truant school was opened in 1880, and after that time the history of truancy in Springfield differs in no material respect from that of other cities in the Commonwealth.

HAMPDEN COUNTY TRUANT SCHOOL, SPRINGFIELD, MASS.¹

The first fruit of the Massachusetts law of 1873 providing for county truant schools was borne seven years after the passage of the law. The cities of Springfield, Holyoke, and Chicopee in 1879 united in a request to the commissioners of Hampden County according to the law, and in response those officers established the Hampden County Truant School, which was opened in June, 1880. It is located 1½ miles from the center of the city of Springfield, upon a "farm" of 11½ acres. The structures provided are a three-story main building, barn, and several outbuildings. In the main building the schoolroom is on the second floor, and the boys' dormitories are in the third story and attic. The building is also used as the residence of the superintendent, his family, and the help. The first cost of land and buildings (in 1880) was \$12,677.96, and the present value is thus reported: Land, \$7,000; buildings, \$13,000; furniture, \$3,000.

The employees and their salaries for 1898 were: Superintendent and matron, \$1,000 a year; teacher, \$40 a month; assistant (man), \$30 a month; cook, \$5 a week; second girl, \$4 a week; laundress, \$1.25 a day. All the employees are boarded at the school.

The amounts received for the board of truants during 1898 were as follows:

From Berkshire County	\$287. 95
From city of Holyoke	691. 90
From city of Springfield	679. 05
From town of West Springfield.....	213. 74
	1, 872. 64

The expenditures during the same year were:

Repairs.....	\$550. 66
Furniture.....	134. 70
Beds and bedding	222. 21
Fuel	246. 15
Lights.....	23. 57
Water.....	45. 97
Feed and grain.....	114. 81
Labor	29. 35
Provisions	1, 328. 46
Clothing.....	588. 42
Medicine and medical attendance	28. 24
Instruction (including salary of teacher and supplies).....	621. 75
Salaries (not including teacher).....	1, 952. 20
Miscellaneous	279. 51
	6, 166. 00

The accommodations of the school were designed for 30 pupils, but for several years the number averaged about 16. Twenty-nine were sentenced during 1898 and the average number in the school at one time during that year was 21. The sentences are generally for a year, but some are for 6 months, 18 months, and 2 years.

The daily routine during winter is as follows: Rise, 5.45; breakfast, 6 to 6.30; yard, 6.30 to 7; work, 7 to 9; school, 9 to 11.45; dinner, 12 to 12.30; yard and extra work, 12.30 to 2; school, 2 to 4; yard, 4 to 5; supper, 5 to 5.30; recreation room, 5.30 to 7; bed, 7 p. m.

¹ Compiled from the Forty-fourth annual report Massachusetts board of education, p. 144; Forty-sixth annual report, p. 66; Sixty-second annual report, p. 476; Report of the treasurer of Hampden County, Mass., for 1898, and letter of Mr. Erwin G. Ward, March 9, 1899.

The class-room instruction is of good quality, and includes some manual training. The school possesses a small but well-selected library.

The following, though written by a visitor soon after the establishment of the school, seems from later accounts to be true, in most particulars at least, at the present time:

The only artificial safeguards for the custody of the inmates consist of a high board fence around a playground that is about one-third of an acre in area, and a heavy "wire mesh" that covers the windows of the sleeping apartments. These simple appliances are deemed necessary, because some of the boys who are sent to the school are determined, at first, to escape if possible, and it is expedient to have the means for holding them until other influences can be brought to bear upon them to change their motives or desires.

There is also a strongly bolted cell which can be used for disciplinary purposes, when deemed best to use it. In other respects there is nothing either in the arrangement or control of the school that has anything of a prison-like appearance. All the boys, at one time or another, sometimes all together, work on the farm in season for such work. They play ball and other games on an open lot of 1½ acres, much more than they play in their inclosed playground; and they have even accompanied the superintendent to scenes of interest away from the school premises. None have ever tried to escape at such times. The policy is to trust them as soon and as fully as they prove themselves trustworthy. Everything in the care and management of the boys, also in their appearance in their daily duties and amusements, gives a careful observer the idea that the institution is a well-regulated home for them rather than a prison.¹

Of the results, the superintendent, Mr. R. C. Barrett, wrote early in the history of the school:

As regards the pupils themselves who have been inmates of this institution, we can see in all a fair advance in knowledge of their school studies, and in most, quite a rapid improvement. We think their average advancement in scholarship to be above that of the pupils of the same grades in the schools of this city. While in some instances the improvement in the moral character of these pupils has not equaled their intellectual advancement, yet in a majority we can see a change for the better, and in some instances a very marked improvement in this regard. We know of several of our graduates, being still of school age, who have been regular in their attendance upon school since leaving us. Others are in positions of honorable employment, and we believe many will be better citizens for their training here. As to the effect upon the attendance in the public schools of the county, so far as I have been able to ascertain it, the testimony of superintendents and teachers is unanimous that the existence of this school has very greatly lessened truancy and irregular attendance in those schools.²

Berkshire County established a truant school in 1887 on the petition of seven towns, but it was never well developed and had only three or four pupils at a time at most. It was discontinued in 1898, and Berkshire County now uses the Hampden County school. A very small proportion of the municipalities of either of the two counties are represented in the truant school, most of the boys being from Springfield, Holyoke, and West Springfield, in Hampden County, and Pittsfield and North Adams, in Berkshire County.

UNION TRUANT SCHOOL OF NORFOLK, BRISTOL, AND PLYMOUTH COUNTIES, WALPOLE, MASS.

There are a number of cities and populous towns in southeastern Massachusetts in which truancy has received earnest consideration almost from the beginning of the general agitation of the question. New Bedford is entitled to the distinction of being the pioneer in establishing a truant school in an almshouse, a distinction which was never a source of pride to her school officers, but which, nevertheless, has meant much in indicating early and constant attention to a very important subject. Fall

¹ Mr. W. W. Waterman, superintendent of city schools of Taunton, Mass., in his annual report for 1882-83, p. 31.

² Taunton, Mass., school report, 1882-83, p. 30.

River, too, maintained an almshouse truant school for a number of years, and Taunton was among the first to adopt by-laws after the passage of the compulsory law of 1861. All these cities are in Bristol County, and all were prompt in petitioning the county commissioners to establish a county truant school. New Bedford school officials took action in that direction almost immediately after the passage of the law of 1873, her experience with the local school being such as to make almost any change seem desirable. Petitions to similar effect were sent in from other places in the same county, and like requests were made of the commissioners of the neighboring counties of Plymouth, Norfolk, and Barnstable by towns and cities in those counties. The idea of a union school, to be maintained by these four counties, was suggested early, and an act of the legislature in 1884 permitted them to unite for that purpose. A great deal of indifference and some active opposition was encountered among county officials as well as elsewhere. The authorities of Barnstable County steadily refused to enter into the project, but the joint action of the other three counties was finally secured, and the union truant school was established at Walpole in 1889. Barnstable County made no provision for her truants for a number of years afterward, and was relieved by law in 1894 from maintaining a county school of her own. The Essex County truant school at Lawrence is assigned as the place to which truants from Barnstable are committed.

The Union School at Walpole is on a plat of 20 acres, with a cottage for general purposes and the usual outbuildings.

The three counties jointly meet all the expenses of the institution, including the food and clothing of the inmates, excepting that the respective towns and cities pay \$1 a week for each pupil sent to the school. It costs per child about \$3.50 per week, net, for all purposes. There are 9 employees, namely, the superintendent, matron, teacher, farmer, assistant farmer, and 4 females in charge of the dining room, kitchen, laundry, and sewing room, respectively. Fifty boys were received during 1898-99, and that is about the usual number in the school at one time.

The boys are in the school room five days in the week from 9.30 to 11.30 a. m., and from 2.15 to 5 p. m., and they do the necessary work of the institution before and after school.

The superintendent, Mr. Aaron R. Morse, writes under date of June 22, 1899:

I think the sentence to the truant school should be indeterminate; then the boy has something to work for. I am in favor of treating these boys just as though they were my own, giving each a fair show. I endeavor to make the school as near a New England home as possible.

I think very few are actually cured if they return to their former surroundings, but that we have had good results here we have proof in the lives of some former inmates.

The State agent who visited the school¹ finds the greatest drawback to the school in the condition of the class-room instruction.

There is but one teacher for 47 boys in all stages of progress. "Here you have," says the agent, "all the difficulties of the district school of all grades, with this additional difficulty, that while the district school is made up of pupils of whom three-fourths are bright and ambitious to learn, the pupils in the truant schools are boys whom the teachers of the graded city and town schools, with all their superior advantages, have not been able to reach and interest." The absence of manual training he considers another serious defect.

THE UNGRADED SCHOOL AT WORCESTER, MASS.

The Worcester ungraded school grew out of the old apprentices' school, which had been established before 1840 at least. This school was kept open during about four months in the winter for apprentices and young men who were not able to attend the ordinary schools regularly. The attainments of the pupils were varied and no

¹See sixty-second report Massachusetts board of education, p. 474.

attempt was made at grading, the instruction being largely individual. The habits and characters encountered in the school were as varied as the literary attainments, and cleanliness was sometimes the first thing that had to be taught. As for behavior, the city school report of 1842, the first accessible here, states that "the school has always been a difficult one to manage, and often but little benefit has been received from it, on account of the inability of teachers to maintain order."¹

Turbulence and indifference to study were so common that ability to deal with refractory pupils was the first requisite in the teacher. It was expected that he would have to deal with "hard cases" in motley assortment, and he had to be equal to any emergency. Such being the character of the school and such the character of its teacher, it was an easy step from the "apprentices' school" to the Botany Bay for bad boys from the regular schools.

It is doubtful if the "mixed school" at New Bedford suggested the change. No mention is made of it in the Worcester reports and the metamorphosis was so natural that no outside suggestion seems to have been necessary. But whatever the cause, the change was formally made in 1862, and though the name "adult school" hung on for several years longer,² its membership after that date consisted almost exclusively of boys between 8 and 16 years of age.³

Truancy was then one of the most discussed topics in Massachusetts school affairs, and the special usefulness of the reorganized school in the treatment of truants was speedily recognized. Some of the pupils of the original sort, namely, young men who could attend but a part of the year and who would not fit into any of the grades, continued to be taught, but after 1862 the school was distinctly for truants and in subordinate pupils.

In this rôle it found immediate favor. In the Worcester school report for 1863 (p. 22), it was stated that "as a reformatory institution the school has proved to be useful, converting many of the most inveterate truants into regular attendants, and restraining many of the mischievous and vicious from their evil course." Similar statements were made in several subsequent reports.

The school grew in numbers as well as usefulness, and additional teachers and new quarters had to be provided from time to time. A school for girls on the same plan was organized in 1867 and that, too, was described as having an excellent influence.

The "Worcester Truant School" or "Reform School," as it was variously called, was established at the almshouse in 1863, and a regular system in the management of truancy, by the use of these two institutions, was developed in the course of a few years. When children became so irregular in their attendance or so unruly in their behavior that they could not be retained in the regular schools, they were transferred to the ungraded schools. There, their attendance was closely watched by truant officers, and their conduct was strictly controlled by skillful teachers. If improvement took place they were in due time returned to the regular schools; if they continued incorrigible, the courts were called upon and sentence to the Truant School was imposed.

The ungraded school was discontinued in 1874. "It had become unpopular," and it seemed possible to secure the desired results as to attendance through the constant watchfulness of the truant officers and the influence of the principals.⁴

It was never reestablished on the old basis, but an "ungraded school" upon a different plan was opened in 1898, and is still in existence. It is intended for those who for various reasons do not fit into the regular classes, and may be used for truants under some conditions, but it is by no means penal in its character.

¹ Report of the board of overseers of schools in the center school district in Worcester, 1842, p. 10.

² It was called the "unclassified school" in 1864 and the "ungraded school" a few years after.

BAY CITY, MICH.

[Statement of Hon. J. A. Stewart, superintendent of city schools, March 7, 1899.]

Some years ago we had two rooms set apart on opposite sides of the city for ungraded and truant schools combined. One has been discontinued as no longer needed. They were a good thing for our schools, as the fear of being sent to them kept many scholars regular in attendance and well behaved. We have one truant officer—a member of the police force. Transfers to the truant school are made by the city superintendent of schools for an indeterminate period. Pupils are retransferred to their former schools when they show likelihood of being regular.

At present the school is in a 3-room building, one room being used for the ungraded and truant school, and two rooms for first and second grade pupils. The teacher of the truant school is principal of the building, and receives \$600 a year.

Very few are actually transferred from the regular schools, as the truant school has a strong deterrent effect on truancy.

DETROIT, MICH.

The ungraded school at Detroit has probably received more attention and commendation from persons not connected with it than any other school of its kind in the country. It has done a valuable work in its time, but like all the others, it has at times failed to meet expectations, and now the wisdom of its very existence as an ungraded school is called into question.

Its need was felt and its establishment foretold at least ten years before it became an actuality. Supt. Duane Doty in 1873 expressed the opinion that sooner or later such a school would be a necessity, though he did not urge that the step be taken immediately, and did not enter into any elaborate discussion concerning it.¹

Among the improvements in which the next superintendent, Mr. J. M. B. Sill, showed special interest was the abolishment of corporal punishment. In 1876 he said that the elimination of the element of physical force could be easily accomplished at once if Detroit had some sufficient provision for the separate instruction of truants and incorrigibles. He, too, expected that such provision would have to be made sooner or later, but did not follow up the matter very strenuously at the time.²

Three years later he reverted to it, this time in connection with a discussion of compulsory education. The State law passed in 1871 was of no account, and Mr. Sill seemed to be in doubt whether efficient general legislation could be secured, though he thought a law authorizing a "reformatory school," with proper police cooperation, might be had for the asking.³ In 1882 a determined effort was made to secure such a law, Superintendent Sill, Representative John Devlin, and Hon. C. E. Warner, the president of the board of education, being its most conspicuous advocates.⁴ The act of May 3, 1883,⁵ resulted. It was, in reality, a general compulsory attendance law, but was especially designed to reach truant and incorrigible children, and to provide for ungraded schools in cities, which such children should be compelled to attend.⁶

The Detroit school board soon availed themselves of the authority granted in the act, and in August, 1883, directed the opening of an ungraded school. It went into operation during the following October, and before the end of the school year 158 pupils had been enrolled, with an average attendance of 45. The choice of a teacher was specially fortunate, and the police authorities cooperated cordially, detailing two officers for truant work, so that the first year's experience was highly gratifying. The majority of the pupils proved earnest and faithful, and though there were some marked exceptions, the general characteristic was one of rapid progress.⁷

Some difficulties arose from imperfections in the law, leading to its amendment and reenactment in 1885. Even then it was found that attendance could not be

¹ Detroit school report, 1873, p. 57.

² *Ib.*, 1876, p. 94.

⁴ *Ib.*, 1882, p. 51, and 1883, p. 13.

⁵ *Ib.*, 1883, p. 77.

⁶ *Ib.*, p. 13.

⁷ *Ib.*, 1884, pp. 13 and 62.

absolutely enforced, and it was only by the most careful management that parents could be induced to allow their children to attend the ungraded schools.¹ In the revision of the compulsory education statutes of 1895 the section relating to ungraded schools received their present form,² and it was thought that all the difficulties had been met. But much is still to be desired.³

The enrollment in the ungraded school has shown marked fluctuations, nearly all explainable by some circumstance or circumstances extraneous to the school itself. It has been as follows:

1883-84	158	1891-92	375
1884-85	230	1892-93	400
1885-86	372	1893-94	379
1886-87	301	1894-95	325
1887-88	221	1895-96	411
1888-89	⁴ 223	1896-97	387
1889-90	241	1897-98	⁵ 300
1890-91	307		

The story of the causes of the fluctuation is easily told. For the first three years all seemed to go smoothly. The school officers were enthusiastic and the police department cordial. Then the novelty began to wear off. The policemen detailed for truant duty were frequently called away by their superior officers for other work; school principals failed to make prompt reports of truancy; weaknesses in the laws became more glaring, and parents and children learned how to take advantage of them; the rented quarters assigned the school were so unsatisfactory as to become almost intolerable.⁶ In short, Detroit felt its share of the troubles so common in the history of ungraded schools, and the attendance showed the effect of them.

A new building was erected specially for the ungraded school and first occupied in 1890. It was supplied with a plunge bath and other conveniences needed for the peculiar work of such a school. At once the attendance increased and once more the future seemed bright.

The greatest drawback mentioned during the next few years was that the truant officers were not under school control. In 1893-94, five policemen were detailed for the truant service, but were called upon for other work so often that their school duties were necessarily neglected. This was, naturally a great hindrance to the successful operation of the ungraded school,⁷ since regularity of attendance upon it was dependent largely upon the activity of the truant officers.

The passage of the compulsory education law of 1895 caused at once an increase in the ungraded school, the enrollment for 1885-86 reaching the highest point in its history. Four additional truant officers were appointed December 1, 1895, and the increased force was able to practically free the streets of the city of juvenile truants, vagrants, and tramps, such characters being either forced to leave the city or to attend the ungraded school.⁸

In 1896 the school was removed from the building which had been specially constructed for it in a central location to another on Champlain street. The change was plainly detrimental to the best interests of the school.⁹

At the present time the conditions are not satisfactory. There is but one school to serve the entire area of 30 square miles covered by the city. Some of the children

¹ Detroit school report, 1894-95, p. 109.

² See page 201.

³ Detroit school report, 1896-97, p. 76.

⁴ Six girls were enrolled in 1888-89, and from that time to 1894-95 there were from 25 to 30 each year. The number fell to 18 in 1895-96 and to 9 in 1896-97.

⁵ The average membership was 60 and the average attendance 38. Three teachers were employed in June, 1898.

⁶ Detroit school reports, 1885-86, p. 110; 1886-87, p. 40; 1887-88, pp. 8 and 19; 1888-89, p. 17, etc.

⁷ Detroit school report, 1893-94, p. 86.

⁸ *Ib.*, 1895-96, p. 162.

⁹ *Ib.*, p. 162.

must walk 3 or 4 miles every day to reach the school, a state of affairs that would not conduce to regular attendance on the part of a much higher class of pupils than that found in a disciplinary school. In case of an unauthorized absence, if an officer is sent after a truant living in a remote section of the city, the session is about over before he can return with the pupil.¹

The establishment of additional schools of the same sort has been frequently urged both by the superintendents and by the principal of the ungraded school. It is evident that this must be done if the present system is to be continued. Whether this or the establishment of a parental school would be the wiser solution of the problem, has been under consideration recently. So far as this office is informed, no conclusion has been reached and no action taken up to this time.

GRAND RAPIDS, MICH.

[Statement of Hon. F. R. Hathaway, superintendent of city schools, March 1, 1899.]

1. The truancy department of the city of Grand Rapids has been in operation for fourteen years. During this entire time there has been but one truant officer, Mr. F. B. Fee. This man is one of the policemen of the city, and during the long summer vacation dons his uniform and serves as a regular officer. During the ten months of the school year he devotes his entire services to the work in the truancy department and is under the immediate supervision of the superintendent of schools. He is paid by the city from the same fund that other policemen are paid, and is appointed by the superintendent of police, at the request of the board of education.

2. We have an ungraded day school for pupils who do not fit into the regular grades; also an ungraded truant school for truants and incorrigibles. Both these schools are day schools. There is no organized boarding truant school.

3. We have a regular report blank which a teacher makes out when she thinks a pupil should be transferred to the truant school. The principal countersigns the same, making whatever comments he desires. This blank is then forwarded to the superintendent, who directs the truant officer to investigate the case, and if that officer unites with the teacher and principal in the recommendation, the superintendent authorizes the transfer of the pupil from the regular school to the truant school. Pupils are returned to their regular school upon the recommendation of the principal of the truant school and the approval of the superintendent.

4. All sentences to the truant school are indeterminate. Pupils may make time by good behavior. Indeed, it is our practice to return the pupil as soon as we think it prudent.

5. We do not parole pupils. Every pupil, however, who is transferred to the regular school, is transferred on the sole condition that his conduct shall be such as to merit approval.

6. Our truant school is in a 15-room grammar school. This is a decidedly objectionable feature. It should be in a building by itself.

7. We have no regular arrangement for feeding and clothing the inmates. Two or three times a year we hold entertainments, securing thereby \$200 or \$300 to be used in clothing the poor children of the city. This amount is doubled or trebled by private contributions. Children in the truant school are, however, no more liable to be helped from this fund than are children in other schools.

8 and 9. The principal of the grammar school above referred to acts as principal of the truant school. The amount of his salary which could be charged to this school is about \$100. One teacher is employed at a salary of \$600. The truant officer receives, through the police department, \$60 per month. I can not well estimate either the cost of heating the room or the expense of janitor service.

10. The daily routine of the school, as far as hours are concerned, is the same as in other schools, viz., from 9 to 11.45 and from 1.15 to 3.30. The course of instruction is rather simple, being much like that of an ungraded district school. There are very few frills. We do, however, try to foster the spirit of patriotism by means of songs, readings, and by biographical works.

11. The means employed for enforcing attendance at the truant school are those laid down in act No. 95, public acts of 1895, as amended by act No. 67, public acts of 1897, Michigan. These are served in the order in which they are numbered, beginning with B. In case a parent wishes to have his child excused under the terms of the statute he makes personal application to the superintendent. His statement is

¹ Detroit school report, 1895-96, p. 79.

taken down in writing, the case is investigated by the truant officer, and decided upon its merits. Other blanks are used in reporting such decision to the parent.

12. During the year ending June 25, 1898, there were 187 different pupils sentenced to the truant school. The average number belonging at any one time was 33, and average daily attendance, 25; per cent of attendance, 77; aggregate tardiness, 196; number of truancies from the school, 98; number returned to other schools, 64; number left to go to work, 12; number who moved from the city, 8; population of the city, 90,000.

13. It is difficult to specify the number "probably cured," as different persons might place an entirely different interpretation on the word "cured." If by that term we mean the number of pupils who are cured sufficiently so that the ordinary day-school teacher could live with them it is probably safe to place the number at 64, as that many were returned to the regular schools. But if by "cured" is meant the number who will ultimately become good citizens, Solomon himself could not answer the question. Thirteen pupils were sent to the State reform school during the year ending June 25, 1898, and as the police courts in this city have decided that all juvenile offenders under the age of 16 who are guilty of the so-called "minor offenses" must first pass through our truant school before being sent to the State reform school, this number (13) covers nearly all the cases sent from Grand Rapids to the State school during the time mentioned.

In this connection it may be interesting to revert to my experience in Flint, Mich., before coming to Grand Rapids. I organized a truant school in that city and operated it three years. During that time the tardiness in the public schools fell off half. The absentees in the public schools decreased 20 per cent. The number of arrests of disorderly juvenile persons for all offenses whatever decreased 65 per cent, and during the three years but three boys were sent to the State reform school for boys and not a girl to the State reform school for girls. The city's population is 12,000. We followed carefully the fortunes of these boys and found that more than two-thirds of those who left the school, having reached the age limit (16), secured regular employment and are now law-abiding citizens.

14. We have no special arrangement for incorrigible girls. Occasionally such persons are sent to the truant school. These instances are, however, rare. If it becomes necessary to take such a girl from the regular school we try to place her in the ungraded school.

15. I am a firm believer in the day truant school, but have not had an opportunity to investigate the boarding truant school. A necessary adjunct to a compulsory school law is a law forbidding the employment of child labor. The two go hand in hand, and neither can stand without the other. Michigan is fortunate in that she has both laws upon her statute book.

NEWARK, N. J.

[Statement of Hon. C. B. Gilbert, city superintendent of schools, March 7, 1899.]

We have a truancy department with a sufficient number of truancy officers, under the control of police management. These officers investigate all cases referred to them, and make daily reports. They also see that children reported truant are taken to school.

We have one central ungraded school for truants and those who have proved unmanageable in other schools. It is in charge of a woman, and has been eminently successful in reforming, apparently, bad boys. The management of the school is placed under the general supervision of a special supervisor, who has this added to his other duties, and who makes personal investigation of all cases. Pupils are transferred by the superintendent of schools from their own schools to the ungraded school when, after investigation by the supervisor, he is satisfied that this course is best. The sentence is indeterminate. Pupils who are deemed worthy are returned to their own schools or transferred to other schools conditionally.

The building is a small one-room structure adjoining the building used for a drawing school. It has no grounds. No provision is made for furnishing food or clothing.

The only employees are the single teacher, and the janitor who is also the janitor of the adjoining building. The teacher receives \$1,200, the janitor a small additional stipend.

The routine of the school is that prescribed by the course of study for all subjects, modified for individual cases, according to the judgment of the teacher. We have manual training every day and much nature study. Interest is the keynote of the school.

The teacher has been remarkably successful in securing regular attendance through her personal influence, though a truancy officer calls at the school every morning in order that absentees may be looked after. It is very rarely necessary to employ his services.

During the past year 75 cases were reported and investigated, of whom 41 were assigned to the ungraded school. Of these the following dispositions were made:

In ungraded school	21
Returned to graded schools.....	6
Entered parochial schools.....	1
Sent to City Home.....	4

There is a penal institution in this city known as the City Home. It is intended as a sort of intermediary institution between the local truant school and the State reform school. It, however, is penal and does not fill the place of a truant home. The city or the county should have such a home. It should be located on a farm at some distance from the center of the city, and to it should be assigned the young boys and girls not yet criminals, but so far unmanageable as to require that they be taken away from their homes.

ALBANY, N. Y.

[Statement of Hon. Chas. W. Cole, city superintendent of schools, March 4, 1899.]

1. (a) The superintendent of schools is, by law, the executive officer of the truancy department and is aided in this city by two truant officers appointed by the board of public instruction. The latter are styled "attendance officers" in the compulsory education law of this State; a better title than "truant officer," because their duties are by no means confined to cases of truancy.

(b) These officials and the principals of the several schools are governed by special regulations adopted by the board of public instruction in compliance with the directions of the compulsory education act.

2. This city maintains an ungraded room for truants and incorrigibles. It does not maintain a regularly organized boarding school. The city has contracts with two private institutions (one under Roman Catholic and one under nonsectarian management, as required by the State law) for the maintenance of truants and insubordinates who are not "cured" in the ungraded school.

3. The regulations for the transfer of truants and insubordinates to the ungraded school are as follows:

"For violent opposition, irregular attendance, namely, a loss of one-third or more of school time, or for gross misbehavior, the principal may suspend a pupil from attendance either temporarily for not more than one week or for an indefinite period, and in all cases of such temporary suspension shall forthwith give information in writing of the cause thereof to the parent or guardian, and shall apply to the member of the board in special charge of the school for advice and direction. In all cases of suspension for more than one week, the principal shall direct the suspended pupil to attend the ungraded school set apart for this purpose by the board, and shall also forthwith notify the parents or guardian, the attendance officer, and the principal having charge of the said ungraded school, of his action. The pupil thus directed to attend the ungraded school shall so attend until he has given satisfactory evidence of reformation, when he may be returned to the school from which he had been suspended, unless sooner returned by a vote of the board. It shall be the duty of the attendance officers to see that the pupils suspended for more than a week are punctual and regular in their attendance at the ungraded school, and the principal of such ungraded school shall report each month all facts concerning such suspended pupils to the superintendent of schools."

Those who are not "cured" in the ungraded school are committed to the institutions above described by the superintendent when the parents or guardians give consent, and by a police magistrate when the parents refuse consent.

4. Commitments to institutions may be for variable periods, but can not be made for a longer time than the remainder of the current school year. All commitments are now made until the close of the school year because experience has shown that short periods of confinement have little or no reformatory influence. Transfers to the ungraded school are indeterminate in length, being until a retransfer to the reg-

ular school is earned by good behavior, the actual terms varying from four months to a year.

5. The power of paroling is vested in the superintendent. I have exercised this power once only during the four years since the law went into effect. The result in that case was entirely satisfactory.

8. One special teacher is employed in the ungraded school, which occupies one room in a regular school building.

9. The only cost is the salary of the teacher, which is \$800 per annum.

10. The ungraded room opens at 8.30 a. m., closes at 12 m.; opens again at 2 o'clock and closes at 4 o'clock p. m. The opening is half an hour earlier and the closing half an hour later than the usual school hours. This prevents the pupils under discipline from mingling with the regular pupils in the building. The teacher works with each individual, the purpose being to prevent the pupils from falling behind the classes from which they are temporarily separated. The results are adequate, as these pupils are always found to be as well advanced as if they had not been suspended.

11. The attendance officers are always notified of absences and follow up each case promptly. The knowledge that truancy from the ungraded room means commitment to distant institutions for a comparatively long period is a strong incentive to punctual and regular attendance. The per cent of attendance of this room is 97, which is higher than that of any other school.

12. The number of pupils transferred to the ungraded room in the year ending June 30, 1898, was 86; the average number in the school at one time was 27.

13. The number probably "cured" was 77; the number sent to institutions (reform schools) was 9. The total number sent to reformatories was 18—13 from public schools. Four of these had been in ungraded school the previous year and 5 were from parochial and private schools.

14. So far we have had no incorrigible girls.

15. The ungraded school is, in my opinion, the most effective agency for the reformation of truants and insubordinate pupils yet devised. It is also economical, saving several times its cost by disposing of cases that otherwise would have been sent to foreign institutions at large cost to the city. I believe that the ungraded school, in cities of moderate size, is more effective than would be a local truant school wherein the culprits are confined and maintained at great expense.

I believe that State truant schools are far preferable to private institutions as reformatory agencies.

The commitments should be for indeterminate periods, not to extend beyond the compulsory age. The compulsory age should extend from 7 to 16 years, inclusive, attendance for the entire school year being required until the age of 14 is reached, while between 14 and 16 years either attendance or constant lawful employment should be required.

BINGHAMTON, N. Y.

[Statement of Hon. D. L. Bardwell, superintendent of city schools, March 27, 1899.]

1. Our truancy department is organized under the compulsory attendance law of the State of New York. We have one truant officer, who devotes his entire time to the enforcement of the law. Teachers in the schools report to him regularly any absences or suspicious circumstances, and, under the direction of the superintendent, he looks up these cases and takes such action as circumstances warrant.

2. We have an ungraded day school for truants and incorrigibles under the instruction of a young man of excellent character and sound scholarship, being a graduate of Yale University. There is also in the city, partially under the supervision of the city authorities, an institution called the Susquehanna Valley Home for orphan children. This institution receives children both from within the city and without it, who are sent to it through various processes, either by the parents or school officials.

3. Pupils are transferred from the city schools to the city truant school by commitment by the city superintendent. Causes for transfer may be grouped under two heads: (1) Irregularity and lack of punctuality; (2) serious and continued misconduct. Children are transferred to Susquehanna Valley Home (1) by parents, (2) by the city authorities, under which circumstances the city pays the board and tuition, and (3) by the board of education, when the charges must be met by said board.

4. The sentence is in every case "indeterminate."

5. Pupils are paroled from the city truant school whenever conduct and attendance warrant it, the parole continuing during good behavior. Paroles from the

Susquehanna Valley Home are so varied that a statement can hardly be made concerning them.

6. The city truant school is in a separate building away from the other schools, but I am sorry to say that the building is very old and very poor and undesirable in every respect except location. I hope that these conditions will be materially bettered before another year. The Susquehanna Valley Home has fine grounds, ample for its purpose, at the outskirts of the city.

7. In the city truant school food and clothing are provided by parents when this can be done. When parents are unable to do this one of three private organizations attends to the matter, and when the private organizations can not or do not take care of the children it becomes a city charge.

9. The city truant school costs in salary \$1,400, in incidentals, \$200.

10. The routine is much like that of a first-class ungraded rural school.

12. During the year 1897-98, 54 commitments were made, the average attendance being about 12.

13. Of these 54, 12 were sent to out-of-town institutions, not, however, to regular reform schools, but to industrial and manual training schools. Of these 54, only 6 have made it necessary for us to deal with them during the present year.

14. We have not, but need, some special arrangements for incorrigible girls.

BUFFALO, N. Y.

[Statement of Hon. Henry P. Emerson, superintendent of education, March 16, 1899.]

1. Our State law requires school authorities in each city to establish and maintain a truant school, or to contract with another city or with some private institution to take charge of incorrigible truants. Accordingly I opened our truant school November 27, 1897, at the same time dividing the city into five districts and appointing as many truant officers to look after absentees reported by the principals of the schools in their respective districts, and also boys and girls of school age found running the streets. The truant officers are paid \$850 per year.

2. Ours is a regularly organized boarding truant school.

3. Commitments are mostly by consent of parents; otherwise by police justices.

4. The "indeterminate" sentence is used.

5. Paroled pupils must attend regular school.

6. We use an old brick schoolhouse; put it in good condition and made an addition to it, making a convenient building.

7. The principal boards the boys at \$1.75 per week. The city furnishes uniforms which are made in State prisons.

8. One male principal and one female assistant are employed; also a man who serves as janitor and watchman.

9. The principal receives \$1,000; assistant, \$600; janitor, \$600.

10. The boys spend part of their time in doing housework, manual training, and bookwork.

11. They are detained in the school night and day.

12. About 100 were sentenced during year. Average number in school at one time, 35.

13. Nearly all show improvement. Probably 60 per cent to 70 per cent attend school regularly when released. None have been sent to reform school.

14. No special provision has been made for girls.

15. It is my belief that the chief benefit of the truant school is found in its deterrent influence. I think that where one boy is committed, probably four others are kept from truancy.

CITY OF NEW YORK, BOROUGH OF BROOKLYN.

The first annual report of the schools of the consolidated city of Brooklyn, made March 1, 1856, by city superintendent J. W. Bulkley, contained a portrayal of the results of truancy and of tuition in the "street schools," and also an earnest recommendation that steps be taken to free the streets of vagrants and idlers.¹ Subsequently the mayor of the city called the attention of the common council to the matter, and in December, 1857, \$10,000 were voted to establish a "Truant home" under the truant law of April 12, 1853.² In due time a building was leased and put in order, a superintendent and teachers were employed, and the institution made

¹ Brooklyn school report, 1855-56, p. 31.

² *Ib.*, 1856-57, p. 47.

ready to begin operation. Three truant officers were appointed and entered upon the work of visitation. They visited the schools regularly and sought out truants, inducing them if possible to attend school regularly. They were successful in most cases, but it was necessary to commit about 70 to the truant home within the first year after its establishment.¹

Neither the school nor the truant officers were put under the control of the board of education, but remained under the direct care of the common council. One of the aldermen at the time, Mr. Aaron B. Clarke, was also the principal of one of the public schools, and it was largely to his intelligent interest and energetic efforts that the establishment of the new order of things was due.² It is likely that his special knowledge of the conditions of truancy, and his fitness for the supervision of agencies for its control, was the principal reason for giving the management of the truant school and officers to the committee of which he was a member. But aldermen are rarely school men, and the control by another body of an institution so intimately connected with the work of the schools was always a source of dissatisfaction to the board of education.

For the first few years the management of the school was commended by the school officers, who declared in 1861 that the principal and his assistants were "faithfully, intelligently, and successfully doing their duty."³ At that time the inmates of the "Home" were almost entirely from the schools, sent there in consequence of truancy. Commitments were by the mayor, police magistrates, and by aldermen. In April, 1860, there were 101 children in the institution, and 167 had been received during the year preceding. In the same time 136 had been discharged and returned to friends, and 21 had been provided with proper homes.⁴

All continued to go well for a time, the truant officers rendering valuable assistance to the teachers and school officers, and the truant home meriting and receiving the commendation of all those interested in its conduct. "That the gentlemanly superintendent and his efficient assistants did all in their power by a careful and wise supervision and faithful and intelligent instruction does not admit of a doubt."⁵ The fact that the board of education had not direct control was deplored, but did not apparently affect the cordial relations of the officials or the efficiency of the system.

The first trouble came in 1862, when the then mayor took exception to some of the provisions of the law and declined to authorize the payment of the truant officers, necessitating the discontinuance of their services.⁶ Truancy immediately increased, quite naturally. Many of the teachers undertook to make special policemen of some of the boys in school by sending them out to hunt up the absentees, but this experiment was a failure. The truants and their associates would lay in wait for the little messengers, beat them severely, and otherwise maltreat them; so that method was soon abandoned.⁷ The truant home was continued, and the magistrates sent offenders to it upon proper complaints, but commitments for school offenses fell off, since there were no special officers to prosecute them, and the proportion of inmates of criminal tendencies and associations increased. The institution thus became in effect a city reform school.

The board of education was not content to allow this condition of affairs to continue without an effort at improvement, and twice in 1865 sought from the State legislature an act to authorize the maintenance of a truant home by the school authorities directly. These efforts failed, but in another direction they were more successful; five members of the sanitary police force were detailed as truant officers and to attend to the general interests of the schools.⁸

Brooklyn was one of the few places in the State in which the school-attendance law of 1874 was ever more than nominally enforced. The board of education in the

October following its passage directed that a census be taken of the children of school age in the city, and this was done, though imperfectly, in the following July. Five attendance officers and a superintendent of attendance were appointed, this time by the board of education directly, in October, 1876.

These men went to work with intelligence and industry, and secured the discharge from employment of all children found working in violation of law. To compel the regular and orderly attendance of these, and of children found idle in the streets, proved a more difficult matter, and it sorely perplexed the school authorities. To provide means for the reformation of habitual truants, the common council transferred the truant home to the board of education, and it was accepted by them June 6, 1876. There was some misunderstanding as to who had authority to commit offenders, and neither those formerly in control nor the attendance committee of the board of education would take any action for several months. The number of inmates as a result fell to 28 at the close of 1877, and the expense of maintenance rose to \$300 a year per pupil. The city council then (January, 1878) withdrew its cession of the institution, and thus ended, unfortunately, the control of the truant home, which, during years before and years after, the officers of the board earnestly sought. At that time the premises of the institution consisted of 12 acres of fertile land and two large and convenient buildings, with a capacity of 250 inmates. The expense of maintaining it by the city council amounted to nearly \$15,000 a year.¹

Two day truant schools, or "attendance schools," were established in October, 1878, and placed in charge of competent men. By the end of the year there were 79 and 34 pupils, respectively, in attendance in them.² Superintendent Field was highly gratified at the work of these schools and reported in 1879 that not only were the regular schools relieved and improved by the taking away their worst boys, but that those boys themselves were greatly benefited by the change. Absence of humiliating comparisons with pupils of higher attainments had an encouraging effect upon them, and under the constant espionage to which they were subjected their attendance became as regular as the average pupils of the best grammar school.³

No special change in conditions relating to compulsory education is noted in any of the school reports until 1887. The attendance agents increased to 8 besides the superintendent in the meantime, but their plan of work was the same; the two attendance schools continued to receive those who were not amenable to the discipline of the regular schools, and boys beyond the power of the attendance schools were sent to the truant home.

In October, 1887, the office of superintendent of attendance was abolished and the attendance department was transferred to the superintendent of public instruction, then Hon. William H. Maxwell.³ That gentleman at once set about to improve the details of the administration of the law, and undoubtedly accomplished many desirable reforms. But he was hampered by the insufficiency of the truant force, by ambiguities of the law which he was required to enforce, and by the unsatisfactory character of the truant home, where boys convicted of no worse offense than truancy were associated with thieves and other malefactors.⁴ Children were sent there only when it became absolutely necessary, for it was well understood that few indeed were cured of truancy by sojourn in such companionship.⁵ Nor did the attendance schools meet the approval of the superintendent. The accommodations assigned them were inappropriate and insufficient, and their reformatory influence was not great.⁶ In 1892 it was recommended that they be either abandoned or reorganized on an entirely different basis.⁷ The first alternative was acted upon; the board of education granted no money for their maintenance in 1893, and they were abolished.⁸

The compulsory education law of May 12, 1894, embodied features that had been urgently recommended for years by the Brooklyn school officials, and its enforcement brought important changes in the work of truancy department of that city. The provision relating to truant schools made the reorganization of the truant home a necessity, since no person convicted of a crime might be sent to the same institution with truants. No truants were committed to the truant home under its former organization after January 1, 1895, and a legislative act in that year¹ transferred the control and management of the institution from the city council to the board of education. In October, 1895, all the former inmates having served out their terms, a complete change was effected in the management and surroundings of the institution. The buildings were put in sanitary condition, new ones were added, proper facilities for school work provided, satisfactory arrangements made for the food of the inmates, and other improvements were made. In many respects there had been serious deficiencies under the old regime, and there was great room for improvement.² The entire personnel of the management was changed at the beginning. The plans and ideals of those concerned in these changes were admirable and assuredly deserved success.

The truant [said Superintendent Maxwell³] is almost invariably untidy and uncleanly in his clothing and personal habits; he is addicted to the use of vile and vulgar language; he is backward in his school attainments, but highly developed in low cunning; and if he ever possessed it, has almost wholly lost the power of sustained attention. A study of the habitual truants in our truant school confirms the common impression that truancy, if unchecked, is a fruitful source of crime.

Obviously, the administration of a truant school should aim at the eradication of these faults. The boy must be trained, in everything he does, to habits of order, cleanliness, and politeness. He must learn respect for himself as well as for others. He must acquire the power of fixing his attention on a piece of work until it is accomplished. He must be gradually accustomed to recognize the value of school studies as a preparation for a useful life.

To design a set of school exercises that will secure these results is a matter requiring much care and thought. A short experiment soon showed that to devote the school day wholly to the ordinary school work would not produce the desired effect. It was discovered that the first thing to be done—the sole condition that would render other work profitable—is to train the power of attention. The most effective means we have so far found to this end is military drill. Every morning from 8 until half-past 9 o'clock the boys are subjected to this discipline. The absolute order enforced by the exercises themselves, the close attention required to recognize the commands, and the prompt response required when the command is given, impart to the boys not only habits of order, obedience, and politeness, but a power over themselves that enables them slowly but surely to keep their minds fixed on whatever task is required of them.

Next in usefulness to military drill came sloyd work and drawing. The exercises employ the hand and eye as well as the brain. The act of cutting a piece of wood accurately to a line and in order to form a figure similar to a model, is in itself a severe strain on the attention. To perform the act correctly, the thoughts must not wander, the eye must be kept true and the hand steady. Thought is required to direct the muscular action, and the muscular action has a strong reflex effect in steadying the thought. Singing too has been found to exercise a most refining and humanizing influence.

Improvement in reading, writing, and arithmetic, almost invariably follows proficiency in military drill, manual exercise, and music, and the improvement is even more noticeable in the boy's deportment and habits of life. The very idea that he is acquiring a power and a knowledge which most boys do not possess, raises him in his own respect and makes him desire the other accomplishments that usually belong to a worthy member of society.

The first year's experience under the board of education was measurably successful. Under the law all inmates must be discharged at the end of the school year, and of the 118 boys committed to the school during 1895-96 it was necessary to

¹ New York laws of 1895, chap. 687.

² Brooklyn school report, 1895, p. 79.

³ *Ib.*, p. 81.

recommit only 16 during the year 1896-97. The rest had either passed beyond the compulsory age or were attending their schools with reasonable regularity.¹

The relation of the truant school to the school system was not altered by the merging of Brooklyn into the city of New York and no radical change has occurred in the control of the institution. Its present condition and methods are set forth in the following statement of Borough Superintendent E. G. Ward:

[Statement of Hon. Edward G. Ward, borough superintendent of schools, April 14, 1899.]

1. A committee of the borough school board, consisting of seven members, has charge of all matters relating to truants and the truant school coming under the provisions of the compulsory education law. This committee makes rules and regulations for the management of the truant school, and appoints all teachers, care takers, etc., to serve in the said school, and such attendance officers as the borough superintendent of schools may nominate. Its action in all these matters is subject to the approval of the school board. The number of attendance or truant officers in the employ of the board at the present time is ten. These officers work under the direction and control of the borough superintendent of schools. The principals of the schools are supplied by the school board with postal cards by means of which they notify the attendance officers of the absence of children known or suspected to be truants. The police also notify the superintendent of schools of such cases of nonattendance as come under their observation. The factory inspectors also notify the superintendent of cases in which they find children illegally employed in factories.

2. There are but two ungraded classes in our schools. Both are for incorrigibles rather than truants. We have a regularly organized truant school. It is a boarding school in this sense only, that the pupils are confined there until they have earned their way out by good conduct and by work performed. No pay is exacted from parents, the entire cost of maintenance falling upon the department of education.

3. When a child has played truant repeatedly and has repeatedly been placed in school by the attendance officer to whom he has been reported, the parent is required to make affidavit that he is unable to compel his child to attend school. If failing to secure the regular attendance of the child, he refuses to make such affidavit, his neglect constitutes a violation of the compulsory education law (section 4, chapter 106, laws of 1896, State of New York), and said violation is a misdemeanor, punishable for the first offense by a fine not exceeding \$5, and for each subsequent offense by a fine not exceeding \$50, or by imprisonment not exceeding 30 days, or by both fine and imprisonment. Having made the necessary affidavit, the parent signs a consent to have his child attend the truant school. The borough superintendent may then, at his discretion, commit the child to said school. If, however, the affidavit or the consent or both are missing and the truancy continues, the child may be proceeded against as a disorderly person, and upon conviction, sentenced to be confined in the truant school for the remainder of the current school year.

4. I have just answered this question as concerns commitments by a police justice. When the borough superintendent of schools commits a child there is, under our present practice, no definite length of sentence, the child being released as soon as he has earned a certain number of marks for good conduct and laid away or deposited a certain amount of truant school (tin) money. The number of merit marks to be earned is 500, the sum of money to be saved is \$40. The money is given the children for the work that they do, not only in their studies, but in making beds and doing other housework, and in the farming work provided in the inclosure surrounding the school. Out of the money they receive they pay a certain amount for meals, etc. When a boy behaves well and takes good care of his money, his release ought to be accomplished in about three months.

5. The majority of the pupils paroled are sent out to make room for others, our accommodations being far less than, under a vigorous enforcement of the compulsory education law, they should be. Pupils are also paroled in case of the severe illness of near relatives or in case of their own illness. Occasionally they are paroled for religious or other reasons. Permanently paroled or what I may call "ticket of leave" pupils report to me weekly, bringing with them a statement of their attendance and conduct signed by the class teacher and countersigned by the principal. Through these weekly interviews I acquire in most cases a strong personal influence over the delinquents, which I exercise to the best of my ability for their good. After a pupil has reported to me for three months, if his conduct and attendance upon school have been satisfactory, his parole becomes a release. The paroling system has thus far

¹ Brooklyn school report, 1896, p. 73.

been exceedingly successful, most of the pupils with whom I have dealt in this way making better records both in conduct and attendance than the average good pupil.

6. Our truant school is located in a suburban district on a plot of ground belonging to the city, including 15 acres, three-fourths of the ground being available for farming, gardening, and nature study. The building has dormitories for 108 scholars. It contains well-lighted class rooms sufficient for that number of children, supplied with adjustable desks and seats, dining and wash rooms, a reception room, an office, and suitable living apartments for the principal and his family. Other buildings on the ground supply suitable rooms for a laundry, for baths, for drills, for hospital purposes, and for chapel exercises.

7. Food and clothing are supplied through the same channels by which books, stationery, and other supplies are sent to the school.

8 and 9. The following is a list of the employees, giving the salary of each:

One principal	\$1, 500
One matron (wife of principal)	420
One caretaker (who is in charge of boys when they are not under the care of their teachers)	480
One caretaker	420
One engineer	730
One seamstress	360
One night watchman	300
One cook	300
One class teacher	1, 200
One class teacher	900
One manual training teacher	1, 000
One drill master	540

10. The hours of duty for the class teachers are from 9 a. m. until 5 p. m., with a recess of an hour in the middle of the day, on all days excepting Saturday, Sunday, and holidays.

The hours of duty for the caretakers are from 5 p. m. of each day to 9.20 a. m. of the following day, on all days excepting Saturday, Sunday, and holidays, when they are on duty all the time. They do not go to supper until 6 p. m., and in no instance do both go at the same time. One remains in charge of the pupils until relieved by the other.

The time schedule is as follows: 6 to 6.25, boys rise and dress; 6.25 to 6.35, boys make beds, wholly or in part; 6.35 to 7, lavatory; 7 to 7.30, breakfast; 7.30 to 9, military drill, including toilet for 15 minutes, in yard or drill house; 9 to 9.30, opening exercises and music; 9.30 to 10.30, school work, first period, one-sixth of school outside; 10.30 to 10.45, recess, toilet; 10.45 to 11.30, school work, second period, one-sixth of school outside; 11.30 to 12.30, school work, third period, one-sixth of school outside; 12.30 to 12.45, toilet; 12.45 to 1.15, dinner; 1.15 to 1.45, noon recess, in yard or drill house; 1.45 to 2, toilet; 2 to 3, school work, fourth period, one-sixth of school outside; 3 to 3.15, toilet; 3.15 to 4.10, school work, fifth period, one-sixth of school outside; 4.10 to 5, school work, sixth period, one-sixth of school outside; 5 to 5.15, toilet; 5.15 to 6, recess, in yard or drill house; 6 to 6.30, supper; 6.30 to 6.45, toilet; 6.45 to 8, reading, sewing, singing, whistling, etc.; 8 to 8.15, toilet; 8.15 to 8.30, boys retire.

On Saturday, from 6 to 9.10 a. m., the same schedule is observed as on other days. During the remainder of the day and up to 6 p. m. the boys, divided into squads, each squad in charge of a foreman selected from the boys who have received instruction during the week, and all under charge of the principal and caretakers, are taken to the farm for work; the usual time is allowed for dinner. When the weather proves unfavorable for work in the field, scrubbing the floors and woodwork of the school building are substituted. During the afternoon the boys, in squads, take their weekly baths.

11. As the pupils are confined to the building and grounds day and night, there is no question of enforcing attendance.

12 and 13. During the year 1897-98 the number of pupils committed was 147. The average number in the school at one time was 67. For the year 1898-99 the figures will greatly exceed the foregoing. During the five months between October 6, 1898, and March 6, 1899, I committed 141 boys to the truant school. Of this number 2 are serving their fourth term, 9 their third, and 38 their second. From these figures and other data it appears that about 70 per cent of the boys committed do not return to their habit of truancy when released. We should undoubtedly make a better showing than this were it not for a provision of law which obliges us to close the school on the 31st of July, dismissing a great many pupils who have not been under

its influence long enough to derive much benefit therefrom. A bill has been prepared for presentation in the present legislature doing away with the July dismissal and making the school session continuous through the year. I trust we shall have no difficulty in securing its passage.

14. No special arrangements have been made as yet for the care of incorrigible girls.

15. I do not feel like making suggestions at the present time, being in a recipient rather than a communicative frame of mind. The successful execution of the compulsory education law with all that the phrase implies concerning the reformation of truants involves the solution of many problems of which, as yet, I consider myself only a student.

It has been frequently suggested that the Brooklyn Truant School, with the ground surrounding it, should be turned over to the board of education of the city of New York for the use of all the boroughs, but those who have made this proposition have ridiculously underrated the needs of Brooklyn itself. We have but ten attendance officers for the whole borough in which there are more than 120 schools, yet on more than one occasion an individual principal has asked me to assign an attendance officer to his school to the exclusion of all other work for at least two weeks, and the demand everywhere for the services of these officers is far greater than can be possibly met. I doubt whether 30 officers would be sufficient to do the school work, keep the streets reasonably free from idle and vicious boys, and in general reduce truancy to a minimum; and just as the force needs to be increased does the size of the building need enlargement. In other words, Brooklyn needs a truant school with accommodations at the very least for 300 boys. To provide these with suitable outdoor exercises, farming, gardening, and the nature work so desirable to inculcate habits of industry, to cultivate the observing faculties, and to create a love of nature, the ground around the school is none too great.

NEW YORK CITY—BOROUGH OF MANHATTAN AND THE BRONX.

The board of education of the city of New York was not organized until 1842, and the only "public schools" existing prior to that time, in this century, certainly were those conducted by the Public School Society. This association was incorporated in 1805 as the Free School Society, its object being "the education of such poor children as do not belong to or are not provided for by any religious society."

Such societies were common in those days. Though they were all, generally speaking, private corporations, they received public moneys, and their functions and official relations made them in fact semipublic affairs. But their schools were essentially charity schools.

After the organization of the New York board of education in 1842, the operations of the Public School Society were greatly restricted, and rivalry sprang up between the two organizations. Their differences were finally settled in 1853 by merging the society into the board of education, the schools of the former then becoming public schools in the sense in which the term is now used.

The Public School Society had no authority to compel the regular attendance of their pupils, nor to bring in those who did not willingly attend. But the large number of vagrant and truant children who spent their time in the streets and around the wharves of the city constantly attracted the attention of the society. The first step taken to bring such children within the influence of the schools was the appointment, February 1, 1827, of an agent to devote his time to personal visits to the children of this class and to their parents, with a view to increasing school attendance.¹ The agent appointed was Mr. Samuel W. Seton, who continued to discharge these and other responsible duties in behalf of the society during the entire remainder of its existence. In the first three months he visited 1,700 families, having 3,700 children. He could use no other weapon than argument and persuasion, but he nevertheless induced many to go to school.¹ His report in 1831 advised some form of coercive law and the withholding of municipal aid from families that neglected to send their children to school,² and his recommendation was repeated in an appeal of the society to the common council.

¹ Bourne's History of the Public School Society, p. 119.

² Public Education in the City of New York, Boese, p. 121.

In seeking plans for the improvement of the schools, a committee, of which Mr. Seton was a member, was sent in 1832 to visit Boston, whose school system at that time was admittedly the best developed in the country. In their report of this visit the committee called special attention to the superiority of the Boston schools in the matter of regularity of attendance, ascribing it to the fact that "truants in that city is deemed a criminal offense in children, and those who can not be reclaimed are taken from their parents and placed in an institution called the 'School of Reformation,' corresponding in many respects with our House of Refuge."¹ The committee wrote approvingly of this practice, and the general matter of nonattendance was brought before the common council. The result was the passage of the resolution previously recommended by the society to the effect that parents who did not send their children to school must consider themselves without the pale of public charities and not entitled in case of misfortune to receive public favor.² Twenty thousand copies of this resolution were printed and distributed by the agent of the society.

The matter was again taken up in 1838, and a resolution was passed by the executive committee of the trustees authorizing the appointment of a committee to prepare "a plan which may lead, through the aid of our common council and legislature, to a more general attendance of the children of the poor and laboring classes at school, and prevent the multitudes now roaming through our streets from the continuance of a habit so destructive to good morals."³ The committee was duly appointed and their report favored the enactment of a compulsory statute, though they doubted if "the morbidly excitable sensitiveness of our laboring classes" would permit it. Nevertheless the plan they presented included securing the enactment of a law "subjecting the stubborn and vicious minor to his being committed to a manual labor school or asylum for moral reformation, to be established," and "the founding, under the management of the Public School Society, or that of a society to be organized for the purpose, of a manual labor school, in an insular situation, to which refractory children may be sent at the request of their parents, or under the law, the passage of which they now ask for."⁴

The report was adopted and a memorial was transmitted to the common council. That body refused to authorize compulsory measures, putting a stop to the entire scheme. The society thereupon employed on their own account four "visitors" to work among nonattendants and vagrants in much the same way that Mr. Seton had done. These men were intelligent and faithful, and brought into the schools several hundred children who would otherwise have remained mere vagrants in the streets. Few of them, however, could be induced to remain, and after a few years of faithful trial the net results were found not sufficient to justify the necessary expenditure, and in 1841 the plan was reluctantly abandoned.⁵

The controversies that arose with the board of education during the following years were of such overshadowing importance that no marked attention could be paid to compulsory attendance or its related topics, but after the consolidation of the rival organizations and the passage of the truant law in 1853 the question was from time to time attacked with greater or less vigor, but without result. The feeling was that the masses of the people would not peacefully allow the enforcement of the compulsory law, and both the school and the judicial officers shrank from undertaking new duties so difficult, troublesome, and delicate.⁶

Thus the matter rested without effective action until the passage of the compulsory attendance law of May 11, 1874. Then it was that the board of education, "aware of the almost insuperable difficulties of carrying the same into effect, but

⁶ *Ib.*, p. 127.

persuaded of the great importance to the thousands of truant children in the city, growing up in ignorance, and to the community in which they are so growing up, undertook cheerfully to carry the law into effect so far as the means at its disposal would permit.”¹

Accordingly a census was ordered to be taken of all children between 8 and 14 years of age, a superintendent and eight officers of truancy were appointed, and provision was made for the commitment of delinquents to Randall’s Island, where they were to be detained, restrained, and sent to school either by the commissioners of charities and corrections or the Society for the Reformation of Juvenile Delinquents, in the discretion of the trial justice.¹ The commissioners of charities and corrections at that time maintained a “nursery” for neglected and abandoned children on Randall’s Island, and the institution under the Society for the Reformation of Juvenile Delinquents was the House of Refuge already described.²

High hopes were entertained of the results to be obtained from the measures contemplated, and energetic work was begun as soon as the necessary preliminaries were completed. From March 1, 1875, when the truancy agents entered upon their work, to the close of the year, 10,189 “cases” were investigated; 1,121 nonattendants were brought in; 537 habitual truants were put to school; 44 were committed to the commissioners of charities and corrections and 16 to the Society for the Reformation of Juvenile Delinquents. Besides these, 78 children were sent to reformatory institutions by their parents at the instance of the truant officers to avoid arrest and court proceedings.³

The superintendent of city schools, Mr. Henry Kiddle, was apparently lukewarm in his support of the compulsory laws, but, nevertheless, stated in his report for 1875⁴ that an increase of school attendance and a diminution of truancy had been produced by the operation of the law, and that its indirect influence had been of considerable value in inducing indifferent parents to send their children to school with greater regularity.

The “nursery” of the commissioners of charities and corrections was closed January 1, 1876, by a legislative act, and the truants confined there were released. Nothing remained then but to send delinquents from the schools to the House of Refuge. The superintendent of truancy at once saw the inadvisability of doing this, and urged the establishment of a truant school and home under the sole management of the board of education.⁵ That body seriously considered the proposition,⁶ but finally, instead, designated⁷ the New York Juvenile Asylum, and the New York Catholic Protectory⁸ as institutions to which truant children might be committed. The boys

⁷ *Ib.* for 1876, p. 41.

⁸ These institutions still receive truants from the New York schools.

The New York Juvenile Asylum was chartered in 1851 “to receive and take charge of such children, between the ages of 7 and 14 years, as may be voluntarily intrusted to them by their parents or guardians or committed to their charge by competent authority, and provide for their support, and to afford them the means of moral, intellectual, and industrial education.” Children younger than 7 years are also admitted under certain conditions. The children received during 1837 and the causes therefor were as follows:

Destitution	422
Truancy and disobedience.....	196
Disorderly conduct	315
Pilfering.....	46
Peddling.....	4
Total.....	983

The asylum proper is finely situated on One hundred and seventy-sixth street and Amsterdam avenue, where it possesses about 20 acres of land and buildings sufficient for 1,000 children. It has

from the schools remaining in the House of Refuge, numbering 88, were thereupon discharged.

It was found impracticable to carry out to any great extent that part of the law which provided for inflicting a fine upon the negligent parent of a school offender, and that constituted one of the principal grievances that Superintendent Kiddle had against the compulsory measures.¹ He also argued, generally, that the arrest of street vagrants belonged more appropriately to the police than to the department of public education, and, specifically, that notwithstanding the faithful exertions of the truancy officials, the results were not at all commensurate with the expense incurred.²

The last statement, however, is not borne out by the figures of the superintendent of truancy, for the showing they make seems in the light of later experience to amply justify the expense of maintaining the department. Fourteen thousand seven hundred and nineteen cases were investigated in 1876; of that number, 3,627 were children kept at home by parents and returned to school at the instance of the agents; 3,966 truants were placed in school, and 253 were sent to various institutions on the complaint of or through the advice of agents.³ This would be considered nowadays a very fair return for the labors of nine men, especially as it does not take into consideration the deterrent influence of such work, always its most important feature.

As time passed new difficulties arose to limit the usefulness of the truant agents, and the old troubles became more pronounced. The courts held that bootblacks and newsboys were "laborers," and not amenable to the law;⁴ the superintendent of truancy appointed in May, 1877, considered it improper for him to deal with vagrants or thieves;⁴ the deficiency in school accommodations was a serious obstacle in some districts;⁵ the formalities required in making arrests were a constant source of delay and difficulty;⁶ the lack of a suitable place for the detention of truants caused much solicitude and annoyance,⁶ and the attitude of the city superintendent of schools, as shown by his reports, must have been a great discouragement to the truant officers. Nevertheless, the operation of the law continued to be beneficial on the whole, without question.⁶ The need of a truant school was constantly felt and persistently urged by the successive superintendents of truancy, but there was no change in the provisions made, and the House of Refuge, the Catholic Protectory, and the Juvenile Asylum continued to receive convicted truants.

The office of superintendent of truancy was discontinued January 1, 1881, and the duties of the position were transferred to the superintendent of schools, then Mr. John Jasper.⁷ That gentleman made many improvements in methods, but no radical changes appear to have been introduced. One of the devices first mentioned in his reports was to make "special visits" to certain districts in which truancy was known to be excessive. On these occasions the entire truant force was put temporarily in a single district to gather in by sudden and concerted action all delinquents who had successfully evaded the single agent assigned regularly to that district.⁷

Superintendent Jasper has consistently favored and regularly recommended the establishment of a system of ungraded classes for the milder cases and a reformatory school for apparently incorrigible cases of truancy. His published reports, however,

also two branches, a house of reception in the city and a western agency in Illinois for placing out its children in farmers' families.

The New York Catholic Protectory was founded in 1863, and is located at West Chester. It received 1,165 boys and 271 girls during 1897-98, and the average attendance during that year was 2,518. A comparatively small proportion of these were committed for serious delinquencies, the majority of commitments being for destitution, disobedience, or disorderly conduct. Besides the ordinary school branches a number of trades are taught, including printing, bookbinding, shoemaking, tailoring, plumbing, harness making, carpentry, painting, and paper-box making. With a few exceptions the inmates of the institution are of the Catholic faith.

have not shown or discussed wherein the institutions assigned for the reception of truants have failed to accomplish the ends desired, or what have been the results of confinement in them.

From 1881 to 1894 the execution of the truant law continued without marked change or noteworthy incident beyond the fluctuations and numbers that are to be expected. The truant agents increased to 12 in that time, and they investigated from 10,000 to 15,000 cases, returned about 3,000 truants to school, brought in about 1,000 nonattendants, and caused from 40 to 75 to be sent to reformatory institutions each year.

The passage of the compulsory attendance laws of 1894 and 1896, however, marked the beginning of a new era. In 1895 the board of education took steps to provide and equip the truant school so long desired and so often recommended by the executive officers, and increased the number of "attendance officers" (instead of truant agents as before) to 20.¹

The greater effectiveness of the new law is apparent in the statistical reports of these officers. The cases investigated were 16,150 in 1894 and 23,842 in 1896; truants returned to school, 3,768 in 1894 and 6,364 in 1896; nonattendants brought in, 1,143 in 1894 and 3,379 in 1896; children sent to reformatory institutions, 46 in 1894 and 35 in 1896.²

The consolidation of the several municipalities to form the greater city of New York did not affect the operation of the compulsory attendance laws, and their enforcement remains in the same hands as before, namely, those of Mr. John Jasper, now the borough superintendent. His statement relating to the present status of the truant school follows:

[Statement of Hon. John Jasper, borough superintendent of schools, March 28, 1899.]

1. According to the by-laws of the school board for the boroughs of Manhattan and the Bronx, the borough superintendent is held responsible for the enforcement of the New York State compulsory education law. He has a supervisor and as many attendance officers as there are attendance districts. There are at present 21 attendance districts and 21 attendance officers, one of whom is acting supervisor. Also, 1 special officer is detailed by the police department.

2. We have no ungraded day schools, but there are three ungraded classes for truants in three different schools, and we have a regularly organized boarding truant school capable of accommodating 50.

3. The general process by which pupils are sentenced or transferred is detailed in the compulsory education law. The particulars relating to suspension of pupils are given in section 64 of the by-laws of the school board.

The attendance officer brings the boy to the office, and by means of a summons secures the presence of the person in parental relation. The letter from the principal and the officer's affidavit as to the history of the case are presented. A private hearing takes place. The parent's written consent for commitment is then taken before a notary. The papers are submitted to the borough superintendent and his signature completes the act. A complete record is made in the commitment book for reference, where also a daily record of the child's conduct is kept.

If the parent will not consent, he is summoned before a magistrate and proceeded against according to section 9 of the compulsory education law, upon the officer's affidavit. The evidence is placed before the magistrate, who secures, if possible, the parent's consent, or, in lieu thereof, commits the boy for the balance of the school year to any institution controlled by persons of the same religious faith as the parent.

The Truant School, the New York Catholic Protectory, the New York Juvenile Asylum, and the House of Refuge are the only institutions to which truants are committed.

In case of incorrigible truants who can not be sufficiently controlled in the Truant School, transfers to any of the aforesaid institutions may be made by similar process.

4. Under the State law, the length of the sentence is for the balance of the school year.

¹ New York school report, 1895, p. 152.

² New York school reports, 1894, p. 156, and 1896, p. 159.

5. The acting supervisor reports to the borough superintendent:

"As to the paroling of the boys: If, while an inmate of the Truant School, the boy appears to feel his punishment and endeavors to obey everyone here, has a good record while in the class room, and the attendance officer is willing to place him, or the principal of the school which he last attended is willing to readmit him, and the parents appear willing to perform their duty in causing said child to attend school, and if the Truant School is crowded, I then have the boy sign a paper addressed to you and he is sent home with his parents or to school with the attendance officer. If the boy is sent home with his mother the attendance officer is notified at once. The boy must report every Friday at the Truant School if his home is near or every two weeks if living at a distance."

6. The Truant School is located at 215 east Twenty-first street, east of Third avenue, in a four-story brick building. The basement contains laundry, kitchen, play room, wash room, and boiler room; the first story, the office and the dining room; the second story, two schoolrooms and a bedroom; third story, two sleeping rooms; fourth story, two sleeping rooms, a hospital room, a disinfecting closet, and two small bedrooms. There is a small back yard and a narrow entrance to it. There is one main stairway and there are outside fire escapes.

7. Food and clothing are provided as follows:

The dry groceries are purchased from responsible merchants; the requisition is signed by the chairman of the committee on special schools; other groceries, such as vegetables, milk, etc., are obtained from a grocer near the school, and meat from a butcher in the vicinity. The bills are approved monthly and sent to the school board. Clothing is purchased from the State prison authorities, according to law.

8 and 9. The employees at the Truant School and their monthly salaries are, as follows:

1 keeper	\$65.00
1 cook	25.00
1 orderly	25.00
1 laundress	20.00
1 assistant keeper.....	25.00
1 watchman.....	40.00
1 clerk	50.00

10. The daily routine in the school is as follows: 6 a. m., rising bell, washing and preparing for breakfast; 7 a. m., breakfast; 7.30 a. m., washing dishes, dusting class room, making beds, etc.; 8.30 a. m., playground (outdoor exercises) and preparation for class room; 9 a. m., school; 10.30 a. m., recess; 10.45 a. m., school; 12 m., dinner; 12.30 p. m., washing dishes; 1 p. m., playground; 1.30 p. m., school; 3.30 p. m., recess (exercise in open air); 3.45 p. m., school; 4.30 p. m., school session over; 5 p. m., supper (prepare for); 5.30 p. m., supper; 6 p. m., washing dishes; 6.45 p. m., assemble for military drill; 7.45 p. m., parade rest, story by drill master; 8 p. m., retiring to dormitories; 8.30 p. m., good night.

11. There are no means for enforcing attendance at the Truant School other than those already described. After incarceration, locked doors and watchful guards make escape difficult. The fear of being taken away from home and put into the Truant School operates to a great extent in enforcing regular attendance in the three ungraded classes.

12. In the year 1897-98 there were 335 pupils admitted to the school, with an average of 50 pupils at one time.

13. From October 1, 1898, to February 1, 1899, there were 125 truants committed to the Truant School for a period of from four to six weeks, after which most of them were paroled. Only eight of these broke their parole. Nine proved so incorrigible as to warrant their commitment to the end of the school year.

14. No arrangements have been made for incorrigible girls.

15. We are of the opinion that a school for boys, to accommodate truants from the boroughs of Manhattan and the Bronx, should be established in the Bronx borough; that the present Truant School should be used as a temporary house of detention; that a school for girls should be established; that special schools or classes for delinquents should be established, but that each school should be so organized as to prevent truancy in its district, so far as possible.

ROCHESTER, N. Y.

In the earlier part of this paper reference was made to the number of societies that were organized throughout the county in imitation of the Society for the Reformation of Juvenile Delinquents in New York City, and for similar purposes. Among

them was the "Juvenile Reform Society" of Rochester. The passage of the New York truant law of 1853 is said to have been secured largely through the instrumentality of members of this society, the support of the then governor, Hon. Horatio Seymour, having been secured through his attendance at one of its meetings.¹ The society promptly took steps to carry out the provisions of that law after its passage. They secured the establishment by the city of a "House for Idle and Truant Children," and employed an agent to seek out children to whom the new law applied, and to take those steps in regard to them that the circumstances demanded. These measures were efficacious, and the society proved a valuable auxiliary to the schools.²

The expense involved, however became too great a tax on the resources of the society, and it became necessary to retrench by dropping the agent previously employed.³ But the value of his services in bringing idle children into the schools had been proved, and the common council was induced by the managers of the House for Idle and Truant Children, in cooperation with the board of education, to authorize the mayor to appoint a special city officer for that purpose. The person first appointed was acceptable to the board of education, he having been nominated by them, but he was soon displaced by the mayor, and his successor failed to accomplish the good results hoped for by those most interested.⁴ As the result of this, the charter of the city was amended by the legislature so that the board of education was empowered to appoint a policeman who should have the same powers as other policemen and perform such duties as the board might impose.

The first appointment under this authorization was made in 1857, and the appointee made his first written report to the board March 4, 1858.⁵ In it he described the House for Idle and Truant Children in the highest terms. It was under the control of an efficient board of managers and under the direct care of a competent superintendent and his wife. The inmates were well cared for and instructed in the common school branches. At that time there were 30 in the institution, 18 of whom had been committed during the half year's service of the school policeman.⁶

The reports show that for a number of years both the truant school and the school policeman did good service, although it does not appear that their work was at any time as thorough as would be demanded under present-day conditions. The law was not entirely satisfactory, nor was the sentiment of the people or of the board of education itself such as to justify generally stringent measures.

The employment of school policemen was continued until 1862⁷ certainly, but probably ceased soon after that, for when the practice was resumed, in 1870, the then superintendent of schools, Mr. S. A. Ellis, expressed the hope that a fair test might be made as to the real value "of this novel appliance for securing more regular attendance in our schools."⁸ Memory of the former experience had evidently had time to grow dim.

The "House for Idle and Truant Children" was known after about 1872 as the "Children's Home,"⁹ and as such continued until 1877, when it was abolished.¹⁰ After the first few years its inmates were only those who had been committed at the request of parents, or at least by their cooperation, and though several of the school reports mention its good influence upon some boys inclined to be wayward in the regular schools, it plainly fell far short of the usefulness it might have rendered under a more rigid enforcement of the laws. As for the school policemen, they were hampered by restrictions imposed by superiors not anxious to carry out the provisions of even such laws as existed, and their efforts with the truants consisted of moral suasion only. They came under the special direction of the committee on supplies, and were paid from funds allotted to that committee. This led to their being assigned to the

duty of caring for the supplies and delivering them to the schools. In time this formed the greater part of their duties, the rest being to look after damages to school property, and petty criminal and semi-criminal offenses of pupils, including truancy.¹

After the passage of the law of 1874, two or more feeble and short-lived attempts were made to enforce it,² but they amounted to little and did not involve the revival of the truant school.

The act of May 12, 1894, however, found the public better prepared for compulsory education and school officers more ready to put it into effect, and at once preparations were made to carefully enforce the law. Five attendance officers were appointed January 7, 1895, and a canvass of the city was immediately begun to discover absentees, truants, and children illegally employed.³ The necessity for a truant school was plainly evident and the board decided to alter one of the older school buildings for the purpose. The windows were barred and rooms were fitted for sleeping, dining, and play rooms,⁴ at a cost of \$625.³ The school was opened April 22, 1895.³ Improvements have been made from time to time since and the institution is said to be now a model of its kind.⁴

The statements appended describe the school as it is at this time.

It may be well to state that the efforts to compel parents to enforce attendance of their children have proved unavailing in Rochester. The courts have not given that part of the laws a cordial support and the school authorities are, therefore, compelled to enforce the penalties provided against the offending child in some cases where the parents might more properly be punished. Care is taken not to commit pupils upon the request of parents anxious to relieve themselves of parental duties.⁵

[Statement of Hon. Milton Noyes, superintendent of city schools, March 7, 1899.]

1. The officers consist of a city superintendent of schools and seven attendance officers, in addition to the employees engaged exclusively in the truant school building, mentioned in paragraph 8 hereinafter.

2. We have a regularly organized boarding truant school, receiving truants from this city and others committed from other counties.

3. To show the process of our commitments and paroles, I beg to append a full set of blanks used,⁶ Nos. 1, 2, and 3 being first distributed where applicable.

In most cases parents' consent (No. 4) is readily obtained, whereupon No. 5 is entered and truant taken into custody and detained in our truant school. If such consent is not given, No. 6 is served upon parent and truant. If after a hearing parents then consent, the earlier order (No. 5) can be used. If they refuse, No. 7 is entered and the truant proceeded against as a disorderly person. Complaint is made before the proper court and upon proper evidence the final commitment after trial (No. 8) is entered and the truant accordingly taken into custody. The parole is No. 9. (An independent remedy by action for fine against parent in police court is given by statute, over which proceedings the school authorities have no jurisdiction.)

4. Length of sentence is indeterminate.

5. Paroles, in the discretion of city superintendent, depend upon pupil's conduct and progress while detained and promise of future punctual attendance on required school. Average term of detention is about 45 days.

6. We have but one building—a two-story brick structure, formerly a ten-room schoolhouse, steam heated, and lighted with electric drops. Surrounding yard sufficient to permit playground. Nearest public school about one-quarter of a mile. The yard reaches from street to street, with ample exit facilities from building.

7. The food supplies are purchased in market and prepared and served under direction of steward, an experienced cook.

Clothing purchased and made up in quantities varying in sizes, etc., of fair quality.

8. Employees consist of principal (who is executive officer) in charge of studies; 1 teacher of lower grades and manual training; 1 steward; visiting physician; janitor; night watchman; matron; and an attendance officer on duty half day—8 in all.

9. Average cost of operating the school, \$2,500, plus \$4,320 salaries.

⁶ See blanks, pp. 174 to 179, inclusive.

11. The city of Rochester is divided into 5 truant officers' districts, each under constant supervision of one officer while schools are in session.

12. Number of truants committed to the truant school past year 106. Average number detained at one time 25.

13. Number returned to day schools and not recommitted was 87; recommitted 15; sent to State reformatory 2.

14. No arrangement for detention of girls. Nearly all of our female truants reached through home influence and personal efforts of teachers.

TRUANT SCHOOL RULES.

[From the public school regulations of the city of Rochester, 1898. pp. 24 and 51.]

The State law authorizing the establishing of truant schools and the compulsory attendance of truants constitutes the superintendents of city public schools the supervising officers to enforce the provisions of said law.

The board of education of the city of Rochester has created a committee charged with the supervision of the details connected with the local truant school, but no changes can be made without the consent of the superintendent. The duties of this committee are as follows:

The committee on truant school shall have general supervision of all matters pertaining to the school maintained for the reception and detention of truants and disorderly pupils, and purchase necessary supplies for said school. It shall prepare with the superintendent rules for the government of the school. It shall nominate truant officers, and hire such employees as may be authorized by the board; recommend changes in the management of the school, and audit claims against it; shall enforce any contracts made for the support of the inmates, and enforce all State and local regulations concerning such school.

The committee shall provide for the keeping of accounts, showing separately, in detail, the disbursements (1) for food supplies; (2) for fuel; (3) for help; (4) for officers; (5) for repairs to building; (6) for furnishing; (7) for books and material; (8) for other expenses. The committee shall provide for recording, so far as practicable, the personal history of the pupils.

The following rules shall be observed in the control and management of the school, known as the truant school, for the detention of school truants, while the same is under the jurisdiction of the board of education, until otherwise ordered:

Rule 1. Attendance officers shall be on duty at the school during the hours prescribed in weekly bulletins, as furnished by the superintendent.

Rule 2. The attendance officer bringing a boy into school shall search, bathe, dress, and turn him over to the principal or the officer in charge, in proper sanitary condition, before such boy shall be allowed to intermingle with the other inmates.

Rule 3. Every attendance officer while on duty at the building shall, in the absence of its executive officer, be in full charge and custody of the inmates and be responsible for the same.

Rule 4. The officer in charge between the hours of 8 p. m. and 7 a. m. shall be responsible for the heat, lights, and condition of the building and custody of the inmates during said time, subject, however, to the direction of the executive officer.

Rule 5. The hours of attendance at the school, as laid down by the weekly bulletin, shall not be changed without the consent of the principal and superintendent.

Rule 6. The principal shall be the executive officer of the school and shall have full power and control over all matters pertaining to the school and building, subject to orders from the committee on truant school.

Rule 7. The principal shall receipt for all foreign inmates, notify the superintendent of the name, address, and time of arrival of every inmate; keep the school record as heretofore required; have charge and custody of the inmates and their instruction, exercise, and drill; shall cause all inmates to bathe at least once per week, and to be exercised in the yard at his discretion.

Rule 8. The principal shall regulate the sanitary changes of beds and clothing; keep the inmates in custody, and release them only upon the written order of the superintendent of public schools.

Rule 9. The principal shall receive all articles intended for the inmates and use his discretion in allowing the use of the same.

Rule 10. In cases of disorderly inmates the principal may in his discretion use sufficient means to bring them to subjection without resorting to cruelty.

Rule 11. Inmates, when received, shall be examined and all articles, except wearing apparel, taken from them for safe keeping and restored to them on being released.

Rule 12. Suitable text-books shall be furnished for use of said school by the board of education.

Rule 13. Profanity and the use of tobacco shall not be permitted.

Rule 14. The building shall be open at all times to the public.

Rule 15. Hours for inmates: 7 a. m. to 8, rising and preparation; 8 to 8.30, breakfast; 8.30 to 9, dormitory duties; 9 to 12, school, with intermission; 12 to 1 p. m., dinner; 1 to 3, school; 3 to 5.30, reading and games; 5.30 to 6, supper; 6 to 9, games and reading; 9, to bed.

[From the Fiftieth Annual Report of the Rochester Public Schools, 1897-98, p. 9.]

Under the subject of compulsory education our city truant school naturally deserves attention.

That school was opened April 22, 1895, in the building on North street, formerly used by public school No. 16.

Since that time 388 different lads have been committed to the school.

The purposes of the school have been well carried out and much good thereby accomplished.

It has stimulated respect for obedience, love of study, and wish for attendance upon required instruction. Kindness, with firmness, has prevailed in the institution.

The humane interest shown to the boys has been appreciated by them. Their better natures were developed. They have displayed genuine and abiding interest in right living. As far as possible the superintendent has made inquiries concerning their conduct, subsequent to being paroled, and finds that many of the older boys are now filling positions of trust and responsibility.

The order in the school, during the past year, has been excellent and general conditions surrounding its management have been heretofore unequalled.

The yearly session began November 17, 1897, and closed June 25, 1898.

During that time there were received 106 boys, 15 of whom were recommitted, making 121 total commitments.

Ages as follows:

8 years.....	3	12 years.....	22
9 years.....	6	13 years.....	31
10 years.....	9	14 years.....	11
11 years.....	16	15 years.....	8

Parentage as follows:

German.....	32	Italian.....	5
American.....	28	Canadian.....	3
Irish.....	24	French.....	2
Hebrew.....	6	African.....	1
English.....	5		

These inmates were received from 26 public schools, 11 private and parochial schools, and 9 out of town schools.

Ninety-one were received at the hands of our attendance officers, upon parent's consent, under commitments by the city superintendent of schools.

Applications to commit from parents anxious to relieve themselves of the custody of children have been refused.

The total expense of improving and operating the truant school from July 1, 1897, to July 1, 1898, amounted to \$2,389.67.

BLANKS USED IN CONNECTION WITH THE TRUANT SCHOOL.¹

1.—NOTICE TO PARENT.

OFFICE OF SUPERINTENDENT OF PUBLIC SCHOOLS,
DEPARTMENT OF PUBLIC INSTRUCTION,
Rochester, N. Y., January 7, 1895.

Please take notice that ———, a child residing at No. ——— street, Rochester, N. Y., does not attend public school or upon lawful instruction as required by the provisions of the compulsory education law, chapter 671 of the laws of 1894.

The persons in parental relation to said child, whether parents, guardians, or other persons, one or more, lawfully having the care, custody, or control of said child, are required to comply with said act, an extract of which is herewith presented.

MILTON NOYES,
Superintendent of Public Instruction.

Required attendance.—Every child between eight and sixteen years of age, in proper physical and mental condition to attend school, shall regularly attend upon instruc-

¹For explanation of the use of these blanks see page 172.

tion at a school in which at least the common school branches of reading, spelling, writing, arithmetic, English grammar, and geography are taught, or upon equivalent instruction by a competent teacher elsewhere than at a public school as follows:

(1) All children between eight and twelve years of age must attend during the entire period public schools are in session between the first of October and the first of June following.

(2) All children between twelve and fourteen years of age must attend at least eighty consecutive days during the same period, *and the whole period*, unless lawfully and regularly engaged in useful employment or service.

(3) All children between fourteen and sixteen years of age must attend when not lawfully employed.

SEC. 4. *Duties of persons in parental relation to children.*—Every person in parental relation to a child between eight and sixteen years of age in proper physical and mental condition to attend school shall cause such child to so attend upon instruction or shall give notice to the school authorities of his city or district of his inability to do so. A violation of this section shall be a misdemeanor, punishable for the first offense by a fine not exceeding five dollars, and for each subsequent offense by a fine not exceeding fifty dollars, or by imprisonment not exceeding thirty days, or by both such fine and imprisonment. Courts of special sessions shall, subject to removal as provided in sections fifty-seven and fifty-eight, of the code of criminal procedure, have exclusive jurisdiction in the first instance to hear, try, and determine charges of violations of this section within their respective jurisdictions.

2.—NOTICE TO EMPLOYERS.

DEPARTMENT OF PUBLIC INSTRUCTION,
Rochester, N. Y., December 17, 1895.

To manufacturers and employers:

The compulsory education act now in force forbids employment of children between the ages of 12 and 14 years unless they have attended upon instruction at some school at least 80 consecutive days each year.

The school authorities have resolved to enforce that provision in this city, commencing Monday, January 6, next.

This will enable deserving boys to remain at work through the holiday season.

Many parents prefer that their children should work at all times and devote their small earnings to family support.

The aid which children 12 years of age can render to families is slight and temporary in duration, while the loss of instruction would be great and lasting to such children and to this community. It is poor policy to deprive future citizens of the instruction which it is the aim of the State to give.

Not wishing to cause any hardship in deserving cases, you are therefore notified in advance that your employees, if any, between the ages of 12 and 14 years, will be expected to commence attendance upon required instruction by the 6th day of January, 1896.

Evening schools do not furnish "equivalent instruction," within the meaning of that law.

Kindly give attention to the following extracts, if applicable to any of your employees.

Respectfully,

MILTON NOYES,
Superintendent of Public Schools.

SEC. 5. *Persons employing children unlawfully, to be fined.*—It shall be unlawful for any person, firm, or corporation to employ any child between the ages of eight and twelve years in any business or service whatever, during any part of the term during which the public schools of the district in which the child resides are in session; or to employ any child between twelve and fourteen years of age who does not, at the time of such employment, present a certificate signed by the superintendent of schools of the city or district in which the child resides, certifying that such child has complied with the law relating to attendance at school during the school year between September and July, then current; and any person who shall employ any child contrary to the provisions of this section shall, for each offense, forfeit and pay to the treasurer of the city in which such offense shall occur, a penalty of fifty dollars, the same, when paid, to be added to the public school monies of the city or district in which the offense occurred.

Required attendance.—Every child between eight and sixteen years of age, in proper physical and mental condition to attend school, shall regularly attend upon instruction at a school in which at least the common school branches of reading, spelling,

writing, arithmetic, English grammar, and geography are taught, or upon equivalent instruction by a competent teacher elsewhere than at a public school, as follows:

(1) All children between eight and twelve years of age must attend during the entire period public schools are in session between the first of October and the first of June following.

(2) All children between twelve and fourteen years of age must attend at least eighty consecutive days during the same period, *and the whole period* unless lawfully and regularly engaged in useful employment or service.

(3) All children between fourteen and sixteen years of age must attend when not lawfully employed.

3.—NOTICE TO TEACHERS.

DEPARTMENT OF PUBLIC INSTRUCTION,
Rochester, N. Y., November 27, 1895.

To principals and teachers:

Inclosed herewith you may find a copy of a report adopted by the board of education of this city, November 18 instant, relating to the compulsory education law.

The purpose of the act was not only to prevent truancy but to stimulate, by its judicious enforcement, desire for attendance upon proper instruction in some school.

We are all in accord respecting the purposes of that act.

Sections 2, 7, 8, and 9 place upon this department *the burden and expense* of enforcing the act in Rochester.

We call your attention to section 6 (embraced in said report), and ask your cooperation.

Possibly many of you already preserve the required records, which are similar to the "daily register"—used in public schools.

If you will kindly preserve such records and notify us of all cases of truancy in your school, you will materially aid in the proper observance of the act.

Also report to us at the close of each school month the total number of children between 8 and 16 years of age who have been instructed at your school in the required topics, viz, reading, spelling, writing, arithmetic, English grammar, and geography. Inclosed you will find blank reports for that purpose, covering the present school year beginning with November.

Children between 7 and 16 years of age, who are habitual truants from instruction, or who are insubordinate or disorderly during attendance, or who are irregular in attendance, may be confined, maintained, and instructed either in a truant school or a private school, orphans' home or similar institution controlled by persons of the same religious faith as the persons in parental relation to such children.

Such confinement is to be conducted with a view to the improvement and restoration as soon as practicable of the child to the school upon which he was required to attend.

MILTON NOYES, *Superintendent.*

4.—PARENTS' CONSENT.

ROCHESTER, N. Y., ————, 189—.

To the Superintendent of Public Schools and Attendance Officers of said City:

I, ———, hereby certify that I am ——— the ¹ ——— of the boy, ——— who now lives at No. ———, ——— street, in said city; and that said boy is ——— years of age; that he has sufficient health to render his attendance upon public instruction expedient; that he is a truant from school, and that I, ———, have been notified concerning his case, and an opportunity for a hearing has been given after due notice to said boy and persons in parental relations. I, ———, consent and hereby request that said boy be forthwith taken to your public truant school, in said city, and confined therein for discipline and instruction until released by the superintendent of city public schools.

_____.

¹ Father, mother, or guardian.

5.—ORDER TO COMMIT ON PARENTS' CONSENT.

———— PUBLIC SCHOOLS,
Board of Education, ———, ———, 189—.

IN THE MATTER OF COMMITTING

Order to commit on consent.

A TRUANT FROM INSTRUCTION, TO THE PUBLIC
TRUANT SCHOOL AT ROCHESTER, N. Y.

It having been made to appear that the boy, ——— ———, who resides at No. ———, ——— street, in the ——— of ———, N. Y., is between 8 and 16 years of age; in proper physical and mental condition to attend upon lawful instruction as required by the compulsory education acts, and is a truant therefrom;

And notice having been given to said truant and to the persons in parental relation to comply with such law, and having failed therein, and a reasonable notice having further been personally served upon such truant and the persons in parental relation to him, that said matter would be considered by the board of education, or the ———, at a session thereof, held on the ——— day of ———, 189—;

And said case having been duly considered at said time by said public school authorities, and an opportunity given for all persons to be heard in relation thereto;

And it further appearing from such proceedings that said child is now ——— years of age, and is a truant from lawful instruction and in proper condition to attend thereupon, and that he is not regularly and lawfully engaged in any useful employment or service, and upon filing the written consent of the persons in parental relation to said child:

It is therefore hereby determined and ordered that said child be forthwith committed to said city public truant school in the city of Rochester, N. Y., pursuant to the provisions of chapter 606 of the laws of 1896, and be there maintained and instructed until discharged or paroled by the superintendent of public schools of said city, not exceeding the remainder of the current school year.

It is further ordered that the attendance officers of this ——— convey said child to said truant school, and the executive officer of said school is hereby required to receive and detain him according to the terms of this order, the provisions of law, and the local regulations applicable thereto.

Given by direction and pursuant to action of the board of education, or the ———, of the ——— of ———, N. Y., this ——— day of ———, 189—.

————, *President.*
————, *Clerk.*
————, *Trustee.*

6.—NOTICE TO TRUANT AND HIS PARENT TO APPEAR BEFORE SUPERINTENDENT.

DEPARTMENT OF PUBLIC INSTRUCTION,
OFFICE OF SUPERINTENDENT OF PUBLIC SCHOOLS,
Rochester, N. Y., ———, ———, 189—.

Complaint having been made that ——— ———, a child between 8 and 16 years of age, residing at No. ——— ——— street, Rochester, N. Y., does not attend upon lawful instruction as required by the provisions of the amended compulsory education law;

And a notice having heretofore been given to such child and to the persons in parental relation to him, requiring them to comply with said act respecting attendance upon instruction;

And such child being still a truant, you and each of you are hereby notified that said matter will be considered by the superintendent of public schools at the office of said superintendent, Free Academy building, on the ——— day of ———, 189—, at 3 o'clock, p. m., at which time and place an opportunity will be given you to be heard in relation to said case.

In default of your appearance or consent that such child be maintained at the public truant school in this city or other similar institution as required, then the said child may be proceeded against as a disorderly person before the police justice of this city, pursuant to said act.

————, *Attendance Officer.*

To ——— ———, *Parent or Guardian*, and ——— ———, *Truant.*

7.—ORDER TO PROCEED AGAINST TRUANT.

ROCHESTER PUBLIC SCHOOLS,
Board of Education, ———, ———, 189—

IN THE MATTER OF COMMITTING

} Order to proceed against truant.

A TRUANT FROM INSTRUCTION.

It having been made to appear that the boy ——— ———, who resides at No. ——— street, in the city of Rochester, N. Y., is between 7 and 16 years of age; in proper physical and mental condition to attend upon lawful instruction as required by the compulsory educational acts, and is a truant therefrom;

And notice having been given to said truant and to the persons in parental relation to comply with such law, and having failed therein, and a reasonable notice having further been personally served upon such truant and the persons in parental relation to him, that said matter would be considered by the board of education at a session thereof, held on the ——— day of ———, 189—;

And said case having been duly considered, and an opportunity given for all persons to be heard in relation thereto;

And it further appearing from such proceedings that said child is now ——— years of age, and is a truant from lawful instruction and in proper condition to attend thereupon, and that he is not regularly and lawfully engaged in any useful employment or service, and the persons in parental relations to said child refusing to consent to his commitment to a school,

It is therefore hereby determined and ordered that said child be deemed a disorderly person and proceeded against, pursuant to chapter 671 of the laws of 1894.

Given by direction and pursuant to action of the board of education of the city of Rochester, N. Y., this ——— day of ———, 189—.

—————, *President.*
—————, *Clerk.*

8.—WARRANT OF COMMITMENT.

STATE OF NEW YORK, ——— County, ——— of ———, ss.

————— court, in the name of the people of the State of New York.

IN THE MATTER OF COMMITTING

} Commitment after trial.

A TRUANT FROM INSTRUCTION, TO THE PUBLIC
TRUANT SCHOOL AT ROCHESTER, N. Y.

To any attendance officer of said town or peace officer of said county:

It having been made to appear to me on oath that the boy ——— ———, who resides at No. ——— street, in the ——— of ———, N. Y., is between 8 and 16 years of age, in proper physical and mental condition to attend upon lawful instruction as required by the compulsory education acts, and is a truant therefrom;

And notice having been given to said truant and to the persons in parental relation to comply with such law, and having failed therein, and a reasonable notice having further been personally served upon such truant and the persons in parental relation to him that said matter would be considered by the public school authorities on the ——— day of ———, 189—;

And said case having been duly considered at said time by said public school authorities and an opportunity given for all persons to be heard in relation thereto;

And it further appearing that said child is now ——— years of age and is a truant from lawful instruction and in proper condition to attend thereupon, and that he is not regularly and lawfully engaged in any useful employment or service, and the persons in parental relation to said child refusing to consent to his commitment to a proper institution;

And thereupon it was ordered that such conduct of the child be deemed disorderly conduct, and that he be proceeded against as a disorderly person;

And whereas the undersigned magistrate at once caused said truant to be brought before him, charged on oath with being a disorderly person within the meaning and intent of the statute; and such proceedings were thereupon had before me pursuant to the provisions of chapter 606 of the laws of 1896 and the general statutes of this State relating to disorderly persons, that I, the undersigned, did adjudge and determine that said truant, ——— ———, was guilty of being a disorderly person as aforesaid, and he was thereupon, on the ——— day of ———, 189—, convicted of said offense by me, and it was adjudged and determined that he should be committed to the public truant school at the city of Rochester, N. Y., and be confined and maintained therein for a term not exceeding the remainder of the current school year, said

offender having previously been required to attend upon lawful instruction in a public school in this State;

And whereas a certificate of such conviction has been accordingly filed in the office of the clerk of this county,

These are, therefore, to command you, the said attendance officer or peace officer, forthwith to deliver him, the said _____, into the custody of the city public truant school in the city of Rochester, N. Y., pursuant to the provisions of chapter 606 of the laws of 1896, to be there maintained and instructed until discharged or paroled by the superintendent of public schools of said city, not exceeding the remainder of the current school year or discharged by law.

Said truant school and the executive officer of said school are hereby required to receive and detain him according to the terms of this warrant, the provisions of law, and the local regulations applicable thereto.

Given under my hand at the said _____ of _____, New York, this _____ day of _____, 189—.

Justice _____ of _____, County of _____¹, N. Y.

9.—PAROLE.

DEPARTMENT OF PUBLIC INSTRUCTION,

Rochester, N. Y., _____, 189—.

To the principal and attendance officers in charge of the truant school:

Whereas, the boy _____, formerly residing at No. _____ street, Rochester, N. Y., was, on the _____ day of _____, 189—, placed in the public truant school for instruction and maintenance; and whereas, such confinement was conducted with a view to the improvement of said boy and to his restoration, as soon as practicable, to the school upon which he was lawfully required to attend for public instruction;

And he having promised to faithfully attend such instruction in the future,

Now therefore, upon application made on his behalf for release from such confinement, and relying on said promise, and upon receiving the written assurance indorsed hereon, of the person in parental relation to him,

You are, by virtue of the authority granted under the provisions of chapter 606 of the law of 1896, of the State of New York, and the action of the board of education of said city of Rochester, heretofore taken in the premises, hereby authorized to forthwith release said boy from such confinement at said truant school, on parole, and deliver him to the person in parental relation to him.

_____,
Superintendent of Public Schools.

Guaranty of attendance.

In consideration of the granting of the foregoing parole, I hereby promise to cause said boy to attend upon school instruction, as required by law. I further consent, that if he becomes a truant from such instruction, or irregular in attendance thereon, or disorderly or insubordinate during attendance, in either of such cases, the public-school authorities of this city, or any attendance officer thereof, may proceed without process and at any time hereafter take and confine said boy in the public truant school of this city, for further instruction and maintenance, and that he may be kept in said school until released by the superintendent of public schools.

ROCHESTER, N. Y., _____, 189—.

_____, Parent.

10.—CIRCULAR TO OTHER BOARDS OF EDUCATION.

ROCHESTER TRUANT SCHOOL.

DEPARTMENT OF PUBLIC SCHOOLS,

Rochester, N. Y., November 18, 1897.

To public school authorities:

We take this method of answering numerous inquiries concerning the school organized here in 1895 as a home for the detention and instruction of male truants under the provisions of the compulsory education acts.

This school is now opened under new management.

Inmates are lodged, fed, and instructed in one building, and are under constant supervision of a male teacher, a matron, and an attendance officer.

A watchman is on duty nights and a house physician is employed, free to inmates.

The building used exclusively for this purpose is a two-story brick structure, with

¹Name of office in full.

large rooms, electric lighted, steam heated, and well ventilated. Playground attached. The building was formerly used for a public school.

Substantial, plain, and well-cooked food is furnished, and suitable hours are afforded for exercise and play. Contract system of furnishing meals has been abandoned.

The studies pursued correspond to grade schools for boys of like ages and abilities.

No truants are received who have ever been convicted of crime or misdemeanor (other than truancy), and who are not pronounced by the house physician free from disease.

The confinement is conducted with a view to the improvement and restoration, as soon as practicable, of the child to his own proper school.

Reading matter is furnished to the inmates, and attention given to stimulating a wish for study.

In the division of each day six hours are devoted to class study, ten to sleep, and eight to reading and recreation.

Manual-training instruction is given.

The school is located on North street, near the intersection of Hudson avenue, and three minutes' walk from the New York Central Railway depot.

The board of education of this city has resolved to receive male inmates from other cities or villages, *if properly committed*, at the rate of \$5 per week each, payable by the authorities committing the truant, or by county where commitment is made in towns having no superintendent of schools. In order to properly charge the county we have written contract to be executed with the committing authorities.

If you desire to avail yourselves of this institution under the foregoing conditions you may send your attendance officer with the truant and the commitment *direct to the building*, when the principal will receipt for him. Also send, with the officer, sufficient funds for the truant's return home at expiration of term of detention.

We are often asked, "How may a truant be sent to the Rochester school?" In most cases the parents' written consent is sufficient to base a commitment upon if made by school authorities, after a notice has been served upon the truant and person in parental relation to him, and an opportunity for them to be heard has been given. If such consent is not given before a trial in which the truant is proceeded against for disorderly conduct, under the compulsory education acts, he may be sentenced to this school upon conviction by the court if the pupil had been required to attend a public school.

Any further particulars relating to the school, or necessary blanks for commitment, may be had on application.

Respectfully,

MILTON NOYES,
Superintendent of Public Schools.

SYRACUSE, N. Y.

[Statement of Hon. A. B. Blodgett, superintendent of city schools, March 2, 1899.]

1. Our truancy department was organized four years ago.
2. We have no ungraded classes for truants or incorrigibles outside of the regularly organized boarding truant school.
3. We secure the written consent of the parents, if possible to do so, or sentence them through the police court if parents do not consent.
4. The length of sentence is nominally for the balance of the school year, but we parole them upon good behavior or a prospect of better attendance and deportment in the graded school.
5. The following is the form of the parole:

Parole.

SYRACUSE, N. Y., ——— ———, 189—.

Being permitted to leave the truant school I promise to be punctual and regular in attendance; to conduct myself properly, and in a polite, gentlemanly manner faithfully to observe all rules, regulations, and requirements of the school I shall hereafter attend.

—————, *Witness.*

If the above pledge shall be wilfully or negligently violated by said —————, ——— hereby consent that he shall be immediately returned to the truant school.

—————, *Parent.*

—————, *Parent.*

—————, *Street.*

The above permit is approved when properly signed and witnessed.

—————, *Superintendent.*

6. Our building and grounds are inadequate. At present we are using an old dwelling house, which has been fitted up for the purpose.

7. Children are clothed at city's expense and boarded in the truant building.

8. We employ a man and wife as general custodians of the building and grounds, a night watchman, two truant officers, and a teacher. We pay the custodian an annual salary of \$720, the night watchman \$500, two truant officers \$900 each, and the teacher \$650.

9. The custodian and wife board the inmates at \$1.68 per week.

11. As the inmates of the school are confined at all times we have no difficulty in enforcing attendance.

12. The number committed during the past year was 60, and the average daily attendance was 12.

13. The attendance officer's annual report gives the total number of investigations as 898; 687 of these were returned to schools from which they were absenting themselves; 60 were placed in the local truant school, and 18 sent to State or other institutions; 137 others amenable to the law were permitted, in most cases temporarily, to remain at work or at home.

14. No special arrangements were made for incorrigible girls, as we have no accommodations for them.

15. Our experience has been that the best features of the law are found in its deterrent effect. This has been more and more apparent, as truants, incorrigibles, and parents as well have come to understand the good effects of the law and that it would be enforced. We are very much gratified at the excellent effects attained through the enforcement of the law.

CLEVELAND, OHIO.

Established in March, 1876, the Cleveland day truant schools are the oldest existing institutions of their class in the United States; their beginning occurred during the superintendency of Hon. A. J. Rickoff. They have been criticised, reorganized, and reformed by every superintendent, with a single exception, who has held the office since, and because of those criticisms, reorganizations, and reformations the history of the Cleveland truant schools is interesting and instructive.

At first a single school was established in Marion street, and the name given it, "ungraded school," was chosen because it could not of itself carry any opprobrium with it. It was designed for those whose influence was found to be pernicious to their associates, and who were incorrigible by means of discipline fit to be used in the schools at large. Its principal purpose was to guard the masses of the children in the school from daily contact in the class room and on the playground with children whose example tended to corrupt everyone about them, to protect the young and weak from those whose domineering habits or violent tempers make them unsafe companions.¹

It was not considered that the salaries paid to the teachers of this school added to the cost of the schools, since the other teachers retained their full quotas, and in some cases were able to take care of a greater number than before, since they were relieved of the most troublesome element of teaching.

The number of pupils transferred to the ungraded school was small at first,² but the effect upon the regular schools was at once so evident as to leave no doubt in the mind of the superintendent as to the wisdom of the establishment of the school. The supervisors, Messrs. H. M. James and L. W. Day, wrote as favorably as Mr. Rickoff of the wholesome influence of the new schools upon the discipline of the city at large. Many vicious boys, it was said, who had previously been the cause of constant hindrance and trouble, strove to their utmost to merit the approbation of their teachers and thus avoid being transferred to the unclassified school.³

The rules relating to the school provided that when it appeared that the attendance of any pupil, either by reason of incorrigibility or immoral conduct, was per-

¹ Report of the city superintendent (A. J. Rickoff) for 1876, p. 105.

² The average number belonging in 1876 was 9. Nineteen in all were transferred to the unclassified school during that year.

³ Report of the city superintendent for 1876, pp. 139 and 145.

nicious to the school of which he was a member, the case should be referred to the superintendent. After conference with the child's parent the superintendent might transfer the delinquent to the ungraded school if there were no objections from the parent. In the event of such objection the case was referred to the committee on discipline and disposed of by them. On sufficient evidence of good conduct the superintendent was empowered to return a pupil from the unclassified to the regular schools, but not during the term for which he was transferred.¹

It will be observed that the primary purpose in view in maintaining the school was the relief of the schools in general of the undesirable elements among the pupils. But the reformation of the bad boys entered also into the calculation, as the following sentence in the report of Mr. James shows: "That they should not be deprived of all school privileges by being sent into the street, but should rather be collected and placed under the care of a good teacher and surrounded by such influences that they can be controlled, and, in a measure, reformed, seems equally plain."

Recommendations by Mr. Rickoff and his associates resulted in the establishment of a second unclassified school in York street in 1877-78 to satisfy the needs of the western part of the city as the Marion street school had served the eastern. In that year 45 pupils were sent to the former school and 39 to the latter, the average number belonging being 17 and 18, respectively.

Both schools steadily grew for several years without receiving especial attention at the hands of the school officials—at least they were not specially mentioned in the school reports, though their statistics appear with those of the other schools.

Superintendent Rickoff retired at the close of the year 1882-83; Mr. B. A. Hinsdale was appointed in his stead and continued in the office until the close of 1885-86, when he was succeeded by Mr. L. W. Day. In none of Mr. Hinsdale's reports did he make any comment upon the unclassified schools, and it does not appear that any important changes were made during his administration. During Mr. Day's term of office a third school was added to the list, the process of transferring pupils to them was modified, their name was changed from "unclassified schools" to "boys' schools," and in classification and management they were made more nearly like the ordinary schools. The old name came to have a very offensive signification in the popular mind, and the change in title was supposed to relieve the pupils in them from the stigma attaching to the members of the "unclassified schools."

Superintendent Day explained in his report for 1888-89² that the pupils in the "boys' schools" were not necessarily bad or vicious but "simply overmischievous or perversely troublesome." "Under restraining influences," he remarks, "they often make very satisfactory progress, and turn out well." The pupils assigned to the schools were grouped as follows: (1) Those who openly and persistently defied the authority of the teacher. (2) Those who were persistently truant. (3) Those whose conduct was not satisfactory and whose parents requested such assignment. The boys were described as "generally bright, nervous, rattling fellows, needing more special personal attention than can be given them in the regular schools." Twenty-five boys were as many as were assigned to any one school, as a rule.

"The upheaval" in the Cleveland schools came in 1892. The circumstances are well known, for because of their results they occupy a prominent place in the educational history of the country. A new scheme of school government was inaugurated and new men with new policies were brought in to administer it. The new men came in with the conviction that radical reforms were needed. Mr. A. S. Draper, the superintendent, afterwards said:³

With false diplomacy, lack of aggressiveness, and insufficient confidence in the people on the part of the superintendent's office, the school system of the city came face to face with the question whether its old plan of organization was equal to the preservation of its own life. The city was being sold out on the business side of its

¹ Manual of the schools of Cleveland, 1876, p. 16.

² Page 102.

³ In his report for 1893-94, p. 89.

school administration, and the unprepared and unworthy who had influence were swarming into the rapidly increasing teaching force and getting places of highest trust and emolument in the service. The result was the degradation of the force and paralysis and desolation in the work of the schools.

This being the attitude of a superintendent all powerful in all matters relating to teachers and instruction, a revolution naturally followed. Everything was to be altered and improved, the boys' schools along with the rest. There had been five of those schools in three different buildings; the number was reduced to three. Corporal punishment was found to be inflicted in some of the schools with frequency and considerable severity; all corporal punishment was promptly forbidden, and other changes intended to be equally as radical were made. As for the surroundings at that time, the rooms were poor and the furnishings dilapidated. Mr. Draper declared his intention to give these schools close attention, and hoped to be able to place them on better footing and make them instrumentalities of greater good. Manual training was especially prominent among the improvements which it was intended to introduce.

"The boys' unclassified schools should be made specially bright and cheerful," said the superintendent, "and should be in the hands of teachers specially steady, manly, kind, and tactful; should be free from all that can further brutalize or degrade an unfortunate boy, and should be filled with the influences which are calculated to arouse his moral nature and appeal to his own future interests and his self-respect. The moment he can be trusted he should be returned to his proper place in the ordinary schools."¹

Notwithstanding the special attention, the next year brought little improvement. No change was made in the location of the schools. They were "housed in rooms as good as would be likely to be found for any school outside of our regular school buildings, and they can not be housed in the regular buildings, but still the rooms are not inviting. The furnishings are not modern; the atmosphere is depressing; the conditions hard."²

It was with an evident feeling of discouragement that Mr. Draper wrote:

I am beginning to conclude that there should be a radical change in the plan, and that an institution should be provided, not penal in character, into which boys who are a menace to the good order of the school might be taken and given the oversight, training, and education incident to a home. Until such boys are taken into the exclusive custody of such an institution day and night, and washed, combed, dressed, fed, trained, and inspired to better things, the outlook will be discouraging. Their associations for nineteen hours of the day will count for more against them than their work with an unclassified school for five hours can possibly do for them.²

The school director, Mr. H. Q. Sargent, believed even more strongly than Mr. Draper that a boarding school was a necessity. He expressed the opinion unequivocally that in the greater number of cases the unclassified schools were unequal to the task of reclamation, and that experience had shown conclusively that the boys must be removed from their unfortunate environment and placed in a public home.³ Believing that no single subject connected with the schools was of more vital importance, he urgently requested the school council to designate one or more of its members to act with the superintendent of instruction and himself "in an earnest endeavor to effect a radical change in the conditions surrounding these unfortunate boys." Whether such a commission was appointed does not appear; but if so, it accomplished nothing toward the establishment of the "public home" suggested. A permissive law was secured from the legislature,⁴ and an effort was made to induce the city council to establish a "city farm school," but without success.⁵

¹ Report for 1892-93, p. 74.

⁴ Act of the Ohio general assembly, passed February 8, 1894.

⁵ Report of the president of the school council, 1895-96, p. 75.

In the meantime Mr. Draper had resigned the superintendency and had been succeeded by Mr. L. H. Jones, and Mr. Jones in his turn had plans for another reorganization and reformation of the unclassified schools.

The tangible changes made at his suggestion consisted of establishing two schools, each having one male and one female teacher, instead of three schools, each having one male teacher; and of making the school hours conform to those of the district schools instead of the high schools. This meant simply that there were to be two sessions daily instead of one, with an intermission of an hour between them for dinner. One of the teachers was required to remain at the school during that hour, and only those boys were allowed to go home for dinner whose conduct had been satisfactory.

As for the rest, Superintendent Jones stated:¹

Men and women have been selected for this work who, it is believed, have especial adaptedness to secure good order by humane means, and instruction has been given them to teach in every way possible the value of institutional life; while securing the respect and affection of these pupils, to make them wish to get back into the regular schools and into harmony with the social organized life from which by their own actions they have separated themselves. Whenever this desire to live a life in harmony with others has been developed in the boy he is fit to be returned to the regular schools, but not until then. * * * It is in many instances real teaching that is needed rather than harsh measures of physical correction. I have great hopes that we have at least begun upon this difficult problem.

These aims and these views differed in no particular from those held and expressed by Mr. Draper, and but little from those of Mr. Rickoff and Mr. Day. The two latter had not nominally the same power over the teachers that Mr. Jones has, but it is clear that all of them sought teachers of special qualifications for the work; that they themselves gave personal attention to the unclassified schools; and that, with the exception of Mr. Draper, they all held the same opinion of the good results of the schools as they, respectively, conducted them. Still, every one of these superintendents found it necessary to entirely reorganize the schools as they had each found them.

In his report for 1895-96, Superintendent Jones expresses gratification at the outcome of the year's experiences, and his statement made to this office in March, 1899, though meager, is hopeful in its tone.²

A peculiar circumstance may be noted in regard to the situation in Cleveland. The chief truant officer, Mr. Alex. McBane, has held that position for a number of years. His efficiency has been often commended in the reports of his superior officers, and his own reports bear internal evidence that the commendation was deserved. In not one of his recent reports has he mentioned the ungraded schools as an aid to his own work, or indeed in any other way, even statistically. He has constantly and consistently urged the establishment of a parental or a home training school, describing as the proper candidates for such a school the very class of children who are supposed to be sent to the unclassified schools, yet he ignores the very existence of those schools. This, in connection with the large number of children sent annually to the State Reform School at Lancaster—averaging about forty a year—seems to indicate that the boys now retained in the unclassified schools are offenders of a type too mild to give a truant officer any concern, and that those schools differ from the ordinary schools less than in most cities where similar schools are maintained.

The following paragraph occurs in Mr. McBane's report for 1895-96:

I would like to present another subject to which I have given much thought, viz, the need of a home training school. I have protested in all my annual reports against sending truant children to the reform school at Lancaster. I still protest, not that the reform school is not well conducted—it is as well conducted as it is possible to be under present conditions. What facilities can be afforded for reformation in a place where criminals of all grades and conditions are classed together? To this same reform school, where we are compelled to send truant boys, guilty of no crime,

¹ Report for 1894-95, p. 73.

² See page 185.

are frequently committed those who are totally unfit to be classed with other boys because of their evil propensities and their already deeply perverted nature. To the same school from the city goes the truant boy of the widow with the criminal boy of the slums. And not long since on the streets of Cleveland might have been seen a truant boy chained to a boy horse thief on their way to Lancaster, seeking reformation at the same school. Cleveland needs a training school where these defective boys may have some sort of a chance to grow up useful and respected citizens.¹

[Statement of Hon. L. H. Jones, superintendent of city schools, March 2, 1899.]

Three truant officers are employed and act under the State law. The compulsory age is 8 to 15. There are two ungraded schools for boys, each with two teachers. Pupils are transferred to them by the city superintendent on information of the proper principal, and are returned to their own schools when they can be trusted. The number probably cured is very large; 36 were sent to the reform school in 1898. These schools are places for helping boys to reform, and not merely places of detention.

DAYTON, OHIO.

[From the report of the superintendent of instruction (Dr. W. N. Hailmann) for 1898-99, page 117.]

The two ungraded classes which were organized in April of this year were unsatisfactory. It is true they afforded relief to the classes from which the pupils were selected, so that the efficiency of the teachers in these classes was increased. On the other hand, the equipment of the ungraded schools was scanty, and the teachers failed to grasp the problem in all its bearings. The successful operation of such schools demands a richer supply of appliances and teachers who by disposition, equipment, and experience are especially fitted for that work. I shall therefore defer my recommendation for the reopening of these classes until the board shall be in condition to meet these requirements.

ALLEGHENY, PA.

[From the twenty-fifth annual report of the superintendent of public schools, 1897-98, p. 53.]

The truant school has been in operation about a year, with Prof. George A. Smith as teacher.

The results attained, the difficulties encountered and overcome, the expenditure of time and money necessary to keep the school in operation, are subjects for the serious consideration of all good citizens.

The city superintendent was made responsible at the outset for the management of the school, and all prosecutions were intrusted to the secretary of the board, with one controller in the district where the delinquent resides. In compliance with this arrangement the following rules were adopted by the board of controllers December 7, 1897.

RULES.

Rule 1. As soon as five days of unexcused absence have accumulated against a pupil he shall be sentenced by the city superintendent to attend the truant school for the next twenty school days.

Rule 2. For the first half day's absence from the truant school without a proper excuse he shall be sentenced to five days additional attendance.

Rule 3. For the second half day's unexcused absence he shall be sentenced to ten additional days attendance.

Rule 4. For the third and every succeeding day's absence from the truant school, unexcused, the parent shall be prosecuted according to law.

Rule 5. Whenever the principal of a school shall report a pupil for incorrigibility or insubordination the city superintendent shall, after an investigation of the case, sentence the pupil to the truant school for such time as, in his judgment, the offense deserves.

Under the above rules the principals of the different schools notified the superintendent when they had pupils who were either persistent truants or incorrigible. On receipt of such notification the superintendent immediately investigated the case and sent the offender to the truant school, if, in his judgment, the evidence justified such action. Three half days of unexcused absence from the truant school made the parents liable to prosecution.

It has been necessary to prosecute a number of parents, and it is just a little odd,

¹ Sixtieth annual report of the board of education, 1895-96, p. 69.

too, that most of them, after paying one fine and costs, amounting to about \$5, were able after this to find a way to get their children into school.

Very few of the parents have been so obstinate as to need a second introduction to the alderman, and only two or three in the whole city were sufficiently stubborn to stand the third prosecution. One man, a Bohemian, went to jail rather than pay the third fine, but two or three days later changed his attitude altogether. He paid the alderman's charges and left the county prison a wiser if not a better man.

The total number of truants sentenced to date is 99. Of these 17 have been returned and served the second sentence in the truant school. One term of twenty days, however, has been found sufficient to greatly improve the behavior of many of these children. A few, though, seem to have neither power nor inclination to do better. Indeed, it ought not to be a matter of great surprise that some of these children are so perverse as to be apparently incapable of any good when it is remembered that one or both of their parents are in prison most of the time on account of dissolute habits. Other parents, although not dissipated, have so little force of character and judgment in the management of their homes and children that the family environment could not well be worse than it is. With this constant pernicious home influence surrounding the children, their control and attendance at school become a most difficult and perplexing problem.

Some of the parents, too, after disregarding the law until they have to be brought face to face with the alderman, resort to all sorts of subterfuges and false statements to screen their children. To such an extent is this policy pursued that it is often difficult to make out a case against the most flagrant offender. There are so many roads leading to the total depravity of these children that it is very hard to see anything for them better than Morganza, Claremont, or Riverside.

After a child is 13 years of age the enforcement of the law gives its parents the following options: To send it to school, put it to work, pay fines, send it to Morganza, or get it out of the city. It can not be put to work before 13.

Not a few parents try to work themselves into the belief that selling papers, blacking shoes, doing odd turns about home, hunting work, etc., will fill the requirements of the law, but no such frivolous and evasive interpretation can or will be accepted.

The class of people thus far under discussion comprise not more than 2 or 3 per cent of the entire school population. The other 97 per cent of the children are orderly, industrious, and a credit to their parents.

The truant law has very greatly improved the ward schools in discipline and attendance. It has put into the truant school a class of children that defied all law and order. These children no longer run the streets at will, furnishing an evil example for other children to follow. The turbulent element in all the schools is much more easily managed, and all classes of children attend school more regularly than ever before.

Everything considered, the law has been very successful.

[From the report of the compulsory education committee of the board of controllers, 1897-98, in the forty-fourth annual report of the board of controllers, p. 71.]

A truant school was established November 1, 1897, in one of the rooms of the old Second ward building, and a male teacher and janitor employed. * * * This school has been of immense value in freeing the other schools of unruly and undesirable pupils, one of whom in a room formerly monopolized a teacher's time, at the expense of every other pupil. These unruly spirits are now grouped together where they may be disciplined as severely as they deserve.

There has been in the truant school an average attendance of about 25. Out of each 25 pupils sent there, about 18 return to their own schools at the end of one term practically cured.

They attend regularly, and are obedient and industrious often for the first time in their lives. Four or five out of each 25 require a second sentence, and three or four only persist in truancy and bad conduct until their parents are obliged to confess that they can not control them and send them to Morganza.

During the year 15 pupils have been sent to Morganza by their parents. In all these cases truancy was but a small part of their offending, and Morganza is unquestionably the very best place for them.

Seventeen suits were entered, and in every case the law was upheld and obedience enforced. In 14 cases one suit was sufficient, and in 2 cases three suits were required. In one of the latter the boy is now in Morganza. In the other the grandfather moved out of the city after the third suit, confessing that he could not make a boy of 11 obey him, and choosing this alternative rather than send him to Morganza.

PHILADELPHIA, PA.

[Statement of Hon. Edward Brooks, superintendent of public schools, March 1, 1899.]

There are 15 truant officers.

We have organized two ungraded schools and expect to establish more. Pupils found on the street or suspended from the regular schools are sent to them.

The principal of each school receives \$800 a year; assistants, \$600.

The daily routine is similar to any ungraded school. We have manual work in our special schools.

The special schools receive both girls and boys.

We have started a course of great value to our city. Our special schools are not a year old yet, but they have already demonstrated their necessity as a part of a school system in a large city. I mail you one of my annual reports, in which you will see my views upon the subject, and also a brief statement of the organization of the department of compulsory attendance.

[From the annual report of the superintendent of public schools for the year 1897, pp. 104 et seq.]

Early in the year the board of public education took steps to put the compulsory education law into execution. A committee was appointed, called the committee on compulsory education, with Mr. Rudolph Walton as chairman. Lists of pupils between 8 and 13 years of age, taken by the assessors of the city, were furnished to the board, and the committee arranged to have them properly tabulated, appointing a number of clerks for this purpose. These clerks began their work in July, and spent several months upon the lists, endeavoring to determine the children who were in school and those who were not attending school as required by law. As the committee studied the problem it became apparent to them that the most efficient execution of the law could be effected through the department of superintendence. This department was in intimate relations with the schools, had cognizance of their condition, of the number in attendance, what schools were overcrowded, and where vacancies existed, and could thus unify the attempt to gather in the truants and other nonattendants, with the general oversight and supervision of the schools. Early last autumn, therefore, the committee decided, after electing thirty attendance officers, to place the execution of the law under the direction of the superintendent of schools. The superintendent selected, to assist him in the work, one of his assistants, Dr. Edgar A. Singer, and took immediate steps to organize the department.

The assessors' rolls, with the result of the work of the clerks upon them, were placed in the superintendent's hands. These rolls were intended to contain a list of all the children of the city between the ages of 8 and 13 years, their names, addresses, and schools, if any, which they attended.

It was soon found that these lists, based upon the assessors' work, were of little value to us, and we decided to rely for the present on the information obtained from the public schools, the parochial schools, and the Friends' schools, and upon the information which the attendance officers could gather upon the streets and at the homes of nonattendant children.

The next step taken was to divide the city into thirty districts, to be known as attendance districts. The basis of the division was partly the school population and partly the area of territory to be supervised.

The attendance officers were then called together and their duties explained to them. The superintendent endeavored to impress them with the idea of the responsibilities of the position to which they had been elected and the obligations they were under for the faithful performance of their duties. The law was designed to secure the interests of the individual and the State; they were to execute this law; and only as it was properly executed would its purpose be accomplished.

The delicacy of their duties was also pointed out, and the necessity for the exercise of good judgment and tact in disposing of difficulties which were sure to arise in the execution of the law. The several elements of a successful execution of the law, the superintendent urged, were fidelity, good judgment, tact, patience, and good, common sense. They were further advised that though the law was called a "compulsory law of education," yet no compulsion was to be used at present. Many people did not know there was a law of compulsory attendance, and to proceed against them by applying the penalties of the law would be both unjust and unwise. People must be gradually educated to understand and obey the law. The first object, therefore, was to instruct the people in respect to the law and its requirements. No threats should be made at present, but in case of negligence there should be a patient explanation of the nature of the law and the necessity of a compliance with it. This applies both to parents neglecting to send their children to school and

people employing children in violation of the law. The glove was to be kept upon the iron hand at first; it could be taken off after a while in dealing with people who were persistent violators of the law.

It was also explained that in cases of indigent children who were unable to attend school on account of want of clothing, no attempt should be made to force them into school, but that all such cases should be reported to the superintendent, who would endeavor to secure the interest of benevolent organizations in their behalf. No attempt, either, should be made to force vicious and incorrigible children into the schools, but all such cases should be referred to the superintendent.

After giving the attendance officers their verbal instructions, a copy of the law was placed in the hands of each, and a list of nonattendants, as obtained from the assessors' lists. They were directed to visit the schools and become acquainted with the principals, to make themselves acquainted with their respective districts, to obtain a list of parochial and other private schools, and to report the same to the office. Arrangements were made for weekly meetings of the officers at the rooms of the superintendent to present reports of their work and to receive further instructions. In the meantime a circular was prepared for their direction, giving explicit instructions in respect to their duties.

Regular and systematized information was desirable in respect to all nonattendants and truants that might be found on the street and in their homes, the reasons for this nonattendance, as the neglect of parents, inability to control their children, or the incorrigibility of the pupils when in school, the indigent circumstances of parents, the illegal employment of children, the physical or mental conditions, or other urgent reasons for not attending school. For this purpose blanks were prepared and placed in the hands of the attendance officers for a weekly report. It was also desirable to have a complete summary of each week's work, and appropriate blanks were prepared for this information.

In order to secure the attendance of children whose nonattendance was due to neglect or willful violation of the law on the part of parents or persons in parental relation, the attendance officers were instructed to notify all such persons that they must comply with the law, and suitable blanks were prepared for such notification.

The efficient execution of the law, as is evident, depends upon the cordial and intelligent cooperation of the principals of the public schools. Principals are therefore required to keep an accurate record of the attendance of pupils between the ages of 8 and 16 years, and to report at the end of each month on blanks furnished for the purpose the names of all pupils who have been absent five days without lawful excuse. Principals are also requested to forward promptly to the attendance officers the names of irregular attendants, truants, pupils suspended, transferred, or withdrawn, with the age of each, parents' names, residence, and any other needed information. In addition to this they will probably be required once a year to make a list of the pupils in their respective schools, with the residences, ages, parents' names and addresses, for the use of the attendance officers in verifying the lists of children obtained by their enumeration.

The experiment of executing the law so far has been as successful as could have been anticipated. Several thousand children have been put into the schools, and the regularity of attendance in many schools has been increased by virtue of the fact that children and their parents have learned that the law is to be executed. Many cases of irregularity have been discovered and the alarming fact made more apparent that a large number of boys and girls are being educated on the street and are growing up in ignorance and vice. Statistics of these cases are being collected, which can be used to show the necessity of "special schools" as soon as the board is ready to enter upon the consideration of that subject. It will not do to force vicious and incorrigible children into the schools with virtuous and well-behaved children, and "special schools" will have to be provided in this city, as has been done in other cities where the effort has been made to carry out a compulsory law of education.

Many cases of real destitution have been discovered as a reason for not sending children to school, which merit the attention of the charitable organizations of our city. In some parts of the city it has been the custom of teachers to provide clothing and shoes for indigent children that they might attend school during the winter season. This charity has in most cases been worthily bestowed; but in some instances the clothing and shoes have been found in pawn shops, having been pawned by the parents for money to buy liquor. This phase of the matter is a serious one and demands the attention of the public-spirited citizens of the city. Children who are thus neglected by their parents should be taken from them and placed in special schools, as contemplated by the law.

SPECIAL SCHOOLS.

In order to execute the law and secure the results contemplated by the law of compulsory attendance, the board of public education will find it necessary to establish "special schools" for exceptional children in different parts of the city. This has been the experience of every city where a compulsory law of education has been in force, and such schools are contemplated by the law of our State. These schools should provide for two or three classes of exceptional children. First, there will be found a number of children in the city whose education has been neglected through the shiftlessness of their parents, or because they could aid their parents in procuring a livelihood by selling papers or doing errands, etc. These children could readily be placed in the schools, but being so backward in their education it would be necessary to put them in the lower grades with children much younger than themselves. This would not only be a humiliation to the pupils and interfere with their progress, but it would have other serious disadvantages. Such children should be placed in small ungraded special schools under special instruction adapted to their age and condition.

A second class of children needing special schools consists of the habitual truants, whose truancy is not the result of criminal tendencies, but of carelessness of parents and a lack of interest in study. The ordinary teacher is unable to secure regularity of attendance, and continued absence results in expulsion, so that the children are growing up ignorant and indolent and shiftless. Many of these children, under the right kind of teachers, can be taught to feel an interest in study and to acquire the habit of regular attendance, as has been shown in other cities where the experiment has been tried. Such children are worth saving, and it is the duty of the State to provide means by which they may be saved. It is quite probable that this class of children, at least many of them, could be placed in the same school as the class previously named. These schools for neglected children and for habitual truants have been found of great value, truancy in most cases being easily cured; and even many children considered incorrigible have been completely reclaimed, so as to be taken out of the special schools and sent to the regular schools without the least danger to the other pupils.

A third class of children for which special schools are imperatively needed is that of incorrigible and vicious children—children who can not be controlled by the ordinary teacher, and children with criminal tendencies whose education upon the street, if not counteracted, will land them in the penitentiary. There are hundreds of children of this class in our city. They can be seen stealing coal on the railroads, playing games of chance in secret corners of houses whose inmates lure them on to the gambling habit for the few pennies they can get from them. Young girls can be seen with vicious companions in secret alleys and disreputable places, learning lessons of vice that can lead only to lives of infamy. These children should be taken out of their surroundings and placed in special schools where, under teachers with special adaptation to their work, they can be trained to habits of virtue. Such schools, standing intermediate between the ordinary school and the House of Reform, have in other cities been appropriately called "parental schools;" and we shall need to provide a number of these parental schools if we would save hundreds of boys and girls who, without them, are being educated to a life of vice and crime.¹

The dual system of school control threatens to interfere with the efficient establishment and working of these special schools. The proper place for the establishment of the first class of special schools is in the immediate neighborhood of neglected and truant children and in buildings already occupied by the regular schools when there are vacancies in them and when no other suitable buildings can be secured. If we organize such a school remote from the residences of these children, we shall meet with a difficulty in securing their attendance. If local boards interpose effectual objections to the use of vacant rooms in buildings already occupied, it will add to the expense of the enforcement of the law and, unless suitable accommodations can be secured, may defeat it. It is to be hoped that local boards will realize the necessity of working in harmony with the central board in carrying out the new law of attendance, which, under the most favorable circumstances, will be attended with many embarrassments.

¹ "We need and are arranging for two classes of special schools—the ordinary 'special school' and the 'parental school.'"—(Letter of the superintendent.)

PROVIDENCE, R. I.

[Statement of Rhoda A. Esten, supervisor of discipline and schools of special discipline and instruction, March 30, 1899.]

The organization of our truancy department consists of one truant officer and one clerk. The salary of the truant officer is \$1,500, that of his clerk, \$480.

We have no regularly organized truant schools, but care for our truants mainly in our schools for special discipline and instruction. Truants are placed in these schools by the supervisor of discipline upon the recommendation of the truant office, the parents, or the teachers.

All truants who do not reform either in the regular or disciplinary schools are sentenced by the court to the State juvenile reformatory schools, viz, the Oak Lawn School for Girls and the Sockanossett School for Boys.

Our disciplinary schools do not wholly solve the question of truancy, but would do so if we could command the pupils' attendance in school until his interest in the school work was aroused. The great need of our city is a parental school, where boys and girls can be placed whose parents are unable through lack of control to compel attendance in our regular or disciplinary schools.

SCHOOLS FOR SPECIAL DISCIPLINE AND INSTRUCTION.

The purpose of these schools is to provide suitable instruction and discipline for pupils for whom our present graded system of schools is not well adapted and who gain comparatively little benefit therefrom.

The immediate occasions for the establishment of these schools were the abolition of corporal punishment in the grammar grades and its very great restriction in the primary, combined with a strict enforcement of the truant law.

The change in the mode of enforcing discipline in our regular schools caused great confusion at first. Pupils recognized at once the new regulations and behaved accordingly. Discipline became more difficult and some means of restraining those who seemed without restraint were needed. At first, the remedy against insubordination was suspension and sending home to parents, but there is hardly anything that, on the whole, brings the school more into disrepute and the teacher into contempt, than frequent and wholesale sending pupils home for misconduct. The parent becomes exasperated and deals more severely with the child than he deserves, or denounces the teacher in the presence of the child, and in many cases allows the child to remain at home altogether. Those suspended were turned loose upon the street. The strict enforcement of the truant law compelled these pupils to return to school, also compelled the attendance of a class of children who never relish the confinement of the school—the truants and children of the street.

Those forced into school are never welcomed nor helpful. They are older and in some respects wiser, or at least more forward, than those with whom they are put; they have not the habits of study nor the familiarity with books of the other children; they submit less willingly to restraint; they can not do as much as the regular pupil, can not get on so fast, and are deficient and discouraged from the beginning.

The committee recognized that some provision must be made for these pupils, and met the issue by establishing special schools whose work in part was to provide for this class. Six of these schools were established during the school year 1893-94, and one in October, 1894.

Of the pupils provided for in these schools, perhaps the most deserving are those who, by reason of poverty or lack of means, can attend school only one term of the year and, in consequence of this loss of time in school, fail to keep up with their grade work.

The boy who gets behind his fellows and has grown old in years and become maturer in powers, but deficient in his studies, is not well provided for in our graded schools. He enters school after a year's absence, perhaps, and is classed with pupils younger and smaller than he, upon whom he looks down in the playground and who look down on him in the schoolroom. This is galling to his pride. If he be a boy of good ability, to whom opportunity has been lacking, he can do much more than his classmates, but has no opportunity to go faster. If he be dull, staying at home has not increased his power of acquisition, though some development has come with years. In a manufacturing city like Providence the number of pupils of this class is large.

Our superintendent and committee recognized the needs of this class early in the school year 1887-88 and urged the necessity of establishing ungraded schools with a course of study adapted to meet the needs of this class, who can only go to school for a few years. The committee concurred with the superintendent, but the council failed to act.

These pupils are now provided for by our special schools and rooms for individual work. There are other pupils who, from absence and lack of self-control, fail to do well and become a disturbing element in the regular schools, requiring so much of the teacher's time to manage as to prevent her from doing justice to the large number of regular, obedient, and studious children under her charge. In these schools, under teachers strong in self-control, patient, and tactful in management, these pupils are brought to a state of obedience and self-respect.

Pupils who for some cause are disaffected and out of harmony with their surroundings are much benefited by a short sojourn in these schools.

Intelligent foreigners who desire to obtain a knowledge of the English language, and are too old to enter the grades in which their present advancement would place them, have derived much benefit from these schools.

The larger class, and perhaps the most difficult and least meritorious, and yet most needful of the pupils provided for in these schools, are the children forced into school—the unfortunate neglected ones who, from lack of sympathy or control at home, have become indifferent, unruly, and unwilling to attend school. With no disposition to work, it is impossible for these to take up the regular work of our graded schools, yet these pupils are compelled by law to attend school.

These schools give to such pupils an opportunity to become educated respectable citizens. There is no class of pupils that it will pay any State or city better to discipline and educate than this. In many instances these pupils have become industrious, ambitious, orderly, and respectful.

Characteristics of the teachers.—Great care, wisdom, and judgment were exercised on the part of the authorities in the selection of teachers for these schools. Strong-willed, self-reliant, self-possessed, cultured, kind, and sympathetic teachers are essential for these schools. Such teachers were selected from among the best in our schools.

These teachers have shown great eagerness to qualify themselves for their work. They have not felt that experience and native tact were a sufficient basis for the best success, but have been anxious to learn those general principles which underlie school management and whose knowledge prepares for the exercise of personal powers. To this end they have had meetings with the supervisor weekly for study and consultation.

They have in the past two years studied critically Abbott's *Gentle Measures in the Training of the Young*, White's *School Management*, Parker's *Talks on Pedagogics*, and Donaldson's *Growth of the Brain*, supplementing this study with a course on neurology at Brown University. A round table for child study has been maintained, and each teacher has subscribed for the *Child Study Monthly*, discussing its contents and testing its suggestions, especially the chapters referring to defective children.

In doing good to others we invariably benefit ourselves. This has been verified in the case of the teachers of these schools. A marked growth of power and tact is manifested in their work.

The work for the present year is the continuation of the round table for child study and a careful and thorough study of Herbart.

Books.—Herbart's *Introduction to Science and Practice of Education*, translated by Felkin; the *Science of Education*, Felkin.

The number of pupils to a teacher in these schools is limited to 20 or 25, better work is done with 20. Pupils sent for discipline are required to remain in these schools until, in the judgment of the teacher, they have acquired sufficient self-control and respect for lawful authority to enable them to enter the regular schools with a fair prospect of remaining. Some of these pupils are so peculiar in their dispositions that they probably can never go back with a prospect of success.

As pupils of all grades below the high school are sent to these schools, attempt is only made to keep them strictly to their respective grades in arithmetic and language. In spelling and reading, writing and music, grade work is combined—i. e., 4 A and 5 B, etc. In geography and history pupils are kept as nearly to grade as time and thoroughness will permit.

Discipline.—As the aim of these schools is mainly the upbuilding of character the discipline is corrective not punitive.

Great pains are taken by the teachers to implant in the minds of these pupils a just conception of their duties to themselves and to those around them and a wholesome respect for lawful authority, thus taking in addition to school training the home training in a marked degree.

The teachers of these special schools receive these pupils kindly and show a personal interest in learning their attainments and preferences, and in pointing out to them what they can do. The past is ignored and a new start taken. In other words, they are made to feel that they are wanted and are of use in life.

Teachers are allowed to use corporal punishment if they deem it useful in any case. They are not to endure disrespect and impertinence tamely, in order to make a reputation of managing bad boys without punishment. At the same time they are to avoid it if it arouses antagonism, and by all means, so far as possible, to have no altercation with a pupil in the presence of others.

To select these unfortunate children and place them in these special schools, before giving them a chance in the regular schools, would imply on the part of the authorities a grave doubt of their ability to behave, hence, with a few exceptions, all are entered in the regular schools on an equal footing.

Pupils of the above class or of any class who fail in respect for and obedience to the rules of schools and can not be brought to a proper state of control through the means at the command of the teacher are referred first to their parents, who are requested to call and cooperate with the teacher. This throws the responsibility on the parents and gives them the opportunity to make the pupil obedient. Should the parent fail to appear within twenty-four hours or, appearing, and, through lack of power or ability, fail to bring the pupil to a proper state of obedience, he is then sent to the office of the superintendent. Here he is dealt with in a firm, kind manner, his duties explained, his errors pointed out, and, if his heart can be reached, an appeal is made to him to give his best to his work and to form habits of respect for proper authority. If the pupil responds to his admonitions and expresses the desire to have another trial, unless the offense is a very grave one, he is given the opportunity to return to his school again on trial. If he is again sent to the office a transfer to the special school is at once given.

Supervision.—These schools are under the immediate charge of the supervisor of discipline, who is expected to spend at least one hour a week in each school, studying the pupils, noting the interest which they manifest in their work, and their progress, mainly, in two essentials, habit and disposition.

These teachers meet weekly with the supervisor and discuss the best means of governing and disciplining their pupils and of inculcating in them right motives of action, correct habits, also proper respect for lawful authority. These discussions are held at the round table for child study.

Our superintendent gives much thought and time to them, making valuable suggestions to both supervisor and teachers.

They are also visited once a week by the truant officer, who inquires into the cases of absence and truancy. He has rendered valuable service to the supervisor in looking up these boys in their homes and impressing the parents with the majesty of law and the necessity of cooperating fully with the teachers.

Records.—Two records of each pupil are kept at the office of the superintendent of schools—first, his record in the school from which he came, embracing the following particulars: Name of pupil, age, name of parent, residence, name of school from which pupil was sent, room, teacher, date of referring to office, offense, action taken, result (the latter item may not be recorded until the end of the school year); second, his record in special school, including the following: Name of pupil, age, name of parent, residence, date of entering school, from whence pupil came, grade, number of days belonging, number of days attending, conduct, where gone, date of referring to office second time, remarks.

Child-study record.—Each child as he enters these schools is made an object of study by the teacher. His physical, mental, and moral defects are noted, and, as far as time permits, a written record is made of the same. Care is taken to note the effect of certain methods of discipline and punishment.

Our schools for special instruction and discipline help us to make good schools the rule. They bring relief to the regular schools by freeing them from disturbing influences and relieving the regular teacher from the severe strain of discipline; thus she is enabled to devote herself the more fully to the needs of the ordinary and more responsive pupils.

By their aid we have successfully reclaimed and properly instructed and disciplined many persistently unruly pupils who could not be retained in our ordinary graded schools, with whom the only alternative was suspension, thus throwing upon the streets the very class most needing instruction and discipline.

These schools are now placed upon a firm basis and are a potent auxiliary in our school system.

The following statistics will show something of the work of these schools since their organization.

From the organization of these schools to June 30, 1895, was a period varying in the several schools from nearly two years to a year and three months. During this period 373 different pupils were enrolled, and of these only 5 were sent to the reform school (for truancy) and but one expelled.

At the beginning of the school year 1895-1896, 92 pupils remained in the disciplinary schools from the previous year. To these 231 were added, making 323 cases treated. Sixteen, however, were sent to these schools for other reasons than misconduct. Of these 323 pupils 120 were returned to the regular schools, where 100 maintained themselves in good standing, and 20, having failed to be satisfactory to the teachers, were returned to the disciplinary schools. Sixty-four left to go to work; 5 went to private and parochial schools; 11 moved from the city; 2 died; 10 were sent to the reform school (truancy and outside conduct), and 30 were reported at home, 7 on account of sickness; 23, having attended the required eighty days, were assisting their parents. One hundred and one remained members of the special schools at the beginning of the present year.

The table that follows shows the grade of the pupils in these schools for the school year 1895-96:

1 B.....	4	6 A.....	21
1 A.....	3	7 B.....	21
2 B.....	5	7 A.....	17
2 A.....	13	8 B.....	12
3 B.....	14	8 A.....	10
3 A.....	25	9 B.....	0
4 B.....	20	9 A.....	1
4 A.....	40	Ungraded.....	11
5 B.....	23		
5 A.....	33		
6 B.....	50		
		Total	323

As will be noticed, these pupils were of all grades but one below the high school, but the greater number were of the middle grades, those of the third to the seventh year. One grade, the 6 B, stands out conspicuous from its number. These were the boys just entering the grammar schools and coming into new combinations of pupils and under the control of men.

Among the essentials for the success of these special schools are: (1) A limited number of pupils in each school; (2) quarters away from regular school buildings; (3) special methods of discipline; (4) child study; (5) The very best teachers, teachers especially apt in teaching, governing, and disciplining children.

IV. LAWS RELATING TO THE DISPOSITION OF TRUANTS AND INCORRIGIBLES.

CONNECTICUT.

[From Connecticut School Document No. 5, 1898.—Laws Relating to the Schools, pp.13-15.]

SEC. 26. Each city and town may make regulations concerning habitual truants from school, and children between the ages of seven and sixteen years wandering about its streets or public places, having no lawful occupation, nor attending school, and growing up in ignorance; and such by-laws, also, respecting such children, as shall conduce to their welfare and to public order, imposing suitable penalties, not exceeding twenty dollars for any one breach thereof; but no such town by-laws shall be valid until approved by the superior court in any county.

SEC. 27. Every town, and the mayor and aldermen of every city having such by-laws, shall annually appoint three or more persons, who alone shall be authorized to prosecute for violations thereof. All warrants issued upon such prosecutions shall be returnable before any justice of the peace or judge of the city or police court of the town or city.

SEC. 28. The police in any city, and bailiffs, constables, sheriffs, and deputy sheriffs in their respective precincts shall arrest all boys between eight and sixteen years of age who habitually wander or loiter about the streets or public places, or anywhere beyond the proper control of their parents or guardians, during the usual school hours of the school term; and may stop any boy under sixteen years of age during such hours, and ascertain whether he is a truant from school; and if he be, shall send him to such school.

SEC. 29. Any boy arrested the third time under the provisions of the preceding section, if not immediately returned to school, shall be taken before the judge of the criminal or police court, or any justice of the peace in the city, borough, or town where such arrest is made, and if it shall appear that such boy has no lawful occupation, or is not attending school, or is growing up in habits of idleness or immorality,

or is an habitual truant, he may be committed to any institution of instruction or correction, or house of reformation in said city, borough, or town, for not more than three years, or, with the approval of the selectmen, to the Connecticut School for Boys.

SEC. 30. Officers other than policemen of cities shall receive for making the arrests required by the two preceding sections such fees, not exceeding the fees allowed by law for making other arrests, as may be allowed by the selectmen of the town in which such arrests are made; but unless a warrant was issued by a judge of the criminal or police court or by a justice of the peace the officer shall, before receiving his fees, present to the selectmen of the town a written statement showing the name of each boy arrested, the day on which the arrest was made, and, if the boy was returned to school, the name or number of the school to which he was so returned.

SEC. 31. In all cases arising under the provisions of the three preceding sections a proper warrant shall be issued by the judge of the criminal court of the city, or by a justice of the peace in the borough or town where such arrest is made, and the father, if living, or, if not, the mother or guardian of such boy shall be notified, if such parent or guardian can be found, of the day and time of hearing. The fees of the judge or justice shall be two dollars for such hearing, and all expenses shall be paid by the city, borough, or town in and for which he exercises such jurisdiction.

SEC. 32. After the hearing in any such case, such judge or justice of the peace may, at his discretion, indefinitely suspend the rendition of judgment.

SEC. 33. The selectmen of any town may appoint committees of school districts and janitors of school buildings, and other persons, on nomination by the school visitors of the town or board of education of an incorporated school district, special constables. Said constables shall have power in the town in which they reside, and in adjoining towns when offenders have escaped thither, to arrest for truancy and other causes named in section 28, and for disturbance of schools and school meetings and damage to school property, and to serve criminal process in all such cases.

SEC. 34. Upon the request of the parent or guardian of any girl between eight and sixteen years of age, a warrant may be issued for her arrest in the same manner and on the same conditions as is provided in sections 29-32 with respect to boys; and thereupon the same proceedings may be had as are above provided, except that said girls may be committed to the Connecticut Industrial School for Girls.

ILLINOIS.

[From act approved July 11, 1897, section 3, in Illinois School Law, 1897-98, p. 96.]

The board of education in cities, towns, villages and school districts, and the board of school directors in school districts, shall appoint, at the time of appointment or election of teachers each year, one or more truant officers, whose duty it shall be to report all violations of this [compulsory education] act to said board of education or board of directors, and to enter complaint against and prosecute all persons who shall appear to be guilty of such violation. It shall also be the duty of said truant officer, so appointed, to arrest any child of school-going age that habitually haunts public places and has no lawful occupation, and also any truant child who absents himself or herself from school, and to place him or her in charge of the teacher having charge of any school which said child is by law entitled to attend, and which school shall be designated to said officer by the parent, guardian, or person having control of said child. In case such parent, guardian, or person shall designate a school without making or having made arrangements for the reception of said child in the school so designated, or in case he refuses or fails to designate any school, then such truant officer shall place such child in charge of the teacher of the public school. And it shall be the duty of said teacher to assign said child to the proper class and to instruct him or her in such studies as he or she is fitted to pursue. The truant officer so appointed shall be entitled to such compensation for services rendered under this act as shall be determined by the boards appointing them, and which compensation shall be paid out of the distributable school fund: *Provided*, That nothing herein contained shall prevent the parent, guardian, or person having charge of such truant child, which has been placed in any school by the truant officer, to thereafter send said child to any other school which said child is by law entitled to attend.

[An act to enable boards of education or boards of school trustees to establish and maintain parental or truant schools. Passed April 13, 1899.]

SECTION 1. In cities having a population of 100,000 inhabitants or more, there shall be established, maintained, and conducted, within two years from the date of taking effect of this act, one or more parental or truant schools for the purpose of affording a place of confinement, discipline, instruction, and maintenance of children

of compulsory school age who may be committed thereto in the manner hereinafter provided.

SEC. 2. For the purpose of establishing such school or schools, sites may be purchased and buildings constructed or premises rented in the same manner as is provided for in the case of public schools in such cities; but no such school shall be located at or near any penal institution. And it shall be the duty of the board of education to furnish such schools with such furniture, fixtures, apparatus, and provisions as may be necessary for the maintenance and operation thereof.

SEC. 3. The board of education may also employ a superintendent and all other necessary officers, agents, and teachers, and shall prescribe the methods of discipline and the course of instruction, and shall exercise the same powers and perform the same duties as is prescribed by law for the management of other schools.

SEC. 4. No religious instruction shall be given in said school except such as is allowed by law to be given in public schools; but the board of education shall make suitable regulation, so that the inmates may receive religious training in accordance with the belief of the parents of such children, either by allowing religious services to be held in the institution or by arranging for attendance at public service elsewhere.

SEC. 5. It shall be the duty of any truant officer or agent of such board of education to petition, and any reputable citizen of the city may petition, the county or circuit court of the county, to inquire into the case of any child of compulsory school age who is not attending school, or who has been guilty of habitual truancy, or of persistent violation of the rules of the public school, and the petition shall also state the names, if known, of the father and mother of such child, or the survivor of them; and if neither father nor mother of such child is living, or can not be found in the county, or if their names can not be ascertained, then the name of the guardian if there be one known; and if there be a parent living whose name can be ascertained, or a guardian, the petition shall show whether or not the father or mother or guardian consents to the commitment of such child to such parental or truant school. Such petition shall be verified by oath upon the belief of the petitioner, and upon being filed the judge of the county or circuit court shall have such child named in the petition brought before him for the purpose of determining the application in said petition contained. But no child shall be committed to such school who has ever been convicted of any offense punishable by confinement in any penal institution.

SEC. 6. Upon the filing of such petition the clerk of the court shall issue a writ to the sheriff of the county directing him to bring such child before the court; and if the court shall find that the material facts set forth in the petition are true, and if in the opinion of the court such child is a fit person to be committed to such parental or truant school, an order shall be entered that such child be committed to such parental or truant school, to be kept there until he or she arrives at the age of fourteen years, unless sooner discharged in the manner hereinafter set forth. Before the hearing aforesaid notice in writing shall be given to the parent or guardian of such child, if known, of the proceedings about to be instituted, that he or she may appear and resist the same, if they so desire.

SEC. 7. It shall be the duty of the parent or guardian of any child committed to this school to provide suitable clothing upon his or her entry into such school, and from time to time thereafter as it may be needed, upon notice in writing from the superintendent or other proper officer of the school. In case any parent or guardian shall refuse or neglect to furnish such clothing, the same may be provided by the board of education, and such board may have an action against such parent or guardian of said child to recover the cost of such clothing, with 10 per cent additional thereto.

SEC. 8. The board of education of such city shall have power to establish rules and regulations under which children committed to such parental or truant school may be allowed to return home upon parole, but to remain while upon parole in the legal custody and under the control of the officer and agents of such school, and subject at any time to be taken back within the enclosure of such school by the superintendent or any authorized officer of said school, except as hereinafter provided; and full power to enforce such rules and regulations to retake any such child so upon parole is hereby conferred upon said board of education. No child shall be released upon parole in less than four weeks from the time of his or her commitment, nor thereafter until the superintendent of such parental or truant school shall have become satisfied from the conduct of such child that, if paroled, he or she will attend regularly the public or private school to which he or she may be sent by his or her parents or guardian, and shall so certify to the board of education.

SEC. 9. It shall be the duty of the principal or other person having charge of the

school to which such child so released on parole may be sent to report at least once each month to the superintendent of the parental or truant school, stating whether or not such child attends school regularly, and obeys the rules and requirements of said school; and if such child so released upon parole shall be regular in his or her attendance at school and his or her conduct as a pupil shall be satisfactory for a period of one year from date on which he or she was released upon parole, he or she shall then be finally discharged from the parental or truant school, and shall not be recommitted thereto except upon petition as hereinbefore provided.

SEC. 10. In case any child released from said school upon parole, as hereinbefore provided, shall violate the conditions of his or her parole at any time within one year thereafter, he or she shall upon the order of the board of education, as hereinbefore provided, be taken back to such parental or truant school, and shall not be again released upon parole within the period of three months from the date of such reentering; and if he or she shall violate the conditions of a second parole he or she shall be recommitted to such parental or truant school and shall not be released therefrom on parole until he or she shall remain in such school at least one year.

SEC. 11. In any case where a child is found to be incorrigible and his or her influence in such school to be detrimental to the interests of the other pupils, the board of education may authorize the superintendent or any officer of the school to represent these facts to the circuit or county court by petition, and the court shall have power to commit said child to some juvenile reformatory.

SEC. 12. Boards of education in cities having a population of over 25,000 and less than 100,000 may establish, maintain, and operate a parental or truant school for the purposes hereinbefore specified, and in case of the establishment of such a school, the boards of education shall have like power in their respective cities as is hereinbefore expressed: *Provided*, That no board of trustees or board of education under this section shall put this law into effect until submitted to a vote of the people and adopted by a majority vote at some general election.

INDIANA.

[From school laws of the State of Indiana, 1899, pp. 51-54.]

SEC. 2. The county superintendent of schools of a county, together with the secretary of the State board of charities and one member of the State board of education designated for such purpose by said board, shall constitute a board of truancy, whose duty it shall be to appoint one truant officer in each county. The truant officer shall see that the provisions of this act are complied with, and when, from personal knowledge or by report or complaint from any resident or teacher of the township under his supervision, he believes that any child subject to the provision of this act is habitually absent from school he shall immediately give written notice to the parent, guardian, or custodian of such child that the attendance of such child at school is required, and if within five days such parent, guardian, or custodian of child does not comply with the provisions of this section then such truant officer shall make complaint against such parent, guardian, or custodian of such child in any court of record for violation of the provisions of this act. Any such parent, guardian, or custodian of child who shall violate the provisions of this act shall be adjudged guilty of a misdemeanor, and upon conviction thereof shall be fined in any sum not less than five (5) dollars nor more than twenty-five (25) dollars, to which may be added, in the discretion of the court, imprisonment in the county jail not less than two nor more than ninety days.

SEC. 3. A city having a school enumeration of five thousand or more children may, in the discretion of the board of truancy, constitute a separate district for the administration of this act, and the truant officer or officers of such city shall be appointed by the superintendent of schools of such city, the secretary of the State board of charities, and one member of the State board of education designated for such purpose by such board. Cities containing a school enumeration of ten thousand children or less shall have but one truant officer. Cities containing a school enumeration of more than ten thousand and less than twenty thousand children may have two truant officers. Cities containing a school enumeration of twenty thousand and less than thirty thousand children may have three truant officers. Cities containing a school enumeration of thirty thousand and less than forty thousand children may have four truant officers. Cities containing a school enumeration of more than forty thousand children may have five truant officers. The truant officers of cities shall enforce the provisions of this act in the manner and under such penalties as are prescribed by section two of this act.

SEC. 4. The truant officers provided for in this act shall receive from the county treasury two dollars for each day for actual service, to be paid by the county treas-

ury upon a warrant signed by the county auditor: *Provided*, That no county auditor shall issue a warrant on the county treasury for such service until the truant officer shall have filed an itemized statement of time employed in such service, and such statement shall have been certified to by the superintendent of schools of the corporation in which such truant officer is employed: *Provided further*, That no truant officer shall receive pay for more days than the average length of school term in the county or city under his supervision.

* * * * *

SEC. 7. School commissioners, trustees, and boards of trustees are empowered to maintain, either within or without the corporate limits of their corporations, a parental home for incorrigible and truant children. Any child or children not being over twelve years of age who shall be truant or incorrigible may, with the common consent of the school trustee or board of school trustees, or commissioners and parent, guardian, or person having charge of such child or children, be compelled to attend such parental home for an indeterminate time. If the parent, guardian, or person having charge of such incorrigible or truant child or children shall refuse his consent to the attendance of such incorrigible or truant child or children at such parental home the superintendent of schools or the principal supervisor or teacher of any school may file complaint in the circuit or superior court of the county, and such court shall have the power, upon the hearing of the case, to order the compulsory attendance of such incorrigible or truant in such parental home for an indeterminate time, not longer than one hundred and twenty (120) days.

MAINE.

[From laws of Maine relating to public schools, 1899, pp. 9 to 12.]

Towns may make such by-laws, not repugnant to law, concerning habitual truants, and children between six and seventeen years of age not attending school, without any regular and lawful occupation, and growing up in ignorance, as are most conducive to their welfare and the good order of society; and may annex a suitable penalty, not exceeding twenty dollars, for any breach thereof; but such by-laws must be first approved by a judge of the supreme judicial court.

SEC. 22. Such towns shall, at their annual meeting, appoint one or more persons, who alone shall make complaints for violations of said by-laws, and shall execute the judgments of the magistrate.

SEC. 23. Said magistrate, in place of fine, may order children proved to be growing up in truancy, and without the benefit of the education provided for them by law, to be placed for such periods as he thinks expedient in the institution of instruction, house of reformation, or other suitable situation provided for the purpose under section twenty-one.

SEC. 25. Cities and towns shall annually elect one or more persons, to be designated truant officers, who shall inquire into all cases of neglect of the duty prescribed in section 24¹ and ascertain the reasons therefor, and shall promptly report the same to the superintending school committee, and such truant officers, or any one of them, shall, when so directed by the school committee or superintendent in writing, prosecute, in the name of the city or town, any person liable to the penalty provided in said section; and said officers shall have power, and it shall be their duty, when notified by any teacher that any pupil is irregular in attendance, to arrest and take such pupil to school when found truant; and further, it shall be the duty of such officers to enforce the provisions of sections one hundred and fourteen to one hundred and sixteen, inclusive, of chapter eleven of the revised statutes. Every city or town neglecting to elect truant officers, and truant officers neglecting to prosecute when directed as required by law, shall forfeit not less than ten nor more than fifty dollars to the use of the public schools in the city or town neglecting as aforesaid, or to the use of the public schools in the city or town where such truant officer resides.

The municipal officers shall fix the compensation of the truant officers elected as prescribed in this section. Superintending school committees shall have power to fill vacancies occurring during the year.

SEC. 26. If a child without sufficient excuse shall be absent from school six or more times during any term, he shall be deemed an habitual truant, and the superintending school committee shall notify him and any person under whose control he may be that unless he conforms to section 25 of this act the provisions of the two following sections will be enforced against them; and if thereafter such child continues irregular in attendance, the truant officer or any of them shall, when so

¹ Which requires the attendance at school of all children between 8 and 15 years of age.

directed by the school committee or superintendent in writing, enforce said provisions by complaint.

Any person having control of a child who is an habitual truant, as defined in the foregoing section, and being in any way responsible for such truancy, and any person who induces a child to absent himself from school, or who harbors or conceals such child when he is absent, shall forfeit not exceeding twenty dollars for the use of the public schools of the city or town in which such child resides, to be recovered by the truant officer on complaint, or shall be imprisoned not exceeding thirty days.

On complaint of the truant officer, an habitual truant, if a boy, may be committed to the State reform school, or, if a girl, to the State industrial school for girls, or to any truant school that may be hereafter established.

SEC. 27. Police or municipal courts and trial justices shall have jurisdiction of the offences described in sections 24, 25, and 26.

MASSACHUSETTS.

[From chapter 496, acts of 1898.]

SEC. 22. The county commissioners of each county, the counties of Barnstable, Berkshire, Dukes County, and Nantucket excepted, shall establish and maintain either separately or conjointly with the commissioners of other counties as hereinafter provided, in a suitable place, not at or near a penal institution, a truant school for the instruction and training of persons committed thereto as habitual truants, absentees, or school offenders. The county commissioners of two or more counties may at the expense of said counties establish and maintain a union truant school, to be organized and controlled by the chairmen of the county commissioners of said counties. The county commissioners of each of the counties excepted as aforesaid shall assign a truant school established by law as the place for the instruction and training of persons committed within their respective counties as habitual truants, absentees, or school offenders, and shall pay for their support in said school such reasonable sums as the county commissioners having control of said school may determine. For the purposes of this act the parental school of the city of Boston, established under chapter two hundred and eighty-two of the acts of the year eighteen hundred and eighty-six and acts in amendment thereof and in addition thereto, shall be deemed the county truant school of the county of Suffolk, and the towns of Revere and Winthrop and the city of Chelsea shall for this purpose be considered as located within the county of Middlesex. When an habitual truant, absentee, or school offender is committed under this act to a county truant school the town or city from which such child is committed shall pay to the county within which such town or city is located one dollar a week towards his support in said school: *Provided*, That the towns of Revere and Winthrop and the city of Chelsea shall pay to the county of Middlesex for the support of each child committed to the truant school of said county two dollars and fifty cents per week, and such additional sums for each child as shall cover the actual cost of maintenance.

SEC. 23. County truant schools shall be subject to visitation by the State board of education and by the State board of lunacy and charity; and said boards shall report thereon annually to the legislature.

SEC. 24. Every habitual truant, that is every child between seven and fourteen years of age who wilfully and habitually absents himself from school contrary to the provisions of section twelve of this act, upon complaint by a truant officer, and conviction thereof, may be committed, if a boy, to a county truant school for a period not exceeding two years, and if a girl, to the State Industrial School for Girls, unless such child is placed on probation as provided in section twenty-eight of this act.

SEC. 25. Every habitual absentee, that is every child between seven and sixteen years of age who may be found wandering about in the streets or public places of any town or city of the Commonwealth, having no lawful occupation, habitually not attending school, and growing up in idleness and ignorance, upon complaint by a truant officer or any other person, and conviction thereof, may be committed, if a boy, at the discretion of the court, to a county truant school for a period not exceeding two years, or to the Lyman School for Boys, and, if a girl, to the State Industrial School for Girls, unless such child is placed on probation as provided in section twenty-eight of this act.

SEC. 26. Every habitual school offender, that is every child under fourteen years of age who persistently violates the reasonable regulations of the school which he attends, or otherwise persistently misbehaves therein, so as to render himself a fit subject for exclusion therefrom, upon complaint by a truant officer, and conviction thereof, may be committed, if a boy, at the discretion of the court, to a county truant school for a period not exceeding two years, or to the Lyman School for Boys, and,

if a girl, to the State Industrial School for Girls, unless such child is placed on probation as provided in section twenty-eight of this act.

SEC. 27. Any court or magistrate by whom a child is committed to a county truant school may make such order as said court or magistrate deems expedient concerning the payment by the parents of such child to the county, of the cost of the support of any such child while in said school, and may from time to time revise and alter such order, or make a new order, as the circumstances of the parents may justify.

SEC. 28. Any court or magistrate by whom a child has been convicted of an offence under this act may in his discretion place such child on probation under the oversight of a truant officer of the town or city in which the child resides, or of a probation officer of said court, for such period and upon such conditions as said court or magistrate may deem best; and within such period, if the child violates the conditions of his probation, such truant officer or probation officer may without warrant or other process take the child before the court, and the court may thereupon proceed to sentence or may make any other lawful disposition of the case.

SEC. 29. County commissioners, whenever they think it will be for the best interest of any child committed to a county truant school under their control, and after due notice and an opportunity to be heard have been given to the superintendent of schools, or, where there is no superintendent, to the school committee of the town or city from which such child was committed to said school, may permit such child to be at liberty, upon such conditions as said commissioners may deem best; or, with the approval of a justice of the court which imposed the sentence, they may discharge such child from said school; and in case of such parole or discharge the trustees shall make an entry upon their records of the name of such child, the date of such parole or discharge, and the reason therefor, and a copy of such record shall be transmitted to the court or magistrate by whom such child was committed, and to the school committee of the town or city from which such child was committed. If any child who is permitted to be at liberty, as provided by this section, violates, in the opinion of said commissioners, the conditions of his parole at any time previous to the expiration of the term for which such child was committed to said school, they may revoke such parole. Upon evidence from a superintendent of schools or a school committee, satisfactory to said commissioners, of the violation by a child of the conditions of his parole, it shall be the duty of said commissioners to revoke such parole. Said commissioners may issue an order directed to the truant or police officers of any town or city to arrest such child wherever found and return him to said school; and any such officer holding such order shall arrest such child and return him to said school, which may thereupon hold him, subject to the provisions of this act, for the unexpired portion of the term of the original sentence. Said commissioners shall meet the expense attending such arrest and return, so far as approved by them, at the cost of the county or counties maintaining said school. But releases from the parental school of the city of Boston shall be governed by the provisions of chapter five hundred and fourteen of the acts of the year eighteen hundred and ninety-six.¹

SEC. 30. Any inmate of a county truant school who persistently violates the reasonable regulations of said school, or is guilty of indecent or immoral conduct, or otherwise grossly misbehaves, so as to render himself an unfit subject for retention therein, upon complaint by the county commissioners in control of said school, and conviction thereof, may be committed by the court, if a boy under fifteen years of age, to the Lyman School for Boys; if a boy over fifteen years of age, to the Massachusetts Reformatory at Concord. The period of commitment to said institutions shall be determined by the laws and regulations governing commitments thereto.

SEC. 31. Any person having under his control a child between seven and fourteen years of age who fails for five day sessions or ten half-day sessions within any period of six months while under such control to cause such child to attend school, as required by section twelve of this act, the physical or mental condition of such child not being such as to render his attendance at school harmful or impracticable, upon complaint by a truant officer, and conviction thereof, shall forfeit and pay a fine of not more than twenty dollars. Any person who induces or attempts to induce any child to absent himself unlawfully from school, or employs or harbors while school is in session any child absent unlawfully from school, shall forfeit and pay a fine of not more than fifty dollars.

SEC. 32. Police, municipal, and district courts, trial justices, and judges of probate courts, shall have jurisdiction of all cases arising under this act relating to persons residing in their respective jurisdiction. Upon a complaint for an offence under this act a summons shall issue instead of a warrant for arrest, unless in the judgment of the court or magistrate receiving the complaint there is reason to believe that the

¹See p. 132.

accused will not appear upon a summons. A warrant may issue at any time after the issue of such summons, if occasion arises, whether or not the summons has been served. Such summons or warrant may be served, at the discretion of the court or magistrate, by a truant officer or by any officer empowered to serve criminal process. Upon complaint against a child under this act the parents, guardian, or custodian of the child shall be notified as is required by law in the case of a juvenile offender. No child under seventeen years of age shall be committed under this act, except to a county truant school, and no child against whom complaint as an habitual absentee is brought under section twenty-five of this act by any other person than a truant officer shall be committed under this act, unless due notice and an opportunity to be heard have been given to the State board of lunacy and charity.

SEC. 33. The school committee of every town and city shall appoint and fix the compensation of one or more persons to be designated as truant officers, and shall make rules and regulations governing said officers. Truant officers shall not receive fees for their services. The school committees of two or more towns or cities may employ the same truant officer or officers.

SEC. 34. The truant officers of towns and cities shall inquire into all cases arising under sections eleven, twelve, twenty-four to twenty-six, inclusive, and thirty-one of this act, and may make complaints, serve legal processes, and carry into execution judgments thereunder. They shall perform the duties of oversight of children placed on probation as may be required of them under section twenty-eight of this act. A truant officer of any town or city may apprehend and take to school, without warrant, any truant or absentee found wandering about in the streets or public places thereof.

[From an act relative to the temporary release of children from truant schools. Approved April 12, 1898.]

Children committed may, upon satisfactory proof of amendment or other sufficient cause, be discharged from * * * places of confinement by the judge or justice who committed them; and in case of death or serious illness in the immediate family of an inmate of a truant school such judges or justices may order such inmate to be temporarily released for a specified time, either with or without the custody of the superintendent or other officer, and may revoke, extend, or otherwise modify such order, the expenses incurred in serving such order to be approved and paid like other expenses of such institution.

RESPECTS WHEREIN THE MASSACHUSETTS LEGISLATION OF 1898 CONCERNING THE ATTENDANCE OF CHILDREN AT SCHOOL DIFFERS IN ITS PROVISIONS FROM THE LEGISLATION PREVIOUSLY IN FORCE.

[From a circular of the State board of education.]

Establishment of truant schools.—Section 22 is largely a reenactment of the old law requiring county commissioners to establish and maintain county truant schools in their respective counties. The principal added provisions in the present law are:

1. The county commissioners of Barnstable, Berkshire, Dukes, and Nantucket counties are exempt from establishing truant schools, but are required, instead, to assign a truant school established by law as the place for the instruction and training of persons committed to truant schools from their respective counties.

2. For the purposes of this act the parental school of Boston is to be deemed the county truant school for Suffolk County.

3. For the purposes of this act Chelsea, Revere, and Winthrop are to be considered as belonging to Middlesex County.

4. For the maintenance of each child sent to a truant school, towns and cities other than the above named are to pay one dollar a week (instead of two dollars, as heretofore), the above named being required to pay two dollars and fifty cents a week and such additional sums as shall cover the actual cost of maintenance.

Visitation of truant schools.—Section 23 provides that the State board of education and the State board of lunacy and charity shall visit the county truant schools and report concerning them annually to the legislature (new).

Habitual truants, absentees, and school offenders.—Sections 24, 25, and 26 name and more fully describe three classes of children that may be committed to truant schools, or elsewhere, under this act, namely:

1. Habitual truants—children between seven and fourteen years of age who willfully and habitually absent themselves from school.

2. Habitual absentees—children between seven and sixteen years of age who may be found wandering about in the streets or public places, having no lawful occupation, habitually not attending school, and growing up in idleness and ignorance.

3. Habitual school offenders—children under fourteen years of age who persistently violate the reasonable regulations of the school which they attend or otherwise misbehave so as to render themselves fit subjects for exclusion therefrom.

Commitments of such children, in case of conviction, if boys, may be made to county truant schools (old), or, in certain cases, to the Lyman School for Boys (new); if girls, to the State Industrial School for Girls (new), or they may be placed on probation, as provided in section 28 of this act (new).

Support of a child in a truant school to be paid for by the parent if so ordered.—Section 27 provides for the payment, at the discretion of the court, by the parent or guardian for the support of a child while an inmate of a truant school (new).

Probation.—Section 28 provides for placing upon probation under a truant officer or a probation officer a child convicted of an offence under this act, and for other disposition of such child in case he violates the conditions of his probation (new).

Parole and discharge.—Section 29 makes new provisions (1) for the parole and discharge of a child committed to a county truant school; (2) for revoking such parole and for the arrest of the paroled child; and (3) for the right of the superintendent or the school committee to be heard upon a proposal to parole or to revoke a parole.

Releases from the parental school of Boston are to be governed by the provisions of chapter 514 of the acts of the year 1896.

Transfer from truant schools in certain cases.—Section 30 provides for the transfer, by order of the court, from a county truant school to the Lyman School for Boys or to the Concord Reformatory of any inmate who persistently violates the reasonable regulations of said truant school or who is guilty of indecent or immoral conduct while connected therewith (new).

Penalties for neglect to send children to school and for inducing unlawful absence.—Section 31 provides:

1. That any person who, having under his control a child between seven (instead of eight, as heretofore) and fourteen years of age, fails for five day sessions or for ten half-day sessions within any period of six months (this period is new) to cause such child to attend school, as required by law, shall forfeit and pay a fine of not more than twenty dollars. The child's attendance is required for the full time the school is kept, instead of thirty weeks, as heretofore, and the allowance of two weeks for unexcused absence is no longer permitted.

2. That a fine of not more than fifty dollars (instead of not less than twenty nor more than fifty) shall be imposed upon a person for inducing any child to absent himself unlawfully from school, or for employing or harboring a child unlawfully absent from school.

Jurisdiction and procedure.—Section 32 tells what courts shall have jurisdiction in cases arising under this act and indicates the method of procedure (partly new).

Truant officers.—Section 33 requires the school committee of every town and city (1) to appoint one or more persons (instead of two, as in the old law) to be designated as truant officers; (2) to make rules and regulations governing said officers; and (3) authorizes school committees of two or more towns or cities to employ the same truant officer or officers (new).

Duties of truant officers.—Section 34 directs truant officers to inquire into all cases arising under this act and authorizes them to make complaints, serve processes, and carry into execution judgments thereunder. The old provision that they shall do this "under direction of the school committee" is dropped. They are to proceed directly under the provisions of this act, by-laws having been done away with. They are also to serve as probation officers as required by section 28 (new).

MICHIGAN.

[From act No. 95, Public Acts of 1895, as amended by act No. 67, Public Acts of 1897. In General School Laws of Michigan, 1898, pp. 68 et seq.]

SEC. 2. The district board or board of education in each school district in the State which has been organized as a graded-school district or as a township district, according to the laws of the State, shall, at its first meeting after this law goes into effect and previous to the tenth day of September of each year, appoint a truant officer for the term of one year from and after the first Monday of September of each year. In townships whose districts have been organized under the primary-school law the chairman of the township board of school inspectors shall be the truant officer and shall perform all the duties of truant officer, as provided for in this act, so far as the provisions of this law apply to the territory over which he has jurisdiction: *Provided*, That in cities having a duly organized police force it shall be the duty of the police authorities, at the request of the school authorities, to detail one or more members of said force to perform the duties of truant officer. The compensation of the truant

officer shall be fixed in graded-school districts by the board which appoints, and in townships by the township board, and in no case shall such compensation be less than one dollar and fifty cents per day for time actually employed under the direction of the school board in performance of his official duties. The compensation of truant officers shall be allowed and paid in the same manner as incidental expenses are paid by such boards.

SEC. 3. It shall be the duty of the truant officer to investigate all cases of truancy or nonattendance at school and render all service within his power to compel children to attend school. * * *

SEC. 4. In all city school districts in this State having a school census of five hundred or more pupils the school board or officers having in charge the schools of such districts may establish one or more ungraded schools for the instruction of certain children, as defined and set forth in the following section. They may, through their truant officer and superintendent of schools, require such children to attend said ungraded schools, or any department of their graded schools, as said board of education may direct.

SEC. 5. The following classes of persons between the ages of eight and sixteen years, and in cities between the ages of seven and sixteen years, shall be deemed juvenile disorderly persons and shall, in the judgment of the proper school authorities, be assigned to the ungraded school or schools, as provided in section four of this act: Class one, habitual truants from any school in which they are enrolled as pupils; class two, children who while attending any school are incorrigibly turbulent, disobedient, or insubordinate, or are vicious or immoral in conduct; class three, children who are not attending any school and who habitually frequent streets and other public places, having no lawful business, employment, or occupation.

SEC. 7. When, in the judgment of school boards of primary and township school districts or the superintendent of city schools and the truant officer, it becomes certain that all legal means have been exhausted in their attempts to compel the attendance at school of a juvenile disorderly person, the truant officer shall, in case the person in parental relation to the child neglects or refuses to do so, make a complaint against such juvenile disorderly person before a court of competent jurisdiction, that said child is a juvenile disorderly person as described in section five of this act. The justice of the peace or court shall issue a warrant and proceed to hear such complaint; and, if said justice of the peace or court shall determine that said child is a juvenile disorderly person within the meaning of this act, then said justice of the peace or court shall thereupon and after consultation with the county agent of corrections and charities sentence such child, if a boy, to the Industrial School for Boys at Lansing for a term not extending beyond the time when said child shall arrive at the age of seventeen years, unless sooner discharged by the board of control of said Industrial School for Boys; or, if a girl, to the Industrial Home for Girls at Adrian, for a term not extending beyond the time when said child shall arrive at the age of seventeen years, unless sooner discharged by the board of control of said Industrial Home for Girls: *Provided, however,* That such sentence shall, in case of the first offense, be suspended.

[Act No. 1, Public Acts of 1897.]

SECTION 1. That every boy between the age of ten and sixteen years, or any girl between the age of ten and seventeen years, who shall frequent or be found lounging about saloons, disreputable places, houses of ill fame, or who shall be an inmate or resident, or a member of a family who reside in any house of ill fame, or conduct any other disreputable place, or who shall frequent other rooms or places where dissolute and disreputable people congregate, or where intoxicating liquors are kept for sale, or who shall, against the command of his or her parents or guardian, run away or wilfully absent himself or herself from the school he or she is attending, or from any house, office, shop, firm or other place where he or she is residing or legitimately employed with labor, or who shall against such command of his or her parents or guardian for any immoral, disorderly or dishonest purposes be found lounging upon the public streets, highways or other public resorts or at places of amusement of dissolute or improper character, or who shall against any such command for any such disorderly or dishonest purposes attend any public dance, skating rink, or show, shall be deemed guilty as a truant or disorderly child.

SEC. 2. Upon the complaint upon oath and in writing made before any justice of the peace, police justice, or other criminal magistrate by the parent or guardian or other person knowing of the facts of his own knowledge that any girl between the age of ten and seventeen years, or that any boy between the age of ten and sixteen years, or by the supervisors of any township, or mayor of any city, or president of any village, and in any city of over eight thousand population by the chief of police, mayor or other person knowing of the facts of his own knowledge that such minor

has been guilty of any of the acts specified in section one of this act, such justice or other criminal magistrate shall issue a warrant for the arrest of such minor, and upon conviction such minor, if a boy, may be sentenced by such justice or criminal magistrate to the Industrial School for Boys at Lansing, and, if a girl, to the State Industrial Home for Girls at Adrian, boys until eighteen years of age, and girls until twenty-one years of age, unless sooner discharged according to law: *Provided*, That no person or persons shall be sent to said Industrial School for Boys or to the Industrial Home for Girls until the sentence therein has been submitted to and approved by one [of] the judges of the recorder's court of the city of Detroit, or judge of the superior court of the city of Grand Rapids, or any circuit judge of the county in which such conviction shall be had.

MINNESOTA.

[From the Act of April 14, 1899.]

SEC. 2. The school board or board of education of each such school district or city may appoint and at pleasure remove one or more truant officers, whose duty it shall be to investigate all cases of truancy or nonattendance at schools, to make complaints, serve notices and processes, and enforce all laws and school regulations respecting truant, incorrigible, and disorderly children, and the attendance of children at schools.

Such truant officer shall have power without warrant to apprehend and take to school any truant or other child who is not, as in this act provided, excused from attendance at school, and he shall act under the supervision of such board, or, when directed by said board, under the supervision of the superintendent of the schools of the district or city for which they are appointed.

For the services rendered by such truant officers, they shall receive no fees, but shall receive a fixed salary, to be determined by the board appointing them.

SEC. 3. Such board of any such school district or city may establish and maintain one or more ungraded schools for the instruction of the following classes of children in such district or city, who are of or between the ages of 8 and 16 years, to-wit: Class 1, habitual truants from any school in which they are enrolled as pupils; class 2, children who, while in attendance at any school, are incorrigible, vicious, or immoral in conduct; and, class 3, children who habitually wander about the streets or other public places during school hours without lawful employment, business, or occupation. All such children shall be deemed juvenile disorderly persons, and may, by such board of such school district or city in which they reside, be assigned to and required and compelled to attend such ungraded school or any department of the graded public schools of such district or city as such board may determine.

SEC. 4. Any member of such truant or ungraded school who renders himself an unfit subject for retention therein by indecent or immoral conduct, by gross misbehavior, or by persistent violation of the reasonable regulations of such school, may, upon complaint of any truant officer or the superintendent of schools or other school officer of the district or city wherein such member resides, and upon due conviction, be committed by the court to the State training school at Red Wing, in said State of Minnesota.

MONTANA.

[From the School Laws of the State of Montana, 1899, p. 65.]

SECTION 1924. In every school district having a population of two thousand or more the board of trustees may appoint one person who shall be designated as "truant officer," whose duty it shall be, acting discreetly, to apprehend on view all children between eight and fourteen years of age, who are residents of the said district, who habitually frequent or loiter about public places, and have no lawful occupation, and place such children when so apprehended in the public school. And such officer shall report all cases of truancy to his respective board of trustees immediately. Upon the receipt of such information from such "truant officer," any member of the board of school trustees shall forthwith proceed to prosecute the person so offending as prescribed in section 1920¹ of this title. Such officer shall be entitled to such compensation as shall be fixed by the board appointing him, which shall be paid out of the school fund.

¹This section provides that the parent or guardian of the offending child shall be fined.

NEW HAMPSHIRE.

[From School Laws of New Hampshire, 1898, pp. 29 and 33.]

School boards are authorized to appoint truant officers for their districts, and to fix their compensation at a reasonable rate, which compensation shall be paid by the towns.

Truant officers shall hold office for one year, and until their successors shall be appointed, but they may be removed by the school board at any time for cause.

Truant officers shall, under the direction of the school board, enforce the laws and regulations relating to truants and children between the ages of six and sixteen years not attending school and without any regular and lawful occupation.

Truant officers shall, if required by the school board, enforce the laws prohibiting the employment of children in manufacturing establishments who have not attended school the prescribed time.

Districts may make by-laws, not repugnant to law, concerning habitual truants and children between the ages of six and sixteen years not attending school and not having a regular and lawful occupation, and to compel the attendance of such children at school, and may annex penalties for the breach thereof not exceeding ten dollars for each offense.

Any offender against such by-laws, upon conviction, may be sentenced to pay a fine and to be committed to the industrial school until it is paid or he is otherwise discharged, or he may be sentenced to the industrial school for a term not exceeding one year.

The court or justice imposing a fine upon any such offender may remit it upon proof that he is unable to pay it, and has no parent, guardian, or person chargeable with his support, able to pay it, and may discharge him from the industrial school if he has been committed there for nonpayment thereof.

Any such offender so convicted may give bond to the district in the penal sum of twenty-five dollars, with sufficient sureties, approved by the court or justice before whom he was convicted, conditioned to attend regularly some school kept in the district for one term next ensuing, to comply with the regulations thereof, and to be obedient and respectful to the teacher; and his fine may thereupon be remitted by such court or justice upon payment of the costs.

NEW JERSEY.

[From New Jersey School Law, 1897, pp. 79-81.]

All children between the ages of seven and fifteen years, who are habitual truants from school, or who, while in attendance at any public school, are incorrigible, vicious, or immoral in conduct, and all children between the said ages who absent themselves habitually from school, and habitually wander about streets and public places during school hours, having no business or lawful occupation, shall be deemed juvenile disorderly persons, and subject to the provisions of this act.

In cities having a duly organized police force, it shall be the duty of the police authority, at the request of the inspectors of factories and workshops, or of the school authority, to detail one or more members of said force to assist in the enforcement of this act, and in districts having no regular police force, subject to this act, it shall be the duty of the board of education or the school district officers to designate one or more constables of said city, township, or village, whose duty it shall be to assist in the enforcement of this act, as occasion may require, and said board of education shall fix and determine the compensation to be paid said police officer or constable for the performance of his duties under this act. Members of any police force, or any constable designated to assist in the enforcement of this act as provided in this section, shall be known as truant officers: *Provided*, That in districts where no constable resides the said board shall have power to appoint some other suitable person as truant officer.

It shall be the duty of any such truant officer or officers detailed to enforce the provisions of this act to examine into all cases of truancy, when requested so to do by the inspectors of factories and workshops, or by the district school board, and to warn such truants, their parents or guardians, in writing, of the final consequences of truancy, if persisted in, and also to notify the parents, guardian, or other person having the legal charge and control of any juvenile disorderly person that the said person is not attending any school, and to require said parent, guardian, or other person to cause the said child to attend some recognized school within five days from said notice; and it shall be the duty of said parent, guardian, or other person having the legal charge and control of said child to cause the attendance of said child at some recognized school. If said parent, guardian, or other person having the legal

charge and control of said child shall willfully refuse, fail, or neglect to cause said child to attend some recognized school, it shall be the duty of said officer to make or cause to be made a complaint against said parent, guardian, or other person having the legal charge and control of said child, in any court of competent jurisdiction in the school district in which the offense occurred, for such refusal or neglect, and upon conviction thereof said parent, guardian, or other person, as the case may be, shall be punished by a fine of not less than ten dollars nor more than twenty-five dollars; or the court may, in its discretion, require the person so convicted to give a bond in the penal sum of one hundred dollars, with one or more sureties, to be approved by said court, conditioned that said person so convicted shall cause the child or children under his or her legal charge or control to attend some recognized school within five days thereafter and to remain at said school during the term prescribed by law: *Provided*, That if said parent, guardian, or other person in charge of said child shall prove inability to cause said child to attend said recognized school, then said parent, guardian, or other person shall be discharged, and said court shall, upon complaint of said truant officer or other person that said child is a juvenile disorderly person within the meaning of this act, then said court shall thereupon sentence said child to a juvenile reformatory until such child shall arrive at the age of sixteen years, unless sooner discharged by the board of control of said juvenile reformatory: *Provided, however*, That such sentence may be suspended, in the discretion of said court, for such time as the child shall regularly attend school and properly deport himself or herself: *It is further provided*, That if, for any cause, the parent or guardian or other persons having charge of any juvenile disorderly person, as defined in this act, shall fail to cause such juvenile disorderly person to attend said recognized school, then complaint against such juvenile disorderly person may be made, heard, tried, and determined in the same manner as is provided for in case the parent pleads inability to cause said juvenile disorderly person to attend said recognized school: *And it is further provided*, That no child under the age of nine years shall be sent to a juvenile reformatory under the provisions of this act.

NEW YORK.

[From chapter 606, Laws of 1896.]

Attendance officers.—The school authorities of each city, union free-school district, or common-school district whose limits include in whole or in part an incorporated village, shall appoint and may remove at pleasure one or more attendance officers of such city or district, and shall fix their compensation and may prescribe their duties not inconsistent with this act, and may make rules and regulations for the performance thereof; and the superintendent of schools of such city or school district shall supervise the enforcement of this act within such city or school district; and the town board of each town shall appoint one or more attendance officers, whose jurisdiction shall extend over all school districts in said town not by this section otherwise provided for, and shall fix their compensation, which shall be a town charge; and such attendance officers appointed by said board shall be removable at the pleasure of the school commissioner in whose commissioner's district such town is situated.

Arrest of truants.—The attendance officer may arrest without warrant any child between eight and sixteen years of age found away from his home, and who then is a truant from instruction upon which he is lawfully required to attend within the city or district of such attendance officer. He shall forthwith deliver a child so arrested either to the custody of a person in parental relation to the child, or of a teacher from whom such child is then a truant, or in case of habitual and incorrigible truants, shall bring them before a police magistrate for commitment by him to a truant school, as provided for in the next section. The attendance officer shall promptly report such arrest and the disposition made by him of such child to the school authorities of said city, village, or district where such child is lawfully required to attend upon instruction, or to such person as they may direct.

Truant schools.—The school authorities of any city or school district may establish schools, or set apart separate rooms in public school buildings, for children between eight and sixteen years of age who are habitual truants from instruction upon which they are lawfully required to attend, or who are insubordinate or disorderly during their attendance upon such instruction or irregular in such attendance. Such school or room shall be known as a truant school; but no person convicted of crimes or misdemeanors, other than truancy, shall be committed thereto. Such authorities may provide for the confinement, maintenance, and instruction of such children in such schools; and they or the superintendent of schools in any city or school district may, after reasonable notice to such child and the persons in parental relation to such child, and an opportunity for them to be heard, and with the consent in writ-

ing of the persons in parental relation to such child, order such child to attend such school or to be confined and maintained therein for such period and under such rules and regulations as such authorities may prescribe, not exceeding the remainder of the school year, or may order such child to be confined and maintained during such period in any private school, orphans' home, or similar institution controlled by persons of the same religious faith as the persons in parental relation to such child, and which is willing and able to receive, confine, and maintain such child, upon such terms as to compensation as may be agreed upon between such authorities and such private school, orphans' home, or similar institution. If the person in parental relation to such child shall not consent to either such order, such conduct of the child shall be deemed disorderly conduct, and the child may be proceeded against as a disorderly person, and upon conviction thereof, if the child was lawfully required to attend a public school, the child shall be sentenced to be confined and maintained in such truant school for the remainder of the current school year; or if such child was lawfully required to attend upon instruction otherwise than at a public school, the child may be sentenced to be confined and maintained for the balance of such school year in such private school, orphans' home, or other similar institution, if there be one, controlled by persons of the same religious faith as the person in parental relation to such child, which is willing and able to receive, confine, and maintain such child for a reasonable compensation. Such confinement shall be conducted with a view to the improvement, and to the restoration, as soon as practicable, of such child to the institution elsewhere, upon which he may be lawfully required to attend. The authorities committing any such child and in cities and villages the superintendent of schools therein shall have authority in their discretion to parole at any time any truant so committed by them. Every child suspended from attendance upon instruction by the authorities in charge of furnishing such instruction, for more than one week, shall be required to attend such truant school during the period of such suspension. The school authorities of any city or school district not having a truant school may contract with any other city or district having a truant school, for the confinement, maintenance, and instruction therein of children whom such school authorities might require to attend a truant school if there were one in their own city or district. Industrial training shall be furnished in every such truant school. The expense attending the commitment and cost of maintenance of any truant residing in any city or village employing a superintendent of schools shall be a charge against such city or village, and in all other cases shall be a county charge.

OHIO.

[From Ohio School Laws, 1893, pp. 104 et seq.]

SEC. 4. Every child between the ages of eight and fourteen years, and every child between the ages of fourteen and sixteen years unable to read and write the English language or not engaged in some regular employment, who is an habitual truant from school, or who absents itself habitually from school, or who, while in attendance at any public, private, or parochial school, is incorrigible, vicious, or immoral in conduct, or who habitually wanders about the streets and public places during school hours, having no business or lawful occupation, shall be deemed a juvenile disorderly person, and be subject to the provisions of this act.

SEC. 5. To aid in the enforcement of this act, truant officers shall be appointed and employed as follows: In city districts the board of education shall appoint and employ one or more truant officers; in special, village, and township districts the board of education shall appoint a constable or other person as truant officer. The compensation of the truant officer shall be fixed by the board appointing him. The truant officer shall be vested with police powers, and shall have authority to enter workshops, factories, stores, and all other places where children may be employed, and do whatever may be necessary, in the way of investigation or otherwise, to enforce this act. The truant officer shall institute proceedings against any officer, parent, guardian, person, or corporation violating any provisions of this act, and shall otherwise discharge the duties prescribed in this act, and perform such other services as the superintendent of schools or the board of education may deem necessary to preserve the morals and secure the good conduct of school children and to enforce this act. The truant officer shall keep a record of his transactions for the inspection and information of the superintendent of the schools and the board of education; and he shall make daily reports to the superintendent of schools during the school term in cities, and to the clerk of the board of education, as often as required by him, in special, village, and township districts. Suitable blanks for the use of the truant officer shall be provided by the clerk of the board of education.

SEC. 6. * * * It shall be the further duty of such principals and teachers to

report to the truant officer, the superintendent of public schools, or the clerk of the board of education all cases of truancy or incorrigibility in their respective schools as soon after these offenses have been committed as practicable.

SEC. 7. On the request of the superintendent of schools or the board of education, or when it otherwise comes to his notice, the truant officer shall examine into any case of truancy within his district, and warn the truant and its parents, guardian, or other person in charge, in writing, of the final consequences of truancy if persisted in. When any child between the ages of eight and fourteen years, or any child between the ages of fourteen and sixteen years who can not read and write the English language or is not engaged in some regular employment, or any child between the ages of fourteen and sixteen years who has been discharged from employment, to obtain instruction or schooling, is not attending school without lawful excuse and in violation of the provisions of this act, the truant officer shall notify that parent, guardian, or other person in charge of such child of the fact, and require such parent, guardian, or other person in charge to cause the child to attend some recognized school within five days from the date of the notice; and it shall be the duty of the parent, guardian, or other person in charge of the child so to cause its attendance at some recognized school. * * *

SEC. 8. If the parent, guardian, or other person in charge of any child shall, upon the complaint under the last section for a failure to cause the child to attend a recognized school, prove inability to do so, then he or she shall be discharged, and thereupon the truant officer shall make complaint that the child is a juvenile disorderly person within the meaning of section 4 of this act. If such complaint be made before any mayor or justice of the peace, it shall be certified by such magistrate to the probate judge. The probate judge shall hear such complaint, and if he determine that the child is a juvenile disorderly person within the meaning of section 4 hereof, he shall commit the child, if under ten years of age, and eligible for admission thereto, to a children's home, or if not eligible, then to a house of refuge if there be one in the county, or to the boys' industrial school or the girls' industrial home, or to some other juvenile reformatory. No child of over ten years of age shall be committed to a county children's home, and any child committed to a children's home may, on request of the trustees of such home, and it being shown that it is vicious and incorrigible, be transferred by the probate judge to the boys' industrial school or the girls' industrial home. A child committed to any juvenile reformatory under this section shall not be detained there beyond the age of sixteen years and may be discharged sooner by the trustees under the restrictions applicable to other inmates. Any order of commitment to a juvenile reformatory may be suspended, in the discretion of the probate judge, for such time as the child may regularly attend school and properly conduct itself. The expense incurred in the transportation of a child to a juvenile reformatory and the costs in the case in which the order of commitment is made shall be paid by the county from which the child is committed: *Provided further*, That if for any cause the parent, guardian or other person in charge of any juvenile disorderly person as defined in section 4 hereof, shall fail to cause such juvenile disorderly person to attend school, then complaint against such juvenile disorderly person shall be made, heard, and determined in like manner, as provided in case the parent proves inability to cause such juvenile disorderly person to attend school.

SEC. 9. When any truant officer is satisfied that any child, compelled to attend school by the provisions of this act, is unable to attend school because absolutely required to work, at home or elsewhere, in order to support itself or help support or care for others legally entitled to its services, who are unable to support or care for themselves, the truant officer shall report the case to the authorities charged with the relief of the poor, who shall thereupon, if the case be a meritorious one, afford such relief as will enable the child to attend school the time each year required under this act. Such child shall not be considered or declared a pauper by reason of the acceptance of the relief herein provided for. In case the child or its parents or guardian refuse or neglect to take advantage of provisions thus made for its instruction, such child may be committed to a children's home or a juvenile reformatory, as provided in section 8 hereof. Boards of education, in urgent and deserving cases where no other relief is available, and where neither parents nor child are at fault, may make suitable temporary arrangements for the instruction of the child, described in this section, either at home or at school, and for such purpose may incur necessary expense to be paid out of the school funds of the district.

PENNSYLVANIA.

[From act approved July 12, 1897, in Pennsylvania School Laws and Decisions, 1897, pp. 440 et seq.]

SEC. 3. Boards of school directors or school controllers shall in cities, and may in boroughs and townships, employ one or more persons to be known as attendance officers, who shall have full power and whose duty it shall be to look after, arrest, apprehend, and place in such schools as the person in parental relation or the board of directors or controllers may designate, truants and others who fail to attend school in accordance with the provisions of this act. The persons appointed such attendance officers shall be entitled to such compensation, not exceeding two dollars a day, as shall be fixed by the boards appointing them, and such compensation may be paid out of the school fund; boards of directors or controllers of any school district, or of two or more districts jointly, may establish special schools for children who are habitual truants, or who are insubordinate or disorderly during their attendance upon instruction in the public schools, and may provide for the proper care, maintenance, and instruction of such children in such schools. Before such penalty shall be incurred by such child, the parent, guardian, or other person in parental relation to the child shall be notified in writing by the secretary of the school board, or by the attendance officer if there be one, and shall have an opportunity to be heard; such person in parental relation may elect to have such child cared for and maintained at his own expense in a private school, orphans' home, or similar institution where the common English branches are taught. If such person in parental relation to such child shall not elect to care for and maintain such child in such private school, nor consent to his care, maintenance, and instruction in the public special school, then such conduct of the child shall be deemed disorderly conduct, and the child may be proceeded against as a disorderly person, and upon conviction thereof shall be sentenced to such special school for a term not exceeding the remainder of the school term in his district, subject to parole for good conduct by the authorities of such special school after four weeks' attendance. Such special schools shall be conducted with a view to the improvement and to the restoration, as soon as practicable, of such child to the school or institution elsewhere which he may be lawfully required to attend. The board of directors or controllers of any city or school district not having such special school may contract with any other city or district having such school for the care, maintenance, and instruction therein of children whom such boards of directors or controllers might require to attend such school if there were one in their own city or district.

RHODE ISLAND.

[From Laws of the State of Rhode Island pertaining to Education, 1896, pp. 66-70.]

SEC. 3. The town council of each town, and the board of aldermen of each city, shall annually appoint one or more special constables, and fix their compensation, who shall be truant officers and who shall, under the direction of the school committee, inquire into all cases arising under the provisions of this chapter, or under any ordinances made in pursuance thereof by the town or city by which such officers were appointed, and shall alone be authorized, in case of violation of any of the provisions of this chapter or of any such ordinances, to make complaint therefor; they shall also serve all legal processes issued in pursuance of this chapter or of any such ordinances, but shall not be entitled to receive any fees for such service: *Provided, however,* that in case of the commitment of any person under the provisions of any section of this chapter, or of any ordinance made in pursuance thereof, or for default of payment of any fine and costs imposed thereunder, such officer shall be entitled to the regular fees allowed by law for similar service.

SEC. 4. The truant officers and the school committees of the several towns and cities shall inquire into all cases of neglect of the duty prescribed in section one of this chapter within their respective towns and cities, and ascertain the reasons, if any, therefor; and such truant officers, or any of them shall, when so directed by the school committee, prosecute any person liable to the penalty provided for in said section one.

SEC. 11. The town council of each town, and the city council of each city, shall make all needful provisions and arrangements concerning habitual truants and children who may be found wandering about in the streets or public places therein, having no lawful occupation or business, not attending school and growing up in ignorance, and shall make such ordinances as will be most conducive to the welfare of such children and to the good order of such town or city; and shall designate or provide suitable places for the confinement, discipline, and instruction of such children.

SEC. 12. Every minor convicted, under an ordinance made under the provisions of

section eleven of this chapter, of being an habitual truant, or of wandering about in the streets and public places of a town or city, or of having no lawful employment or business, or of not attending school and of growing up in ignorance shall be committed to any institution of instruction or suitable place designated or provided for the purpose under the authority of said section eleven, for a period not exceeding two years.

SEC. 13. Children so committed may, on satisfactory proof of amendment or for other sufficient cause, be discharged from such institution or place by the court which committed them.

SEC. 16. The district courts of the State shall have jurisdiction in their respective districts of all cases arising under this chapter and all ordinances passed in conformity with this chapter.

SEC. 17. No officer complaining under any of the provisions of this chapter, or under the provisions of any ordinance that may be passed in pursuance hereof, shall be required to give surety for costs; and such officer shall not in any wise become liable for any costs that may accrue on such complaint.

UTAH.

[From act of March 11, 1897, in School Law of the State of Utah, 1897, pp. 53 and 56.]

PARENTAL SCHOOLS.

SECTION 1. The board of education of any city of the first or of the second class, or the boards of education of any two or more such cities, under a contract to be approved by each of such boards, may provide for the establishment and maintenance of "parental schools" and for the support and education of the inmates thereof, conformably with the provisions of this chapter.

SEC. 2. Any child between the ages of eight and fourteen years residing within the city or cities maintaining such a school, adjudged guilty of being a habitual truant, or of wandering about in the streets and public places of said city or cities without lawful employment or business, shall be committed to the parental school provided for the purpose for a term not extending beyond the age of fourteen years.

SEC. 3. Any child committed as provided in the next preceding section may be released from confinement at such school either conditionally or absolutely, before the expiration of the term of commitment, in accordance with the by-laws established by the board or boards of education maintaining the same.

SEC. 4. Children under sixteen years of age who, by reason of neglect, crime, drunkenness, or other vices of parents, or by reason of orphanage, are suffered to grow up without salutary parental control and education, or in circumstances encouraging them to lead idle and dissolute lives, may be committed to the proper "parental school" for a term not extending beyond the age of sixteen years.

SEC. 5. When the parents of a child committed under the next preceding section have reformed and are leading orderly and industrious lives, and are in a condition to exercise salutary control over such child, and to provide him with proper education and employment; or when, said parents being dead, any person offers to make such suitable provision for the care, nurture, and education of such child as will conduce to the public welfare, the board of education may discharge him to the parents or other such person.

SEC. 6. The district courts of the several counties shall have jurisdiction within their respective counties to enforce the provisions of this chapter, upon such notice to the parents or guardians of the children whom it is proposed to commit to parental schools as the court may deem just and proper.

SEC. 7. Any board or boards of education maintaining a parental school in accordance with section 1 of this act shall estimate and determine as near as may be the average actual expense per month of keeping and taking care of the boys and girls who may be committed to the parental school, and the average cost of keeping such boys and girls shall be wholly paid by the parent or guardian of each boy or girl committed to the school unless for good cause said board or boards of education shall otherwise order and direct. The board of education of the city in which the parent or guardian of any such committed boy or girl resides may bring suit to enforce this provision.

SEC. 8. On the tender of a payment which will meet all costs of support at the parental school, the board or boards of education maintaining such school may receive into it on equal terms boys or girls whose residence is in the State outside of the city or cities to which the school belongs.

SEC. 9. The board of education of each such city may appoint and fix the compensation of a truant officer, whose duty it shall be to make complaints and arrests in

cases contemplated by this chapter, and to serve legal process issued by courts in pursuance hereof. The police authorities of the city shall make such truant officer a special policeman.

[Chapter 14.]

SEC. 4. All children in the district between the ages of eight and sixteen years, who, in defiance of earnest and persistent efforts on the part of their parents or teachers, are habitual truants from school, or while in attendance at school are vicious, immoral, or ungovernable in conduct, shall be deemed incorrigible, and it is the duty of the president of the board of education or the chairman of the board of trustees of each school district to inquire into all such cases within his district and report them to the county attorney acting for such district, whose duty it shall be to prosecute such cases as incorrigible and fit candidates for the State reform school.

VERMONT.

[From general laws of the State of Vermont relating to public instruction, 1895, pp. 192-194.]

SEC. 710. Selectmen of a town and the mayor of a city shall annually appoint two truant officers therefor. On failure to appoint such truant officers, constables, sheriffs, deputy sheriffs, and policemen shall act as truant officers.

* * * * *

SEC. 716. A teacher shall promptly give notice to a truant officer of violations of this chapter by any pupil enrolled in his school, and said truant officer shall forthwith inquire into the cause of the pupil's nonattendance; and if he has reason to believe that such pupil's parent, guardian, or master has violated the provisions of this chapter, he shall forthwith enter complaint to a town grand juror of the town in which such person having control of the child resides, or the State's attorney of the county in which such town is situated, who shall prosecute such person. Any person violating the provisions of this chapter (section) shall be fined not more than twenty dollars and not less than five dollars, which shall be paid into the treasury of the town. A justice of the peace or judge of a municipal court shall have concurrent jurisdiction with the county court for offences under this section. The truant officer may stop any truant under the age of fifteen years, wherever found, and take him to school in the town where he resides.

SEC. 717. If it appears on trial that the child is not properly clothed for attending school, and that his parent is unable to so clothe him, the overseer of the poor shall furnish suitable clothes for the child; and such inability of a parent shall be a defence to a prosecution under this chapter. If it appears that the parent or guardian is unable to control the child and keep him in school, the justice or court, with the consent of a majority of the selectmen, may sentence such child to the Vermont industrial school.

SEC. 718. A truant officer, school director, or any officer authorized to make arrests in the town may, and upon the written application of three voters in the town shall, arrest a child who, under the provisions of this chapter, is required to attend school, and during the term of the public school in the town in which he resides is habitually found in the streets, or other public places, having no lawful occupation, or is an habitual truant, and shall take him to the school in said town and place him in charge of the teacher thereof, and give notice in writing to the parent, guardian, or master, requiring him to cause such child to attend school regularly. But a boy between eight and fifteen years of age who is an habitual truant, or who is guilty of wilful and continued disobedience to school rules and regulations or laws, or whose conduct is pernicious and injurious to a school, may be sentenced to the Vermont industrial school for a period of not less than twenty-six weeks. Justices of the peace and judges of municipal courts shall have concurrent jurisdiction with the county court of offences under this section.

* * * * *

SEC. 721. A truant or other officer authorized to make arrests in the town, who refuses or neglects to carry out the provisions of this chapter, shall be fined not more than one hundred dollars. A justice or municipal court shall have concurrent jurisdiction with the county court in such prosecutions.

SEC. 722. All persons acting as truant officers shall receive compensation from the district for which the service is rendered at the rate of two dollars per day for time actually spent, unless otherwise provided.

WISCONSIN.

[From school laws of Wisconsin, 1898, p. 35.]

The board of education or the district board may appoint one or more truant officers, whose duty it shall be, acting discreetly, to apprehend upon view all children between seven and thirteen years of age who habitually frequent or loiter about public places and have no lawful occupation, and place such children, when so apprehended, in such schools as the parent or other person having the control of such children may designate; and such officers shall report all cases of truancy to their respective boards within a reasonable time. Such truant officers shall be entitled to such compensation, to be paid out of the school fund, as shall be fixed by the boards appointing them.

V.—REFORMATORY AND ALLIED INSTITUTIONS IN GREAT BRITAIN.

In continental Europe there are no institutions exactly parallel in purpose to our truant schools. Absence of children from school is accounted a transgression of parents, and penalties of fines and imprisonment are inflicted upon them. Children may be forcibly brought to school by police or truant officers, but judicial commitment of pupils to penal or semipenal institutions for purely school offenses is not the rule.¹ In Great Britain, on the contrary, there are two classes of institutions which are specially designed for school offenders, namely, truant schools and day industrial schools.

The Britons have serious troubles with their truant schools just as we have, and like us are constantly striving for improvement. Three important commissions have investigated and reported on the condition of reformatory and industrial institutions generally. First, a royal commission, under the chairmanship of the Duke of Newcastle, was appointed in 1858 "to inquire into the state of popular education in England." Their report was made in 1861, and one of the "parts" related to the "Education of vagrants and criminals." Then, the "Reformatories and industrial schools commission," under Lord Aberdare, appointed in 1882, made an exhaustive report in 1884. Finally, a departmental committee, of which Sir Godfrey Lushington was the head, was named in 1895 to inquire into the state of reformatory and industrial schools. Their report, made the following year, is the most elaborate and searching of the series. With its appendices and voluminous "evidence," it is by far the most complete and valuable document on the subject in the English language—probably in any language.

That part of the Lushington report proper which relates to truant schools and day industrial schools is reprinted on the following pages. The description of English reformatories and industrial schools is from Mr. Graham Balfour's "Educational systems of Great Britain and Ireland." From these accounts an excellent idea of the British system and methods may be obtained:

TRUANT SCHOOLS.²

Origin of the schools.—These schools in the eye of the law are ordinary industrial schools, but actually are different. The elementary education act of 1876, by the first subsection of section 11, authorized an attendance order requiring a child to attend a public elementary school, to be made by the court at the instance of the school authority, against the parent who failed to provide such child with elementary education. The second subsection authorized a similar order in the case of a child

¹In this connection, see "Compulsory education in Central Europe," Vol. 1 of this Report, page 147; also "Reform schools in Baden," in Education Report for 1895-96, Vol. 1, page 158, and "Special schools for children of limited mental capacity in Prussia," in Education Report for 1896-97, Vol. 1, page 141.

²Report of the departmental committee on reformatory and industrial schools ("Lushington's report"), 1896, pages 121-124.

habitually wandering, or without proper guardianship, or frequenting the company of rogues, etc. In the event of breach of the attendance order, the court had power to commit the child to a certified day industrial school, or if it appeared to the court that there was no such school suitable for the child, then to a certified industrial school; and by the fourteenth section, in contemplation of the detention being brief, managers were enabled to grant a license after a detention of one month (instead of eighteen months, which is the rule in ordinary cases under the industrial schools act), such license to be conditional upon the child attending as a day scholar at some certified efficient school. When the act passed there was no day industrial school, and now there are only 23 in England and Scotland, so that the remedy of a day industrial school has never been available except in a limited number of districts. On the other hand, objections were entertained by managers to the use of ordinary industrial schools for the brief detention of truants; they thought it would be upsetting to the other children who were under detention for longer periods. Accordingly, it was suggested that the powers of the industrial schools act should be employed to establish schools which, though called industrial schools, should be set apart exclusively for truants, the period of detention to be brief, but the discipline punitive. The secretary of state, after consulting the education department, sanctioned the experiment, and altogether 15 truant schools have been set up by 12 school boards, and these schools are to a certain extent used by other school boards. No application for permission to establish a truant school has been received from any private person or association of voluntary managers. All the existing schools are for boys. In two instances application has been made to the home office for the establishment of truant schools for girls, but in both it has been refused. There is no truant school in Scotland. With regard to the mode in which the expense of these schools is defrayed, we have already referred to what appears to us the improper practice pursued by some school boards of having their truants committed under the second subsection of section 11 of the elementary education act, 1876, in order to obtain the higher grant of 3s. 6d. per head per week which is allowed for cases under that subsection. For cases under the first subsection the Government grant for each child is limited to 2s. per week, leaving a sum of 5s. or more to be made up by the school board. For this reason, and because the school is constantly being depleted while the full staff has to be maintained, the detention is expensive to the school authority while it lasts; but then the detention does not last very long. The nominal detention may be (as in ordinary industrial-school cases) until 16—usually it is only until 14—and the practice, varying according to the rules of the different schools, is for the managers to grant a license after a detention of two months or so on the first admission, and after a detention for a greater number of months in the case of a child admitted for a second or third time.

Discipline.—The object of all truant schools is the same—to set up a punitive system which shall be deterrent from truancy. The following, which is a description of Plymouth Truant School, given in 1893 at a conference of school managers, may perhaps serve as a fair representation of all the schools:

“Anything like harshness or unkindness is carefully avoided; but the distinct object of the managers is to make residence in the school irksome and distasteful, so that rather than stay, and still less to return to it, the truant boy will give up truanting and steadily attend school. The boys are well fed under a dietary approved by the Home secretary. They are well cared for as to health, cleanliness, and dress. In most cases they gain weight during their stay, but the discipline is strict, continuous, and inexorable. They are there because they love play better than work, and therefore they are kept at work almost all the day long, from 6 in the morning until 8 at night (see time-table). Household work, school drill, industrial training, with very brief intervals of rest, occupy the whole day. There is little opportunity for the mischief which idle hands so readily find to do.”

In some districts, as in Liverpool, there are day industrial schools as well as truant schools; in others, as in London (until quite recently), truant schools only. And it is, perhaps, in consequence of this that very divergent theories have been entertained on the cardinal point whether truant schools are intended and appropriate for incipient truants, or for hardened truants, or for truants in general. Nor hitherto has there been any uniform system for the general conduct of truant schools. Thus, although the magistrate has no power to order the truant to be flogged, in some schools the custom is, or was, for every boy on readmission to be flogged; in others an inquiry is made, and the boy is not flogged unless it appears that the truancy is due to his own fault and not that of his parents. In others, again, there is no flogging on readmission. For general purposes, it may be convenient to take as examples the Liverpool schools and the London schools.

At Liverpool the detention is divided into two stages, the disciplinary stage and the

probationary stage. The disciplinary stage occupies 4 days on the first admission, 14 on the second or any subsequent occasion, or 1 month in the case of a child over 12 admitted for the third time. The superintendent, however, has power to reduce 4 days to 2, and the 14 to 7; also to increase the 4 days to 6, and the 14 to 21. During this stage the boy is in separate confinement at night, and also during the day when at industrial work; he joins the other boys at prayers, lessons, and work, but during those times no talking is allowed. He has no play. A child is not subjected to the disciplinary stage if he is under 9 years of age, and before he is subjected to it he is examined by a medical officer and certified to be able to bear the separation, and during the disciplinary stage he is visited three days in a week by the medical officer. The disciplinary stage is followed by the probationary stage, the two constituting the total period of detention, the average length of which is, on the first admission, 10½ weeks; on the second, 12½; on the third, 13½ weeks. During the probationary stage the children are, according to the rules, to be treated as in an ordinary industrial school, and to be "subjected as much as possible to softening and humanizing influences." We find it difficult to describe what meaning is attached to these terms. Mr. Hance, the secretary to the school board, informed us that his board had never been in favor of anything like the silent system. But what is certain is that the discipline enforced is of a rigorous character, as shown by the punishments. In the Roman Catholic school at Hightown, comprising about 60 inmates, the number of corporal punishments in the year 1895 amounted to 200. The preliminary confinement in cells during the disciplinary stage was condemned by the royal commissioners of 1883, and has been repeatedly protested against by the inspector, but with some slight modification it still continues.

The two truant schools belonging to the London school board, at Highbury and Upton House, which resemble each other very closely, but not in all details, were represented to us by Mr. Rogers as exhibiting the truant-school system in its more modern and milder form. No cells are used, nor is there any initial seclusion or disciplinary stage, and on readmission it is not, and never has been, the practice to flog the boy unless, after inquiry, it is clear that the boy has been personally much to blame. The school is presided over by an officer called a governor, not superintendent. The average length of the period of detention, is on the first admission, 8 weeks, on the second 15, and on the third, or any subsequent admission, 20 weeks; and on each repeated admission the detention is not only longer, but also, as will appear, of a more severe character. The following is the time-table for Upton House for boys on their first admission:

6, boys rise, fold bedding, and wash.....	Talking not allowed.
7, clean house and school.....	Quiet conversation allowed.
8, boys' breakfast.....	Talking not allowed.
8:40, prayers.	
9, distribution for school and work; one division in school, remainder industrial work.....	Necessary conversation.
12, drill.....	Talking not allowed.
12:50, prepare for dinner.....	Quiet conversation allowed.
1, boys' dinner.....	Talking not allowed.
1:30, recreation.	
2, distribution for school and work.....	Necessary conversation.
5, drill.	
5:30, prepare for supper.....	Quiet conversation allowed.
6, boys' supper.....	Talking not allowed.
6:30, industrial work (singing lesson Tuesday and Friday).....	Necessary conversation.
7:30, prayers.	
8, boys to bed.....	Talking not allowed.

It will be seen from this that the boys have 1 hour and 20 minutes' drill daily, and that for the whole period of 8 weeks there is only half an hour each day when they are allowed either to play or to talk freely. To this, for sometime past, has been added a half holiday on Saturday. When talking is not allowed silence is enforced, not as a matter of orderliness, but strictly as part of the punitive system; so, too, is the restriction of conversation to what is necessary; and the difference between quiet conversation and necessary conversation is so slight that the governor of Highbury would not object to its being abolished (as, indeed, it has been in Lichfield truant school). Then, on the first readmission, the half hour for play and talking is taken away for a fortnight, during which period, therefore, the boy has no play and no freedom to talk at any hour of the day. On the second readmission the complete deprivation of play and free talking lasts for a month, and the Saturday

half holiday is taken away as well; and on the third, or any subsequent readmission, the complete deprivation of play or free talking is enforced throughout the whole of the weeks.

Results in truant schools.—Truant schools have had a certain degree of success, but no more. The percentage of attendances made at the public elementary school by children on license from the truant school, and who do not return to it, is as a rule very good, but there is a large proportion who come back to the truant school. Up to December 31, 1894, out of a total of 19,767 children licensed from these schools, over 40 per cent were readmitted, viz, 25 per cent readmitted once, 10 per cent twice, 4 per cent thrice, and 2 per cent four times and upward. One consequence of these numerous readmissions is that the truant school as a remedy for truancy is made much more expensive. Another consequence is that almost at all times in these schools boys who have been there before are in a majority over those who have not. For instance, at Highbury, on the day that the governor gave evidence before us, of the 193 boys in the school 111 were there not for the first time. It is admitted that this predominance of recidivists is injurious to the tone of the school, but it remains to be explained how it is that boys who have once experienced this severe treatment come to incur it again. The explanation is that in most cases they can not help themselves. They are children completely neglected by their parents, and children of their age, so neglected, so abandoned to a life in the streets, and with such surroundings, simply can not go to school unless they are helped. It is vain to expect them to do so. This is thoroughly understood by those who carry on day industrial schools for children of the same class. It is admitted by Mr. Hance, the clerk to the Liverpool school board, with respect to such children as find their way repeatedly to the truant schools. It is also admitted by the London school board, to judge, at least, from the statement reported to have been made by Mr. Sharp (the chairman of the Highbury subcommittee of the industrial schools committee of the board) at a recent conference of managers: "In the Highbury school, where we have 200 truants constantly within our walls, in the majority of cases it is not the fault of the children, but of their surroundings;" and the same gentleman at the same conference is reported to have used these words in reply to those who advocated the institution of a truant school for girls: "I do not think one-half per cent of the girls are truants of their own free will. My point was that you are punishing the child for the mother's fault." To such children severity is as useless as it is undeserved. Instances are not wanting of children on whom the severities of the truant school, repeated in successive detentions, have produced no impression, but who become regular attendants at the day industrial school when treated with kindness and helped to go to school. This is a consideration which has to be put into the balance against such success as has been obtained in truant schools.

Truant schools, it may be said, have never received the sanction of Parliament. Though called industrial schools, and though founded under the industrial-schools act, they rest on a principle the opposite of that which, it is assumed, is recognized by Parliament for ordinary industrial schools, viz, on punishment, not on kindness. In our opinion it is contrary to right principles of education that a governor or teacher should have it imposed upon him as a duty to cause his scholars to be uncomfortable every day from the first to the last that they are with him, or that little children of this age should be kept, as it were, in disgrace for a continuous period of months. The late inspector, Colonel Inglis, regarded these schools with little favor. In his last report (for 1894) he observes:

"Since truant schools came into existence I have never ceased to protest against the strict treatment, the excess of corporal punishment, and the absence of recreation, or anything like reward for good conduct. Useful schools they are, but though I could name two or three that have always been conducted on moderate or sensible lines, there have been others with which I have never entered without feeling more sympathy for the inmates than for the truant system."

Recommendations.—The present inspector, we understand, does not desire truant schools to be retained. In his opinion they are ineffectual. Sir G. Kekewich's view of the system appears to be that as a mode of treating children it is objectionable, and as a means of enabling school boards to compel attendance at public elementary schools it is unnecessary. It would be sufficient for that purpose if truants were for a brief period of two or three months sent to an industrial school reserved exclusively for truants, but conducted on the ordinary nonpunitive system. To this we see no objection. Such a school would not, indeed, meet the case of the very neglected children we have described; but for those who are truants from their own willfulness, and not by reason of their surroundings, it would probably suffice by interrupting for a while their mode of life, and separating them from their companions. We recommend therefore that truant schools, as at present established,

should be discontinued.¹ Further, we consider that no child should be transferred from one of such schools as we have suggested to an ordinary industrial school for a long period of detention, on the ground that brief detention had proved ineffectual to make him attend school. Detention for years is, in our opinion, not justifiable, unless a child is in danger of becoming a criminal, and as such has been formally proved to fall within one of the clauses of the industrial-schools act. There may be truth in the observation that truancy is often the beginning of a criminal career. But mere truancy, even of a child under license from a truant school, is not enough to establish a criminal tendency.

Considering that the inmates of truant schools will be exclusively truants from the public elementary schools, sent at the instance of the school boards, and that the schools will be administered by the school boards with a sole view of education, we are of the opinion that the responsibility for these schools should be transferred from the secretary of state to the education department as the central authority, and any legal power of detention should be included in the elementary education act.

Before leaving this subject we take the opportunity of pointing out what has been suggested by the London school board, that the education act should be amended so as to provide for the parent being compelled to produce his infant child in the event either of a breach of attendance order or of a breach of the license from an industrial school conditional upon attendance at a public elementary school or day industrial school; also that the order of payment made against the parent on the commitment of his truant child to an industrial school shall continue if the child is licensed from an industrial school on condition of attending a day industrial school.

DAY INDUSTRIAL SCHOOLS.²

Régime of the schools.—These schools were first authorized in England by the education act of 1876, which enabled school authorities to procure children—chiefly truants—on the breach of an attendance order to be committed to a day industrial school for a term of three years, but not beyond 14 years of age. With one exception, all these schools have been established and are managed by school authorities; but they are only 23 in number, viz, in England 20 and in Glasgow 3, established under the Glasgow delinquency act, 1878; and they provide altogether for between 3,000 and 4,000 children. It was only in 1893 that power was given to establish such schools in the rest of Scotland. The Edinburgh school board, we understand, has taken steps with a view to make use of this power. The schools are in all cases mixed schools for boys and girls, and, with the exception of the London school board school, recently opened in Drury Lane, are all under the charge of women. The children attending them are from the very poorest class. The school is open for reception from a very early hour in the morning, so as to enable parents going out to their work to leave their children, if convenient to do so. A later hour is fixed by which the children are bound to have come; if they fail, they are sent for. On arrival, at whatever time, the child is washed and cleaned. The day is spent in school work and the simpler kinds of industrial employment, manual drill, and play. The system is nonpunitive, and the object is to make the children as happy as possible. The child receives three meals in the course of the day, and at 6 o'clock is set free to go home. With regard to expense, the Government grant is 6d. per head per week for maintenance, and another 6d. dependent upon the results of the examination. The parent is put under contribution to the managers usually in the nominal amount of 2s.; in case of his default he has to apply to the guardians, and they are under an obligation to pay on his behalf so much as they consider he is unable to pay. Whatever expense is not covered by the Government grants and parents' payments has to be made up by the managers; usually it amounts to a considerable sum.

We have nothing but praise to give these institutions. We concur with the observations of Colonel Inglis in his last report:

“Day industrial schools are, without exception, going on well and doing good

¹ The later documents at hand are not sufficient to show the full effect of these recommendations. There seems to be, however, no disposition to discontinue any of the schools concerning which this office has information, but rather to establish new ones. It is probable that in changes in internal administration the principal influence of the report will be shown. The rules of the London truant schools were undergoing revision with reference to the recommendations of the committee of inquiry at the date of the last report of the London industrial schools committee (Lady Day, 1898). The matter was still under consideration at that time, and the extent of the proposed changes was not stated. There is nothing to indicate, however, that marked or radical changes of general policy are contemplated.—[Ed.]

² Report of the departmental committee on reformatory and industrial schools (“Lushington's Report”), 1896, pages 124-126.

work. It is always a pleasure to go into these schools and see the order apparent everywhere and the children almost invariably look bright and cheerful. In some more attention might well be paid to industrial training, while in others I have no reason to find fault on this score. These schools are doing well wherever they have been established. * * * They are most interesting schools to an inspector; he can feel that there is no mistake about the quality of the work done in them; the order and attention are always excellent, and one can not but hope that some of the orderly and cleanly habits learned in them may be reflected in some degree on the miserable homes from which they generally come."

The attendance at these schools is very good; and so also is the attendance at public elementary schools of those licensed from day industrial schools. Almost the only offense at the school is truancy, chiefly during the summer months, when the children are apt to sleep out at night and not to go home in the morning, and so are not sent to school. Those who have experience of the system do not find it pauperizing to the parents. As a rule the parents object to their child being sent to the day industrial schools; besides being laid under contribution, they lose the service of the child out of school hours and have the trouble of sending him to school an hour earlier in the morning. The homes are wretchedly poor and in many instances bad; to say that no injurious effects follow from the children returning home at night would be going too far, but, on the whole, the children from returning home receive considerably more good than harm; the work of the school is not thrown away in consequence. Some of the worst cases are doubtless more fitted for a boarding industrial school, but these by natural process will sooner or later find themselves there.

In our opinion these schools are founded on right principles; parental responsibility is enforced; the home tie is maintained; the child, while subjected to so much discipline as is necessary, is not deprived of its liberty, and is treated on a system of kindness; and the school authorities recognize that in dealing with such a neglected class it is requisite to have better teachers and better appointments than those which suffice for an ordinary school. The work of dressing and attending to these children is often of a most disagreeable character; but it is encouraging to know that the fact of the teacher doing so much for the children personally attaches not only the children to the teacher but also the teacher to the children, and that as a rule a teacher having once taken to the work would not exchange it for employment in a public elementary school.

In one respect these schools have disappointed the intention of the legislature. It was contemplated that it would not be necessary to keep the children in these schools for more than a brief period, and accordingly there was inserted in the act of 1876 a provision enabling, but not compelling, the school authority, after the detention of one month, to release the child on license conditional on his attending a public elementary school. Practically nothing like this has been found possible with the bulk of the children who are sent to these schools. They come from homes where they are completely neglected, and this being the case, it is unreasonable to expect that children of their age will attend the public elementary school; probably they will not try to go, and if they do they will, from their dirty and neglected condition, be an offence to the other children. In consequence the children are kept longer at the day industrial school—the average duration is now nearly two years—and thus the school becomes to a certain extent a substitute for the public elementary school instead of a feeder to it. We believe this to be necessary; but at the same time the matter requires to be carefully watched, and, to prevent encouragement of parental neglect, the school authority should strictly compel parents to pay what they can. In this respect Manchester shows an admirable example.

Recommendations.—Day industrial schools, as at present constituted, are only possible in populous towns, where within a narrow circle there is a number of neglected children large enough to fill them, and they are also expensive to the school authority. It is for these reasons that there are so few. We venture, however, to express a hope that there will be a considerable increase in the number of these schools, and that when established they will be placed under the charge of women, as more suitable than men to have the care of young children, especially young children of this neglected class.

The extra day's schooling, the provision of meals and of industrial (in contrast with technical) training, seems to make it impossible to use the ordinary elementary school as a day industrial school. If, however, these difficulties could be removed in the case of towns, by making one school in each town a day industrial school, the plan would, in our opinion, be worth trying. In the country districts, where such a plan can not be tried, there might, perhaps, be grafted on the public elementary schools so much of the day industrial school system as provides for the appoint-

ment of an attendance officer, who should be sent out to bring in the children who did not come of themselves—a fine, if necessary, being levied on the parents of such children to defray the necessary expenses. These matters will, no doubt, receive the attention of the education department.

For the same reasons as those already stated with regard to truant schools, we are of the opinion that the education department should be constituted the central authority for day industrial schools, and any legal power of detention should be included in the education act.

REFORMATORY AND INDUSTRIAL SCHOOLS.¹

These schools, so far as they are recognized by Government, are under the control of the home secretary. "Reformatories are schools to which are sent juveniles up to the age of 16 convicted of an offense punishable with penal servitude and imprisonment. Industrial schools are for children up to the age of 14 who may not have committed an offense, but whose circumstances are such that if left in their surroundings they are likely to join the delinquent population. Thus reformatories are for actual, industrial schools for potential delinquents, and the former contain children some three years older or more than the latter. Both are voluntarily maintained by private associations or local authorities, aided by a Government contribution toward their expenses, and are subject to Government inspection."²

REFORMATORY SCHOOLS.

Schools which subsequently became reformatories were founded in the last century, and received recognition from Government prior to 1838, when the Crown exercised its prerogative through the home secretary by granting pardons to boys sentenced to transportation on condition that they would submit to the training of some specified school of this class.³

The treasury contributed to their support a sum that was intended to cover the expenses of these offenders.

In 1846 the committee of council on education offered grants for industrial training, and schools of the reformatory class availed themselves of these privileges until the end of 1857, when those institutions which had begun to receive aid and inspection from the home office were handed over altogether to its consideration. In 1846 the committee also recommended that £5,000, out of the £20,000 voted by Parliament, should be expended on a model penal school, but this was never done.

In 1854 the first statute dealing directly with reformatories was passed—the youthful offenders' act. By it the home secretary was empowered to certify reformatory schools, if on the report of an inspector of prisons they appeared useful and efficient for their purpose. Any person under 16 convicted of any offense punishable by law on an indictment or a summary conviction before a magistrate or two or more justices of the peace might on the direction of the court be sent at the expiration of his sentence to a reformatory school for an additional period of not less than two or more than five years. The treasury might defray the cost out of funds to be provided by Parliament for the purpose and parents or stepparents might be compelled to support such offender while in the school. An inspector of prisons visited the institutions and made an annual report.

The reformatory and industrial schools act passed in 1856 provided that young persons should not be sent to a school to which the parents objected, if they named another school duly certified.

In 1857 the quarter sessions or council of any quarter sessions borough were allowed to grant money in aid of a reformatory school.⁴

In the same year the Rev. Sydney Turner was appointed as a prison inspector by the home secretary, especially to inspect and report on reformatory and industrial schools.

During the four years, 1854–1857, 44 of these schools were certified in England.

By the reformatory schools act, 1866, the previous acts were repealed, consolidated, and amended. Offenses for which persons could be sent to reformatories must be such as were punishable with penal servitude or imprisonment.

¹ From *The Educational Systems of Great Britain and Ireland*, by Graham Balfour, Oxford, 1898, pp. 51–57.

² Inspector's report for 1895, p. 8, slightly abridged.

³ This is a recital in an act by which, in the first year of the Queen's reign, a prison was established for young offenders only at Parkhurst, in the Isle of Wight. It was a step in reform, but even at Parkhurst the prisoners at first all wore irons, and in the fields were superintended by sentries with loaded weapons.

⁴ Now transferred to county councils and councils of larger municipal boroughs.

No child under 10 might be sent to a reformatory unless sentenced by a judge of assize or court of general or quarter sessions or previously charged with an offense punishable with penal servitude or imprisonment. The parents might apply within thirty days to have an offender removed to a reformatory conducted in accordance with the religious persuasion of the offender.

The prison authorities were given power to defray the cost as current expenditure, while the treasury might contribute out of moneys provided by a parliament for the purpose a sum recommended by the home secretary. A special inspector was appointed for the reformatories and industrial schools of Great Britain.

The prison authority was given power to contract with a reformatory to receive and maintain offenders, or to contribute to the establishment of such a school, or subsequently (in 1872) to build and maintain such a school themselves.

By Lord Leigh's act, passed in 1893, new provisions were substituted for those of 1866 for sending offenders to reformatories. The age was raised from 10 to 12, unless the child had been previously convicted, the minimum term raised from two to three years, and the imprisonment previous to being sent to the school might be dispensed with. In no case were offenders to be kept at the school after attaining the age of 19.

INDUSTRIAL SCHOOLS.

The early history of industrial schools is the outcome of two different purposes. On the one hand there was the anxiety to prevent boys from falling into bad company, which has latterly been the controlling influence in these schools; and on the other there was that desire to give an industrial training which has recently found its expression rather in technical and manual instruction.

In the early days ragged schools were frequently mentioned in the same connection with industrial schools. They were provided by charity free of charge, and made no requirements as to the dress of pupils. Consequently they were used chiefly by the children of outdoor paupers, of the dissolute, and of those unwilling to pay fees. The secular part of their educational work has naturally been absorbed by the board schools.

The education department in 1846 offered grants to day schools of industry for rent of field gardens and help to hire or build workshops, washhouses, or kitchens, and to provide tools. It specially referred to schools situated in the denser parts of great cities, intended to attract from the streets vagrant youths who are there trained in criminal pursuits or accustomed to beggary and vagrancy.

By minutes in 1856 and 1857 the committee of council considerably extended their industrial grants to schools, confining them, however, to schools which were industrial in character and educated scholars taken exclusively from the criminal and abandoned classes, but by 23 and 24 Vict., c. 103, industrial schools were transferred to the charge of the home secretary in 1860, and all connection with the education department ceased.

Meanwhile the first industrial schools act for England and Wales had been passed, in 1857. Children above 7 and under 14 convicted of vagrancy might be committed to a school certified by the committee of council on education and examined by their inspector (after 1860 by the inspector of the home department), but only if the parents would not give an assurance in writing for the child's good behavior to find a security for the same. The parents might be made liable for the support of the child up to 3s. a week. The child could not be detained beyond the age of 15 against her or his will.

In 1861, 24 and 25 Vict., c. 113, consolidated the previous acts and enlarged their scope.

A distinction was introduced between children under 12 and those under 14. The latter, if destitute, vagrant, mendicant, or frequenting the company of reputed thieves, might be committed to an industrial school; under 12, they could also be sent if they had committed an offense punishable by imprisonment or some less punishment. Children need no longer be convicted in order to be sent to an industrial school, but if convicted previously of felony they are not admissible. Parents might present their children under 14 before the justices as unmanageable and obtain an order committing them to school, but in this case the parents had to defray the whole expense. For the maintenance of the others the treasury was empowered to contribute any sum that the home secretary might recommend, and the extent of their parents' possible contribution was raised to 5s. a week. Children convicted on a previous charge of felony were not admitted to these schools.

This act was only temporary, but in 1866 29 and 30 Vict., c. 118, was passed, which embodied most of its provisions and remains the controlling act till the present time. Under the new regulations a child under 14, being a destitute orphan or with a sur-

viving parent undergoing penal servitude or imprisonment, was added to the list of those liable to be sent to these schools, and the limit of detention without consent was raised from 15 to 16.

The inspector of industrial schools and the inspector of reformatories must be necessarily one and the same person appointed by the home secretary. Refractory children might be sent from workhouses and pauper schools, and the guardians had power to contribute. The same school might not be certified both as a reformatory and an industrial school. The prison authority might contract for the reception of children at these schools, and contribute to the capital or current expenditure; and in 1872 these bodies received power to establish and maintain schools themselves, if necessary.

Children under 14 of a woman twice convicted of crime, or children living with prostitutes, may be sent to these schools.

In 1870, by the elementary education act, school boards received powers of contributing to the establishment and maintenance of industrial schools, and, with consent of the education department,¹ of establishing such schools themselves.² They also received power to enforce the industrial schools act if they thought fit.

By the 1876 act, school boards and school attendance committees were compelled to enforce the act unless they thought it inexpedient.

In the case of offenses against the act, if no day industrial school was available, a child might be committed to any certified industrial school. Children so sent might be released on license at the end of one month, instead of eighteen months as in 1866.

Industrial schools established after March, 1872, receive only 3s. 6d. for each child from the Government, instead of 5s.

¹ Since 1876, of the home secretary.

² There were nine industrial schools under school boards in 1896.

CHAPTER IV.

EDUCATION IN PORTO RICO.

By Hon. JOHN EATON, *formerly U. S. Commissioner of Education.*

In the first days of January, 1899, in accordance with the recommendation of Hon. W. T. Harris, LL. D., United States Commissioner of Education, I accepted the invitation of the insular cabinet of Porto Rico and went to San Juan to cooperate in making the needful changes in the organization and administration of education on the island. On October 18, 1898, General Brooke had raised the American flag on the island. When I arrived Gen. Guy V. Henry was in command of the department, having received it from General Brooke a few weeks before. The changes as the result of the war were most manifest and followed each other in rapid succession in spite of the fact that the four secretaries constituting the insular cabinet, viz, the secretaries of state, of fomento, or of the interior, of justice, and of finance, who were in power under Spanish control, had been continued in their respective offices by General Brooke. Affairs went on under them much the same, save that the Spanish spirit had given way to the American in the authority exercised by the commander of the department. The old methods on the part of the alcaldes and the members of the cabinet struggled with the new as represented by the General.

The fact that the old continued under American direction, even for a short time, disappointed the expectation of immediate improvements, which many of the citizens entertained, and so far gave a quasi approval to the bad methods of the past and rendered more difficult their removal or improvement. General Henry, in assuming command, had made comprehensive announcements touching various features of the government. He said in regard to education: "The system of school education should be looked into, and it is my desire to ascertain how many teachers can be paid who can teach the English language, commencing with the younger children. It is believed that the people who can speak English only can accomplish the purpose by object lessons. It is thought that American women for teaching can be obtained at \$50 a month in gold, and they are well worth it. The young children are anxious to learn, and now is the time for them to do so. If the alcaldes will report to me how many teachers they can employ, they will be brought from the States and sent to those towns."

The General had the great advantage of having been a close observer of affairs on the island from the first landing of American troops under General Miles. For a portion of the time he had been in command of the district of Ponce. In the city of Ponce he and Mrs. Henry had aroused among the people a spirit of self-help and organized an American aid society, out of which had come the establishment of a school on the American plan, taught by American teachers. Without a building erected for school purposes, and without school furniture, but in a private house, with such furniture as could be obtained, the school was commenced, and was so attractive to the children that the numbers coming could not be accommodated; and not unfrequently those who were disappointed in seeking admission went away in tears. The General's interest in education was cordially seconded by officers in all grades of the service, and by his orders all possible aid from the Army was rendered the administration of the school work.

He at once assigned me to the care of education, and I found it was one of the subjects for the responsibility of which the department of the interior was charged. Dr. S. Carbonell was the secretary of that department, and formally appointed me inspector. His office was being removed to new quarters and all was in confusion. After a little, a desk was assigned me, and a little later, a part of the time, a clerk. I began to study the situation. The first request was that I should inspect the orphan school conducted by the insular government. The orphans were gathered from all parts of the island. I found them and the insane of the island accommodated in different parts of the same large building, intermingling with each other to a considerable extent. On Saturday, the day after my arrival, the secretary called the San Juan teachers together to meet me. Their minds were alert, and they interested me greatly. Calls from all directions became numerous. Statesmen and scholars came to ask my plans; parents and children, for aid in securing instruction. Every opportunity for information was afforded me. Alcaldes, or mayors, and other officers and prominent citizens visited me from different parts of the island. There was at once manifested a partisan cleavage running through official information and conditions. It was difficult to know exactly how affairs were; they were not always what they seemed to be. Evidently my hands were to be more than full. General Henry saw that I must have assistance, and I selected Victor S. Clark, Ph. D., of Minneapolis, Minn. I had known him from his childhood and was sure of his qualities. He had been educated in public schools in Minnesota and in its State university; had taught a high school; studied and traveled in Europe two years, and, on his return, had superintended a city system of schools and published a book in English and one in Latin. He had been given a fellowship and a year's study at Columbia University, where he had received the doctorate of philosophy. He had been elected a teacher in Brooklyn and resigned. His arrival was delayed, but he became my other and younger self, sharing in all my plans and labors and succeeding to my responsibilities when I resigned, and has discharged them with great credit to himself and American methods and with untold advantage to the people of the island.

The course of events moved rapidly. General Henry found many of the embarrassments arose from within the so-called cabinet. Secretary Carbonell resigned in February and was succeeded by Mr. Degeteau. The cabinet was dissolved, all of its old members retiring save its secretary of finance. In March Mr. Degeteau's health failed, and he was succeeded by Dr. Del Vallé. The methods of administration coming down from other years were most cumbersome and un-American, and had the policy adopted by our Government permitted, the work could have been greatly reduced in amount and greatly increased in efficiency. But having our object clearly before us, by degrees an efficient office was organized with great capacity for work and ready to be reduced as soon as the methods adopted would permit. Up to this time no women had been employed in the public service. The first so employed was Miss Margaret Dodd, of Ponce, who was given a place in the educational work in our office. She was a native of the island, of Scotch descent, educated partly in the island and partly abroad; was for a time a resident of the States, and was a good Spanish and English scholar, stenographer, and typewriter. Her success will open a new door for worthy women on the island.

COMMUNICATION WITH TEACHERS.

Everything pointed to the importance of the freest communication with the teachers. On looking over the records of the office, I observed that many changes had occurred just before my arrival. There were many signs of unrest among teachers, especially a disposition to claim each other's places. Not a few held their positions, as it was alleged, by illegal tenure. It was said that here and there they had been appointed as political partisans. Soon I had to restrain the active partisanship of

some; indeed, one had to be called before the commanding general. Much money was overdue teachers. It was a common remark that the teachers were among the last paid in the employ of the municipalities. The General issued an order requiring their payment and requested special attention to the subject on the part of the office.

Current demands confined me most closely to the office and rendered my visiting other parts of the island for the time impossible, and I sent a printed note directly to each teacher, inclosing a card with specific inquiries ready for return to me by mail, and calling for specially needed items of information. The responses were most interesting and helpful. They revealed much of the situation, told something of the spirit and qualifications of the teachers, and gave most abundant evidence of the need of improvement and of the desire for it on the part of the great number of teachers. On a good-sized map sent from Washington, Dr. Clark began to indicate the location of every school. Visits from representative teachers from various municipalities afforded the office valuable data. A glance at the map gave information which it would take a long time to find in the records. As soon as the work would permit I sent Dr. Clark on a tour of inspection and received from him the following very valuable report:

SAN JUAN, P. R., *March 14, 1899.*

Gen. JOHN EATON,
Director of Public Instruction.

HONORABLE SIR: In accordance with your directions I left San Juan on the morning of March 6 with maps, flags, and books for distribution to the schools of the eastern part of the island. I first visited Carolina and left maps and flags and 52 books for use in the schools there.

None of the teachers are reported as speaking English. An American or English lady whose name I did not learn gives private lessons in English in the municipality. After making two unsuccessful attempts by different routes, I found that it was impossible to reach Loiza without danger of injuring the supplies in the ambulance. At Rio Grande I distributed books to the school, and sold 64 books to the alcalde, receiving the money for the same. Mr. Emile Just, a Norwegian by birth, speaks excellent English, and gives private lessons in English in the town and in the vicinity.

His method is somewhat antiquated, and I was informed privately that there were considerations unfavorable to his appointment as an English teacher. I think, however, that he should be considered carefully as possibly an available candidate, if an English teacher is to be appointed at this place.

I spent the night with Rafael Rexach, teacher at Mameyes, who is learning English at Rio Grande. Salaries are paid to date, but a system of store orders is complained of and is said to work injustice to the teachers. People of intelligence asserted that not over 20 per cent of the population of the municipality could read or write.

The next day I left maps and flags at Luquillo, and left books, as well as maps, at Fajardo. Mrs. Jenny M. Hill, a graduate of the State University of Illinois, and a teacher of several years' experience, residing at Fajardo, might be secured to teach English at this place. There are four schools in the town. There was much complaint that educational reforms were not being more vigorously furthered by the central government. The local authorities think that money is misspent in the payment of incompetent teachers. There was a very urgent demand for an English teacher here, but no appropriation to pay one could be made before July 1.

The municipality has a population of approximately 16,000, and spends 8,000 pesos annually for its schools. Part of the country district is practically without school accommodations, some pupils being 9 miles from a schoolhouse.

I spent the night at Naguabo. There is no American or English teacher here. The postmaster speaks English, and many of the prominent men are learning that language. Complaint was made that the Catechism and kindred subjects took up the time of the teachers. The authorities urged immediate and radical changes in the school system. This municipality pays about 3,000 pesos per annum for educational purposes.

The next day I visited Humacao, Piedras, and Juncos. In one of the Humacao schools English is being taught. The books that we sell for 25 centavos were sold by a Ponce firm for 60 centavos. I found some of the schools here the best supplied with school furniture of any that I had seen in the island. The alcalde was very severe in his strictures upon the present school system, stating that he had visited

schools in several European countries and that those of Porto Rico were the poorest that had ever come under his observation. Books, flags, and maps were left at Piedras. One of the school buildings here is owned by the municipality, but the building was not specially erected for educational purposes. This municipality pays about 3,000 pesos per annum for school purposes, and has a population of about 8,000. Much complaint was made about the commercial condition of the country, due, it is said, to the difficulty of getting their products to a market on account of the poor roads. Several times the statement was made to me that more and better roads and more and better schools were the two crying needs of the country, to which all others should be made subordinate. At Guarabo, with a population of 8,000, 2,500 pesos are spent for educational purposes. I stopped here merely long enough to leave books, maps, and flags. The roads between Guarabo and Caguas are very poor.

Our ambulance was overturned once, and we had to unload and carry our supplies a portion of the way. At Caguas I was unable to see the authorities and distribute supplies. Salaries are not paid to date, but it is said that an attempt is being made by the present alcalde to secure their settlement. I was not favorably impressed with the schools I visited here. On account of the error in shipping supplies to Coamo instead of Caguas, I was unable to visit Guyama and the neighboring towns, but continued down the military road. At Cayey I learned that months ago an appropriation was made for an American kindergarten, and this office was notified of that fact, but with no acknowledgment of such notification having been received. This municipality, with a population of 15,000, spends about 9,000 pesos annually for school purposes. I visited a private college here, which receives an appropriation from the municipality. Mrs. E. W. Van Metre, wife of the postmaster, graduate of the Maryland Normal School at Baltimore, and with two years' experience as teacher, will teach English here, if desired. She is now in the States.

At Aibonito, on account of the low prices of coffee, there is considerable business depression, and this has influenced the schools. Two thousand four hundred pesos are paid annually for their support. The population given is 5,000.

At Coamo, with a population of 13,181, 4,700 pesos are paid annually for school purposes. This town authorized an English teacher several months ago, and notified this office of the fact, but had received no acknowledgment of the notification. The authorities seemed to be irritated with what they considered neglect on the part of this office.

In general, there seems to be a strong desire that English be taught by American teachers in the different towns. The people desire to learn English for political and commercial reasons. For the latter reason they desire that arithmetic be taught in English in the advanced classes. There was strong opposition in many places to the appointment of any but native American teachers, as the municipalities feel that they are to pay a high price for this instruction, and that they should have teachers with perfect pronunciation and command of the language in return for the money they spend. Some people were very radical. Occasionally a man of prominence could be found who desired all the teaching to be done in English. Teachers complained that there are too many subjects taught, and that it is impossible for them, with the large number of pupils under them, to instruct properly the large number of classes now required. Private persons complained that children not paying tuition are neglected. This was mentioned to me frequently as a very great evil.

It was generally agreed that the present method of instruction tends to cultivate the memory at the expense of observation, reasoning, and expression. Teachers justified themselves by the statement that their classes were so large and the number of subjects taught so many that it was impossible for them to develop individuality and those faculties which require that the attention of the teacher be devoted to individual pupils, in the children under their charge. There seems to be a strong latent hostility to religious teaching in the schools. It was very hard to secure an open expression on this subject.

I have come back with the impression that the people desire a change very much, but that they desire to throw the responsibility for it entirely upon the central government. I found in some cases a tendency to blame the capital and the government here for slowness and lack of decision in educational reforms. Authorities were accused of being in sympathy with the Spanish system and hostile to the education of the masses. A strong class feeling may develop in some of the towns of the island, and a large majority, representing the illiterate classes, may look upon the introduction of English, unless it be accompanied by increased educational facilities for all the children, and especially instruction in that language for all the children, as an attempt to establish class rule. It was pointed out to me that there might be a tendency upon the part of the wealthy people to monopolize English in their own ranks, and to use it to keep political and commercial control, and as an additional instrument for the oppression of the lower classes. I think that in some places the common people have a vague idea that English is in some way associated with liberty

and political rights, and that there is an earnest effort being made to prevent the people from securing it. I suggest that great care be taken to prevent anything like partiality in the introduction of English; that teachers be forbidden to give private lessons in that subject for money in schoolhouses; that the fee system in the schools be immediately abolished. It excludes from the schools children of that very important class who, though they can not afford to pay for the education of their children, are too proud to make a *declaratio paupertatis*. I recommend, however, that teaching in the public schools be confined to the Spanish language and literature, English language and literature, including American and Porto Rican history and civics, arithmetic in English and geography in Spanish, and that these changes be introduced as rapidly as possible; that a special effort be made to reach the rural schools, which are often neglected; finally, that the payment of fees by pupils be abolished, and that no municipality be authorized to pay teachers who violate this regulation.

Yours, most respectfully,

VICTOR S. CLARK,
Subdirector of Public Instruction.

THE BENEFICENCIA.¹

This was large and well built, but without modern improvements. The building and its management embodied the beneficent manifestations of the ideas and customs of the people in their public affairs. It was duly supplied with officers and regulations. My early inspection impressed me with its needs. At that time it was under the secretary of state, but was later transferred to the secretary of the interior and at once placed under the bureau of public instruction.

One part of the building was occupied by several hundred orphans and another part by the insane of the island.

The sexes were carefully separated, but some of the insane were employed in the care of the orphans, and, vice versa, some of the older children in the care of the insane. This shocking condition was not permitted because there were not capable people engaged in its management. There were those, according to their ideas, who were skillful, self sacrificing, and devoted to those under their care, but the system, the arrangement of the building, conditions which no one in particular was able to change, came out of prevalent ideas, and embodied the evils fixed in the public mind, and thus they furnished an illustration of the progress of society.

As in former days in the States, so here the places for punishment of crime, the jails and prisons, furnished the receptacles for all who required care separate from the family, whether insane, criminal, or feeble-minded. The jails were reported extremely filthy and much neglected. This condition of the jails had received from General Henry special attention. It manifested the need of education in a most distressing manner. Immediately when charged with this special responsibility I recommended the separation of the insane from the orphans and their assignment to buildings in different localities. Now, under the order of General Davis, the care of the insane has been removed from the office of public instruction and placed under the proper board. During the time of my responsibility an insane woman was reported violent in a distant part of the island and sent by an officer to San Juan for confinement in the *beneficencia*; legal steps had been duly taken, when after dark one evening, amid considerable confusion on the street, the man in charge of her appeared with her at my door. He had wrapped her in a sort of gunny sheet or blanket, and bringing the opposite edges of the wrap or cover together in the form of a sack ran a pole through the wrap or sack, so as to suspend it, each end of the pole resting on the shoulder of a stalwart man while the woman rested on her back within the sack; thus suspended in the wrap or sack she was brought to my door and taken thence to the asylum. There was no lack of indications of personal kindness in the intention, but there was deficiency of knowledge of important methods of caring for the insane.

¹ Asylum at San Juan for orphans and insane persons.

THE SPANISH SCHOOL LAWS.

The legal conditions which prevailed in the island went back to the Spanish school law of 1857, and were to be found in modifications added later by royal decrees and changes made under the so-called autonomy. The situation was very much mixed, and, as it is passing away, it is necessary to recall it only so far as it may help in the development of educational work in the future.

There was much of excellence in the law of 1857, especially as compared with laws in the States of that date. In the making of Spanish laws there is indication that the best minds were consulted, whatever may be said of the defects of administration. These defects, whether charged to laws or administration, are sufficiently seen in the results—no houses built for school purposes and owned by the public, with poor text-books, memoriter methods, conditions which render classification and discipline impossible, teachers poorly paid, a system which provided for less than a fifth of the school population, almost all of whose provisions were of the most elementary character; with no instruction in the island in its advanced grades or qualities sufficient to prepare students for admission to a good college in the States; and leaving at least 80 per cent of the population unable to read and write; and, as found in some of the communities by the manager of elections, as elsewhere stated, often only 5 per cent, and in some cases only 2 per cent, able to read and write.

In the laws and administration as already seen the insular government and municipalities shared both in the exercise of authority and in the meeting of expenses. With the central authority was associated a council. This, however, rarely met. The island was divided into two inspection districts, and an inspector for each was under the direction of the insular government. With each alcalde were associated a group of citizens constituting a municipal board of education, whose members before exercising their functions must be approved by insular authority. There was great complaint of the neglect of duty by these boards, and especially of their partisan action.

School attendance was obligatory for the ages from 6 to 9 years, but this provision was not enforced. Schools in the country were divided into auxiliary and rural. In the towns they were designated as elementary and superior; but the instruction in all cases was most elementary and for the most part of the same grade. The chief real difference was in the pay of the teachers. A teacher of the superior school, first class, had 1,200 pesos a year; of the second class, 1,000 pesos a year; the teacher of an elementary school, first class, had 600 pesos a year; but in San Juan, Ponce, and Mayaguez the salary of the first class was 720 pesos, and of the second class 480 pesos. The second grade, however, in San Juan, Ponce, and Mayaguez was to receive 540 pesos. The salary for an auxiliary school was 360 pesos, a rural school 300 pesos.

A somewhat similar condition appeared in the rent for houses. The rent for superior schools, first class, was 500 pesos a year; for superior schools, second class, it was 204 pesos; elementary school, first class, 144 pesos; auxiliary, 36 pesos; rural, 24 pesos.

When vacancies occurred, publication was made, and any teacher could apply. If all applicants held a similar grade of certificate, the one of longest service could claim the appointment; or if they had different grades of diplomas, the one of superior grade could claim the appointment. Theoretically, the provisions for obtaining places were rigid and exact, but practically very much mixed. There was a board of examiners for the entire island, and two dates—January and July—fixed for examination, which by insular authority might be permitted at any time. A special fee for examination was fixed, which was so large in some cases as to embarrass the

poor candidate. A school obtained in accordance with the exact provisions and to suit the teacher was his for life. He could only be removed for malfeasance after trial, as legally provided. A school thus held was, in a way, looked upon as owned by the teacher and not the public. Separate schools were provided for boys and girls. The feeling against bringing the sexes together, however young the pupils, was very strong.

A system of pensions was established in 1895, derived from 3 per cent of the salaries of teachers in the normal school and of the inspectors and teachers of both sexes in the auxiliary elementary schools, and the product of salaries of schools that were vacant, and a discount of 10 per cent on the school budget. The money due to this fund was taken away by the Spanish authorities, amounting to some 35,000 pesos. Effort has been made for its recovery. Its administration is no longer intrusted to the school authorities, but has passed into the voluntary control of an organization effected among the teachers who participate, and the money is deposited with the insular treasurer.

EDUCATIONAL SENTIMENT.

The indications of educational sentiment were extremely interesting. I had rarely been situated in a way to hear education more universally commended. It was good for everybody, and everybody wanted it. All classes talked about it. The need of improvement was admitted on all hands. Americans and Porto Ricans were prolific with plans. The General promised to give free passage on Government transports to both teachers and pupils who should go to the States for educational purposes. This order brought to my attention a great number of typical facts. The number who sought its benefits was very large, especially among the orphaned and most dependent. Widows came with their children, sometimes long distances; often it was difficult to discover how they obtained the means for making the journey. The number who were in extreme poverty and sought the benefit of education for their children was especially touching. The pallid and anæmic condition of not a few left no doubt of their lack of food, as they would reluctantly confess themselves well nigh to starvation. One saw many manifestations of the mother's affection, stronger and more active than those of the father's affection for the child. Often the families of these destitute children had been in better circumstances, and there was manifest the great lack of means or instrumentalities for giving them aid either official or voluntary. It was pitiable to see the number of waifs adrift. Save the limited number in the orphan asylum, there had been neither schools nor provision for the support of the dependent, the blind, or the deaf and dumb, or the feeble-minded. In spite of the fact that the number of beggars was so large that one day in the week they were allowed special privileges in begging, there were many whose pride would not allow them to confess their poverty. The so-called submerged class was large. The great amount of talk about education was indefinite and crude. Those who had been educated abroad had some idea of the systems and methods which prevailed in the instruction which they had received. Few could be found able to give an adequate idea of satisfactory principles or methods or of a working system. A portion of the Spanish press was quite as likely to hinder as help any wise movement. Americans on the island, whether in the Army or out of it, favored schools, but were so conflicting in their notions as to be of little aid in improving the situation. One would abolish all that was old; another dismiss all teachers; another employ only men as teachers; one would teach little but industry; another would teach all letters; one claimed that the law in his State permitted the schoolhouses to be only two stories high. Perhaps the question asking for a modern system toward which to work would be answered by pointing to a State in which education went forward by a law that gave no coherent relation of part to part. Indeed that was

not a system in any proper use of the term. Generally the teaching of subjects was urged without any proper regard to their comparative pedagogical value, and methods were put forward as the best which had long been discarded by the best judges.

INTELLIGENCE OF THE PEOPLE.

There was no sure measure of the intelligence of the people; the usual measure of ability to read or write, or both, was only an estimate. Many said that not more than fourteen in a hundred could read and write; the highest estimate was twenty in a hundred. Several municipalities have held elections. Suffrage has been limited to those who could read and write. Some instances have been reported where not more than 5 per cent could give good evidences of this qualification. Below that line one could go down to a most submerged condition, the number, poverty, and degree of ignorance increasing as one descended. As in the States, there were those who had prospered or obtained a measure of success with little knowledge of letters. Near the line of demarcation there was a large number who could barely read and write. As one ascended, applying higher tests, the number grew increasingly smaller until one approached the summit of the cone, where were found the truly educated. They had enjoyed the best privileges in Europe or America, and were cultivated men and women. Their language was correct; often they could speak in several tongues. There was less knowledge of Latin and Greek than one would expect. Attention to the sciences, which kept up with their progress, was generally lacking. Indeed, there were on the island neither the opportunities nor the motives to the highest scientific research. The cultivated people, men and women, could not be excelled in good manners. Libraries of decided merit were owned here and there by private individuals, and there were some of considerable value furnished by municipalities. One in San Juan reported 5,000 volumes; the one connected with the institute was about the same size; another, at Mayaguez, had 7,000 volumes and was well housed. Little was known of improved library administration, but the library at Mayaguez was installed substantially on the stack system. The atheneum in San Juan had valuable collections in foreign journals and scientific works. Some European journals of character were taken by private individuals. The desire for American prints began to manifest itself. Accurate knowledge of American life, institutions, and principles of liberty was possessed by few natives. The government had manifestly neither been shaped nor administered to inspire to the highest attainments. In spite of this, there were men of eminence among engineers, teachers, clergy, lawyers, and doctors, deserving of the greatest respect, and whose views of education I found helpful. There was no lack of natural ability; opportunity and use were wanting; the practical application of attainments to the conditions of life was the great need in all directions. Skill did little to improve the natural conditions or resources of the beautiful island. The rich fruits grew abundantly as when first used by man, but of no better quality. Thirteen hundred mountain streams turned no wheels for man's benefit. The plow might be a part of a tree; a flail a straight stick. Grain would be winnowed in the wind and ground with a pestle in a mortar. One was reminded of the conditions of industry in Palestine two thousand years ago. Nature is so profuse in productions useful to man that they require little change for his existence, and motives and conditions are wanting to assure his progress in intelligence. Education must meet this question or man's efforts for improvement will be feeble.

In the relation of the educated to the ignorant there needs to be kept in mind the temptation presented to the selfish, unprincipled, or viciously educated in the presence of large numbers of the ignorant whom they can control by their intelligence and skill.

MODIFICATION OF EDUCATION.

Every source of information disclosed the inadequacy of the instruction that had been given. Clearly, education must be revolutionized. What authority will direct it? What will be acceptable to the people? Hereafter the source of supreme authority is to be the United States, instead of Spain. The island separated by the broad ocean is nearer to the American continent. The people native to the Spanish tongue are to be nearer to and more closely affiliated with Americans. The currents of history, like the tides of ocean, bring them nearer to American civilization, and by every consideration increase their interest in English. The direct work is to be among the young, while their minds are plastic and in a formative condition, before their habits are fixed or crystallized; but the adults must not be overlooked. Their views will affect the attitude of the young and render them favorable or unfavorable to the changes. Education must be thought of in its broader sense. Both the authority must be kept in view and the people to be educated. In this adjustment to the requirements of the authority of the United States and to the conditions of the people, young and old, is our supreme educational problem. Authority may decree, but minds must be willing to learn. There must be nice adjustment to produce the desired results. How shall we know the authority? The United States has no secretary or minister of public instruction in the Cabinet of the President to execute his directions under the laws of Congress. Education is among the interests whose regulation is left by the Constitution and by custom to the States. States make their school laws and administer them. This has been held and should forever be held a sacred duty. Congress has supreme power over all details of government in the Territories and the District of Columbia. This includes the authority over education, but this authority Congress has not exercised, save over the District of Columbia and Alaska and for Indians. It has otherwise left education to local action in the Territories as well as in the States. The Territories have, therefore, kept up or fallen behind the general sentiment of education of the country according to the local desires of the people. The condition of schools in Arizona and New Mexico, once under Spanish rule, contrasts unfavorably with school conditions in the Dakotas. Science, invention, and authorship have had national provisions from the first. In recognition of the supreme importance of education, under the authority to provide for the "general welfare," and having absolute control of the domain in the Territories, Congress has patronized education by giving lands for common-school and university purposes and for colleges of agriculture and appropriated money for experiment stations. It has incorporated and conducted the Smithsonian and the National College for Deaf Mutes, and finally, after finding the collection and dissemination of information so beneficial to education, has created and administered a Bureau of Education as an office of information, to focus and disseminate the lessons of experience in this department of the public welfare. This office has carefully regarded its limitations and become a favorite with the educators of the country. Its reports gather information from the educational experience the world over as no other report does; it is careful to assume no authority, but comes the nearest to furnishing an official form of expression of the national idea of education. Personally I felt conscious that sympathy and cooperation in all well-advised efforts were extended to me by the Commissioner of Education and other officers of the Administration, as well as by the President; but no one in Washington spoke to me legally with an authoritative voice. While around me the officers in the several subdivisions of the Army—commissary, quartermaster, medical—and in the several bureaus of the Treasury, Post-Office, weather service, and other civil forms of administration, were in direct communication with a chief in Washington, from whom they received their instructions in regard to all internal regulations of their

service, the supreme authority is vested in the commander in chief on the island as long as the island is in the military grasp and under what may be termed a Presidential government, under the war power of the Constitution and the acts of Congress. It is a matter of unspeakable good fortune for education that the General on the island, exercising the supreme authority vested in him by the President, was so thoroughly an American, of such unselfish and single purpose, so patriotic and quick and broad in his apprehension of what improved instruction may do for the people of the island. His orders were law, and clearly whatever was attempted must accord with his judgment; but not only was it my duty to consult and obey authority, but the people who were to be educated must be studied and consulted. The old maxim is still true, "You may lead a horse to the water, but you can not make him drink." Clearly, no preconceived scheme or iron-bedstead plan of education should be imposed. Theories will be vain if not fitted to the situation. The origin and race peculiarities of the people must be taken into account, as well as present customs, ideas, and aspirations. The local authority and sentiment were officially represented by the minister of the interior. From the first, therefore, I attempted no plan which had not the approval of the general commanding, the supreme authority on the island, and the Secretary of the Interior, as the local official. Great as were the perplexities, it is a pleasure to say my plans received their cordial approval. It was of primary importance that I should have some ready means, first, of knowing the views of the people, and, second, of conveying to them the plans approved for execution. As I have indicated, aid could not be expected with assurance from the press, and from the clergy only in exceptional cases. Only one priest called to promote education in his municipality. The religious sentiment in all peoples, so powerful when aroused for their uplift in any community or state, was in the main untaught or perverted. The family as a social force was in an abnormal condition; many were beautiful in their exemplification of domestic virtues; many parents, though perhaps, as claimed, more than one-half were not bound by any legal marital ties, were faithful to each other as man and wife. There were not wanting striking illustrations of their love for their children and their desire for their education. In this confusion of social, civil, and ecclesiastical conditions, how should I be able to know and measure the pulse of life on the island?

There was no representative body to be consulted. I therefore decided to try to organize a voluntary "society for the benefit of children," taking one suggestion from England, another from the State of Maine, another from New Orleans in giving it shape. The cooperation of every Porto Rican was invited, without regard to partisan differences. General Henry became the honorary president, and the members of the previous and the present cabinet, the several consuls on the island, and General Grant and Colonel Hood became honorary vice-presidents. Eminent men of the best character from the different political parties were selected for active officers. The operations of the society were under the direction of an executive committee, with which a subordinate executive committee was to cooperate in each municipality. The executive committee were charged with the general management of the society; they were to arrange all meetings, name subjects and speakers, designate the committees charged with special duties, and do whatever else, in their judgment, would promote the objects of the society, which were to be, to promote the attendance of all children upon school, to aid those who do not attend on account of destitution, to give attention to the supply of teachers, the advancement of their qualifications, the supply of school houses and furniture, the learning of English, the supply of reading for the home, the acquisition of knowledge of the history of the United States, the cultivation of patriotism and all good sentiments, and otherwise to promote intelligence and virtue. I uniformly attended the meetings of the executive committee. The members were not only representative men, but men of the highest order of intelligence on the island. There was little in the condition of the people and situa-

tion of the island which they did not know; and they had a great variety of ways and acquaintances by which they could make known the plans upon which they agreed. They had a deep interest in education and the welfare of their people, and were alert for every means of improving the condition of the schools. It was a delight and an encouragement to meet with them. There were no public amusements for children or parks for their entertainment about San Juan, and their supply was taken up for consideration. The occasion of the ratification by the Senate of the treaty with Spain was seized as an opportunity for cultivating a spirit of patriotism, as was the anniversary of Washington's birthday, by the gathering of the schools, with their flags, with music and speeches. On the 22d of February there was a popular assembly, with attractive exercises, which filled the theater, the largest audience room in the city of San Juan, and in the evening the hall of the Athenæum was filled, by card invitation, with an audience of the élite. The music was patriotic and the speaking of a high order and filled with the most patriotic sentiment. The purposes and possibilities of the association were so commendable that the gift of \$1,500 was made to the society for its expenses. Important questions touching the improvement of education in various ways were discussed by the executive committee. The establishment of evening schools and other means of instructing adults, such as the introduction of lectures with stereopticon illustrations, especially on subjects relating to American customs and conditions, were discussed. A member gave the money necessary to buy the required stereopticon outfit, but after a limited period the partisan spirit began to show itself, and those on one side of the line manifested less interest and began to withdraw, leaving what the society undertook to do to those on the other side of the political line, which soon would represent the action of the society to the public as partisan. Strangely enough, in one of the efforts of the society to give the schools an opportunity to express and cultivate patriotic sentiments, as mentioned above, the Aguinaldo spirit—the spirit to rule or ruin—began to show itself. There was a band of boys in the orphan school which played with considerable acceptance to the public. This school at the time was under the control of the secretary of the state, and the attendance of the band was solicited of him, when he declared “no band should participate in the occasion while under his control.”

But the people, on the other hand, were very responsive to the efforts to cultivate the American spirit—loyalty to the American flag and what it symbolizes. The society considered the subject of night schools for adults, and for a time I gave the subject special attention. The number of Americans coming into the cities was constantly increasing, and there was a growing demand for the use of English terms in the retail trade. There had been one night school, so called, sustained at the expense of the city of San Juan. The teacher was a man of superior character, but the means at his control for meeting the public demand were utterly inadequate. Every voluntary effort was encouraged. The so-called Economic Society, which for over eighty years had sought to promote the advancement of the people in various directions, furnished rooms free for instruction. Mr. Swenssen, a student from Illinois, occupied his entire time in teaching pupils for pay. Professor Myers, formerly connected with the Institute of Technology in Boston, did efficient service and reported that there were over 600 applications for night instruction. I sought to bring all efforts into harmony. Volunteer teachers were invited. A considerable number of soldiers offered their services. The dictionary and grammar, to which many thought to turn to learn the use of language, were in a measure discarded; the word method of instruction was advised, and instead of urging the study of the science of language and the translation and definition of tens of thousands of English words, the attempt was made to select a definite vocabulary of a few hundred words most used in each of the several trades, such as dry goods, groceries, etc., and to drill in their pronunciation, meaning, and use in the forms of speech used by merchants. The

members of the society and many others heartily approved the plan. Considerable work was done, but there was a lack of public funds and the difficulty of raising sufficient money from private sources was too great, and so the systematic organization to meet the situation was given up.

THE AMERICAN LIBRARY.

Many called attention to the absence of sources of information in regard to United States history, persons, and events. The society considered the importance of the collection of American books, in which there could be found the record of the settlement and development of the Republic; where could be studied the character of American people, their sentiments and activity, their progress and legislation, the administration of laws, judgments of courts, the development of industry and commerce, the advancement of science, the triumphs of literature and art and patriotism, and the unfolding of American life—national and personal—in its manifold manifestations. The general commanding and Secretary Carbonell united in approving the plan of founding an American library, where should be collected all books, pamphlets, and pictures concerning the States, which should be made available for the people of the island. The library should be located in San Juan, but branches established in each of the several municipalities and a system of exchange arranged between each branch and the center, so that these sources of information could be brought within the reach of the most distant localities on the island. Familiar with the publication of reports at Washington, I was sure that a considerable supply could be secured at once. Accordingly, I addressed L. C. Ferrell, esq., superintendent of the distribution of documents, and others connected with the several departments, and in a short time several thousand public documents arrived free in the due course of mail. The following printed circular was also sent:

WAR DEPARTMENT, DEPARTMENT OF PORTO RICO,
San Juan, January 19, 1899.

MY DEAR SIR: With the approval and desire of the authorities an American library is to be established in San Juan, administered under the department of public instruction, on the plan of New York State Library, for the entire island. The books will be loaned to the different cities for a definite number of weeks, according to their population.

The documentary history of the United States will be furnished by the National Government at Washington. All departments and bureaus are invited to forward their current publications, and all publishers are invited to furnish one copy of each publication, including magazines.

There will be a reading room for the daily use of citizens and soldiers. All books and periodicals addressed to Gen. Guy V. Henry, care A. S. Kimball, quartermaster, New York City, will be forwarded free on Government transports.

I am sure you will wish to contribute to this important agency to aid the million of Porto Ricans in their effort to come into a knowledge and love of the institutions of the United States, and I address you with the hope that you will send us a copy of each of your publications at present on the market.

Very respectfully,

JOHN EATON,
Director of Public Instruction.

There were many gratifying responses, but publishers did not seize the opportunity with special avidity. The organization and growth of the library would naturally have fallen into various departments under the head of law, sanitation, education, etc. The pedagogical development was the most satisfactory. Very soon this department of the collection equaled that to be found in the control of State superintendents of instruction in a considerable number of the States. An illustration of the difficulty experienced in giving effect to entirely new ideas occurred in connection with the furnishing of cases for the library. The custom had prevailed of installing books on shelves which could be reached in part only by a ladder so as to fill the higher space assigned to the library. No one knew anything of the stack system.

In ordering the cases, however, I explained that system and showed that no shelf for books should be above easy and natural reach. The architect of public works, who had charge of public buildings, was accomplished in all departments of construction with which he was familiar. He gave the directions for shelving to a subordinate, and when the book cases appeared they were of the old type, tall and massive, requiring a ladder for the use of books on the upper shelves. When Secretary Degeteau was installed he desired that his exalted idea of the possibilities of a pedagogical museum should be realized if possible.

The objects of the museum, as stated by him, are (1) the exposition of projects and plans for educational buildings, of samples of school furniture and school supplies, of scientific apparatus, material to be used for object lessons, gifts of Froebel, pictures, photographs, drawings, and paintings, and all other aids that are used at present to develop physical, moral, and artistic education in modern centers; (2) the organization of lectures about all questions relating to pedagogical questions and work; (3) the organization of a circulating library specially devoted to pedagogical matters, although it would also contain the works regarding general culture in order to facilitate the progress of education, lending books with the necessary trusts to the teachers, municipalities, and every one interested in its development; (4) the collection of all the material of education which not being of daily use in every school and too costly to be possessed by every teacher, can be lent by the museum to the different schools; (5) the publication of bulletins regarding the progress of education, and explanatory catalogues of books and pedagogical materials; (6) the organization of scholar excursions during vacations from the country to the sea towns and vice versa, and from the island to the States and vice versa; (7) the organization by correspondence of interstate fraternities to facilitate the study of languages, especially among those in Porto Rico who are engaged in the study of English and those in the States who study Spanish; (8) to furnish the authorities all information required about pedagogical matters.

Thus the museum would aim at accomplishing much provided for in part officially and in part by voluntary effort. The largeness of the scheme was equal to the demands of a great nation.

When charged with the execution of the plan, I naturally associated it with the American library.

INSTRUCTION IN ART.

In connection with the effort for night schools and instruction of adults, Mr. Oller, an artist of considerable repute, began to instruct in one of the public halls young ladies of standing who sought to improve themselves in drawing and painting. He had painted the portrait of the King of Spain and other pictures of considerable merit. There were belonging to the government a number of pictures, some of them of large size and impressive in character, which had been installed in halls and other out of the way places in part. These he was encouraged to bring together and install appropriately in a hall of considerable size, where they could be seen by visitors. He added some of his own pictures. He instructed his classes in the same room, which adjoined the rooms of the library and museum, and thus, naturally, the art school and collection supplied appropriately an additional means of public entertainment and instruction. Distinguished strangers inspected the school and collection with pleasure; among them may be named Secretary Alger and the insular commission. When General Henry resigned, and the citizens wished to testify their respect and sense of loss, they raised the required funds and ordered his portrait painted by Mr. Oller for the art gallery. A copy was also presented to Mrs. Henry. This school and its collection furnish an interesting suggestion of the appreciation of art possibilities among these people. Embroidery and lace-making are common. Even the prisoners are adepts in making artificial flowers. A teacher writing of her

early experiences in preparing to teach sloyd, says: "I teach drawing only just now. Some of my pupils are real little geniuses in art." Good home-made lace will be found adorning chambers where cleanliness is neglected.

EDUCATIONAL POLICY ADOPTED.

Naturally while keeping in view American principles and methods of education in its broadest sense, we sought their adoption by the hearty choice of the people. It would be difficult, in a few words, to describe how deeply the changes entered into the general and personal life of the people on the island. There were before us numerous lessons from ancient and modern history; the rise and fall of every nation told its story in the change of peoples from the use of certain customs and languages to others. In more modern times the dismemberment of Poland, the transfer of Canada from France to England, of parts of Mexico to the United States, of a portion of France to Germany. Then, too, the colonial experiences of Holland and England were full of instruction. Any reasonable view of the past enforced the conviction that the method adopted should be dictated by common sense on the alert to appreciate and meet every condition as it unfolded itself; facts should not be forced into any preconceived theories, but they should be studied and theories fitted to them. A great ruler reveals his greatness by his cultivation of the aspirations of his people. The rule of this people by Spain was one both of suppression and oppression. Whatever aspirations were permitted were toward Spain. A narrow way up to a few honors doled out by Spain was offered to the teacher, the lawyer, the doctor, the engineer. All occupations and profits, however small, were made to bear in the same direction. The changes in school policy must recognize all other modifications taking place in the body politic. The attendance upon schools would be affected by the condition of roads. Expenditures must be regulated by income. Nothing must be overlooked. Inadequacy of means, unfitness of methods, the untold perversions of the past met one in every direction. We must go neither too slow nor too fast. The future must be better than the past. The steady pressure in all directions of our American methods toward American ends, gaining in a degree the confidence and cooperation of the great majority of all concerned, was constantly uppermost, meantime using all sources of information to aid in revising the entire scheme of education.

HOLIDAYS AND VACATIONS.

Few would be prepared to appreciate the difficulties connected with the question of holidays and vacations. Shall the school year correspond to the calendar or financial year? The financial year began the 1st of July, the school year was often spoken of as continuous. Teachers were supposed to be paid monthly twelve months in the year, and to teach uninterruptedly six days in a week every week in the year, excepting holidays. These were mostly saints' days. The question, therefore, of vacations was seen to have its relation to religious belief. Holidays were numerous, but no one was prepared to give the number. The minister of justice, by the command of General Henry, named as holidays New Year's, the 22d of February, Good Friday, Christmas day, and the day named by the President for national thanksgiving, and the 4th of July. School holidays and vacation were brought in a measure into accord with this order. Some teachers had had a vacation of a month for July or August. Others had taught only a half a day, six days in the week, during those months. It was at first decided that school should be taught five and a half days during the week, attendance not being required on Saturday afternoon, and later five days each week; that the school year close with the financial year and begin with the 1st of October, or the twelfth Monday before Christmas week, and the winter term the twelfth Monday before Holy Week, and the spring term Monday after Holy Week. The question of summer vacation proved much more serious. Not a few

parents in the cities looked upon the schools as nurseries where the teachers kept the children from the street and saw that no harm came to them; but this could hardly be regarded as a sufficient pedagogical reason to warrant the regulation of vacation.

Physicians and sanitarians were asked if there were any conditions relating to health furnishing reasons why the children of Porto Rico should not have a longer vacation in the summer, and the universal answer was that there were none. Some pointed out that there were considerations of health why schools should not be taught in the rainy season. Recalling the fact that the larger proportion of children reside in the country districts where roads, if there are any, are poor, and where children often have to cross swollen streams dangerous to life, it was considered better that there should be no attempt at school during those months in those regions, and that the quality of those schools should be improved during the time taught.

The purpose to retain the native teachers as far as possible, together with the importance that these teachers should have an opportunity to devote themselves to improving their knowledge of modern pedagogical principles and methods, rendered a vacation desirable for them.

After taking into view these and other considerations it was decided that the year time of service required of teachers paid from the general or insular treasury should be nine months, and that they should be paid at the end of each month. There was no prohibition against teaching school the other months—July, August, and September. Municipalities, if they chose, could continue the schools as formerly during the summer vacation, and teachers could teach for tuition also so far as not incompatible with the efforts that might be required by the bureau of education for their self-improvement. This was the most trying to the teachers of all the new provisions. Few teachers had been able to lay up money. Those who had no accumulated savings did not see how they could pay their expenses for the three months of summer vacation. In order to relieve them as far as possible it was authorized that \$15 per month should be advanced each of the three months' vacation from the annual salaries to those teachers needing it.

SCHOOLS TO BE FREE.

Teachers from time immemorial have been allowed to supplement the salaries paid by the public with a collection of fees from those pupils whose parents were able to pay. This drew a line between the rich and the poor, likely to be most injurious in its consequences. Pupils recognized it. One class was in danger of asserting its superiority and the other of cultivating the resentments and jealousies natural under such circumstances; thus there was danger of cultivating in childhood a class feeling which might be fraught with dangerous consequences to society and the state in the future.

There was no purpose to deprive the teacher of the privilege of giving lessons for pay out of the school hours, or to hinder the people who had means in employing private instruction, but it was recognized that the principle was fundamental, that the time paid for by the public money should be devoted by the teacher unreservedly and equally in the hours required to all pupils under his instruction. A few teachers whose popularity had added greatly to the number of their pupils saw in the abolition of fees no small reduction of their income, but most of them acknowledged the rightness of the principle and gave hearty support to its application.

SEPARATION OF SCHOOL LIFE FROM FAMILY LIFE.

The custom of the teacher having his residence in the same building with his school, and sometimes using the same rooms, had a strong hold on the minds of teachers and some communities. It was difficult for them to see the harm of this mingling of the family life with that of the school. Great pressure was brought upon

General Davis to get him to revoke this provision, until with Dr. Clark he visited in person one of the schools in San Juan and saw for himself the harm of uniting school life and family life, and gave the provision his emphatic indorsement. In many cases the teacher subordinated his school entirely to his other or domestic demands. A trustworthy visitor states that he visited school during hours and found the teacher in bed taking a siesta; other teachers were away attending store; in another case we found a teacher who was running a rum shop. Teachers went about the schoolroom in untidy and insufficient attire, and the demands of neighborhood callers upon the time of the teacher left her less than the required amount of time for instructing pupils.

Through the English supervisors each building is now inspected, and rural schools are housed entirely apart from the residences. In towns and villages, so far as possible, the schools are grouped into one building and a very simple system of gradation is attempted. In many instances a town does not contain a building large enough to afford two or three schoolrooms under the same roof, and in these cases the schools have to remain separate.

TEACHING ENGLISH IN PUBLIC SCHOOLS.

The absence of the English language furnished the greatest difficulty in the way of those who wished to become American in thought, belief, and loyalty. How should English be introduced with the least friction? The imagination is likely to magnify greatly the difficulty of a child's learning any other than its native tongue. The way children learn their own language may be called the natural method. A simple text-book with appropriate lessons, pictures, words, and sentences is selected, and the child goes forward from lesson to lesson by easy stages. In Porto Rico it was important that the learning of English should as far as possible be divested of imaginary objections in the minds of the teachers of the public schools. The 10,000 copies of Appleton's First Reader ordered were considerably delayed in coming. Every Saturday I had been meeting the teachers in San Juan an hour, enforcing a few important simple methods in regulating the schools. The Saturday after the arrival of the First Readers I took with me a sufficient number to supply a copy to each teacher. And beginning with the first lesson, which is wholly in English—a picture of a cat and a few simple words—I began to drill them as beginners. They at once mastered the lesson, and we went on from lesson to lesson through the hour, when they found they had begun to learn English, and no bugbear had turned up as expected. From that time they went forward giving the lessons to their respective schools. In some cases the pupils learned faster than their teachers. Some teachers employed private instructors and specially prepared themselves in each lesson before giving it to their schools. The people of wealth could employ instructors in English at will. The question of its introduction into the public schools was mainly of importance to those who had not the means of doing as they chose in providing for the instruction of their own families, or, in other words, those who were entirely dependent on the public schools for education. It was clearly their right to demand that these schools should furnish them the privilege of learning English, upon which so much of their future depended. It was remembered that German had been extensively introduced into the city schools in the States by putting a German text-book in the hands of the pupils who should give it the prescribed attention under the direction of the regular teacher, who spoke only English, and an expert in German should visit the schools once or twice a week, as prescribed, and see that the German was correctly pronounced and written. The instructive expedient of Jacotot was recalled. Native teachers and pupils used Spanish. They all, teachers and pupils, were together beginners in English. What could be better than the natural method of acquiring the new language? Objections to a new language were expected. One might say: "I heard the first words from my mother's lips in Spanish. I breathed the first

words of tenderness to my love in Spanish. Would you have me forget my mother tongue?" The answer was: "By no means. The American plan would teach a better Castilian than you were taught, but it would also teach English as opening the greatest door of opportunity to the rising generation."

SUPERVISORS OF ENGLISH.

When the commanding general, therefore, had so far advanced in the knowledge and control of affairs as to find the general or insular treasury receiving sufficient money to warrant expenditure, the island was divided into sixteen parts, and a supervisor of English, native to the language, was employed at \$50 a month for twelve months of the year to visit each school as frequently as the number would permit and to see that English was correctly pronounced and written. This was an aid both to the pupils and the regular teachers. No native teachers were removed; their fear of loss of place disappeared; they foresaw that in the nature of things they would be expected to teach English themselves some time in the future and many of them specially appreciated this opportunity to gain a knowledge of it themselves.

UNITED STATES FLAGS AND PATRIOTIC SONGS.

Col. A. C. Blakewell, of the Lafayette Post of the Grand Army of the Republic of New York, had visited the island and had commenced to supply the United States flags to every school, together with directions in English for saluting the flag. The exercise interested both teachers and scholars. Later a flag for every school was supplied.

No singing was found in the schools, but patriotic songs in English were introduced as far as possible, the teachers in many instances copying the words and the music for their schools, as no appropriate text-books were to be had. The interest was so great that shortly a visitor from the States calling at a school would be surprised by a reasonably good recitation in English reading and the salutation of the flag in English, together with the singing of "America."

Meantime Spanish was taught as efficiently as in the past, and teachers, pupils, and the public saw how the attention to the two languages would harmonize, and it was apparent that the fear of losing the Spanish was groundless and more and more the advantage of knowing English became manifest. Moreover the regular teachers saw that its introduction, instead of displacing them or in any way operating against their interest, was altogether to their advantage. And thus the question was settled in a way to win popular approval instead of disapproval and resistance.

UNITED STATES MAPS.

Another step added interest to the language. Many of the schools had on their walls fair collections of maps, especially maps of Spain and of Porto Rico; but as a rule no separate map of the United States. I therefore addressed a request to Hon. W. T. Harris, United States Commissioner of Education, for a gift from the Land Office through the Interior Department of a supply of maps made by that Bureau of the United States. Fortunately 250 maps were spared at once and distributed as rapidly as possible to the schools, and later a supply came sufficient for every school. This map impressed both teachers and pupils with new ideas of the United States. Many considerations united to quicken an interest in its study; naturally they used English terms, names, etc. Teachers began to talk about American events; some teachers took pains to carefully study and write out an outline history of the United States and to include it in oral instruction to their schools. Pictures of distinguished Americans—Washington, Grant, McKinley—and of American scenes and events were recommended for installation on the walls of the schools.

Into all of these plans the supervisors of English were expected to enter with the utmost tact and enthusiasm.

The following letter was addressed to the supervisors:

SAN JUAN, *May 13, 1899.*

MY DEAR SIR: Supervising the teaching of English in Porto Rico, which you now undertake, is one of the most important duties of the hour. Porto Ricans manifest a great interest in the subject, and the eye of the United States is upon it. You start with a small book in your hand, but in it are the greatest possibilities, warranting the concentration of all your powers and the utmost singleness of purpose. You should spare no thought, you should omit no preparation, in order to do it well. You are not to remove or disparage Spanish, for four hundred years the language of this people, in the use of which their ancestors lived and died and recorded their history. But you are to teach the reading and writing of English, and you are selected because it is believed you can do it correctly. You do not displace other teachers. They are paid from the municipal treasuries, and you are paid from the State treasury. You do not come to disparage or antagonize their work; but you go to them as their special friend, to aid them in making the changes which the new conditions require. In the ocean currents which swell around Porto Rico the island has always been continually nearer America than Europe. Now the currents of history have swept around the people and separated them from Europe and united them to the United States, the most powerful nation on the American continent, to a people enjoying the largest liberty of any in the world—not license to do evil, to harm others, but liberty regulated by law, in which there is found the largest good for the greatest number. Porto Ricans are Americans. The rich can buy what they desire, but those without money or wealth are dependent upon the opportunities which the law assures them. Their possibilities, not assured by their possessions, are to be found in their natural endowments and in their knowledge and power to use them for their own advantage and the benefit of the public. The school system, common and equal for all, is their only hope for gaining the training by which they can fully enter into the enjoyment of their new privileges. To them, the gaining of the knowledge of English is the medium through which they will become acquainted with the principles of American liberty, with American affairs, American commerce and trade, and thereby share in their benefits. All that they expect from their new relations must come to them through the English language, in which are to be found American history, literature, art, science, statesmanship, and in the use of which they are to enter into industrial and commercial relations with the business of the States and take a share in their civil administration. This great boon you carry to them in the little reader in your hands. Your duties should be discharged with the utmost devotion to principle and with the most winning tact; not only be in truth the friend of teachers, pupils, parents, and people, but show them by your acts and manners that you are such. Help them to see that you come to serve and benefit them all. Familiarize yourself with the principles of the American Constitution, and be sure that your official conduct is guided by them. Do not indulge in fault-finding.

Remember that "the joys of victory are the joys of man," and so try to assure the success of teachers and pupils that they may share in these joys. Be sure that your example is worthy to be followed in all things. "Peace hath her victories no less renowned than war." May you add a conspicuous illustration to the truth of this saying by fidelity and success in the discharge of your important duties.

Sincerely yours,

JOHN EATON, *Director, etc.*

This letter indicates the view taken of their appointment. The supervision thus introduced was full of possibilities which have since been disclosing themselves with the approval of all who are interested in the progress of education. As their duties were increased, increased qualifications were required and larger pay was provided. The information gained through the supervisors was specially helpful in the revision of school provisions. Their present duties may be stated as follows:

1. To visit each school of their district at least once a month, rendering a report upon Government blanks under the following heads:

- (a) Enrollment.
- (b) Teachers.
- (c) Books and supplies.
- (d) School buildings and grounds.
- (e) School programme.
- (f) Progress in studies.

And a special examination and report wherever a school is supposed to have fallen below grade.

2. To distribute the salary checks to public-school teachers, cashing them, when necessary, at the nearest bank in town. This is rendered necessary on account of the poor exchange facilities of the island.
3. To act as advisory members of the local school boards.
4. To secure proper buildings for public-school purposes.
5. To distribute and keep account of text-books and school supplies owned by the insular government.
6. To hold teachers' meetings and to give instruction in English in rural schools.
7. To preside at the quarterly written examinations for teachers, held at the heads of their respective districts.

All of the supervisors are of American or English parentage, and are familiar with the American school system. Of the 16 supervisors, 10 are college graduates, 2 are normal-school graduates, and the others are graduates of public schools and high schools of standing.

SCHOOL FINANCES.

The difficulties in finding out about school revenues and expenditures multiplied to the point of amusement. It was apparent that education, its administration, and its attempt to supply higher instruction had been sustained from the insular treasury and that instruction in the municipalities had been compensated from municipal revenues, but I could find no principle of equity regulating the assessment or the expenditure of revenues for educational purposes either on the part of the insular treasury or that of the municipalities. I shall never forget the din of the cry of poverty that came up from all quarters at first. There was no money for supervisors, no money for night schools, no money for text-books. Every improvement required money, and the universal cry was "There is none." The general commanding, in studying the general question of taxation, had found many opportunities to relieve the burdens of the citizens. Spain apparently had placed the burdens heavily upon individuals and their enterprises, and lightly upon accumulated wealth. The American method had sought to equalize the burden and give enterprise a chance. Great complaints were still made against the tariff, and yet on many articles it had been greatly reduced, in many cases one-half. The power of taxation in municipalities had been so abused as in cases to come near confiscation. The enforcement of honesty and economy was followed by salutary results. By degrees funds in the insular treasury increased beyond expenditure, and the limitation on local taxation had reduced the income of municipalities; indeed, the extreme poverty in out-of-the-way barrios or districts can hardly be believed. Some are reported not to have a single house—only palm-leaf huts, where there are not a dozen people whose average income is 60 cents a day; where the large majority have an income of less than 20 cents a day. The children live largely in nakedness. The cry of poverty from such a condition has significance. Partisan alertness never sleeps. The increase of insular funds afforded the opportunity to suggest that from the 1st of July next the expenditures for schools by the municipalities should hereafter be borne by the treasury of the island. Immediately various municipalities began to join in this demand. The significance of the change thus suggested will be seen from the following statement:

The municipal boards of education, according to the last statement, expended—

First. For the salaries of teachers of elementary, auxiliary, rural, and superior schools	\$224, 507. 00
Second. For materials for embroidery	3, 482. 00
Third. Text-books for the poor.....	11, 010. 00
Fourth. Writing materials and gifts to meritorious teachers.....	11, 726. 00
Fifth. Rewards to pupils	3, 512. 75
Sixth. Rent of buildings.....	55, 678. 00
All in Porto Rican money.	

The danger lying in this suggestion is apparent. The assumption of the entire school expense by the insular government involves a violation of the principle fundamental to the improvement of the schools in any community. Any locality to have a proper interest in its own affairs, its own schools, must have some direct responsibility for them. The best results the world over, it may be said, are secured by the wisest adjustment of general to local action. Here the best results will be secured by the wisest cooperation of municipal and insular efforts. The more the cities do for their own schools the more interest they will have in their improvement. Carefully considering the facts, weighing the above suggestion and my protest, calling to mind the fundamental principle imperiled, the commanding general ordered that the municipalities should continue to bear the expenses of supplying quarters, first for the schools and second for the teachers, and on this basis the adjustment of the schools for the following year was made.

As the new year advanced, General Davis issued an order levying a male poll tax of \$1 for school purposes. This will give everyone who pays a dollar a sense of sharing in the education of the children, and it is hoped that this tax is here, as it is to be elsewhere, one of the most acceptable burdens of the Government.

SCHOOL STATISTICS.

There will be special interest in preserving the last official statements of the municipal schools as I found them under Spanish direction, and they are herewith added:

SUMMARY.

Superior schools:	
Boys	7
Girls	4
First elementary schools:	
Boys	48
Girls	38
Second elementary schools:	
Boys	55
Girls	59
Auxiliary schools:	
Boys	52
Girls	34
Rural auxiliary schools:	
Boys	223
Girls	5
Total schools	<u>525</u>
Rent for all school buildings	\$55,678.00
Expenses:	
For embroidery materials	3,482.00
For books	11,010.00
For writing utensils and gifts to teachers	11,726.00
For rewards for pupils	3,512.75
For teachers' salaries	224,507.00
Total expenses	<u>309,915.75</u>

REGISTERED SCHOLARS.

Boys	16,821
Girls	8,794
Total	<u>25,615</u>
Average attendance:	
Boys	11,406
Girls	6,600
Total	<u>18,006</u>

PRIVATE INSTRUCTION.

First elementary schools:		
For boys.....	1

A report for the following year, 1898-99, made for the English supervisors gives the following résumé:

RÉSUMÉ.

Total population	889,768
Number of town schools	212
Number of barrios with schools	294
Number of barrios without schools	426
Number of boys from 4 to 16 years of age	161,246
Number of girls from 4 to 16 years of age	144,166
Number of boys registered	19,804
Number of girls registered	9,388
Number of boys attending	15,084
Number of girls attending	7,411
Salaries of teachers (in gold)	\$149,971.40
House rent (in gold)	\$33,323.00
School supplies (in gold)	\$23,716.60
Total children of school age	305,412
Total accommodated in present school	29,192
Total without school accommodations	276,220
Total expenditure (not including fees)	\$207,011.00
Total expenditure per pupil enrolled	\$7.09
Total expenditure per pupil attending	\$8.05

By this résumé it appears that less than one child in ten of school age was enrolled in school.

HIGHER EDUCATION.

As already indicated, this came directly under the insular administration and was paid from the insular treasury. For some time there had been in operation an industrial school and a normal school for boys and girls and a collegiate institute. The industrial school was not in operation during the year, on account of the lack of funds, and the valuable plant has since been destroyed by fire, with all of its equipment.

When I arrived, the collegiate institute was in the process of removal from the building it had occupied for a considerable time in the city of San Juan, to the building which the Fathers had occupied with a school of higher instruction in Santurce. The normal school for boys had been abolished, and joined with the institute. The institute had hardly been established in its new quarters when it was discovered that the lease granting occupation of the building in Santurce to the Fathers for their use had not terminated. With the usual regard under the United States Constitution for the fulfillment of legitimate contracts, or, as termed in this case, chartered rights, an order was issued for the restoration to the Fathers of their former quarters for use until the termination of their right. This continued the disturbed conditions, and cost me special effort. No appropriate building could be secured for the institute immediately, but quarters for the various classes were obtained. The director took little pains to aid in minimizing the inconveniences. I had found in connection with the elementary schools of the island more than it is possible for me to accomplish. Various parties boasted greatly of the institute. I found that several of the learned and best men of the island were connected with it and hoped that they would aid in bringing about the needful changes; but, on the other hand, there were from a variety of sources repeated reports unfavorable to the work of the institute. On my invitation, eminent Americans familiar with education visited the institute, observed its work, and gathered facts about it and reported them to me. All of them were very unfavorable. This was specially true while the institute was in its ample quarters at Santurce. When I could no longer omit

attention to it I recommended to the commanding general that a commission of four gentlemen—two eminent Americans and two eminent Porto Ricans, all having considerable knowledge of education—be appointed to consider and report upon the industrial school, the normal school for girls, and the institute. There were about 60 students reported in attendance upon the institute. The course embraced five years. The first year included Latin, Castilian, and geography; the second year, United States history, Latin, and Castilian; third year, arithmetic, algebra, universal history, and rhetoric; fourth year, geometry, psychology, logic, and ethics; fifth year, physics, chemistry, natural history, and agriculture. French and German were optional. English had been introduced. Those who passed a successful examination were entitled to the degree of bachelor. The institute opened October 1, and closed May 31. Ample provision was made for fees in different directions. The law provided that private institutions could enter into definite relations with the institute. Students who didn't wish to attend classes daily could matriculate and study at home and pass examination as required. In addition to all fees it was found the institute cost the island treasury annually 26,780 pesos. As I have said, some of the most learned men on the island were employed as instructors, and some were well qualified for the work they were performing, and fully in accord with the American spirit which had taken possession of the island; but on the whole the institute was pronounced an unwarranted expense. Its theory required no use of text-books. Much was said about the use of the seminary method. Nothing in particular was known about the students by the director personally. The go-as-you-please spirit prevailed, excepting as to the compliance with forms. Neither the method of instruction nor discipline was adapted to the age of the students, many of whom entered before they were in their teens. It was not only costly but it was a bad example so far as its influence extended over the island. In spite of some of its worthy teachers, the Aguinaldo spirit had the control of its direction. The commission appointed went fully into the facts and recommended the abolition of the institute and the normal school for girls, and both were ordered suspended from June, 1899, by General Henry, commanding. The director of the institute, foreseeing the result, resigned, and occupied himself in issuing a pamphlet of some 28 pages, filled with an attempted exhibition of pedagogical learning, containing misstatements and contradictions; the whole aimed against the incoming of American changes.

The school under the care of the Fathers had not only the benefit of the building, but a considerable subsidy. The Fathers whom I met were able men and endeavored to take the whole situation philosophically, but found little response to great learning and advanced scholarship.

The valuable apparatus which at different times had been purchased for the institute indicated a lack of skill in its selection. It was not adapted to the laboratory work for which the pupils were prepared. There was connected with the institute a library of considerable value. When it was closed, every effort was made to preserve the books and apparatus for further use, whenever the progress of scholarship among the youth of the island may make their intelligent use possible.

The normal school for girls was presided over by a lady of excellence, with whom was associated a corps of worthy assistants, and there was claimed to be associated a model school; but the practicing methods were wanting and the general plans of operations were not in accord with the principles required by the times, and the attendance from the entire island was only about 50.

NEW SCHOOL PROVISIONS.

Experience in the office, facts from every quarter of the island, and the urgency of the commanding general united in demanding a general revision of the provisions for schools. Fortunately, if mistakes were made in adopting new provisions, the entire situation was under military authority and any mistake could be promptly

remedied by a military order. Old as the local civilization was, as far back as many forms of action might date, changes came rapidly and often unanticipated. The considerations brought into view must be most comprehensive, but with a right aim pervading all the plans formed, it was hoped that even mistakes might make gain for the public good. Necessarily, one of the first inquiries was for the means—the money with which to meet expenses. The withdrawal of municipalities from the payment of teachers and their payment from the insular treasury completely changed the financial situation. The safest figures obtainable from the past, as already seen, indicated that no attempt had been made to provide education for more than one in five of the school population of the island. All considerations united to emphasize a conclusion that a less adequate provision was not permissible under United States authority. The general decision was reached that the municipality must continue to meet the expense of furnishing, first, quarters for the schools; second, residences for the teachers, and that the insular treasury would pay the salaries of teachers and the expense incurred in furnishing text-books. So much in general decided, the revision commenced.

It was painful to provide a plan for the schools which should leave out of consideration four-fifths of the children due to school. Every feature of the public welfare looked to public instruction for aid in a solution of its difficulties. As has already been made apparent, there was no equitable valuation of property and no definite assurance of income; indeed the financial possibilities could only be a matter of estimate. The money anticipated could only come into the treasury as time proceeded, and yet the contracts for teachers must be definitely made at the start. An increasing number of teachers must be drawn from the States, and they could not think of undertaking the work with a contract for less than a school year. Beset with these embarrassments, the preparation of provisions went forward.

These new provisions were to go into effect the 1st of July. All schools supported by public taxation, either local or insular, were styled public schools, and admission to them was to be free and without charge to all children between the ages of 6 and 18. Teachers were forbidden to accept fees for instruction in these schools during school hours. Pupils might be excluded from the public schools for bad moral character, insubordination, or exposure to infectious diseases. It was provided (1) that a legal school day shall consist of two sessions of three hours each, (2) a school week of five days, (3) a school month of four school weeks, (4) a school term of three school months, (5) a school year of three terms, the winter term beginning the twelfth Monday before Holy Week, the spring term beginning the Monday after Holy Week, and the fall term beginning the twelfth Monday before Christmas week. Schools were classified as rural and graded. Rural schools had been attended chiefly by boys, and it was provided that children of both sexes could attend, thus supplying instruction to girls where the local sentiment of parents permitted. There was great sensitiveness on the subject of coeducation of the sexes even in the earliest years of attendance, and it was thought this provision, under careful administration, would produce the best results. The average number fixed for the teacher was to be 50. Schools at first could only be of the most elementary character, but were to be carefully graded where the conditions warranted, and where there were four or more grades the principal teacher was to exercise supervising functions over all the grades of the school, and was to be known as principal of the graded school and paid accordingly.

Careful classification, it was believed, would greatly add to efficiency. The inadequate supply of schools rendered it important that every seat should be occupied, and it was provided that the seat of any pupil absent more than two weeks except for sickness should be given to another applicant. The total lack of buildings erected on pedagogical principles and adapted to the purpose rendered the provision of rooms by rental impossible, and as the only alternative it was provided, in order to assure suffi-

cient space, that school rooms furnished by municipalities should contain as a minimum $1\frac{1}{2}$ square meters of floor area for every pupil seated in the room. This was especially necessary, because often pupils were crowded together in the most inconvenient manner, with no space for seats or in which to move about in any orderly manner. Of course, in the construction of the building rented no proper regard had been had to the requirement of a school for the incoming of fresh air or light. Under old provisions school attendance was termed compulsory for the ages from 6 to 9, but the instruction furnished left four-fifths of the children of these ages out of consideration. It was deemed wise, therefore, in view of the great demand for schools, that the legal school age should be 6 to 18, so that between these ages there might be a chance for as many as possible to enjoy a period of attendance, even though limited. The improved school provisions required so many and so great changes that many details were specified which otherwise could have been left to the discretion of teachers. In all of these changes it was felt to be important to keep constantly in mind the expectations of the prevailing educational sentiment in the States, as well as the aspirations of the people of the island. Everything good was to be retained and improved, and only changes were to be made where there was a reasonable ground for something better. All requirements must commend themselves to the approval of orders from Washington, while their success must depend upon their fitness to the conditions and sentiments of the people to enjoy their benefit. Theories must be kept sufficiently in mind, not to disappoint, but to encourage aspirations. One of these aspirations, much talked about in the island, was the possibility of a university; while it was well known that in the States the greatest value would be placed upon the introduction of those pedagogical features which would yield the greatest results to the largest number, especially give thorough training in the elements of industry and in the elements of learning, language, English and Spanish, arithmetic, geography. In the States it would be expected that promotion, step by step, would be by attainment, careful preparation in each grade for advancement to the next, and although the instruction in the island is of the most elementary character and there is no adequate preparation, and will not be for some time, to use to advantage university opportunities, it was deemed important that the gradation provided should make known to the people the several steps up to university work, but specify and include the possibility of that work. In the place of the institute which, as hereinbefore stated, had been found unworthy and abolished it was considered important that instead of a single institution in the capital, maintained at the expense of the entire island, whose benefits were enjoyed by a limited number from the distant parts of the island, a way should be specified by which the advantages of the several grades up could be secured to a large number of municipalities if the local sentiment required and money could be secured for the purpose. It was therefore ordered that wherever a municipality petitioned for a school of the high-school grade, and furnished a site and not less than \$10,000 for the erection and furnishing of a building, a high school, with graded schools, shall be provided by the insular government, with courses preparing for an American college or university, with additional courses in graded manual training and for the special preparation of teachers. Provision for the qualification of teachers in these schools was carefully specified. Special subjects were to be taught, such as sloyd and mechanical drawing, as in the States. Whenever Porto Ricans possessed qualifications equal to those of other candidates they were to be preferred in appointment. Every well-informed person felt especially the need of providing training for teachers. It was therefore ordered that beginning with the fall term of 1899, or as soon thereafter as possible, a normal school should be opened. Towns were permitted to bid for the school, and it was to be located where the offer made was satisfactory. The insular government is to provide the building, and there is to be a practice school connected with it. This school is to be

regulated, its courses of study provided, and its entire administration to be under the direction of the chief educational authority of the island. Tuition is free to the citizens of the island. Provisions were also made foreshadowing features of university work, with the hope that there might early be a school of commerce, a school of agriculture, a school of mechanics, a school of pharmacy, etc.

COURSE OF STUDY.

The course of study was carefully outlined in detail. It was intended to be specific and leave no room for doubt, but at the same time to allow ample opportunity for the exercise of judgment on the part of the well-qualified teacher.

(a) *Spanish*.—During the first two years reading and writing only shall be taught. During the last four years two periods a week will be devoted to language work in Spanish and Spanish grammar. As soon as the pupil has mastered the first difficulties of reading, his work in this subject shall be so directed as to develop literary taste, and wherever possible complete or abridged literary masterpieces shall be read.

(b) English reading shall begin in the second year, but in town schools chart work shall be begun in English in the first year whenever the teacher has less than three grades. During the last four years English language lessons shall be taught two periods a week, where exact training in composition and the use of correct grammatical forms will be taught through practice. In the last three years two periods a week shall be devoted to United States history and civil government as major subjects. Class work in English must be entirely in that language after the second year.

(c) *Arithmetic*.—Number work during the first two years will be in Spanish and English. For commercial reasons and because of the simple vocabulary required, the arithmetic of the last four years will be taught in English. The metric system will be used, the English tables being placed in the appendix of the text-book for reference. The text-book must contain a Spanish and English vocabulary.

(d) *Geography*.—Oral geography may be taught as a minor subject during the first two years in graded schools where the teacher has not more than three grades under her charge. The text-book will be used during the last four years. Geography shall be taught in Spanish.

5. The minor subjects taught in public schools shall be the following:

(e) *Music*.—Pupils will be required to learn the national airs by ear. Kindergarten motion songs will also be taught in lower grades. Where the teacher is competent to do so, or a supervisor of music is provided, note singing may be taught.

(f) *Drawing*.—Where the teacher is competent to do so, or a supervisor of drawing is provided, drawing may be taught. Clay modeling and stick laying may be associated with drawing wherever practicable, to develop the pupil's sense of form.

(g) *Manual training*.—Where facilities are provided and the teacher's time allows, plain needlework, sewing, and cutting may be taught girls, or sloyd work may be taught pupils of both sexes. Oral lessons in agriculture will be taught as heretofore.

(h) *Writing and spelling*.—Ordinarily writing and spelling will be associated with the major subjects, reading and language work, in the two languages; but where the teacher has not more than three grades, or the time is not otherwise occupied by the major subjects, these subjects may be taught at separate periods.

(i) *Hygiene*.—This subject is required, and must be taught orally in all schools or from charts. In graded schools, where teachers have not more than three grades, a text-book may be used.

(j) *Morals*.—Morals as distinct from secular or religious teaching may be taught orally in schools, with the use of anecdotes.

A course of study has been planned containing four or six years' work, and intended to prepare students for admission to colleges and universities of standing in the United States. This course includes the four years' course in Spanish,

English, algebra, plane and solid geometry, plane trigonometry, chemistry, physics, botany, and physical geography, history, a four years' course in Latin, and a two years' course in Greek.

TEXT-BOOKS.

Closely allied to the course of study was the question of text-books. Pupils were generally without text-books. Text-books had been prescribed by authority; those with sufficient means had been required to purchase them, and those without means were supposed to be supplied by the municipality. But it was rare to find a school fully supplied. A school of 70 scholars might not have half a dozen scholars owning their own text-books. There were rarely either desks or copybooks for writing. Some teachers wrote out with great pains, texts, which the pupil was required to commit to memory. The teacher would read aloud and the pupils be required to repeat after him in unison, and thus in a measure supply the lack of text-books. Anything like quiet study on the part of the pupils was most rare. The text-books so far used had been generally poor in quality of paper and printing and lacking in their conformity to pedagogical principles. It was found that in the trade, in spite of the poverty of the people, exorbitant prices were charged for books. It was decided, therefore, that the Government must not only prescribe the books, but, in order to make sure that the pupils should have the full advantage of the text-books, acquire the habit of using books, and study silently, that the Government would purchase and supply them free to the schools. All books and supplies owned by the municipalities were ordered collected, and provision was made for the purchase and distribution of the text-books required by law. Municipalities were to provide all supplies for schools except text-books, maps, and flags. As has been seen, flags had already been supplied by the Lafayette Post of New York, and a map of the United States by the Secretary of the Interior, through the Land Office and the Bureau of Education. In addition to the regular text-books, the insular office of education provided a considerable list of books of reference for teachers, to be furnished them at cost. All books handled by the insular office of education were to be supplied on contract by the lowest bidder, except where emergency might require purchase without bidding.

LIST OF TEXT-BOOKS.

The text-books ordered by the State for the public schools of the island are as follows:

SPANISH.

McGuffy's Chart. The American Book Company, Washington square, New York.
Libro Primero de Lectura. The American Book Company, Washington square, New York.

Libro Segundo de Lectura. The American Book Company, Washington square, New York.

Primeros Pasos en Literatura. Silver, Burdett & Co., New York.

Primeras Nociones de Lenguage, por Bartlett. Silver, Burdett & Co., New York.

ENGLISH.

Canifix Reading Chart. B. F. Johnson Publishing Company, Richmond, Va.
Appleton's First Reader. The American Book Company, Washington square, New York.

Riverside Primer and Reader. Houghton, Mifflin & Co., Boston, Mass.

Tarbell's Lessons in Language. Ginn & Co., Boston, Mass.

SPANISH AND ENGLISH.

Lecciones en Lenguaje, Español Ingles. The American Book Company, New York.

Geography.—Frye's *Geografía Elemental*. Ginn & Co., Boston, Mass.

Arithmetic.—Wentworth's *Elementary Arithmetic*. Ginn & Co., Boston, Mass.

Music.—*Song Book for Home and School*. Ginn & Co., Boston, Mass.

POVERTY OF THE POOR.

I have said the submerged population is large. It is due that more facts illustrative of what this signifies and of the result of the Spanish school laws in the island should be given. In preference to my own language, or to relying upon my own observations for the purpose, I take the following in substance from the description of another, which has already been widely accepted as in the main correct:¹

The life of the peasant, the peon, of Porto Rico, is not a dream of ease or luxury; neither has he ever passed through the nightmare of wretched hunger and biting cold, which adds so vitally to the hardships of the poverty stricken in northern climes. In squalor and filth, in crudity and ignorance, the larger number of the inhabitants go through their comparatively short lives, for one does not see many aged people among them. They die off from fevers, contagious diseases, and troubles handed down from sickened forefathers, at a comparatively early age.

At no period of the poor man's existence can he suffer the tortures of starvation because his job of work has given out, for while during whole months of the year he may not earn a single centavo, he has still his little plot of vegetables on the hill; then if worst comes to worst, or the landowner turns him out, he may live on the profusion of fruits and roots of the forest, or, as is a common practice in the country, upon the fruits filched from his more opulent neighbor.

In the dry season he complains of the cold, yet he needs but the merest rags to cover his nakedness, for on no day in the year is it colder than our mildest autumnal weather. Shoes are a useless burden to his bare and sole-leather-lined feet, which have traveled the rocky, briery trails in their nakedness from infancy; and a hat, if he must have it, he makes in his own house from the grass grown around the doorway.

The house in which he is domiciled he builds in a few short days from poles and thatch and the bark of the royal palm; and a good house it is in spite of its primitive appearance, for it screens him from the colder winds of night and sheds the water of the driving rains like a duck's back.

The average wages of a laboring man is less than 50 cents, Spanish, a day, and the work for which he is paid does not cover a period of more than five months in the year. In idle times of the year he must support himself from his garden patch on the hillside.

Children are an ever-present and abundant factor in the domestic economy of the peasant's life. Domestic economy is the fitting term, since it costs nothing to supply the air of day to the lungs of these little waifs, and it costs nothing for their clothes, for they run about in the sunshine and rain just as God made them and sleep in odd corners without cover for the first half-dozen years of their baby lives, while when older a single discarded tattered garment adds to their natural grace the shield of decency. So they live, without expense and with little tenderness bestowed upon them in the shape of material comforts, though the mother's kiss is often given and the father pats the little head. They soon toddle, at the command of the mother, to do small errands, to help weed the garden, to bring the handful of wood for the fire, to dig the tubers for a meager meal, and, lastly, to hold up their tiny hands and, with pleading eyes, gain a copper from the passer-by on the roadside. They are a good investment in the family; the majority of them die at an early age, and it costs but a few strained hours to the mother's heart, a bit of cloth for a shroud, and the energy needed to carry the tiny form to the potter's field. Offsetting this is the usefulness of those who, by the law of the survival of the fittest, pull through, with sturdy forms, to pick berries, work in the cane and tobacco fields, and add to the common fund, until, at a varying age, they rebel against the paternal banker and live for themselves in poverty and in bondage to the landed kings, just as the generations who came before them.

Marriage is almost unknown among the very poor classes, and the distinction of having the written word and the blessing of the priest carries with it no special meed of honor; it is a much easier matter for a man to select his companionable partner and set up housekeeping in a new wickiup under the banana trees without more ado. Wretchedness, poverty, and oppressive rulers beget, as an offspring, an abject humanity with no great sense of moral honor; but it is to be remarked that there is little quarreling among these people thus paired, and their relations, while not the acme of conventional modesty and virtue, are, on the whole, constant.

After a day's toil the women plod home in the dying sunlight, with swaying hips and stiff necks, carrying, balanced on their heads, huge bundles of damp clothes,

¹ In substance from "Porto Rico; Its Conditions and Possibilities." Harper & Brothers.

washed in the near-by river, which they throw in an empty corner of the hut for to-morrow's ironing. They laboriously blow the fleeting spark of a carefully smoldered fire into a bright glowing flame and prepare the frugal meal for the family. The tiny light sparkles on the hillside in the falling darkness and, with far more picturesque effect than does the ruddy glow of a conventional hearthstone within a luxurious home, welcomes the home-coming of a barefooted, ragged, cotton-appareled husband, who wearily climbs the narrow winding pathway.

The little children are already creeping into the house, to lie down in odd corners for a night of dreamless slumber, clasping some morsel of food, to be eaten or not, depending on the speed of Morpheus's descending arms.

The writer adds: "The American nation has been to the Porto Rican, in the past, the synonym of all that is just and grand and righteous, and if we do not abuse our power Porto Rico may be made a twentieth century Garden of Eden, in which the native, trained in new methods of freedom, may for the first time in three centuries enjoy the sweets of liberty."

In connection with the above I quote the following recent statement from an authority whom I deem entirely trustworthy:

The financial condition of some municipalities seems to be growing worse instead of better. There are towns where there literally has not been a cent in the treasury since the cyclone. The actual amount expended upon schools is nothing. Schools are being closed because municipalities can not pay the rent of buildings, and proprietors sometimes evict the teachers. Towns like ——, for instance, find it almost impossible to get a building because their credit is so poor. The American teachers are in some cases teaching in barrooms, without so much as a table or chairs or benches, simply with a reading chart and books, with the little children seated on boxes or little chairs which they bring from home; yet in towns and barrios where the average income of a family is not \$100 a year, where 95 per cent of the families have an income of 25 cents a day, American currency, and where perhaps none of the other 5 per cent have an income exceeding \$5,000 a year, the education of the children by the taxes raised in a community is simply impossible. Some boards of trustees have not money to carry on their official correspondence or to purchase books to keep a record of their proceedings. These conditions, of course, are not universal. Progress is made in the more prosperous parts of the islands.

PUBLIC SENTIMENT APPRECIATES PUBLIC WELFARE.

It is a question of significance in regard to any people how far will the general sentiment rise above personalities in appreciation of the public or general welfare. The resignation of General Henry afforded an opportunity for a test of the capacity of the Porto Ricans to illustrate their appreciation of the public welfare. The General, in guarding that welfare, had many occasions to correct evils and to disappoint personal wishes. The times and conditions so soon after the war were fraught with many changes and trials. In all this the General had shown great singleness of purpose, purity of motive, and the greatest devotion to the public interest. He had punished crime, enforced honesty, rewarded virtue, quickened justice and stayed injustice, protected health, cleaned the prisons and set prisoners free from unjust confinement, fed the poor, given work to the idle, created a new era of road building, and made provision for reorganizing the schools, and thus answered the cry for roads and schools. His vigorous enforcement of the law had been united with great personal kindness, but there had been many personal disappointments. The officers of the Society for the Benefit of Children conferred with the teachers. The use of the occasion furnished evidence that the public spirit in Porto Rico can forget personal disappointments and appreciate regard for the public welfare. The new commanding general, George H. Davis, had arrived, and both generals were invited to meet the teachers and pupils and public in the theater, the largest place of assembly in San Juan. What occurred is here taken from the San Juan News, the only paper published in English in the island:

Promptly at 2 o'clock yesterday afternoon the school teachers, in honor of Generals Henry and Davis, assembled at the theater on the Colon Plaza. Two thousand chil-

dren were present from the schools of San Juan and Santurce, and twenty-four schools were represented.

The exercises were under the control of the English supervisor of San Juan. The time for preparation was short, but the exercises were nevertheless wonderfully successful. The following was the programme rendered:

Salute.

Star-Spangled Banner, band of Beneficencia.

Farewell address in English to General Henry.

Same in Spanish.

Response of General Henry.

Song, Columbia, by the girls of the Normal College.

Address of welcome to General Davis, in English.

Same in Spanish.

Response.

National anthem, by all, with band.

The singing of Columbia by the young ladies of the Normal College was nicely rendered, the words being very clearly pronounced. The band of the Beneficencia assisted by playing the "Star-Spangled Banner" and "America." The speeches in English were by two pupils of Mr. Timothee, 22 Sol, and the same in Spanish by two pupils of Mr. Saavedra, of Santurce.

The singing of the national anthem was accomplished with precision and enthusiasm.

Address to the retiring governor-general:

"General Henry: We, who are about to live, salute you. When we heard the thunder of American ships bombarding our homes our hearts were filled with fear, and when we saw the proud flag go down which had floated so long over our land we were told that the end of things was near; but the stars did not fall. We soon saw that the Yankees who walked our streets were not pigs. Slowly we forgot our fears. The Lafayette Post brought to each school a Star Spangled Banner, hereafter to be the flag of our island. Now, every morning we salute it, and pledge ourselves to defend it. Since you have been our commander we have learned many things. By your order our schools are becoming better. A map of your great country, and a little book in your language has been put in our hands, to teach us to speak and write it and read its stories. It opens to us a new door of opportunity. When our teachers tell us of the boyhood of Washington, Lincoln, and Grant, and how they became great and good men under the Star Spangled Banner, and now that we have the same liberty which they had to learn and to do, our childish fears are changed to hopes.

"We rejoice that ours has become the land of the free and the brave, and that we can be what we make ourselves. You have removed the burden of tax from the daily pursuits by which our fathers supported our homes, and from the bread which we eat. You have been thoughtful of our child life, and ordered the clothing of the naked and promised us a park for sports. You have abolished the payment of the school fee, which drew the line between the rich and the poor, led teachers to be partial, and caused us to spend our school days with a growing sense of class differences, cultivating on the one hand offensive pride and on the other disturbing jealousies. We expect that no more this dislike for each other will grow with our growth. We shall receive equal attention from our teachers, sit side by side on the same bench, and learn to think that our merits and our honors depend on the good things we do. We hear of your interest in our having a house specially fitted for a school, apart from all bad conditions, as have the children in the States, and we thank you. We part from you with regret, and trust that we shall, by becoming worthy American citizens, show our appreciation of what you have done for the many children of Porto Rico. Young as we are, we are not without some thought of the cares which have burdened you and injured your health. We trust that rest will make you well again. We shall remember your labors—that you had an ear for the story and a heart of sympathy for the suffering for the humblest of our people, and that you enforced justice with mercy; that you gave work to those in need, and that you guarded our homes against disease; nor shall we forget the efforts of Mrs. Henry for the poor.

"In your departure you have our best wishes for your welfare, long life, and happiness."

General Henry's response was as follows:

"This is a very beautiful sight before me. These children are the seeds of the earth, and their proper culture depends upon us. You people have to change and adopt the American customs.

"I do not think there are any brighter children in the world than the Porto Rican. In Ponce the children were asked what they wanted for Christmas presents. You can not say what they asked for? They did not ask for presents; they asked for teachers. The little minds are thirsting for knowledge.

"The representative here, General Eaton, is devoted to his work. He would rather die than give up his work. I am the coward, and am going home. He will assist you in every way. All that is required of you is to obey your teachers and be respectful to your parents.

"I thank you for your kindness and also for the kindness I have received in this island. God have you in his care. I am very sure my successor, General Davis, can well take my place. He will do better than I have done by you. I have tried to do my best, however I may have failed in it.

Good-by, and may God keep you."

Address to the new governor-general:

"General Davis, speaking for the school children of Porto Rico, we give you hearty welcome. Your coming relieves our sorrow over the loss of General Henry. You and he grew up under the same skies, in the same land of liberty. You were trained in the same school. You represent the same great nation and the same noble liberty and justice-loving President, Mr. McKinley, all of which assures us that you have come to carry forward the plans for our welfare now progressing so successfully, and when the day of your departure arrives we trust that our separation may be relieved by the multitude of good things which your administration will have accomplished.

"We know you come to bear many burdens for us, but as school children we hope to be obedient and to learn the wise lessons taught us, and that those who love us will help to lighten your labors. We are not young Washingtons, but we are happy that you come to bring us the privileges for which he fought, and that we may, in the enjoyment of them, grow up to be patriotic citizens, prepared to make our island a happy, worthy part of his great country.

"In these anticipations we bid you thrice welcome—welcome to our beautiful island and to our homes and our hearts."

General Davis's response:

"Children of Porto Rico, I salute you. What a gratifying situation is this to a stranger who has just come upon this beautiful island. My future as representative of the United States is before me. I anticipate that my residence will be gratifying from every point of view. •

"The thought that came to me as I came down from New York on the steamer was, What will be my reception in Porto Rico? If I could have made a programme for myself, nothing would have been more gratifying than to be received in the way I have by the children of Porto Rico.

"The thought that presented itself to my mind as I came along the street to the theater to-day was that many of the little boys of the island would be holding seats in the Congress of the United States. This should be the endeavor of the people of this island; it is the hope of the President of the United States.

"When my time comes to depart, if I can be saluted in the manner of my predecessor it will be more than gratifying, but I can only promise effort on my behalf.

"I salute you again."

When General Henry embarked further manifestations of regret were made by the multitudes who gathered on the wharf for the last sight and word of parting. As his vessel touched at Ponce the time was filled with similar manifestations by all classes of citizens, but especially by those who had cooperated in plans for the improvement of the place and in efforts for the promotion of the American school.

But the most touching indications of interest and gratitude occurred when the news of his death reached Porto Rico. His illness was brief, and he died in New York City Friday, October 27, 1899. Telegrams and letters of sympathy were received by Mrs. Henry by the hundreds from all parts and classes on the island, and by many Porto Ricans who were in the States. Friends, citizens, teachers, and pupils in Ponce united, Mme. Antosante leading, she having prepared with her own hands a beautiful burial wreath of artificial flowers and sent it to Mrs. Henry with touching expressions of sorrow.

LOCAL SCHOOL BOARDS.

These boards, as is manifest, occupied a position of vital importance to the improvement of the schools. Under the old régime there was more or less patronage at their control. They could be very useful to the schools, or they could take advantage of their positions to gratify their personal and partisan ends. As the application of the new provisions began to enforce honesty and a care for the interest of the public instead of themselves, there was increasing report of their neglect of duties here and there. In the municipalities in which elections have been held by the order of General Davis the election of new boards was ordered. Some of these new boards do their work faithfully, others decline to serve, and others neglect it. The lack of money for expenses in some municipalities rendered their task difficult and is an excuse for inaction. One simple duty with which this board is charged is handing over to the teachers the monthly payments from the treasurer of the insular board of education. This simple duty carries with it no fees, and is here and there declined, and the duty has to be added to the service of the English supervisors.

SCHOOL BOARDS ARE WITHOUT DEBTS.

Indeed, municipalities owe few debts and own considerable property, usually a jail and a building for city administration at least. Under proper regulations and assurance the boards of education would be able to effect loans for money to be expended in erecting school buildings to be paid in time, bonds to run for ten, fifteen, or twenty years, careful provisions being made for the payment of interest and principal by a proper system of taxation.

QUALIFICATION OF TEACHERS.

The greatest care was taken to do justice to teachers already doing good work in the schools, but there was great difficulty in being sure of reaching the merits of every individual case. There were teachers of the most self-sacrificing record amply qualified for the work expected of them, and doing it efficiently with satisfaction to the parents of their pupils and to the public. The hope was to retain all worthy teachers; and yet the new order of things could not permit the teacher to be a proprietor of a public school as against the public. He must be selected, his qualifications duly attested, and his contract made with the public authorities, which must be faithfully discharged by both contracting parties.

In all cases, the qualifications being the same, the native Porto Rican was to be preferred. The requirements aimed at a general elevation of the profession. More emphasis was placed upon pedagogical training. Less value was placed upon a Spanish diploma and more upon qualifications required in the States. Certificates were to be granted by the Bureau of Education, good for five years. New teachers were expected to have sufficient knowledge of both Spanish and English to be able to teach in either of those languages. It was made illegal for any public official to pay money from public funds for services as a teacher to any person not holding the certificate required by law. The Bureau of Education was required to publish a plan for granting diplomas, in conformity with the gradation established, to teachers now employed in the public schools and to English supervisors. Provision was made for supplying substitutes and for annulling of contracts between school boards and teachers when circumstances might require. Municipal boards were granted much liberty in selecting and employing teachers from those certificated by the Bureau of Education.

EXAMINATION OF TEACHERS.

On one hand the friends of the schools called almost universally for the examination of teachers. On the other hand there were many teachers fearful of the results, and they and their friends saw great dangers in the examination as required in the

foregoing provisions. Rules and regulations were prepared in due time by Dr. Victor S. Clark and furnished to each of the supervisors in the island. To prevent misunderstanding as far as possible, the directions were carefully specified, including the place and time of each examination.

1. The questions and blanks were sent in sealed packages in each case. (A) Envelopes containing questions for each examination separately. (B) Copies of the rules for examination. (C) Copies of the programme and supervisors' certificate. (D) Class list. Each supervisor, by personal examination, was to make sure that nothing was lacking.

2. The material was not to be exposed until the class was seated.

3. The supervisor must conduct the examination in person at the hour named.

4. Questions, pen, ink, and paper were to be supplied by the supervisor.

5. Not more than two hours were to be occupied by one subject.

6. The examinations must not be divided. All of one subject must be taken at a sitting. There was to be no communication between those to be examined.

7. No explanations were to be allowed.

8. Answers were to be written in order of the questions, and carefully.

9. In arithmetic, entire operations were required. No lexicons or other aids were to be used.

10. Reports must be made, accompanied by the certificates and schedules required carefully signed.

On this carefully prepared plan several examinations have been held. On August 21 the insular school board passed the following resolutions unanimously:

Resolved, That, in admitting new candidates to the profession of teaching, certificates shall be granted only upon examination or upon diplomas from reputable normal schools, colleges, or universities, and that the standard of examination shall be maintained equal to that observed in New York, Ohio, Minnesota, California, and other States of the Union.

(2) That all teachers of Porto Rico holding superior titles under the former law shall receive principals' certificates.

(3) That all teachers possessing elementary titles under the former law shall receive graded-school certificates.

(4) That teachers holding rural or auxiliary titles under the former school law shall receive rural certificates.

The Spanish system was deadening to a professional spirit. The idea of the teacher as a member of a professional rather than of a social or bureaucratic class seems not to have been awakened. The whole body of teachers became a sort of bureaucracy—a teacher was first of all a politician and an officeholder. A school was acquired in propriety through competitive examinations, appointment being governed somewhat by the term of service of the teacher. If the school ceased to exist for any reason the teacher continued to receive one-half his salary from the municipality, and had a right to the first vacancy occurring in the school system for which his title qualified him. Schools not held in propriety were said to be held temporarily, i. e., until they could be provided for in "propriety," as designated through suitable examinations. At the close of the last school year about two-thirds of the schools of the island were held in "propriety," the remainder having been filled temporarily. This large number of temporary appointments was due in part to the effects of the war and the vacancies occasioned by the return of the Spanish teachers to the peninsula. The various grades of certificates were secured through written and oral examinations. It was also claimed that many were secured through political influence. As it was charged that there were many illegal certificates in the island and many that were granted to unqualified persons, for the purpose of securing a thorough examination of the documents held by each teacher, new certificates, graded as rural, graded-school, and principals' certificates, were granted by the insular educational authorities. Teachers holding superior titles under the old law were given princi-

pals' certificates valid for five years; teachers holding elementary titles were granted graded-school certificates, qualifying them to teach in graded schools for the same length of time; teachers holding rural or auxiliary titles were in the same manner granted rural certificates. Up to date 757 teachers have received new certificates under this ruling. That many of these teachers would not be qualified to teach in American schools can hardly be doubted, but it has been thought best that where incompetent teachers possess titles they should be allowed to demonstrate this fact in the schoolroom itself, their removal being a matter entirely at the discretion of the insular board of education, and easily accomplished in case of unfavorable reports from the supervisors.

To show how far below the standard to which Americans are accustomed they fall in many subjects, it may be stated that in the July examinations there were teachers holding superior titles who received less than 25 per cent in the examination upon universal geography, given to seventh grade pupils of the States, the questions being translated into Spanish, and all questions pertaining strictly to local geography of the United States being omitted and questions relating to Porto Rico substituted for them. In the examination in United States history 50 per cent out of the 65 required for passing could be gained upon two questions, relating to the voyages of Columbus and to the Spanish-American war and the recent political changes in this island, and yet out of 41 examinees but 30 secured the required 65 per cent. In arithmetic the lack of practical knowledge of the subject was still more apparent. There were 139 examinees, of whom but 4 secured the 65 per cent; in geography, out of 137 examinees 48 secured the required per cent. The questions were taken verbatim from a set of questions given to candidates for admission to the high schools of the State of Minnesota. One or two intricate problems in the examination in arithmetic were modified and metric measurements substituted for English measurements. The applicants were to repeat rules in Spanish grammar, and to show their ability in analysis and parsing of the principal words of a continuous extract of prose of about ten lines. These teachers are qualified, however, to teach all that they will be required to teach in the schools of Porto Rico for two or three years to come, and during that time, with modern text-books and other school facilities, it is expected that the majority of the younger ones will be able to continue the work in higher grades. A large per cent of the teachers are very old—in fact, superannuated. When a man becomes useless for anything else, it has been frequently customary to assign him a position as a school-teacher. Applications have been received for appointments where the chief qualification cited was the fact that the teacher was physically incapacitated for doing anything else. The school board of the city of Guayamas appointed a man 72 years of age, with defective sight and hearing, and who received but 25 per cent in the examination in geography, principal of their schools. This is one of the largest and most important towns of the island, and this fact shows how different a position toward public schools is taken by local school authorities here compared with similar officers in the States. For explicitness, I may in part restate here that the provision for the professional training of teachers in Porto Rico, under Spanish rule, consisted of a boys' normal school which was later united to the secondary institute at San Juan, and a girls' normal school in the same city. There were about 50 pupils in attendance at the girls' normal. Theoretically, there was practice teaching, and there were two so-called superior schools, one for boys and one for girls, in the city for this purpose. The instruction in the normal was chiefly in academic subjects, and the girls' normal was probably the most efficient institution of learning in the island, though it fell far below what we should expect of a graded school in the States both in the way of methods of instruction and of discipline. Graduates of this school received elementary school titles. As stated above, the school was suspended.

SUMMER TEACHERS' INSTITUTE.

A summer school and institute conducted by three ladies who were experienced public school-teachers in the States and who speak Spanish, was held in San Juan in vacation. There was practice teaching and instruction in American school branches.

FUTURE PROVISIONS.

Dr. Clark states expectations of future provisions for the training of teachers as follows:

1. In the industrial school, which it is expected will be located at Fajardo, there will be a normal department, with model school training.

2. The model training school at San Juan is created with three purposes in view:
(a) To provide a school in which the children of American and Porto Rican parents can be educated, who would otherwise be sent to the States. It has been thought true economy that the money for the support of these children should be kept in the island if possible.

(b) To provide a concrete illustration of what the American graded school is, model school furniture is purchased and model methods of teaching and of school organization and discipline, with the strict following of programme and the systematic graduation of pupils, are introduced. It is also hoped through this school to set a standard for primary and secondary instruction similar to that in the States. If Porto Rico is part of the United States, her pupils will naturally look to the institutions of that country for their higher education, and unless the standard of higher instruction in this island is made equal to that in the States this is going to lead in the future to continual embarrassment and expense on the part of students and parents.

(c) To provide training courses for teachers in a model school. It is hoped to place in this school only pupils recommended by the supervisors from the different parts of the island. Special courses will be given in Spanish and English; the teachers will observe the work in the American school and will do practice teaching under the eyes of the supervisor in the public schools of San Juan and the orphan asylum.

3. The appropriations permit school officers to hold teachers' institutes at other towns of the island, and this will be done at intervals during the school year.

4. The introduction of the 60 or 70 normal trained American teachers, teaching model grades in each community, will, it is hoped, assist in familiarizing the Porto Rican teachers with the methods of school organization and discipline and teaching followed in the States.

5. As the supply of teachers is sufficient for the immediate needs of the island under our present appropriation, the board of education feels justified in admitting other teachers to the profession only upon strict examination, showing the required scholastic qualifications as provided.

TEACHERS FROM THE STATES.

The correspondence from those in the States offering to teach was very large. Indeed, so large that the office force was not able to reply to every letter. The following circular was therefore issued:

SAN JUAN, P. R., *October 19, 1899.*

On account of the large number of applications received we send the following formal answer to teachers:

There are several vacancies to be filled in Porto Rico, and we would request teachers desiring to come upon the conditions mentioned to send their names, credentials, and photographs immediately that we may request transportation for them from the Quartermaster-General at Washington, providing there are appointments to be made upon receipt of their applications.

1. Teachers must be normal graduates or high-school graduates, with one year's experience as a teacher, and preference is given to those familiar with kindergarten methods and primary work.

2. The insular government pays the salary of \$40 gold per month for nine months of the school year. Salary begins with service. The municipal authorities pay house rent or a commutation for house rent, amounting from \$2 to \$20 gold per month. In the larger towns the most desirable positions have been filled.

3. Teachers can add considerably to their incomes by giving private lessons in the evenings. In nearly every town of the island there are a number of well-to-do families the members of which are extremely anxious to learn the English language.

4. Living expenses vary. In the larger towns they are as high as in the larger cities of the East. In the smaller towns they vary from \$10 to \$20 gold per month. Each school is under inspection of an English supervisor, who has general supervision of about 40 schools. This supervisor will arrange for accommodations for teachers, and will escort them from the nearest port to the town in which they are to teach. Frequently teachers are entertained in the best families in the town.

5. There is but one teacher appointed for each town. In some towns there are no other American residents. There are no public school buildings, the schools being held in rented rooms, and there is very little school furniture. The work is in every respect pioneer work. The teacher is expected to teach a model grade for one three-hour session and to give instruction in English in the other grades in the town school the remainder of the school hours, though this arrangement may be modified somewhat where on account of a lack of school facilities pupils attend half sessions.

6. Transportation from New York to San Juan is furnished by the Government, but it does not include meals while on board vessel. This latter item amounts to five or six dollars for the trip. Transportation home at the end of the school year can not be promised, as the military government may cease and consequently military transportation be withdrawn before that time.

7. No teacher need hesitate to come from considerations based upon the climate of the island. There are very few uncomfortably warm days, and even during the rainy season there are few days without a fair share of sunshine. Fevers and epidemic diseases are probably less common than in the States. The office force of this office is composed largely of Americans. The office hours are seven hours, and have been continued during the past summer, and for the last six months not a day has been lost on account of the illness of American employees.

8. Text-books are of good quality, published by American firms, and are furnished by the insular government. All the work of the schools is very elementary in its character.

Educational conditions in Porto Rico are promising. School facilities must be rapidly widened and extended, as but one-seventh of the children of school age are accommodated at present. Consequently there is reasonable prospect for rapid advancement for teachers who secure a mastery of both languages.

Very respectfully,

VICTOR S. CLARK,
President Insular Board of Education.

The interest in the employment of American teachers became very manifest. Out of the list of teachers who received certificates from the insular office, the municipalities were authorized to make their own selection, the payment coming as provided from the insular treasury. As the opening of the schools early in October approached, it was evident that the municipalities in the exercise of their choice would call for sixty or more teachers from the States.

The presence of so many American teachers illustrating in so many ways the excellence of American methods necessarily hastens the changes in progress so much talked about, and, in the case of many so earnestly desired, has in it the possibility of awakening jealousy and creating conditions which may be used by the designing who are controlled by the Aguinaldo spirit to create disturbances, thereby retarding the good work.

RESIGNATION.

As the end of May approached, the condition of my health compelled me to address the honorable Secretary of the Interior as follows:

SIR: Some months since, as you are aware, my health was suddenly and specially impaired, and it seemed that my resignation would be necessary to my recovery, but

we were in the midst of work that could not well be dropped. The new educational plans are now substantially completed. The effect of the increasing heat upon my health admonishes me that I must rest in order to save myself from another attack. I therefore tender to you, and through you to Gen. George W. Davis, my resignation as director of public instruction.

The purpose of my labors, the devising of the best educational methods for Porto Rico, has wholly absorbed my time and strength. It has brought me into contact with many of the best people, whose association I have greatly enjoyed. As I became acquainted with the needs of education, I have been encouraged by the desire shown by many teachers and citizens for better schools, and by the readiness with which the children learned. The future of the island will be determined by what is done for the rising generation. The friends of Porto Rico need, above all things, to dismiss all differences, and concentrate their efforts upon the improvement of the young. The American flag offers full American privileges, which means the largest liberty, regulated by law, known in any land. If the young can be trained to improve and enjoy this freedom, this beautiful island will be crowned with an industrial, social, civil, and religious life not less an ornament and attraction among the peoples of the earth. In parting with my duties my anxieties for the future are relieved by the assurance that they will continue to receive the watchful attention of yourself and the general commanding, and that their immediate care will be in the hands of my very competent deputy, Dr. Victor S. Clark, who has so fully shared in my labors, aided by those who have so faithfully cooperated with us in the office.

To all officers, teachers, and citizens, who have extended to me so many courtesies, I tender my hearty thanks.

Very sincerely, yours,

JOHN EATON,
Director of Public Instruction.

The kindness of Porto Ricans and their appreciation of efforts in their behalf was manifested by many good-bye calls and notes from citizens and officers expressing their regrets and wishing my restoration of health, a happy voyage, and many good things. The News said the following day:

A great deal has been accomplished during the past few months, and the prospect for the future is very bright. Before leaving, General Eaton was given a call by the city teachers. After a short talk, in which he praised them for their good work and kind assistance—also giving them a few words of encouragement and advice—he shook hands with each, bidding all farewell, making it a touching scene long to be remembered by those present.

The following letter, signed personally by a body of teachers, was handed him at the same time:

“General EATON, *San Juan.*

“SIR: We, the teachers of the capital, desire to express our regret at your departure from our island, and sincerely hope that the climate of your native country will restore you to health. We appreciate the good work in education that you have commenced since you have been here, and it will be remembered by our children when you are gone. May your voyage and change restore you to health and strength, is the earnest desire of

“Yours, respectfully,”

(Signed individually.)

To the teachers of Porto Rico:

My health is so far impaired that I have resigned for rest and recuperation. My labors have been overtaxing, but full of interest. Although the difficulties have been great, the possibilities of the future are encouraging. War, change of sovereignty, and short crops have brought great disturbances and exposed many to suffering. How many teachers had received no pay! This we have tried to remedy. Great changes were expected. We have sought to make them as limited as possible with the improvement of the schools. To have good schools we must have good teachers. When I came, I everywhere heard “there is no money.” The cry began to come up that the municipalities can not pay the salaries of the teachers next year. Soon relief came in the assurance that the insular treasury could pay \$325,000 for education next year. It was decided that this should be divided equally for the benefit of the whole island and used mainly in the payment of teachers' salaries. This would so far support the teachers and keep the schools open for the benefit of the children; at the same time it was expected the municipalities would do the rest, and they are therefore required to furnish homes for the teachers and buildings for the schools, and meet any further expenses necessary. Indeed, wherever municipi-

palities have money for the purpose, they should open schools for the instruction of children who can not be provided for in the schools whose teachers are to be paid from the insular treasury.

Public schools, it should be remembered, must be conducted in the interest of the public and not in the interest specially of any class. In America these principles are fundamental—rich and poor must be served alike—therefore the payment of fees by the rich has been abolished. This does not interfere with the rich providing out of their own means for the instruction of their children, nor does it interfere with teachers who choose to establish other than public schools for pay scholars; nor does it forbid the teachers of public schools teaching for pay in hours not occupied in the public school; but it does proceed upon the broad principle that in the public service there must be no distinction between the rich and the poor and that during the hours for which the teacher is paid by the public he must devote himself faithfully to the instruction of all the children under his care.

In dividing the money from the insular treasury for the benefit of teachers, it was decided to make the payment in nine parts, or for each of nine months. In surveying the whole island it was found that this would accomplish more for the whole people than to attempt to divide it into twelve parts and thus require service during all the months of the year, including the rainy season. A very large proportion of the population resides in the country districts, and during the rainy season, when roads are poor and streams are swollen, which children have to cross oftentimes in peril of their lives, it was seen that schools could amount to but little. It was therefore decided, in conformity with the practice in the United States and other countries where education accomplishes most, to provide for a longer vacation.

As it was reported that many teachers had been unable to save money, the treasury, for a general rule, would be authorized to advance \$15 per month on the annual pay of each teacher, which, in addition to the house to be furnished by the municipality, would, especially in the country, make sure their relief from suffering. In municipalities it was expected that they would know the situation of the teachers and make any additional provision for their comfort which might seem expedient—might continue the schools a part of the time. This has already been done, I am informed, by several municipalities. In several instances teachers are exercised with fear upon this point and appeal for relief to the insular treasury, but they will see that the insular treasury already proposes the greatest relief for the year, and if they need additional relief they should appeal to the municipalities. If they are good teachers they can teach pay schools, as above suggested, a part or all of the time; but since the municipalities have so large a share of the teachers' salaries met by the insular treasury, is it unreasonable to expect of them that they will supply any further want of the teachers of their children who have so long rendered them faithful service?

As to text-books, it is already manifest that they will be furnished of better quality and at less expense than ever before. The instruction in English, from which so many feared great evils, is going on with much satisfaction to the children and the public generally, opening a new door of opportunity to rich and poor alike. A way has been found not to displace native teachers, as so many prophesied would be done, but to introduce supervisors of English instruction who should train both native teachers and pupils in the correct pronunciation of English. The island, therefore, is divided between 16 supervisors whose native language is English. Before the year closes it is hoped 10,000 pupils will have made a beginning in this important acquisition. It should be remembered that this expense has not been met by the municipalities, and the small text-books in English introduced have not been a charge upon them but have been paid for out of the insular treasury, the like of which has never been done before.

I have marveled as I have visited schools that teachers have been able to accomplish so much without proper equipment, without classification, and without houses erected for school purposes. We have therefore provided for the grading of the schools, from the kindergarten, class by class, according to qualification, and from the high school to the State normal and academic school, and for the possibility of a university when the youth are prepared for that grade of instruction. In this gradation regard has been had both to instruction in letters and in the industrial arts, in the latter beginning with the kitchen garden and sloid.

Instead of a single institution of a higher grade conducted mainly for the benefit of the capital at the expense of the entire island, it has been provided that each of the municipalities may have a high school, whose teacher will be paid from the insular treasury, where pupils will receive instruction of a higher grade than it has been possible to obtain on the island before, thus benefiting three or four times as many young people as at present, and giving a large number of aspiring teachers an opportunity for training in pedagogy.

In this manner the new laws appeal to the wisdom of teachers and of citizens. The extent to which they are approved by the best teachers and citizens is very gratifying. It is not pleasant to know that some teachers have allowed themselves to say things and to propose to do things contrary to the spirit of these new school laws. Let every teacher, instead of grumbling, try cheerfully to improve the situation—let him, as far as possible, use his vacation to improve himself. For this purpose some will go to the States; some will attend institutes.

Here and there a teacher is reported as spending the time for which the public pays engaging in other business or in political scheming. Word has come to me that teachers have been threatened that if they do not do this or that for some partisan they will be made to suffer. It has been intimated that the new commander, Gen. George W. Davis, is expected to favor some of these schemes. Let it be known to every teacher, and I have it from his own lips, that he does not come here with any such purpose. He expects every teacher to attend directly and especially to his duties and to take no part in any political or partisan agitation.

He expects teachers to be a worthy example for their pupils in all things. Remember, "the better the teacher, the better the school—the better the school, the better the people." The eyes of the people of the States are upon you. By your excellent conduct you will create a favorable impression of the fitness of your island for self-government. Do not make the mistake which will mar your own welfare and delay the fulfillment of promises of good for your native land.

Committing my efforts for your welfare to your most serious attention, the judgment of mankind, and the favor of Almighty God,

I am, sincerely, your friend,

JOHN EATON.

THE AGUINALDO SPIRIT.

The Aguinaldo spirit is not limited to the Philippine insurgent. It is altogether too common an element in human nature. It is not altogether wanting among Porto Ricans, and was known to possess active partisans among the teachers. This element bestirred itself, called a convention to oppose the operation of the new school provisions, and sought in every way to secure a large attendance of the teachers of the island. Teachers were besought, cajoled, and threatened with the loss of place if they did not attend. A small fraction only could be induced to participate in the movement, which was inspired and managed by a small coterie, who passed resolutions and appointed a committee to make a formal protest. This protest, on examination, proves to be against those features of the new provisions for the schools most in accordance with American plans and methods, or against features subordinate to the main purpose of the school orders.

General Henry, who had issued the new school provisions, having left the island, and Gen. George W. Davis, the new commander, having just assumed the responsibilities of governor-general, it was thought the occasion was opportune to get him to reverse the orders of his predecessor. It was sought to play upon his motives or deceive him. One of the disaffected leaders had written a letter to President McKinley, the receipt of which had been acknowledged by the President's private secretary, and this was shown as evidence that the President approved the disaffection. After a careful consideration of all that was said and written by the malcontents, General Davis wrote the following letter:

Dr. A. ROSELL, *Chairman Teachers' Committee.*

DEAR SIR: I have read the papers handed to me, specially the report of the board of teachers and schools, of which board you are a member.

You ask specially that the new school laws be suspended, alleging that in their application and execution they are detrimental to the best interest of Porto Rico; but other teachers and experienced educators are of opinions exactly to the contrary of those which your board presents.

There is no more certain manner of developing the defects of any human law or ordinance than by enforcing the defective statute. If and when it is made apparent and clear that any features of the new school law ought to be changed, I shall not hesitate, on clear proof, to take the necessary steps to insure their modification, but as at present informed, and after very attentive consideration of the papers submitted, I can not abrogate or suspend the new rules relating to schools.

The administration of the schools will be watched with the keenest interest, for I fully realize that there is no branch of the public service more important to the people of Porto Rico than that of the education of their children.

While colleges, universities, and institutions of higher education are, no doubt, greatly needed, and will in time be provided, it seems to me of vastly greater importance that the Porto Rican children be supplied with facilities for gaining the rudiments of an education than that a few of the youth of more advanced age be taught the higher branches.

I have learned from statistics that are vouched for as and appear to be reliable that the number of children in Porto Rico of suitable age to attend school considerably exceeds 100,000—but of this number only about one-third have had any instruction save in reading and writing.

Were the means of the island adequate to meet the expenditures, I would gladly take steps to institute all requisite schools—high and normal schools, and colleges also—but this would involve expenditure of quite \$1,000,000 per annum for Porto Rico, a sum that at present is not available. It becomes necessary, therefore, to concentrate efforts and expenditures upon a less ambitious project. The number of children who have been receiving instruction, it is said, does not exceed some 35,000. This shows how much remains to be done to bring school advantages to the doors of all, specially the poor.

The former institute, I learn, was discontinued by my predecessor. As to this act, I am advised by three experienced teachers who looked into the matter that the institute, as then carried on, was scarcely more than a farce. With my present knowledge, I can not find any justification for revoking General Henry's order and reestablishing this institution.

I hope, before long, that it may be found to be possible to provide facilities for the teaching of those who seek to secure a higher education, but I am satisfied that the former institute did not efficiently and economically do this.

I thank you and your colleagues for the interest you have taken in this matter. I am sure that suitable employment can be offered to all teachers who are willing to lend their best efforts to the public good. I regret that means are not available to give to all teachers salaries that they regard as deserved, but it will be my earnest endeavor to see that all deserving teachers and professors are properly compensated. I shall also endeavor to see that wages allowed are fully earned.

Respectfully,

GEO. W. DAVIS,
Brigadier-General, Commanding.

This Dr. Rosell was the director of the institute which had been abolished. He was a man of ability and had studied some in France. Had he devoted himself as assiduously to the helping as to the hindering the new order of things, he might have aided the forward movement to his own advantage, instead of throwing himself across its path to his own great injury. This gentleman has become better acquainted with American aims and methods and is now their efficient advocate.

INSULAR BOARD OF EDUCATION.

General Orders, No. 116, dated San Juan, Porto Rico, August 12, 1899, Gen. George W. Davis, commanding department, Paragraph VI, provided that the bureau of education with its then existing organization should be continued under the board of education, the president of the board reporting direct to the military governor. Such of the records of the Department of the Interior as pertained to schools and education were to be turned over to the board of education.

At the time of the American occupation, the officials of the bureau of education were receiving 25,165 pesos per annum.

At different times considerable reductions were made in the expenses of administration. Under the reorganized bureau the salary list will be \$7,220 per annum, and this includes the salary of an English bookkeeper and cashier, under bond, not previously employed, as under the new system of financial administration the educational budget is expended and accounted for to the auditor sent from the States directly by the educational authorities, a duty formerly falling upon the department of finance.

A feature illustrative of the Spanish method of handling funds may be mentioned.

In the payment of clerks in a bureau or division the accounts were carefully made out monthly, and one of the regular clerks would be designated to go to the treasury and get the cash required for the payment of the several persons designated. For the performance of this duty each clerk paid him a per cent of his salary, which, where the number of the clerks was large, amounted to a considerable sum.

The members of the board designated under the order referred to above were Victor S. Clark, president; George G. Groff, José Saldana, Henry Huyke, and R. H. Todd.

In the organization of the board Victor S. Clark, the president, was the insular superintendent; H. B. Wiborg, cashier and United States disbursing officer; and Enrique Hernandez, secretary.

The accounts and records of the board are kept in English. Its methods of procedure are thoroughly American.

The insular board of education issues a monthly or occasional bulletin to teachers, containing a programme of the course of study and outlines for general lessons, nature study, and kindred subjects. It controls or authorizes the purchase of text-books and school supplies for the whole island; it issues and authorizes the course of study for primary and secondary schools; it recommends school legislation, and, when necessary, interferes to secure the discharge of incompetent teachers and impartial elections by local school boards. Hitherto the local boards of education have been appointed by an administrative officer of the central government or by the board of education. By a general order just issued five school trustees will be elected in each municipality at the regular municipal election, who will supersede the present local school boards.

ITS MANUALS OR BULLETINS.

These are issued monthly or occasionally, as circumstances may require. These publications are exceedingly helpful to the supervisors of English and the teachers. They are exceedingly helpful to citizens and parents who take an interest in the schools. Bulletin No. 1 contains the outline of study and programme for primary schools. It gives in detail the outline of the course of study for each term for five years in accordance with the provisions elsewhere described. Among the directions are the following: 1. No teacher is permitted to leave the schoolroom during regular school hours upon any legal school day for the purpose of attending to business not connected with the school work. In other words, the teacher is expected to be at his post of duty during the full time required by law. 2. Employment of substitutes not authorized by the insular board of education is positively forbidden. 3. Religious instruction in schools during school hours is not permitted, the full time being devoted to the regular course of study. 4. Teachers are held personally responsible for the condition of text-books and for their proper return at the close of the school year. Teachers are permitted to dismiss the youngest pupils an hour before the close of the session in the afternoon. The bulletin also contains a model programme as an aid to each teacher in making the programme which he is to post in his school. It also contains a list of text-books authorized by law.

Bulletin No. 2 is still more extended. Supervisors are expected to aid in grading pupils, usually the first-year pupils being in charge of an American teacher. Pupils should be classified at first on the basis of reading. While pupils of one class or grade are reciting the others should be studying. Pupils must always be studying or reciting. No studying aloud is permitted. How to teach each subject is carefully specified and illustrated.

Touching the physical side of education, this manual says the poverty and destitution at present prevailing in many parts of the island make the prospect for improvement in food and clothing very discouraging. It will be necessary to teach parents and pupils the necessity of industry and thrift, if possible, to make constant labor and constant saving a habit with them, before radical reforms in home surroundings,

clothing, and in food can be accomplished. But if we teach parents and children the advantages of better food and better clothing, we may, on the other hand, make the demand for these things an incentive to industry, thrift, and saving. We should advise that all instruction in hygiene and calisthenics should be centered in teaching these five things, upon which health depends:

- (a) Sufficient nutrition.
- (b) Sufficient clothing.
- (c) Cleanliness, which includes personal cleanliness, pure water and pure air.
- (d) Physical exercise.
- (e) Moderation.

A child should not be sent to school without his breakfast. The blood, which feeds all of those organs upon which the physical and mental activities directly or indirectly depend, is depleted of its nutriment in the morning and a further drain upon it, unless it is replenished with food, leads to the permanent weakening of the child. Dwell upon this fact—preach the gospel of enough to eat; take a personal interest in your children and see that this want is supplied; appeal to authorities if necessary. The teacher of intelligence and appreciation of the needs of the community should place himself “in loco parentis,” or in the place of the parent, to all the children of his vicinity.

These manuals, prepared by Dr. Clark, are full of wise suggestions. They will be a revelation to those not familiar with modern methods of teaching.

Schools conducted in accordance with the principles laid down and the methods specified, can not otherwise than give a great uplift to the entire instruction of the island.

AMERICAN SCHOOL AT PONCE.

The American school at Ponce deserves special mention. This school deservedly attracted much attention. Its establishment and progress are specially due to the personal efforts of General and Mrs. Henry. When General Henry was in command of that division, headquarters at Ponce, he and Mrs. Henry aided in organizing a society to promote the general welfare of the people, including education.

Teachers were secured from the States, and prosecuted their work with great skill and success. The mayor and other leading citizens cooperated efficiently. Among the most effective promoters of the school were Mrs. Antosanti and her friends.

PONCE, P. R., *April 30, 1899.*

Gen. JOHN EATON, *San Juan, P. R.*

MY DEAR SIR: I thought, perhaps, a letter giving you a description of our school, stating our progress, and giving you an account of the methods we employ in teaching 300 Spanish children our English language might interest you. I know that Chaplain Sutherland keeps you fully informed regarding our work here, but perhaps we, as teachers, can give you a better idea of the progress we make than anyone else. As before stated, we have 300 pupils, ranging in age from 4 years to 16, and perhaps older. We have 5 teachers, one of whom teaches only the Spanish, and she does not speak one word of English. We found it very difficult to grade them to any very satisfactory degree, as one seemed to know about as much English as the other. Finally we concluded to grade them according to their standing in their Spanish studies, and we found this a very good way to do. Even yet we keep passing them up and down, as we learn their standing, trying to get them in those where they can learn to the best advantage. As a rule they are inclined to be very disorderly, and one of the first things we did was to insist upon their marching into and out of class rooms orderly and quietly. They are none too quiet as yet, but they are a vast improvement over what they were at first. They have no idea of studying, and sit with their books closed, and never think of opening them until called upon to recite. We had considerable trouble teaching them to study, and the first few weeks we took a half hour each morning and afternoon, when we would go from one to the other, requiring them to open their books and showing them how to study. We have them pretty well trained in this one respect now. The moment they are seated in the class room they open their books and begin to study, but they have to be spoken to

quite frequently, as they are very apt to forget to look at their books, but just stare around through the room. Of course we can not accomplish it all at once, and we are encouraged when we notice a small improvement. We started them all in Appleton's First Reader, requiring them to spell and pronounce correctly, teaching them the different sounds of the letters and the diacritical marks. We didn't require them to do all this at once, of course, but I am now outlining our plan of work. We teach them the use of the diacritical marks, the sounds of the letters, and we teach them to spell by sound as well as by letter. The larger pupils are required to give us the Spanish word for every English word in their lesson, also to tell us the meaning of the word in English and be able to use it in an English sentence. Their reading lesson they must translate into Spanish, and tell us in English all about the lesson they have just read, while we correct their sentences, their pronunciation, etc. Sometimes we are three or four days on one lesson, as we never leave it until we know it thoroughly and can talk about it in English. Of course I am describing my own classes, as I do not know enough about the others.

In the afternoon we have Simmone's Method for Learning English; from this we learn the verbs, English names for different objects, and have exercises to translate. In connection with this we hold conversations in English, in which everyone is obliged to take part, and it is really remarkable how much of their lessons they are able to use in conversation. At first I couldn't get one of them to say one word to me in English, and I was discouraged. Finally I said to them: "The pupil who refuses to talk to me to-day some in English, no matter how little, I shall send home, and it is doubtful whether I'll admit them to this class again this term." This had a miraculous effect, and every child had something to say to me. Since that time I have had no further trouble. I talk in English entirely, employing the Spanish only to translate what they do not quite understand. I speak very slowly, and there are but very few who do not understand all I say to them. I am surprised at the progress, as I had no idea they could get along so fast.

I am really only experimenting with methods, as experience alone will teach us what is best to be used, and no two teachers can employ the same methods and be successful.

Every day we are obliged to turn pupils away simply because we have no room for them, and it almost breaks our hearts to see them turn away crying, often both parents and children crying and begging for the children to be admitted. They are all so anxious to learn, and they can not be kind enough to us. Some of our classes are about ready for a Second Reader, and if you have any I would be glad if you will send perhaps 100 here. We can probably collect for most of them. I would also like an arithmetic, a United States history, a geography, and a grammar—Read & Kellogg, if you have it. These I will see are paid for. They are for our mayor's little girl, who recites to me every day for an hour, and who speaks English very well, considering the advantages she has had for learning it. The people all seem to take such a kindly interest in this their first "American public school."

We enjoy the work very much. Our school hours are from 9 to 11 and from 1 to 3, which we find plenty long enough for the children to sit on straight chairs with no desks and low benches with no backs. Even in two hours they get very tired and restless these warm afternoons. I would greatly appreciate if you could send me the books at once. Will I give Mr. Brown the money for them or remit to you?

Anything further you may wish to know about the school, or any information either myself or Miss Mendel can give you, we would be most happy to have you write us.

Yours, very respectfully,

EDITH V. HOLLOBAUGH.

A record has been found in which it appears that in the year 1842 the municipality of Ponce, before the Spanish school law of 1857, made a grant of 300 pesos a year for the education of 10 girls annually. A few years later a much larger number of girls were educated, and in 1861 public schools were opened for girls on the same plan as those for boys.

In 1895, it appears from a public school address, there were 1,400 children enrolled in the schools. In 1898 the municipalities set apart 36,509 pesos for school purposes.

There are enterprising citizens of Ponce who have sought that their municipality should lead in the work of education and who are ready to cooperate with the plan for the American school to the utmost of their ability.

It is now hoped that the movement among the citizens here will result in their raising \$20,000, to be supplemented by a like amount for the erection of a normal and industrial school on the plan of one at Fajardo.

A MODEL TRAINING SCHOOL IN SAN JUAN.

On the recommendation of Dr. V. S. Clark, president of the insular board of education, Gen. George W. Davis, commanding the department, ordered the money necessary for the purpose set apart and the erection, on the economical plans provided, of a model training school in San Juan, which, in addition to the schools of the municipality, should afford the children of American officers, civil and military, and such other children as might be found capable of attending, an English school. It was expected the school would have special effect in quickening the people of the different municipalities to make an effort to erect for themselves buildings similar in plan and arrangement. In everything about the school the strictest economy was consulted consistent with American system and methods. The school was opened early in the school year in an old building. The new building was ready for occupancy by the 16th of January. The number in attendance had increased to 350. The San Juan News, in describing the occasion, says:

The teachers and scholars assembled in front of the building, which was located near Plaza Colon. Two students stood on the platform of the double stairway leading into the building, one holding a large American flag and the other the halyards. As Old Glory reached the top of the pole and fluttered to the breeze the boys and girls alike shouted and cheered, caps were thrown into the air, all saluting with wild hurrahs the flag of the country. After silence was obtained the children recited in unison the pledge to the flag. The Star-Spangled Banner and Columbia, the Gem of the Ocean, were sung by all, and three cheers given as only boys and girls can for the red, white and blue. After this ceremony the children were marched, class by class, to the platform and photographed before they entered the building.

This is the first building erected in Porto Rico by Americans in which to teach the children of the island by American methods. It is admirably adapted for the purpose. There are twelve rooms in all, two of which were reserved for the board of education, which will occupy them as soon as furnished. Every modern scientific idea in regard to light, ventilation, and sanitation has been applied for the comfort and health of the pupils. Each class room is furnished with adjustable desks, each individual pupil having one. Around the walls are slate blackboards, at a convenient height to be reached by the scholar.

The school is divided into nine departments, viz: Kindergarten, primary, intermediate, grammar, high school in English and Spanish, scientific, training, and sloyd.

The corps of teachers under Professor Benedict, the principal, are as follows: Miss Gould, Miss Howe, Miss McDavid, Miss Beckwith, Miss Ericson, Dr. Rosell, Dr. Berkeley, and Mr. Riddle. They are experienced educators, and the work which they have done and are doing is worthy of the highest commendation.

The school had a regular session in the afternoon.

In connection with this model training school, a teachers' course for lady primary teachers and for kindergartners has been opened. Each class will be limited to 12 young ladies of good family and education, between the ages of 17 and 27 years. Applicants for admission to the class for primary teachers need not know English. As it has been impossible to secure a trained kindergarten teacher who knew Spanish, it is required that applicants for admission to the kindergarten training class shall know English.

The courses are for two years and will entitle students to the highest certificates granted by the board of education in these courses and preference to all positions under the influence of the insular board. The course in primary methods is as follows:

COURSE IN PRIMARY METHODS.

First year.—School methods and administration, three hours per week.

Primary methods, two hours per week.

Sloyd, three hours per week.

Clay modeling and table work and primary drawing, two hours per week.

Spanish literary selections, one hour per week.

Botany, laboratory work, and nature study, three hours per week.

Physical experiments, three hours per week.

Half hour observation work, and after first semester one hour per week practice under a critic teacher.

Second year.—The course for the second year will be a continuation of the work of the first year so far as subjects are concerned, except that psychology and child study will be substituted for school administration, and zoology and chemistry for botany and physics.

The two years' course in kindergarten methods is pointed out in detail like the above.

FAJARDO NORMAL AND INDUSTRIAL SCHOOL.

According to the school provisions, several municipalities bid for this school. Fajardo, in the eastern part of the island, made the best offer, and secured the school. One hundred acres of land beautifully located near the town have been obtained. The buildings will be erected upon an elevation with the view of the sea on two sides. The municipality placed \$20,000 in gold at the control of the insular board for the school. The other expenses will be paid from the insular treasury. The school is to be under the direction of the insular board of education.

The plans for building, course of study, employment of teachers, and the entire management of the school is under its direction. It is expected that the school will be a model in its several departments, and of incalculable benefit to the island. Instruction will begin as soon as the buildings are completed.

OTHER EFFORTS.

Carolina has appropriated \$1,200 for a three-room house. Ponce is preparing to establish a normal and industrial school at the cost of \$40,000.

SPECIAL AID.

Early in the year Hon. Charles J. Skinner visited the island with a party of excursionists and saw something of its educational needs.

On his return to New York he tendered free tuition to Porto Rican teachers who wished to attend the normal schools of his State. Later, Hon. Mason S. Stone, superintendent of the Vermont schools, made a similar offer.

Prof. W. F. Phelps, of Minnesota, was of the same mind:

The school board of St. Louis voted to aid the schools of Ponce with desks.

Recently the receipt of over a thousand desks from the Commissioners of the District of Columbia has been acknowledged.

Miss Sarah W. Dagget, State regent, Daughters American Revolution, State of Massachusetts, for the establishment of a school as a memorial to her father, Henry L. Dagget, late of Boston, at her own expense, sent the literature and equipment, including a piano, for a kitchen garden or elementary industrial school.

Maj. R. H. Pratt, superintendent of the Indian school, Carlisle, Pa., sent a set of sloid models.

Dr. Irwin Shepard, secretary of the National Educational Association, on behalf of the trustees of the association, furnished a set of valuable reports of the association.

Hon. W. T. Harris, LL. D., United States Commissioner of Education, was watchful to furnish every aid in the power of his office. He contributed specially to the collection of pedagogical literature. A gift from him of special importance was a large collection of pictures of school conditions in the States, including views of buildings, school appliances, arrangements, classes, etc., which were examined with great interest and advantage by the native teachers.

The United States maps from the United States Land Office, and United States flags from the Lafayette Post, have already been mentioned. Transportation on army vessels from New York for teachers, text-books and other supplies has been

ordered by the Secretary of War at the expense of the Department and to the great advantage of the island. For a time free transportation was given by order of General Henry to teachers and pupils wishing to study in the States. This was an important aid in the transformation of opinions in the island. Colonel Pullman and Major Clem and their assistants specially aided the work of education by furnishing transportation of supervisors, teachers, and supplies on and about the island.

Words like the following are especially helpful to those bearing the responsibilities of education in distant fields.

At a meeting of the American Institute of Instruction, held at Bar Harbor, Me., July, 1899, the following resolution was passed:

Resolved, That the educational policy of our new possessions should be shaped and their educational affairs be administered by recognized educators;

That the schools be kept free from all sectarian interference and control;

That the principles of a free and democratic education be observed;

That the English language be introduced and become the common language of the schools in the most expeditious but frictionless manner possible, and that all funds appropriated and distributed by Government for school instruction shall be given only to those schools which are free and public, in which the English language is taught and used, and which are absolutely under the control of the Government;

That appropriations for education be in proportion to the importance and value of the subject as compared with all other interests.

Extract from the declaration of principles by the National Educational Association at its meeting in Los Angeles, Cal., July 14, 1899.

The past year has brought new and grave responsibilities to our common country and has opened before it new and difficult opportunities. With a courage born of high hope and of confidence in democracy, the nation's schools and schoolmasters will assume their full share of the burden so suddenly imposed upon our citizenship, and will contribute by every means in their power to the wise, patriotic and democratic solution of the problems which confront us as a people. * * *

Committee on Resolutions.

RURAL SCHOOLS.

Opportunities for instruction in country sections were admitted on all hands to be most deplorable. There was no elasticity in the Spanish system of laws by which schools could be established at a distance from the centers of population. In some cases homes were far apart, scattered among the mountains. There were no roads, and only bridle paths at best. Schools were reported where pupils went over 7 miles to school. Not infrequently they had to pass mountain streams several times on their way, and, when these streams were swollen, at the peril of their lives. Schools when taught were of short continuance, attendance irregular, and in the main limited to boys. A large per cent of the girls in rural regions received no instruction. Even among the people there was no inclination to improve the condition, but where there was a desire for improvement there was no legal method provided by which any action could be taken by neighborhoods or districts. A carefully elaborated plan was therefore provided to meet this emergency. A small number of citizens could concert action, and, by securing the permission of the commanding general, obtain from the Bureau of Education instructions, agree upon geographical limits, elect officers, for whom a method of procedure was designated by which a school could be established and built, private teachers employed, taxes levied, collected, and expenses paid, thus putting it in the power of the most remote locality, after the method in the States, to act for itself in providing instruction for its children. The

scheme of education in the island can never be completed until this is accomplished. Without country schools, the island can never enter upon the full fruition of its possibilities. How a well established school and qualified teacher would speedily change the whole aspect of society in these benighted localities! Every interest appeals for an effort to accomplish this result. How it would transform the rudeness of labor, increase the skill of the hand, improve the quality of instruments of labor, and multiply the products of the farm and the shop! It has been found that the ability to read and write on the part of the rudest laborer who works with the spade and the hoe indicates an increased productiveness of 25 per cent. Suppose this skill is added to 500,000 of these ignorant laborers, what a daily increase of productiveness! How it would add to the comfort and wealth of the island and furnish means for increasing the comforts of living, save sickness, prolong life, and add to the possibilities of intellectual and moral uplift! The unfolding of the American flag furnishes the opportunity to begin this beneficent work. It should mean to these people a new era of hope and aspiration.

VOLUNTARY SCHOOLS.

A considerable number of voluntary schools, or schools other than those under government direction, have been opened on the island by teachers from the States. Some of the teachers undertake the task at their own risk, but most of them are sent to the island by large and responsible societies in the States. These societies have aimed specially at religious training. Their teachers are of superior character. They have high qualifications and generally speak Spanish and English. They use improved appliances and teach according to the most improved methods. Their instruction in the common branches of learning, in addition to their religious purposes, is substantially the same as that in similar branches under public direction. They offer a measure of opportunity to the large number of school children for whose instruction there is no public provision. Some of these schools have been reported to have attracted a larger attendance than they can accommodate. They are located at such points as San Juan, Ponce, Mayaguez, Lares, Santurces, Bayamon, etc.

Every Porto Rican educated in the States and every American teacher becomes the center of American influence. In the former case the benefits are so apparent that no ill feeling is likely to follow, but in the case of a teacher obstructive jealousies may arise.

CONCLUSIONS.

In the preparation of this statement or report, it has been felt that two special reasons emphasize the importance that it should be assured that the conclusions from it would be substantially correct; first, that it should be in no way misleading, because of the prevalence of misinformation on the subjects treated, and, second, because of the advantage in the effect upon legislation and administration of correct knowledge of the conditions herein described. If the future fails to understand the past, it loses the benefit of its lessons. This statement is not therefore made up of opinions and theories, but of documents and description of facts as they have occurred. Personally my relation with everybody in the island was pleasant. In general, officers and soldiers of the army manifested a sense of the importance of education to the island, and the people themselves looked toward changes in education to the American flag as a source of all the personal benefits which they anticipated. Naturally quick of thought, ready to catch ideas and to act, the people in their manners are courteous and in their hearts kindly. One becomes deeply interested in them. All facts about them must be seen as they are and given due weight. They can not be expected to be all alike, all either of a superior or an inferior type. They have the usual differences. Their race descent, climate, and occupations must be taken carefully into account. The original Indian has long since disappeared, save as his

characteristics are disclosed in the mixture with other races. As in the States, the recent arrivals from any country are to be distinguished from those whose ancestors made the island their home one, two, or three centuries ago. The people by descent are, first, mostly Spaniards; secondly, African; third, Corsican French; and fourth, a great variety of other sources. The French Consul claimed that in his study of property conditions he found that nearly half of the real estate was owned by persons of French descent. Africans and their descendants had been slaves until about 1873, when they were purchased by the Spanish Government and set free. The African mixture was of all grades. Race peculiarities and feelings were to be discovered, but color prejudice did not show itself with any force in the schools or in business. Social separation was fixed.

It is generally useless to give figures until the census is complete. The people, as I have indicated, are the few who are possessed of intelligence and of large or considerable wealth, or the many who are very ignorant and poor. We are accustomed to say that a great and powerful people has a large, intelligent, strong, and vigorous middle class. On the island this element of strength, the middle class, is wanting. This want affects all its possibilities, especially where the principle of government by majority is applied. Everybody asks, "Can the people of the island govern themselves?" Their aspirations for self-government are profound and universal; yet it is evident they have not reached the knowledge of what constitutes that unit self to which the principle of self-government is to apply; shall it be San Juan, or Ponce, or the whole island, or its whole population joined with the whole population of the States; what is the majority rule to include? All classes have lived under Spanish rule in a condition both of suppression and oppression, measured by our standards. They have not had the sunlight and warmth of liberty. They are necessarily like plants which have grown in the darkness, the needed light and warmth have reached them only in part; that something is wanting which the sunlight of free institutions enjoyed for centuries imparts. This want must not be attributed to race. These people along race lines look back to those among their ancestors of the noblest aspirations and of the most distinguished careers. What may be now wanting, free institutions will give them.

Can they govern themselves? Yes; some can and some cannot. Can those who are capable of self-government govern the whole body, or themselves and those who are not capable of self-government? This question can only be answered by experiment.

As they become a part of the body politic of the United States they must enter into the great average. Out of this great average of condition and sentiment comes fundamental law, calculated in any unit to secure the greatest good to the largest number. In the application of this theory of self-government there must be along with privileges provision for duties and adjustments, not allowing overtaxing trials or experiments to become self-destructive. This application must be looked at not as a theory, but as intensely practical. How far shall guides or preventatives be applied? When evils arise or disease in the body politic appears, how shall they be cured? What shall be the remedy? Who shall apply it? We believe certain great laws of human development are universal. Each race may illustrate in its history modifications, but no race is an exception. Each individual is subject to those laws, whether he is of Spanish, African, French, or Anglo-Saxon descent. Trusting to the operation of those fundamental laws, what of suffrage, the primary source of power in majority rule under free institutions? I would say divide it. Limit it as near as may be to manhood suffrage in all questions but those touching education. On questions of education make it universal. They appeal less to pecuniary gain and more to the kindly sympathies and involve less the immediate danger both to property and life. Mistakes have better chance for correction, motives appeal less to violence, and have less opportunity for the destruction of property or confiscation by taxation. All

political action should proceed upon the idea that it is educative and on the anticipation of indefinite improvement. Laws of Congress should be adjusted to all interests and fix all necessary fundamental rights and principles. The better all interests are balanced the less disturbance and conflict may be expected. Administration should be permissive of great freedom, but assure safety from destructive peril by providing for proper checks on the island, and, when required, from the President as the embodiment of the will of the United States. He should be provided with the same means of knowing of interests on the island as he has of knowing like interests in the States, by each and all his secretaries, and thus, through each and all, able to exercise the national authority when required, as authorized by the laws of Congress under the Constitution.

For two great interests now becoming prominent, as I see them, in our new conditions the cabinet of secretaries is unprepared. First, the friends are already awake to the fact that a secretary of trade, including manufactures and commerce, is needed. Second, I believe a secretary of education is imperatively required. Education is the one word which more than any other signifies the transformation to be effected in Porto Rico. All admit the same is true with reference to the recent acquisitions by the nation. It should not, therefore, be treated as inferior to any other interest. It should have equal opportunity at least both in reaching the President and receiving his action. Its far-reaching and complicated questions are enough to occupy the mind and absorb the devotion of a secretary of public instruction as a member of the President's Cabinet. Under him the present Bureau of Education, so much a favorite within its limitations as an office of information, thus fulfilling the constitutional relation of the nation to the States, would then naturally, retaining its functions, pass into the new department, while otherwise that department would be provided by Congress with methods of activity toward the new populations, whatever their relation or however large or small; and in these matters there would be no question of the right of Congressional legislation. Thus equipped, our national authority would "get a good ready" for its new duties—would be adapted to them.

As I see it, the fundamental law should provide (1) that public instruction should be universal and obligatory between the ages of 6 and 14, inclusive, and permissive, at present, until 18. The requirements of this law should be mandatory, so that no locality could nullify it. English and Spanish should be required. (2) Action by the island and by the locality should be properly combined. (3) Methods of temporary financial relief should be provided either by direct aid or by a duly authorized loan. (4) The moneys accruing from all sales of public lands should be set apart sacredly for education and deposited in the United States Treasury and their interest devoted to public instruction. (5) The tariff, as in the States, should be adjusted to the promotion of art, science, literature, and education. (6) The chief officer of education on the island should be nominated by the President and confirmed by the Senate, and be compensated as each of the other chiefs in charge of a great interest, and communicate, as others do, directly to the Cabinet officer, as already suggested.

The transformation expected of Porto Ricans is great. The present trying conditions have been intensified by the August hurricane of 1899. They must be rid of the ideas and practice wrought in them by Spanish rule and rise into that higher life compatible with self-government, with the full fruition of free institutions, liberty regulated by law. We need not wait for the historic delays which occurred under the Egyptians, the Greeks, and the Romans, or the mistakes of later times. With honest and skillful application of the principles and methods of education as now understood, the transformation is easy. The processes in the past were limited in the main to adults, when the character was fixed and customs crystallized and could only be changed by breaking; now education, in its large sense, not only includes all agencies

which are likely to modify adults, their ideas, institutions, laws and customs, public and private, but concentrates itself upon youth, beginning in the earliest years with the kindergarten, the kitchen garden, and the school of sloyd, and exerting itself especially through the period of youth, when all the powers are impressible and formative. The whole man is trained; the head, the heart, and the hand, as we are accustomed to say. The will, the directing faculty, is trained to obey the right, to follow the most exalted precepts for the good of the individual and society; the intellect or head is trained along the line of letters and science, and the hand along the line of industry, each from the first elementary and rude action, step by step, up the heights of learning on the one hand, and on the other to the application of science to handiwork up to the most masterly attainments of skill as guided through life by that old precept, "practice makes perfect."

This more complete and masterful education of our day not only makes the transformation of a people from the use of one language to another, and from one system of civil laws and social customs more easy, but more sure and speedy. Our American people from the first have cherished an aspiration that the blessings of free institutions which they enjoy might be extended to others. Without our foreseeing it, the opportunity is now in our hands to extend these blessings to millions scattered over the islands of the sea. We are not permitted to go back; we must go forward. With the proper adaptation of ourselves, the task is easy and the future safe.

It would be an impossible task for me to attempt to enumerate the numerous officers, civil and military, and citizens to whose kindness and aid I have been indebted in undertaking the duties above described, but to each and all I tender my hearty thanks.

CHAPTER V.

EDUCATIONAL EXTENSION IN THE UNITED STATES.

By HERBERT B. ADAMS.

I.

ORIGINS OF EDUCATIONAL DEMOCRACY IN ENGLAND.

POLITICAL ORIGIN OF POPULAR EDUCATION.

To understand the beginnings of the nineteenth-century movement toward educational democracy we must recognize the pioneer influence of English leaders. They are closely connected with the reform movement in politics and with the extension of the suffrage. The material which exists for a study of these relations is illustrated by the recently published *Life of Francis Place*, by Graham Wallas, a prominent leader in the present cause of university extension and municipal reform in London. He shows very clearly the democratic influence of old Major Cartwright and of William Cobbett, both of whom had lived for many years in America; also the liberalizing spirit of Jeremy Bentham, Lord Brougham, James Mill, and other English philosophers and statesmen. Francis Place, William Lovell, Dr. Anderson, Dr. Thomas Arnold, and a considerable number of popular teachers and writers represented in England that same movement toward the education of the common people as did American lyceum leaders, who are specially considered in the present monograph. The writer has discussed this subject in a chapter on "English pioneers of university extension" in a monograph on "University extension in Great Britain," published by the United States Bureau of Education.¹ The following additional observations will perhaps aid in discovering other historic origins of educational democracy in our mother country, which certainly received its first impulse in this direction from the American and French revolutions.

The downfall of Napoleon Bonaparte was the beginning of the liberation of Europe, and especially of the English people. For over twenty years (1793-1815) England had waged relentless war against France, first against a revolutionary republic and then against a military despot who had throttled the revolution and threatened the conquest of England. Although representative government had been granted to Canada in 1791, all thought of popular government in England was suppressed until after the overthrow of the archenemy of Great Britain. *Inter arma silent leges*. In war time the voice of reformers is stilled and the noise of party conflict is hushed.

I. MAJ. JOHN CARTWRIGHT, 1740-1824.

In the winter of 1814-15 (while Napoleon was still in the Island of Elba) Maj. John Cartwright organized the famous Hampden Club for restoring the political lib-

¹ Rep. Com. Ed., 1898-99, Vol. 1, pp. 957-1055.

erties of England. Soon after, he sent printed petitions all over the country in order to secure signatures in favor of his favorite political doctrines, which afterwards in 1838 became the six points of Chartism:

- (1) Annual parliaments.
- (2) Equal electoral districts.
- (3) Suffrage for all taxpayers.
- (4) The ballot instead of viva voce voting.
- (5) Payment of members.
- (6) Abolition of property qualifications for members of Parliament.

Some of these popular ideas of constitutional reform were first suggested by Major Cartwright as far back as 1776 in a pamphlet entitled "Take your choice," revised and republished in 1777 under the title "The legislative rights of the commonalty vindicated." The influence of English history and American politics on Cartwright was profound. He was one of the English defenders of local legislatures for the American colonies. He became famous as the "Father of Reform."

Major Cartwright was, when he organized the Hampden Club, an old man. In fact, he was known as the "Old Gentleman." Possessing some wealth and good social position, he was regarded with general respect; but he was not the man for the times. Francis Place, who aided him in his patriotic work of political agitation, says of him:

When he was in town he used frequently to sup with me. * * * He was, in political matters, exceedingly troublesome, and sometimes as exceedingly absurd. He had read but little or to little purpose, and knew nothing of general principles. He entertained a vague and absurd notion of the political arrangements of the Anglo-Saxons, and sincerely believed that these semibarbarians were not only polished people, but that their "twofold polity," arms-bearing and representation, were universal and perfect.

Major Cartwright's opinions and political agitations bore no immediate fruit, for Napoleon broke loose from Elba March 1, 1815, and scared all Europe for one hundred days; but old Major Cartwright's ideas¹ were never forgotten by Francis Place (1771-1854), or by the English people; in fact, Place himself gave them fresh vitality and historic currency in the People's Charter, drafted by him in 1838.

2. WILLIAM COBBETT (1762-1835).

If Major Cartwright gave historical impulses to the democratic movement in England in this nineteenth century, William Cobbett, by his journalistic and editorial work, did much toward the development of public opinion in the national agitation from 1816 to 1830.

William Cobbett, born in a thatched cottage near Aldershot on the borders of Berkshire and Hampshire, was the grandson of a day laborer, and the son of a tavern keeper who was intelligent enough to teach his boys to read, write, and cipher. "I do not remember the time," wrote Cobbett, "when I did not earn my own living. My first employment was scaring birds, my next was weeding [beds of flowers in the garden of the Bishop of Winchester at the Castle of Farnham, Cobbett's native town], and tending a single horse at harrowing barley. Hoeing pease followed; and then I arrived at the honor of joining the reapers in harvest, driving the team, and holding the plough."

Such was the thrifty, rural, agricultural curriculum of that son of the soil, that

¹"The life and correspondence of Maj. John Cartwright," edited by his niece, F. D. Cartwright, was published in 1826, and reviewed by Francis Place in the Westminster Review, October, 1827, under the absurd title "History of parliaments," Article I. The second article, although promised by Place, never appeared. Graham Wallas says the first gets no further than 1688, and consists of "a pointless series of facts from original sources, put together in a style compared with which that of Stubbs' Constitutional History is airy and journalistic." A list of Cartwright's writings, some eighty tracts and books, is given by his biographer.

English populist, journalist, and demagogue, William Cobbett. He had the pride of a so-called "self-made man," as appears from the following boasting account of himself:

Thus was I receiving my education, and this was the sort of education; and I am perfectly satisfied that if I had not received such an education, or something like it, that if I had been brought up a milksop with a nursery maid everlastingly at my heels, I should have been at this day as great a fool, as insufficient a mortal, as any of those frivolous idiots that are turned out of Winchester or Westminster school, or any of those dens of dunces called colleges or universities.

It is impossible to admire arrogance or conceit, boastfulness or social scorn, either in demagogues, pedants, or college graduates. No one should ever plume himself upon being "self-made" in mind or body. William Cobbett ascribed his "birth of intellect" to reading Dean Swift's Tale of a Tub, but he owed more to his sensible father, who taught him to read and to work. The son was a hard reader and worked to the end of his days, but he was first really educated by outdoor life, farming and gardening, in rural England. Agriculture is still a sufficient school for many a "village Hampden" in England and America. Cobbett then took a graduate course in military training in the English army, where he found abundant leisure for reading and became a good disciplinarian and sergeant-major, consequently a literary martinet and political fighter for the rest of his life. Cobbett came out to Nova Scotia with his regiment, found there a good wife who saved his money. He retired from the army and settled in Philadelphia, where, true to his early love for books, he opened a bookstore. Soon after he launched out as an editor of *The Porcupine Gazette*, in which he showed his aggressive English qualities by assailing anything French or republican. Fined heavily for libel in Philadelphia, he returned to England and became for a time a Tory pamphleteer in the interest of Mr. Pitt. But his experience in America made itself felt in England, and he went over to the Liberal Party.

In the year 1802 William Cobbett founded the *Political Register*, which became the organ of the revolutionary and reform movement in England. This movement had been repressed by coercive laws in 1795 and 1800 and by the necessary war with Napoleon. We have seen how the democratic spirit was revived by old Major Cartwright and the Hampden Club in 1815. In this same year, Cobbett put the price of his *Political Register* from a shilling and a half-penny down to twopence. This inaugurated democracy in journalism. "The 'Twopenny Trash,' as it came to be called," says Graham Wallas, "at once acquired an enormous influence, and through it Cobbett with his friend 'Orator Hunt' began to crystallise the widespread discontent into a definite demand for parliamentary reform."

Cobbett and Orator Hunt addressed their efforts chiefly to the working classes and the disaffected elements in English politics. The *Political Register* became, like some of our modern newspapers, a great power with the people. Cobbett was always looking for political and social abuses. He struck out savagely against every grievance. He has been called "an Ishmaelite of the political world; the Thersites of journalism." He attacked every ministry in succession and never pretended to be loyal to anybody except to his wife and family. He was consistent only in striving for democratic progress in England.

"For all the abuses he attacked from 1801 to 1832," says Mrs. Latimer in her *England in the Nineteenth Century*, p. 121, "his panacea was parliamentary reform. He formed associations for reform, he lectured for reform, he pressed reform on all his readers (and they amounted weekly to some hundred thousand). Over the top of his paper was always set a woodcut of a gridiron, because he had said he would rather be roasted to death than give up the cause of reform."

Cobbett became a kind of political extension lecturer. He traveled on horseback through English towns and villages, everywhere attacking the existing evils in tax-

ation and representation, especially the rotten borough system. One should read Cobbett's *Rural Ride through England* for a picture of the man and his times. Cobbett was an excellent writer and speaker. Hazlitt says of him:

Mr. Cobbett speaks almost as well as he writes. The only time I ever saw him he seemed to be a very pleasant man, easy of access, affable, clear-headed, simple and mild in his manners, deliberate and unruffled in his speech, though some of his expressions were not very qualified. He had a good sensible face, rather full, with little gray eyes, a hard, square forehead, a ruddy complexion, with hair gray and powdered, and had on a scarlet broadcloth waistcoat, with the flaps of the pockets hanging down, as was the custom for gentlemen farmers in the last century, or as we see it in pictures of members of Parliament in the reign of George I. I certainly did not think less favorably of him for seeing him.

Cobbett used to amuse himself by criticising the bad style of the state papers of the English Government and by illustrating bad grammar from the writings of prime ministers. He carried politics into his published tractate, called *Cobbett's Grammar*, which is to be strongly commended for a careful and entertaining study of the subject of political style. Cobbett is one of the very few writers who have succeeded in making mere grammar interesting. I shall never cease to be grateful to an old Baltimore lawyer and lover of Greek, the late Mr. Alexander Rogers, who, in the library of the Maryland Historical Society, first called my attention to William Cobbett's little book exposing the bad style of English statesmen.

Cobbett lost his fortune and was driven out of Philadelphia for libeling Dr. Rush. Ten years later he was fined £1,000 in Westminster Hall and sentenced to two years' imprisonment in Newgate for another offense of this character. He was always getting into trouble on account of his political writings in the *Register*. No writer excelled William Cobbett in the vigorous use of the King's English. He could pour out a perfect torrent of invective and vituperation. His controversial writings deserve to be compared with the *Letters of Junius*. It was considered the proper thing to hate and revile him in his lifetime. Francis Place called him an "impudent mountebank" and "an unprincipled, cowardly bully." Certainly William Cobbett had no fear of man before his eyes. He spoke out boldly for the common rights of Englishmen when most of his contemporaries were too selfish or too timid to be champions of the popular cause.

Cobbett's work was essentially that of a pamphleteer. He was an English Tom Paine, a forerunner of Horace Greeley and Charles A. Dana. He was an educational editor in politics. He became a member of the first Parliament after the passage of the reform bill and championed the agricultural interests of England, with which he had been more or less identified from his youth up. He opposed the manufacturing classes and stood for the honest farmer. Cobbett introduced Indian corn into England from America, and the English still speak of it as "Cobbett's corn." His monument is, however, the *Political Register*. His career was that of an agitator and a fearless journalist. He was one of the pioneers of modern English democracy; but, like old Major Cartwright, he learned his democratic lessons from America. He abused and praised this country by turns.

3. FRANCIS PLACE (1771-1854).¹

This English pioneer of the reform bill of 1832 and of Chartism, 1833, deserves to be better known. Graham Wallas, of the London School of Economics, has made an admirable contribution to English constitutional and social history in reviving in historical and literary form the life of this forgotten radical and utilitarian philosopher, this friend of Cartwright, Jeremy Bentham, James Mill, and J. B. Say.

A man of the people, a journeyman tailor at one time, Place early became a

¹The Life of Francis Place, by Graham Wallas. London, 1898. Reviewed in *The Citizen*, May, 1898, and in the *American Historical Review*, July, 1898, pp. 723-25. Article on "Place," by Blanqui, in the *Dictionnaire de l'Économie Politique* (Coquelin & Guillaumin, Paris, 1853), vol. ii, 369.

scholar, a master and organizer of labor, a man of property and leisure, a writer and successful agitator, and withal a trainer of politicians and members of Parliament.

Richard Carlile said of him in an article in the *Monthly Magazine*, for May, 1835, on "The real nobility of human character:" "Francis Place, by his assistant labors and advice given to members of the House of Commons, has produced more effect in that House than any man who was ever a member." Graham Wallas says that Joseph Hume was Place's greatest and most permanent success as parliamentary schoolmaster, but many members and men of different parties owed to Place their higher political education. Wallas tells us:

There is an old gentleman still alive and active who can remember being taken as a boy, about the year 1820, up into a big room lined with books at the back of Place's shop, and being told in a reverential voice that this was the headquarters of English radicalism. Place had been a collector of books ever since his school days, and continued to collect nearly to the end of his life. From the first the library was especially rich in parliamentary papers, catalogued by subjects, and in pamphlets and newspaper cuttings, bound and lettered with his own hand. Everything was arranged with that scrupulous "method and tidiness and comfort" to which Place's correspondents often refer.

This was the "Civic Palace, Charing Cross," where the "Arch Radical" sat all day long on a high stool at his desk, as before his retirement from business he had sat all day long in the adjoining shop. Every member of Parliament who lived, as most members then did, in Bloomsbury or the city, would pass Charing Cross twice a day. In any case, the House of Commons and Downing street were both within a few minutes' walk.

"My library," says Place, "was a sort of gossiping shop for such persons as were in any way engaged in public matters having the benefit of the people for their object. * * * No one who knew me would hesitate to consult with me on any subject on which I could either give or procure information." And again, "When I lived at Charing Cross my library was frequented very much in the manner of a common coffee-house room. It was open to a considerable number of persons, many of them members of Parliament." In times of excitement the room became crowded.

A very good description of Place and his daily life about this time was given in the *Northern Liberator*, "Francis Place * * * is about 5 feet 7 inches high, with a head which would delight the phrenological taste of our worthy friend Alderman Fife, and is of a stout, stalwart frame. A walk of 20 or 30 miles a day is one of his favorite amusements; but his time, from 6 in the morning to 11 at night, is generally spent in his library, where he is surrounded with books, pamphlets, journals, and memoranda of every kind—political, philological, physiological, and every other 'cal' which can be imagined, all arranged in such perfect order that he can put his hand on any book or paper he may want in a moment. The bump of order is in him very prominent indeed."¹

It is impossible, in this connection, to do more than briefly summarize some of the most valuable contributions made by Francis Place to the history and forward movements of his time:

(1) He was a leading spirit in the London Corresponding Society, founded in 1791 by Thomas Hardy, its first secretary. Entrance fee, 1 shilling; dues, 1 penny a week. The object of this society was correspondence with individuals and other societies for the promotion of democratic ideas among the working classes. Edmund Burke, who hated anything which proceeded from the French Revolution, pronounced the London Corresponding Society "the mother of all mischief." After the arrest and imprisonment of Hardy, Francis Place became the dominating influence among the workingmen of London. He organized trades unions and drafted their laws and constitutions.

(2) Francis Place devised a plan of radical reform, promoted by correspondence. He revived the ideas of Major Cartwright: (1) Manhood suffrage, (2) annual Parliaments, (3) payment of members, etc.

(3) Place advocated the education of workingmen. He had enjoyed ten years of schooling in his youth, and had been passionately devoted to good reading. When

¹ Graham Wallas: *Life of Francis Place*, pp. 176-178.

out of work, instead of moping and despairing, he engaged in the hardest kind of study.

"My desire for information," he says, "was, however, too strong to be turned aside, and often have I been sent away from a bookstall when the owner became offended at my standing reading, which I used to do until I was turned away. * * * I used to borrow books from a man who kept a small shop in Maiden Lane, Covent Garden, leaving a small sum as a deposit, and paying a trifle for reading them, having one only at a time." During the first year of his married life he had lodged with an old woman who took charge of chambers in the Temple, and lent him books borrowed from the rooms which she cleaned. At that time he said he had already worked through "the histories of Greece and Rome, and some translated works of Greek and Roman writers; Hume, Smollett, Fielding's novels, and Robertson's works; some of Hume's essays, some translations from French writers, and much on geography; some books on anatomy and surgery; and some relating to science and the arts, and many magazines. I had worked all the problems in the introduction to Guthrie's Geography, and had made some small progress in geometry."

His landlady enabled him to read "Blackstone, Hale's Common Law, several other law books, and much biography." When out of work he read "many volumes in history, voyages and travels, politics, law and philosophy, Adam Smith and Locke, and especially Hume's Essays and Treatises. These latter I read two or three times over. * * * Reading of Hume put me on improving myself in other ways." (Graham Wallas: *Life of Francis Place*, pp. 17-18.)

This love of reading and this desire for self-improvement Place endeavored to introduce in the Breeches-Makers' Union, which he organized in 1794, and into the London Corresponding Society. Both of these organizations had a system of book subscriptions whereby each man in the union subscribed for a particular but generally useful and readable book. Before claiming it as private property he allowed his associates to read it. This literary communism is an excellent feature of modern book clubs. The effect of good reading upon Place and his companions on the general committee of the London Corresponding Society was most helpful. He himself said: "We had Sunday evening parties at the residences of those who could accommodate a number of persons. At these meetings we had readings, communications, and discussions." Again: "This course of discipline compelled them to think more correctly than they had been accustomed to do; it induced them to become readers of books, and the consequence, the very remarkable consequence, was that every one of them became a master, and permanently bettered his condition in life."

(4) Francis Place was one of the most ardent supporters of "schools for all," that form of popular education first revived in England by Andrew Bell and Joseph Lancaster, but borrowed from India, where the elder children still teach the younger in open air under the shade of forest trees. The so-called Lancastrian or monitorial system of school training was inaugurated in London in 1798 in a shed on Borough road by a Quaker named Joseph Lancaster, who got his idea from Andrew Bell's pamphlet published the year before and entitled "An experiment in education, made at the male asylum of Madras." The original experiment of teaching boys in squads and utilizing the elder to drill the younger had been tried by Dr. Bell in an institution for the education of English boys, sons of officers, and English residents at Madras. Lancaster repeated it for the benefit of poor children in London, and claimed that his system could be extended over all England and that 1,000 pupils could be taught at once by 100 monitors. The estimated annual cost was less than 5 shillings per pupil.

Lancaster's projects proved, however, more costly than he had imagined. He became involved in debt and had to appeal to the public in 1804. Francis Place examined the Lancastrian system, avowed his belief in it, and subscribed money. Benevolent Quakers subscribed funds, paid off Lancaster's debts, and formed, in 1810, the Royal Lancastrian Association, which, under Place's influence, became, in 1813, the British and Foreign School Society, which exists to this day, and which laid the historic foundations for the Forster education act of 1870.

Place differed with Lancaster and the Quakers in his ideas. They were still attached to the inherited English idea of charity schools, or education for the poor. Place wanted to break away absolutely from all class distinctions and have schools for the people—schools for all. In the by-laws which he drafted for the British and Foreign Society, he omitted all reference to the “poor” and the “laboring poor.” He insisted that the children of the middle classes as well as the working classes should be given educational advantages; and he believed that all parents who could afford to do so should be required to pay a penny a week for the teaching of each child. He thus early represented the Prussian economic idea in popular education.

Place differed with Lancaster and the Quakers and the established views of his time on the subject-matter of popular education. The orthodox party desired to restrict all school reading to the Bible and to make church attendance, in some form, compulsory upon all Lancastrian pupils. This, again, like charity schools, was an idea inherited from Rome and the Church of England, and is still held by extreme churchmen of all sorts. Place and his friends, Brougham, James Mill, and Jeremy Bentham, opposed religious and sectarian ideas in popular education, and were both pioneers of the modern thought of intellectual freedom in school training. Brougham said he would “blow up the whole Lancastrian concern” if he should find a tendency for converting it into an instrument of bigotry and superstition. James Mill touched the keynote of Place’s educational philosophy in a famous essay entitled “Schools for all, not schools for churchmen only.”

The Church of England had early scented danger in the Lancastrian Association, which was popular with Quakers, Non-Conformists, and utilitarian philosophers. In 1811 was organized the “National Society for the Education of the Poor in the Principles of the Established Church.” This organization has been the historic rival of the British and Foreign School Society, founded by Francis Place. Both still survive in the party conflicts of English educationists, but Place was the pioneer of these modern ideas:

- (1) Education is not for the poor, but for the people.
- (2) Education is no charity, but a right.
- (3) Education is not for the benefit of any church or sect, but for all.

In the time of the Chartist agitation in 1840, when William Lovett was advocating the idea of Chartist schools, Place strongly opposed him, and said: “I hope to see the time when £20,000,000 will be voted to pay for the building of schools—schools for all, and not schools for churchmen or Chartists only—and when a compulsory rate will be levied on all, in each school district, by a committee of the district, to pay the expenses of carrying on the schools, in which the teaching shall be really good and apart from all religion, and especially apart from all sectarianism, whether religious or political.” This sound public doctrine from a professed Chartist clearly anticipates the most advanced American as well as progressive English thought upon the subject of public schools. They ought not to be specifically Protestant or Catholic in religion nor specifically partisan in politics or medicine.

Francis Place also anticipated some of the best modern ideas in public school work. Up to his time the English notion of a liberal education was a smattering of classical culture, with some mathematics. Place wanted to introduce modern languages, politics, economics, and morals—in short, a really useful education for the children of the middle classes.

Place did not favor the prevailing English custom of sending boys away to great boarding schools, which, by the way, are the so-called “public schools,” like Eton and Rugby. He favored higher day schools, town schools, such as Rugby originally was, schools where lads could enjoy, as Place said, “the advantages which are to be derived from the learning of a master, and the emulation which results from the society of other boys, together with the affectionate vigilance experienced in the house of their parents.”

Place understood the educational value of games. "It is as necessary," he wrote, "for boys to play together as it is that they should be taught together. It is therefore intended (in the scheme for higher Lancastrian schools), if possible, to provide a space large enough for this purpose, in which their games may be made more attractive and more useful than they have hitherto been, where new ones may be introduced, and thus their very amusements out of school may be made to conduce to their improvement, and their morals made much more conducive to their happiness, by teaching them, as it were, in a little world of their own, patience, forbearance, and kindness to one another."

Place had also the idea of employing the higher Lancastrian schools as normal schools for the training of pupil teachers and as evening schools for adults and apprentices. He thus anticipated two of the best modern methods of promoting popular education. But he did not succeed in carrying his project for so-called "chrestomathic schools," or schools of useful knowledge, based on Jeremy Bentham's treatise, "Chrestomathia" (from *chrestos* and *mathein*, signifying select or useful knowledge). Bentham's utilitarian idea in education took historic shape in the so-called Library of Useful Knowledge, a series of publications still in progress and still one of the most helpful adjuncts of higher popular education.

Place's enthusiasm for this kind of popular education finally found an outlet in the Birkbeck Institute, first known as the London Mechanics' Institute, originally proposed by his friend Thomas Hodgskin. Place was present at the first course of lectures on chemistry, in March, 1824, and describes his joy at the sight of "from 800 to 900 clean, respectable-looking mechanics paying most marked attention."

As one of the founders of the above institution he took the deepest interest in its welfare. It flourishes to this day under the name of the Birkbeck Institute, the historic pioneer of all the mechanics' and polytechnic institutes in England and America.¹

REPEAL OF THE COMBINATION LAWS.

"The repeal of the combination laws in 1824-25 was," says Graham Wallas, "the most striking piece of work that Place ever carried through single handed. During the eighteenth century there had been passed a series of statutes directed against combinations of journeymen in particular trades," or what we should now call trades unions or labor unions. The first of these repressive laws was an act passed in 1721 for "regulating the journeymen tailors." The last was the comprehensive act of 1799, "to prevent unlawful combinations of workmen."

The effect of these combination laws was to make labor absolutely subject to capital. Workingmen were compelled to work on the employer's own terms. Any refusal of offered work meant possible imprisonment or impressment into military or naval service. The masters of trade could arbitrarily lower wages and treat journeymen with the most cruel tyranny. Place himself had been blacklisted as a journeyman breeches maker and had been driven to the very borders of starvation. He had been an employer of labor since 1799, but left business in 1813 and devoted himself through education and legislation to the improvement of the condition of the working classes, whom he so thoroughly understood.

Place's objections to the oppressive combination laws of England are briefly summed up in the following extract from his pamphlet entitled "Observations on Huskisson's speech," London, 1825:

If keeping down wages was a national good; if the degradation of the whole body of the working people by law was desirable; if perpetuating discord between masters and men was useful; if litigation was a benefit; if living in perpetual violation of law was a proper state for workmen and their employers to be placed in, then the laws against combinations of workmen were good laws, for to all these did they tend.

Place had begun agitation for the repeal of these combination laws as early as 1814. His principal means at first were, (1) correspondence with trades unions, from which

¹For further discussion of this subject see University Extension in England, by H. B. Adams.

he gathered useful information on strikes and concrete cases of the oppression of labor; (2) the press, through which he created editorial and public opinion adverse to the enforcement of the combination laws. He succeeded in enlisting the support of the London Times, the Chronicle, the Star, and the Scotsman in his chosen cause. He even advanced money for the support of a weekly trade paper, the Gordon, for the sake of influencing the press at large as well as representatives of labor and capital. On this use of newspapers Place once said: "It has always appeared to me to be good policy to work with the press in any way it may at any time be willing to work for the public good."

A third method in Place's propaganda was the public use of the authority of expert economists, e. g., McCulloch, editor of the Scotsman, a paper which he supplied with full information on the evil working of the combination laws. McCulloch gave scientific expression to the facts and opinions of Place in an article on the repeal of the combination laws, published in the Edinburgh Review, No. 78. This economic article had great weight with some members of Parliament, and "one of them said he was prepared to speak the substance of the essay in the House."

A fourth and most efficient method of carrying the repeal of the combination laws through Parliament was the thorough and systematic "coaching" which Place gave to Joseph Hume, an influential member of the House of Commons, whom he constantly supplied with evidence, classified information, digests, and briefs. Graham Wallas says, "Place's greatest and most permanent success as a parliamentary schoolmaster was with Joseph Hume." And Hume said that Place was "the most disinterested reformer he ever saw, valuable in council, fertile in resource, performing great labors; but he never thought of himself. Honors and advantages he might often have commanded, but he preferred assiduous and private services, which he rendered of his own zeal, and defrayed out of his own wealth."

Place's campaign for the repeal of the combination laws in 1824 and the defense of this repeal in 1825 cost him more than \$1,000, but he won his cause both in the House of Commons and in the House of Lords largely by his own personal efforts and by the methods above described. Whenever Hume slackened in his support, Place reinvigorated him and once more set his champion upon his legs. He virtually drafted the repeal and pushed it through by the most energetic but tactful canvass. There were really three distinct measures thus carried through Parliament: (1) An act to repeal the laws relating to the combination of workmen, and for other purposes therein mentioned (5 George IV, c. 95). (2) An act to consolidate and amend the laws relative to the arbitration of disputes between masters and workmen (5 George IV, c. 96). (3) An act to repeal the laws relative to artisans going abroad (5 George IV, c. 97).

Place thought that this body of good legislation would put an end to trades unions, strikes, and all further difficulties between capital and labor, but the war had only just begun. The late Mr. Gladstone, in an article on "The English laborer," said in 1892, "The labor question may be said to have come into public view simultaneously with the repeal, between sixty and seventy years ago, of the combination laws which had made it an offense for laboring men to unite for the purpose of procuring by joint action, through peaceful means, an augmentation of their wages. From this point progress began." This repeal was the first great emancipation of English labor. From this time on trades unions grew and flourished more than ever. Industrial democracy began to be organized and Parliament endeavored to undo its own work; but Place rallied in 1825 such imposing cohorts of opposition against Peel and Huskisson and a reactionary committee on Mr. Hume's act of 1824 that the repeal was practically reaffirmed.¹

The connection of mechanics' institutes and labor leaders with English university

¹ For detailed accounts of this important work of emancipating English labor, see Graham Wallas's chapter on "The combination laws" in his *Life of Francis Place*, and *The History of Trade Unionism* by Sidney and Beatrice Webb, London, 1892.

extension has been already traced in a previous contribution to the Report of the Commissioner of Education,¹ and we now pass to certain American aspects of educational democracy.

II.

AMERICAN LYCEUMS AND POPULAR EDUCATION—1826-1900.

The American Lyceum was a popular society, at once local and national, for the diffusion of useful knowledge. The institution was one of the numerous educational agencies which attempted to realize the spirit of George Washington's patriotic injunction in his Farewell Address, wherein he said: "Increase the institutions for the diffusion of knowledge among men." The American Lyceum should be associated with that historic group of institutions which sprang from the democratic influence of the American and the French revolutions. It belongs to a goodly company of institutes, libraries, museums, and other schools for the people.

The American or national museum was the federation of State and local types and was styled the American Lyceum. It was supposed to comprehend all the rest and was founded in New York City in 1831.

The journal of the first convention, held in the district court room of the city hall, is printed and gives the names of delegates from the State lyceums of Maine, Massachusetts, and New York. Professor Olmsted and Mr. Barnard represented Yale College. Henry Duffield represented Dickinson College and the citizens of Carlisle, Pa. There were five delegates from "the village of Brooklyn" and three from Washington County, N. Y. The chosen president of the convention was Alexander Proudfit, D. D., of Salem, Washington County, N. Y. Thus all types of local lyceums were represented in the formation of the National or American Lyceum, the constitution of which is printed in full, together with specimen constitutions of town, county, and State lyceums.

The objects of the American or National Lyceum were declared by the constitution (article 2) to be "the advancement of education, especially in common schools, and the general diffusion of knowledge." Annual May meetings in New York City were provided for. There were corresponding secretaries appointed for various cities and sections. Important educational subjects of national interest were discussed by the National Museum, and some of the contributed papers were published, e. g., one by Hon. Theodore Frelinghuysen, entitled "Study of our political institutions," an essay on the propriety of introducing the Constitution and political institutions of the United States as subjects of instruction in common schools.

Among the measures approved and recommended by the executive committee at various times were the following:

1. The plan of employing agents.
2. Formation of a central cabinet or museum of natural history by means of local contributions.
3. A system of exchanges for the benefit of local museums.
4. Promotion of cooperation between schools.
5. General introduction of apparatus for illustrating lectures.
6. Addition of vocal music to common school education.
7. Study of American history and constitutional law.
8. Study of natural history and environment.
9. Town maps and local museums.
10. Preservation of materials for local history.
11. Uniform plan for keeping meteorological tables.
12. People's colleges with various departments of mechanical and fine arts.
13. Beautifying of village scenery [village improvement].
14. Text-books for schools and tracts for the people.

¹ University Extension in Great Britain, referred to above.

Many of these features will be recognized as practically identical with those of certain modern projects for educational and social betterment. Most of these objects were earnestly promoted and are worthy of historic record as characteristic features of the first great movement for popular educational extension in these United States. Essays and school text-books were published under the auspices of the American Lyceum and the American Annals of Education. Vigorous efforts were made to introduce history, the study of political institutions, and natural science into the public schools. The lyceum movement was closely connected with that general advance in public education which is represented by the extension of the common school system, the normal education of teachers, and the extension of libraries, first in school districts and then in towns and cities. Lyceum extension was far more general and popular than the later "university extension," because, like mechanics' institutes, it was a more democratic and spontaneous movement. Both lyceums and institutes are American extensions of popular English movements for the diffusion of useful knowledge.

Correspondence was early opened and long maintained with friends and ministers of education in Mexico, Cuba, Venezuela, and New Granada. Sketches of education in Spain and the new republics in South America were published or reported by the American Lyceum, which represented an international as well as a national spirit.

Origin in New England.—The lyceum system was first proposed to the public in the American Journal of Education, No. 10, 1826. About this time a society of thirty or forty farmers and mechanics was organized at Milbury, Mass., and became known as the Milbury Branch of the American Lyceum. Twelve or fifteen neighboring towns followed this local example, and subsequently united by delegates in forming the Worcester County Lyceum. A similar group of local societies was organized in Windham County, Conn.

Extension westward and southward.—The system quickly spread throughout New England and extended westward to New York, Newark, N. J., Ohio (Cincinnati and Marietta), Michigan (Detroit), Indiana (Franklin Lyceum at Jacksonville), and Illinois. Lyceums are early reported in East Baltimore and Washington. There were corresponding secretaries in Lexington, Ky. (Rev. B. O. Peers), Richmond, Va. (Oliver A. Shaw), and in Alabama (Alva Woods, D. D.).

The writer has before him an octavo volume of 100 pages belonging to the State library at Albany, and entitled the "American Lyceum, with the proceedings of the convention held in New York, May 4, 1831, to organize the national department of the institution." It includes the proceedings for 1832 and 1833 (Boston: Hiram Tupper, printer). It is stated that there were in 1831 "not less than eight or ten hundred town lyceums, fifty or sixty county societies, several State lyceums, and a general and national union of the whole."

General characteristics.—The American Lyceum is characterized as (1) a voluntary institution. It invited the cooperation of citizens in every town, village, and neighborhood throughout the Republic for the double purpose of local and national improvement. Branch lyceums were suggested for every town in the Union. All the friends of common schools were invited to cooperate in "the great and dignified cause of universal education."

(2) The lyceum is described as a social institution. Public instruction was advocated upon a social basis. The subjects of instruction were to be treated in a familiar, conversational way. Natural science was to be made practical. "The principles illustrated in lyceum hall are exemplified and amplified in the shop of the mechanic, the farm of the husbandman, and the kitchen of the housekeeper. Those who associate upon this principle are a town lyceum when together, and several family lyceums when separated."

(3) The lyceum is further characterized as a self-adapting institution. It may be conformed to the needs of any class or community. Farmers, mechanics, merchants, teachers, women—each group may have its own lyceum or may become departments

of one general society. Women's clubs, teachers' associations, and farmers' institutes were clearly anticipated by these town and village lyceums.

(4) The lyceum is a republican or patriotic institution, holding itself above party politics, teaching the privileges of citizens and the rights of free men. "It has for its object the universal diffusion of knowledge, which has ever been considered the strongest and surest, if not the only, foundation of republican government. It aims at universal education, by inducing and enabling all whom it embraces to educate themselves." This idea was undoubtedly the most radical and popular feature of the American lyceum. It was the idea of self-help in education in connection with self-government. It was the idea of educational democracy, and had a powerful influence historically in promoting popular and adult education in America, as well as strengthening the foundations of common schools and local libraries.

(5) The lyceum was a benevolent and Christian institution. It was based upon neighborly good will, disinterested and universal benevolence, self-help, and mutual aid. Teachers were bound not only to instruct their pupils, but to do good to each other and the world. Their improvements in the science and art of teaching were made known in town and county lyceums and became public property. Men and women felt bound to add to the common stock of human happiness by contributing all that their talents and opportunities permitted; in short, to do all the good they could. This spirit still survives in the teachers' institute or association.

Main types of lyceums.—Among the historic and generic types of lyceums in the country were those associated with (1) a town, district, or village; (2) a county; (3) a State; (4) the nation.

Town or local lyceum.—The constitutional objects of the town lyceum were mutual improvement and the general diffusion of knowledge. The means for effecting these objects were meetings for reading, conversation, discussions, dissertations, illustrating the sciences, or other exercises which should be thought expedient; a cabinet consisting of books; apparatus for illustrating the sciences; plants, minerals, and other natural or artificial productions. Annual membership was rated at \$2; life membership at \$20. Persons under 18 years of age could enjoy for \$1 per annum all the privileges of the society except voting.

Lyceum proceedings.—These varied somewhat in different localities, but it was a very general custom to have weekly meetings, with alternate lectures and debates. Popular science was a favorite subject of public instruction, and no lyceum was properly equipped unless it possessed a so-called "philosophical apparatus" for experiments in physics or natural philosophy. The favorite subjects of public discussion were practical and economic; for example, the utility of railroads, which came into vogue at the very time that lyceums and education were rising in popular favor.

Lectures and discussions were often extempore, but sometimes elaborated by local appointees and read from manuscript, with copious citations from good authorities. Home talent and self-help were the life principles of a village or town lyceum. A community which could not produce its own lecturers and debaters could not support a good lyceum. It was a training school for adults, and many Americans here received a decisive impulse toward public life. That gift for public speaking for which Americans have long been famous was locally fostered by debating societies and in other ways.

Junior members.—"It is becoming common in country towns for the first class, or the oldest pupils in each of their schools, to become members of lyceums, not merely to witness the illustrations or other exercises performed by adults, but to take part in them, to which they have found themselves equal, greatly to the satisfaction and sometimes to the astonishment of their parents and other friends."¹ A good illus-

¹ American Lyceum, 1831, p. 7.

tration of this phenomenon is recorded in the early life of Gen. N. P. Banks, of Massachusetts.

Influence on the community.—The village or town lyceum was a helpful and uplifting power for various classes in local society. "Teachers are accommodated with the room, apparatus, specimens, books, etc., of lyceums for their mutual improvement in relation to their schools. Farmers and mechanics also have their special lyceums under the patronage of a general society. In the summer season ladies' lyceums are conducted, one afternoon in a week, under the same arrangement." Here are clearly foreshadowed the teachers' associations, farmers' institutes, and women's clubs of more recent times.

Influence on libraries.—Local libraries were early founded and privately incorporated in this country, but the organization of town lyceums and young men's societies first gave life and circulation to local collections of books. The desire for useful knowledge and the preparation of subjects for debate influenced the foundation of lyceum libraries in many places. The American Lyceum said, in 1831: "A deep and general regret has been expressed that town and village libraries are but little read, or that they are entirely neglected and scattered. The cause for this regret is removed by the meetings of lyceums. The moment that young people come together for mutual instruction in subjects of useful knowledge they call for books. The old library is looked up or a new one formed, and when the members are not conversing with each other, they are perhaps conversing with their books."

Idea of traveling libraries.—Among the measures proposed in 1831 by the American Lyceum for promoting its educational objects was that "a portion of the money collected from memberships may be put under the direction of the county and State lyceums, to be appropriated to itinerating county libraries."¹ This is a remarkable and early anticipation of one of the best ideas in the American library movement of our time. Traveling libraries, under public, corporate, or private control, are now everywhere growing in popular favor, in the Northern, Southern, and Western States of the Union. The old lyceums never advanced beyond local library collections, but American railroads, the Boston and Albany, the Baltimore and Ohio, and the New York Central, early set their books "itinerating."

Local examples of lyceums.—From scattered notices and authoritative reports by delegates it is possible to gather some definite information regarding town or local types of lyceum institutions which early flourished from Maine to Marietta, Ohio, and even as far west as the Illinois country. They were doubtless much alike in their essential features. We may say, from one learn all (*ex uno disce omnes*). Historic types of local lyceums deserve investigation, for they represent the first great wave of educational democracy or adult popular education. Free public libraries followed lyceums.

Worcester (Massachusetts) Lyceum.—This was described in 1832 by the Rev. Jonathan Going, as in a flourishing condition. The lyceum was divided into classes or sections, representing different subjects. Each section had its own president and often held separate meetings. Great benefits are said to have resulted from this plan, which has been perpetuated by the American Association for the Advancement of Science and the National Educational Association. The original lyceum especially emphasized popular science and education. The Worcester section devoted to schools is described as "particularly efficient." Indeed, that entire educational movement which permanently transformed the schools of New England and the West proceeded in no small degree from the influence of such local lyceums as those of Worcester, Hartford, New Haven, and New York. "The influence of the lyceum,"

¹ "In the year 1817 a system of what was called "itinerating libraries" was begun in East Lothian, Scotland, the object being to furnish the towns and villages of the county with libraries of useful books. Each library was to consist of 50 books."—(Library Journal, May, 1899, 206-207.)

said the Worcester clergyman, "has been very favorable on morals, the use of time, and the promotion of intelligence; the saving of money, too, by the neglect of expensive amusements, has been very great."

The cost of membership in the Worcester Lyceum was from \$1 to \$2 per annum. Ladies and strangers were invited as guests. Lectures by members and others were the principal attraction. There was a lyceum library of 400 volumes, also a mineralogical cabinet and a philosophical apparatus. It was a period of institutional beginnings in 1831, but by her fruits men now know the city of Worcester. She stands for libraries and schools in close alliance.

New Bedford Lyceum.—This was mentioned in 1832 as owning a handsome building, a library, and a philosophical apparatus. It is described in greater detail in reports of the Massachusetts Lyceum of earlier date.

Hartford, Conn.—Goodrich Association.—Hon. Thomas Day said in 1832 that this society had been recently formed, and that its general object was strictly coincident with that of the American Lyceum, viz, moral and intellectual improvement. The means to this end were a series of lectures delivered weekly by members on subjects selected by themselves. "These lectures have been popular, and attended by the most respectable ladies and gentlemen of the place, and have had a tendency to excite a desire for improvement and an interest in the diffusion of useful knowledge."

New Haven.—Franklin Institute.—At the New York convention of the American Lyceum in May, 1832, the curator of this well-known institute, Charles Upham Shepherd, afterwards professor of mineralogy in Amherst College, presented a brief digest of the experience of the New Haven institution in the matter of public instruction by lectures. He gave a synopsis of several courses and recommended the establishment of a school for training college graduates and other advanced students "for lecturers before lyceums." Thus early was anticipated the most essential factor for all academic success in popular education, viz, proper preparation.

New York.—Young Men's Society.—This forerunner of the Young Men's Christian Association was organized in 1831. The city was divided into 40 districts, for each of which a distinct association was at first proposed, but experience finally led to consolidation into 10 union associations, in which the average number was about 52. Each association was governed by its own rules. The exercises were various, but in some associations practical discussions were held every other meeting. The intermediate meetings were devoted to the reading of original essays and to lectures and illustrations in natural history and philosophy, the applications of science to art, geology, chemistry, mineralogy, and botany. In some associations, courses of lectures were given on history and painting. Attendance was voluntary, and the various associations were supported by the contributions of members. The constitutional objects of the New York Young Men's Society were declared to be "the moral and intellectual improvement of young men in the city of New York." The avowed objects of the American Lyceum were "the advancement of education, especially in common schools, and the general diffusion of knowledge." The two organizations in various towns and cities had much in common, and both helped to prepare the way for the more efficient Young Men's Christian Associations, which now extend throughout our larger towns and cities. It is worth noting that the New York Young Men's Society held out "religion and morality first, intellectual improvement next."

Newark, N. J.—There was a mechanics' institute and lyceum here in 1829. It had about 120 members, a library of 700 volumes (principally standard works), and "a philosophical apparatus," or instruments for illustrating physics, once called natural philosophy. S. H. Pennington, M. D., of Newark, reported May 4, 1832, on this lyceum at the first annual meeting of the American Lyceum held in the city hall, New York. He said the subjects of the lectures had become more practical than at

first. Minors were permitted to use the library for \$1.50 per annum. Clearly the Newark Lyceum was for adult education.

Utica Lyceum, reported at the New York meeting of American Lyceum in 1832, with following delegates: Rev. Dr. Weeks, Mr. Prentice, Dr. Coventry, Rev. Mr. Bethune, Mr. Floyd, and Mr. Seymour.

Rochester Lyceum.—This was founded in 1826, on the plan of the Andersonian Institution, Glasgow, Scotland, for the scientific education of mechanics.

The Buffalo Lyceum, reported at New York in May, 1832, by Mr. R. W. Haskins, was established two years before by the aid of Mr. King, a student from the Rensselaer¹ Institute at Troy. The Buffalo Lyceum had a library, a mineralogical cabinet of 600 specimens, and a philosophical apparatus. Admission was free, and the usual attendance was from 200 to 300. "Its aim has been, not to form scientific men, but to excite a desire for knowledge and a taste for reading, which the library gratifies. Handbills have been issued to advertise the meetings."

Cincinnati Lyceum was established in 1831, probably through the influence of Josiah Holbrook, who was the Boston corresponding secretary of the American Lyceum and who represented the department of "Books, apparatus, and branches of study." He said at the New York meeting, May 4, 1832, that hopes were entertained of establishing lyceums in all the counties of Ohio. Several local courses of lectures had been well attended. In places where schools could not yet be established, it was thought that the children might be reached by the lyceum system. "Schools might be attended weekly, and from three to six of them might be taught in rotation by one teacher."

Marietta Lyceum.—At the New York convention of the American Lyceum, May 4, 1832, Rev. G. Bingham reported that the Marietta Lyceum then numbered about 100 members. It had been formed about eighteen months, and now had a good library. Lectures and debates constituted the exercises. Scientific lectures were popular. The Marietta Lyceum had a "news reporter," whose duty it was from time to time to give a comprehensive account of important intelligence. This was doubtless an Ohio forerunner of modern club summaries of current events. Mr. Bingham said that a great deal of interest had been taken in Ohio in the diffusion of useful knowledge.

Illinois Lyceum.—The first branch, the Franklin Lyceum, was founded March 24, 1831, at Jacksonville, Switzerland County, Ind., by Mr. Josiah Holbrook, a Boston man and one of the leading promoters of the lyceum movement in the west. Rev. Theron Baldwin, in 1831, reported lyceum progress in the Illinois country as limited to the Jacksonville Lyceum:

Its influence thus far has been very happy; it has created a very strong interest on the subject of education in that village. Lectures are given in natural philosophy, chemistry, botany, history, etc. Western antiquities form a distinct subject of investigation, with the origin of the mounds, whether natural or artificial, and of the prairies. This lyceum is the first experiment on the system in the State, and is a peculiarly successful one. The exercises are conducted with spirit, and the audiences are usually very large, and apparently delighted. This institution is peculiarly calculated to bring upon common ground the individuals who make up the mixed population of the West and who could scarcely be brought in any other way to harmonize in any one well-directed effort on the subject of general education.

County lyceums.—Their objects were to promote the interests of lyceums and schools throughout the county, and to cooperate in measures recommended by the State and national lyceums for the advancement of popular education and the general diffusion of knowledge. County lyceum members were delegates sent from the several town lyceums, each being limited to three delegates. Semiannual meetings were held to

¹ Rensselaer Institute at Troy was considered a good training school for lyceum lecturers. In 1831 seven young men educated there were reported as successful public teachers.

hear reports from town lyceums and schools, and for discussions upon the science or art of teaching. Something of the spirit of these county lyceums passed over to teachers' institutes and conventions.

State lyceums.—These were for the advancement of education throughout the State, especially through the medium of schools and lyceums, also to cooperate with other State lyceums in the general purposes of the national or American lyceum. Annual meetings were held to hear reports from the county lyceums concerning the state of education and to hear discussions, lectures, or addresses.

Massachusetts State Lyceum.—A report on the progress and influence of local lyceums in the old Bay State was made at the New York convention of the American or National Lyceum in May, 1832. The substance of that report may be found in the previous proceedings of the Massachusetts Lyceum, printed in the *Annals of Education* for April, 1832, by William C. Woodbridge. Massachusetts delegates at the first annual meeting of the American Lyceum in New York, May, 1832: Hon. Stephen C. Phillips, Salem; Hon. Thomas A. Greene, New Bedford; Prof. Chester Dewey, Pittsfield; Rev. Jonathan Going, Worcester; Rev. Jacob Abbott, Boston; William C. Woodbridge, Boston.

Pennsylvania Lyceum.—An account of this, from the pen of Mr. Josiah Holbrook, was published in the *American Annals of Education* for 1836, volume 6, page 475. Provision was made for two classes of members—delegates and corresponding. The first were appointed from local lyceums. The corresponding members paid \$1 per annum and held passports to all the lyceums in the State. In Philadelphia there were several hundred corresponding members of the State Lyceum and they were so organized as to act together under the title of the Philadelphia Lyceum, which held monthly and semimonthly meetings. "At these meetings lectures are given, reports made, specimens exhibited and exchanged, and plans of cooperation adopted, both for the individual benefit of the members and for the success of the general cause of education in this and other States."

Corresponding members also formed local and social circles embracing from six to a dozen persons under the name of social and family lyceums.

German lyceums.—These once flourished to a considerable extent in the State of Pennsylvania. Many were reported at a convention held in New York in 1836. The counties of Lancaster, Cumberland, Berks, Montgomery, and Bucks were especially well represented by German delegates. The *National Gazette* is quoted regarding these German lyceums and their decided preference for a practical and rational system of instruction, capable of being universally adopted and universally applied, especially in the education of farmers, mechanics, and other laboring classes.

Statistics of lyceums.—At an educational convention held in Westchester, Pa., August 18, 1835, Mr. Josiah Holbrook, the Boston promoter of this institution, said there were, in addition to the National Lyceum, 15 or 16 state lyceums, over 100 county lyceums, and about 3,000 village lyceums, besides a great number connected with academies and schools. Many of the lyceums, especially those connected with academies and colleges, had libraries, whose volumes were eagerly read. He said lyceums had been found to give the schools greater efficiency and to make the pupils more diligent. The day after the above-named convention the State Lyceum of Pennsylvania was formed, and its first annual meeting was appointed at York for August, 1836 (*American Annals of Education*, vol. 5, p. 470). On the next two pages are printed nine resolutions showing the ideas then current in Pennsylvania regarding the usefulness of lyceums and their intimate connection with "cabinets," or museums, for encouraging the elementary study of natural history (minerals, plants, and animals) by children, and the school exchange of specimens.

Scientific cabinets.—There is a revived interest nowadays in the use of specimens for the illustration of natural science in our public schools. It is, therefore, historically

interesting to find that the American Lyceum early favored not only the introduction of science into schools, but also the provision of selected and labeled specimens "to illustrate the elements of rocks and useful minerals." A small set containing about 20 specimens, illustrating the common rock, was furnished for \$3. A larger set of 50 specimens, embracing some of the most useful minerals, was supplied for \$5. These simple collections, American forerunners of the French *musée scolaire*, introduced by the Brooklyn Institute into this country in 1899, was said in 1831, to "provide the necessary means for introducing this interesting and practical science (geology) into every school and lyceum in the Union, and thus qualifying agents in great numbers in every part of the country, who will render their gratuitous but efficient services in exploring our productions in the mineral kingdom, and in laying open new sources of industry and wealth to individuals and the nation."

Many Americans, like the present writer, whose youthful passion was for mineralogical specimens and external nature, from which the unwilling mind was finally dragged away by more exacting scholastic studies, will perhaps welcome the return to the more natural and more humane methods symbolized by the French *musée scolaire* and its possible introduction into our American public schools.

There are still to be found in many American schools and colleges melancholy survivals of the early scientific cabinets which once delighted the souls of early American collectors of natural-history specimens. These old cabinets remind the beholder of neglected New England graveyards which need the rehabilitating hand of the landscape gardener and the village improvement society to make them worthy of the pioneers and of their descendants. The resurrection is surely coming for the museum idea in local New England. We shall soon see it, as already in the Springfield and Brattleboro museums of natural science, applied to all the flora and fauna and the immediate environment of old historic towns. Museums of local art and local history are already in process of evolution. Pictures of historic characters and local celebrities, old houses, old trees, and familiar places will soon become as natural and scientific as the drawing of a crayfish or the photographing of any good specimen of bird or beast.

Rensselaer Institute, in Troy, N. Y., was first established in 1824, and was incorporated by act of the legislature in March, 1826. Its founder, Hon. Stephen Van Rensselaer, of Albany, early proposed a plan "for extending to every class of citizens the benefits of those departments of scientific knowledge which are most intimately connected with the common concerns of life." Young men were trained at Troy for the special purpose of becoming popular instructors. They were to give evening lectures on experimental chemistry, physics, and other practical sciences. Experimental classes, composed of from four to ten of the most promising students, were to be selected from the popular evening class for special instruction in the local district where a Rensselaer lecturer was called for. It was expected that the local school-master should become one of the class, and that he should cooperate with the instructor in preparing experiments and in extending education more widely among the people.

A committee of instructors at "Rensselaer School, Troy, N. Y.," consisting of Samuel Blatchford, president; Amos Eaton and Lewis C. Peck, professors, said in a circular republished in the *American Journal of Education* in 1826, volume i, page 635: "Though this undertaking is of vast importance in its tendencies, it is unquestionably practicable. Should it succeed, it must necessarily improve the state of society more than any other scheme hitherto proposed."

We hear in other connections of the success of students trained at Troy, on "the Rensselaer plan," to be public lecturers and instructors in natural science, and note this pioneer New York attempt to promote educational extension in a practicable way, viz, by training men for their responsible work.

Southern lyceums.—Theodore Dwight, jr., corresponding secretary on "Lyceums,"

said in his report on the Transactions of the American or National Lyceum, May 8, 1835: "The most general interest at present prevails in some of the Southern States. Lyceums have been taken up with spirit in Georgia and South Carolina, advocated in the latter State by the late lamented Thomas S. Grimké [1786-1834], one of the ablest contributors to our list of essays."¹

The Baltimore Lyceum was reported in New York at the first annual meeting of the American Lyceum in May, 1832. Children, it was said, were admitted at half price. The usual lyceum rates were \$2 per annum for an adult. Children in Baltimore had separate meetings, where they were instructed in the elements of science, and were thus prepared for the higher exercises of the lyceum. Baltimore parents were said to be interested in the new system. The seat of the experiment was in East Baltimore, or "Old Town."

A Southern champion of lyceums.—Thomas Smith Grimké, of Huguenot descent, was born in Charleston, S. C., in 1786, and was educated at Yale College under the friendly influence of President Dwight, who wrote of his travels in New England and New York. At the age of 21 Grimké began the study of law, and soon became a member of the Charleston bar. Like Thomas Jefferson, he early became an advocate of popular education and of modern studies. John Locke was the educational forerunner of both of these Southern leaders.

Thomas Smith Grimké was the foremost champion of lyceums for his section of country. It was doubtless due to his influence that the Literary and Philosophical Society of South Carolina passed resolutions in 1834 favoring the lyceum system as an important means of "promoting education and diffusing knowledge," and cordially approving of the national lyceum. The society appointed Mr. Grimké the chairman of a committee to prepare an address to the people of South Carolina "on the classification, character, and exercises, or the objects and advantages of the lyceum system, with a view to its general introduction into our towns, villages, and the country at large."

Extracts from Mr. Grimké's address are preserved in the American Annals of Education and Instruction, May, 1835, the year following Grimké's sudden death from cholera. Mr. W. C. Woodbridge, editor of the Annals, presented an elaborate review of this address to the American Lyceum. The two articles, printed together, are among the best sources of information on this half-forgotten American institution.

T. S. Grimké on the lyceum.—The origin of the word is to be found in Grecian literature. The lyceum was a grove in the suburbs of Athens, originally devoted to military exercises, but in the time of Aristotle it was employed by him for the delivery of lectures. Here he taught in the morning a select number of disciples, and instructed them in that elevated philosophy which Alexander rebuked him for having published to the world. In the afternoon he taught in like manner, by lectures, the young men of Athens promiscuously. But we may remark of him, and of all the schools of ancient philosophy, that whatever may have been the genius and learning of the professors, and whatever the number of their disciples and the direction of their schools, they produced no sensible effects on the great body of the people. They left behind them no vestiges of a salutary influence over manners and morals, over the cause of general education, or over civil and political institutions. The reason was that the schemes of the ancient philosophy did not comprehend the general instruction of the people, embracing both sexes and all ages and conditions. The same defect existed in the museum founded in France by Pilatre de Rozier, the cabinet and library of which were sold, as the patrons were unable to sustain the institution. To this succeeded the lyceum established by La Harpe, at Paris, in 1786, but whose object was limited to the improvement of a select company of the educated of both sexes meeting together at stated times. "Thus," saith La Harpe, "the French nation will not boast in vain of having known better than all others the advantages of sociability and all the pleasures of virtuous souls and cultivated minds."

Proposed classes of Southern lyceums.—Grimké then goes on to describe the classes of lyceums best suited to the needs of a scattered population like that in South Caro-

¹American Annals of Education, July, 1835, p. 297.

lina. He discusses two classes, the elementary and the representative lyceums. Under the first class he enumerates and briefly characterizes: (1) Social and neighborhood lyceums (one adapted to city life, the other to the country); (2) village, parish, or beat company lyceums (corresponding to town lyceums in the Northern States); and (3) class lyceums (for special subjects in a more general organization). Under representative lyceums, Mr. Grinké mentions: (1) The district, (2) the State, and (3) the national lyceum.

This classification was partly borrowed from institutions then actually existing at the North, where Grinké had lived and studied, and partly worked out by him to fit local conditions and terminology at the South.

Proposed exercises.—Among the exercises proposed for Southern lyceums are things very familiar to both Northern and Southern people, viz, lectures, essays, debates, and conversation. The persons expected to take part in and profit by lyceums were the clergymen, the physician, the lawyer, the merchant, the farmer, the planter, the manufacturer, the mechanic, and “last but not least—as among the most honorable professions—the teacher.” Grinké understood very well that he was applying an old name to things already familiar to Southern people. He said in his address to South Carolinians:

Perhaps it may be asked, what are the literary and philosophical societies, lecture-ships in colleges and universities, debating clubs, mechanics’ institutes, and conversation parties, but lyceums? We reply, that they are. We have only given to an old name a more extensive application to old things, in order the more easily to embrace in one system all those various forms of improvement, and to give a more regular, extensive, and frequent application to known methods of improvement; while the additional advantages are secured by concerted action, and of the intercommunication of a large amount of experience.

A pioneer of popular education.—The South Carolina lawyer, like Thomas Jefferson, was a pioneer of popular education and common schools. Grinké used some expressions that remind us of university extension. He said: “The lyceum system interferes with no other scheme of improvement and is, on the contrary, auxiliary to them all.” He added: “It is in harmony with the spirit of the age.” He quoted the constitutional object of the American lyceum as “the advancement of education, especially in common schools, and the general diffusion of knowledge.” In conclusion, he asked: “What objects can be more truly popular and republican, wise and benevolent? Common schools form the great majority of youth and prepare them to become the people of each succeeding generation.”

Revival of the lyceum in the West and South.—In the Northern and Eastern States the lyceum system flourished before the civil war and accomplished its work in the higher education of the common people. Since the war the lyceum as an institution has been more conspicuous in the West and at the South.

Mr. F. Hopkinson Smith, a well-known popular writer and lecturer in America, said in the *Independent* (New York, May 18, 1899):

To the Redpath Lyceum Bureau, of Chicago, is due much of the success of the present lecturing movement in the West and South and in parts of the East. Others have gone into the field to help themselves. They have helped the people. They go into a town of fifteen to twenty thousand inhabitants, where there is an opera house or hall capable of accommodating 2,000 people, and arrange for a course of ten lectures. There will be two or three musical subjects, several on literature, and others on science or art. They do not charge an exorbitant price, but sell the entire course of ten lectures for \$1.50 (7½ francs), or 15 cents apiece. For single tickets they charge 50 cents and for a reserved seat 75 cents.

They give the best talent that the country can afford for these nominal prices. It is astonishing to see the popularity of the course and how eagerly the people look forward from one lecture to another. This is so different from what has hitherto prevailed that the success of the movement is assured beforehand, and the lecturer has an audience in every town that is very gratifying to him. The lectures used to be so high only a few people could afford to purchase the tickets, and the managers could not make them pay.

The lectures cover many fields of popular interest and are of much educational value. Take literature. After the lecturer has discussed the particular subject before a large audience the interest in it does not die with his departure. The public libraries are besieged for books on the subject of the lecture, and for weeks after they read and discuss the questions at their homes. It stimulates the people to read and gives them new thoughts to occupy their minds until the next lecturer of the series appears. If an author comes to the town and reads from his own books there is a great run on the bookstores and libraries for his works. It helps an author very much in this way and revives an interest in his books that nothing else I know of equals.

The old method was to take famous men on lecturing tours and charge such high prices that the people could afford to attend only one or two lectures in the course of the season. Emerson, Phillips Brooks, and others of their character attracted crowds in their day; but the thing was overdone in time, and the lectures could not be made profitable to the managers. Then a group of readers appeared, and they would read from their works and charge high prices for the privilege of listening to them. Dickens and others made remarkable successes in this line. But that was overdone, too, in time, and there is no demand for such high-priced lectures in the towns and cities.

A recent writer¹ for the *Atlantic Monthly*, May, 1899, has attributed to oratory a powerful politico-educational influence upon the old South. Before the civil war there were no public libraries and no widely extended, well-organized system of public schools. Literature did not flourish and the lyceum or popular lecture system had not been introduced; but churches, camp meetings, barbecues, political conventions, and law courts abounded.

These, in fact, were the true universities of the lower South, the law courts and the great religious and political gatherings, as truly as a grove was the university of Athens, or a church, with its sculpture and paintings, the Bible of a mediæval town. The man who wished to lead or to teach must be able to speak. He could not touch the artistic sense of the people with pictures or statues or verses or plays; he must charm them with voice and gesture.

William Lowndes Yancey, of Alabama, who more than any other one man, except John C. Calhoun, helped to build up the Southern Confederacy, was one of the greatest of Southern orators. His power lay in his marvelous voice and grim fixedness of purpose.

He wrote no books and published no collection of his speeches; the fragments that remain bear the marks of imperfect reporting; the most effective of his addresses were those delivered before popular audiences, usually in the open air, and they were not taken down. * * * But oratory, we know, is action, and the truer picture of the man is the image of tremendous articulate passion which abides in the minds of those who fell under his power nearly half a century ago.

Oratory may be used in America as in the days of Demosthenes for a losing or for a winning cause; but in either case, it is still a great popular educational force in political and economic, as well as in religious and social questions. The country is more than ever under its magic power, whether for good or for ill. But oratory is not King. Education comes not alone from eloquence, but from the deeper, more irresistible currents of law and order, good government, inherited religion and morals; public opinion and the press; good literature and the library; the school, the church, the home, the family, and social institutions of many kinds. "Still waters run deep," even in modern democracy. Historic forces will always triumph, though the waves of popular feeling run high in time of party elections and civil or foreign war.

Education by discussion.—There has been a long process of public education in the United States in the presidential elections and in the political campaigns of every city and State. It should be remembered that the American people, like the ancient Greek, have always been fond of oratory and debate. The public assembly and the folk-mote or mass meeting are still conspicuous institutions of the North, South, and West. Whenever there is a crisis in the affairs of the nation or of the community, vast concourses of people rally for open-air meetings or mass meetings in town halls.

¹ William Garrett Brown, on "The orator of secession" (William Lowndes Yancey, 1814-1863).

There the public questions are discussed by the best available public speakers. There is not a topic of public policy, whether relating to finance or national economy, that is not thoroughly thrashed out in these popular assemblies. The press takes up the matter and carries the knowledge into every household.

Popular debating societies.—An interesting modern development of the old-fashioned village lyceum of New England is the popular debating society, now fostered in connection with public schools, colleges, Young Men's Christian Associations, churches, clubs, labor unions, etc. The so-called village lyceum was not a school or college, like the French Lycée, but was rather a popular organization for debates and lectures. In the early part of the present century almost every large New England town or village had its public lyceum, which sustained not only popular debates among young men and citizens, but also a regular winter course of lectures on historical, political, and social themes. Some of the greatest orators and public educators in New England, like Daniel Webster, Wendell Phillips, and Charles Sumner, used to address these little companies of people assembled in their village lyceum or literary folk-mote. The training of the North for the great civil war and for the emancipation of the negro was brought about in these early debating societies. Since the war between the States, northern lyceums have fallen into desuetude, but in the South and West there has been a remarkable extension of the old institution. In very many Southern and Western towns and cities there are now sustained courses of so-called lyceum lectures, which are organized and guided by some regular bureau or director.

But even more remarkable is the revival of the old idea of popular debates in American schools, colleges, churches, and clubs of the present day. For a long time in many Northern colleges the so-called open or public societies have ceased to flourish, and the so-called "secret societies" or "college fraternities" have practically monopolized the social, literary, and forensic spirit; but in the Middle, Western, and Southern States open societies have survived the civil war. Within the past few years the art of public debating has been cultivated in a larger and more representative way than ever before. Students have studied and practiced public speaking on questions of current economic and political interest, for the sake not only of individual and class improvement, but also for the successful representation of their own college in intercollegiate prize debates. The spirit of intercollegiate rivalry has been extended from the domain of athletic games, ball playing, boat racing, etc., to more intellectual fields of competition. In recent years there has been an annual contest in public debate between Harvard and Yale universities, which is attended with great *éclat* and which brings to the prize winners really academic distinction.

Collegiate interest in forensics and oratory has always been conspicuous in the Western and Southern States, where the colleges are now organized into State associations for the State championship in public debates and oratory. Sometimes the best speakers in an individual State are matched against the acknowledged leaders in some neighboring State. This interstate competition interests college men and citizens throughout wide sections of country, and attracts great audiences of men and women who become ardent supporters of the colleges and universities which educate these representative sons of the common people. In some cases winning orations prepared for these intercollegiate contests in oratory have been published.

Prof. Percy Gardner, in the *Nineteenth Century*, for January, 1899, giving his "Impressions of American Universities," says that the custom of intercollegiate debate has no parallel in England:

The art of debate, which has always been much encouraged and practiced in America, has been completely organized on a competitive basis. Teams are selected in each college for a debating tussle, just as for a rowing match or a football contest. The teams of rival colleges meet on the platform of some large hall. A political or

social subject which offers good scope for argument has already been selected; one side is assigned by lot to each of the contending parties. Each competitor in turn takes up his brief, and attacks or defends, as the case may be. Judges assigned for the purpose decide which team is victorious, having regard, not to the justice of the cause, but to the skill of the disputants. A victorious college is proud of its team and of the trophy which victory brings it.

The churches, with their social missions and boys' clubs, have also taken up this excellent device of training young citizens in the art of public speaking and to the intelligent appreciation of public questions. The writer of this report has served at contests for the award of prizes for the best debaters chosen from young people's societies in Baltimore. The idea of debating societies has been caught up even by churches and colleges now devoted to the interests of colored people. The labor unions in their various halls of assembly have long been in the habit of encouraging public discussion of labor questions.

It is very interesting to observe that in the Young Men's Christian Associations, as well as in some American colleges, young men have been organized into an artificial Congress, sometimes in two houses, called respectively the "senate" and "house of representatives." This latter custom now prevails in the Johns Hopkins University, Baltimore, Md., where the two upper collegiate classes (seniors and juniors) are trained apart in the house and the senate, and at the end of the year the best speakers from each body come together for a prize debate in the presence of their classmates and invited friends from the city, in the large university hall, where the two so-called "teams" struggle for intellectual and forensic mastery, as the athletic teams struggle upon other fields for physical victory. The participation of American college athletes in the modern Olympic games at Athens has given increased impetus to the rivalry of colleges and classes in outdoor contests, but recent developments would indicate a healthful modern revival of the best features of those ancient Grecian festivals, which combined public exercises of the mind with those of the body.

The Lyceum League of America was organized under the auspices of the Youth's Companion, which established a lyceum department in its own columns. The league consisted of a system of local clubs organically connected through the lyceum department, which granted charters, gave free equipment, suggested topics for discussion, and furnished lists of good books. Among the books recommended to young Americans for the discussion of American subjects were Bryce's American Commonwealth; Our Country, by Josiah Strong; History of American Politics, by Alexander Johnston; Problems of To-day, by R. T. Ely; Civil Government in the United States, by John Fiske; The American Citizen, by Charles F. Dole; and The American Statesmen series. All of these books except the latter series were given, with a bookcase, to the first ten clubs organizing under this plan proposed by the Youth's Companion. To every club of ten or more young men this enterprising paper supplied, free of cost, a copy of Cushing's Manual for guiding parliamentary proceedings, a secretary's book, and a president's gavel. The secretary's book contained a model constitution, rules of order, subjects and rules for debate, and blank pages for the record of eighty meetings.

It is difficult to conceive of a more popular plan for spreading and multiplying the idea of school lyceums. The enormous circulation of the Youth's Companion gave wide information and definite ideas regarding the plan of organization, and it rapidly increased and multiplied throughout the country. As a matter of fact, many boys' clubs, schools, churches, Young Men's Christian Associations, social settlements, missions, have to this day profited by that idea proposed ten years ago of reviving the old-fashioned New England lyceum. When it is remembered that in 1888 the Youth's Companion started the idea of an American flag for every public schoolhouse, an idea which has now passed into popular legislation and has become an established institution and a symbol of patriotism in almost every youthful sem-

inary of learning, we shall have some conception of the wide civic possibilities of the American extension of these popular debating societies or school lyceums.

Authorities.—The American Annals of Education, published in Boston, and the Magazine of Useful Knowledge, published in New York, were adopted May 8, 1831, as the organs of publication for the proceedings of the American Lyceum, and they are among the best sources of information concerning this and other early popular educational movements in this country. The printed lectures given before the American Institute of Instruction and the published lyceum lectures of many distinguished Americans—Edward Everett, Ralph Waldo Emerson, and Henry Ward Beecher—will reveal the kind of superior instruction enjoyed by the common people fifty years ago.

The Education Reporter, a weekly paper, published in Boston, was also contemporary with the lyceum movement, and is said to have exerted a powerful and salutary influence.

Professor Silliman's Journal of Science, published at New Haven for many years, should be regarded as the highest exponent of that semipopular scientific spirit which found local expression in the lyceum lectures of Silliman, Olmsted, Shepherd, Hitchcock, Agassiz, and Young. The well-known and highly valuable German series of printed lectures on popular science (Volkswissenschaftliche Vorträge) and our American Popular Science Monthly are among the current organs of this patriotic educational spirit. Science for the people—for adults, men and women—is quite as legitimate public instruction as elementary science for boys and girls, or outdoor scientific rambles with children and school-teachers.

Printed lectures for lyceums.—As early as 1830 the publication of a series of "Scientific tracts" was begun in Boston on various subjects of useful knowledge. An annual series of 24 numbers, of 24 pages each, was sold at \$1.50. It was designed to extend these educational tracts among the great mass of the community. "They are intended to answer as substitutes for lectures before lyceums, to be read and explained in schools, and to be pleasant fireside companions."

These tracts anticipated university extension and Chautauqua printed lectures and handbooks, but were obviously an American imitation of the cheap publications of the Library of Useful Knowledge, and the Penny Cyclopædia, projected by the patriots of England (edited by George Long). These and other English forerunners of modern devices for popular education deserve remembrance.

American lyceum leaders.—Among the names early conspicuous in the organizing work of the American Lyceum were John Neal, Portland, Me.; Edward Everett, William C. Woodbridge, and Josiah Holbrook, of Boston; Prof. C. Dewey, Pittsfield, Mass.; President Day and Professor Olmsted, of Yale College; Dr. T. H. Gallaudet, Hartford; Nathan Sargent, Prof. John Griscom, LL.D., and William Forrest, New York; Theodore Dwight, jr., of New York; Robert Vaux, Philadelphia; Samuel M. How, president of Dickinson College, Carlisle, Pa.; Oliver A. Shaw, Richmond; Thomas S. Grimké, Charleston, S. C.; Rev. B. O. Pears, Lexington, Ky.; Philip Lindsley, Nashville, Tenn.; Alva Woods, Alabama; Rev. Timothy Flint, Cincinnati, and Prof. J. M.

Sturtevant, Illinois. The movement before the year 1832, beginning in Massachusetts, had extended from Maine on the east to the Gulf States on the south, and to the Mississippi Valley on the west. (For further inquiries on this subject, see the next section, on "Pioneers of popular education.")

Among other lyceum orators were John B. Gough, Henry Ward Beecher, Wendell Phillips, Ralph Waldo Emerson, Oliver Wendell Holmes, Bayard Taylor, Dr. Bellows, Dr. Chapin, T. W. Higginson, J. G. Holland, Elibu Burritt, Horace Greeley, George William Curtis, and Fred. Douglass. Best and most famous of all was Abraham Lincoln.

Education, like all knowledge and culture, is only a song of degrees. It is simply an ascending scale from arrested attention and passing observation to philosophic reflection and clear understanding; from the mere prattle and A B C knowledge of the child to the wisdom of the sage and the world's common sense. This the press of the Nineteenth century has done much to develop. Nations are destined to be governed by educated public opinion rather than by war and conquests. Some years ago an English popular lecturer on astronomy published an article in an English review on "Capital and culture in America," and took the ground that, on the whole, American national culture was degenerating because, forsooth, our people do not employ as many public lecturers as formerly. He said that of 500 American towns which used to support, season after season, lectures on literary and scientific subjects, scarcely 50 felt justified in continuing these regular courses because the public would not support them.

There is perhaps a better explanation of the apparent decline of the old-fashioned lyceum system, at least in some parts of this country. The American public has had too many of those old-time lyceum lectures, especially those single lectures under personal "management," exacting high prices. The simple truth is, there are several better things now circulating in America than even those star lecturers. Among better things are good books from our public libraries, and also our popular, beautifully illustrated, and very instructive monthly magazines. At less cost than a single hour's pyrotechnic lecture by some wandering star from the old world these American magazines circulate from hand to hand throughout the year. In very attractive and satisfactory ways they carry literary, scientific, and historical culture into thousands of modest homes, where habits of good reading are constantly cultivated by the combined influences of the daily press, the public library, and the public school. It is manifestly absurd to attempt to measure American culture by the success or failure of a traveling lecturer or any lyceum manager.

What excellent lectures are the readings, illustrated articles, editorial comments on current events the world over to be found in our best American monthly magazines; what fresh and original but readable contributions to knowledge are contained in them. The magazines are usurping the position once held by the popular lecturer, because they know better what the public wants, and they say it in better and more pleasing form, and for far less money.

The illustrated magazines of America are generally recognized, even in foreign lands, as among the best in the world. Supported by large capital and wide patronage, American editors are able to engage for their columns some of the best literary, scientific, and educational talent of the times. Compared with the very limited amount of positive instruction or inspiration formerly given by the traveling public lecturer in a somewhat turgid, rhetorical style, the manifest wealth of good literary and scientific materials afforded by the modern magazine is truly marvelous. Periodicals are the handbooks of the people; they represent philosophy, art, letters, criticism, history, politics, economics, social science, latest discoveries, inventions, popular sciences, and the freshest thought on many questions of vital interest to the living age. While the daily press photographs current events for what they are worth, quarterly and monthly magazines quietly review the progress of the world.

Poole's Index.—Many years ago a Yale College student began to index and classify magazine articles for ready reference. Continued through long years this resulted in Dr. W. F. Poole's famous Index of Periodical Literature, first published in the years 1848–1853, revised and enlarged in 1882, through the influence of the American Library Association, and is carried on to this day, upon the cooperative plan, under the editorial direction of W. I. Fletcher, of Amherst College, Amherst, Mass. This superb index is the American clearing house of the best English and American magazines. It mediates between the student and the periodical, the public and the library, where bound volumes are preserved for consultation.

III.

AMERICAN PIONEERS OF POPULAR EDUCATION.

Ten years ago, 1889, the term "university extension" was a new thing in the United States, but the thing itself was old. As early as 1808 a course of popular lectures in chemistry was given by Prof. Benjamin Silliman (1779–1864), of Yale College, for the benefit of a class of ladies and gentlemen in New Haven. The class met in the college laboratory, and the lectures were accompanied by experiments. "This course," said Professor Silliman, in his reminiscences, "was the opening of a series of labors performed many years afterwards, with popular audiences, often in large assemblies, and sometimes in distant cities." College and university lectures for New Haven people have been continued, in varying forms, down to the present day.

The idea of instructive courses in natural science was extended by Professor Silliman from his coeducational class to the mechanics of New Haven in the years 1831–1833. In a letter to the *New York Times*, March 22, 1891, a writer claims priority of university extension for old Yale. He says that about 1828 Mr. James Brewster, a leading citizen of New Haven, erected a large building called Franklin Hall, at the corner of Church and Crown streets, for the purpose of disseminating scientific knowledge among people not connected with the college. Mr. Brewster had previously interested himself in the development of a mechanics' institute, which, it is said, still exists under another name in New Haven. Prof. George P. Fisher, in his *Life of Benjamin Silliman* (Vol. II, pp. 326–327), quotes a letter from Mr. Brewster to Professor Dana, which establishes a strong case for Yale College extension, fifty years ago.

Professor Silliman ever evinced a deep feeling of interest in the moral and intellectual improvement of the mass of the people. Prompted by his encouragement, I erected Franklin Hall for the purpose of providing instruction in the elements of mechanical science to those who could not attend lectures in the daytime. He assisted me in obtaining the means to illustrate the experiments to be made, and introduced me to his assistant in Yale College, Mr. Charles U. Shepard (afterwards of Amherst College), who assumed the position of curator of Franklin Hall. Professor Silliman and Professor Olmsted gave courses of lectures to the people of this city. The beneficial effects were manifest by the erection of steam engines, and the perfecting of machinery, greatly aiding in the development of mechanical skill in its application to the useful arts. These benefits have long been manifest in all departments of business. This was the first time, I believe, that college professors had gone out to lecture upon natural and mechanical science.

A further extension of influence by Professor Silliman occurred in 1834, when he began to lecture outside of New Haven. His first course was given in Hartford in the lecture room of the Center Church, upon the subject of geology. The lectures were attended by three or four hundred of the most intelligent citizens of that town and were well illustrated by drawings and geological specimens. Every morning the professor devoted an extra hour in the lecture room to a conference with persons who wished to see his specimens and hear additional explanations. This was an anticipation of the modern "class," or conference, in connection with university exten-

tion lectures. From New Haven and Hartford, Professor Silliman's public-spirited work was extended, in 1834-35, to Lowell, Salem, and Boston.

In the Athens of America, an introductory lecture, like that of Professor Stuart, of Cambridge, when he captivated the English workingmen at Crewe, was given upon the subject of meteors: "A large and brilliant audience was before me; much larger than any that I had ever addressed. I was awed," adds the Yale professor, "but not abashed." Silliman's first lecture to the Bostonians in 1835, like Stuart's to the English workingmen in 1867, was a phenomenal success. Mr. William J. Loring immediately announced, on behalf of the Society for Promoting Useful Knowledge, a systematic course on geology. "This course," says Silliman, in his reminiscences, "was my first great success, both as regards reputation and remuneration." The subscriptions yielded \$2,000. There was an afternoon and an evening course. Both were thronged. "The audience is not surpassed in numbers and intelligence by the assemblies of the Royal Institution in London." Mr. Abbott Lawrence told the lecturer that no man had ever drawn together in Boston such audiences, both for number and character. Returning home, Silliman naïvely rejoiced that he had been permitted to sustain the honor of his college. After "six anxious years" of public lecturing in Boston, he is still deeply impressed with his responsibility for the honor of Yale College, the faculty of which had urged him forward in this public work. He rejoices that he has been successful in making the subjects on which he had spoken intelligible and attractive, without diminishing the dignity of science or neglecting Yale College. President Woolsey once said: "There were, I believe, in the universities of the Middle Ages, orators annually appointed who represented their communities on public occasions. He (Silliman), in his prime, was our standing orator, the principal medium between those who dwelt in the academic shade and the great public."

The Yale professor lectured in Nantucket in 1835. In 1836 he gave a geological course in New York to many of the first people of the city and to what he called "a solid mass of intelligence from the middle classes of society." In 1838, after a second course in Boston, he was consulted by Mr. John A. Lowell regarding the best mode of organizing and equipping the Lowell Institute. He was engaged to give the opening course of lectures on geology in the People's University of Boston. By special arrangement with Mr. Lowell, Professor Silliman gave four courses of scientific lectures upon geology and chemistry, extending through four winters. Public interest continued unabated. The Lowell Institute lectures, being generously endowed, were made free to the public. There were as many as 10,000 applications each season for tickets to hear Silliman. He regarded it as the most arduous scientific engagement, and at the same time as the greatest honor of his life, to give the introductory courses in such a splendid institute as that of John Lowell, who had completed his will on the ruins of Thebes. Edward Everett, governor of Massachusetts at the time the Lowell Institute was opened, said, "The few sentences, penned with a tired hand by our fellow-citizen on the top of a palace of the Pharaohs, will do more for human improvement than, for aught that appears, was done by all that gloomy dynasty that ever reigned."

The impulse to higher popular education, given first through the Franklin Institute of New Haven, and afterwards through the Lowell Institute in Boston, was extended by Professor Silliman to distant cities in the South and West, to Pittsburg, Baltimore, New Orleans, Mobile, Natchez, and St. Louis. Almost everywhere Yale men were the organizing influences that made these local academic lectures possible in days before university extension was heard of. Professor Silliman continued this public educational work for a quarter of a century, from 1834 to 1859, from his fifty-fifth to his eightieth year. At the close of this remarkable experience he said: "I conceive that in no period of my life have my efforts been more useful, both to my country and my family; and as regards professional labors, there is no part of my career

which I reflect upon with more satisfaction." Joseph Henry, secretary of the Smithsonian Institution, said that Silliman "was the first to introduce in this country public lectures illustrated by experiments on a scale of magnitude and of a character to interest a popular audience; and his success in this enterprise was such as to give an impulse not yet exhausted to a means of adult instruction which, though it has been abused, is well calculated, under proper regulation, to effect much social and personal good."

The career of Professor Silliman as a public lecturer was nearly synchronous with the rise of American lyceums, through which the influence of college-educated men made itself widely and deeply felt upon the American people. Dr. William E. Channing (1780-1842), writing in 1836, said in praise of lyceums:

I have long seen with much satisfaction the diffusion through our country of institutions for the intellectual culture of the people. I have rejoiced in the establishment of lyceums and popular lectures, and I feel that everyone is bound to do what he can to forward these good works. By this I do not mean that I consider such institutions, in the present form, as fitted to meet all our wants. The lectures are too disconnected, and too generally intended for mere amusement, to stir up the minds of the hearers to any strong and enduring activity. But we must not despise the day of small things. A lyceum, or young men's association, though liable to the charge of giving superficial knowledge, is still a promise, a harbinger, of something higher. It is a sign that the people are beginning to hunger for more refined pleasure and increasing knowledge. It shows that intellectual life is at work and spreading through the community. Such an omen I hail with joy.¹

Two of the most highly developed types of city lyceums, the Lowell Institute in Boston and the Peabody Institute² in Baltimore, both founded by Massachusetts men, still flourish with ever-increasing usefulness. While other means of higher popular education have now sprung into vigorous life in the Pratt Institute of Brooklyn, the Armour Institute of Chicago, the Drexel Institute of Philadelphia, the Metropolitan Museum and the American Museum of Natural History in Central Park, New York, and in similar institutions elsewhere, it should never be forgotten that this country had already passed through a remarkable phase of higher popular education by means of lyceum lectures of no mean order.

The old lyceum system was fostered by such men as Daniel Webster, Dr. W. E. Channing,³ Edward Everett, Ralph Waldo Emerson, Theodore Parker, E. H. Chapin, Horace Mann, Charles Sumner, Thomas Starr King, Wendell Phillips, John B. Gough, Henry Ward Beecher, and George William Curtis. It developed at least one generation of noble orators and patriotic leaders. It has left to this day high standards of public speaking in America. It contributed in no small degree to the rise of the abolition and temperance parties in American politics. Its intellectual and moral influence is still moving on in the West⁴ and the New South, where old-fashioned oratory lingers, and where the Chautauqua summer assemblies are at once a curious survival and an edifying combination of the camp meeting, or religious folk-mote, with the old lyceum idea of popular education by local lectures. College and university men are now everywhere at work in these summer assemblies. Indeed,

¹ Memoir of Channing, Vol. III, 87.

² The Peabody Institute of Baltimore for many years offered to the public thirty superior lectures upon literary, historical, and scientific subjects at the slight charge of \$1.50 for the entire course. During the winter of 1890-91 Mr. Richard G. Moulton, the English university extension lecturer, gave two courses before this Baltimore lyceum.

³ Channing's lectures on "Self culture" (Works, ii, 349-411) and on "The elevation of the laboring classes" (v, 153-230) were given to the mechanics and apprentices of Boston in 1838 and 1840.

⁴ Professor Jenks says: "The lecture system, which was in its glory in New England thirty and forty years ago—and which doubtless exercised a wide-spread influence for good—is still very common in Indiana. Many a graded school, in a village of not more than three or four hundred inhabitants, supports its lecture course of five or six lectures every winter, and the lectures given are usually of good quality. It has been the policy of the State university for several years to meet requests of this kind in a favorable way, and to send a man to deliver an evening lecture whenever called upon."

some of our American institutions of learning have long been encouraging summer schools upon their own academic premises. For example, Harvard,¹ which first (1873) developed the American summer school of natural science, has now a great variety of summer courses; so have the universities of Virginia, Indiana, Wisconsin, and many other State institutions.

It is no secret that the summer schools of Oxford and Cambridge were suggested by American experience. It is well known that the idea of English home reading circles, and of a National Home Reading Union, were "consciously borrowed" from Chautauqua. While Americans attempted to introduce from England her well-developed methods of university extension, it is not improper to point out the above facts and to observe that, for nearly a century, each of the two countries has been working out, in its own way, the problems of elementary and higher education for the people. In our eagerness for public improvement, let us not ignore our own educational history, nor forget that we have long had in this country certain blessings of our own, some of which England is just acquiring, namely, free common schools, free libraries, and the true university spirit of teaching and research.

In a letter written in 1835 by Dr. William E. Channing to Josiah Quincy, president of Harvard University, there is a remarkable anticipation of the essential idea of university extension:

The education of the people seems to me more and more to be the object to which the college should be directed. This institution has always existed, and exists now, for the people. It trains young men, not so much for themselves, as that they may be qualified to render services to the community; and perhaps they render no higher service than by spreading their own intelligence and giving a higher tone to the public mind. Can not the college do more for this end? I hope it may. If it can furnish a course of philosophical instruction, which can be pursued by a greater number than now pass through college; if it can extend the demand for this higher education by supplying its means, and if it can give a rank to those who enjoy this advantage, it will render inestimable service to the community.

Perhaps the most important inquiry for the friends of the college is, How can it become a popular institution, an object of public interest, without narrowing at all its present course of instruction? Its well being requires that the community should look to it as their friend and benefactor. I do not, however, think so much of the prosperity of the college, in the suggestions now made, as I do of the general improvement of the people. Popular education is a more important interest than any particular institution, involving, as it does, the religious and political as well as intellectual good of men. The progress of society can hardly be aided more than by bringing greater and greater numbers under the influence of moral and philosophical instruction. I wish that the college may take an active part in this great work. It has an extensive apparatus of means. Can it not render them more productive?²

If one should attempt to investigate the lines of university extension that have gone out from Harvard,³ since the days of Channing, in graduate or professional ways, for the higher education of the American people, he would enter a boundless field of inquiry. It would not be difficult to show that the popular influence of that institution has widened with every decade. Harvard has played a noble part in the development of school and college education, of teachers' institutes and summer schools, of lecture courses in Boston and the country at large. A system of outside lectureships was early inaugurated at Harvard for the benefit of the university and the people of Cambridge at the very beginning of President Eliot's administration in 1869. Distinguished specialists were invited to give public lectures under the auspices of the university. Among these courses were Dr. Samuel Eliot's upon "The history of the nineteenth century;" Ralph Waldo Emerson's upon "The

¹The Harvard faculty have recently voted that work done in their summer schools may, with the consent of the various departments, be counted as regular work toward the degree of A. B.

²Memoir of Channing, Vol. III, pp. 84-85.

³The lyceum lectures of Jared Sparks on American history at the Lowell Institute in Boston and at the Tabernacle in New York City are the subjects of a special chapter in the author's *Life and Writings of Jared Sparks*, Vol. II, Ch. XXVIII.

natural history of the intellect;" W. D. Howells's on "New Italian literature;" Professor Hadley's on "Roman law;" John Fiske's on "Positive philosophy," and many others. The system was not altogether a success at Harvard. President Eliot, in a public address in Baltimore, February 22, 1878, said: "I have seen the results of this plan at Harvard, where they [short lecture courses] were kept up for some time, but I do not consider them very profitable. The result, as I observed it, was that they encouraged short, detached work, not that year by year."¹ This is undoubtedly the defect of all such courses, unless duly coordinated with private reading or regular class instruction.

IV.

UNIVERSITY EXTENSION IN AMERICA.

This subject was first publicly presented in the United States at a meeting of the American Library Association in their session upon one of the Thousand Islands in September, 1887. The well-known English system, as adapted to American local needs, was promptly taken up by public-spirited American librarians in Buffalo, N. Y.,² in Chicago, and in St. Louis. In all three cities and in many others, west and south, the idea was gradually developed and extended by the co-operation of university graduates with libraries, churches, and other local institutions. The subject was first publicly presented in Philadelphia March 11, 1891, at the galleries of the Art Club, Dr. James MacAlister presiding.

New York beginnings.—In January, 1888, Melvil Dewey, then chief librarian of Columbia University, laid the plan before the regents of the University of the State of New York, and at the university convocation in Albany, July, 1888, advocated university extension in connection with public libraries. A year later he again brought the matter before the convocation. In February, 1890, a committee of New York colleges and universities urged the regents to establish, under State supervision, a system of extension teaching. It was further urged that the State should work through existing colleges and institutions.

First State appropriation.—In the spring of the following year, May 1, 1891, a bill was signed by the governor appropriating \$10,000 for the state organization of university extension. This was on "university day," the historic anniversary of the granting of the original charter of the University of the State of New York, May 1, 1784—fit augury of a new era of public control of the higher education of the people. This grant of \$10,000 is absolutely the first case on record of a State appropriation for university extension.

It was stipulated by the bill of 1891 that no part of the grant should be used for the payment of lecturers, but only for purposes of organization, supervision, and printing. The expense of local lectures was very properly to be defrayed by the local constituency. From this auspicious beginning there rapidly developed in the state of New York the double system of public instruction: (1) University extension from the Albany center or popular education by lecturers, accredited or controlled by university authority, and reporting results to the regents; (2) library extension from Albany or popular education by means of well-selected classified libraries, suiting definite local needs in connection with local lectures or home-study clubs.

It is possible to follow out both of these lines of educational extension through the valuable and interesting extension and library bulletins issued by the University of the State of New York and exhibited by the same in illustration of this subject.

The University of the State of New York at first, in 1891, made "extension" one

¹ Baltimore Evening Bulletin, February 23, 1878.

² "An experiment in university extension," by J. N. Larned, Library Journal, March-April, 1888.

of five great departments: (1) Regents' office, executive, administrative, and supervisory, through which educational charters are granted; (2) extension for lecture courses, study clubs, reading circles, for extending educational opportunities outside regular teaching institutions; (3) examinations; (4) State library; (5) State museum. The extension department included all agencies for higher education outside the regular teaching institutions. These agencies were at first distributed in four sections: (1) Public libraries and traveling libraries; (2) extension teaching, outside regular schools and colleges, or "university extension;" (3) study clubs, for associate study and discussion of a common series of topics; (4) summer schools.

Experience showed the necessity of some modification of the above organization.

The university has now (1899) six main departments: (1) Administrative; (2) college; (3) high school; (4) home education, in distinction from schools and colleges; (5) State library; (6) State museum. These are all well illustrated in the bulletins and circulars of the University of the State of New York.

"Home education" includes the following six divisions: (1) Extension teaching; (2) study clubs; (3) exchanges; (4) traveling libraries; (5) public libraries; (6) library school. The term "home education," as employed in the State of New York, comprehends that entire group of agencies which promote the higher education of adults at home and through life, in distinction from the work done by the regular teaching institutions, such as the university, the college, and the school. Mr. Melvil Dewey, in his director's report of the New York State library for 1897, page 61, practically identifies "home education" with what the present writer prefers to call simply popular education or "educational extension," e. g., from an institutional center like a university, a college, a State board of public instruction, a church, a public library, or a people's institute. The published bulletins of the regents of the University of the State of New York, by their long use of the phrase "extension," have given sanction to the idea of established agencies proceeding from some central source, e. g., Albany, towards the town, the village, the home, and the individual.

Mr. Dewey on home education says:

Our extension or home education department has from the first been conducted in the rooms of the State librarian and under the supervision of its director. In the nature of the case this was necessary, and we should without hesitation have carried it on always under the library name had it not been thought desirable to use a distinctive name because of the initial appropriation of \$10,000 for a fuller organization of this new work.¹ Both in print and in addresses I have from the first impressed extension societies and conferences and those interested in other phases of home education that it was in itself naturally so closely allied to the public library that it would be folly to dissociate them in administration. The library has won its place as an essential part of our educational system, and every community of 500 inhabitants is coming to feel that it is discredited unless it has a free library as well as provision for instruction of its children in something more than the three R's. In our own State we are quietly studying the distribution of institutions and looking forward to a not distant day when there shall be no village of 500 inhabitants in the State which does not have a regents' school and a public library. The most enthusiastic believer in the work of the study clubs, summer schools, extension lectures, correspondence teaching, and other forms of home education will admit the folly of undertaking to organize a third educational center in the smaller communities. The work will be done best and cheapest by associating it either with the high school or the library, and there is no question that the library, as in itself the most important of the agencies for home education, is the proper center around which the others should be grouped. It has long been our habit to think and speak of the work of

¹"University extension" act was passed May 1, 1891. Home education as a descriptive term originated in Albany, 1897, and it was first publicly emphasized by Mr. Dewey at the Chautauqua meeting of the American Library Association in 1898. Among the best known types and agencies of "home education" of an earlier date were, (1) the "home-culture clubs," founded and promoted in Northampton, Mass., by George W. Cable, and by him extended throughout the country; and (2) the still earlier "Society for the encouragement of study at home," founded by Miss Ticknor, of Boston, and long sustained by her circle of friends; (3) Catholic home reading circles; (4) the National Home Reading Union of England. One more recent is the Chicago Record's "Home study circle."

the State library and the extension department as being substantially one, and we couple it under the phrase of "State library and home education." The reasons that led to giving this work an independent name in 1891 no longer hold good, and it would doubtless be better hereafter for us to make in form what we have in fact—a single department for the rapidly growing interests of home education. Other States are sure to follow New York's leadership, and we shall set a more practical and convenient example if the administration is understood to belong with that of the library.

While we are so much gratified with what has recently been accomplished in this great field, those who best understand its possibilities realize that this work is now only well begun. The public are demanding more and more because they are learning that it is possible, through the State library and home education department, to secure more help educationally than has ever before been afforded by an equal expenditure of time and money.

Popular education.—Undoubtedly a better name than "university extension" must be found to describe that class of extramural educational activities which Mr. Dewey includes under the domestic roof-tree of "home education." The objections to this latter term are: (1) The home idea does not comprehend the larger social and institutional ideas conveyed by extension teaching, study clubs, public libraries, library schools, and educational extension in general; home education is only a part of a larger public education. (2) Attention should not be diverted from the varied and universal sources of educational power, activity, or supply, whether in nature, society, university, college, public library, or peoples' institutes, and monopolized by one of the local objects of popular education—the home. (3) Popular education, like freedom, health, or salvation, is living water springing up from many fountains, which can not be grouped under two or three heads like "home," "school," "library," or even "university," although all of these terms and others are needed for purposes of educational extension. (4) Home education is a term not easily translated into a cosmopolitan language. Imagine a Frenchman resolving his lucid "education populaire," or "education des adultes" into "education chez moi!" (5) No descriptive term for the education of the people is worth considering if it requires debate and exposition; whatever term is finally chosen it must be perfectly clear, self-explanatory, and go straight to the mark, as does the phrase "popular government." If "educational extension" is not sufficiently lucid, what is the objection to "popular education?" Dignify this familiar term by association and ennoble it as men are trying to ennoble democracy. Noblesse oblige.

"Tis in the advance of individual minds
That the slow crowd should ground their expectation
Eventually to follow; as the sea
Waits ages in its bed till some one wave,
Out of the multitudinous mass, extends
The empire of the whole, some feet, perhaps,
Over the strip of sand which could confine
Its fellows so long time: thenceforth the rest,
Even to the meanest, hurry in at once."

BROWNING'S "Paracelsus."

Results in the United States.—Limitations of time and space, in this connection, forbid more than a passing notice of the results of university extension in the United States. It has been tried and found wanting in many parts of this country and Canada. The State universities of the West and South, for public reasons, early entered their State fields, and some still hold their own with varying degrees of honor and success; but as an educational movement, university extension in America can not be said to have accomplished all that its friends at first hoped. It will probably not die, but causes of its diminished zeal are not far to seek: (1) Lack of suitable extension lecturers; (2) lack of financial support; (3) the vast distances to be traversed by university men, already overworked; (4) the necessity and greater importance of academic service on college and university premises; and (5) the recognition of better and less expensive instrumentalities for popular education.

Among these better and cheaper agencies, which are to be elsewhere considered by the present writer, are (1) free illustrated lectures for the people in town and county at city or State expense; (2) education at institutes; (3) public libraries; (4) traveling libraries and traveling pictures; (5) educational clubs; (6) vacation schools. All of these popular educational movements are growing in America more rapidly than is university extension and have already surpassed it in practical efficiency.

Results in New York.—Leaving for a more special form of publication the history of the educational extension movement in America, let us notice its three best surviving phases, which may be associated with (1) the University of the State of New York; (2) the American Society for the Extension of University Teaching (Philadelphia); and (3) the University of Chicago.

These three original head centers, Albany, Philadelphia, and Chicago, still remain the most active and influential points of departure for American university extension. All three strategic centers have permanently advanced the cause in America and have given rise to other and better popular educational agencies. The University of the State of New York has organized "home education" and "study clubs," with the combined aid of traveling libraries, traveling pictures, extension lecturers, and State examiners. All work harmoniously and efficiently together under one central guidance at Albany.

The latest report of the extension teaching division of the University of the State of New York, June, 1899, shows that this organization now includes under the head of "extension teaching" whatever is under the immediate supervision of a teacher; i. e., extension lecture courses, free lectures to the people, institutes both social and general, correspondence instruction in its various forms, summer schools, vacation and evening schools.

During the year 1898-99 there were maintained under Albany auspices 36 extension lecture courses at 12 different centers, as compared with 21 courses at 13 centers the year before. Extension methods were adopted to some extent by Dr. H. M. Leipziger in certain of the free lecture courses of the people of New York State; they are growing elsewhere in public favor. These extension features are of great pedagogical value: (1) Continuity of course on one great theme; (2) a printed outline of topics; (3) a class conference with the lecturer; (4) occasional written exercises; (5) final written examination; (6) certificate.

The greatest practical difficulties in New York, as elsewhere, are (1) the local financial problem; (2) the discovery and engagement of satisfactory lecturers; (3) the absorption of university and college men in their own academic duties; (4) the extent of travel and extra work required from busy professors.

Results in Philadelphia.—This city and the whole region round about have been quickened to new intellectual life and social activity by university extension since its organization in 1890. Noteworthy is the union of energy, enthusiasm, self-sacrifice, and devotion to duty, quick insight and skillful direction on the part of the leaders of the American society for the extension of university teaching. Many experienced lecturers have been invited from England to lend expert service in the American popular educational cause. Progressive and public-spirited institutions have cooperated with well-trained, earnest lecturers and their classes of eager students. Generous and whole-souled citizens, men and women, have hitherto sustained the American society by voluntary subscriptions. Its various series of useful and readable publications, especially *The Citizen* and the *University Extension Magazine*, have united to promote the extension movement, which has accomplished noble, patriotic, and helpful service in Philadelphia and throughout the Middle and Eastern States, where it will doubtless endure in many grateful and permanent ways.

Representatives of the American society justly maintain that there is a decided advantage in the contact of the speaker with the people whom he is teaching. "The

living teacher is the center of inspiration. He gives them the best fruit of wide reading and systematic study; he not only can tell them what to read, but he can rouse an interest by his personal conviction and enthusiasm, and he gives an opportunity after each lecture for the discussion of any questions that arise; he examines the essays that are written, and guides the class study of those who do work between the lectures. Compared with fixed plants for doing the same sort of thing, university extension is more flexible, and has the advantage of mobility. It carries the teacher as well as the teaching to the people. The lecturer goes where he is needed, and uses any hall or room which will accommodate an audience."

According to the report published in the extension bulletin of the University of the State of New York, June, 1899, the American society last season gave lecture courses in 14 different places in Philadelphia, and in 29 different towns throughout Pennsylvania and adjoining States.

The University of Chicago was opened in October, 1892, and early made the university-extension¹ division one of the main branches of educational effort. Like Philadelphia, Chicago enjoyed the hearty cooperation of all friends and promoters of the extension movement. The writer was present in Washington, D. C., when one of the most experienced English extension lecturers, Prof. R. G. Moulton, was engaged by President Harper for pioneer work in the West. In the personality of President Harper, Chicago has been singularly fortunate. He inherited the administrative training of a professor, schooled at Yale University, Chautauqua and other summer schools, also in the American Institute of Sacred Literature. All of these institutions are democratic in their work and methods, national in their scope. Dr. William R. Harper, a man from out of the West, educated in the East, patriotic in sentiment, fervent in spirit, serving in his generation "the god of things as they are," and expressing the higher criticism with prudent reservation and helpful suggestions, has been the maker of the University of Chicago, which was founded and is upheld by the lavish gifts of John D. Rockefeller. The University of Chicago is liberal in spirit and municipal in name. Its founder and trustees were wise enough not to burden an institution of learning with one man's name. Cities and States are now lending themselves anew to municipal and State universities for baptismal and other public purposes, as cities and States have done for the local and national identification of the church in all ages of the world.

President Harper and his trustees early attracted to Chicago eminent professors from other institutions east and west, together with many home-wandering scholars from Europe. At least two experienced directors of university-extension work were called to Chicago from Philadelphia. The present head of the extension movement, which may be truthfully and tersely characterized as academic expansion, is the eminent economist, Prof. E. J. James, founder of the American Academy of Political and Social Science.

Results of Chicago extension.—In no small degree, by the aid of university extension, with its superior pedagogical methods and its marked adaptations to local needs, has Dr. Harper, of Chicago, built up his academic resources and a great federal university. Educational extension, lecture studies, correspondence courses, affiliation and coeducation, have made John D. Rockefeller's institution well known to Chicago people, and also to the towns, schools, colleges, libraries, and churches round about. Under Dr. Harper's extension policy the University of Chicago is now surely developing a vast academic and national alliance, which will perhaps yet reach Washington, D. C., and include the Columbian University.

All nonresident work connected with the University of Chicago is conducted through the extension division, which provides for different methods: (1) Lecture

¹Dr. William F. Poole was one of the fathers of the original Chicago society for university extension, and the Newberry Library was one of its first centers. (See article by Dr. Poole in *The Dial*, September 1, 1892.)

study courses; (2) correspondence courses; (3) study clubs, and (4) evening and Saturday classes for Chicago and vicinity. In the lecture study courses the university cooperates with existing literary organizations. During the year closing June 30, 1898, 141 such courses, each of 6 lecture studies, were given in 92 different centers, with an aggregate attendance of 30,315. To these different organizations or communities the university sent out small traveling libraries containing in all 3,562 books, which have been kept in constant local use. Local librarians recognize the beneficial influence of these traveling libraries in connection with lecture studies, and cooperate with the university in every possible way.

Benefit to the city.—The University of Chicago also cooperates with the board of education, and has given in the city itself 17 courses of lectures in 13 different public school buildings. Of the total number, 10 were systematic university extension lecture studies, and the rest were arranged, as far as possible, in educational sections. Fifty-five lectures were illustrated by the stereopticon.

The extension staff of the University of Chicago has been utilized by Prof. E. J. James for the purpose of teaching public school teachers. Representative branches of knowledge, history, economics, political and matured science, have been taught as illustrating superior educational methods, and a teachers' college, at last accounts, had begun to develop in connection with the university.

Through university influences the board of education in Chicago lifted the famous Cook County Normal School, with the experienced Col. F. W. Parker at its head, into the still more honorable position of the Chicago Normal School. In order to raise the educational profession entirely above politics Mrs. Emmons Blaine endowed a school of pedagogy in Chicago and called to it from the Chicago Normal School Colonel Parker, who chose 17 well-trained teachers, who were given a year's leave of absence for special study and preparation in Europe and elsewhere for their new and responsible work. The avowed purpose of the new school of pedagogy is by institutional means to develop teachers who shall bring the public schools of Chicago to such excellence that private schools shall no longer be necessary.

Influence upon the country.—The influence of the University of Chicago upon the whole country, east and west, is beyond present estimate. We are living in the era of federations. Colleges and universities in this country as well as in Canada and England are coming into academic affiliation. In Chicago and New York great libraries are combining or associating together. Colleges and universities themselves in America must ultimately follow the federal trend of anglo-American institutional development.

At the present time our American universities, particularly the State institutions and the church colleges, have their acknowledged spheres of influence. No one institution can swallow all its neighbors or establish a great academic trust. Historic colleges and universities will doubtless continue to live and let live in some capacity; but Chicago University has extended its power far beyond State lines, and the end is not yet.

Extension work at the Catholic University.—Courses of lectures open to the public have been given at the Catholic University of America, Washington, D. C., for a number of years, under the auspices of the University, in addition to the regular courses of instruction under each faculty. The Yearbooks of the University for the past two years give the programmes of lectures delivered in 1898-99 and 1899-1900, as follows:

1898-99.

By the Rt. Rev. John L. Spalding, bishop of Peoria:

“Life and Education.”

By the Hon. Carroll D. Wright:

“The Principles of Social Economics.”

“The Use and Abuse of Statistics.”

“Statistics in the Study of Social Economics.” (Two lectures.)

“The Elements of Industrial Society.”

By the Hon. Carroll D. Wright—Continued.

“Systems of Labor.”

“The Evolution of Manufactures.”

“The Factory System.”

“State Efforts to Regulate Industry.”

“Efforts of Individuals and Organizations to Regulate Industry.”

By Hon. George F. Hoar, United States Senator:

“George Washington.”

By Dr. James Field Spalding:

“Nathaniel Hawthorne.”

“Oliver Wendell Holmes.”

By John J. Delaney, esq.:

“Constructive Force of European Civilization.”

Besides the above lectures, there were given in Philadelphia, under the auspices of the University, two Father Mathew lectures on “Total Abstinence.”

1899-1900.

Wednesday course.

By the Hon. Carroll D. Wright:

“Communism the Forerunner of Socialism.”

“Romantic Socialism. General Socialistic Platforms.”

“Anarchism, Nihilism, etc., as Related to Socialism.”

“Social Democracy; State Socialism.”

“Municipal Socialism.”

“Cooperation a Phase of Socialism.”

“Phases of Industrial Socialism.”

“Socialism of Arbitration.”

“Socialism of Capitalism.”

“Socialism and Trade Unionism. True Socialism.”

By Rev. Dr. William J. Kerby:

“The Idea and Nature of Society.”

“Social Traditions.”

By Dr. Charles P. Neill:

“The Economic Structure of Society.”

“Phases of Economic Evolution.”

“Development of Political Institutions.”

Friday course.

By Rev. Dr. Edward A. Pace: St. Thomas on Immortality. (Three lectures.)

“The Concept of Immortality.”

“The Argument for Immortality.”

“Consciousness in the Future Life.”

By Dr. Maurice Francis Egan:

“Literature and Life.”

“Books and Their Pedigrees.”

“Modern Literary Movements.”

By Rev. Dr. John J. Griffin:

Besides the above lectures, there were given under the auspices of the university, two Father Mathew lectures on “Total Abstinence,” under the direction of the C. T. A. U.

Educational extension has a great future in the United States in connection with live colleges and State universities, people's institutes, public libraries, public schools, traveling libraries, traveling museums, and traveling pictures. Lately a specimen French *musée scolaire* was brought to Brooklyn, where it has attracted great public attention. Like the earlier Scotch and English traveling libraries, the school museum has also come to stay, and it will doubtless soon appear in our public schools and town museums. Already for years the National Museum in Washington, D. C., has been distributing to local institutions of science and learning its surplus geological and ethnological specimens. The various tendencies in educational extension, local, State, and federal, will undoubtedly merge in a broader current than any one university can possibly represent. Nothing will suffice short of a national university, coextensive with the nation, like the University of France or its historic prototype, the University of the State of New York.

Smithsonian Institution.—Of all distributing centers of historical and scientific knowledge in America, there is nothing comparable to the Smithsonian Institution, that Washington clearing house of the publications of the American Historical Association and of the literary and scientific work of all our productive colleges, universities, and learned academies. Nor is there any institution in the United States which can begin to accomplish so much for the educational and social betterment of the entire American people as do already the various national agencies in the Federal City at Washington, beginning with Congress and continuing through the Departments of Labor and Agriculture, and all the social and educational ramifications of the United States Government in its relations with the country at large.

Authorities.—The best account published on "The extension of university teaching in England and America" is by James E. Russell, Ph. D., published by the University of the State of New York in 1895. Dr. Russell well says: "New York takes pride in the fact that the first five significant steps in extension history in America were all in the Empire State, viz: The library meeting at the Thousand Islands, the work at Buffalo, Chautauqua, Brooklyn, and at the capital in connection with the regents. New York also claims the distinction of being the first State in the world to make university extension an integral part of its educational system." Consciously or unconsciously this policy is an historical expansion of that Hamiltonian idea of university control which the Empire State shares with the University of France.

For a detailed study of university extension in America the following bibliographical references have been supplied at the State library at Albany by Miss Avery.

1. *University of the State of New York.*—The extension bulletins devoted to that subject and published from year to year since the beginning of the movement in America are the most comprehensive sources of information. The university early reprinted articles by H. B. Adams on "University extension and its leaders," *Review of Reviews*, July, 1891, and "University extension in America," *the Forum*, July, 1891. See also Miss Katharine L. Sharp's regents' prize essay on "Public libraries in relation to university extension," published in 1892 as a regents' bulletin, and republished by *University Extension World*.

2. *Philadelphia.*—In Philadelphia a magazine called *University Extension* was started in 1891. For three years it was a news magazine, but in November, 1893, a second monthly, *The University Extension Bulletin*, was started, which gave the news side and left the other magazine free for discussion of problems connected with the work. In March, 1895, the publication of both was stopped and they were replaced by *The Citizen*, devoted to university extension in its widest sense. Practically the magazine dealt with subjects of interest to the Civic League, and incidentally with extension subjects. *The Citizen* rendered very great service to the educational cause and to the promotion of good literature as well as of good government. The suspension of the journal in 1898 was widely regretted.

3. *The Chicago University Extension Society*, a city organization antedating the organized extension work of the university, published very early a periodical called

The University Extension Magazine, which changed its form and character four times within a year and a half, and suddenly vanished out of existence. The result was a small collection of numbers of various sizes, volumed four times, with usually two monthly numbers to a volume. When the University of Chicago organized its extension division the Chicago magazine was practically replaced by the University Extension World, which was first published as a quarto, and contained a good deal of local material. A change in the editorial staff resulted favorably for the reading matter and the size was reduced. Finally, in 1894, the issue was changed from a monthly to a quarterly and printed on heavy glazed paper with wide margins. Cuts were frequently inserted and the magazine was changed to a high-grade quarterly. Unfortunately with the issue for April, 1895, the magazine stopped, but the occasional publications of the university afford sufficient information regarding the continuation of extension work down to the present time.

Later developments briefly and intelligently summed up.

V.

CHAUTAUQUA.

The place.—In America the name "Chautauqua" stands for a place, an institution, and an idea. The place is a summer town on Lake Chautauqua, in southwestern New York. It is a popular educational resort during the months of July and August for several thousand people, who go there from all parts of the country to hear lectures and music, to attend class courses of instruction, to enjoy college life and open air. Chautauqua is a well-nigh deserted village during nine months in the year, but in the summer season it has a cottage and hotel population ranging from 3,000 to 10,000 people.

It is a kind of educational Baireuth for the people; indeed it has become a center of musical and social-economic training of no mean order. It is a vast summer encampment or cantonnement, 165 acres in territorial extent, on the upland terraces of a beautiful lake 18 miles long and from 1 to 3 miles wide, the highest navigable water on the continent, 730 feet higher than Lake Erie and 1,400 feet above the sea level. Chautauqua was the Indian name for this lake, the shores of which are a natural "divide" between waters which flow northeastward with the St. Lawrence from the Great Lakes district, and waters which flow southwestward to the Mississippi River and the Gulf of Mexico. Chautauqua is one of the highlands of New York, although it lies in the lowly southwest corner of the State, 70 miles south of Buffalo, 200 miles north of Pittsburg, and 450 miles west from New York City. Chautauqua

is connected with the Lake Shore route to Chicago, and easily reached by railroads from the east.

Von Holst on Chautauqua.—When von Holst, the German historian of the United States, was asked what are the most characteristic American sights, he replied: "Go to Niagara Falls and then around the corner [of New York State] to see Chautauqua." It is certainly a better thing to see than the stock yards and pig-sticking of Chicago. Chautauqua is beautiful for education but not remarkable architecturally. The academic village has some useful school buildings; a few hundred decent cottages in the woods; a fair hotel called "The Athenæum;" a few shops or "stores;" a plain college building on a hilltop, with a beautiful lake environment; a so-called "hall of philosophy," which is a wooden temple with supporting pillars, open to the summer breeze and seating three or four hundred people; and a vast amphitheater, like a Greek theater dug out of a hillside, but well roofed, well lighted by electricity, and capable of seating five or six thousand people. It is an inspiring sight to see a large Chautauqua audience in the afternoon or evening.

The Chautauqua salute.—When the presiding officer wishes to show special honor to some foreign visitor or distinguished lecturer, the audience is requested to give the so-called "Chautauqua salute." Immediately thousands of white handkerchiefs are waved in the air, and suddenly the vast amphitheater seems full of life and motion. The effect is picturesque in the extreme. It appeals only to the eye, but it surpasses any noisy applause. The custom had a natural origin, which is thus explained by Chancellor Vincent: In the early days of the Chautauqua Lake Assembly, Professor Green, a deaf-mute from Canada, was giving a lecture in pantomime, illustrating certain incidents in the life of Christ. The performance was so good that the audience applauded vigorously by clapping their hands. Chancellor Vincent, realizing that the professor could not hear the applause, suggested that the people wave their handkerchiefs, which was done amid great enthusiasm. This "Chautauqua salute" is now given at many Chautauqua gatherings in various local assemblies, but the honor is reserved at the central Chautauqua for very rare occasions.

Governor Roosevelt at Chautauqua—At a recent visit (August 19, 1899) of the warrior, statesman, and historian, Governor Roosevelt, of New York, to Chautauqua, where he has long been known as a public historical lecturer, he was welcomed by the Chautauqua salute in the presence of 10,000 people assembled in the vast amphitheater. In response he said from the platform that he came to preach the gospel of intelligent work. It is good for everybody, for parent and child. He appealed to the presiding genius of Chautauqua:

Bishop Vincent, nothing has interested me more in reading the history of the growth of the West than to read what Peter Cartwright and other Methodist clergymen did to tame the shaggy wilderness and instill a love of the higher spiritual life into the minds and hearts of the tapers of that wilderness. They worked hard. They had no easy life. We should emulate them. Look back at your own career. Do you not take the greatest pride in that portion of your life when you manfully labored with all your might? This Chautauqua did not come by chance. It is the result, obviously, of years of work. * * * You here have had to work long and hard, and now there is no institution more fraught with good to the nation than this one at Chautauqua. * * * I am going to speak soon at the Catholic Chautauqua [at Plattsburg] and hope next year to speak at the Jewish Chautauqua. Recognize the good qualities of any man, South or North, Jew or Gentile, provided he is a good American.—(New York Tribune, August 20, 1899).

This is certainly the spirit of Chautauqua, which is something more than a New York local institution. It is national and even international in its influence. Governor Roosevelt emphasized at Chautauqua the gospel of work, which is as old as the motto of the Benedictine monk who said "*ora et labora.*" Andrew Carnegie once told the students of Union College "An honest day's work well performed is not a bad sort of prayer."¹

The institution—Chautauqua should be viewed primarily as an unconscious educational adaptation of the old Frankish idea of the folknote or public open-air assembly.

¹Andrew Carnegie's college lectures: "Wealth and its uses;" "Business;" "How I served my apprenticeship." New York: F. Tennyson Neely, publisher, 114 Fifth avenue.

The historic survival of this ancient institution is seen in the American mass meeting, popular convention, or New England town meeting. A religious outgrowth of the folk-mote in the Southern States was the camp meeting. The Chautauqua Lake Assembly, established in 1874 at Fairpoint, on the site of an earlier Methodist camp meeting, still retains many religious and some political characteristics of the older assemblies. Amid the multiform developments of modern Chautauqua, the observer should hold closely to the original and central idea of a summer meeting for popular educational and religious purposes. The institution is a camp meeting for culture and religion. Bible study and the biblical training of Sunday-school teachers were originally and still are dominant educational features. When General Grant visited Chautauqua the chancellor publicly presented him with a Bible. Grant took it, but characteristically said nothing. The control of the institution is in the hands of a legal corporation representing religious as well as secular interests. The work is not carried on for pecuniary profit to the stockholders, but primarily for philanthropic purposes and for Christian popular education.

The highest exponent of the institution is its present chancellor, Dr. John H. Vincent, one of the two original founders. He best represents the broad religious, and patriotic spirit of Chautauqua. He infused into it the idea that all sound learning is sacred, and that the secular life may be pervaded by a religious spirit. Accordingly he has added to biblical study and higher training for Sunday-school teachers the greatest variety of allied subjects; for example, history, literature, languages (ancient and modern), art, science, music, elocution, physical culture; in short, education in general.

The following tabular view of the Chautauqua system of summer study and rational recreation at Chautauqua Lake and of home reading and study was published in Bulletin No. 29 of the University of the State of New York:

TABULAR VIEW.

CHAUTAQUA SYSTEM.	HOME READING AND STUDY.	1. <i>The Chautauqua Literary and Scientific Circle.</i> A four years' course of general reading. [Certificate granted. Does not count for degree.]			
		2. <i>Specialized courses</i> for continued reading and study. [Certificate does not count for degree.]	{	History. Literature. Science. Art. Pedagogy. Teachers' Reading Union.	
		3. <i>School of Theology.</i> Correspondence instruction. [Degree B. D.] Rigid examinations personally supervised. [No honorary degrees.]	{	Hebrew and Old Testament. Greek and New Testament. Biblical and doctrinal theology. Ecclesiastical history. Homiletics and pastoral theology. Christian science, life, and literature.	
		4. <i>College of Liberal Arts.</i> Correspondence instruction in preparatory and college studies. [Degrees of B. A., etc.]	{	Latin, Greek, French, German, English, mathematics, psychology, political economy, history, physical science, geology, and biology.	
			{	Sixteen courses and rigid personally supervised examinations are required to secure the degrees of B. A., B. S., etc.	
				{	Correspondence and residence combined complete; a system of academic study looking toward the degrees of B. A. and B. S.
SUMMER STUDY AND RATIONAL RECREATION AT CHAUTAUQUA.	1. <i>College of Liberal Arts.</i> [No degrees except through correspondence department.]	{	Personal instruction by well-known men in all departments mentioned under (4) above.		
	2. <i>School of Methods in Teaching.</i>	{	Psychology. Pedagogic principles. Applications and methods.		
	3. <i>Schools of Sacred Literature.</i> Study of the Bible as a great classic and inspired book.				
	4. <i>Classes in art, music, physical culture, elocution, kindergarten, etc.</i>				
	5. <i>Lecture courses</i> on the university-extension model.	{	Progressive courses by one lecturer. No extra fee is charged. The attendance is large.		
	6. <i>Public lectures and addresses</i> by men and women prominent in various departments of life.				
	7. <i>Recreative and æsthetic elements,</i> concerts, dramatic recitals, stereopticon entertainments, etc.				

The passing visitor will perhaps form his opinion of Chautauqua from the popular and recreative sides, but he should know that, as in an American or English college, which sometimes seems to exist exclusively for athletics and student amusement, there is a good deal of serious academic work. The bulletin above mentioned says: "For the many there are popular lectures, concerts, entertainments; for a somewhat less number there are philosophical, scientific, and literary lectures in progressive courses; for the comparatively few are provided means for careful study under able and well-known instructors. The Chautauqua Assembly should be judged, not by its recreative exercises, but by its educational classes. The former attract the crowds from which the latter are recruited, and the revenue from the many supports the higher departments. All these elements combine to form a community life which, as a whole, makes for intelligence and arouses interest in higher education."

The Chautauqua Literary and Scientific Circle (called for short, the "C. L. S. C.") was founded in 1878, and represents the first great popular differentiation from the original Chautauqua, which was, and is still, a summer educational meeting on the Chautauqua Lake shore. The C. L. S. C. is a well-directed system of home reading in literature and science carried on in connection with local reading circles, and practically aided by many good suggestions in a monthly magazine called *The Chautauquan*. The course of reading occupies four years, which are called, respectively, the Greek year, the Roman, the English, and the American, from the relative prominence given to the history and literature of those four countries. An interesting feature of the course for 1899-1900 was a so-called "Reading journey through France," published in *The Chautauquan*, and taking the reader on an imaginary journey through France, introducing him to the historical associations of the places visited, and thus forming an admirable preparation for a visit to the Paris Exposition in 1900, or for a more extended study of France which the C. L. S. C. will take up.

The text-books on England and the United States, Greece, and Rome, and other subjects, social and economic, are prepared by good writers representing American colleges and universities. With all of the four regular courses in history are combined corresponding literary and cultural studies in art and religion. Natural science also forms a feature of every course. In the American year the special subjects are, besides religion, American history, literature, government, diplomacy, social institutions, and physiology. The entire expense for the required books and for the illustrated magazine is now about \$5 per annum. In former years the text-books were purchased at reduced rates from regular publishers, but in recent years Chautauqua has maintained its own press and employed its own writers, who understand the special needs of a Chautauqua constituency. All readers are now registered at the central office of the C. L. S. C., in Cleveland.

The course of reading is carried on in leisure hours by Chautauquans at home, but once a week they come together in local circles in neighborhoods and villages all over the country, and, under the best local guidance they can find devote an evening to the discussion of topics suggested by *The Chautauquan* and other private reading. The number of these local reading circles during the past twenty years has been about 10,000. The total enrollment of Chautauqua readers has been about a quarter of a million. Of course, by far the larger number fail to complete the four years' course, but it is estimated that about one-half have done consecutive reading for two years. A saving remnant of perhaps 40,000 continue to the end, and win a simple certificate testifying to the fact that they have completed the four years' course of Chautauqua reading. There is no degree awarded to the holders of these certificates, but the graduates of the C. L. S. C. are encouraged to form local educational clubs and to continue along lines of special historical and literary study. For example, this very year (1899) the writer, who is a member of the "educational council" of Chautauqua, was asked to recommend a course of reading in Russian history. There are literally scores of specialized courses for continued reading and study in history, literature, science, art, and education.

Schools.—Next in importance to the C. L. S. C. are the summer classes or so-called “schools,” wherein definite class instruction is carried on at Chautauqua by well-known college professors during the summer season. A great variety of regular and advanced work is offered. Work begun under competent direction at Chautauqua may be continued by correspondence with the professor or representative of the “school” throughout the year. This combined work done in residence and by correspondence may, in a few rare cases, lead to the degree of bachelor of arts or bachelor of science, conferred, however, only after searching tests. The degree-giving power is vested in the regents of the University of the State of New York, whose academic honors are better guarded by State examinations than by some academic corporations in America.

The various “schools” at the central Chautauqua are the following:

(1) School of English language and literature; (2) school of modern languages; (3) school of classical languages; (4) school of mathematics and science; (5) school of social sciences; (6) school of pedagogy; (7) school of religious teaching; (8) school of music; (9) school of fine arts; (10) school of expression; (11) school of physical education; (12) school of domestic science; (13) school of practical arts.

The Chautauqua idea.—Much has been said and written concerning the “Chautauqua idea.” Bishop Vincent is the best exponent of the original conception of the institution, and he has attempted to define it in various publications. In a book entitled *The Chautauqua Movement*, and published by the Chautauqua press in 1886, Bishop Vincent said:

The full-orbed “Chautauqua idea” must awaken in all souls a fresh enthusiasm in true living, and bring rich and poor, learned and unlearned, in neighborhood and comradeship, helpful and honorable to both. Education, once the peculiar privilege of the few, must in our best earthly estate become the valued possession of the many. * * * The theory of Chautauqua is that life is one and that religion belongs everywhere. Our people, young and old, should consider educational advantages as so many religious opportunities. Every day should be sacred. * * * Chautauqua pleads for universal education; for plans of reading and study; for all legitimate enticements and incitements to ambition; for all necessary adaptations as to time and topics; for ideal associations, which shall at once excite the imagination and set the heart aglow. * * * Show people no longer young that the mind reaches its maturity long after the high-school days end, and that some of the best intellectual and literary labor is performed in and beyond the middle life. College halls are not the only places for prosecuting courses of study. College facilities are not the only opportunities for securing an education. A college is possible in everyday life if one choose to use it; a college in house, shop, street, farm, market, for rich and poor, the curriculum of which runs through all of life, a college which trains men and women everywhere to read and think and talk and do; * * * this is the “Chautauqua idea.”

Prof. Albert S. Cook, of Yale University, and a well-known Chautauqua lecturer, in an article on “Chautauqua: Its aims and influence,” published in *The Forum*, August, 1895, says of the “Chautauqua idea:”

As nearly as I can formulate it, it is something like this: A fraternal, enthusiastic, methodical, and sustained attempt to elevate, enrich, and inspire the individual life in its entirety, by an appeal to the curiosity, hopefulness, and ambition of those who would otherwise be debarred from the greatest opportunities of culture and spiritual advancement. To this end, all uplifting and stimulating forces, whether secular or religious, are made to conspire in their impact upon the person whose weal is sought. * * * Can we wonder that Chautauqua is a sacred and blessed name to multitudes of Americans?

Dr. Merrill E. Gates once said:

The true significance of the Chautauqua movement seems to me not to lie chiefly in the great summer gatherings, in the crowded lectures, the enthusiastic conferences, and the inspiring commencement address at Chautauqua itself, nor in the diplomas awarded there. But the Chautauqua circles throughout the land mean useful, wisely-directed home reading and intelligent general conversation in the home circle wherever their influence extends. Not only is it true that neighborhoods which

have been stagnant for the lack of any common themes for conversation higher than the local gossip have been stirred to new intellectual life when the circles met to consider the facts of science or history and the noble thoughts and perfect forms of the best literature of all time, but in the home circle as well, in the family life of thousands of homes, children and parents have new themes brought into their horizon and talked about with a common interest at the table and in the evening.

Principal A. M. Fairbairn, of Mansfield College, Oxford, England, says:

The C. L. S. C. movement seems to me the most admirable and efficient organization for the direction of reading, and in the best sense for popular instruction. To direct the reading during a period of years for so many thousands is to effect not only their present culture, but to increase their intellectual activity for the period of their natural lives, and thus among other things, greatly to add to the range of their enjoyment. It appears to me that a system which can create such excellent results merits the most cordial praise from all lovers of men.

Sir Joshua G. Fitch, for a long time Her Majesty's chief inspector of the training colleges of England, said to an audience of 5,000 people at Chautauqua:

It seems to me that you have hit upon one of the most admirable and fruitful devices ever yet adopted when, by means of reading circles and correspondence helps, the solitary student has opened to him what he shall read and what use he shall make of his reading when he has it. This is a great work on which you have often invoked the divine blessing. * * * I earnestly trust that it may continue to go on and prosper, that this great assembly may be one of the most notable agencies by which you may encourage the love of truth, the devotion to knowledge, and the help and guidance of the people of America.

Religion realized.—It would be a fatal mistake for any observer to imagine that religion had been neglected amid the multiplication of departments, for in point of fact religion, in its spiritual ethical sense, is the very heart of Chautauqua. In these days of growing secularization and materialism Chautauqua is a good object lesson in what might be called a religious survival or revival in concrete, wholesome, visible ways. Chautauqua, like Judaism in its best estate, is an institution for the promotion of the higher life, social and intellectual. "Holiness to the Lord" is an historic synonym for righteousness in all human relations, peace on earth to men of good will. The Chautauqua idea, comprehensively stated, is religion realized in life and culture in practical, not merely in theoretical, ways or barren creeds. Chautauqua cultivates faith and works.

The American Library Association held its annual conference at Lakewood on Chautauqua in July, 1898, where the president, Herbert Putnam, then librarian of the Boston Public, now of the Library of Congress, paid the following deserved tribute to Chautauqua:

The Chautauqua system has a most intimate interest to us as a system of practical and economic education, inaugurated by a sincere humanitarianism sustained by an enthusiastic missionary spirit, successful in reaching a vast body of individuals not reached by more formal processes of education, and successful also in bringing these—at least for a time, and even if but superficially—into touch with the highest in literature and achievement.

Local Chautauquas.—There are now scattered throughout the United States and Canada more than 300 so-called "Chautauquas." They are federated with the parent "Chautauqua" only in filial ways, like Greek colonies to their metropolis. The daughter educational societies follow the same methods and courses of reading as their alma mater, and gladly report to her their progress. Bishop Vincent every summer "swings around" at least part of the grand Chautauqua circle to encourage these local assemblies.

Historical study, including short accounts of forty other Chautauquas.

VI.

SELECT TYPES OF SUMMER SCHOOLS.

*Catholic Summer School of America.*¹—For nearly ten years the friends of higher education have maintained a Catholic Summer School for the benefit of teachers and students. After meeting in various places, the school finally settled down at Plattsburg, N. Y., on Lake Champlain. In 1893, the regents of the University of the State of New York granted a charter by which this school became a legal corporation, and was classified in the system of public instruction devoted to university extension. By this charter certain advantages are acquired by summer school students who wish to prepare for the regents' or State's examinations.

The objects of the school, officially stated, are to increase the facilities for busy people as well as for those of leisure to pursue lines of study in various departments of knowledge. Opportunities for instruction are provided by lectures from eminent specialists. Courses are given in anthropology, history, literature, ethics, science, and religion.

The school itself is beautiful for situation and not far from the principal summer hotel on Lake Champlain. The Catholic Chautauqua has, however, its own cottage accommodations, a club or casino for social reunions, its lecture halls and local book store. The place, like the central Chautauqua, is an ideal summer resort and attracts many friends of education, both Catholic and Protestant.

It is pleasant to see even pictures of buildings on the lake shore and some of these summer gatherings of the clergy who are leading spirits in this popular movement. Dr. Conaty, who was long its faithful director, is now the eloquent and progressive rector of the Catholic University of America.

*Catholic Winter School.*²—Three or four sessions of the Catholic Winter School of America have been held at New Orleans, one of the most catholic centers of American education—secondary, higher, and popular. With Tulane University, the Howard memorial library, and a fine system of public schools, New Orleans, for its educational background, has a noble record of French Catholic spiritual and intellectual activity extending through nearly two centuries, from the time of the grand monarch under whose sovereignty Louisiana was first colonized and named. The early Catholic movement in American education is well described by Professor Fay in his *History of Education in Louisiana* (contributions to American educational history, published by the U. S. Bureau of Education).

¹ A special account of the origin of this new and remarkable movement may be found in the author's paper on Chautauqua. See Report of U. S. Commissioner of Education, 1894-95, pp. 1065-1077.

² Dr. Weeks says (Education Report, 1894-95, p. 1484): "As the summer was originally chosen because of its comparative freedom and the greater suitability of climate in the Middle and Northern States, so the idea has been reversed in the extreme South, and we have the Florida Chautauqua held in February and March, and the Catholic Winter School of America, which held its first session in New Orleans, February 16 to March 14, 1896, and was a financial success." Winter schools for adults would be expedient in Baltimore and Washington or some other cities which are prevented by climatic reasons from attempting summer schools.

At the Catholic Winter School of America popular education is naturally connected with religion. The school is opened with pontifical high mass in St. Louis Cathedral. A bishop from Mexico officiated at the formal opening in February, 1898. It is noteworthy that the rector of the Catholic University of America, Rev. Dr. Conaty, gave five lectures on the relations of the Church to the educational movement of to-day. This former and well-beloved director of the Catholic Summer School of America at Cliff Haven, Plattsburg on Lake Champlain, has thus served as an educational link between the North and the South, between the historic shores of Lake Champlain and of the Gulf of Mexico. Prof. Alcée Fortier, of Tulane University (one of the best romance scholars in America), introduced the educational programme. The distinguished novelist, F. Marion Crawford, also gave a course of literary lectures. In the public instruction given at summer schools by these traveled men and cosmopolitan spirits there is and must be a peculiar extension of the best international and Catholic influences. What the Congrès international de l'enseignement des sciences sociales represented at Paris in July, 1900 (the idea, namely, of an interchange of personnel between the universities and schools of different countries), is already realized in some measure by various American institutions, Harvard, Johns Hopkins, the Catholic University of America, and by well-known American summer schools like Chautauqua and Philadelphia, some of which institutions every summer call over to this country celebrated European educationists and public lecturers—e. g., Brunetière, Doumic, George Adam Smith, Principal Fairbairn, Professor Mahaffy, Michael Sadler, Professor Moulton, F. Marion Crawford, and many others.

Columbian Catholic Summer School.—At Madison, Wis., one of the best centers of academic and popular education in the great Northwest, there assembled in July, 1898, the Columbian Catholic Summer School with lecturers from Washington, D. C., and other seats of educational extension. Noteworthy among these public teachers were the Rt. Rev. Thomas Gorman; Bishop Spalding, the Catholic historian from Peoria; Henry Austin Adams, from the Brooklyn Institute, who lectures now on Lake Champlain, now in New Orleans, and now in the lake district of Wisconsin.

Jewish Chautauqua.—The third summer assembly of the Jewish Chautauqua at Atlantic City, from July 14 to July 30, offered the following general programme of work, which continues throughout the year: (1) Popular lectures; (2) Chautauqua circles for Bible studies; (3) Chautauqua circles for post-biblical studies; (4) teachers' institute; (5) general conferences; (6) religious services; (7) social entertainment; (8) preparatory work; (9) reunion of Chautauquans.

The Jewish Chautauqua now enrolls over 2,000 members in its various local circles in the United States and Canada. For summer assembly work it employs the most eminent American Hebrew scholars—e. g., Prof. Richard Gottheil, of Columbia University; Rev. Dr. Jastrow, of Philadelphia; Rev. Dr. Guttmacher, of Baltimore (a graduate student of the Johns Hopkins University); Rev. Dr. F. De Sola Mendes, of New York; Rev. Dr. Kohler, of New York; and D. W. Amram, of Philadelphia. The Jewish Chautauqua also employs various Christian scholars of eminence, for example, Rev. Dr. Charles Cuthbert Hall, president of the Union Theological Seminary, New York; Prof. Leon H. Vincent, the well-known Chautauqua lecturer on literary subjects, whose themes in 1899 were partially Jewish—"Heine" and "Zangwill." This combination of lecturers and subjects well illustrates the truly catholic influence of the Chautauqua idea. Much attention was paid to education, for example, Professor Bamberger, principal of the Jewish Training School in Chicago, lectured on "Religious education from the view point of pedagogy." The chancellor of the Jewish Chautauqua is the Rev. Dr. Henry Berkowitz, whose wholesome and liberalizing influence upon American education can not be too highly praised.¹

¹ A more elaborate account of "National Jewish educational work," by Charles S. Bernheimer, was published in the American Monthly Review of Reviews, New York, April, 1897.

The original Chautauqua is undoubtedly the most popular and best-known type of American summer schools. Its example influenced the development of very many others, and, perhaps, suggested certain English summer meetings—e. g., those of the National Home Reading Union, at Chester, London, and other well-known places. The summer meetings of university extension and their friends at Oxford, Cambridge, and Edinburgh are truly international in spirit. They are the most delightful summer schools in the English-speaking world, but Chautauqua remains after more than twenty-five years' experience the most democratic and largely-attended summer school. It is the earliest continuous school of the kind in the world. Chautauqua was founded in 1874 as an educational assembly, with the primary idea of promoting higher and better Sunday-school work. While this idea is wisely retained, educational effort had been extended over many other fields. We may best characterize all Chautauquas as religious summer schools.

Summer schools of science.—In July, 1873, Louis Agassiz, the Swiss naturalist, professor in Harvard University, opened a scientific summer school on Penikese Island, about 25 miles from Newport. This experiment served to develop several young zoologists and gave rise to a succession of similar schools of natural science, for example, the Chesapeake Zoological Laboratory, the marine stations at Newport, Woods Holl, and others. The Marine Biological Laboratory at Woods Holl, Mass., has completed its twelfth year, and is known as the clearing house of American scientists. Sooner or later the prominent workers appear at this interesting summer school and pay tribute by giving public lectures on the trend of their work. There are three main departments: (1) Zoology, in charge of Professor Whitman, of the University of Chicago; (2) physiology, Dr. Loeb; and botany, Dr. Davis. (See letter from Woods Holl, dated August 12, 1899, in Sunday Tribune, following.)

Types of summer schools.—Dr. Stephen B. Weeks, who prepared for the United States Bureau of Education (Report of Commissioner, 1894-95, pp. 1483-1503) a check list of American summer schools, says they

may be roughly divided into the following classes, according to the phases of education, which they emphasize particularly: (1) Schools that teach special branches of knowledge, as ancient and modern languages, literature, psychology, natural sciences, law, medicine; (2) schools of the arts, as drawing, industrial art, music, oratory, etc.; (3) professional, normal, or schools of methods, where the training of teachers is the main idea—summer schools of pedagogy; (4) general, where all, or nearly all, the subjects in the general curriculum of education are treated; (5) Chautauqua, where the idea of study is united with that of rest and recreation, and where the Chautauqua course of reading (C. L. S. C.) is made the basis of the educational work.

Again, from the standpoint of control, they may be divided into several classes: (1) Private, which range in scope from a school devoting itself to preparing students for college or to making up the deficiencies of common-school teachers, to a private school of chemistry, law, or Bible study; (2) college or university, which are usually more general in character; (3) State, which are generally devoted to the training of teachers, are more or less local and even migratory in character. In the matter of fees, they range all the way from the private, with fees sufficient to support the school, to the public State schools, which are free.

In the same report Dr. Weeks says:

The length of term varies in different schools from a few days to three months. The tendency to increase the length of time and make as much use of the vacation as possible is increasing, and there has been a material change in the character of the courses offered. At first it was the custom to give many short courses or single lectures. It is now the custom to make the courses of lectures as continuous and connected as possible.

University of Chicago.—The most remarkable and most recent development of the summer school idea in America is that of the fourth quarter or summer term at the University of Chicago, where academic work goes straight on throughout the year (forty-eight weeks) like any other business. President Harper, for many years principal of Chautauqua, was probably influenced by its example in devising his

plan for a summer university course. The result of his excellent policy is that while most American colleges and universities rest or go to sleep in summer time Chicago is drawing students and professors from nearly all of them. Many Chicago professors arrange to take their long vacation in the winter or spring. Outside seekers after academic knowledge can, therefore, find good men at their Chicago post in the mid-summer term. Thus, the summer school idea has been fully incorporated by a vigorous and progressive American university.

“Continuous sessions for colleges and universities” was a subject presented to the Southern Association of Colleges and Preparatory Schools in November, 1898, by Jerome H. Raymond, president of West Virginia University, where the Chicago system of the summer quarter was introduced that very year. President Raymond’s favorable account of his West Virginia experiment and of its educational advantages is printed in the *School Review*, University of Chicago press, February, 1899. Among the advantages enumerated are:

(1) The new system of four continuous sessions (with a week’s recess between successive terms) enables a college or university to meet the needs of young men and women who are obliged to work their way by teaching during the winter months, and can recover lost academic ground by returning to college for the summer quarter.

(2) Professional teachers and others can get some advantage by a summer sojourn at a university of the West Virginia or Chicago type.

(3) Professors in such a university can take a vacation when other academic institutions are in full session and can profit by these outside courses.

(4) The Chicago system enables the student to complete his academic work more quickly.

(5) What business man would equip an extensive plant and allow it to lie idle for three months out of every twelve? “Shall we, then, be less zealous to make the greatest possible use of the great educational plants?”

In answer to the argument in favor of summer courses and continuous sessions of all sorts, it may simply be said that the experience of many generations in the world of education, from mediæval universities down to modern kindergartens, indicates that it is not well to force either pupils or teachers to continuous mental work or to overproduction. Whatever manufacturers may do or railroads require, Mother Nature imperatively demands that sometimes we allow productive acres to lie fallow and that overworked men, tired women, and growing children also have a chance for sufficient rest. If American teachers do not heed the lessons of human experience and common sense, Mother Nature will probably give us a private course in neurology at expensive rates.

Harvard Summer School.—By special request the following account of Harvard Summer School in the July season of 1899 was contributed by Miss Elizabeth T. King, president of the Arundell Club of Baltimore:

Cambridge possesses nearly every qualification for a summer school. The class rooms, laboratories, and college library of 400,000 volumes are at hand. The zoological and mineralogical museums, the Fogg Art Museum, and the Peabody Museum, with its unrivaled Central American, Semitic, and other collections, are open to the student. The boarding houses and some halls are ready; the majestic and varied series of buildings in their beautiful setting of court and turf and trees; the historic and literary associations, not only of Cambridge, but of all the neighboring region, stimulate the imagination and arouse enthusiasm.

The beginnings of the school were university lectures given on Saturdays to teachers as far back as 1863. Course after course has been added and developed, until now the university offers forty-seven different courses ranging from Greek through modern languages to history, psychology, and science. There are this year over 700 students, mostly college graduates, teachers, and special students. The work is arranged so that each student is expected to specialize in one, or at the most two courses, and much outside work is required in addition to daily recitations.

The six weeks’ work is equivalent to a half year’s course of three lectures a week, and it so counts for Harvard students. A certificate is given at the close which is

useful to teachers in many States, especially in New York, where a summer school certificate is required.

The fee for each course varies from \$15 to \$25 and does not admit the student to any other advantages beside those included in his own work. There is none of the pleasant interchange of thought common to most summer schools. Even in more elementary work, the university spirit and seminary methods of a great center of learning are evident. There are, however, admirable general lectures given in the evening upon educational and literary topics, such as German secondary education, the drama of to-day, Dürer, the abbey of Cluny, the evolution of the conscience, etc.

At the close of the school an educational conference is held to which two students from each class are appointed and who prepare a programme of conference and discussion. The historic pilgrimages are by far the most interesting general feature. They are preceded by a lecture showing how the civic conscience can thus be cultivated, and encouraging students from distant States to go home and find their own Mayflowers and Bunker Hills. The connection between the literature and history of this rich region is pointed out, and twice a week most interesting and significant pilgrimages are made to surrounding places where the local historical societies and the antiquarians welcome the students.

This year a new feature has been added in a three weeks' course in the divinity school. It is intended for the "intellectual quickening of the clergy;" and that this purpose was realizable was at once shown by the enrollment of more than 100 clergymen, although at first a very small attendance had been expected. Eight women have availed themselves of these advantages. Lectures are given on ethics and the ideal elements of religion; on Old Testament history including institutions, Babylonian parallels, and methods of historical investigation; on church history and its development from primitive to Catholic Christianity. The most distinguished scholars and theologians from Harvard and other divinity schools have in turn lectured to an enthusiastic body of workers and thinkers, and the course has been a conspicuous success.

In general it is remarkable to see what an admirable body of special students have been assembled at the school, especially from the South and West, and to hear from their teachers how good the quality of their work is. The result of disseminating the methods and influences of Harvard throughout the States and institutions thus brought into contact with it can not fail to benefit both the university and the country. Much praise is due the earnest and disinterested men who give their time to it.

It is amusing to see how frankly coeducational Harvard becomes in summer, and the question naturally arises, if for six weeks in summer, why not for six months in winter? The men and women students board at the same houses, work in the same laboratories, study in the same library without the slightest supervision—but human nature is so inconsistent that it will doubtless be some time before this logic is convincing. Summer schools are, however, quickly and gradually solving many educational problems, and their directness of methods, adaptation to practical needs of workers, absence of hampering conditions, and quickness of response to popular wants make them interesting laboratories for discovering solutions for the educational problems of democracy.

An equally significant feature is the eagerness for knowledge and desire for enlightened methods in education shown by representatives from every part of this great country which can not fail to affect the life of the nation.

Melvil Dewey on summer schools.—"Thousands testify after trial that the change of surroundings and occupation, the stimulus of cheerful companions interested in the same subjects, and the many provisions of our best summer schools for healthful recreation, are better preparation for hard work the next year than a vacation spent in idleness. In brief; it is evident that the tendency is growing among teachers to congregate for a few weeks during the long vacation."

VII.

THE CITY AND POPULAR EDUCATION.

The city an object lesson.—On the occasion of the opening of the Teachers' College in New York City, President Gilman, of the Johns Hopkins University, spoke of the educational advantage of New York City as a colossal object lesson. He said:

It is in itself a sort of teachers' college where other cities may learn both what to do and what not to do. * * * Other cities may follow or neglect the lessons, but are sure to watch, weigh, and judge what happens on the island of Manhattan. The Central Park is opened—similar parks appear in Boston and San Francisco; museums devoted to the works of nature and art are established—Washington and Chicago begin the like; Columbia unites the institutions of higher education in a federative union—Baltimore longs to do the same. Here and now the unfolding of a new idea is celebrated; an idea not absolutely new, but new in its environment and possibilities. The leaders of education in other cities in surprise and delight will note, praise, and emulate the suggestions here embodied, the generosity with which they have been supported, the enthusiasm which has governed their development.

Public schools.—Every American city takes especial pride in its public schools and these are deservedly praised in the Federal city, in Richmond, Atlanta, and the new South; in Philadelphia, Brooklyn, Brookline, Boston, Providence, Worcester, Albany, Cincinnati, Chicago, St. Louis, Indianapolis, St. Paul, Minneapolis, and many other places that might be named. The Chicago Exposition in 1893 revealed the striking fact that many cities in the Northwest are becoming models of education, in the higher branches, history, literature, art, and science. The examples of work actually done in the way of English composition and artistic illustration by the sons and daughters of the people were surprising to many observers.

Public libraries.—Next to the support of public schools are the institution and maintenance of public libraries.¹ Most of the larger and progressive towns and cities of America have already introduced the people's university, in the form of a growing collection of readable books and periodicals. New England and western towns are especially liberal in this regard. Many States (New York, New Jersey, Wisconsin) have themselves given an impetus to library extension. In the older, historic communities of New England, generous individuals have either given or founded libraries which the town has gladly accepted and continues to enlarge. A combination of public aid and private endowment seems to work very happily in the development of this highest of high schools. Very often the town library bears the name of the original donor or of his family. The institution is at once a memorial of the dead and a joy to the living. Public-spirited citizens, men and women, unite in its further improvement, by private philanthropy as well as by public appropriations. The most competent and discriminating judges of good literature are usually appointed on the library committee by town authority, and see to it that the right choice is made of new books, which are bought by public money or by private donations.

Among the most remarkable public-library creations in recent years are those of Boston, New York, Baltimore, Pittsburg, Allegheny City, Chicago, Milwaukee, Atlanta, and other great industrial towns. Here in most striking ways private foundations of public libraries have been made by wealthy, far-sighted, and public-spirited individuals, for example, Enoch Pratt, of Baltimore; and Andrew Carnegie, of Pittsburg, who is said to have learned his municipal policy from Mr. Enoch Pratt, a lineal descendant from Phinehas Pratt, one of the Pilgrim Fathers. How to combine a privately endowed institution with the principle of municipal ownership,

¹A special monograph upon the subject of "Public libraries and popular education," has been prepared for Regents' Bulletin of the University of the State of New York and for the Paris Exposition, by the present writer.

without the attendant dangers of political interference, that was the question. Enoch Pratt founded, built, and equipped a splendid public library with various local branches in Baltimore and then presented the whole system to the city with \$1,000,000 endowment, which Baltimore agreed to accept as a public fund and to pay 5 per cent interest upon it for all time for the support of the Enoch Pratt Free Public Library, which should be forever managed by a private board of trustees, selected originally by Mr. Pratt and choosing their own successors.

1. *Libraries and schools.*—Free public libraries are now becoming well coordinated in America with free public schools. The movement began in New England, where great public libraries, like those of Boston, Providence, and Worcester early made their collections especially attractive and accessible to teachers and their classes. For many years Mr. William E. Foster, librarian of the Providence Free Library, has made the city newspapers and printed bibliographies practical means of mediation between the actual needs of the public schools and the resources of the public library. If a distinguished lecturer were coming to Providence to give a public course, Mr. Foster prepared a list of good books upon his chosen themes and published it broadcast in the newspapers and posted it conspicuously upon the bulletin boards of his library. For years he has cooperated with the professors of Brown University and other teachers in the promotion of their public or private class work. His reference lists of good books on a great variety of subjects interesting to students in school and college have been published far and wide. Mr. S. S. Green, in the Public Library of Worcester, Mass., has made that institution a favorite place for the congregation of classes or groups of school children, under the guidance of their teachers, for the examination of illustrated books, prints, portraits, and other valuable material for the illustration of history, art, and literature. Public librarians now generally follow his example in making known to students and the people through the agency of bulletins or the newspapers the most interesting accessions of new books to the public library.

Branches.—City libraries now have their local branches in the various wards or districts. The public librarian of Jersey City, Mr. George Watson Cole, says: "Experience has shown that many people who will not go far out of the way to secure books for home reading will use a library if its books can be brought conveniently near to them. The reader needs stimulating, and in order to reach him in towns covering large areas or having distinct centers of population several enterprising libraries have established branches or delivery stations at points sufficiently accessible to overcome this natural inertia inherent in the general reader." In Jersey City a dozen or more local-delivery stations have been established. Book collections are made in the morning and book deliveries in the afternoon by a hired delivery wagon. It costs the city about \$2,000 a year for such transportation. The circulation of the city library has been doubled by this popular method. Mr. Frank P. Hill proposes to make each of the city schools in his city, Newark, N. J., a local library station, under the direction of the principal, and to furnish each school with a working library of 50 volumes. In short, the system of traveling libraries initiated by Mr. M. Dewey in connection with the New York State Library will be connected with the public school system.

The schools of Brookline, Mass.—In the Baltimore Sun of August 8, 1899, was published an interview with Miss Elizabeth T. King, president of the Arundell Club, regarding the relation of Brookline schools to the community, the library, and other institutions. This interview will serve to illustrate the progressive educational spirit in New England, and reveals a system of public schools so good that private schools can not be supported in competition with them.

In regard to her visit to Brookline, Miss King said that the town still preserves its elementary conception of civil government—the collective assembly, the representative body—and it declines to become a part of Greater Boston. Perhaps this is the reason why its citizens take such an interest in public affairs, especially in the public

schools, which are so good that, in spite of its wealthy inhabitants, Brookline does not support private schools, and nearly all its children, rich and poor, attend the public schools. These are famous for many reasons, chief among them their superintendent, Mr. Samuel T. Dutton, who has raised them to their present high standard by his wise coordination of all the interests which go to build up the character of the child in home, church, and school, and by his appreciation of the necessity of training the pupil for life in its broadest sense. In his own words, his aim has been to take the public school out of the "narrow aims and mechanical methods of the past and to develop it to realize life to-day in all its fullness, and to fit a child to be a true member of the social community."

"Second only to the influence of its superintendent," Miss King continued, "is the influence of the Brookline Education Society,¹ composed of public-spirited men and women who intelligently supplement the public school system by their active support and investigations. Its constitution announces that it is established 'to promote a broader knowledge of the science of education, a better understanding of the methods employed, and a closer sympathy and cooperation between the home and the school.' It realizes the principle, which Mr. Dutton warmly advocates, that volunteer and professional workers are a great help to each other, and only by their union can the best results be obtained. This society holds general meetings where educational topics of interest to parents and teachers are discussed. It has formed committees on child study, music, manual and physical training, lectures for the young, school libraries, etc., and its secretary and treasurer, Mrs. Alice N. George, is a leading spirit in building up and promoting these ideas in every direction.

"DECORATIONS IN SCHOOLS.

"Brookline fully appreciates the educational value, both for artistic and historical reasons, of hanging on the walls of schools the best art reproductions. In view of the primary school No. 4 in Baltimore having been recently decorated by the Arundell Good Government Club at the request of a public-spirited and generous citizen, it will probably interest readers to know what is being done in Brookline. Mrs. Leslie Mead took us first to the Lawrence School, which owes its inspiring artistic interior to her intelligent supervision. The pictures are grouped in the rooms so as to present a homogeneous idea; for instance, the Italian room has large photographs of some of Raphael's Madonnas, the 'Castle of St. Angelo,' the 'Forum and Colosseum,' the 'Dying Gladiator,' Michael Angelo's 'Moses,' and 'The Hermes.' There are also Norwegian, French, Scotch, English, and American rooms, containing the best examples of scenery, architecture, and pictures.

"The general geography room is specially interesting, giving the Parliament houses, Pyramids, Acropolis, Shakespeare's home, Windsor Castle, etc. Over the blackboards a frieze of cabinet-sized photographs is arranged, so that the children are daily familiarized with scenes from all over the world.

"One room is devoted to a surprisingly good series of colored prints of striking scenery in the Rocky Mountains and Switzerland. Children like and understand color, and even at a loss of some values in tone the result of conveying an impressive effect is thus sometimes best gained. It is very much to be hoped that this work will be supported in Baltimore under the auspices of the Municipal Art Society, which has undertaken to promote it.

"THE PRIDE OF THE TOWN.

"Our next visit was to the Devotion Primary School, which is appropriately filled with pictures, and is not, as seems at first sight, a Sunday school, but is named in honor of Edward Devotion, the first of a long line of public-spirited descendants who came from France in 1621, and did much to promote education and to build up the town. The old family home is preserved as a landmark, and the new primary school, built beside it, perpetuates the spirit of the family, and passes on to future generations their enlightened principles.

"The High School is the pride of the town. Its exterior is not beautiful, but within it seems to possess every advantage for the fortunate boys and girls who attend. The art department has an immense collection of photographs illustrating various periods of art, and loaned, on occasions, to other schools. Friends of the school remember it on their visits abroad and bring home photographs; parents, when their children graduate, often give presents to the school; graduate students preserve their interest and there is evidently a strong local pride felt and general support given to it by the community.

¹For a more detailed account of the work of the Brookline Education Society see the Report of the Commissioner of Education for 1898-99, vol. 1, pp. 538-546.

"MANUAL TRAINING.

"Manual training and its relation to other branches of education is a very important part of the whole system. The grammar schools have a cooking-school kitchen, sewing room, and carpentering and metal workshops. These courses are very popular, and boys and girls often remain at school for a much longer period than before and parents make many sacrifices to obtain these advantages. In the High School special attention is paid to them and they are extremely popular. A curious experiment has been tried of giving the boys half a year's experience in the kitchen while the girls spend the same length of time working with tools. This has been found very successful, both on educational and practical grounds.

"There is no doubt that the training of eye and hand, the correlation of brain and muscle, and the mastery of practical details are invaluable preparations for life, as well as excellent means for developing good mental qualities, and serving as a stimulus all along the line of a general and complete education.

"THE PUBLIC LIBRARY.

"The cooperation of the public library enables the schools to shape the reading of the boys and girls and to illumine their studies by collateral literature. This was effected by the Educational Society. Its committee asked for an appropriation for the salary of a school librarian, for a room and for the purchase of books in order that school children should be taught systematically to use a library and to be brought into touch with books suited to their capacity.

"They are regularly examined on their knowledge and facility, and the library becomes really an object lesson and a schoolroom. The librarian learns the needs of the schools, and reveals to the children the uses of the library; with the assistance of teachers she makes out lists of books to be added to it, and sends them, on request, to special classes. Thus the public library and the public school system supplement each other.

"OTHER NOTICEABLE FEATURES.

"There are many other noticeable features connected with the schools. Coeducation, from the kindergarten through the High School, is so much a matter of course that much surprise was expressed that it should be questioned.

"On the common, in front of the High School, is a public playground, and a beautiful bath house and swimming pool close by are the delight of the youthful inhabitant.

"A novel feature of the public schools is the training class for college graduates, which brings them into relation with all grades of work, and is significant of the growing feeling that colleges and universities are dependent on the public schools, and graduates feel that these are a fruitful field for training.

"A PRACTICAL QUESTION.

"One of the most striking results of these excellent schools is the local pride and universal interest felt in them by the community; or, it may be, that one reason why they are so good is that the richest and most influential citizens interest themselves in them. We might profitably ask how many such in Baltimore trouble themselves to find out the conditions of our schools, and their needs and possibilities, or feel that in their development lies the promise of a high type of citizenship. To help our hard-worked officials and teachers, to give hearty support as well as intelligent criticism ought to be a distinct feature of every municipality. Certainly the town of Brookline shows the benefit of such a course. Visitors from a distance come to learn, and are freely welcomed to observe the good order, cheerful cooperation and ideal of social service which prevail. Emphasis is laid on the strengthening of mental powers—the reason, observation, and perception, and less on the simple acquirement of information. The pupils may be slower in repeating the multiplication table and tables of measures, but they know what multiplication means, and how to measure a pint and a quart. The fact that history, geography, literature, spelling and reading may be included in one lesson, and that each subject illumines the others so that the child grasps the whole, instead of a part, of an idea is now so thoroughly understood that no lesson which is not conducted on that plan is considered satisfactory.

"The school is regarded as a social institution, and the natural activities of a child and the various influences which surround it, are correlated to lay the foundations of a liberal education. This is all done in a conservative spirit, as Mr. Dutton¹ recog-

¹ Cf. Samuel T. Dutton's valuable and suggestive book on *Social Phases of Education in the School and the Home*. (New York, Macmillan Company, 1899.)

nizes that 'we can not go far beyond a point which public opinion is prepared to follow.'"

Free lectures for the people.—Within recent years there has sprung up in some of the leading cities of America a remarkable system of free lectures for the people. One of the most conspicuous examples is that started in New York City about ten years ago (1889) in connection with the public school system. An appropriation of \$15,000 was made by the city for the purpose of supporting a series of evening lectures given in six different schoolhouses. The total number of lectures in the first season was 186. The total attendance was 22,149. The attendants upon the lectures were very largely the family friends of school children who occupied the schoolhouses during the day. Announcements of lectures were made, among other ways, through the school children themselves, who carried into their own homes the circulars descriptive of coming popular courses.

From year to year handbooks¹ have been published giving the names of the lecturers, the subjects of lectures, and the exact time and place of each appointment. An examination of these handbooks shows a gradual development and a steady improvement both in the character and extent of these popular courses. During the past winter season, 1898-99, 1,800 lectures have been given to popular audiences in New York schoolhouses. Appropriations have been increased. There were 48 different centers of public instruction and over 200 different lecturers. The total attendance was 519,411. This remarkable increase shows that the free lecture system has struck a popular chord and that it deserves to be considered as a valuable adjunct of the public school system. The evening lectures are designed more especially for adults, for in New York and all American cities adult education is a growing necessity. In a popular democracy, where, in the last instance, everything depends upon the intelligence of the voter, there can hardly be too much public education, provided it is of the right sort. The managers of these popular evening courses have striven in every way to adapt the work to the actual needs and highest interests of the people.

Dr. Leipziger.—The leader of this New York movement in higher popular education is Henry M. Leipziger, Ph. D., who for years has been in close relations with the New York school board and with the cause of popular education. At a recent banquet in New York City he gave the philosophy of the whole movement in the following words: "To gratify the various yearnings of the less fortunate multitude, to acquaint the newcomers with the spirit of our institutions, to give the denizens of our city knowledge that will lead to a better physical life and thus to a higher moral life, to bring beauty and culture into the humblest homes, to give more men and women high aims, to teach the truth that life is a school, that all are learners, and that man is in the world not merely to 'eat and drink and vote and get honors,' but that 'man needs knowledge, not only as a means of livelihood, but as a means of life'."² Dr. Leipziger has caught the spirit of university extension as well as the sentiment of Dr. G. J. Goschen, the early leader of the London Society for the Extension of University Teaching. For several years Dr. Leipziger was content with single and disconnected lectures, but more recently he has shown his appreciation of the principle of continuity in public instruction and has encouraged more connected courses of public instruction, designed to extend popular knowledge upon specific subjects. Brooklyn now grants \$10,000 a year for free lectures for adults.

Boston.—In 1898 in Boston, Mass., a system of free lectures for the people was arranged in six school halls provided by the city and conducted by the education

¹ Report of the Free Lectures to the People, season 1898-99. See "Free Lecture Movement," Library Journal, August, 1898.

² The Free Lecture Course in New York City. Addresses at the ninth annual reunion and dinner, May 4, 1899, pp. 8, 9.

department of the Twentieth Century Club. The lectures were given by men and women well known in the vicinity of Boston.

In the Girls' High School, West Newton street, the following six subjects were presented in successive weeks: (1) Shakespeare as man and poet; (2) Electricity, Thales to Franklin (stereopticon experiments); (3) Electricity, Galvani to Edison (stereopticon experiments); (4) Boston anti-slavery days; (5) Electricity, Faraday to Tesla (stereopticon experiments); (6) Niagara Falls (illustrated by stereopticon).

In this course electricity was the central theme. In another school special attention was drawn to the public institutions and interesting places in and about Boston: (1) The public library; (2) half holidays in the Museum of Fine Arts; (3) historic buildings in Boston; (4) interesting places in Cambridge; (5) Boston in the Revolution; (6) parks in and around Boston.

Nearly all of these lectures were illustrated with stereopticon views. Similar courses of six lectures were in progress on the same dates and at the same evening hour (7.45) in six different school buildings. A great variety of popular subjects was presented. They were, however, for the most part chosen from the local or American environment, or at least from the world of nature, which is always near and around us. Such themes as "Insect life," "How plants scatter their seeds," "The photography of wild animals," "The beauty of nature," will always interest and instruct the people.

Music is also a subject of intense interest to the masses. The art department of the Twentieth Century Club of Boston has endeavored to foster and develop a natural appreciation of good music by instituting free concerts and organ recitals in the churches of Boston and its suburbs. Tickets are issued on request and the number is limited, so as to prevent overcrowding. Printed circulars and programmes are distributed, containing brief characterizations of the music rendered and short sketches of the original composers. The educational value of good music for the people is becoming more and more widely appreciated in American cities. Many American cities now supply free concerts to the assembled crowds in the city parks, which in themselves are a source of great pleasure to all classes. Free lectures and free music are sometimes grouped with free school lunches, children's playgrounds, open-air gymnastic recreation piers, and free municipal baths. These institutions are now becoming very popular in leading American cities.

Philadelphia.—The free-lecture movement has extended to the Quaker City, which for years has been one of the foremost leaders in university extension, which there proceeded from the University of Pennsylvania. The movement for free lectures in public schools of Philadelphia was undertaken by the American Society for the Extension of University Teaching, in cooperation with the board of public education, and was further supported by the Public Education Association. The example of the Old South Church historical courses in Boston seems to have been before the minds of the Philadelphia managers. Free lectures for adults in well-known public-school buildings were instituted in 1898-99. Their purpose was to make known Philadelphia's contributions to history, science, art, literature, commerce, jurisprudence, and philanthropy. The lectures were designed especially for public-school teachers, but were open to all teachers and the public generally. Among these lectures was one by Mrs. Alice Freeman Palmer, ex-president of Wellesley College, on the "Citizen's relation to the public school." Mr. J. W. Martin, an instructor in the People's Palace, gave a suggestive lecture on "Educational work in London." This lecture, reported in the Philadelphia papers, was soon after repeated in Baltimore as the introduction to the public-school teachers' course at the Johns Hopkins University, in November, 1898.

The faculty of the Northeast Manual Training School, in Philadelphia, in the season of 1898-99, offered and gave a series of free illustrated lectures to the public and

patrons of the school on such subjects as "The London of Shakespeare," "America before the flood," "Where our lumber comes from," and "How laws are made."

There is hardly any limit to which this popular and democratic development of the American public school is likely to be carried in the near future. Popular professors or lecturers are often available; the class rooms and schoolhouses are the city's property; they can properly be used for evening classes of school graduates or adult citizens, and for the continuation of regular school work in more special or, if desirable, more popular classes than those maintained in morning hours for younger pupils.

Chicago.—The school board of the city of Chicago, in cooperation with the university and the trustees of the Ryder lecture fund, have encouraged free lectures in the public-school buildings. For the initial courses in 1897 tickets were distributed by teachers to those who applied for them. The courses were well attended, the average being about 700. Prof. E. J. James, director of the extension division of the University of Chicago, says that if extension lectures continue to be given free in public-school buildings the attendance will rise to undreamed-of proportions. "There is here an opportunity for an ideal system of cooperation in educational work between the university, which can guarantee the character of the instruction; the school board, which can give the lecture rooms, and the public-spirited citizen, who may contribute to the support of the work." The expense of the initial experiments was borne by the Ryder lecture fund, but the idea of supporting free lectures for the people either by private philanthropy or by appropriations from the city treasury will certainly expand in American cities, as it has already done in New York.

Professor Bickmore's work.—In New York City and State a remarkable system of free illustrated lectures to teachers and citizens has been developed by Prof. Albert S. Bickmore under the auspices of the State department of public instruction. It is a system of visual instruction by means of well-arranged sets of slides accompanying carefully prepared lectures on geography, botany, and zoology. The relation of these free lectures to the study of geography, natural history, and human history has proved educationally helpful and quickening. Teachers and citizens realize as never before man's place in nature, the natural environment of historic countries—Mexico, Egypt, Palestine, Greece, Italy, and Switzerland. Americans learn to appreciate the beauty, resources, and historic institutions of their own country and of individual States or sections. Classes of teachers and citizens are taken on imaginary pilgrimages through the historic and scenic regions of Lake George, Lake Champlain, Canada, the St. Lawrence River, the Connecticut Valley, White Mountains, the coast of New England, Pennsylvania, Virginia, and the District of Columbia, the Mississippi Valley, Southern States, the Rocky Mountains, the Yellowstone National Park, California, and the Yosemite Valley. Pictures of wild flowers, beautifully colored and lifelike, the flora and fauna of the far West (which children and teachers in a city audience will perhaps never see) are shown to appreciative eyes in the Central Park Museum. A snap-shot picture of one of those vast popular audiences reminds one of an even grander sight, the crowded amphitheater at Chautauqua, where frequently 10,000 people listen to a lecture or a concert. "The order of subjects for our lectures," says Professor Bickmore, "which has proved most profitable to the teachers who attend our instruction here at the museum is to devote one half of the year to the study of our own country and the other half to foreign lands."

This kind of popular education representing nature and man's relation to it was begun in 1884, and was first developed for the special benefit of school-teachers in connection with the American Museum of Natural History in Central Park, New York City, but has since been extended through New York and into various other States or sections by normal schools, teachers' institutes, farmers' institutes, manufacturing corporations, and other economic, social or educational agencies. Courses

have also been given under Dr. H. M. Leipziger's management, by authority of the board of education, to evening audiences of adult citizens in many schoolhouses of New York City. They have been repeated at Albany, Poughkeepsie, and many other cities. The system has attracted wide attention on the part of State and city boards of education, e. g., Massachusetts, Connecticut, Ohio. A representative of the Boston school committee wrote in November, 1897: "This is a work which can be so much better done by the State that I think an attempt will be made to have a law passed which will enable us to work up the subject of illustration in connection with school studies in a thorough and systematic manner. Of course we shall have to meet the objection of the State doing what may be done by individuals, but the New York State law¹ will be a decided help by way of example."

Professor Bickmore's lectures are all carefully elaborated by research and travel, beautifully illustrated and typewritten, and, with suitable slides, are supplied on certain conditions to responsible organizers of this visual system of public instruction in different States or sections. The subject-matter is so well arranged and the points capable of illustration by stereopticon are so clearly indicated that any good teacher, reader, or amateur local lecturer can repeat any one of Professor Bickmore's numerous serial courses to a popular audience.

Usually the State, city, or community pays the expense of the desired courses. At the American Museum of Natural History in Central Park, New York, "free illustrated lectures to the people" are advertised for alternate Saturdays and public holidays: "Doors open at 3 o'clock. Lectures begin at 3.30 p. m. All are welcome. No tickets are required." At the Lowell Institute in Boston, where for many years free lecture courses have been given every winter to the people, it has been found expedient to require the public to apply for tickets some time in advance. But for the Saturday afternoon and other holiday crowds in Central Park, New York, absolute freedom of public instruction has been found the better policy. The theory is rapidly growing in America that, for the people at large, knowledge, music, and recreation in city parks should be as free as health (salvation), air, or water. Natural history and art museums, public libraries, and public schools are now recognized as the free gifts of whole-souled men and women, of enlightened people to the public.

In the forty-second annual report, pp. 371-393, of the State superintendent of public instruction there is a full list of all the lectures delivered by Professor Bickmore at the American Museum of Natural History to State and city teachers from 1884 to 1895. In the forty-fourth annual report, pp. 223-257, the series is continued to the end of the year 1897. Among the most recent and suggestive lectures are those on the West Indies, the Lesser Antilles, the Colorado River and its Canyons, Southern California, Washington and Oregon, British Columbia, and the Rocky Mountain Park.

Most of Professor Bickmore's lectures are based upon actual tours of personal observation through the scenes and countries which he describes. In his recent journeys he has been accompanied by one of the most skillful American photographers, Dr. Dwight L. Elmendorf, who is also an accomplished and artistic lecturer, whom members of the University Club in Baltimore lately heard. We saw his marvelous and lifelike reproductions of events which he himself had witnessed on land and sea in the recent American war with Spain.

Such lectures naturally interest all classes, the most cultivated and exclusive as well as the unlearned and democratic, for such scenes from nature and actual contemporary life are real and intensely human. "One touch of nature makes the whole world kin." "Nothing human is foreign to us" is a noble sentiment derived from Seneca. Why should not modern teachers, preachers, editors, social workers, and

¹ This New York law regarding public visual instruction may be found in chapter 362, laws of 1895, and chapter 97, laws of 1897.

representatives of the people build upon the enduring moral and educational foundations of our common humanity and help civil society realize its essential unity and common interest, past, present, and future? Surely the United States and every other modern democracy need to recognize and strengthen every underlying basis and outstanding buttress of the social-economic order—the family, the church, school, city, and State. Of all the common interests that still constitute the Republic (*res publica*) or Commonwealth there is nothing more vital to the welfare of all than the public safety (*salus publica*), public health, sanitation, and education (moral, civic, historic, and humane).

Any system of public instruction like that of Professor Bickmore or Dr. Leipziger's, that tends to convert the people of New York City and State into better informed, more thoughtful citizens, deserves hearty commendation and wider extension. It is good public policy. It is not mere theory; it is a visible fact. It is not the reproduction of bread and circuses (*panem et circenses*), according to the Roman imperial precedent, but rather an enlightened modern and democratic way of teaching the people to educate themselves and their children by using the free gifts of nature and society and to appreciate the blessings of Christian civilization.

The president of the board of education in New York City, Hon. Charles B. Hubbell, said to the assembled teachers of New York and vicinity, October 9, 1897: "The real object of education in its relation to the state is to extend rational happiness to the greatest number of persons who can possibly avail of it."

A report from one conductor of teachers' institutes in New York State shows that in one year he gave illustrated lectures in connection with 18 different institutes to changing audiences of citizens and teachers, aggregating 9,000 people. He illustrated Mexico in 26 different halls, with a total attendance of 20,000. Another institute conductor reports having given in one year 24 illustrated lectures to audiences aggregating 14,000 people. A lecture on "Egypt" was given in 11 institutes to a total attendance of 7,000. These facts and figures merely indicate that this system of visual instruction is becoming popular with the people. Hundreds of teachers and thousands of children will profit by the system of free illustrated lectures as it is extended from county to county and town to town. The extension is so organized that there can be only two centers of control in each State and no possible profit to individual promoters. Simply the cost of the lantern views and lectures is required. The American Museum of Natural History in Central Park, New York City, Professor Bickmore, and the State department of public instruction at Albany are the head centers of the whole movement.

Vacation schools in New York.—This popular educational movement was practically started in Boston in 1835. The idea originated in Cambridge, Mass., as early as 1872. It was to give city children such instruction in manual training as would prove useful and interesting without being burdensome. Recreation was to be combined with education. School buildings hitherto standing idle during the summer months were now used for this excellent purpose. The idea proved so successful in Boston that it was taken up in New York City in 1894, and was financially supported by the Association for Improving the Condition of the Poor, which guaranteed \$5,000 the first year. The board of education placed three school buildings at the service of this association for six weeks in the summer of 1894. During that time 2,100 city children, with a daily average of 983, were agreeably instructed. The next season six schoolhouses were opened for vacation courses, and attendance was trebled. The average cost per pupil in 1895 was about 5 cents per day. In 1897 10 schoolhouses were opened, with a total attendance of 170,070 and a daily average of 5,703.

In 1898 the board of education took control of the experiment and granted \$10,000 for the support of 10 summer or vacation schools in city schoolhouses. Mr. Seth T. Stewart, long prominent as an advocate of university and school extension, was

appointed chairman of a committee on vacation schools and playgrounds. Under his efficient management the total attendance rose to 117,756, with a total registration of 7,517, and an average attendance of 408 in each of the 10 schools. The term was of six weeks, from July 11 to August 19. The school hours were from 9 to 12 daily, except Saturday and Sunday.

The chief features of these popular vacation schools were well-selected readings, discussions about authors and books, observational studies, drawing, modeling, coloring, sewing, and kindergarten exercises. The New York Circulating Library and the Cathedral Library lent books for use in these vacation schools, and the attendance is said to have been always highest on library days, a fact which points clearly to the line of least resistance in the conduct of educational classes in hot weather.

The playground is a characteristic feature of the vacation school. "In New York schools these playgrounds are usually in the school basements, for ground is expensive. An effort to have roof playgrounds in the new schools in crowded districts was not successful on the ground of expense. Two or three schools have such a playground, which is a great boon to the neighborhood. * * * No attempt was made to enforce the discipline of the ordinary school. The children were allowed more freedom, and only restrained where obviously necessary. This was possible because no compulsion forced the child to attend school; he or she went of his own free will, and no truant officer could ask an explanation of the absence." (See *Recreation plus Education: Vacation Schools in New York*. Municipal Affairs, September, 1898.)

Country outing.—Each of the 10 summer schools had, in the course of the six weeks' season, at least one day's outing in the country or by the seaside. Sometimes mothers were allowed to accompany their children on these excursions and thus to share their joy in nature. Among the beneficial results enumerated in the above article are: "That contact with nature which is denied by the child's circumstances is supplied at least partially by the vacation school. Every text-book is forbidden, and observation teaching is the rule. A manual-training school is merely devised to cultivate observation, and from observation the child is led to creation. The joy of creating is the joy that makes it worth while. * * * Negatively the vacation school prevents idleness and mischief. Positively it creates the deepest life for morality."

Summer session of 1899.—At the beginning of the last session a report in the New York Times, July 18, 1899, for the boroughs of Manhattan and the Bronx, showed an aggregate attendance the first day of 6,000 pupils. There were 10 schools, keeping from 9 a. m. to noon for five weeks. Associate Superintendent Seth T. Stewart said the registration was far beyond the capacity of the appropriation set aside for the work of vacation schools. There were 175 teachers for the 10 schools, and the number of pupils limited to each building was 600.

There were four branches in the schools: (1) Kindergarten, taking children from 5 to 6 years old; (2) the primary, taking children from 6 to 10 years old; (3) grammar and art schools, with pupils from 10 to 12 years old; and (4) industrial schools, taking children between the ages of 12 and 15 years. The indoor gymnasiums used in 1898 were supplemented with five outdoor gymnasiums. Sketch classes for boys and girls over 12 were added. They met in morning hours in city schoolrooms and proceeded later, if the weather was fine, to Central Park or to some other outdoor school of nature. In case of rain the children remained inside the school buildings and worked from models. There were also free swimming classes. Fifteen pools were opened under the direction of the dock board. Teachers of swimming met boy classes every other day; on the alternate days girls' classes had their swimming teachers.

Dr. William H. Tolman, secretary of the League for Social Service, published an

original and illustrated article on "Vacation schools," in Harper's Bazar, August 19, 1899, in which he reviews the educational experience of New York City with this new and popular institution. He gives the following statistics from 1894 to 1897:

Year.	Registra- tion.	Total at- tendance.	Cost per day for each child.	Number of schools.
1894	2,100	28,000	<i>Cents.</i> 11.7	3
1895	7,666	98,880	5.1	6
1896	5,762	101,009	4.9	6
1897	5,669	179,070	6	10

In 1898 the city expended \$13,201.83 for the educational benefit of 4,072 children, and in the summer of 1899 the experiment was continued under a special committee responsible to Hon. Miles M. O'Brien, chairman of the committee on special schools. "There are 10 schools, of which 4 are in buildings with roof playgrounds. The schools are at 8 Henry street, Rivington and Forsythe, Hester (between Orchard and Ludlow), East Broadway and Gouverneur street, and Rivington and Suffolk streets, all of which are on the East Side.

"An important educational feature of the system is the 21 playgrounds in connection with the various schools, and in addition to these there are 5 outdoor gymnasia. During the session plans are made for 80 outings and 8 barge trips." It is plain that New York is cooperating with its newspapers and the best efforts of individuals and of society itself to better the condition of city children in hot weather.

Vacation schools in Chicago.—In a paper on "Vacation schools," by Richard Waterman, jr., of Chicago, published by the National Educational Association, 1898, pages 404-410, the author says:

In 1896 the Civic Federation of Chicago conducted a vacation school in one of the most crowded districts on the west side of that city. The board of education gave the use of a fine public-school building, in which there was a very complete equipment for teaching woodwork. The Chicago Record gave the entire school an excursion to the country once each week. The work of the school was grouped around this excursion as a center. The subjects taught were nature study, woodwork, sewing, music, gymnastics, drawing, and modeling. Only 300 children could be admitted to the school, and nearly 4,000 had to be turned away for lack of room.

In 1897 a vacation school was conducted in the heart of the stock-yards district of Chicago, under the auspices of the University of Chicago Settlement. Here, again, the enrollment was limited to 300, but the number of applications was far in excess of the accommodations. The subjects taught were woodwork, sewing, housework, nature study, drawing, music, and physical exercises, and a very practical form of training for citizenship was given through the penny savings bank and the Clean City League. Frequent excursions to the country were made a prominent feature of the work.

These two schools in Chicago have aroused so much interest in the vacation school movement that a number of public-spirited women have agreed to provide the money needed for the support of several schools during the coming summer. The school authorities take a great interest in the work. At the end of the first summer the president of the board of education recommended in his annual report that vacation schools be made a part of the public-school system.

In an article on "Vacation schools" in The Independent, June 1, 1899, it is stated that in 1898 "the women's clubs of Chicago undertook to mother some thousand little ones during the summer," and to provide a weekly excursion which should be the center around which swung a curriculum of manual training, woodwork, needle work, drawing, painting, nature study, music, and gymnastics. Five such summer schools were opened in Chicago, July 5, 1898, accommodating 2,000 children. Over 6,000 applied for entrance. Only visitors in Chicago who have seen the pressure of juvenile democracy upon those Chicago public schools and libraries can begin to realize their significance as civilizing agencies and their vast possibilities.

Each week the whole school, in groups of varying sizes, was taken to some park or farm or suburb, and according to the nature of the place observations were made and material gathered as the basis for study during the week. Trees and flowers and birds, stones and soil were carefully observed, and many were the interesting discoveries of the children. Butterflies and bees, aye, even snakes and frogs and fishes, were carried back alive for further study in boxes specially prepared for the purpose.

Who shall say that city summer schools have not the freedom of the country in these days of parks, trolleys, and steamboats?

Instead of costly experiments for amusing and reforming city boys, the utilization of existing institutions such as public schools and public libraries is now generally approved in America. The movement for vacation schools has spread from New York to Brooklyn, Philadelphia, Baltimore, and Chicago. The city summer school, accompanied by fresh-air excursions to the seaside, the park, and the country, is a popular institution which like all democracy has come to stay and will doubtless improve from year to year.

The American city is not all that could be desired in educational or political respects, but there is much to encourage a believer in democracy and the church, and in the power of society to improve itself by the aid of education, religion, and experience. The Old World visitor should inspect the public schools and libraries of Boston, Brookline, and the neighboring towns. Visit the Museum of Fine Arts and the Public Gardens, behold the statuary and bronze memorials, the open air gymnasias and free baths of Boston, the "Athens of America." Go to Chicago and do likewise before visiting the stock-yards and abattoirs (as many travelers are urged to do). See the city in its best and noblest aspects, its magnificent parks and lake front, its Art Institute and Field Museum (a permanent memorial of the Chicago Exposition and of "The great White City"). Visit the Newberry, Crerar, and public libraries, where the eager interest of young Chicago in good books and periodicals is wonderfully manifest. Do not ignore the Armour and Lewis Institutes, people's seminaries of industrial education, nor the University of Chicago, the noblest educational and institutional expressions of the wonderful energy and vitalizing wealth of men who have laid an enduring economic basis for the intellectual and scientific training of the great West. If we extol the merchants and traders who made possible the art palaces of Venice and Florence, what shall we say of the extraordinary evolution which is going on before our very eyes in the great industrial towns of Philadelphia, Pittsburg, Atlanta, Chicago, St. Louis, Minneapolis, St. Paul, Seattle, and San Francisco. View them at their best and think of the physical difficulties which they have overcome with the aid of good engineering, better sanitation, and the best devices of modern science. The labors of Hercules are being repeated in every American city. English and American cities are beginning sometimes to reflect the human spirit on the nobler side, as Isocrates was finely said to do always.

The Greek ideal of city life was educational.—S. H. Butcher, in "Some aspects of Greek Genius" (pp. 65-66 and 70-71), thus describes the Greek idea of the city state:

The city was the teacher, the guide of life, the sovereign educator. The truth of this had been felt and acted on in Greece. Each city stood out as a person, a moral agent. It had its own character (*ἦθος*) and individual stamp. That character it impressed upon its members. Manifold were the agencies and influences by which it worked. It spoke to the citizens through its laws and constitution, which were the truest image of itself. It spoke, as at Athens, through its art and architecture, in which the service of the state and of religion was united. It spoke through the poets, who, at the great public festivals, were more than private individuals. They bore, in some sort, the commission of the state; and when, in the hearing of their fellow-citizens they set forth their deepest thoughts upon the problems of life, they did their part toward harmonizing ancient pieties and sacred legend with the moral sense of a more reflective age.

On page 70 Butcher has another highly suggestive passage for the modern citizen:

But the state, as conceived by the philosophers, while in one aspect it resembled a church, was also something more than a church. On its secular side, statesmanship had to concern itself with the outward means of livelihood; to regulate the production and distribution of wealth; to lay down minute rules for the guidance of the individual from the cradle to the grave; to exercise supreme control over all the practical arts, assigning to each its due rank and place. It had to prescribe what sciences should be admitted and studied by different classes within the community. Above all, the complete culture and education of the citizen must be undertaken by the state, for this, the highest of all civic interests, was, under existing social arrangements most defective. It must no longer be left in private hands, as at Athens. The training of the citizen thus becomes the chief concern of the political philosopher. Severe, indeed, was the preparation, and long and arduous the self-discipline enjoined upon those who were to be rulers in the state; and if few could hope to attain to such perfection, those few were the men whom nature had marked out as fitted to bear rule. With Aristotle as with Plato, the construction of an ideal state merges in a scheme of national education.

Civic education in Athens.—In Macaulay's Essay on the "Athenian Orators" there is a graphic picture of Athenian education:

Let us for a moment transport ourselves in thought to that glorious city. Let us imagine that we are entering its gates in the time of its power and glory. A crowd is assembled 'round a portico. All are gazing with delight at the entablature; for Phidias is putting up the frieze. We turn into another street; a rhapsodist is reciting there; men, women, children are thronging 'round him; the tears are running down their cheeks; their eyes are fixed; their very breath is still; for he is telling how Priam fell at the feet of Achilles, and kissed those hands—the terrible, the murderous—which had slain so many of his sons. We enter the public place; there is a ring of youths, all leaning forward, with sparkling eyes, and gestures of expectation. Socrates is pitted against the famous atheist, from Ionia, and has just brought him to a contradiction in terms. But we are interrupted. The herald is crying, "Room for the Prytanes." The general assembly is to meet. The people are swarming in on every side. Proclamation is made, "Who wishes to speak?" There is a shout and a clapping of hands; Pericles is mounting the stand. Then for a play of Sophocles; and away to sup with Aspasia. I know of no modern university which has so excellent a system of education.

Ancient and modern cities compared.—Greek cities were by no means perfect in their municipal economy or practical politics. Nor were their citizens altogether immaculate in public or private morals. Greek society was only half developed as regards family life, and Greek education broke down at some of the most practical points. The platonic republic and its socialistic ideals were never realized in old Greece, and some of them are absolutely impossible for any people under the sun. With all his splendid visions Plato was more impracticable in his domestic and educational theories than Rousseau, with his "Social contract."

Modern cities, especially those in America, have greater obstacles to overcome than did Athens or Sparta or other Greek cities, based upon servile labor. The voting citizens of Athens were less than 100,000. Her servile, nonvoting population was four times as large. Modern republics have undertaken to ennoble work and the family and popular education. France, England, and America have enfranchised the people, and American cities are attempting to educate not merely the native population, but great masses of freedmen and foreign born. The process is not merely political, but it is also educational in the profoundest sense. It is the uplifting of the common people by the means of institutions, laws, industries, and public schools.

In the American Review of Reviews for April, 1895, was published a valuable historico-political article on "Our civic renaissance," by the editor, Dr. Albert Shaw, who calls public attention to the extraordinary revival of good government, civic reform, and municipal common sense in various cities of the United States. In some respects the civic renaissance in England and America is a nobler kind of renaissance than even the revival of Greek art and literature, for good government is the very

life and health of society. Nothing is paramount to the *salus publica*. Good government not only redeems the city from evil, but in some form or other it holds civic society together and regulates or influences all that lives and moves within its sphere, even education and culture. Good government is civic salvation.

Civic creed of Chicago's children.—God hath made of one blood all nations of men, and we are his children, brothers and sisters all. We are citizens of these United States, and we believe our flag stands for self-sacrifice for the good of all the people. We want, therefore, to be true citizens of our great city, and we will show our love for her by our works.

Chicago does not ask us to die for her welfare; she asks us to live for her, and so to live and so to act that her government may be pure, her officers honest, and every corner of her territory a place fit to grow the best men and women who shall rule over her.—(See National Educational Association Report, 1898, p. 407, article on vacation schools, by Richard Waterman, jr.)

VIII.

ART FOR THE PEOPLE.

Art for the people has long been fostered by the means of public galleries, museums, exhibitions, monuments, statues, and memorials. In England and various other countries of the Old World municipal art galleries are regular institutions, but in America they are not yet fully developed. In New York City the Metropolitan Museum of Art was erected by the city upon land belonging to the city and is leased to-day upon the most generous terms to a private corporation. In the United States interference by politicians in art matters is so much dreaded that public-spirited citizens contrive to protect the art cause in corporate ways. Accordingly, in very many American municipalities there already exists a public art gallery under private control. The Metropolitan Museum, in New York, has a collection of art works valued at upward of \$8,000,000. The association expends every year a vast amount of money in the purchase of works of painting and sculpture, in providing educational lectures upon art subjects, and in supporting scholarships for the aid of art students.

The Pennsylvania Academy of Fine Arts is the oldest art institution in the United States. It dates from 1791, when Charles Willson Peale undertook to organize in Philadelphia a school for the fine arts. The academy was, however, legally founded and incorporated in 1805-1806. It first met in Independence Hall, where the Declaration of Independence was signed. The educational objects of the academy were thus defined: "To promote the cultivation of the fine arts in the United States of America by introducing correct and elegant copies from works of the first masters in sculpture and painting, and by thus facilitating the access to such standards, and also by occasionally conferring moderate but honourable premiums, and otherwise assisting the studies and exciting the efforts of the artists gradually to unfold, enlighten, and invigorate the talents of our countrymen." Throughout the present century the academy has accomplished much for the collection and public exhibition of works of painting and sculpture and encouraging art talent by medals and other awards.

One of the oldest municipal art societies in the United States is the Fairmount Park Art Association, founded in 1871. Its efforts were at first directed toward the purchase of works of art to beautify Fairmount Park, but the scope has been widened so as to include the whole city of Philadelphia. The association has a membership of over 1,400; it has expended over \$100,000 and has secured many oil paintings, bronzes, statues, and fountains for artistic purposes in Fairmount Park, Memorial Hall, and other places. Fairmount Park Museum contains some of the best souvenirs of the Centennial Exposition held in Philadelphia in 1876.

In Boston there is an art association dating from 1890. It is composed of the mayor, the president of the trustees of the Boston Public Library, the president of the trustees of the Museum of Fine Arts, the president of the Boston Society of Architects,

and the president of the Massachusetts Institute of Technology. Probably the best supervision in the country has been exercised over the decorations of the great staircase and corridors in the new Public Library. Eminent artists have been employed for the work of pictorial and sculptural decorations. The symbolical paintings by Puvis de Chavannes and the sculptural work by Mr. Daniel C. French and by St. Gaudens are especially noteworthy. The Boston Museum of Fine Arts is one of the very best art collections in America. This museum and the Boston Public Library are the two chief artistic attractions to visitors of the city. Both are truly educational centers for art students, public-school teachers, and pupils of Boston and vicinity.

In March, 1893, was founded the Municipal Art Society of New York City "to provide adequate sculptural and pictorial decorations for the public buildings and parks." A membership of 500 was soon secured. Among the objects accomplished by this society are the mural decoration of the court rooms and the erection of a suitable memorial to Mr. Richard Hunt, the late president of the society, a monument built in the wall of Central Park opposite the Lenox Library building. There is also a municipal art commission in New York composed of the mayor, the president of the Metropolitan Museum of Art, the president of the New York Public Library, the president of the Brooklyn Institute of Arts and Sciences, one painter, one sculptor, one architect, and three residents of the city without any such artistic profession. This commission is practically controlled by the Fine Arts Federation, composed of the various art societies of New York City. At the instance of this federation the so-called "French law" was passed March 15, 1896, providing that no statue, piece of sculpture, or other work of art in the nature of a public monument or memorial should be erected upon any ground or within any building belonging to the city unless approved by the mayor, the president of the board of aldermen, the president of the National Sculptural Society, and the president of the Municipal Art Society. If any one of these four persons objected, the proposed monument or memorial should not be accepted. "The art commission has authority over plans for municipal buildings, bridges, approaches, parks, gates, fences, lamps, and all structures erected on State property."

Similar institutions have lately been established in Baltimore: (1) The City Art Commission and (2) the Municipal Art Society. Mr. J. B. Noel Wyatt, secretary of the art commission, makes the following careful distinction between the two institutions: The "City Art Commission" now exists under the new charter of the city of Baltimore and consists of eight members, viz, the mayor, ex-officio, and one appointed by each of the following bodies: The Johns Hopkins University; the Peabody Institute; the Maryland Institute; the Charcoal Club; the Architectural Club; the Historical Society, and the park board. All designs for decorative features, such as monuments, fountains, statues, and other like objects, proposed to be placed in any public park, square, street, or public building in the city must be submitted to this art commission for their approval from whatever source they come, and their decision is absolute and final in the matter. The purpose of this committee is to further in every way the art spirit and the erection of art objects of all kinds throughout the city, but it is their strict duty to accept only those that, in their opinion, possess some real artistic merit, designed by artists of some skill. The duties of this commission end here, with the exception that it may be called upon by the mayor at any time that he may see fit to do so for its advice in regard to the designs for any public building. So much for the "City Art Commission." The "Municipal Art Society," on the other hand, formed in the spring of 1899, is an association whose members may be any citizens of reputable character, men or women, sufficiently interested in art matters to subscribe funds, which are to be used for the purpose of giving to the city, from time to time, various objects of art, of different kinds, for the adornment of either the exterior or interior locations in

the public parks and buildings. Such objects, in all cases, must be submitted for the approval of the "Art commission." The existence of this Municipal Art Society is largely owing to the efforts of Mr. Theodore Marburg, who was its suggester and most active promoter. Dr. D. C. Gilman, of the Johns Hopkins University, is the first president of the society, and there are associated with him, from among its members, an executive board, consisting of well-known citizens, for the control of its affairs. In addition to the donation of art objects from its regular funds, the society will, from time to time, have in hand various other schemes looking to the promotion of art interests in the city, among which at present is the decoration of the walls of some of the public schools, which is being done under a special committee and by a special fund donated for that purpose and not taken from the general funds of the society. Plans are now formed in Baltimore for increasing the number of statues of distinguished men, to be placed in public squares.

Very many of the older and leading cities in America have academies of fine arts or art galleries, either public or private. In 1879 the Academy of Fine Arts was founded in Chicago and is now known as the Art Institute. Its rapid development is due in no small degree to the energy of its president, Mr. Charles L. Hutchinson. It now occupies a handsome building on the corner of Michigan avenue and Van Buren street. The interior plan comprises a lecture room, various galleries, and exhibition rooms, with art studios and special rooms for clay modeling and wood carving. The galleries are filled from time to time with loan exhibitions, of which the institute has held a great number, including "paintings, sculpture, engravings, autotypes, pottery, illustrative designs, etchings, and black-and-white drawings." These exhibitions have proved very helpful to the school and interesting to the public. The Art Institute of Chicago has several hundred pupils every year and is exercising a permanent influence upon the art taste of the city.

St. Louis also has a beautiful museum of art, with a large room for public art instruction. Professor Ives says: "The work to be done in the West is not to bring French or other paintings before the public, but to do something with raw material. Nearly all the useful ores, with iron at the head, are found in Missouri. What the school and museum most help in doing is the working up of these ores with brains, so that the work shall be recognized and a school founded like those of Nuremberg and Belgian ironworkers." The St. Louis school aims to give the the best possible training in art and at the same time to make its principles of practical service in decoration and in design. The collections in the museum are not extensive, but are growing in public interest and suggestive value.

Other Western cities have their local societies of fine arts and their loan exhibitions. Milwaukee has a public art gallery founded by Mr. Frederick Layton. In Cincinnati there is a combined art school and museum, and in Pittsburg the art idea is in process of development in connection with the Carnegie libraries.

CIRCULATION 2. EXHIBITION OF PICTURES.

There has grown up in England and America a very useful educational practice of circulating collections of pictures and photographs in the public schools and in the homes of the people. Miss Barlow, one of the active leaders of the National Home Reading Union, some years ago developed this practice in connection with local reading circles and courses of university-extension lectures. Mr. T. C. Horsfall, of Manchester, who has been very public-spirited in the museum work of that city, has also done much to promote the circulation of pictures in the board schools. He says that "The decision as to whether art shall be used in education is to modern communities a decision as to whether the mass of the people shall be barbarian or civilized."

A social settlement, Hull House, in Chicago, was early active in local exhibitions of good pictures and in providing both pictures and plaster casts for public schools in the poorer districts. Good educational and social use of pictures has been made there

for many years, especially among Italians and other foreign-born, with whom it is not always easy to converse. All sorts and conditions of our common humanity are reached through the eye, and it is really a great boon to the people to exhibit loan collections of good pictures at social settlements, and especially to circulate, like traveling libraries, cheap prints in small portfolios in rural neighborhoods, for the illustration of subjects of special interest, e. g., a local lecture course, class work, or home study.

The idea appears to have been developed in various parts of this country, both East and West. In New York, Miss Edith Putnam has combined the idea of a small circulating library with that of circulating pictures for the use of boys and girls' clubs, mothers' classes, etc. Miss Putnam says: "It is very interesting to me to observe that the Italians took up very few books, preferring pictures." In Boston there is a picture club which circulates folios of photographs in working girls' clubs and Sunday afternoon classes. The Massachusetts State Federation of Women's Clubs in the meeting at Springfield, in February, 1897, gave currency to the subject of "Art, the need of the beautiful in the home, the schools, the streets." Specimen pictures were exhibited suitable for home or school use, and have been introduced into public schools of Salem, Mass. In Bridgeport, Conn., an art teacher devised a plan for circulating through the 21 school buildings 21 works of art, being reproductions of famous pictures or works of sculpture. A good masterpiece is allowed to remain in one school for a fortnight and is then passed on to the next. (See article by H. J. Carter on "Traveling libraries of illustrations" in the *Library Journal*, June, 1897.)

PICTURE EXHIBITIONS IN LIBRARIES.

The well-known librarian, Mr. C. A. Cutter, in the *Library Journal* for May, 1897, describes the experience of the Forbes Library, in Northampton, Mass., where exhibitions of photographs, posters, and engravings have been encouraged. He says:

These exhibitions are a way of making the library known. People are drawn to the library to see the show, and when there it occurs to them to register and take books. Our registered membership always grows faster during an exhibition. But this is not all. In accordance with the curious fact that men see what is about them better after seeing it imitated in art, the Sella views of the Alps must have opened some one's eyes to the winter beauty of Mount Holyoke and Mount Tom; the Soule Corots and Rousseaus must have drawn a new attention to our elms and pines. A public library should be the center of culture of its town. It should promote knowledge, literature, and art by every means in its power. Almost the only point to be regretted in the construction of our building is that it does not allow us to make it the headquarters and place of meeting of our literary clubs. It has, however, room for exhibitions, large and small, which have been very fortunate for us. Those which we have held have, I am sure, not only given pleasure, which in itself would be a sufficient justification, but have broadened their visitors' minds; have supplied some of the advantages of travel to those who could not leave home; have renewed the impressions of those who have been abroad; have increased the knowledge of art, and educated the taste of all who saw them.

The Civic Club of Philadelphia in 1896 started a circulating picture gallery, with 133 pictures radiating from two centers of distribution. Picture exhibitions were also freely opened for evening attendance by the poorer classes. Two exhibitions have been held each winter, and free tickets have been distributed through the instrumentality of labor leagues, friendly societies, clubs, and other organizations. As many as 25,000 people have attended a free art exhibition in one evening. To each ticket was attached a coupon, on which the holder could vote for his favorite picture. This privilege, of course, encouraged closer attention and discriminating judgment.

The College Settlement of Philadelphia in 1896 united with the Civic Club of that city for the establishment of a circulating picture library. Framed photographic copies of works of the best artists were supplied to the settlement and properly catalogued by the club. A printed slip giving a brief account of the artist and of the

particular work in hand was pasted on the back of each photograph. These pictures were exhibited at the settlement, and in some cases, as in that of mothers of children in the kindergarten, were allowed to be taken home. "Even among our Hebrew friends," says the report of 1896, "the madonnas are favorites with both mothers and children. It is, of course, the human interest that attracts them."

TRAVELING PICTURES.

This interesting movement was started some years ago in England in connection with the National Home Reading Union, which is in the habit of supplying portfolios of pictures to accompany reading courses on history, art, or travel. The same idea has been independently developed in New England in connection with public libraries, and in Wisconsin in connection with the traveling-library movement. Miss Mary E. Tanner, of the State Normal School, has thus described a system of traveling pictures in Portage County:

The pictures are various in kind as to subject and manner of reproduction. They comprise flowers, landscapes, marine views, game, and religious subjects in photographic and brown and colored lithographic reproductions. They are mounted behind gray cardboard, which is cut to form a mat. On the back of the picture is a small cardboard pocket, in which is kept a library card with name of picture written on it. There is also another pocket in which is placed a short written account of the picture and life of the artist. A tape with a brass ring on it is pasted on the back of the picture, furnishing a means for hanging the picture on the wall. On the matting, in the lower left corner, is printed the name of the picture and artist. A stout manila envelope protects the whole. So far these libraries have been carried into the country communities through the medium of the school, the teacher being asked to invite the children and their parents to the schoolhouse on Friday night, when the pictures were shown to them, and they were further interested by simple talks about the art of picture making and photography and the stories which the artist had portrayed. They were then left in care of the teacher, who is also a librarian. The children in the school and the people in the neighborhood were made to understand that the pictures might be taken home and kept for a week, when they were to be returned and new ones drawn. Those which were not in use were to be hung in the schoolroom, so that the pupils might derive pleasure and benefit from them. The plan has worked admirably, everyone enjoying them and speaking in the highest words of praise regarding them. In June, when they were returned from the various communities, there came the request to have them again in the fall. Many of the older people among the foreign population surrounding Stevens Point derived more from them than from the books, for, as one old man said in his broken English, "I can read your pictures, but I can no read your books."

ART DECORATION IN THE PUBLIC SCHOOLS.

A new feature of public school education in America is the artistic and historical decoration of class rooms or school interiors with pictures representing the masterpieces of sculpture, painting, and architecture, together with historical portraits and views of historic places, natural scenery, animal and plant life, etc. Impressions received by school children from the contemplation of good pictures, good portraits, and interesting objects from nature are deep and lasting. Moreover, the beautifying of the environment of school children is in itself educational, for it cultivates the taste. In striking contrast to the bare and ugly walls of old-fashioned schoolrooms are the tinted and decorated interiors of the model schools in many of our American cities. The publishers of prints and photographs have cooperated with the directors of this recent movement for art decoration and it is now possible to obtain a vast number of very attractive pictures and portraits at trifling cost. The small pictures, when artistically arranged in collective groups and hung low so that they can be studied by little children, are very effective as a means of popular education. They produce lasting influences upon the plastic mind of youth and are certain to convey the art idea from the schoolroom to the home. Thus the attempt to cultivate and refine the artistic taste of children makes itself felt in domestic life and in wider civic circles than in the public schools.

This educational movement in the direction of artistic school decoration began in Boston as early as 1870, and it has gradually spread throughout the Northern and Western States. The Boston Public School Art League declared it their aim "to make the schoolroom a temple worthy to receive and fitted to inspire the children of all the people to the dignity of free citizenship in the Republic."

A lady president of the Civic Club, of Philadelphia, said: "In a country like ours, where, owing to republican institutions, any of these children may some day have a share in the development of municipal art in our great cities, the importance of training the eye to what is best and greatest is obvious." The committee on art has rendered conspicuous service in the decoration of public school buildings. One building in particular, at the corner of Nineteenth and Addison streets, was especially chosen for the artistic commemoration of the good civic work of Mrs. J. Dundas Lippincott. The stairways and fourteen rooms of this building were decorated with carefully chosen pictures, casts, and flags. In one room there are portraits of prominent characters in American history. In another there are plaster busts of distinguished authors with various masterpieces. "Still other rooms are devoted to animal life, natural scenery, famous paintings and sculpture, effects of the forces of nature, patriotism, Greek and Roman history, etc." Particular attention is shown in the kindergarten room to the choice of pictures which are easily understood by a child of 5 years old. The Civic Club has decorated other schools in Philadelphia, but none so well as the "Alice Lippincott School." (See Municipal Affairs, March, 1898, pp. 3-5.)

This movement has lately reached Baltimore, a university city on the borders of the new South. Baltimore is already an art city. The Barye bronzes decorate Mount Vernon place. The Washington Monument, towering above the Peabody Institute, gives historic fame to the Monumental City. The Walters Art Gallery, in the immediate vicinity, contains the finest collection of French art in America. The art gallery of the Peabody Institute is of growing educational value to the public, and especially to the public schools of Baltimore. The Arundell Club, a social organization of the most cultivated ladies in Baltimore, has undertaken to cooperate with the Municipal Art League in the decoration of school halls and staircases. A representative school has already been transformed by the hand of art. Bare walls have been beautifully tinted, and these serve as backgrounds for a fine collection of pictures and other decorations. A special attempt has been made to foster the American spirit. A framed copy of the Constitution of the United States, with the heraldic shields of the thirteen original States and a picture of the Capitol at Washington, catch the eye of every pupil and every visitor. Views of American scenery, lake, mountain, meadow, and forest, give these young Americans glimpses of the beauty of their native land.

Among the historical pictures are the Landing of Columbus, the Departure of the Pilgrim Fathers, many historical portraits from Washington to Lincoln, various historic cathedrals, Venetian palaces, French chateaux, and German castles. There are also photographs of the masterpieces of art, especially of Greek sculpture and of Christian painting. This art movement will undoubtedly spread through all the schools of the city and gradually extend into the country and through the Southern States.

An American artist has well said: "I sincerely trust that the school committee of the future will consider the furnishing of the walls of the schoolroom as much a part of its duty as furnishing desks and books, for as Americans we have developed too much of one side, considering nothing but that which appeals to us as practical, and ignoring that through which the glory of the past has been handed down to us."

A chapter on "Art decoration in schoolrooms," compiled by a graduate of Johns Hopkins University, Dr. Stephen B. Weeks, was published in the Report of the United States Commissioner of Education, 1895-96, pages 1363-1411. This chapter calls attention to the first efforts in America toward the decoration of schoolrooms,

to the work of the Brooklyn Institute, the interior decoration of schoolhouses, art in the schoolroom, and the place of art in general education. Miss Stella Skinner and Miss Rachel Webster, of New Haven, Conn., have published "A list of casts and pictures suggested for the first eight years of school, with special reference to the general course of study in these grades." This list was prepared especially for the schools of New Haven, and has lately been published in book form.

An excellent paper by Miss Skinner on "Art in the schoolroom," read before the Buffalo meeting of the National Educational Association, is reprinted in the Report (p. 1383) of the Commissioner of Education above mentioned.

ENCOURAGEMENT OF ART.

American cities have long fostered a combination of the historical and art spirit in the form of public monuments and memorials. Baltimore is called the Monumental-City because of a monument near the court-house commemorating the battle of North Point, fought September 12, 1814, with the British. The monument was begun 1815 and completed in 1825. The more stately and impressive monument in memory of George Washington was begun by Baltimore citizens in 1815 and was completed in 1829. It was adopted in 1827 by the State of Maryland and antedates by many years the monument built by the National Government in the Federal city in honor of the first President.

Baltimore has long been recognized as one of the chief art centers in America. The Walters Gallery, with its wonderful collection of modern paintings and its remarkable museum of oriental pottery, Japanese bronzes, and rare curios, has been for art-loving Americans a veritable palace of delight. It has not been public like the National Gallery in London, or the Louvre in Paris, or the Royal Museum of Berlin; it has been more like the princely collections of Italian cities, at first open to a select few and then on certain occasions for a fee to the many. An increasing liberality has marked its management and it seems only a question of time when this home of the fine arts in Baltimore should become a home of beauty for all who choose to visit and enjoy it.

Mr. William T. Walters a short time before his death was considering the project of a public art gallery in connection with the Woman's College of that city. The plans for a \$200,000 building had been drawn, and Mr. Walters had shown the greatest interest in every detail of the undertaking, which was being actively pushed forward by that generous promoter of the art idea in architecture, President John F. Goucher, from whom I learned these facts. Mr. Walters had expressed himself to Dr. Goucher as profoundly gratified with the evidences of good architectural taste shown in the buildings of the Woman's College. "You have built well, and for the future," said the founder of the Walters Gallery, who liked things that are solid and permanent and beautiful. All true friends of art and good architecture will echo these sentiments and honor the college president who had the sense and genius to build a church and a group of college buildings after noble Italian models of the period of the Renaissance. Like Thomas Jefferson, when he designed from classical models the University of Virginia, Dr. Goucher intended that his college buildings should be a great object lesson in good architecture. It was this grand idea which Mr. Walters evidently appreciated in the Woman's College. He said it would be a fine lesson for the young women of the college to look upon those buildings, and manifested a growing interest in the project of allying the Walters Art Gallery with that rising institution, which stands for art as well as for the education of women. This was a grand idea, but Mr. Walters died too soon for its realization.

For the promotion of art in America various scholarships and funds have been established by individual bequests and foundations in some of our leading cities. For example, in Baltimore the Reinhart fund, managed by the trustees of the Peabody Institute, enables promising young artists and sculptors to study abroad. Rein-

hart himself was a Baltimorean, early befriended by the late John W. McCoy, and sent to Europe for the development of a manifest talent for plastic art. The work of his hands is now to be seen in the art gallery of the Peabody Institute. Reinhart showed his gratitude to Baltimore by leaving his accumulated property to the Peabody Institute for an art-educational fund, which was so well husbanded for the institute by the late William T. Walters that the income is now very helpful to the cause for which Reinhart lived and labored.

Other cities have similar endowments. In New York there is the McKim scholarship for encouraging foreign study in architecture. In Boston the Rotch foundation accomplishes the same object. Colleges and universities in the United States have their art galleries and professors of art and music. There are endowed lectureships for the maintenance of art courses in academic communities. Harvard, Yale, Columbia, and Princeton universities are prominent supporters of art and archaeology. A combination of American colleges and other patrons of the cause sustain the American Journal of Archaeology. American schools of classical and archaeological study are maintained at Rome and Athens. It is a growing custom for American professors to take what is called their Sabbatical or septennial year for travel and study in Europe. The history of art, as illustrated in famous Old World galleries, interests all American travelers, but those of the academic class usually settle down for protracted study in great centers of art and science.

The best examples of art set by city, state, and nation to the American people are decorative. Art is applied to a public educational purpose in the decoration of the corridors and stairways of the Boston Public Library and the new Library of Congress at Washington. A study and description of the details of those wonderful nineteenth century art creations would require more space than is here available; but there is no doubt that the highest artistic development which the American Republic has now reached is to be seen in this renaissance of painted fresco and art decoration for the mural interiors of municipal and other public buildings. In this line of artistic development, as in many other ways, America has been led by French example and by French artists.

In an article on "Puvis de Chavannes," in the *Conservative Review*, Washington, D. C., May, 1899, Miss Dora L. Murdock, of Baltimore, an artist well trained by study and travel abroad, gives this frank recognition of art as essentially decorative:

Was not the best art in the ages of great production "art in harness" as it were? In Greece each statue was destined for a given pediment or niche; in Italy each painted fresco was for a given wall, and altar piece for a particular altar. They did not think art degraded because made subservient to architecture, but all the arts worked together to increase the architectural effect. It might be a group for a triumphal arch, the ceiling of the Sistine Chapel, mosaics for the façade of St. Mark's, or a saltcellar, a dagger, a seal, a medallion, that in the hands of a Benvenuto Cellini became a work of art.

Speaking of the possibilities of American art, Brooks Adams said at a recent banquet of the National Sculpture Society:

I ask you, American artists, have we no national life which fires your imagination and stirs your blood? I tell you this continent is quivering with an energy beside which the energy of Rome is as the shock of the galley to that of the battle ship. I feel it about me on every hand; our people are possessed with a premonition of their destiny.—*The Press*, Philadelphia, June 8, 1899.

POPULAR TRAINING IN ART.

For popular training in art there are many agencies in America. At all the technical and industrial institutes there are art classes, some of them excellent. Work of a high order is carried on at the Metropolitan Art Museum, the Boston Art Museum, the Art Institute in Chicago, and in connection with nearly all the art academies in our American cities. Prominent among the art galleries are the Phila-

delphia Academy of Fine Arts, the Walters Gallery in Baltimore, and the Corcoran Gallery in Washington. This last collection, although privately founded, is virtually the National Art Gallery of the Federal city. It is manifestly the art center of Washington and will surely expand and improve with the development of the nation and of critical as well as patriotic interest in art matters. Already Washington is by far the most interesting city in America by reason of the Library of Congress, the Smithsonian Institution, the National Museum, and other Government buildings; its general plan of broad streets and avenues radiating from the Capitol; its Washington Monument and many statues in public open spaces; the Soldiers' Home and other parks; its scientific bureaus, and its multiplying schools, colleges, and universities.

A popular educational need to-day is systematic instruction in art history. By this term is meant the historical process of art development in the most important fields, namely, architecture, sculpture, painting, and music. The fine arts are the noblest product of historic life, or as Hermann Grimm, of Berlin University, used to say, "Art is the very flower of history."

At German universities, gymnasia, technical schools, and girls' schools great attention is devoted to what is called *Kunstgeschichte*, or the history of art. In every institution of higher learning there is either a museum of art or a good equipment for its illustration. It is customary for every lecturer upon art subjects to exhibit to his class some concrete image, in plaster, photograph, or engraving of every subject which he describes. At Heidelberg, where I used to hear lectures in archaeology and art history from Professor Stark, we always enjoyed looking at the pictures while the professor lectured. At Berlin, every Saturday morning, we used to go to the museum with Professor Grimm or Prof. Ernst Curtius, to look at plaster or pictorial images of Christian and Greek art. In the very presence of the art creations of great masters, these famous professors gave instruction to their students. Impressions came to our minds through the eye as well as through the ear. This is the method of teaching art history in the *Volksschulen*, as well as at the university. Class rooms are furnished with large-sized pictures which appeal to children's eyes. When a teacher talks about the Pyramids of Egypt, or the Parthenon of Athens, or the Coliseum of Rome, he has a visible symbol of the object under consideration. A fine series of *Bilder zur Geschichte*, or pictures illustrating history, was prepared some years ago by Joseph Langl, and published in Vienna by Eduard Hölzel. We have a set of these pictures which are in use at the Johns Hopkins University. They represent the chief epochs of human culture. They present in bold relief the monuments of Egypt, India, Assyria, Persia, Greece, Rome, the Medieval Church, Moorish architecture, Romanesque, Gothic, Byzantine, and Russian art.

It is a great thing for classes of young students to be educated amid an environment of beauty and illustrations of human history. At the Johns Hopkins University, acting under a stimulus received many years ago from my German teachers, I have endeavored to surround my students with symbols of great men and of great deeds. I have always tried to illustrate historical lectures by the aid of pictorial art. Since our department removed into McCoy Hall, this art idea has received fresh impulse from the architectural convenience, if not beauty, of our present surroundings. The visitor to our historical department in the third story of McCoy Hall will find a suite of seven spacious rooms which are a veritable museum and art gallery combined. We have upon the walls of our lecture room portraits of some of the greatest German historians, Niebuhr, Mommsen, Curtius, Ihne, and Ranke, the greatest of all historians since the world began. There too upon the walls are pictures of famous English historians, Thomas Arnold, Edward A. Freeman, of Oxford, J. R. Seeley, of Cambridge, and James Anthony Froude. We are beginning to honor our American historians and writers on America, for already we have pictures of George Bancroft, De Tocqueville, James Schouler, Von Holst, Andrew D. White,

William F. Allen, J. Lewis Diman, James Bryce, and other writers on American history and politics. Portraits and busts of the world's great statesmen and public men are seen in our corridors and seminary libraries. Cicero, a representative of classical politics; Dante, the writer on Monarchy; John Locke, the great English writer on civil government and the forerunner of Rousseau and Jefferson; Washington, Hamilton, and Lincoln, the greatest of American statesmen; Stein and Bismarck, the founders of New Germany.

The Johns Hopkins University, at various times, has undertaken to give some public instruction in art history. We have had systematic lectures and exhibitions representing, to some extent, the development of classical and medieval art. Mr. J. Seymour Hayden early lectured to us upon the art of etching. Dr. Allan Marquand and Dr. Arthur L. Frothingham, for some years, gave special attention to these subjects at the university, and the *American Journal of Art and Archaeology*, under the editorship of Mr. Frothingham, was first published in Baltimore. An archaeological society was early organized by a little coterie of Hopkins men, but this has now been merged in the Baltimore Branch of the American Archaeological Institute. This local archaeological society meets occasionally at private houses in this city and is entertained by exhibitions of pictures and interesting objects of art, together with lectures upon art subjects. Besides keeping alive an interest in such matters, this Baltimore society contributes annually to the funds of the American Archaeological Institute, under whose auspices explorations are now carried on in Greece and Italy. A substantial return for these contributions is made to Baltimore by the institute, which from time to time sends a share of the antiquities discovered in the Old World to the Monumental City, where they are displayed in the art gallery of the Peabody Institute.

The University Club has also lent an impulse to popular interest in art by occasional lectures and exhibitions. From time to time illustrated lectures on art subjects have been given. The club itself is an art gallery. From the beginning the club has been favored with a choice selection of engravings belonging to Mrs. T. Harrison Garrett, whose husband purchased the famous Claghorn collection, well known in Philadelphia. Members are accustomed to lend or exhibit choice etchings and engravings for the general enjoyment of their fellows. Mr. Theodore Marburg has given or lent various oil paintings. The other clubs of Baltimore foster a love of art among their members by gradually increasing and improving their picture galleries, which contain historic portraits of well-known members of the club. The Baltimore artist, Charles Didier, painted a portrait of Professor Gildersleeve, the first and only president of the University Club.

Such clubs are not for the benefit of the people. They are more or less select bodies of men, who are willing to pay an annual fee for club privileges. Other agencies must be sought besides clubs and colleges. Popular education in art must be promoted by popular institutes like the Maryland and the Peabody, by art exhibitions and public art galleries, by art training in the public schools, by art lectures in young people's societies, in Chautauqua circles, in church circles and guilds, in workingmen's clubs, in the artistic embellishment of public squares, gardens, and city parks.

It has long been possible for any young lady who is ambitious to study art history in a systematic way to put herself into communication with the Society for the Encouragement of Study at Home. This society had for its founder and administrative center Miss Ticknor, at Boston. Many cultivated young ladies in Baltimore have pursued intelligent courses of private reading in ancient art under the guidance of well-trained correspondents, appointed by Miss Ticknor. The necessary books were recommended; letters of instruction were sent to the student; occasional examinations were set, and an essay was now and then required.

Similar work for the benefit of individual students has long been done under the direction of the Chautauqua College of Liberal Arts. One year the whole body of

Chautauqua students, perhaps 50,000 scattered individuals, were studying the "Renaissance and modern art" under "common guidance." An excellent text-book was prepared for Chautauqua use by Mr. William H. Goodyear, lecturer on the history of art in the Cooper Institute, Brooklyn Institute, and the Teachers' College. Mr. Goodyear's Chautauqua text-book is well written and beautifully illustrated. The publication of such a book by the Chautauqua Century Press and its popular use by thousands of men and women are among the most gratifying signs of the times.

Among recent authorities on popular education and art are the following: College Histories of Art (Longmans); Hamlin, Alfred D. F., History of Art; Van Dyke, John C., A History of Painting.

IX.

MUSIC FOR THE PEOPLE.

Vocal music in schools.—A paper on "Vocal music as a branch of common education" was communicated to the Proceedings of the American Lyceum, No. X, April and May, 1833, by Mr. William C. Woodbridge,¹ of Boston, one of the best exponents of the American Lyceum. He early gave popular lectures upon this favorite subject and should be regarded as one of its pioneers. The above paper contains extracts from those early lectures on musical education and is of special interest as embodying his own observations of popular musical culture in Germany and Switzerland. Mr. Woodbridge appears to have visited not only schoolrooms, but village festivals, in those countries for the sake of noting the effect of musical training on popular character.

We visited communities where the youth had been trained from their childhood to exercises in vocal music of such a character as to elevate instead of debasing the mind. . . . We have seen the young men of such a community assembling to the number of several hundreds from a circuit of 20 miles, and instead of spending a day of festivity in rioting and drunkenness, pass the whole time, with the exception of that employed in the frugal repast and a social meeting, in a concert of social, moral, and religious hymns, and devote the proceeds of the exhibition to some object of benevolence.

Mr. Woodbridge drew a sharp contrast between European and American popular knowledge of music, and expressed his surprise at the acquaintance with musical science which he found among the common people in Germany and Switzerland, where even schoolboys can write music. He gave the words and music of a song composed by a Swiss peasant girl, whose only musical knowledge had been derived from her village pastor. Mr. Woodbridge visited Nageli and Pfeiffer, the fathers of the Swiss system of popular training in music, and became "convinced that vocal music was one of the most important branches of national education, especially among a free people; and from this moment we resolved that we would never cease to urge this subject upon our countrymen until vocal music should become a branch of instruction in every school in the United States."

Mr. Woodbridge actually introduced into this country Pfeiffer's system by means of Nageli's lessons² and cards, which served to communicate Swiss ideas to many American teachers of vocal music. Mr. Ives, of Boston, afterwards of Philadelphia, was especially instrumental in his popular extension of Swiss elementary music transcribed from Pfeiffer and Nageli. In 1830 Mr. Woodbridge presented his subject before the American Institute of Instruction at its first anniversary, in Boston.

¹ William C. Woodbridge was the editor of the American Annals of Education from 1830 to 1836, one of the best sources of information on American educational history in that period. His father, Rev. William Woodbridge, of Middletown, Conn., was the founder and president of the first teachers' association in America, 1799. (See American Annals of Education, August, 1831.)

² The notes of each lesson were first written on a blackboard and corresponding cards were given the pupil for home study and practice.

Lowell Mason, of that city, embraced with zeal the Swiss or Pestalozzian system of instruction, and "acknowledged himself indebted to it for the only rational method of teaching, and the best style of juvenile music." Mason taught gratuitously large classes of children in Boston and conducted a popular series of juvenile concerts, which were attended by crowded audiences. Mason and Ives together brought out the so-called Juvenile Lyre, containing selections from German juvenile music, with original compositions in the same spirit. Mr. Kingsley, of the Boston Sunday School Society, adopted the methods of Mason and Ives, and so did Mr. Hastings, in New York.

From such individual beginnings the cause of American popular education in music was extended through schools and churches. The formation of the Boston Academy of Music still farther promoted the object of diffusing popular knowledge. Mason¹ and Webb were appointed to professorships in this institution, which trained great numbers of pupils and teachers who afterwards became helpful in developing and extending the love of music in New England. Indeed, from Boston's earliest and latest schools of music have gone forth in no small measure "the extension of a knowledge of vocal music among the teachers and schools of our country."

But in Germany and Switzerland are found the historic sources of American popular culture in vocal music. It was Luther who said "A schoolmaster must be able to sing, or else I would not look upon him." It was a Prussian ordinance published in the Official Gazette January 25, 1825: "Among the essential branches of education which ought to be found in all the common schools, and to which every teacher who undertakes the management of such schools is in duty bound to attend, is instruction in singing."

Mr. Woodbridge in 1833 emphasized the fact that whole communities and nations in Europe have been taught to sing with as little difficulty and as much success as they are taught to read. He said, "The teacher of the poor children of Hofwyl—chiefly taken from the highways and hedges—assured me that among several hundred pupils he had found but two with whom he had had any serious difficulty."²

As early as 1830 Mr. Woodbridge made the Swiss methods of popular education known to American teachers in a series of letters from Fellenberg and Hofwyl in the American Annals of Education, vol. 1. The ground plan of Hofwyl appears as a frontispiece to that volume. Woodbridge says he gained in a few conversations with Pfeiffer more distinct conceptions of the nature and signs of music than he did in all his "quarters" spent at singing school. It is sometimes said that American popular education in music was the result of the old-fashioned singing school, but between that and the new school which Woodbridge and Lowell Mason introduced there is all the difference between an old-folk's concert and the folk songs now sung by our school children and college glee clubs. Undoubtedly we had our musical inheritance from the Massachusetts Bay Psalm Book, but the old and new schools are not in the same class.

Mr. Ives had great success in Philadelphia in training large singing classes. The elementary singing book embodied the general principles of Pfeiffer, as did the Juvenile Lyre and Lowell Mason's songs.

In a review of the second annual report of the Boston Academy of Music, 1834, Mr. Woodbridge said, in his American Annals of Education, vol. 4, 322: "Only four years have elapsed since the introduction of vocal music as a branch of general education in our country was proposed, and the rational inductive system of instruction announced to the public. Our pressing engagements at that time only allowed the oral translation of Pestalozzi's works, to the gentleman who made the first experiments on the system. Our views were regarded by many as visionary."

¹ In the American Annals of Education, vol. 5, p. 6, will be found some of Lowell Mason's early American adaptations of the German folk songs.

² Proceedings of the American Lyceum No. 10, April and May, 1833, p. 98.

Woodbridge then goes on to show, from the report of the Boston Academy of Music, what had been accomplished by that institution, whose object was "to diffuse the knowledge of music and elevate the standard of taste among the schools and the people of our country."

In the historical sketch of musical instruction in the public schools of Boston by Hon. J. D. Philbrick, printed in a "Testimonial given to Luther Whiting Mason" (Ginn & Heath, Boston), there is a confirmation of the above view regarding the origin of popular musical education in the schools of this country. Mr. Philbrick said:

The first impulse in favor of this instruction in our country dates from the address on the subject delivered in Boston by the geographer, William C. Woodbridge, of Connecticut, in which he described the successful teaching of vocal music in schools which he had visited in Switzerland. Martin Luther is often referred to as having advocated general instruction in this branch on the ground of utility, saying: "The youth must always be accustomed to this art, for it makes good and virtuous citizens." And again, "The utility of this noble art is so great that no one, however learned he may be, can give a satisfactory account of it." But the great pedagogues who came after the German reformer—Comenius, Locke, Rousseau, and Pestalozzi—placed universal instruction in music on a firm basis by establishing the now generally accepted principle of development as the central idea of education. In accordance with this principle, if the child is endowed by his creator with the musical faculty in ever so small a degree, that is the all-sufficient reason for its cultivation. And experience has proved that the human being born wholly destitute of the musical sense is a rare exception. This was the foundation on which Mr. Woodbridge rested his argument in favor of making vocal music one of the regular branches of instruction in common schools. He made influential converts, who set to work to provide for teaching music in the schools: The foremost of these was Mr. George H. Snelling, who, in December, 1831, in behalf of a special committee appointed on his motion for that purpose, presented to the primary school board of the city of Boston an elaborate report strongly urging the adoption of music as a regular study in our primary schools. But public sentiment was not yet prepared for this measure. At length, after eight years of effort, in 1838 this branch was introduced into our schools by vote of the school board. Its progress, however, during the first half of the period which has since elapsed, was slow and unsatisfactory. The work of developing, systematizing, and perfecting this instruction in music, by means of which our schools were made in this respect equal to the best in the world, has been accomplished mainly within the last two decades.

Mr. Philbrick also said:

I reckon three epochs in the history of musical instruction in the Boston schools. The first was the movement already mentioned, which resulted in the appointment of Lowell Mason as music master in 1838; the second was the appointment of Dr. Upham as chairman of the committee on music; and the third, the appointment of Luther Whiting Mason as supervisor and teacher of music in the primary schools.

In 1874 there was printed in Boston, by J. F. Loughlin, 36 Winter street, a valuable pamphlet entitled "The commencement, progress, and results of systematic instruction in music in the primary schools of Boston." The purpose was to present in compact and connected form for reference such passages as occur from year to year in the official reports made in the Boston school committee relating to the commencement and progress of systematic instruction in music in the schools of that city. In this pamphlet can be followed the entire course of historical development of this feature of public education in the most influential city of New England.

GERMAN INFLUENCE ON MUSIC.

German settlers and immigrants exercised a remarkable influence upon the early popular development of music, concerts, festivals, and choral classes in America. As early as 1756 Benjamin Franklin, in a letter to his wife, reported that among the Moravians at Bethlehem, Pa., the church organ was accompanied by a band of flutes, oboes, horns, and trumpets. The followers of the Hussites and Count Zinsendorf appear to have been the first settlers in the New World to foster musical culture as

well as schools for girls. Haydu's "Creation" was sung in German at Bethlehem in 1811. A philharmonic society was formed there in 1820.

In Philadelphia in 1835 was organized the Männerchor, which flourishes to this day. This was ten years before the first Sängerkunst was held in Germany, at Würzburg, in 1845. In 1849 the Nordamerikanischer Sängerbund, or a union of American singing societies, was organized in Cincinnati, the historic head center of German popular musical culture in the United States. In that city, in the month of June, 1899, the above Sängerbund celebrated its fiftieth anniversary in a three days' festival. A chorus of two thousand voices sang in three successive evening concerts, and were accompanied by symphony orchestras from Cincinnati and Chicago.¹ For this extraordinary musical occasion a hall was built with a seating capacity of 18,000. Even greater musical festivals in the East and in the West were the historic outgrowth of German singing societies in our large cities. The German-American element is very prominent in Boston, New York, Philadelphia, Baltimore, Cincinnati, Louisville, Chicago, St. Louis, and other towns which have now their Männerchor, philharmonic societies, chorus classes for both sexes, and their symphony concerts.

AMERICAN MUSICAL EDUCATION.

Theodore Thomas got his idea of biennial musical festivals of American singers from the great Sängerkunst in Cincinnati in 1870 with its chorus of 2,000 voices. The Cincinnati May festivals are said to be the direct historic outgrowth of the German Sängerkunste. From a combination of German and American ideas have developed the most famous orchestras, the more distinctly American schools of music, the innumerable oratorio or musical societies, music halls, conservatories, and colleges of music, which are doing much to make the Americans a music-loving people. The German element is still very prominent in orchestral music, but singing societies are thoroughly Americanized.

Perhaps the best distinctly American thing that has been done for musical education on a large scale was the Higginson endowment or guarantee of the Boston symphony concerts, which are now given every season in many of our great Eastern cities. Twenty-four concerts and 24 rehearsals are yearly enjoyed in Boston and 10 concerts are given at Harvard University. Mr. Higginson personally guarantees the salaries of the director and musicians employed, and these concerts are profitably repeated in New England cities, New York, Philadelphia, Baltimore, and Washington. First-rate talent is thus kept together in one great orchestra and the whole country is improved by Mr. Higginson's public spirit.

Other American cities besides Boston support their own orchestras, which give every season a series of symphony concerts. Most conspicuous are the New York Philharmonic Society, recently conducted by Seidl and now by Emil Paur; the Chicago symphony, conducted by Theodore Thomas; and the Philadelphia symphony, conducted by H. G. Thunder. The Choral Society of Philadelphia and the accompanying orchestra have together accomplished great things for the higher musical culture of that city.

A former director of the Boston Symphony Orchestra, later of the Philharmonic Society of New York, Emil Paur, has lately been appointed Wagner director of the Metropolitan Opera Company, which has two other directors, one of French and one of Italian operas. In addition to its regular duties this orchestra gives Sunday night concerts for the people at which the singers of the opera company appear. Admission costs only 50 cents. Such concerts are growing in popular favor in America.

The finest opera in the world may now be heard in New York. In the season of 1898 a total of 100 performances were given during twenty-five weeks, and the gross receipts amounted to more than \$1,000,000. Never before—in London, in Paris, or

¹See a valuable article on "Musical matters. A half century of German song in America" (New York Sunday Tribune, June 25, 1899). See a valuable series by Mr. Krebiel.

even in Germany—have such casts been arranged as those in New York last season. The cost of a single performance sometimes amounted to \$10,000 and the receipts to \$15,000.¹

Flourishing oratorio societies have been maintained in nearly all of the large cities of America, with choruses numbering several hundred voices. Foremost among these societies was that of New York, founded about twenty-five years ago by Leopold Damrosch, and now conducted by his son, Frank Damrosch, the organizer of symphony concerts for young people. The influence of these oratorio societies in developing musical culture among native Americans has been very great, and the effect of symphony concerts on great masses of people has been elevating and refining in a perceptible degree.

There has been a general advance in church music in all parts of the country, especially in the good training of church choirs, the employment of good soloists, better music, the extension of organ recitals, and more general appreciation of musical culture by church-going people, Protestants and Catholics alike.

The Jews are building handsome synagogues in the larger cities, and make a special point of encouraging good music. It is no uncommon thing in America for Jews to sing in Christian choirs and for a Christian to direct the music in a Jewish synagogue. This fact is quite as interesting as the institution of Hebrew Men's Associations after the model of the Young Men's Christian Associations and the employment of Christian lecturers before Hebrew associations on Sunday afternoons.

There is a recent organization known as the American Guild of Organists, promoted by Dr. Gerrit Smith, of New York, the main object of which is the raising of the standard of church music. Dr. Smith himself has done much for musical culture by giving a series of free organ recitals of classical music on Monday afternoons. Dr. Smith was also instrumental in founding the Manuscript Society of New York, an organization of American composers, comprising about 200 members. At their concerts, only compositions by Americans are given. In nearly all progressive American churches, organ recitals have become an extremely popular method of public instruction and improvement. Sometimes, as at Chautauqua, these concerts are given on Sunday evening, but more often on week days.

The art department of the Twentieth Club of Boston, supported by contributions from the public, in 1898 arranged for a series of free organ recitals Tuesday evenings in various churches in and near Boston. Some of the best known organists and musicians took part in these concerts for the people. Descriptive programmes were distributed in advance to those who desired tickets. Exchange tickets were allowed to suit the convenience of holders as regards time and place. Exchanges were effected only by mail.

In the United States the example of European cities is now followed in affording good music, in the public parks, at the expense of the city. New York spends every summer about \$25,000 or \$30,000 in this way; Philadelphia, \$22,000; and the park board of Baltimore is making arrangements for a concert every night in the week in one of the six leading parks for the city: Druid Hill, Patterson, Clifton, Carroll, Riverside, and Federal Hill. The Western cities, Cincinnati, Chicago, Milwaukee, and St. Louis are even more devoted than the East to open air musical entertainments for the people.

For a long time, the collection of good music and of books on music and musicians has been an attractive feature of some of our best public libraries. The public library in Boston has a musical room containing one of the finest collections in the country. There are full scores, superbly bound, of all the important musical works. This collection was presented by a public-spirited business man of Boston. Another city in Massachusetts, Worcester, has a similar collection, and from that library was

¹ English Opera as an Educator (Werner's Magazine, November, 1898).

borrowed the idea of adding music to the Pratt Library in Baltimore. Some time ago a musical collection was begun and, in 1899, an intelligent and music-loving Baltimorean, Edwin L. Turnbull, a graduate of the Johns Hopkins University, and himself a composer of music, made additional selections for violin and piano, which are classified under the following heads: (1) Classical music, including all the great composers of violin music; (2) *morceaux de salon*, or more popular compositions; (3) selections and *potpourris* from operas; (4) dance music; (5) favorite melodies; and (6) national airs.

Mr. Turnbull is a good example of a college man in America, who, while actively engaged in business, is employing his leisure and special talent for music in the cultural development of a great city. He is constantly composing new music and directs an orchestra on "Commemoration Day" at the university. He wrote the music for an ode bearing the title "Alma Mater," the words written by another alumnus, Dr. J. F. Jameson. One afternoon in May, 1899, a recital of Mr. Turnbull's compositions was given in the great hall of the university with the assistance of a volunteer orchestra of thirty professional musicians and of various Baltimore singers. Through the intelligent efforts of Mr. Hamerik, Mr. Harold Randolph, directors of the Peabody Conservatory of Music during past years, and of many other individuals, the whole community has been awakened to fresh interest in matters of music. Not long ago the Arundell (Women's) Club of Baltimore devoted an evening to the hearing of songs, of which every number on the programme was the work of a Baltimore composer.

In the letter from George Peabody, February 12, 1857, to the trustees for the establishment of an institute in the city of Baltimore he expressly said: "The institute shall embrace within its plan an academy of music, adapted in the most effective manner to diffuse and cultivate a taste for that, the most refining of all the arts." The results of his liberal foundation are that the Peabody Institute now maintains a conservatory of music, with a preparatory department, which brings it into close touch with the people. The institute long maintained an orchestra and it still offers afternoon and evening recitals, students' concerts, alumni and exhibition concerts of a high grade. The virtual endowment of the Boston Symphony and other orchestras has made it inexpedient to retain the old Peabody organization, but there is abundant life still welling up from the original fountain.

Besides the Peabody Conservatory of Music there are now many other excellent and popular academies of music throughout the country. Foremost among them is the New England Conservatory of Music, under the direction of G. W. Chadwick, with about 1,200 students. In some of our colleges there are endowed chairs of music. For example, in Yale University the musical professor is Horatio W. Parker, the well-known composer and organist of Trinity Church, Boston. At Columbia University, New York, there is another distinguished composer in a professional chair, Mr. E. A. MacDowell. Others might be mentioned.

There are in our time numerous courses of lectures for the musical education and cultural improvement of the people. The younger Damrosch used to employ his orchestra for the illustration of Wagner to popular audiences in New York City. In Washington, Baltimore, Philadelphia, and New York, Mr. Elliott Schenck has delivered public lectures on the Wagner operas. Especially praiseworthy is the educational work of Mr. Thomas Whitney Surette, who, for some years has been giving, under the auspices of the American Society for the Extension of University Teaching, public lectures on the great composers of the classical and romantic period. He has the rare faculty of combining musical knowledge, real ability for public lecturing, and enthusiasm for popular culture. "Mr. Surette's lectures are designed to interest and instruct the same audiences which listen to lectures on other subjects, and are not meant for musical people alone. The subjects are treated simply and clearly, and there have been repeated assurances that the lectures are understood by

persons who possess no musical knowledge whatever." The lecturer talks in a familiar and interesting way about his subject and, at frequent intervals, illustrates it in musical ways by piano or organ recitals. Skilled musicians and trained voices are often employed to render Mr. Surette's selections. His work has been so successful in Philadelphia and in many other cities that he has been engaged by Dr. Leipziger and the New York school board to give free lectures to the people in the public schoolhouses and elsewhere in evening hours when the parents of school children can attend.

American musical composers are rapidly developing good work, which is appreciated both by critics and the public at large. Among the more noteworthy are Messrs. Parker, MacDowell, Chadwick, Foote, Hawley, Gilchrist, Surette, Arthur Foote, Mrs. H. H. A. Beach, and many others.

The best newspapers in America are contributing to the culture of the people by regular reviews of musical matters and prominent notices of operas, oratorios, concerts, festivals, recitals, etc. The New York Tribune began July 2, 1899, a series of articles on "musical literature." The first article had particular reference to national and folk music. Other subjects were treated in Sunday supplements to the Tribune. A select bibliography was appended to each article for the further illustration of the given subject. Each book title was followed by printed abbreviations indicating in what great collections the various authorities may be found. The following list shows what libraries are practically aiding this excellent project: New York Public Library (Astor and Lenox foundations); Columbia University; Pratt Institute, Brooklyn; Newberry Library, Chicago; public libraries of Chicago, St. Louis, Milwaukee, Cincinnati, and Boston; Harvard University; Atheneum, Boston; Drexel Institute, Philadelphia. The articles for August 20 and 27, 1899, were on "The Music of the Bible." Mr. Krebiehl was the author of this excellent series.

The Baltimore Sun for December 7, 1894, had an interesting account from the pen of Miss Evans of a movement in that city for good concerts at cheap prices. Miss Evans said: "There has been much talk from time to time of 'popularizing music,' of 'educating the masses to an appreciation of good music,' and the like, but many of the previous attempts in this direction have been made in one or two ways—either by putting before the public poor programmes, poorly performed, at cheap prices, or by presenting good programmes, well performed, but at prices far beyond the means of the majority."

An attempt to secure a happy mean between these two extremes was successfully made by the Christian Union of the First Independent Christ's Church, of Baltimore. On the evening of December 6, 1894, was given to the people for 15 cents' admission a programme of really good music, interpreted by prominent professional musicians. Upon the programme was printed this motto: "An effort to bring the expensive luxury of good music, well rendered, within the reach of all who care for it." The programme contained not only the names and dates, but also brief biographies of the composers whose works were to be represented. Each division of the programme was preceded by a brief exposition of the character of the music which was to be next rendered. Thus an instructive lecture was combined with an entertaining concert.

"The concert," says Miss Evans, "was not for the benefit of anything or anybody as far as the proceeds were concerned. It was simply its own excuse—and a very good one—for being, and the proceeds will be devoted only to defraying the expense of the recital and to help defray the expense of another similar entertainment."

The idea of educational concerts has long been fostered at the Peabody Conservatory, where Mr. Hamerik and others used to lecture upon the history of music and the lives of musicians. The class concerts at the Peabody, the piano recitals, and the symphony concerts have exercised a growing influence upon the public taste.

X.

EDUCATIONAL EXTENSION BY TRAVEL AND PILGRIMAGE.

Historical excursions.—Education by travel has long been recognized in Europe and America as an excellent means of supplementing education, especially for young men. France and all Europe welcome Americans. In recent years there has been an extraordinary revival in both the United States and Canada of a very ancient custom of making excursions to historic places. Under instructive guidance groups of college students and large companies of school children in New England have frequently been led from educational centers into the surrounding region as far as Quebec, for the sake of visiting historic towns, with their quaint colonial architecture, famous battlefields, monuments, statues, memorial tablets, etc. No foreign visitor can fail to be impressed with the interesting associations of old Plymouth, Plymouth Rock, Burial Hill, the old colony records in the court-house, Pilgrim Hall, with its ancient household furniture, utensils, guns, swords, and souvenirs of the Pilgrim Fathers and Mothers. A visit to Lexington Common and Concord Bridge, a sight of Daniel C. French's "Minute Man," will give any thoughtful beholder a better appreciation of the outbreak of the American Revolution.

"By the rude bridge that arched the flood,
Their flag to April's breeze unfurled,
Here once the embattled farmers stood,
And fired the shot heard round the world."

A great impulse to American patriotism and popular education has been given by the city of Philadelphia, which frequently gathers her school children within the sacred precincts of old Independence Hall to hear historical addresses by public men. In Boston the same patriotic purpose is accomplished by courses of historical lectures to school children, from far and near, in the Old South Church. Excursions are frequently made from neighboring towns to these historic capitals by young people's societies and large classes from Sunday schools and day schools. Mount Vernon, too, on the Potomac River, below Washington, is another favorite shrine for historical pilgrims. The home of George Washington and his tomb are the Mecca and the Kaaba of faithful Americans. Every day in the summer season troops of school children and swarms of patriotic tourists visit Mount Vernon, coming down the Potomac River by steamboats from Washington or Alexandria. The grounds are full of picnic parties, and all the rooms in the quaint old mansion are crowded with eager sight-seers. The regents of the Mount Vernon Association are a society of ladies representing the older historic States, some of which have selected particular rooms in Washington's home and furnished them in colonial style. There are still many relics and souvenirs of the Washington family, but many of the most precious things have been deposited in the National Museum in the Federal City. Every State and every citizen, every boy and girl, takes a wholesome pride in Mount Vernon. In the proper season almost every foreigner who comes to America finds his way thither and wanders through the ancient house and the adjoining gardens. Thomas Jefferson's old home at Monticello and Madison's country house at Montpelier are not so frequently visited, for they belong to private parties, but Mount Vernon belongs to the nation.

Renaissance of the historical pilgrimage.—In the Review of Reviews, October, 1893, there is an interesting article by the Rev. Lyman P. Powell on "The Renaissance of the historical pilgrimage." (See also, his "Historical pilgrimage of 1894" in The Spirit of '76, September, 1894.) This graduate of the Johns Hopkins University, a former leader in university extension work in Wisconsin and Philadelphia, describes four historical pilgrimages in and about Philadelphia: (1) To historic landmarks within the city, Independence Hall, and the first halls of Congress and of the Supreme

Court; (2) to the battlefield of the Brandywine, 26 miles from Philadelphia; (3) a coaching party through Fairmount Park to Germantown, where Washington was defeated; (4) to Valley Forge and the old stone cottage where Washington made his headquarters during the darkest period of the American Revolution.

In the summer of 1894 Mr. Powell conducted a large party of university extension students from Philadelphia through the historic towns of New England, New Haven, Boston, Cambridge, Concord, Salem, old Plymouth, and other places. Everywhere local receptions and historical addresses by well-known authorities were given. The exercises were well reported in the newspapers and thus served a good educational purpose throughout the country.

Foreign travel.—For a young American just graduated from college there is no educational experience so delightful as a post-graduate course of foreign travel, especially when combined with protracted sojourns in such old-world centers of historic culture as London, Paris, Rome, Florence, Venice, Munich, Vienna, and Berlin. In our mother country there is a current saying to the effect that an English college graduate, if he can afford to do so after taking his degree, makes the grand tour of Europe; if he can not afford it he stays at home and reads Green's "Short history of England." Sometimes the stay-at-home prepares himself for a civil-service examination, and thus wins a positive advantage over the richer, traveled man in the race of active, useful life.

Substitutes for travel.—Many Americans can not afford the grand tour, the *Wanderjahre* of the German student-Bursch, or the delightful experience of French pupils of Le Play and certain graduates of the *École Normale Supérieure*, who now wander all over Europe, and even around the world, in the interest of French education and social economics. But we have many pleasant compensations and alternatives. We can go to Chautauqua and hear travelers lecture and see their pictures, or attend one of Professor Bickmore's illustrated travel courses at the Museum of Natural History in Central Park. Better still, anyone can enjoy a course of foreign or home travel in some good American public library by means of maps, good books, pictures, and other people's experience and observations. Anyone can soon know more about any chosen country than does the American tourist or English "tripper" who hurries through it. Humboldt used to say that he never found in any country what he did not carry with him in his head.

A blind man's sight.—There was a well-known and influential blind man in Baltimore, a man of great intelligence and superb business ability. His name was Mr. John Glenn, for years the virtual director of Charity Organization Society work in that city, where he lived and died. Once in summer time he journeyed by a picturesque route across the continent to attend a conference of charities held in the far West, and, en passant, to see the Rocky Mountains through the eyes of a young friend, Dr. Charles Lee Smith, secretary of the Baltimore Charity Organization Society. The blind man came home most enthusiastic regarding his observations of Western mountain scenery. Often in glowing colors did he describe it to his personal friends, but with never a word regarding his own visual limitations. As many Baltimoreans can testify, this was Mr. Glenn's habitual practice. Everywhere and always he spoke with confidence and boyish enthusiasm of men and things he had clearly and personally seen—in his mind's eye. Another case deserving remembrance is that of Helen Keller, the beautiful and accomplished blind girl, whom the writer saw one summer morning introduced from the platform to a vast audience in the amphitheatre at Chautauqua. She said in response to the welcome: "My friends, I am very glad to see you." Then, while the people wondered, she added with charming simplicity: "Of course, I mean with the eyes of my soul."

Chautauqua travel classes.—Years ago at Chautauqua the writer took an historical part in the social exercises of a travel class of teachers, pleasantly conducted by George E. Vincent, now principal of the Chautauqua system. He guided his class

over European routes of travel, England, France, Germany, Italy, and Spain, which he himself had actually visited, and now visually reproduced for the benefit of others. He gave some of the most useful points and interesting object lessons as well as the most picturesque incidents of his own itinerary. Teachers who had also traveled through the same country as that described contributed information from their own experience. Thus all profited by the opportunities and teachings by each. Thus every teacher learned how to conduct a similar travel class in her own school, home, neighborhood, or church society. Maps, illustrated books of travel, pictures of men, women, children, social classes, manners, customs, institutions, art, and scenery were always shown in a Chautauqua travel class, and very often an evening exhibition of lantern views in the great amphitheatre, superbly illustrated to thousands of people, the travel-talk of the afternoon. For example, a beautiful review of Spanish and Moorish architecture, the famous Alhambra and the beautiful cathedrals of Spain, closely followed a teachers' tour through that country.

Nothing is more popular in American study clubs and church clubs than such imaginary or pictorial tours through European countries, Egypt, the Holy Land, India, China, and Japan. There is absolutely no limit to the possible variation and applicability of this delightful and inexpensive custom of profitable educational travel by artistic and social study at home.

XI.

IDEA OF A NATIONAL UNIVERSITY.

Idea of a national university.—The Father of his Country is also the father of the idea of a national university. This idea is repeatedly suggested in the writings of George Washington, but it is stated in the clearest and fullest way in the following extract from his last will and testament:

It has been my ardent wish to see a plan devised on a liberal scale which would have a tendency to spread systematic ideas through all parts of this rising empire, thereby to do away local attachments and State prejudices, as far as the nature of things would or indeed ought to admit from our national councils. Looking anxiously forward to the accomplishment of so desirable an object as this is, in my estimation, my mind has not been able to contemplate any plan more likely to effect the measure than the establishment of a university in a central part of the United States, to which the youths of fortune and talents from all parts thereof may be sent for the completion of their education in all branches of polite literature, in arts and sciences, in acquiring knowledge in the principles of politics and good government, and as a matter of infinite importance in my judgment, by associating with each other, and forming friendships in juvenile years, be enabled to free themselves in a proper degree from those local prejudices and habitual jealousies which have just been mentioned, and which, when carried to excess, are never-failing sources of inquietude to the public mind, and pregnant of mischievous consequences to this country. Under these impressions, so fully dilated, I give and bequeath, in perpetuity, the 50 shares which I hold in the Potomac Company * * * toward the endowment of a university, to be established within the limits of the District of Columbia, under the auspices of the General Government, if that Government should incline to extend a favoring hand toward it.

The amount of Washington's bequest has been computed at compound interest from his death down to the present time and amounts to over four and a half million dollars. Although his stock in the Potomac Company never paid but one dividend, his educational bequest is regarded by many citizens as a national debt of honor. The late Dr. G. Brown Goode, assistant secretary of the Smithsonian Institution, urged the above obligation upon Congress. If the United States Government would regard this historical debt as a national bond and provide simply for the interest on the same at 5 per cent, there would be an adequate income for a national institution, with the primary object of educating young Americans in the science of government, according to Washington's original idea in his speech to both Houses of Congress, December 7, 1796 (Washington's Writings, Sparks' edition, Vol. XII, p. 71). In that

speech Washington urged "the expediency of establishing a national university and also a military academy." All the world knows America's debt to West Point and Annapolis. In these days when colonial administration, civil service reform, international law, political economy, trade and commerce are coming to the front as never before, the United States surely needs a great civil academy, or national university, as well as continued support of its Military and Naval Academies. Through its Department of Agriculture and experiment stations in connection with agricultural colleges the Government is doing great things for the American farmer. It should also provide for the civil service, or, as George Washington especially desired, for "the science of government," or good administration.

George Washington's favorite idea was advocated by succeeding Presidents of the United States, John Adams, Thomas Jefferson, James Madison, James Monroe, John Quincy Adams, Ulysses S. Grant, and Rutherford B. Hayes, all of whom regarded the establishment of a national university as a patriotic duty. The Senate of the Fifty-second Congress, first session, published as a Miscellaneous Document No. 222 a memorial in regard to a national university by John W. Hoyt, who gives a complete account of all that had been done before the year 1892 in support of George Washington's project. The historic array of educational opinions thus presented is most impressive and the reasons for the establishment of a national university by the Government are clearly and strongly stated. There has been in successive Congresses a select committee on the university of the United States, and some of the ablest public men in America are avowed supporters of the project, which sooner or later in some form will probably be realized by Government aid. The educational campaign toward this object is active and progressive. Three times already the National Educational Association, the largest organized body of teachers in the United States, has indorsed this project. A national committee of 100 has been working to promote the establishment of "The University of the United States."

The George Washington Memorial Association.—This was organized in Washington, April 8, 1897, for the purpose of promoting a patriotic interest in the bequest made by the "Father of His Country," for the establishment of a national university, which shall complete the American system of education, and furnish facilities for investigation and the diffusion of knowledge. The society is largely composed of ladies, who have an executive board, representing the patriotic societies of America and individual States of the Union. The recording secretary is Mrs. Susanna P. Gage, of Ithaca, N. Y., who says that the George Washington Memorial Committee desires to raise a fund of \$250,000 for a building which shall be the administrative home for a national university. The committee is striving to develop the national consciousness of historic duty. They wish every man, woman, and child in the United States to hear of George Washington's educational bequest and have the opportunity of giving something toward an academic memorial. In her published plea, Mrs. Gage says of George Washington:

His will is unfulfilled. Is it not a reproach to us as a people that the wisdom of one of our greatest men has not been heeded? Education in politics and good government was a part of his thought, and the need is as great to-day as ever. The safety of the home and of individual liberty depends upon the proper education of statesmen. The future of the nation and of the race demands the service of the most carefully trained minds, that by public hygiene and preventive medicine stalwart bodies may be the rule; that the complex relations of sex and of capital and labor arising from the introduction of machinery may cease to threaten the welfare of children yet unborn; that a higher type of education for every individual child may be evolved, and that material conditions may not stifle the spiritual life of the people.

Opportunity for research, investigation, the factor of education which alone can produce these results, is slightly cared for in this country. Our students flock to Europe for it. Where in universities it is provided, it is done by the uncertain gifts of individuals, and depends upon the fluctuation of interest-bearing securities. The nation could receive such gifts and give stability to the income, could confer grants, and thus insure the highest opportunities to young people of genius. In a democ-

racy still more than in a monarchy this opportunity of genius should be given, because in a democracy the fruits of genius more readily become the property of all.

In an address given at a meeting of the George Washington Memorial Association in Washington, Mrs. Gage, after reviewing what has already been done for higher education of the American people by Government aid, land-grant colleges, experiment stations, and existing universities, makes a strong plea for a national university for research, on the basis of national cooperation. She called attention to the fact that during the year 1896-97 over \$8,000,000 were given to the various institutions of higher education in the United States. In view of the losses of original endowment which some universities have experienced, Mrs. Gage suggests that would-be founders and promoters of higher education call upon the United States Government for security, cooperation, and aid. She proposes that personal donors of moneys designed for the endowment of a national university or for the support of any of its State or local branches ask the United States Government to agree to the payment of 5 per cent interest on all gifts specially intended to aid research. A precedent is afforded by the Morrill bill, which requires that all land-grant funds, based upon Government bounty to the State agricultural colleges, should be so invested as to yield not less than 5 per cent interest. The United States Government can easily borrow money at 3 per cent. If a donor to the cause of national education by research is willing to intrust principal and its minimum of 3 per cent interest to Government control for the purpose of promoting national education, Mrs. Gage argues that the Government itself can well afford 2 per cent extra interest in perpetuity on such a trust fund for the scientific benefit of the nation. The total 5 per cent income on such trust funds should be paid for research purposes in any designated branch of the national university. This project would convert the higher educational interests of the American people into a national trust based on national cooperation: "The generous giver on the one side, the people represented by their government on the other; the giver placing the principal with its minimum of 3 per cent interest, the government adding its share in the perpetual 2 per cent grant; both uniting for the benefit of the whole people. A special series of Government bonds at 5 per cent could be issued as individuals or corporations might choose to place their means in such investments, leaving to each donor the choice within reasonable limits of the institution to be benefited. Here would be such safe haven for troubled investors in good deeds as would bring the States and the universities great educational funds. Here there is a practical basis for cooperation between Government and private benefaction for the good of research."

In view of the expenditure by the United States Government of \$20,000,000 for the Philippine Islands, and of much larger sums raised for war purposes by the willing contributions of a patriotic people and secured by 3 per cent bonds, it would seem not unreasonable to hope that with returning peace and general prosperity Congress might indulge itself in the modest luxury of a Washington memorial bond for five or ten million dollars, to be subscribed for by the American people, the interest to be forever guaranteed by the Government to the support of a national university, with research branches in Washington and Baltimore, if not in one university in every State of the American Union.

As already stated, the entire range of opinion upon national education from Washington's time down to the present has been compiled by Hon. John W. Hoyt, chairman of the national committee of 100, to promote the establishment of "The University of the United States." He has recently expressed his views very succinctly upon that subject in a letter to the New York Tribune August 18, 1899:

The university of the United States is planned as the logical culmination of the American system of public education, now terminating with the State universities; the stimulation, coordination, and elevation of all lower institutions to be not the least of its beneficent results. The proposed charter provides exclusively for post-graduate work; that "the university shall have authority to establish, with other institutions

of learning, such cooperative relations as shall be deemed advantageous;" and that "in all the operations of the university neither sectarian nor partisan preferences shall be allowed in any form." The national character of the university is made complete by provision for a representation of leading institutions in the educational management, while the general direction will be in the hands of the Government. In short, the university of the United States is to be such an institution as only a great nation can make and utilize in the public interest; such a university as will alone befit the dignity of a great and growing power aspiring to lead the world in civilization.

Between an undergraduate institution designed as the central seat of a particular theological propaganda and such an institution as the proposed university of the United States there can be no friction, no rivalry, no comparison.

The New York Tribune, remarking upon the above letter, observed on the same date:

Mr. Hoyt's citations certainly show clearly enough that there might not be great friction, in the sense of rivalry in competition for students, between his proposed "University of the United States" and the university which the Methodists are to build up at Washington. It is not so clear that his new university could make for itself, even under the patronage of the United States Congress, such a distinct field, in the immediate vicinity of the Columbian University, the Georgetown University, the Catholic University, the Methodist University, and the Howard University, all in Washington, and the Johns Hopkins University, only an hour away, as to justify its existence, without seeming to some of them to infringe needlessly, if not unfairly, upon their field.

It is only candid also to recognize the fact, so clearly pointed out a few years ago by Dr. Gilman, the president of Johns Hopkins, in discussing this very subject, that there is, both among the universities and among educated people generally, considerable distrust of the idea that Congress, amid the multiplicity of its other duties, should also undertake to provide for and direct university education. Dr. Gilman undoubtedly spoke for a general and widespread opinion among the educated classes in saying: "Such apprehensions may be pronounced groundless, nevertheless it will be difficult to get rid of them. There will be an ever present expectation of political interference, first in the governing body, then in the faculty, and finally in the subjects and methods of instruction. It is true that partisan entanglements may be avoided, but it will be difficult indeed to escape the thralldom."

President D. C. Gilman, in the last chapter of his volume on "University problems in the United States," suggested that the Smithsonian Institution might organize a plan for utilizing the educational material now existing in Washington.

The outlines of such a plan may now be indicated as a basis for further suggestions. To begin with, a head of this branch of service must be announced. This may well be the secretary of the Smithsonian; but if he is already too much occupied, let there be an assistant secretary in charge of advanced instruction and research. He must be the organizing and administrative officer. Next the inventory, already published, of the literary and scientific resources of Washington must be reexamined, and the conditions on which these resources may be opened must be clearly stated. A certain number of teachers must be enlisted who will give, for proper emolument, instruction and guidance in their specialties. There should be no attempt to provide a general or liberal course of education, but only opportunities and encouragement for the prosecution of certain specific courses. Consequently there will be no curriculum, no public examinations, no degrees. On the other hand, there must be abundant opportunities. Any person of either sex, from any place, of whatever age, without any questions as to his previous academic degree, should be admissible; provided, however, that he demonstrate his fitness to the satisfaction of the leader in the subject of his predilection. Evidence of preparation in one department will be totally different from that required in another.

Such a learned society may be developed more readily around the Smithsonian Institution, with less friction, less expense, less peril, and with the prospect of more permanent and widespread advantages to the country than by a dozen denominational seminaries or one colossal university of the United States.

The national university here already.—Many old and well-established universities—Harvard, Yale, Columbia, Princeton, University of Pennsylvania, and some of the older State universities, e. g., Virginia, Michigan, Wisconsin, California, and many newer creations, e. g., Johns Hopkins and Chicago universities—are truly and justly

viewed as something national in spirit. With a manifest cooperation of national and State institutions, would it not be a good working hypothesis, even if somewhat nebular, to regard the national associations of America, historical, educational, and scientific institutions, as potentially a national university? This country was called "The United States" many years before the present constitutional Union was adopted. The old confederation was simply a loose aggregation of individual State governments. Each higher educational institution with corporate powers and property rights will naturally preserve its own individuality and autonomy; but the federative process has already begun among colleges and universities in the United States through Chicago and church influences as it did years ago in Canada, through influences proceeding from Toronto and Quebec. Probably that federative process will never be fully accomplished. Indeed, it is not desirable, except perhaps, within state or provincial bounds and religious or sectarian limits.

A mere suggestion of what a national university might gradually become is the constitution of the University of the State of New York, Alexander Hamilton's original creation, incorporated in 1784, which now includes, with local autonomy, all the higher educational institutions of the Empire State. This American university is said by M. Buisson to have suggested the idea of the University of France. The national university of the United States, with certain local officers and Government departments in Washington, should comprehend in a national way the higher educational interests of the country at large. For such national upbuilding the Library of Congress, the Smithsonian Institution, the National Museum, the Bureau of Education, and all Government departments with educational activities are actually historic foundations. Some of them are very "lively stones" in the nation's growing temple of knowledge. So are all truly national associations like the American Historical Association, the American Library Association, and the National Education Association. So also are State universities, patriotic societies, and institutions, State and public libraries, library schools, and every newspaper which teaches national ideas and the true significance of popular education.

The board of regents of an organized national university should be strictly Federal (not State, local, or sectarian). They should comprise, *ex officio*, the President and Vice-President of the United States, the Chief Justice, the Secretary of State, the Secretary of the Interior, and the Secretary of the Department of Agriculture, the Speaker of the House, the Secretary of the Smithsonian Institution, the Commissioner of Education, the Commissioner of Labor, the Director of the Geological Survey, the Director of the National Museum, the Librarian of Congress, and the president of the National Educational Association. The secretary of this Federal board should be chosen by itself.

Washington is best adapted to be the executive center of a national university and Congress is the true source of any new line of national policy or expenditure for education.

One strong point in favor of some such project is that the United States Government already appropriates annually for educational and scientific purposes many million dollars. The national university is potentially here already. It is in manifest process of evolution like national unity and international peace. The kingdom of national education cometh not with observation, and he that believeth doth not make haste.

Washington, D. C., a national center of education.—The Federal city of Washington, D. C., is not only the center of American politics, law-making, and judicature, but also of American science and education. The Government is expending annually for scientific purposes, of one kind or another, over \$8,000,000, more than the entire endowment of some of the leading American universities.

XII.

THE SMITHSONIAN INSTITUTION AND THE AMERICAN HISTORICAL ASSOCIATION.

The Smithsonian Institution.—The history of the Smithsonian Institution affords the most striking example of the possibility of organized scientific and educational work under the control of the National Government. The general public sees only the museum and collections, and not one person in a hundred is aware that underneath the great halls, in the basement, is an enormous work going on which connects the whole civilized world by its system of interchange of scientific publications. The interpreters of the Englishman George Smithson's bequest for "the increase and diffusion of knowledge among men," wisely construed it to mean a central clearing house for scientific knowledge. This system has grown until the Institution has now 240,000 correspondents, ranging from the Friendly Islands to the European centers of learning. The United States Government orders fifty copies of all publications of its scientific and department bureaus to be sent here, and every institution of learning, or private individual, who wishes to distribute knowledge, can send publications to the Smithsonian Institution, which undertakes to distribute them to the desired localities. Thus an international exchange of ideas and knowledge is forever going on, and national bureaus, universities, solitary students, and isolated communities are brought into touch with one another. In nine months of last year 40,000 publications were sent out and 15,000 received, and in the forty-three years of its existence 1,500,000 packages have been distributed. Such a civilizing work contains in itself many university functions and, combined with the more obvious features of which the public is more aware, makes the Smithsonian Institution a potent factor in the advancement of knowledge. But almost the most important point is that this is carried on under a board of regents who consist of the Vice-President, the Chief Justice of the United States, three Senators, three Representatives, and six members appointed at large. Such a board of directors for a national university would at once arouse criticism and fear of political interference, and yet for fifty years this great institution has grown and developed without a question as to the integrity of its administration. A quarter of a million has been added to its endowment by bequests from private individuals, and Congress now annually appropriates about \$20,000 to further its scientific interchanges and disseminate its valuable publications. (From the address of Miss E. T. King to the George Washington Memorial Association, December 15, 1898.)

In the Handbook of the Library Association of Washington City, 1897, it is stated that in 1836 the library collection of the Smithsonian Institution was deposited with the Library of Congress, to which depository accessions are sent every week; but since 1878 a small working collection has been kept in the institution itself. The strength of the Smithsonian library is estimated at 175,000 volumes, pamphlets, etc. The annual growth is said to be 30,000 volumes, pamphlets, etc.

The library is not restricted to any special subjects, but is very strong in transactions of learned societies and periodicals. By virtue of the unique position which the Smithsonian Institution has occupied for so many years as the representative American institution for the cultivation of the arts and sciences, it has acquired, by gift from governments, or by gifts or bequests of private special collections, expensive governmental publications, original records and manuscripts, pamphlets, theses, and other works, rare, valuable, and curious. As examples may be enumerated: Two hundred and thirty-two tracts and theses written by Luther and his contemporaries, original prints of 1518-1546; original records and reports, many of them unpublished, on the property of British loyalists in America during the Revolution; facsimiles of British national manuscripts from William the Conqueror to Queen Anne, presented by the British Government; 54 volumes of bills, legal instruments, etc., illustrating the history of prices in England, 1632-1792, etc. A list of the catalogues in print of the collection may be found in the Checklist of Public Documents, second edition, issued by the Superintendent of Documents, 1895, pp. 189, 190.

The United States National Museum.—Among the public institutions in Washington, D. C., the great National Museum holds the most popular place. It is the favorite resort of school children, citizens, and foreigners who visit the Federal city. The Museum is an extensive, low-roofed building, near the Smithsonian Institution, and contains, among other attractions, good beginnings of American historical, cultural, and ethnological collections, chiefly of American Indians, Alaskans, Aztecs, etc.

Catlin's superb gallery of Indian portraits calls to mind some of the most celebrated Indian chiefs and tribal types. Relics of prehistoric men, aboriginal modes of living, the occupations, arts, and industries of native and foreign races are exhibited in most instructive ways. Human inventions and historic modes of transportation from women carriers to modern locomotives are illustrated by progressive series of object lessons. The place of man in nature is indicated by a series of skeletons from lower to higher orders. Animals and men native to America are exhibited in their proper setting or natural environments.

There are said to be two classes in the various collections made at Washington: (1) "The exhibition series," constituting the educational portion of the Museum and therefore exposed in the most attractive way to the public view; and (2) "the study series," which is kept in scientific laboratories and is rarely examined except by experts and investigators. Probably the great mass of things owned by the National Museum is not shown at all. Duplicate collections, illustrating American ethnology, botany, mineralogy, and geology are frequently lent or given to local museums in various States of the Union and thus become of truly educational and scientific influence throughout the nation.

It was a favorite dictum of the late Dr. G. Brown Goode, assistant secretary of the Smithsonian Institution, for many years in charge of the United States National Museum, that a people's museum should be something more than a house full of specimens in glass cases. "It should be a house full of ideas arranged with the strictest attention to system. * * * An efficient educational museum may be described as a collection of instructive labels, each illustrated by a well-selected specimen." Dr. Goode himself illustrated this dictum in practice and also his idea that good museum management, like good library administration, must be represented or personified by one or more well-informed, scholarly, practical men, "fitted by tastes and training to aid in educational work."

In his Report of the National Museum, 1888-89, pp. 427-445, there is published Dr. Goode's paper on "The museums of the future," a prophetic and highly suggestive sketch, but historically based on the best experience of the Old World and the New. He reminds us that the Greek idea of a museum was that of a home or temple of the muses. Then it became a place of study, a school. Athens was called the museum of old Greece. The Alexandrine Museum was the university of the Græco-Roman world and contained many distinct schools or colleges; also a vast library. "The history of museum and library runs in parallel lines. It is not until the development of the arts and sciences has taken place, until an extensive written literature has grown up, and a distinct literary and scientific class has been developed, that it is possible for the modern library and museum to come into existence. The museum of the present is more unlike its old-time representative than is our library unlike its prototype."

Dr. Goode was an American champion of the idea that "the museum of the past must be set aside, reconstructed, transformed from a cemetery of bric-a-brac into a nursery of living thoughts. The museum of the future must stand side by side with the library and the laboratory, as a part of the teaching equipment of the college and university, and in the great cities cooperate with the public library as one of the principal agencies for the enlightenment of the people."

The great National Museum in Washington is not made up, like so many local collections in America, of miscellaneous cabinets of natural history and mere curiosities, but it is composed of a well classified and clearly labeled series of illustrations of various arts and industries, as well as of various natural sciences, zoology, botany, mineralogy, and geology. The ethnological collections in Washington are classified on a double system, in one of its features corresponding to that of the European, in the other, like the famous Pitt Rivers's collection at Oxford, arranged to show the evolution of culture and civilization without regard to race. No one who has seen

the historic evolution of musical instruments and other inventions as illustrated in the collections of the National Museum will fail to realize the meaning of this second system of classification.

Professor Huxley once described a museum as a "consultative library of objects," but Dr. Goode thought this definition unsatisfactory because it related merely to museum contents and not to methods of use and administration. The books in a library must be removed from their place, examined one at a time, by one person, whereas the objects in a museum should be viewed in groups and scientific sequence. "The museum cultivates the powers of observation, and the casual visitor even makes discoveries for himself, and under the guidance of the labels forms his own impressions. In the library one studies the impressions of others. The library is most useful to the educated; the museum to educated and uneducated alike, to the masses as well as to the few, and is a powerful stimulant to intellectual activity in either class. The influence of the museum is not so deep as that of the library, but extends to a much larger number of people. The National Museum has over 300,000 visitors a year, each of whom carries away a certain number of new thoughts." Think of the educating influence of that vast historical treasure-house of human arts and inventions upon a naturally observing people. Visit then the United States Patent Office, and see in its museums the myriads of American practical devices designed to make human labor more efficient, to lighten or relieve it altogether by mechanical force.

American Historical Association.—This national society, now embracing 1,500 members, was incorporated by act of Congress, January 4, 1889, "for the promotion of historical studies, the collection and preservation of historical manuscripts, and for kindred purposes in the interest of American history and of history in America." The association has its principal office in Washington at the United States National Museum, where its historical collections are gradually accumulating. Its curator is Mr. A. Howard Clark, of the Smithsonian Institution. In triennial rotation the association meets now in an Eastern city—e. g., Boston; then in a Western city like Detroit, and every third year in the Federal capital. Thus by its annual convocations it exercises a truly national influence in historical matters. Its yearly proceedings and historical bibliographies are reported to Congress through the Smithsonian Institution and are published as a Government document, to be had free on application to any Congressman or at cost from the Public Printer. The association also sends to its members free of charge the *American Historical Review*, the quarterly magazine representing the best historical scholarship in America. The association has published a bibliography of the most important work of the State and local historical societies so that this national society has become a kind of clearing house for historical matters of interest to the whole country. One of its members, Professor Richardson, of Princeton University, New Jersey, reports annually to the *Jahresbericht* of the Berlin Historical Society concerning the progress of historical literature in America. Other members report to the *Revue Historique* in Paris.

Among other features of the American Historical Association are the following:

- (1) An annual prize of \$100 for the best original contribution to American history.
- (2) An historical manuscripts commission for the preservation and publication of important manuscript materials for American history.
- (3) A commission on the history of colonies and colonial dependencies.
- (4) A general committee representing the individual States of the American Union and serving as centers of historical information regarding their own States and cities.
- (5) A committee of seven on the study of history in secondary schools. After a three years' inquiry this committee has made an elaborate report upon this important educational subject, which has just been published by the Macmillan Company, of New York City. The inquiry was originally begun at the request of the American Educational Association, but it has been continued and ended in the interest of the

American Historical Association and of better methods of historical study in the public and private schools of the United States.

(6) A committee on bibliography.

(7) A public archives commission.

In the future the American Historical Association, through its manuscripts commission, is likely to interest itself in the publication of some of the historical materials now belonging to the United States Government. For example, the original records of the Virginia Company, representing the colonial beginnings of this country, will perhaps be undertaken through the joint efforts of the association and of the Library of Congress. The relations of this library with the association are most friendly. The historical documents and exchanges received by the association from foreign countries and learned societies are all sent through the Smithsonian Institution to their final repository in the library of the nation.

XIII.

LIBRARY OF CONGRESS.

Potentially this is one of the greatest educational institutions in the United States. It is the national library in which all the printed books in America are now deposited under the Federal law relating to copyright. It was founded by act of Congress, April 24, 1800, and was organized the following year on the basis of a report made by John Randolph. The first appropriation for books was \$5,000. In 1814, when the British occupied Washington, the old Capitol was burned and the original library was destroyed. A memorable acquisition of books was the library of Thomas Jefferson, comprising 6,700 volumes. Other purchases were made, but in 1851 a second fire destroyed some 30,000 volumes. The following year \$75,000 was granted for reconstructing the library rooms and \$75,000 more for the purchase of books. At the outbreak of the civil war the Library of Congress numbered less than 100,000 volumes. It now contains 890,000 volumes and 250,000 pamphlets.

Since 1894 the new Congressional Library¹ has been built by special appropriations amounting to \$6,400,000, or with the land to \$6,950,000. The new building is veritably a people's palace, not only for the representatives of the States, but also for any citizen who will take the trouble to visit it and ask for books in the prescribed way. The building is one of the most sumptuous in the world and is constructed of marbles representing the quarries of the nation and is decorated with mosaics and costly frescoes, suggesting to the mind of every beholder not only the history of the United States, but the greatest events in the history of human culture. Famous names in art, science, literature, religion, law, and statesmanship are commemorated here. In the corridors are displayed the finest specimens of early printing, book making, and engraving. The literary treasures of early American colonial history may be seen by any student or passing schoolboy. The portraits, prints, and other souvenirs of great Americans are grouped in interesting ways; for example all the Presidential administrations from that of George Washington down to the living present are represented by the best and most significant engravings. It is a liberal education for an American citizen to wander through those immense corridors and see the history of his own country in its relation to the history of the world.

The magnificent reading room of the Library of Congress is daily filled with all sorts and conditions of men, from scholars and Government officials to the boys and girls from the Washington public schools. All are eagerly pursuing subjects of research important to their various callings. The mechanical appliances for obtaining quickly from any part of the library any desired book, are the most ingenious of

¹The building of the Library of Congress. Bernard R. Green. Smithsonian Report for 1897, pp. 625-632 (with 13 plates).

their kind in America. The Library of Congress has emerged from its former condition of literary chaos to a relative cosmos of order and convenience.

A. R. Spofford on the Library of Congress.—At a meeting of the library department of the National Educational Association in Washington, D. C., July 11, 1898, Mr. A. R. Spofford spoke of the popularization of the Library of Congress:

The ultimate connection between libraries and schools is of national importance, for very few schools have enough books accessible. A step has been taken in this city to popularize libraries, by opening the national library from 9 a. m. to 10 p. m., so that Government employees and all residents and sojourners of Washington may have access to the books during the day and evening. After years of hope deferred and long and perilous delay, the Library of Congress has moved into its new home, built from the appropriation of \$6,000,000, so wisely expended that every dollar tells. The building represents the flower of modern architecture, the triumph of modern art. It receives almost unanimous praise. In this casket are accumulated jewels worthy of so magnificent a setting. In one of the upper halls is an exhibition of rare American books. We are now trying to make this the most representative library in the world.

Brooks Adams, of Boston, in a recent address in New York to the National Sculpture Society, said of the new Library of Congress:

I affirm that as a workshop this building approaches perfection. It is ample, it is light, it is convenient, while in rapidity of service it can hardly be excelled. In the National Library of Paris it costs an hour to get a book; in the British Museum, half an hour; in Washington, five minutes. In Paris and London one works in dark and gloomy rooms, often crowded to excess; in Washington the reading rooms are numerous, cheerful, and comfortable.

In a special monograph, published by the University of the State of New York, the present writer has discussed in extenso the relation of public libraries to popular education. He there considers the origin and development of free public libraries in New York, New England, and other parts of the country, together with the more modern and popular developments of these useful institutions. The public library is the people's university, the highest of its high schools.

XIV.

MUSEUM EXTENSION.

The United States National Museum in Washington, D. C., has long been in the habit of sending out loan-museums, of varying size, to illustrate ethnology, anthropology, geology, and the various natural sciences, for the benefit of local museums all over the country. The United States Government owns vast collections of duplicates in almost every field of natural history, and it has been considered good public policy to distribute small portions of this scientific surplus in well-classified groups to important local exhibition centers in many towns and cities throughout the Union. New life is given by this government bounty to many a community possessing a town or village library or the beginnings of a local museum.

The United States Geological Survey also has been specially active in this work of museum extension from Washington, of furnishing materials for promoting popular scientific education. As regards this phase of its work, Prof. Bailey Willis, in a letter dated June 28, 1899, said:

The most conspicuous action in the way of distributing collections of specimens was the assembling and distribution of the educational series of rocks, a project started by Major Powell when Director, and completed under Mr. Walcott's supervision. Two hundred and fifty full sets of rocks and 40 partial sets have been sent out, apportioned among the States on the basis of Congressional representation, and, within the States, given to those higher educational institutions having the largest number of collegiate students. I cause to be sent to you the bulletin published in connection with these collections. In addition to this, many of the leading geologists of the Survey, including the Director, have given public lectures in most of the large cities, and have very frequently done so in Washington. Several of the geologists

of the Survey are or have been connected with the universities of the country to give courses of lectures on their special subjects. This policy is encouraged by the Director in so far as practicable when not interfering with public business.

In connection with the discussion of the establishment of the national university, the Geological Survey has repeatedly been cited as an example of the relation which scientific Government institutions might hold to the higher educational institutions of the country upon the basis of a national university, it being the fact that many more graduates than can be accepted apply for the educational opportunities afforded by association with the Geological Survey.

The State geological surveys are, in some cases, doing a similar work. For example, in Maryland, the State geologist, Prof. W. B. Clark, who is also connected with the United States Geological Survey and the Johns Hopkins University, authorized in 1899 the distribution to Baltimore teachers of unusual excellence representative collections of Maryland geological specimens for the purpose of fostering the museum idea in the public schools. He himself once built up, in his native town, Brattleboro, Vt., a first-rate local museum of geology and natural history in connection with the public library. He now has in contemplation a general pamphlet on the physical characteristics of Maryland and will put the illustrated description in the hands of teachers and school children throughout the State. The geological maps issued under his direction are already being distributed through the Maryland counties for educational purposes. The whole State, the agricultural college, teachers' association, farmers' institutes, public schools, and other educational forces are thus coming into a cordial federation.

Maryland very early set a good example in the direction of public educational service. She was the fourth State in the Union to organize a geological survey, in 1833. In 1858 Philip T. Tyson became State geologist and did something to promote ideas of popular education in geology. Under the act of 1848 he was required each year "to deliver a public lecture, after having given timely notice, in each election district in each county, and then to deliver a course of public lectures at each county town." Of course this scheme as a whole was impracticable, but the idea was creditably represented by Mr. Tyson down to the civil war.

The popular cause has now been revived in better form by local lectures, although given in moderation, in prominent towns, in connection with local educational and agricultural interests.

Most of the progressive State geological surveys at the present time are dwelling upon the educational importance of bringing to the attention of teachers and pupils in the public schools the physical characteristics of the State and neighborhood. Home and school education is everywhere fostered in America, but nature study and the utilization of the immediate environment for scientific and historical study is not yet so well developed as in France.

Musée scolaire.—Great interest has been awakened in New York City and throughout the State by a recent exhibition in Brooklyn of a specimen of Deyrolle's "Musée scolaire" by the Brooklyn Institute of Arts and Sciences. This is the first portable museum for school children ever brought to the United States, and it will undoubtedly lead to introduction into the public schools and to an American adaptation of the whole idea of a traveling museum, analogous to the miniature traveling library and the traveling picture gallery (selected and exchanged) for schools and study clubs. The French musée scolaire, as first shown in Brooklyn, contained a series of 117 charts or object cardboards, about 2 feet square, representing and describing natural objects. The products of the earth and sea are exhibited and the industrial uses are clearly stated. For example, the plants are pictured from which the various dyestuffs are obtained—indigo, saffron, etc. Samples of cotton, wool, or silk, colored with these dyes, are also exhibited. As far as practicable, actual raw materials are shown in glass tubes, wired to the cardboard.

There are obviously infinite applications of this charming idea of pictures and

specimens, combined on one chart, and thus supplementing one another. This educational idea will be useful in teachers' object lessons in physical geography, geology, botany, mineralogy, history, biography, art, and literature. America has long been illustrating some of these studies by pictures and specimens, but the French *musée scolaire*, or school museum, will suggest the possibility of introducing a regular museum system into public education.

A good article upon the subject of "A museum for small scholars," showing the possible study of nature in small space, appeared in the *New York Evening Post* June 10, 1899. Another and very suggestive article on "A children's museum" appeared in the *Commercial Advertiser*, New York, May 30, 1899.

XV.

HIGHER COMMERCIAL SCHOOLS.

So-called "business colleges" have long flourished in America for the practical training of the sons and daughters of the people in penmanship, book-keeping, stenography, typewriting, and elementary branches of mathematics. A higher commercial education is now coming into vogue in our larger cities and in connection with the public-school system. Mr. William H. Maxwell, superintendent of schools in Brooklyn, lately said to the New York Chamber of Commerce: "The merchants and manufacturers of the city have done little toward improving the education of the masses by insisting on a youth's reaching a certain standard, such as graduation from grammar schools before going to work."

The present plan in New York City is to institute so-called "Commercial high schools," in which the first two years shall be in direct continuation of the work of the grammar schools or upper grades, and then proceed along special lines which are likely to be directly useful in mercantile and commercial life. At the same time it is intended that these specialized schools shall not be merely technical and commercial, like the old-fashioned "business college," but more broadly civic and educative. Instead of confining the student's attention to literary, scientific, or classical fields, the chosen subjects of specialized knowledge are taken from civic life and the world of politics and economics. Stress is laid upon the science of government, the laws of trade, economic and commercial history, commercial geography, commerce itself, statistics, modern languages, forms of foreign correspondence, and the progress of other countries as described by our consular reports. Here is a vast body of most interesting and concretely useful knowledge about the world in which America is actually living and moving. The point is that "things as they are" are worth studying in themselves and possess a positive cultural value.

The French, the Germans, the English, and the Americans are all grasping this wholesome truth. The director of a new German institution, at Leipzig, said in his inaugural address:

The commercial college is not designed as a direct preparation for breadwinners, such as commercial classes can give. It is to be the home of higher intellectual training and its golden fruits will fall into your lap, not directly but indirectly. The commercial college will teach you to think clearly; it will train your mental powers, and will provide you with ability to rise superior to the most difficult tasks and the most critical situations. * * * Our times make greater demands upon our men of business and industrial life than was formerly the case—demands which our schools are no longer able to fulfill.

Full of such ideas, acquired by actual experience and now confirmed by Old World educators, the Americans in many of our great industrial cities, Philadelphia and Chicago, as well as New York, have for some time been pushing towards schools and museums for higher commercial education. In the now famous Field Museum, Chicago, were rescued some of the best and most instructive spoils of the Exposition in 1893. Philadelphia did the same after the Centennial Exposition in 1876. Balti-

more and other American cities are eagerly looking forward to similar museums and to higher commercial schools and colleges, which shall intimately ally education and business. Science has long been an adjunct of industry in America. Witness the works of Fulton and Morse, Bell, Edison, and Carnegie.

Columbia course in commerce.—The New York Sun of June 10, 1900, calls attention to the proposed endowment of this college course with \$500,000 in chamber of commerce scrip and says:

The prospects for the establishment of the collegiate course in commerce at Columbia University are good. About a year ago the chamber of commerce indorsed a plan of cooperation with the university, proposed by the chamber's special committee on commercial education, and passed a resolution authorizing the officers of the chamber to secure the necessary funds. Because of the subscription of the new building fund for the chamber of commerce it was deemed inadvisable to make any such effort last year. Now that the building fund is completed the committee of the chamber acting upon the suggestion of the president, is endeavoring to provide permanently for the course in commerce by securing the assignment to the university of chamber of commerce scrip, which is to be issued for subscription to the building fund to an amount not less than \$500,000. It is understood that good progress is being made in this enterprise. The fund is expected to produce \$15,000 to \$20,000 a year to run the proposed school.

The course will cover four years' work and will lead to a certificate. No degrees will be granted. All those who have attained the standing of high-school graduates will be eligible for admission. The curriculum will include the following subjects, some required, others elective: Topography, orthography, hydrography, meteorology, orography, geognosy, geography, German, French, Spanish, Italian, industrial chemistry, systems of weights and measures, exchange, arbitrage, customs regulations, currency and banking systems, storage bonding and harbor regulations, commercial law, rules of navigation, markets, fairs, exchange and price quotations, roads, canals and railways, commercial documents, operations in produce exchanges, inland trade and transportation, vocabulary and nomenclature, and principles, practice, and legislation.

The chamber's special committee on commercial education in charge of the project is composed of Seth Low, chairman; W. Bayard Cutting, Gustav H. Schwab, James G. Cannon, and F. B. Thurber.

XVI.

NEWSPAPERS AS POPULAR EDUCATORS.

Good journalism has long been one of the best means of educating the English and American peoples. The rise of great newspapers is one of the most striking educational phenomena of the nineteenth century. Probably the press has had more to do than any other agency in shaping public opinion and in developing the democratic spirit in politics and culture. Newspapers accomplish for adults what public schools do for the young. They liberate and inform the mind. They inspire the will and train the human spirit for useful action. In one sense the public prints are the school books of the nation, educating citizens and voters to a knowledge of their duty.

It is worth our while to inquire into the origin of this wonderful power which has become the day and night school of the nation. We are all students of the daily newspaper, whatever may be our academic connections. One of the chief values of reading and philosophy is the acquired ability to interpret aright the news of the world, the truth that comes straight, not from musty tomes, but from God's own laboratories, the workshops of history and politics, the high fields of human action.

The origin of the great political journals of England goes back to that period of political storm and stress known as the American and French Revolutions. Mere dates become significant in the light of central facts. In 1769 the Morning Chronicle was founded; in 1772, the Morning Post; in 1785, the Times (the modern thunderer, more powerful than the god Thor); in 1792, the Courier. Look at specimens of these, or any eighteenth century newspapers, and compare them with first-class

modern journals, and see how ideas of popular government and education have expanded. Four pages were enough for London and New York a century ago. Now there is hardly room for anything but newspapers in a modern reading room.

The original motive for English newspapers was, first and foremost, to chronicle the doings of Parliament, in which, at the time of the American Revolution, the English people had considerable interest. There never were any official reports of Parliamentary proceedings until the *Morning Chronicle* took up this public duty. For a time Government resented such democratic impertinence, and did not resign itself to inevitable fate until 1770. To this day the newspapers are the only means of publicity for the proceedings of Parliament, which has neither shorthand reporters nor daily records like those representing the American Congress. It now seems a truism in England and America that representatives of the people should report to the public through the press.

While tolerating political newspapers the English Government at first proceeded to tax them as heavily as possible. From 1789 to 1815 the burden was from 4 to 8 cents on every copy issued. The Government also levied a heavy tax on paper. In 1819, the 4-pence stamp duty was imposed upon every periodical costing less than 6d., so that a newspaper at that rate cost an English citizen the equivalent of 20 cents of our present American money. Of course this was a prohibitive tariff for the great mass of English readers.

In 1815, the *Times* had a daily edition of only 8,000 copies, but the total number of copies of all newspapers subject to this tax on popular knowledge was, in 1801, 16,000,000. In 1821, the total had risen to 25,000,000, showing that English democracy was learning to appreciate political and other news. Curiously enough, at first the six great London dailies favored the tax on newspapers because it gave them a virtual monopoly and prevented smaller newspapers from starting up a competition. In spite of steady increase in circulation English newspapers were by no means for the chief benefit of the masses.

The man who deserves the greatest credit for opposing the tax on newspapers was Francis Place (1771-1854) who, beginning in 1819, brought forward year after year the question of repeal of "Taxes on knowledge." Graham Wallas, Place's biographer, says: "It was not till 1855 that the penny stamp was abolished, and only with the repeal of the advertisement duty in 1853, and the paper duty in 1861, that taxes on knowledge ceased, and a penny daily press became possible in England." Any one familiar with the high educational character of the great London dailies of our time—e. g., the *Standard*, the *Times*, and the *Daily News*—and with the great provincial dailies, like the *Manchester Guardian*, must realize what educational leaders and tribunes of the people English newspapers now are.

English journalists opened the way for political liberty and free speech in our mother country. Under the old laws of libel it used to be very easy for the English Government to imprison or send beyond the seas any editorial writer who had expressed himself too freely in political or religious matters, or who had spoken irreverently of the party in power, of George IV, or of any member of the royal family. In 1812, the Hunt brothers were condemned to a year's imprisonment for having said that the *Morning Post* exaggerated in calling the Prince of Wales an Adonis. From 1808 to 1821, 94 English journalists were condemned to penalties of various sorts. Among these, 12 were deported.

The nineteenth century is not only the era of newspapers, the best known educators and leaders of the people, but also the era of great magazines, the standard-bearers of politics, religion, and literary criticism. To understand the origin and rise of the periodical literature of England or America is to understand the history of Anglo-American culture and progress.

Of far-reaching educational influence upon the American people is the daily newspaper. It comes morning and evening into almost every household in large towns

and is read by every adult citizen of ordinary intelligence. The affairs of the town, city, State, nation, and the world are subjects of familiar conversation at breakfast and dinner in every household. In many public and private schools, social organizations, women's clubs, and college classes, talks on questions of the day or so-called "current events" are a recognized means of public instruction. At the present time special efforts are made in many communities to interest women in public contemporary affairs. In a recent conference of normal school teachers in Boston, May 12, 1899, a lady teacher from Providence, where for many years the city press has cooperated with the public library and the public schools, expressed the hope that "the time would come when all women, in school and out, would read the papers as regularly and thoroughly as men do."

Doubtless too much attention is given by some men to "news" and to the editorial opinions of the daily press and too little time to good books and the best periodical literature, but on the whole, the American passion for newspaper reading shows that the Republic is vitally interested in contemporary progress, in living truth. "Ancient history" is a familiar phrase for things dead and buried; but for real news, and for new aspects even of scientific truth, Americans are very keen.

Beyond all question, the daily newspaper is the most potent educational power in the United States, as it certainly is also in the French Republic, where every voter is a reader. In a democracy this must be so, for the press molds public opinion, shapes political parties, and determines elections. In America, newspapers support all measures for the public health and public welfare, including public libraries, public schools, and all other forms of popular education. The press to-day is the tribune of the people, more potent perhaps than the pulpit or the college or the public library in educating the great masses of men and women. Science and religion are both taught in liberal, catholic, and progressive ways by the daily newspaper. Its classes of eager readers in all branches of really vital knowledge are numbered literally by the thousand. Some critics affect to despise newspaper reading, but it is the bread of intellectual life for the common people and some of the best and most cultivated writers in America are regular contributors to the press.

Newspaper civilization.—Dr. William T. Harris, in an address to the Congregational Club in Washington, D. C., expressed his appreciation of newspapers in the following language: "Far surpassing our libraries in educative influences are our own daily newspapers and magazines. Our people are far more freely supplied with newspapers than the people of any other nation. We are governed by public opinion, as ascertained and expressed by the newspapers, to such an extent that our civilization is justly to be called a newspaper civilization" (Washington Post, October 16, 1894).

Educational value.—Thus material information drawn from the daily newspaper and the monthly magazine enters into the life and thought of the rising generation. Children are taught to observe passing social and political phenomena as they are taught to study nature herself. Indeed, children soon begin to realize that history and sociology are vitally connected with nature and quite as well worth serious study as are objects in the animal and vegetable kingdoms. It is much the same whether the materials for educating the mind of youth are caught from the air or dug from the earth, fished out of the sea or taken from that great river of time represented by the daily newspaper, the magazine, the book, the sermon, the lecturer, the walk, or the talk.

There was no question about the educational value of peripatetic and Socratic methods in the groves and markets of Athens. There ought to be none about the living words of the modern press and platform.

Antiquarians and "dry-as-dusts" realize the scientific value of newspapers when they get old enough to be preserved in musty folios. Politicians, social economists, and citizens have no hesitation about utilizing newspapers fresh from the press. The

rapid rise of press bureaus in England and America and the growing tendency to exploit newspaper material for educational and social purposes shows that democracy is bound in some way to keep up with its own self-made history.

The idea of adult education continued for life has long been in process of evolution through the American press, and now there is hardly a first-class daily that does not have its educational and literary columns, its weekly page devoted to American colleges and schools, its special writers on art, music, religion, and science. There are special columns for women, children, and the household. A public school for the American people is the daily press. Of particular educational interest to many readers was a series of articles on folk music, published in the early summer of 1899 in the Sunday supplements to the New York Tribune. References were given to the standard literature upon the various national variations of this great and popular theme. Those libraries, in various cities, containing the books and music recommended, were briefly indicated. Thus the common cause of musical culture was sensibly and cheaply promoted all over the country by the cooperation of great public libraries with one metropolitan newspaper.

Digests and summaries.—There are also classified condensations of American newspaper views and magazine articles in special organs like Public Opinion, the Literary Digest, the American Monthly Review of Reviews, etc. Many other publications give monthly summaries, topically arranged, under such heads as history, politics, religion, art, science, literature. Schools, clubs, and various associations have their weekly or monthly reviews of current events. From the primary school to the college, it is not unusual for teachers to direct the attention of their pupils to the important events of the time.

The Chicago Record's "Home study circle."—Not long ago, January, 1897, an enterprising Chicago newspaper undertook to supply its readers every day with two columns of well-digested or well-edited educational matter, arranged under special subjects and in orderly sequence, for the "Home study circle." The matter proved so very interesting and helpful to wide circles of readers that it was syndicated or supplied in duplicate to dozens of daily papers. The home circle studies appear in Chicago, Cleveland, Cincinnati, Buffalo, Pittsburg, Louisville, Memphis, Minneapolis, St. Louis, Denver, Los Angeles, and in several smaller cities. It is impossible to estimate the number of students who are following the course. The Chicago Record has stated that fully 100,000 people follow the work, either closely or incidentally. This is probably an underestimate, for the newspapers which represent this work have a much wider circulation.

The following brief outline of "The Chicago Record Home Study Circle" has, by request, been furnished by Mr. Ivan A. Thorson, of Johns Hopkins University, who has followed with interest the development of these courses since they began to appear in 1897.

"The Chicago Record Home Study Circle" was organized in January, 1897. It appeared first as "The night school at home;" later the name was changed to "The summer school at home," and finally in October, 1897, it assumed the name by which it is known at present.

The "Home study circle" has from the beginning been under the chief direction of Dr. Seymour Eaton, of the Drexel Institute, Philadelphia, who was the originator of the idea. As will be noticed from the list given below, 53 distinct courses have been published, including those running at this writing (December, 1899). The general plan of publishing these courses may perhaps also be gathered from this list. From two to three columns of the newspaper has daily been given up to the "Home study circle" work.

From an elementary course, almost entirely in the more common branches, for the special benefit of those whose educational advantages have been very limited, these "Home studies" developed and broadened so as to include courses in literature, science, and art, adapted to all classes. Among the later contributors to the courses we find men representing all the leading colleges and universities in the country.

The form and style adopted in presenting these courses have throughout been the

simple and direct, enabling any person with average intelligence to follow along without difficulty, though previously possessing no knowledge in the particular subject under consideration.

The following is a list of the courses of instruction which have been offered:

I.

January to May, 1897:

- | | |
|---|------------|
| 1. Bookkeeping and finance | Monday. |
| 2. Elementary mathematics (first course) | Tuesday. |
| 3. Beginner's course for working boys and girls | Wednesday. |
| 4. Mechanic's bids and estimates | Thursday. |
| 5. Correct English and correspondence | Friday. |
| Notes, hints, and answers | Saturday. |

II.

May to October, 1897:

- | | |
|--|---------------------------------|
| 6. Popular and applied science | Monday and Tuesday. |
| 7. Economic principles and problems | Wednesday. |
| 8. School ideas—a course for teachers | Wednesday. |
| 9. Literature and literary criticism (first) | Thursday, Friday, and Saturday. |

III.

October, 1897, to February, 1898:

- | | |
|--|------------|
| 10. Common school course | Monday. |
| 11. Civil service examination course | Monday. |
| 12. Course in stenography | Tuesday. |
| 13. Course in English composition | Tuesday. |
| 14. Elementary mathematics (second) | Wednesday. |
| 15. Course in mechanical drawing | Wednesday. |
| 16. Double entry bookkeeping | Thursday. |
| 17. Course in commercial arithmetic | Thursday. |
| 18. Course in ancient history | Friday. |
| 19. Course in literature and literary criticism (second) | Saturday. |

IV.

February to June, 1898:

- | | |
|---|----------------------|
| 20. Commerce and finance | Monday. |
| 21. Course in commercial law | Monday. |
| 22. Course in civics | Tuesday. |
| 23. Course in parliamentary practice | Tuesday. |
| 24. Course in elementary electricity | Wednesday. |
| 25. Course in English history | Thursday. |
| 26. Literature and literary criticism (third) | Friday and Saturday. |

V.

June to October 31, 1898:

- | | |
|--|------------|
| 27. Popular studies in architecture | Monday. |
| 28. Geography—Trade centers of the world | Tuesday. |
| 29. Lectures on astronomy | Wednesday. |
| 30. Lectures on health and hygiene | Thursday. |
| 31. The world's famous scientists | Friday. |
| 32. Literature—Popular living authors | Saturday. |

VI.

October, 1898, to February, 1899:

- | | |
|--|---------------------|
| 33. Night school course | Monday. |
| 34. Popular studies in Shakespeare (first) | Tuesday and Friday. |
| 35. Elementary mathematics (third) | Wednesday. |
| 36. Drawing, designing, and illustrating | Thursday. |
| 37. The world's great musicians | Saturday. |

VII.

February to June, 1899:

- | | |
|---|----------------------|
| 38. Popular studies in European history | Monday. |
| 39. The world's great commercial products | Tuesday. |
| 40. Governments of the world of to-day | Wednesday. |
| 41. Popular studies in literature | Thursday and Friday. |
| 42. The world's great artists (first) | Saturday. |

VIII.

June to October, 1899:

- 43. Vacation studies for young naturalists Monday.
- 44. Historic cities of Europe..... Tuesday.
- 45. Popular lectures in physical science Wednesday.
- 46. Three centuries of French literature..... Thursday and Friday.
- 47. Royal women of European history..... Saturday.

IX.

[Course running at this writing, December, 1899.]

October, 1899, to ——:

- 48. Popular studies in Shakespeare (second)..... Monday and Thursday.
- 49. The world's great artists (second)..... Tuesday.
- 50. Desk studies for girls..... Wednesday.
- 51. Shop and trade studies for boys..... Wednesday.
- 52. Great American statesmen..... Friday.
- 53. Home science and household economy..... Saturday.

In most cases the titles furnish a good index to the contents of these courses. The subjects taken up the first year and a half were presented in very nearly the same manner as we find them presented in the average text-books on these subjects. I would make an exception to this with regard to the course in "Literature and literary criticism," as no ordinary text-book that has come to my notice covers the same ground with such completeness as did this course.

About the middle of 1898, a marked improvement took place in the make-up of the courses. Instead of employing one or two writers to furnish the whole set of articles on a given subject, the system of engaging for the purpose several specialists from various colleges and universities began to be introduced. Thus we find that the articles on "Popular living authors" (June, 1898) were written by such men as Professors Gates of Harvard, Butler of Boston University, Demsey of Ohio University, Brander Matthews of Columbia, Rev. Edward Everett Hale, and others. In the fall term of 1898 appeared the course called "Popular studies in Shakespeare," having the following distinguished Shakespearean scholars and literary men among its contributors:

1. Hiram Corson, LL. D., Cornell (director).
2. Edward Dowden, Lit. D., D. C. L., LL. D., University of Dublin.
3. William J. Rolfe, Lit. D., editor Harper Bros.' Shakespeare Editions.
4. Isaac M. Demmon, A. M., LL. D., University of Michigan.
5. Oscar Lovell Triggs, Ph. D., University of Chicago.
6. John Franklin Genung, LL. D., Amherst.
7. Theodore W. Hunt, Ph. D., Princeton.
8. Albert S. Cook, Ph. D., LL. D., Yale, and several others.

Since February, 1899, this system of employing several specialists as contributors to each course has been adopted with reference to nearly all the courses, two or three exceptions being made where the nature of the subjects has been such that a single contributor would seem preferable.

To give a more definite idea of the work that the "Home study circle" is doing, I shall give a brief outline of a few of the courses mentioned in the list above, with the names of some of the contributors.

The authors treated in the course on "Popular living authors," just referred to, were:

- | | |
|-------------------|------------------------|
| 1. Howells. | 10. Bret Harte. |
| 2. Warner. | 11. Hall Caine. |
| 3. Aldrich. | 12. Anthony Hope. |
| 4. Mark Twain. | 13. Conan Doyle. |
| 5. Riley. | 14. Barrie. |
| 6. Stockton. | 15. Kipling. |
| 7. Cable. | 16. Sir Walter Besant. |
| 8. Crawford. | 17. Weyman. |
| 9. Harding Davis. | |

The plays studied in the first course, entitled "Popular studies in Shakespeare," also referred to above, were:

- | | |
|-----------------------------|------------------|
| 1. Romeo and Juliet. | 5. Julius Cæsar. |
| 2. Midsummer Night's Dream. | 6. Hamlet. |
| 3. King John. | 7. Macbeth. |
| 4. Merchant of Venice. | 8. The Tempest. |

The studies taken up under "Popular studies in European history" were:

- | | |
|---------------------------|--------------------------|
| 1. Mohammed. | 6. The Ottoman Turks. |
| 2. Charlemagne. | 7. The Moors in Spain. |
| 3. The Crusades. | 8. The Hanseatic League. |
| 4. Feudalism. | 9. The Huguenots. |
| 5. The Italian Republics. | 10. Peter the Great. |

The contributors to this course were:

1. Edwin A. Grosvenor, M. A., professor of European history, Amherst College.
2. Dana C. Munro, Ph. D., professor of Mediæval history, University of Pennsylvania.
3. George Emory Fellows, Ph. D., professor of history, University of Chicago.
4. Samuel B. Harding, Ph. D., professor of history, University of Indiana.
5. Willis M. West, M. A., professor of history, University of Minnesota.

The course called "The world's great commercial products" was prepared under the general direction of Dr. Wilson, director of the Philadelphia Commercial Museum, and contained a great amount of interesting information relating to the commerce of the world. The commerce of the following products was taken up:

- | | |
|--------------------|------------|
| 1. Breadstuffs. | 5. Wool. |
| 2. Meat products. | 6. Lumber. |
| 3. Dairy products. | 7. Sugar. |
| 4. Cotton. | 8. Coffee. |

"Governments of the world of to-day" included comparative studies of the forms of government in operation in the following countries:

- | | |
|-----------------------|-------------------|
| 1. France. | 6. Great Britain. |
| 2. Russia. | 7. Italy. |
| 3. Switzerland. | 8. Canada. |
| 4. Turkey. | 9. Japan. |
| 5. The German Empire. | 10. India. |

The contributors were:

1. Albert Shaw, Ph. D., editor of the American Monthly Review of Reviews.
2. J. Whipple Jenks, A. M., Ph. D., professor of political science, Cornell University.
3. Jesse Macy, LL. D., professor of constitutional history, Iowa College.
4. Frederick W. Speirs, Ph. D. (Philadelphia).
5. J. Roy Perry, M. A., LL. B., lecturer on constitutional law, University of Toronto.
6. William W. Folwell, LL. D., professor of political science, University of Minnesota.
7. J. A. Woodburn, Ph. D., professor of political science, University of Indiana.

The studies taken up in the course called "Popular studies in literature" were the following:

1. Chaucer: The dawn of English literature.
2. Caxton: The old printers of Westminster.
3. Translation of the English Bible.
The Bible as an element in literature.
4. Spenser: The Elizabethan age.
5. Bunyan: The religious element in early literature.
6. Early English essayists.
7. The first great English novelists.
8. Gray: Critical study of "The Elegy."
9. Wits and humorists of English literature.
10. De Quincey: Early prose masterpieces.
11. First historians and famous histories.
12. Charlotte Brontë: Literary women of fifty years ago.
13. Literary clubs of London.
14. Ibsen: Review of Scandinavian literature.
15. Tolstoi: Review of Russian literature.

The contributors were:

1. Lewis E. Gates, A. M., professor of literature, Harvard University.
2. Maurice Francis Egan, LL.D., professor of literature, Catholic University of America.
3. John Ebenezer Bryant, M. A. (Toronto, Canada).
4. John Millar, M. A., deputy minister of education, Ontario, Canada.
5. Hattie Tyng Griswold, author of "Home Life of Great Authors," etc.

6. Julius Emil Olson, B. L., professor of Scandinavian literature, University of Wisconsin.

7. John Franklin Genung, LL.D., professor of literature, Amherst College.

8. Joseph Villiers Denney, A. M., professor of literature, Ohio State University.

This course, taken in connection with the course on "Literature and Literary Criticism," and the course on "Popular Living Authors" (both of which are mentioned above), cover in a general way the whole field of English literature.

The course called "The World's Great Artists" (1st series) included studies of the lives and works of the following artists:

- | | |
|---------------|--------------|
| 1. Raphael. | 5. Hogarth. |
| 2. Rubens. | 6. Reynolds. |
| 3. Rembrandt. | 7. Turner. |
| 4. Murillo. | 8. Millet. |

This course was liberally illustrated with portraits of artists and copies of famous pictures.

The contributors were:

John C. Van Dyke, L. H. D., professor of the history of art, Rutgers College.

Russell Sturgis, Ph. D., F. A. I. A., author of "European architecture;" art critic of the New York Times.

Rev. James M. Hoppin, D. D., professor of the history of art, Yale University.

The subjects included in "Popular lectures in physical science" were:

1. Lakes and Caves.
2. The Glacial Period.
3. The Fossil World, and How Man Came to Know it.
4. The Origin and Nature of Soils.
5. Animal Intelligence.
6. Extinct Monsters.
7. Volcanoes and Earthquakes.
8. The World's Time Standards.
9. The Formation of Coal.
10. The New Planet of 1899.
11. Color in Nature.
12. Wobbling of the Earth's Pole.

Contributors to this course were:

1. Dr. Carl H. Eigenmann, of Indiana University.
2. Dr. Samuel Calvin, of the University of Iowa.
3. Professor G. D. Harris, of Cornell University.
4. Dr. I. C. Russell, of the University of Michigan.
5. Dr. Howard Ayers, of the University of Missouri.
6. Dr. James E. Talmage, of the University of Utah.
7. Dr. Harold Jacoby, of Columbia University, and
8. Dr. Edward L. Nichols, of Cornell University.

The course, "Three Centuries of French Literature," included the following:

1. Montaigne: The French Renaissance.
2. Corneille: The Classical Drama.
3. Molière: The Age of Louis XIV.
4. Voltaire: Period of Doubt and Criticism.
5. Rousseau: The Theorists of French Literature.
6. Madame de Staël: The Age of Napoleon.
7. Guizot: The Philosophical School.
8. Hugo: The Romantic School.
9. Alexandre Dumas: The Historic Novel.
10. George Sand: Naturalists in French Fiction.
11. Balzac: Realists in French Fiction.
12. Gustave Flaubert: Masters of French Prose.
13. Émile Zola: Modern French Fiction.
14. Alphonse Daudet: Modern French Humorists.
15. Guy de Maupassant: The Master Short-Story Writer.
16. Victorien Sardou: The Modern French Drama.
17. Contemporary French Writers.

Among the contributors were the following:

1. Brander Matthews, LL. D., author and critic, Columbia University.
2. Benjamin W. Wells, Ph. D., author, University of the South.
3. Jean Charlemagne Bracq, A. B., lecturer, Vassar College.
4. Prof. Édouard P. Baillot, Northwestern University.
5. H. Morse Stephens, M. A., author, Cornell University.
6. Alcée Fortier, D. Lt., Tulane University.

7. Charles W. Pearson, A. M., Northwestern University.

8. Courtney Langdon, A. B., Brown University.

Of the courses that are being published at this writing the first two mentioned in the list above, nos. 48 and 49, are continuations of nos. 34 and 42, respectively, of which mention has already been made.

The "Desk studies for girls" are presented under the following heads:

1. New Words and How to Use Them.
2. Correspondence and Handwriting.
3. Reading Courses and a Girl's Library.
4. Personal Accounts and Money Affairs.
5. Writing for Publication.

The "Shop and Trade studies for boys" are divided into the following departments:

1. Arithmetic of the Workshop.
2. Drawing for Mechanics.
3. Arithmetic of the Counter and Office.
4. Money Problems and Business Records.
5. Machine Drawing and Design.

The course in American history, entitled "Great American Statesmen," includes studies of the following:

- | | |
|------------------------|----------------------|
| 1. Samuel Adams. | 9. John Jay. |
| 2. Patrick Henry. | 10. John Marshall. |
| 3. John Randolph. | 11. Albert Gallatin. |
| 4. Gouverneur Morris. | 12. Andrew Jackson. |
| 5. Benjamin Franklin. | 13. John C. Calhoun. |
| 6. Thomas Jefferson. | 14. Henry Clay. |
| 7. James Madison. | 15. Daniel Webster. |
| 8. Alexander Hamilton. | 16. Charles Sumner. |

Contributors:

1. Albert Bushnell Hart, professor of history, Harvard University.
2. John Bach McMaster, professor of American history, University of Pennsylvania.
3. Bernard C. Steiner, Ph. D., librarian of the Pratt Free Library.
4. Frederic W. Spiers, Ph. D., university extension lecturer on American history and economics.
5. Charles H. Smith, LL. D., professor of American history, Yale University.
6. Willis M. West, M. A., professor of history, University of Minnesota.
7. John W. Perrin, Ph. D., professor of history, Adelbert College, Cleveland.
8. James A. Woodburn, Ph. D., professor of history and political science, Indiana University.
9. Andrew C. McLaughlin, A. M., professor of American history, University of Michigan.

The last-mentioned course, on "Home science and household economy," is a new departure. The following outline will give some idea of the general character of this course.

- I. The home healthful and beautiful:
 1. The home construction.
 2. The home environment.
 3. The home furnishing.
 4. The home decoration.
- II. The buying, cooking, and serving of food:
 1. The economic buying of food.
 2. The chemistry of cooking.
 3. Foods for invalids and children.
 4. The dining room and table service.
 5. Carving and serving meats.
- III. The social life of the home:
 1. Family relations and domestic life.
 2. Visiting and entertaining.
 3. Recreation and amusement.
 4. Women wage-earners of the home.
 5. The home in its relation to the State.
- IV. The care and education of children:
 1. The children in infancy.
 2. The kindergarten age.
 3. The first years at school.
 4. The boys and girls of sixteen.

Department No. 1 is under the general direction of Mrs. Helen Campbell, who is well known as a writer on domestic science. Department No. 2 is under the general direction of Miss Anna Barrows, managing editor of the American Kitchen Magazine, and working associate of Mrs. Mary J. Lincoln. Mrs. Kate Gannett Wells, of Boston, has general supervision of Department No. 3; and Mrs. Margaret E. Sangster, editor of Harper's Bazar, and Miss Lucy Wheelock, the most widely known kindergarten lecturer in the United States, contribute largely to Department No. 4.

MELVIL DEWEY ON NEWSPAPERS.

At the second international library conference, held in London, July, 1897, Mr. Melvil Dewey, director of the New York State Library, said:

I yield to none in my high appreciation of what the best kind of a newspaper may do in its capacity as the strongest ally of the public library and of the public school. I am confident that early in the next century such journals will be recognized as a distinct part of our educational machinery, but I am equally clear that the worst journals, conducted merely as money-making enterprises, and catering to the worst instead of to the best elements of both society and individuals, are the most potent factors for evil, and the greatest enemy which the ideal librarian has to combat in carrying forward his best work.

J. N. LARNED ON NEWSPAPERS.

The true public journal-diary of the world [says Mr. J. N. Larned], which is actually a newspaper and not a gossip paper, is most powerfully an educator, cultivator, and broadener of the minds of those who read it. It often lifts them out of their petty personal surroundings and sets them in the midst of all the great movements of the time on every continent. It makes them spectators and judges of everything that happens or is done; demands opinions from them; extorts their sympathy, and moves them morally to wrath or admiration. In a word, it produces daily in their thought and feeling a thousand large relations with their fellow-men of every country and race, with noble results of the highest and truest cultivation.¹

All the great newspapers in America have their Washington offices and correspondents. Some of the very keenest journalists (American and foreign) are stationed and liberally maintained on salary in the Federal city throughout every session of Congress, if not the whole year round, in order to keep the public in close touch with the very heart and life of the nation. The contemporary history of American politics and economics, national and international, is written from day to day in the city of Washington and telegraphed to the chief cities of the world.

¹ "The mission and missionaries of the book," by J. N. Larned, printed in the First Biennial Report of the State Library Commission of Wisconsin, 1896, pp. 19-34.

CHAPTER VI.

SOME HISTORICAL DOCUMENTS BEARING UPON COMMON SCHOOL EDUCATION IN VIRGINIA AND SOUTH CAROLINA PREVIOUS TO THE CIVIL WAR.

CONTENTS.—(1) Proposed plan for the organization and support of common schools in Virginia, by Henry Ruffner. (2) Address of Henry A. Wise to his late constituents. (3) Letter of Dr. J. H. Thornwell to Governor Manning on public instruction in South Carolina (1853).

PROPOSED PLAN FOR THE ORGANIZATION AND SUPPORT OF COMMON SCHOOLS IN VIRGINIA.¹

By HENRY RUFFNER,
President of Washington College.

The fundamental principles of the plan here presented are, first, the organization of a system of district schools under proper superintendence, and, second, the support of these schools, in a great part, out of the literary fund, increased to a sufficient amount by a tax on property. These principles are deemed essential to any successful scheme for the dissemination of common learning through all parts of the commonwealth and all classes of her citizens; but many of the following details are admitted to be susceptible of variation without injury to the result, and possibly with benefit to the cause of popular education. They are exhibited in order to show by what ways and means the great principles may be carried out, and as the primary form of a system whose outlines have the sanction of experience in other countries, and whose subordinate details are susceptible of amendment, as our own experience may dictate after its adoption.

The details are arranged in order under distinct heads.

1. OF THE SCHOOL DISTRICTS.

The people of every county and town should be organized into school districts with definite boundaries, except those parts where the population is too sparse to sustain a school. Wherever 25 children live sufficiently near to attend the same school there a district might be laid off, for even a poor people in such a case may with some public aid maintain a school during some three or four months in the year; and under the system here proposed they will be moved to exert themselves for this end.

The districts should vary in size and form according to the population and natural features of the country. Large rivers, mountains, and miry swamps should generally constitute boundaries; yet in many cases, when necessity so requires, these obstacles could be surmounted by children living near them, and therefore accustomed to them. Youngsters between 8 and 15 years of age often make light of crossing rivers and mountains about home, and parents could generally facilitate their

¹ Prepared and presented to the legislature at the request of a school convention held in Lexington, on the 7th day of October, 1841, and composed of delegates from the counties of Bath, Augusta, and Rockbridge.

attendance at school by improving the ways or providing cheap water craft; so that this difficulty, arising from the geographical character of our State, is not so great as many suppose. It is, at all events, a difficulty which operates with much more injurious effect now than it would under a well-organized system of district schools.

Where no difficulty of this sort lies in the way children over 10 years of age could generally, if need be, go either on foot or on horseback $3\frac{1}{2}$ or even 4 miles to school. These distances will therefore limit the possible extent of the districts. In the more populous parts of the country they should not exceed 5 or 6 miles in diameter; nor should they often, unless villages are included, be less than 4 miles in diameter, because the inconvenience of going 2 miles where the way is good will be more than compensated by the advantage of a larger, which should be a better if not a cheaper, school.

Cities and towns with their outskirts should each constitute one district only, with such number and variety of schools as the number of pupils and their diversity of age, sex, and acquirements may render expedient. The advantage of having schools adapted to the age and acquirements is so great that rural districts able to sustain two schools should have one for beginners and one for advanced scholars.

The districts might be laid off by the county superintendents, assisted by commissioners appointed by the county courts. Much care and judgment will be requisite to do this well. Reference should be had to the probable increase of population as well as its present state. The necessity of changing the location of district schoolhouses, or of making other inconvenient changes, should be avoided.

2. OF THE LOCATION AND CONSTRUCTION OF SCHOOLHOUSES.

Schoolhouses should be so placed as to unite in the highest possible degree the twofold convenience of centrality and pleasantness of situation.

In extensive districts the schoolhouse must of necessity be near the middle point, that all may reach it without too much difficulty; and pleasantness of situation must sometimes be sacrificed in part to this necessity. But in smaller districts some greater or less removal from the center should be allowed for the sake of a dry, healthy, agreeable spot, near to good water and remote from bad moral influences. The difference between the best and worst situation for a schoolhouse should have some influence in laying off the boundaries of districts. A sufficiency of ground should be attached to the rural schoolhouses, and, if possible, to those in towns also, to furnish playgrounds and other appurtenances, either useful or ornamental. The children should not be necessitated to trespass on private property or to go into the streets for exercise and amusement.

In the construction of schoolhouses commodiousness is the first requisite: that is, space sufficient for all without crowding or confusion, and for a large school two apartments; a comfortable degree of closeness and warmth in winter, healthful ventilation at all times, glazed windows properly distributed, well made and properly arranged furniture, and a scrupulous cleanliness within and about the house.

But not only should the schoolhouse be commodiously built and neatly kept; the architecture and the appurtenances of the house should be tasteful and agreeable to the eye, that the objects constantly associated with the exercises of the pupils may tend rather to refine than to vulgarize their minds, to win their affection and care rather than inspire contempt and prompt to mischief. In poor districts the building must indeed be of cheap materials and plain workmanship. But then what need of putting children to be educated into such miserable dens of deformity, dirt, and discomfort as are many of the hog-stye-looking schoolhouses of the "ancient domain?" When the seminaries of the land are such nests of filth and vermin what must the teachers be? and what the education of the pupils whose young ideas are taught "to shoot" in such gardens of knowledge and refinement?

The location, architecture, and care of schoolhouses are now left to accident, and

to the irregular and partial cooperation of individuals, who often verify the proverb "What is everybody's business is nobody's business." Without a district organization no improvement can be expected in this and other important matters connected with our primary schools.

3. OF DISTRICT OFFICERS.

The householders and parents of each district should elect annually, in small districts, three or four, in large districts, five, school trustees, who should appoint a treasurer and a collector for the district, and whatever other officers may be found necessary. The treasurer and collector should give official bonds and receive a moderate commission for their trouble; the trustees should not act under oath, but gratuitously.

To the board of trustees should be intrusted:

The selection of a site, and the purchase, or, if necessary, the condemnation of sufficient ground for the schoolhouse, leaving to persons who feel aggrieved by their decision the right of appeal to the county superintendent; if he confirm the decision it should be final, if he do not confirm it he should call in the trustees of a neighboring district, whose decision should be final.

The contracting for and superintending the construction and repairs of the schoolhouse, and in general the supervision and care of the school property of the district. When schoolhouses previously built are found convenient for the district, as a good many would be, they might be used either temporarily or permanently as district schoolhouses.

The legal title of the district school property should be vested in the board of trustees as a body corporate.

(3) The raising of funds by district taxation to defray the expenses of ground, buildings, furniture, and other accommodations for the school, and with the consent of a general meeting of the district, to pay the teacher's salary. But in all cases wherein money is raised by district taxation, it may be questioned whether the one-half should not be assessed on tithables, like county levies, and the other half on property, like the State taxes, that the burden may be divided between numbers and wealth, and that the rich and the poor may not oppress each other.

(4) The disbursement of the school funds collected by them, or put into their hands.

(5) The employment of schoolmasters for the district, settling the terms of contract with them, fixing the rates of tuition, when fees are paid, the admission of indigent children at reduced rates or gratuitously, etc.

The trustees as a corporation should guarantee to the teacher not only his fixed salary, but the proceeds of the fees, which should be collected by the district collector as the taxes are collected. The part of the salary derived from the public funds should be so far additional that if the county superintendent find the teacher unqualified for his duties, or the district officers to have failed in providing sufficient funds and accommodations for the school on their part, he should be authorized and instructed to withhold the district's quota until these errors should have been corrected.

(6) To report quarter-yearly to the county superintendent respecting the school affairs of the district, and particularly the levies, taxes, and fees laid and collected; the disbursements, and for what objects; the state of the schoolhouse and other school property; the teacher or teachers employed, and on what terms; the number of pupils attending school, and their classification according to age, sex, and attainments; the studies pursued, and the number pursuing each; indigent scholars admitted at reduced rates; the number who may have applied to be so admitted; and once a year the total number of children in the district between 6 and 11, and between 11 and 16 years old; the number of each class who are deemed unable to

pay full fees, and the number who can not read and write. The district collector could easily gather these particulars, and the statistics of the district could be conveniently reduced to a tabular form, of which the blanks should be furnished by the superintendent.

(7) It is implied in the foregoing articles that the trustees should frequently visit the school; they ought to consider themselves its official guardians and responsible for its good management; they should also feel that they are public guardians of all the children in the district, in so far as their schooling is concerned; they should make the school equally accessible to rich and poor, according to their respective means, and use their influence with all their neighbors to induce them to send their children regularly to school, until they have become well grounded in the most necessary branches of learning at least.

4. OF THE COUNTY SUPERINTENDENTS.

Each large county, and each two or three small adjacent counties, should have a superintendent of schools, a man of good character, industry, and learning, whose duty it should be:

(1) To assist in laying off the school districts, and, when disputes occur, in locating the schoolhouses.

(2) To visit the schools under his superintendence twice a year, and oftener when his presence may be needed to correct abuses, heal dissensions, stimulate trustees, teachers, or parents, to do their parts in diffusing the blessings of good learning through all the families of the district.

(3) To receive, keep, and disburse, as directed by law, or by the board of education, the moneys paid into his hand for the school fund, and to keep an exact account of his receipts and disbursements, and report the same half-yearly to the general superintendent.

(4) To report also semiannually an account of his other official doings, and the statistics of the schools under his superintendence, in like form as they are reported to him by the district trustees. When these fail to report in due time, he should by personal visitation, or otherwise, have the deficiency made up; and all such failures should subject the district to a forfeiture of some part of its claims on the public funds, or the trustees to a personal fine.

He should be annually appointed by the board of education, and, besides taking an official oath, he should give bond for the due discharge of his pecuniary obligations.

He should receive a small stated salary, and a moderate daily allowance for the time spent in visiting the districts. He should be liable to a fine for neglecting any of his prescribed duties.

5. OF THE SECTIONAL SUPERINTENDENTS.

Let the counties of the State be distributed into four nearly equal groups called sections, and for each of these let a sectional superintendent of schools be appointed, who should be a man of high standing for purity of character, learning, and sound judgment, and who, besides his being a member of the board of education, should exercise some general superintendence over the schools and county superintendents of his section. He should visit occasionally the counties where his presence may be useful. He should call on the superintendents of the counties visited, and inspect their books; and should visit some of the schools, and gain information from various sources respecting the school affairs of the country. When academies shall be introduced as a part of the organized school system, he should visit them occasionally.

When a county superintendent fails to perform his duties, or the office becomes vacant, he should make a temporary appointment to supply the deficiency.

He should be appointed for three years by the legislature, but be liable to be superseded for neglect of duty.

He should act under oath and receive a reasonable daily allowance for the time spent in his official duties. The pay of a member of assembly and traveling expenses would perhaps be sufficient.

Instead of the usual sectional divisions, namely, the Tidewater, Piedmont, Valley, and Trans-Alleghany, it would be, in some respects, more convenient to distinguish the school sections as Northeastern, Southeastern, Northwestern, and Southwestern, by lines corresponding generally with the line of the James River and the two Kanawhas, and the North Mountain from the Potomac to the James River or Roanoke, thence the Blue Ridge to the Carolina line. This division would give better shaped sections and more convenient routes for visitation.

6. OF THE GENERAL SUPERINTENDENT.

This officer being the head of the system, and charged with the highest duties, ought to possess rare and eminent qualifications. He should be a first-rate scholar, experienced in the business of teaching youth, regular and industrious in his habits, observant and judicious, pure in morals, sound in his religious principles, but free from sectarian bigotry. The reason for these various requirements will be obvious when his duties are specified. He should be appointed for three years by the legislature.

He should reside at the seat of government, and devote his whole time to his official duties.

His ordinary home duties would be to correspond with county superintendents and with other persons from whom useful information might be derived; to receive and digest reports from county superintendents; to study treatises and documents on education; to examine schoolbooks and consider what improvements or change may be beneficially made in the books, the modes of teaching, and the system generally; and to exercise a constant guardianship over the interests of education and the diffusion of useful knowledge among the youth of Virginia.

At intervals he should make tours of observation both in Virginia and in other States to learn the operation of various systems of popular education, and to discover wherein our own may be susceptible of improvement.

He should of course have a liberal salary and a reasonable allowance for traveling expenses, not only because justice to an important public servant requires it, but because the public interest requires that none but the best-qualified individuals be chosen to this office, and that such be able to maintain a family at the capital of the State in a style becoming their office; otherwise the men most apt to be well qualified for the office would be least able or least disposed to accept it. Two thousand five hundred dollars would be but a reasonable salary for an office of such importance and such labor.

Perhaps it were well to appoint an officer of this sort in advance of the adoption in detail of any specific system of schools, and to let him visit divers countries during the year 1842, and then assist in framing the system on principles antecedently approved by the legislature; in the meantime, preparatory measures could be put in operation to raise funds and put the general outlines of a system in a train of execution. Districts could be laid off and schoolhouses prepared.

7. OF THE BOARD OF EDUCATION.

Annually, in December, the general and the sectional superintendents should meet in Richmond as a board of education, the former being ex-officio president of the board.

This board should be charged with the following duties:

1. Out of the county reports and other sources of information to prepare for the legislature a general statistical report of schools, both public and private, in the commonwealth; of the school funds of all sorts, both receipts and disbursements, with

such remarks as they may think proper on the operation of the system and recommendations of amendment so far as legislative aid may be required.

(2) The appointment of county superintendents and the necessary officers of their own board.

(3) The framing of general regulations and instructions for the government of inferior officers, and the management of schools conformable to the provisions and intent of the school laws, and to give uniformity, regularity, and efficiency to the operations of the school system. These regulations should, among other things, prescribe the qualifications of schoolmasters, the branches of learning to be taught in the several ranks of schools, the schoolbooks to be used, the mode of teaching and managing the schools, the rules to be observed in visiting and examining the schools, the admission of poor scholars, the application of the public school funds, the forms of reports, etc.

(4) The selection and printing of schoolbooks, and their distribution among the counties, so that every school may be duly furnished with good editions at a moderate price. Large editions being printed by contract, and sold at a little more than cost, the books would come cheaper and of better quality than they do now in our schools. The county superintendents might manage the distribution of them among the districts.

(5) The apportionment of the public school funds annually among the districts according to law, and to the statistical reports. Failure in district officers to report should cause a forfeiture of some part of the whole of the district's quota for the year. Failure to maintain a school during the term prescribed to a district should produce a correspondent forfeiture. On the other hand, when a district by extraordinary exertions maintains a better school, or one for a longer period than the rules prescribe, its quota should be increased out of the sums retained as forfeits.

S. OF THE SCHOOLMASTERS.

Without some public regulations on the subject the State will never be supplied with a sufficient number of good schoolmasters, nor will the best be always preferred by employers; and without good teachers the children of the Commonwealth will never be well educated, whatever be the amount of public funds appropriated for the support of schools or the education of the poor. Great care should be taken to prevent our youth from falling into the hands of immoral or incompetent men. Many such now go about as schoolmasters—some of them lazy, drunken, unprincipled, ignorant vagabonds—who impose on illiterate and incautious parents by crafty pretensions, and gain employment by offering to work cheaply. Effectual measures should be taken to rescue the children of the State from this class of worthless impostors. While such schoolmasters are "abroad" the youth of the Republic must suffer great detriment, and better men will be driven from an employment disgraced by such professors.

The following should be deemed indispensable qualifications for the office of schoolmaster, and no one should be permitted to teach a school who does not possess them all in some good degree:

(1) An unblemished moral character and sound principles of Christian piety. If not in full communion with a Christian church, he should at least be free from religious infidelity and profaneness of language or sentiment, and be well acquainted with the Holy Scriptures.

(2) Competent scholarship. He should have an accurate knowledge, both theoretical and practical, of the elementary branches of common learning, including orthography, reading, penmanship, English grammar, arithmetic, plain book-keeping, the simple elements of rhetoric and composition, geography, general history and the history of the United States, and the Virginia and Federal constitutions. To take charge of the higher order of common schools, his knowledge should extend to several other branches of science.

(3) Aptness to teach and to govern his scholars without unnecessary harshness.

(4) Habits of regularity and industry in the management of his business.

To these we may add as important auxiliary qualifications, general intelligence, refinement of mind and manners, energy, firmness, and evenness of temper, with affection for children, a predilection for teaching, and an enlarged desire for the improvement of society, to which we must add that sort of prudence which will keep him from intermeddling with religious, political, or personal disputes among his employers.

Vocal music should after awhile be introduced generally into our schools as a part of common learning, valuable in its humanizing influence, and as an exercise delightful to children, adapted to sweeten their daily studies, and to make them fond of the school.

Teachers qualified to teach vocal music on scientific principles should be sought after and preferred when they are otherwise qualified for their office.

Teachers guilty of immoral conduct or of gross neglect of duty should, on conviction, be discharged from employment, and if the trustees fail to discharge them in such a case the county superintendent should withhold from them the portion of salary derived from the public funds, as he should in all cases when the trustees employ a teacher without the requisite qualifications, until a sufficient number of fully qualified teachers can be provided. It will, notwithstanding, be necessary to allow the poorer districts to employ such as can be had, provided always that they be of good moral character and competent to give useful instruction.

9. OF NORMAL SCHOOLS.

The scarcity of good teachers will make some provision necessary to increase the supply. A certain sum might be granted to each of the colleges, or to academies for the education of poor young men, upon the condition that they serve the State as schoolmasters during a number of years, greater or less, according to the amount of aid received. In this manner the supply of competent teachers might be increased. But in addition to this measure another, and in some respects a better, mode of increasing the supply, should be resorted to—that is, the establishment of a normal school for the sole object of educating teachers.

This institution should be in a town sufficiently populous to support common schools of different ranks connected with the normal school and conducted by its teachers, these serving as examples of the most approved methods of instruction and government, and as means by which the apprenticed teachers could be exercised in the business of teaching under experienced masters while they carried on the studies of the normal school. It is evident that the young teachers so trained would carry with them into all quarters of the State not only the learning necessary in schoolmasters, but the best theory of teaching and some degree of practical dexterity. It is true that any young man who has studied under good masters has at the same time learned much of the theory of teaching. But our common schools are not generally taught by such masters, and the art of teaching a primary school can not be learned either by observation or practice in academies or colleges, where different branches of learning are taught and different modes of discipline are proper.

The masters of the normal school ought, of course, to be not only men of learning and talents, but distinguished for their skill as practical schoolmasters.

The course of studies in this school should include far more than is required to be taught in common schools, that the teacher may the better understand and teach the elementary branches of common learning; that he may command higher respect from his pupils and their parents; that he may inspire his pupils with desire for the higher knowledge that they see in him, and that he may be qualified, by his profusion of light, to warm and quicken and illuminate, in some degree, the whole mass of untutored minds around him. There is another reason: Common-school masters should

have such a broad foundation of learning that they may hope, by exercising industry and gaining distinction in the lower ranks of schools, to gain promotion, first to the higher ranks of common schools, and ultimately to the academies, and even to the colleges of the country. This policy would tend to improve the quality of teachers, to raise the standard of common education, to induce many young men of talents to embrace the office of teacher as a permanent profession, and to elevate and improve the general mind of our commonwealth. Should these results follow in the smallest degree the State would be richly compensated for the money expended in educating teachers and in giving them an extent of learning far beyond the ordinary requirements of schoolmasters by profession. But the learning taught in the normal school should be mostly scientific—mathematics, natural philosophy, chemistry, botany, mental and moral philosophy, rhetoric, philosophical grammar, composition, natural theology, the evidences of Christianity, the Bible, and vocal music should all be studied; the German and French languages, especially the former, and perhaps some of the Latin classics, might be added by such as desired to learn them.

The office of schoolmaster is too humble and too little lucrative to induce many except poor young men to seek it. The normal school would not be filled, therefore, unless the State afford some aid to young men of good character and deficient means, who are willing thus to qualify themselves for teaching. They should be required in return to give bond, by themselves or some friends, for the amount of aid received, on the condition that the obligation be canceled by their teaching a certain time in the common schools of the State, or by their inability to do so by death or otherwise.

10. OF LOWER AND HIGHER SCHOOLS.

In feeble districts but one school could be maintained, and in that the course of studies would have sometimes to be contracted into narrower limits than would be proper in abler districts. In the lowest, however, the teacher should be qualified to teach all the most necessary branches of common learning. When the school is of larger size, and is kept during longer terms, the range of studies ought to be wider, and the children should be encouraged, and the parents induced, if possible, to persevere until the whole was completed.

Where more than one teacher can be employed at once, the school should be divided into separate departments, the lower composed of beginners and the upper of advanced scholars; and when convenient, the older male and female scholars should also be separated, out of regard not only to moral considerations, but to the different sorts of instruction adapted to the difference of sex.

But a complete system of popular education will require three sorts of intermediate schools between the primary schools and the colleges:

(1) Grammar schools, or as they may be called high schools, designed exclusively to prepare youth for a regular course of college studies. The Latin and Greek languages would therefore constitute the chief parts of instruction in these schools. None should be admitted to them until they are well versed in the studies of the primary school; then they should be taught the elements of classical knowledge in a more thorough and accurate way than is customary in the miscellaneous schools usually termed academies in this country.

(2) Academies for males. These should be attended only by young men destined to the more common pursuits of life, but desirous of extending their knowledge beyond the studies of the primary school. The branches of science useful to the farmer, mechanic, merchant, and citizen of the Republic should be the principal studies of this class of schools. The more useful branches of the mathematical, physical, and moral sciences, and a thorough acquaintance with the English language, would therefore be the chief objects of attention. German, French, and Spanish might be occasionally taught, but the Latin and Greek should be confined to the grammar schools.

For want of a sufficient number of these two sorts of schools, well conducted and kept distinct, as they ought to be, our colleges have become too miscellaneous in their character; the standard of scholarship has been unavoidably lowered by the defective preparation of the students for college, and the cause of learning has materially suffered among us.

(3) Academies for females. These should do for the future wives and mothers of the land, a service equivalent to that which should be done for the fathers and citizens by the academies for males. We need not here argue the justice and utility of extending to the higher education of the gentler sex a share of public patronage whenever academies shall be taken into the general system of organized schools. In framing the system this order of schools should undoubtedly be kept in view; but it may be questioned whether, in the first instance, the system of common schools should not be put into regular and successful operation, and then, the broad foundation being laid, the superstructure of higher schools could be built upon it more successfully. By good management this may be done in two or three years after the commencement of operations. In the meantime the present academies, private and incorporated, would still in some sort afford classical and scientific instruction.

The academical part of the system might then be arranged after this manner:

The present incorporated academies to be taken into the system upon the conditions: First, that the buildings and grounds be sufficiently spacious, neat, and adapted to the accommodation of the school; second, that the trustees organize the school either as a classical high school or as an academy for teaching the sciences; and, third, that no teachers be employed but such as possess the qualifications prescribed by law or by the board of education.

Where the buildings and other means of the institution are sufficient for both a high school and an academy, both these classes of schools might be allowed, on the condition that they have a separate and independent organization, and that each be conducted upon the principles peculiarly proper to its character and object.

Private academies, with suitable buildings, might in like manner be adopted, but they ought to have trustees, who should be subject to the laws and regulations respecting these institutions.

Where new academies or grammar schools are wanted, the inhabitants of the place and neighborhood ought to be required to furnish the ground and buildings, in consideration of the local advantages that would accrue to them from the institution. Some aid might, however, be given in a few cases, out of the literary fund, in erecting academy buildings when such an institution is much wanted and the inhabitants are scarcely able to defray the expense.

There should be an academy in every large county, or two or three smaller ones, where the spirit of education is sufficient to sustain one. The willingness of the people to furnish the buildings would generally be the proper test of this spirit. A less number of grammar schools would be requisite. Twenty or less of these, in addition to the private classical schools, would be amply sufficient. Care should be taken not to multiply institutions of these sorts too fast. A few well-managed and well-sustained schools would be more beneficial to the interests of learning than many with a feeble patronage, and consequently feeble teachers. The tendency in our country is to run to excess with every good thing when it once gets hold of the popular mind. Having secured the main points in a good system of education, we should then proceed with caution.

We may safely affirm, however, that unless the Government exercise more than a nominal patronage of academies, it can do little toward regulating and improving them. Were the literary fund sufficient for every valuable purpose of education, we would recommend liberal appropriations yearly to schools of this order, but supposing the fund inadequate to a full endowment, we would choose to limit the public aid in ordinary cases to two objects in these schools: First. A yearly sum

granted to academies, male and female, for the purchase of scientific apparatus, and to them and the grammar schools for the purchase of books for their libraries, they being all required to conform to the regulations prescribed to them as a condition precedent; and second, another sum yearly to assist poor youth of merit who had distinguished themselves in the primary schools and desired to prosecute their education in the higher schools.

The institutions thus patronized should be officially visited by the superintendents, and should be required to make semiannual reports of their condition.

11. OF COMMON-SCHOOL LIBRARIES AND OTHER AUXILIARY MEANS OF POPULAR INSTRUCTION.

In rural districts, especially those remote from towns, and inhabited by illiterate people, libraries will be essential auxiliaries to the schools; indeed, in all districts where the children have not generally access to social libraries the schools ought somehow to be furnished with them. Multitudes of families, and not a few of them rich enough in other things, have no books in their houses; at least none adapted to interest and improve their children. What, then, is the result when their children are taught to read? What else but that these children, having an instrument of knowledge without materials for its exercise, not only fail to use it profitably, but undervalue and throw it away as useless? In fact many neglect and forget altogether the little smattering of knowledge acquired at school. Had suitable books been put into their hands as soon as they were able to read them, great numbers would of themselves have overcome the imperfections of their schooling, and have grown into intelligent men and women.

We do not expect by any means to make a whole people learned or even intelligent; but who can doubt that an adequate supply of suitable books would greatly enhance the valuable results of the school system?

As soon, therefore, as the district schools have been organized, efforts should be made to establish school libraries. A strong bookcase should constitute an article of furniture in most of the schoolhouses, and in this, under the supervision of the trustees and the immediate care of the master, should be collected all the suitable books that can be procured by donation, subscription, tax, or other proper means.

The board of education should furnish printed catalogues of books suitable for these libraries; they also might make arrangements with booksellers to supply them on the best terms and have them sent where wanted with the common school books. Thus the schools could be furnished with useful libraries at a very small expense, and in a few years the reading youth of each district might have access to a library of 200, 400, or 600 volumes, mostly small, but all profitable to their minds, at an expense not exceeding 50 or 60 cents per volume.

These should be lent out for short periods and under strict regulations to the advanced pupils of the school, and to others on their paying a small library fee, sufficient to repair the damages resulting from the use of the books.

Other auxiliary means for the diffusion of knowledge need be but briefly alluded to. Among these we may name lyceums, mechanics' institutes, and library associations. Under proper management these have proved themselves to be highly useful, especially where scientific lectures by competent men are duly attended to. They are for the improvement of the adult population. They rarely succeed, except in towns and large villages. Being in their nature voluntary associations, managed by the members, they can not form a regular part of our public-school system, but the Government and school superintendents may do much to promote their establishment and success by their influence and encouragement.

Sunday schools are, in a moral and religious point of view, of unspeakable importance, and as auxiliary means to promote education in general they are of no small importance. Being also voluntary institutions, connected with the churches of various denominations of Christians, they can not be generally included in the public-

school system; but in school districts where this sort of institution is neglected by the religious community and where no religious worship is regularly attended to, the Sunday instruction of the children should be provided for by the school trustees. The schoolmaster, with some assistance, or, when no master is employed, such intelligent, pious, and benevolent persons as can be obtained, should be induced to take charge of this important duty. The Bible and other books proper for teaching the common principles of religion should there be taught to the youthful population, who would otherwise in such cases employ the sacred day in idle and corrupting practices.

12. OF POOR CHILDREN.

It has been already suggested that the district schools should be open to all the white children within their bounds, upon such terms as their parents can afford.

The operation of the school fund should reduce tuition fees to so low a rate as to enable many parents to pay them who must now, through contracted means, either stint the education of their families or degrade themselves into applicants for the charitable aid of the literary fund, and even for this aid they would often apply in vain, either because the fund was deficient or because they were not deemed poor enough to obtain the pauper's dole.

There would still be some families, however, too poor to pay even the small fees required under this system. To provide for these in the way least degrading, the school trustees, in whose election they will have a voice, should be required from year to year to designate the families whose means, compared with the number of their children to be schooled, are deemed inadequate to the expense. These should be required to pay the half or the fourth of the full fees, for all should pay something, as all can pay something, except a very few reduced to want by misfortune or otherwise in peculiar circumstances. Destitute orphans should be taught gratuitously as the children of the State only.

If it be said that there is still something of degradation in the exemption here proposed, we observe that this is the necessary consequence of extreme poverty, from which no system can remove all the degradation; but those who pay something according to their ability, though it be but little, will not feel the shame of pauperism, and those few who must go without paying at all will be less humbled by the exemption than the multitudes who, under the present mode of educating the poor, must, if they go at all, be entered on the teachers' books as paupers, whose tuition is paid for by the public at 4 cents a day.

However this may be, one thing is certain, that, in the system here proposed, provision is made for the education of the whole of our citizen population except those whom, by reason of their scattered situations, no practical system can reach; and this, we venture to affirm, is more, far more, than can be done for the extension of common schools of the best sort, or of any sort, by any scheme whatever that comes short of a district organization and a general school tax.

13. OF THE PUBLIC SCHOOL FUNDS.

Experience in Virginia as elsewhere, proves that when the schooling of children is left wholly to the undirected and unaided efforts of individuals it is often mismanaged and neglected; and the more in proportion as popular ignorance prevails. Ignorance, poverty, and a blind parsimony increase the difficulty of doing well in a matter which requires associated action directed by intelligence and subjecting those who partake in it to considerable expense. Without the agency of government, popular education has never flourished. In a despotism it may suffice to issue mandates and compel the people to educate their children according to prescribed rules. In our country a different course must be pursued. Laws may indeed be enacted on the subject not only authorizing but enjoining the people to attend to the education of their children,

and even prescribing the system to be pursued. But in a state of society like ours such laws, if they provide not the means of carrying their provisions into execution, will be as they have been, almost wholly inoperative. The proper means, however, in a case like this are not penal sanctions, but a well-organized system, aided by a fund of such magnitude that the moving and regulating power of pecuniary interest may be added to the prescriptions of law and the sense of duty. An excellent theory of school organization and superintendence may be devised and put into the form of law and be even adjusted for action; but without the quickening influence of a large fund it will be no better than a well constructed machine without the moving power. There are no self-moving machines in the moral more than in the natural world; and as we can not move the people in this case by fear of penalties, we must needs apply the inducement of cheap schooling for their children, and that it may be cheap to them as individuals the community must render it so by means of a large common fund.

The present literary fund is now admitted on all hands to be quite inadequate to effect the general education of the people on any plan or mode of application. Only two questions remain to be determined in relation to it; how may it be sufficiently increased, and to what extent ought it to be increased?

The late distribution law of Congress offers the easiest and best mode of increase, so far as that may go. We firmly believe that while that law shall continue to put a large sum yearly into our treasury, every dollar of that sum should be consecrated to the education of the youth of Virginia. If applied to the redemption of the State debt, which is by no means burdensome, a slight reduction of taxes may ensue, but no sensible improvement in the social or pecuniary condition of the people; if it be appropriated to some scheme of internal improvement, though some local benefit may result, yet, judging the future by the past, the stock thus created will be unprofitable to the State, and therefore the capital so invested will, like so much other capital similarly employed, be in a great measure sunk and lost forever; but if invested in profitable stocks, and the proceeds applied to the education of our youth, it can not fail to improve for ages to come that which in Virginia most needs improvement, the mental and moral condition of our citizen population.

But even with this aid, the school fund will yet be insufficient unless increased by a tax.

If a tax designed to reduce tuition fees in our common schools could be a public burden, and did not return to the people in the form of a substantial relief, we might hesitate to recommend it. But as the sole effect of a school tax on the community will be to change the mode of paying the necessary expenses of education, the only reasonable question respecting it is, whether this change of mode will be just and beneficial.

As we propose that this tax shall be laid on property alone, its effect will be to draw from the wealthy and those who have no families some aid for the poorer classes in giving their children a good common education. This we hold to be just, for the whole community is interested in the good education of children; the safety and prosperity of the Commonwealth depend upon it quite as much as upon courts of law, penitentiaries, and soldiers, now maintained by taxes on property. The State now acts upon this principle in the application of the literary fund to the education of poor children, for that fund was originally the fruit of taxation, and if appropriated to the expenses of government would save taxation on property.

That the reader may judge whether such a tax will operate beneficially upon the interests of education, we request him to consider in connection all the chief parts of the scheme here proposed, including what we shall present under the next head. We are much mistaken if it does not appear that by paying about half the tuition fees, or teachers' salaries, out of a public-school fund the education of children will

be easier, better, and more general than it now is or can be made on a system that does not embrace this principle.

The school tax ought to be a State, not a county, tax; for if this matter be left to counties, the system will operate lamely and partially. Some counties, especially the poorest and most ignorant, will do nothing, others too little, others will do it injudiciously; all will be liable to irregular and vacillating action on the subject. There will be no unity or generality in the system, general organization and superintendence will fail, and the whole system, like an ill-adjusted machine, after a crippled and irregular movement for a few years, will, as like schemes have done heretofore, come to nothing, and leave the Commonwealth as degraded by her popular ignorance as she now is. In that case, too, the poorer counties of the State can derive no aid from the general resources of the State, and the very places where most should be done for improvement will be abandoned to their dark and helpless illiteracy.

Let the State then levy a general school tax for the general good. At first it might consist simply of a certain percentage on the revenue taxes of the State, and be collected by the sheriffs in the same manner. If experience afterwards dictate any alteration in this part of the system, the change can be easily made. The proceeds of the tax should be paid to the county superintendents, whose receipts, presented to the State auditor, would acquit the sheriffs of this part of their liabilities. All the money thus collected in each county would be expended within it; for the present literary fund would be sufficient to answer other demands, especially if it be somewhat increased by the proceeds of the public lands.

The amount of the public-school fund should be, from the commencement, sufficient to pay about half the schoolmasters' salaries besides the other expenses of the system. The other half of the salaries would then be raised by tuition fees, or, if the people of the counties or the districts chose, by local taxes, so as to abolish fees and make the schools free to all.

This plan is offered, not only because it is believed to be theoretically good, but because it will effect a compromise between the extremes of opinion existing on this subject, and therefore be likely to give more general satisfaction than any other that embraces the principles necessary to secure the great end in view. Whilst many oppose any general system sustained by taxation, others advocate a general system of free schools, supported wholly by taxation. We prefer to confine our school reform to those points which are most needful, and to such limits as the habits and sentiments of the people are likely to bear. Insisting on a general State organization, instead of the fragmentary and ill-concerted action of counties, we limit the district feature to the territories sufficiently populous, and the general tax to an amount sufficient to move and regulate the action of the districts.

Of course the people not included in school districts should be exempted from school taxes.

14. OF THE DISTRIBUTION OF THE SCHOOL FUNDS.

As the school districts will differ much in population and wealth, and consequently also in the amount of their contributions to the school fund and in their need of aid from it, the board of education ought to be governed in the distribution of the fund by such principles as will in the highest possible degree combine equity with utility.

On the one hand, a district may equitably claim from the fund a share in some degree commensurate with its contribution, but, on the other hand, a poorer district has a claim on the score of utility to such an amount of aid as will enable it to maintain a good school. Then, again, the population of a district, that is, the number of children to be educated, and consequently the expenditure necessary to effect their education, is another element which should enter into the calculation of what is due on the score of equity and utility both. One thing more should be regarded in appor-

tioning the school fund, mainly on the score of utility; that is, the degree of effort made by each district in its own behalf for the good education of all the youth within its limits. By aiding and rewarding these efforts the fund will operate with double force as a stimulant to exertion in all the districts, for whilst sluggish and delinquent districts incur a forfeiture, total or partial, of their ordinary quota, the districts which put forth extraordinary exertions will thereby gain an increase of their ordinary quota.

To give these several elements due influence in the apportionment, we propose the following rule:

The board having before them the statistical returns of the districts and the amount of funds to be distributed, let them divide this amount as follows:

Two-fifths among all the districts in the ratio of their contributions to the general school fund.

Two-fifths more in the ratio of their amounts of schooling during the past year, these amounts to be ascertained by multiplying the number of scholars by the average number of months during which they attended school.

The remaining fifth equally among all the districts, except that large towns which constitute but one district each should have something more by reason of their great population and numerous schools. But as this equal distribution is designed to help feeble districts which have neither wealth nor population sufficient to maintain a good school, and as towns have great advantages for education, no town should get more than a double or triple share in this equal apportionment.

To show the effect of this compound ratio of distribution, let us suppose that \$300,000 are to be distributed among 1,500 districts. Then, as \$120,000 will be distributed on the basis of taxation, a district of average wealth will get on this account \$80, one of average schooling the same, and every district will get \$40 in the equal distribution. A district which on the grounds of taxation and schooling together may claim an average share will get \$200 for its quota; one of double the average would get \$360; one of half the average \$120. Thus the weaker districts getting a larger quota than their wealth or quantity of schooling would entitle them to, they would be able, by proper exertions, to maintain a school during so much of every year as would suffice for the useful education of their children.

When the districts came to be laid off and the fund to be distributed, it might be found that one-fifth is either more or less than is proper to be equally distributed, and that some variations in the other parts would be expedient. The principles here laid down are, however, so well adapted, we think, to the object in view and so easy of application that we feel confident of their being generally approved after they are well considered and understood.

We should call attention only to one more particular of their operation. As two-fifths of the fund are proposed to be distributed according to the quantity of actual schooling in the districts, which will include poor scholars as well as others, it is obvious that this will stimulate the districts to get as many children as possible to attend the schools, whether they be poor or not, for an increased number of scholars will increase the quota of the district and reduce the sum necessary to be raised by tuition fees.

But as precaution is necessary to prevent unprofitable schooling in a district, no scholar should be reckoned as such in calculating the amount of schooling except such as have attended with ordinary regularity during at least three consecutive months.

To entitle a district to its quota it should be required to maintain a school during a certain period of the year, unless it can show a satisfactory reason for its failure. The districts should be classed according to their population and wealth. Those of the first or highest class should be required to have a perpetual school or schools, and be able to report at the end of the year a certain total amount of schooling actu-

ally done, or forfeit a part of their quota proportional to their shortcoming. Those of the lower classes should in a like manner incur a forfeiture if they failed to maintain a school of the proper rank and magnitude during a certain term yearly. Those of the lowest class should keep up their school not less than four months yearly, for any term short of this would be in great degree unprofitable to the children and a waste of the funds. Eight months of continual instruction in a period of two years should be recommended as preferable to broken terms of four months in each year.

These and other regulations to the same effect should cooperate to spur the districts to activity and regularity in the management of their school affairs, for such is the ignorance and such the indifference on the subject prevalent in many parts of the State that all these "means and appliances to boot" will be necessary to give motion and regularity to our school system and to diffuse the benefits of good common education throughout the rising generation of our citizens

15. MISCELLANEOUS MATTERS.

We shall conclude with some observations and estimates which have not been sufficiently or at all introduced under the foregoing heads:

First. The district system of schools has so many obvious advantages, and no disadvantage whatever. Many persons argue that it is not applicable to a country so thinly and irregularly inhabited and so cut up into narrow vales and strips of peopled territory as most of Virginia is.

These peculiarities in the State, and distribution of our population, are difficulties, to be sure, but not in the way of the district system so much as of the maintenance of schools in any manner. They prove the necessity of bringing all possible aids into requisition, that we may overcome the natural and unavoidable difficulties in the way of diffusing education among our people. We need the district system the more on account of these difficulties, because this system so groups and organizes the population as to make the most of whatever means we have. Every family to which schooling is attainable is thereby connected with those other families with which it can be most conveniently associated in maintaining a school, and all are compelled to contribute somewhat, according to their means, for the support of education among them. Thus none of the means in existence are suffered to be inert, or to be wasted by ignorance, folly, and dissension among the individuals of a neighborhood. We do not propose, it is true, to compel parents by legal penalties to send their children to school, but we offer such inducements as must ultimately prevail with all. We abstain as far as possible from coercive measures, because we remember that the ignorant and blindly parsimonious have votes at elections, and we wish not, unnecessarily, to array their political power against the means of removing ignorance from their children.

We prefer the district system for another reason. It will organize our population into small communities, corresponding with the townships of New England, the parishes of Great Britain, and the communes of France. Many neighborhood interests will thus be better attended to; new ties will bind our people together in these primary communities, and new centers of intelligence and social improvement will be created. The want of communities smaller than counties has doubtless retarded our social improvement.

Second. To show the lamentable degree of ignorance in Virginia, and the necessity of an effectual reform in our school system, we need only examine the returns of the late census. More than 58,000 adult white persons were returned as unable to read or write. This amount of ignorance is enough to alarm us; but were this all that the census discloses we should not have thought it necessary to mention the subject here. An attentive examination of the returns will show beyond question that they come far short of the truth. This appears from the following facts: (1) In four large counties not distinguished for intelligence, namely, Frederick, Stafford,

Charles City, and Marshall, none of this class are returned. (2) In not a few other counties, the number returned is incredibly small, as 8 in Rockbridge, 8 in Ohio, 16 in Powhatan, 17 in Clarke, etc. (3) The comparative returns of adjacent counties show an incredible difference. Thus in Cabell one-fourth of the adults are returned as wholly illiterate, but in the wilder county of Logan only 1 out of 32 adults; in Prince William, one-sixth; but in Fairfax, 1 out of 91; in Pittsylvania and Henry, one-third; but in Halifax, one-eleventh, and in Franklin, one-nineteenth. The like differences appear in the returns from every part of the State. Many and great errors evidently exist in these returns. They must be errors of defect, for no cause of excess can be assigned, while the negligence of the marshals, and the reluctance of individuals to report their ignorance, may easily account for defects. We venture to assert also that multitudes were reported as able to read who could indeed labor through a printed page, but who were in no proper sense readers of books or even of newspapers, and who were in reality as ignorant, if not quite so illiterate, as those who had never learned the alphabet.

When these things are taken into the account, we must conclude that not less than 150,000 of the adult white population of Virginia are in a state of debasing ignorance. This is more than one-third of the 377,000 citizens over 20 years of age.

Third. Estimated expenses of the system. Some of these estimates are necessarily liable to error, but, on the whole, we can assure ourselves that they do not vary much from the truth.

1. *Expenses of superintendence.*

General superintendent's salary and traveling expenses.....	\$2, 800
Four district superintendents, pay and mileage.....	1, 200
Board of education, rent, stationery, clerk hire, and printing.....	500
Eighty county superintendents, at \$100 each	8, 000
Contingent expenses, such as postage, stationery, blanks, etc.....	500
Total for superintendence.....	<u>13, 000</u>

2. *The normal school.*

Buildings, viz, lecture rooms and dormitories	13, 000
One professor's house.....	3, 000
Library and scientific apparatus	2, 000
	<u>18, 000</u>
Interest on the cost and repairs, 8 per cent.....	1, 440
Yearly increase of library and apparatus.....	260
One principal professor and two assistants.....	3, 000
Sixty scholarships, averaging \$80.....	4, 800
Contingencies	500
	<u>10, 000</u>

These are all the costs properly chargeable on the system here proposed, except the expense of collecting and disbursing the proceeds of the school tax, for the net proceeds go directly to defray the necessary charges of education, which must be incurred in some way.

Now if the sheriffs collect the tax as a mere addition to the revenue they can well afford to do it for a commission of 3 per cent, and as the distribution of the funds by the county superintendents among their districts will be an easy operation, 2 per cent would probably be an equitable commission. The present literary fund will have to be distributed, as now, among divers and many of them distant places; but this must be done at all events, and therefore is not chargeable on the system here proposed.

Now we aver that the charges above stated for superintendence, the education of teachers, and the management of the school fund will be repaid to the people fivefold by the extension of education and the improved quality of the schools. A bad school, like bad merchandise, is dear even at a low price. Under a system whose cost will be scarcely \$40,000 a year many families will have the benefit of good schools whose children are now growing up in ignorance, and three-fourths of our white population will be able to give their children a better education than they can now give them.

If we suppose 40,000 square miles of the State to be laid off in school districts (thus leaving out 20,000 square miles of almost or quite uninhabited territory), and the size of the districts to average 20 square miles, including the towns, there will be 2,000 districts. If we assume 700,000 as the number of white people in the districts (leaving about 50,000 not included), the average population of the districts will be 350; or, making allowance for the large towns, the rural districts may average a little more than 300. Now, by the late census it appears that the number of children between 5 and 15 is upward of 26 per cent of the whole population; or, taking one-fourth as the number of proper age to attend school, the average number in the rural districts will be 75, which is a sufficiently large average for a district system—indeed, greater than necessary. The only doubt will be respecting the more thinly peopled districts; but as these may be enlarged to almost double the average space of 20 square miles, we may reasonably suppose that very few in the 2,000 would fall below half the average population—that is, below the number of 37 schoolable children—and if half these should attend school at once there would be no difficulty in supporting the district school, with the aid of the fund, during four or five months in the year; and when the school is kept only during such short portions of the year, at least half the children might be expected to attend at once if proper means are employed to induce them.

If the fund applicable to the district schools should, with the aid of the literary fund, be \$300,000, this would give an average of \$150 to each district and \$80 or \$90 to the weakest, a sum sufficient to pay three months' salary to a good teacher, and leaving only \$80 or \$90 more to be raised among the 25 or 30 families of the district to support their school and keep their schoolhouse in repair. This shows that a tax that will produce from \$200,000 to \$250,000 per annum would be sufficient to carry the plan into effect, and this tax would not be felt as a burden, because it would relieve the people from paying an equal sum in another way.

Hoping that sufficient has been said to render this plan intelligible and to unfold the reasons upon which its chief provisions are founded, it is respectfully submitted to such members of the legislature and other citizens of Virginia as may think it worthy of their attention.

ADDRESS OF HENRY A. WISE TO HIS LATE CONSTITUENTS.¹

TAXATION AND EDUCATION.

If I had an archangel's trump—the blast of which could startle the living of all the world—I would snatch it at this moment and sound it in the ears of all the people of the debtor States and of the States which have a solitary poor “unwashed and uncombed” child untaught at a free school.

Tax yourselves.

First. To pay your public State debt.

Second. To educate your children—every child of them—at common primary free schools at State charge.

¹ Delivered in 1856, on the occasion of his retirement from Congress as Representative of the Accomac district, to accept the position of minister to Brazil.

That is my legacy of advice to you before I leave my country's shores to return, perhaps, no more forever.

Distrust all attempts to disturb the operations of a tax bill already passed. Disbelieve any set of men who come before you with false promises of freedom from taxation. Listen only to those sincere friends who will honestly tell you that you must be taxed, how much you ought to be taxed, and who will counsel freely and fully with you beforehand as to the mode and subjects of taxation. In a word, learn to love taxation as the only means of accomplishing such objects as those of paying the public debt and of educating your children, rich and poor. See to it well that no revenue raised for legitimate purposes is wasted; see that it is all faithfully applied to the true ends of government, but be sure to raise enough and amply enough for every kind of State necessity, usefulness, and honor. There is no easy mode of taxation, no royal road to paying debts or to education. Industry, honesty, economy, and education alone can make you a free and happy people.

Educate your children, all your children—every one of them!

STATE OF EDUCATION IN THE CONGRESSIONAL DISTRICT IN 1840.

Do you know how education languishes with us [in twelve counties having 37,230 free white persons, of whom 17,809 were over 20 years of age]?

First. The fact appears that of the whole number of free white persons nearly one-eighth can not read and write.

Second. That of the whole number of free white persons over 20 years of age more than one-fourth can not read and write.

Third. That you have but 17 academies and 101 primary schools, making 118 in all, when you ought to maintain at least 259, leaving a deficiency of 141 common schools.

Fourth. That you have 2,628 scholars in your primary schools and but 695 children in them at public charge, when you ought to have at least 7,448 children at from 7 to 15 years of age, all at public charge, in free schools, leaving 4,175 children of that age unaccounted for.

Fifth. That this number of 4,175 children of that age presumed not sent to school is nearly the precise number of adults, 4,514, who in this generation have grown up ignorant of letters.

Sixth. That this number of adults, 4,514, who can not read and write exceeds even the number of voters, 4,379, in the district.

Seventh. That, allowing \$12 to each scholar, you are now expending but \$38,643 per annum for common schools, when you ought to expend the sum of \$89,376, leaving a deficiency of funds amounting to \$50,730 per annum.

Eighth. That this sum of \$50,730 must be raised and expended in some way to make the rising generation more learned than their fathers.

This is a lamentable condition of education among us. I would never have exposed it to the scoff or pity of the world, but our own census takers have already made report thereof to the Department of State of the United States, and Congress has printed these facts at public expense. I know that a very large body of our people is among the most intelligent, and some of them among the most learned, of the country; I know how much credit and honor is due to some of our parents, who have not only rubbed nature's rust off their sons at common schools, but have polished their minds bright not only at our own colleges and universities, but in the universities of Europe. I know what a body of well-instructed gentlemen we have who would do honor to any society of any Athens in the land; how gracefully they live in all the means of the light of learning; what a venerable alma mater of great men we have in old William and Mary College; what a select corps of professors and teachers become our seminaries and academies; what a fine body of young graduates yearly come out of our own and the Northern schools; what an eminent professional

corps, both in law and medicine, ministers to our minds as well as our physical and pecuniary cases; what active industry, enterprise, and intelligence there is among the great body of our farmers, planters, and mechanics. I know how to account for much of the lack of learning among our people from their geographical location, living, as many of them do, on islands and long peninsulas inconvenient to schools, and how much ignorance is to be attributed to the valuable labor of poor children whose poor parents can not spare their time at school, precious as it is, to procure for them their daily bread. I know all these consoling excuses, but still the fact stares us frightfully in the face that more than 4,000 poor children in our district are growing up in the night of ignorance. Most of these doubtless are female children, and the touching fact is presented that many mothers of the generation to follow will not be able to teach their sons and daughters how to read and write. We can not mend the present generation of fathers and mothers, but we may provide intellectual food enough, and to spare, for the health and happiness of those who are to come after us.

ERROR IN THE PRESENT SCHOOL SYSTEM OF VIRGINIA.

The first and greatest error of our present system is that it proceeds upon the principle of charity. Common school education should not be a State charity, but it should be the chief element of the freedom of the State. The poor man pays taxes, renders military and civil service, is subject to fines, must obey the laws, and in return he should have the protection of the laws, the ordinary privileges of citizenship, such as the right of voting, and I say he should have his children educated as of right, free of charge. And in all these respects the rich and poor should be placed on precisely the same equal footing. There should be no distinction between the children of a republic. They are not in the school sense the children of their parents, but the State is *parens patriæ*, and they should all be regarded as sons and daughters of Mother Commonwealth. The taxes, it is true, will have to be raised chiefly from the property of the rich; but at last the school revenue is distributed as funds of the State, and when with her liberal and equal hand they are distributed impartially to all there is no feeling of dependence in any. They all alike look up to the benign State mother for the mental bounty, all praise her only and love her supremely for it, and thus is laid a foundation of *amor patriæ* ever-during as the reminiscences of schoolboy days and fervent as the fondest recollections of life and gratitude can ever be in the human heart.

As our system now is, in schools mixed of children whose parents pay for schooling them and of those who are sent by the school commissioners of the State, the child of charity is humbled by the comparison of itself with those who pay. The school is not pleasant to this child, and the pride of parents so revolts at the dependence and inequality in the school that they often refuse to allow their children to enter. While the school is free of charge, still it is not free. The true course is to make it free to all, make it the school of the State, and let all her children come, "without money and without price." Then no human pride will militate against education, but, on the contrary, every little checked apron will be washed and ironed and every little fly-flap bonnet will be stiffened and straightened for the "school parade." Funds and the universal school are all that are wanting to enlighten every child among us and to array human pride on the side of the school.

PLAN OF VOLUNTARY SYSTEM.

You need not, my friends, wait for the tardy action of our legislature. If we wait for that, I fear we will wait forever. What then? Organize yourselves by counties and districts. All that you have need to ask of the legislature is to pass an act for every county which will adopt a system for itself, incorporating for it a board of education with powers similar to those of the county courts for county levies and other

purposes. Let this board be elected biennially by the votes of all the male parents and guardians, having a member for every hundred voters, according to districts to be laid off by the board.

Let this board be required to levy taxes sufficient to educate every white child between the ages of 7 and 15 years, at common free schools, at the rate of \$12 per annum for each child, and allowing 30 scholars to each teacher, and to pay expenses of assessment and superintendence. Let it lay off the county in districts of 30 scholars, and 1 teacher to each district.

Let it have power to appoint one assessor to take annual census of the persons and property to be taxed for the school fund; of one collector of the fund, to give bond and security; and one superintendent to visit quarterly each school, to take regular account of the system of teaching, of the number of pupils, and of the qualifications and conduct of teachers and to make report thereof to the board; with reasonable compensation to each of those officers.

Let this board have power to fine and to collect fines of parents and guardians, rich or poor, who fail or refuse to send their children or wards to some schools of their own selection. And let it meet quarterly or as often as it chooses, with power to pass by-laws for its own government.

PLAN OF STATE AID TO COUNTIES THAT WILL HELP THEMSELVES.

For every county that will thus tax itself to educate itself the State should, out of the literary fund, build all the additional schoolhouses required. It should do more, and what is all essential—it should take upon itself to furnish competent teachers in a reasonable course of time to every county in the Commonwealth. And this can easily be done. The university and the colleges, particularly, must be more liberally patronized. The universities and colleges are the fountains of good teachers. They must be upheld and encouraged, and the most munificent and beneficent mode of doing this, in my humble opinion, is for the State, out of the literary fund and by taxation, if necessary, to support at the respective colleges a number of our own Virginia youths equal to twice the number of delegates and senators in the legislature, and to require these youths, when they have obtained certificates of competency, to teach in the primary and common free schools, at the rate allowed for each scholar (\$12) as long as they have been maintained at college at State charge. Let them enter into indentures to the State, and then they will obtain their education and will have worthily paid for it. Each youth of this description will cost not more than \$250 per annum for his board, tuition, and incidental expenses.

The number proposed is 332, and the cost to the literary fund would be \$83,000 per annum. This would give to each university and college 25 State students, and distribute to each the patronage of \$6,385 per annum. This would give to the State in the term of three years, say, a corps of 332 competent teachers, certain to be engaged in the work of tuition for a period of three years more, and shedding the light of their knowledge into every recess of the State and exciting the thirst for mental improvement everywhere by their example, and when done teaching, abiding ornaments of the State.

The State, too, should furnish the books for the free schools, and should have two general superintendents, one for eastern and one for western Virginia.

AN APPEAL TO ALL CLASSES TO AID THE WORK OF UNIVERSAL EDUCATION.

I call upon the learned professors of William and Mary and of the academies and schools; I call upon the reverend clergy of every denomination; I call upon my brethren of the bar; I call upon the humane faculty of medicine; I call upon our most excellent farmers and mechanics; I call upon parents and guardians; I call upon women who would be the mothers of scholars, philosophers, sages, and great men; I call upon all ages and sexes; I call upon the rich man and the poor man, and

upon men of all conditions, to stir—to “live, move, and have their being” in this vital subject. Knowledge is power; it is the greatest of all power. It is the power which overcomes all social obstacles; it is the power which prostrates all political inequalities; it is the power which overcomes all physical obstructions in the way of man; castes and ranks and grades bow before it; wealth is impotent against it; it subdues the earth, and it humbles tyrants. And if knowledge is power, ignorance is weakness—utter, impotent weakness. We say we were all born free and equal. That may be so; but if we were born so, the state of freedom and equality does not last long in life if one man is to be cultivated in his mind whilst the other is permitted to grow up in ignorance. How is the man who can not read and write the equal in power of any sort, except muscular power, of the man of letters? No. Ignorance among the people destroys the liberty and equality of the people; it makes inequalities in the social state; it gives one man a preeminence and preference among men over another in the political state; it makes the very weeds of the earth too strong for man’s physical might to earn his bread; it makes the rich richer and the poor poorer, the strong stronger and the weak weaker; it is the sycophant and slave of tyrants and the foundation of despotism; it not only enslaves the citizen, but enervates the State.

Does anyone suppose that if education had been diffused universally among our people Virginia would have increased in the last ten years in white population some 20,000 or 30,000 only? That her agriculture and mechanic arts would be in the low state they are now in? That the rich bowels of her inexhaustible mountain mines of iron and coal would be undug and almost unexplored? That her manufactures would have languished as they do? That the big bend of the Ohio River would not have been tapped long ago, and that the mighty Miami country, and an interminable back country besides, would not ere this have built us an Eastern city to consume our products at home? That emigration would have flowed from us to lands not half so precious, to homes not half so sacred? Oh, my friends, the theme is full of facts, figures, and feeling.

SELF-EDUCATED MEN AND BOOKS.

To the poor, ignorant man I say, let no man tell you that a “little learning is a dangerous thing.” The least of it is not half so dangerous as that ignorance that can not read and write. If Patrick Henry once said “natural parts are better than all the learning in the world,” don’t believe it, though he said it. What would he not have been had he possessed only half the learning of the world? Of what would the power of his “natural parts” have stopped short in human greatness, in human eloquence, if he had been possessed of the purchase of the lever of learning? The self-made man may boast—I love to admire him rising by the lone power of his genius—but I despise his self-sufficiency when he boasts against “the books.” Not once in an age does it happen that one self-made man stamps the age with his genius. But, at last, how can any man be said to be self-made? Those who claim to be self-made are so made by the books, if not by the schoolmaster. Tell me the knowledge that anyone of you all has which was not derived, directly or remotely, from the books? None. There is none in law, none in medicine, none in agriculture, none in mechanic arts not traceable to the books. And, my friends, if you would only yourselves go to the books, they would inform you much better than you are now instructed, by tradition, or second-hand informers. Look for yourselves; learn for yourselves. To the books! to the books! and be self-made yourselves if you will.

But the schoolmaster must teach you how to read and write. Remember that the books are sealed to those who can not read and write. I will not descant upon the pauperism and the crime which “a little learning” would diminish. No, there is a much more interesting class than that of inmates of poorhouses and of jails to be discussed. I mean one of the best classes of men on God’s earth—a class with whom

“the gods” are said to take part in their struggles through life—that class of good men who, notwithstanding they were never taught, are so endowed by nature with noble instincts as to perform their whole duty worthy of themselves, worthy of the State, and worthy of their eternal destiny. Men whom ignorance does not debase, whom it does not enervate nor make to despair, men who work in the world against all odds of ignorance and win a crown of earthly honor and of eternal glory. I know who they are. I know every one of them in my old district by name. I would have a word with them. They are the good, hard-working, honest class of men who, notwithstanding they can not read and write, can “make their marks” in the world. May God bless them! I know an aged man, small in stature, his head is silvered over with the white frost of years, with a lively, joyous face and a twinkling blue eye that needs no glass for its keen vision, an honest heart and a hand as hard as ax helve and plow handle would have it, who does “not know a letter in the book,” and who yet is rich in the stores of practical wisdom and of real wealth. Some one near Guilford, in Accomac, can guess who I mean. I would have a word with that good old friend of mine. I speak to his noble example. I speak to him because I love him and he belongs to a class by whom I wish to be heard. I speak to him for his class. Listen to me good old man. I see you smile and swear you are not old. Well, that is exactly like you, but I am serious. You are great in my eye. You can not read and write; you will have to get some one to read what I write to you and all like you, but you have, without learning, achieved a conquest in life. You began a neglected, penniless, friendless boy. You have worked, honestly worked at hard labor, until your hand is as hard as your heart is soft and tender. “Scorn can not point her slow-moving finger” at you. There is no blot on your name. You have dug the earth for your living and lived literally by the sweat of your brow. You have lived honestly, you have paid your debts with the cash down, you owe no man anything but good will, your industry has been untiring, a thousand and a thousand sturdy blows you have struck with a freeman’s “right good will” for the “glorious privilege of being independent.” Every way by which you have won “geer” is justified by honor. You have oppressed no man. You have been just to every man and have never robbed the poor, or the widow, or the orphan. You are a happy old man, there is jollity in your very eye, and temperate habits have made you healthfully buoyant and cheerful. God has given you children and grandchildren, and your sons and daughters are like a thick forest around you. The kind, hospitable partner of your bosom and of your journey through life still abides with you on earth, and you have laid up plenty, plenty, and have peace with it for your good old age. This is a mastery; this is a self-made man.

Now, tell me, good and great old man, what would you not have been had you held in your grasp the lever of knowledge? Ah! you know what it is to have a handspike at a logrolling or a house raising. You know what a “purchase” of power is. Knowledge, learning, is all that, and more. How many blind licks it would have saved you. How many thousands and tens of thousands more than you have now in your old “blue chest” you would have had could you have seen by “learning’s light” the dark ways of nature. Do you know that learning made your ax helve, your plow handle; that it applies in the most proper way that very handspike, your ox chain; that it prepares the very best manure; that it can beat you all hollow in applying it to the soil; that it knows more than you do all about the soil of every field you plow, and can tell you of every plant which grows on it and the food it craves? Did you know that learning saves labor, sells your grain, fixes the price, and carries it away for you? Ah! you shake your head and say, “Well, I would not give my poor, weak experience for all your book learning.” Do you say that? Well, if that be so, if you know something that the books don’t teach, I am the more urgent still. You must write it down for the rest of the world, for your own posterity. Write it, record it; you are bound to do so for the sake of some poor fellow who is to

come after you in your way of life and who hasn't your experience. But you can't write. Pity! pity! You know something, then, which you can't communicate to more than the few who hear the sound of your voice. Learning would enable you to do that much, at least. Suppose you go and get some one to write it down for you—your experience in cultivating corn, potatoes. You told me once tobacco was a valuable medicine for horses. Write it, I say, and have it printed, and bind it, and what then does it become but book learning? Book learning to be dispensed by somebody else, perhaps, in the present or coming generation; and what is poor, despised, "book learning" at last but somebody's discovery, somebody's experience of nature's laws and nature's truths?

Don't despise it my friends; but go to that old, long-used, well-worn, leathern bag or stocking-leg purse in that same old blue chest, and take from it 12, just 12, of those hard dollars, for which you have labored so honestly and so hard, for each and every child and grandchild you have, put it in his satchel, and send him to school.

DR. J. H. THORNWELL'S LETTER TO GOVERNOR MANNING ON PUBLIC INSTRUCTION IN SOUTH CAROLINA.

SOUTH CAROLINA COLLEGE, *November, 1853.*

His Excellency Governor MANNING:

I ask the favor of presenting to your excellency a few reflections upon the subject of public instruction in South Carolina. As I feel that I am addressing one whose interest and zeal in the prosperity of letters will induce him to weigh with candor, to estimate with charity, and even to invest with disproportionate value the crudest hints which spring from the desire to increase the educational facilities of the State, I shall dismiss all apprehensions of being suspected of an officious obtrusion upon your notice. You are the man above all others to whom the head of this institution should look with confidence to give fresh impulse to the general cause of education; and you will excuse me for saying that if all the suggestions which shall fall from me or the maturer recommendations which shall come from yourself shall terminate auspiciously to the wishes of us both, there will be furnished a beautiful instance of providential retribution in connecting the name of the first conspicuous benefactor of the South Carolina College with the establishment of an adequate system of common schools. A proud distinction in itself to be the friend and patron of learning, the honor is increased in your case in that it has been preeminently your care in its higher and lower culture to dispense its blessings to the poor. Apart from fellowship with God, there can not be a sweeter satisfaction than that which arises from the consciousness of being a father to the fatherless; and if the ends which I know are dear to your heart can only be achieved, every indigent child in the State, looking upon you as its real father, may address you in the modest and glowing terms which the genius of Milton has canonized as fit expressions of gratitude for the noblest of all gifts.

At tibi, chare pater post quam non æqua merenti
 Posse referre datur, nec dona rependere factis,
 Sit memorasse satis, repetitaque munera grato
 Percensere animo, fideique reponere menti.

DIFFICULTIES OF THE SUBJECT.

I am not insensible to the dangers and difficulties which attend the discussion of this subject. It is so seductive to the fancy that the temptation is almost irresistible to indulge in schemes and visionary projects. In the effort to realize the conception of a perfect education we are apt to forget that there is no such thing as absolute perfection in the matter, that all excellence is relative, and that the highest recom-

mentation of any plan is that it is at once practicable and adjusted to the wants and condition of those for whom it is provided. A system of public instruction, like the form of government, must spring from the manners, maxims, habits, and associations of the people. It must penetrate their character, constitute an element of their national existence, be a portion of themselves, if it would not be suspected as an alien or distrusted as a spy. The success of the Prussian scheme is ascribed by Cousin to the circumstance that it existed in the manners and customs of the country before it was enacted into law. It was not a foreign graft, but the natural offshoot of popular opinion and practice. It is an easy thing to construct a theory when nothing is to be done but to trace the coherencies and dependencies of thought; but it is not so easy to make thought correspond to reality, or to devise a plan which shall overlook none of the difficulties and obstructions in the way of successful application. In the suggestions which I have to offer I shall endeavor to keep steadily in view the real wants of the citizens of this Commonwealth, and, avoiding all crotchets and metaphysical abstractions, shall aim exclusively at what experience or the nature of the case demonstrates to be practicable. I have no new principle to ventilate, but I shall think myself happy if I can succeed in setting in a clearer light, or vindicating from prejudice and misconstruction, the principles which have already been embodied in our laws. It is, perhaps, not generally known that the legislature of South Carolina contemplates a scheme of public instruction as perfect in its conception of the end as it is defective in its provision of the means. The order, too, in which the legislature's attention has been turned to the various branches of the subject, though not the most popular or the most obvious, is precisely the order of their relative importance. It began where it ought to have begun, but, unfortunately, stopped where it ought not to have stopped. To defend what it has already done and stimulate it to repentance for what it has not done is the principal motive of this communication.

OUR EDUCATIONAL SYSTEM.

Permit me, in pursuance of this design, to direct the attention of your excellency to the nature, operation, and defect of the system among us. The system consists of the South Carolina College, established in 1801; of the free schools, established in 1811, and of the Arsenal and Citadel academies. This series of institutions is evidently adjusted, without, perhaps, any conscious purpose of doing so, to a threefold division of education, in so far as it depends upon instruction, into liberal, elementary, and professional. The college is to furnish the means of liberal, the free schools of elementary, and the Arsenal and Citadel academies of that department and professional education which looks to the arts of practical life, especially those of the soldier. For the liberal or learned professions, those of law, physics, and divinity, no provision has been made. The college undertakes to give the same kind of instruction which is given by the faculty of arts and philosophy in the universities of Europe. Our military academies, with a slight change in their organization, might be converted into scientific schools, and free schools are, or were, designed to be substantially the same as the elementary and grammar schools of England. The scheme as here developed, though far from fulfilling the logical requirements of a complete system of public instruction, is amply sufficient, if adequately carried out, to meet the real wants of our people. The kind and degree of education for which there is any serious or extensive demand is what is provided for. To make the system logically complete there would have to be a succession of institutions individually perfect and yet harmoniously cooperating to a general result, which, taking the man at the very dawn of his powers, shall be able to carry him up to the highest point of their expansion and fit him for any employment in which intelligence and thought are the elements of success. It should supply the means to every individual in the community of becoming trained and prepared for his own peculiar destiny. It should overlook no class, it should neglect no pursuit. It may be doubted whether

a scheme so comprehensive in its plan is desirable—it is quite certain that it is not practicable. The legislature has done wisely in confining its arrangements to liberal and elementary education. It has aimed, by a preliminary discipline, to put the individual in a condition to educate himself for the business of his life, except where his calling involves an application of scientific knowledge which does not enter into the curriculum of general instruction. In that case it has made a special provision. I see, then, no improvement that can be made in the general features of our scheme. It is as perfect in its conception as the wants and condition of our people will justify. All that the legislature should aim at is the adjustment of the details and the better adaptation of them to the end in view.

THE SOUTH CAROLINA COLLEGE.

The first in the order of establishment, as well as the first in the order of importance, is the college. Devoted to the interests of general, in contradistinction from professional education, its design is to cultivate the mind without reference to any ulterior pursuits. “The student is considered as an end to himself; his perfection as a man simply being the end of his education.” The culture of the mind, however, for itself, contributes to its perfection as an instrument, so that general education, while it directly prepares and qualifies for no special destination, indirectly trains for every vocation in which success is dependent upon intellectual exertion. It has taught the mind the use of its powers, and imparted those habits without which its powers would be useless; it makes men, and consequently promotes every enterprise in which men are to act. General education being the design of the college, the fundamental principles of its organization are easily deduced. The selection of studies must be made, not with reference to the comparative importance of their matter, or the practical value of the knowledge, but with reference to their influence in unfolding and strengthening the powers of the mind; as the end is to improve mind, the fitness for the end is the prime consideration. “As knowledge,” says Sir William Hamilton (man now being considered as an end to himself), “is only valuable as it exercises, and by this exercise develops and invigorates the mind, so a university, in its liberal faculty, should especially prefer those objects of study which call forth the strongest and most unexclusive energy of thought, and so teach them too that this energy shall be most fully elicited in the student.” For speculative knowledge, of whatever kind, is only profitable to the student in his liberal cultivation, inasmuch as it supplies him with the object and occasion of exerting his faculties; since powers are only developed in proportion as they are exercised, that is put forth into energy. The mere possession of scientific truth is, for its own sake, valueless; and education is only education, inasmuch as it at once determines and enables the student to educate himself. Hence, the introduction of studies upon the ground of their practical utility is *pro tanto*, subversive of the college. It is not its office to make planters, mechanics, lawyers, physicians, or divines. It has nothing directly to do with the uses of knowledge. Its business is with minds, and it employs science only as an instrument for the improvement and perfection of mind. With it the habit of sound thinking is more than a thousand thoughts. When, therefore, the question is asked, as it often is asked by ignorance and empiricism, what is the use of certain departments of the college curriculum, the answer should turn, not upon the benefits which in after life may be reaped from these pursuits, but upon their immediate subjective influence upon the cultivation of the human faculties. They are selected in preference to others, because they better train the mind.

THE END OF COLLEGE INSTRUCTION.

It can not be too earnestly inculcated that knowledge is not the principal end of college instruction, but habits. The acquisition of knowledge is the necessary result of those exercises which terminate in habits, and the maturity of the habit is measured

by the degree and accuracy of the knowledge, but still the habits are the main thing. In the next place it is equally important that the whole course of studies be rigidly exacted of every student. Their value as a discipline depends altogether upon their being studied, and every college is defective in its arrangements which fails to secure, as far as legislation can secure it, this indispensable condition of success. Whatever may be the case in Europe, it is found from experience in this country that nothing will avail but the authority of law. The curriculum must be compulsory or the majority of the students will neglect it. All must be subjected to catechetical examination in the lecture room, and all must undergo the regular examinations of their class as the condition of their residence in college. The moment they are exempted from the stringency of this rule all other means lose their power upon the mass of pupils. Much may be accomplished by rewards and by stimulating the spirit of competition, and great reliance should be placed upon them to secure a high standard of attainment; but in most men the love of ease is stronger than ambition, and indolence is a greater luxury than thought. For, whilst mental effort is the one condition of all mental improvement, yet this effort is at first and for a time painful—positively painful in proportion as it is intense, and comparatively painful as it abstracts from other and positively pleasurable activities. It is painful because its energy is imperfect, difficult, forced. But as the effort is gradually perfected, gradually facilitated, it becomes gradually pleasing; and when finally perfected—that is, when the power is fully developed and the effort changed into a spontaneity, becomes an exertion absolutely easy. It remains purely, intensely, and alone insatiably pleasureable. For pleasure is nothing but the concomitant or reflex of the enforced and unimpeded energy of a natural faculty or acquired habit, the degree or permanence of pleasure being also in proportion to the intensity and purity of the mental energy. The great postulate in education is, therefore, to induce the pupil to enter and persevere in such a course of effort, good in its result and delectable, but primarily and in itself irksome. The argument of necessity helps to reconcile him to the weariness of study; what he feels that he must do he will endeavor to do with grace, and as there is no alternative, he will be more open to the generous and manly influence which the rewards and distinctions of the college are suited to exert. There are always causes at work apart from the repulsiveness of intellectual labor to seduce the student from his books; and, before his habits are yet formed and the love of study grounded into his nature, it is of the utmost consequence to keep these causes in check. No other motives will be sufficient without compulsion of law cooperating with this. There are many others which, if they do not positively sweeten his toil, may help to mitigate the agony of thought. I have insisted upon this point because it is the point in regard to which the most dangerous innovations are to be apprehended.

THE ELECTIVE PLAN.

Two changes have at different times been proposed, one of which would be absolutely fatal and the other seriously detrimental to the interest of the college as a place of liberal education. The first is to convert it into a collection of independent schools, each of which shall be complete in itself, it being left to the choice of the student what schools he shall enter. The other is to remit the obligation of the whole course in reference to a certain class of students, and allow them to pursue such parts of it as they may choose. In relation to the first, young men are incompetent to pronounce beforehand what studies are subjectively the most beneficial. It requires those who have experienced the disciplinary power of different studies to determine their relative value. Only a scholar can say what will make a scholar. The experience of the world has settled down upon a certain class and order of studies, and the verdict of ages and generations is not to be set aside by the caprices, whims, and prejudices of those who are not even able to comprehend the main end of education. In the next place, if our undergraduates were competent to form a judgment,

their natural love of indolence and ease would, in the majority of cases, lead them to exclude those very studies which are the most improving, precisely because they are so—that is, because in themselves and in the method of teaching them, they involve a degree, an intensity, of mental exercise which is positively painful. Self-denial is not natural to man, and he manifests but little experience and acquaintance with human nature who presumes, as a matter of course, that the will will choose what the judgment commends. *Video meliora proboque deteriora sequor* is more preeminently true of the young than the old. They are the creatures of impulse. Permit them to select their own studies and the majority will select those that are thought to be the easiest. The principle of choice will be the very opposite of that upon which the efficiency of a study depends. Experience is decisive on this point. What creates more trouble in the interior management of our colleges than the constant desire of pupils to evade recitations? And is it not universally found that the departments which are the most popular are those which least task the energies of the student? I do not say that the professors who fill these departments are themselves most respected. That will depend upon their merit; and in matters of this sort the judgments of the young are generally right. But easy exercises are preferred, simply because they do not tax the mind. The practical problem with the mass of students is the least work and easiest done. Is it easy? Is it short? These are the questions which are first asked about a lesson. I must therefore consider any attempt to relax the compulsory features of the college course as an infallible expedient for degrading education. The college will cease to train. It may be a place for literary trifles, but a place for students it can not be.

COLLEGE AND UNIVERSITY.

There is much in a name and the change here condemned is delusively sought to be insinuated under the pretext of converting the college into a university. The latter title sounds more imposing, and carries the appearance of greater dignity. But the truth is, there is hardly a more equivocal word in the language. "In its proper and original meaning," as Sir William Hamilton has satisfactorily shown, "it denotes simply the whole members of a body (generally incorporated body) of persons teaching and learning one or more departments of knowledge." In its ordinary acceptation in this country it is either synonymous with college as an institution of higher education, and in this sense we are already a university; or it denotes a college with professional schools attached. It is clear, however, that the introduction of the faculties of law, medicine, and theology necessitates no change in the faculty of philosophy and arts. It is not necessary to make general education voluntary in order to provide for professional instruction. There is, consequently, nothing in the name or the nature of the case which demands a fundamental change in the system in order that the South Carolina College may become the South Carolina University. For myself I am content with our present title, and if it promises less I am sure it will accomplish more than the new title for the corresponding change. As to the expediency of adding the faculties of law and medicine—theology is out of the question to the present organization—I have only to say that it will multiply and complicate the difficulties of the internal management of the institution without securing an increased proficiency in these departments of knowledge—that is, if there is to be any real connection between the faculty of arts and those of law and medicine. I dread the experiment. I think it better that the professions should be left to provide for themselves than that a multitude of inexperienced young men should be brought together, many of whom are comparatively free from the restraints of discipline, and yet have an easy and ready access to those who are more under law. The very liberty of the resident would be a temptation to undergraduates. I have no objection, however, to the founding of professional schools by the State. All that I am anxious for is that they should not be so connected with the college as

that the members of all the schools should reside together. To be under a common government is impossible; to be under a different government would breed interminable confusion and disorder. That sort of nominal connection which requires that all medical and law degrees should be conferred by the authorities of the college, and which is perfectly consistent with the law and medical schools, being established in a different place, would, of course, be harmless. But this difficulty might arise: The college would be unwilling to confer any degree without a liberal education—it could not, without abjuring the very principles of its existence, grant its honors upon mere professional attainment. With respect to the other change, that of allowing students, under certain circumstances, to pursue a partial course, it is evidently contradictory to the fundamental end of the college. These students are not seeking knowledge for the sake of discipline, but with reference to ulterior uses. They come not to be trained to think, but to learn to act in definite departments of exertion. It is professional, not liberal, education which they want. The want, I acknowledge, ought to be gratified—it is a want which should be supplied—but the college is not the place to do it. That was founded for other purposes and it is simply preposterous to abrogate its constitution out of concessions to a necessity, because the necessity happens to be real. What, therefore, ought to be done is not to change the nature of the college, but, leaving it untouched to do its own work, to organize schools with special reference to this class of wants. We have the elements of such an organization in the arsenal and citadel academies.

THE INTERMEDIATE SCHOOLS.

Let these be converted into seminaries of special education, which will be only an extension of their present plan, and they will form that intermediate class of schools between the elementary and the college, which the circumstances of every civilized community, in proportion to the complication of its interests, demand. These changes in the college have been favored on the ground that they will increase its numbers; but the success of the college is not to be estimated by the numbers in attendance, but by the numbers educated. It should never include more than those who are seeking for a liberal education; and if it includes all these, whether they be 50 or 200, it is doing the whole of its appropriate work. No doubt, by the changes in question, our catalogue might be increased two or three fold, but we should not educate a single individual more than we educate now. Numbers in themselves are nothing unless they represent those who are really devoted to the business of the place. What real advantage would it be to have four or five hundred pupils matriculated here if some remained only a few months, others remained longer in idleness, and out of the whole number only four or five applied for a degree. That four or five would be the true criterion of success. The real question, I insist, is, How many graduate? This is the decisive point. As long as we receive the whole number of young men in the State who are to be liberally educated, whether that number be greater or smaller, we are doing all that we were appointed to do, or that we can be legitimately expected to do; and a decline in numbers is not a necessary proof of the declension of the college—it may be only a proof that the demand is ceasing for higher instruction. The work, however, to be done loses none of its importance in consequence of the failure to appreciate its value, and the remedy is not to give it up and yield to empirical innovations, but to persevere in faith and patience, relying upon time as the great teacher of wisdom.

INDEPENDENCE OF TEACHERS.

Another cardinal principle in the organization of the college is the independence of its teachers. They should be raised above all temptation of catering for popularity, of degrading the standard of education for the sake of the loaves and fishes. They should be prepared to officiate as priests in the temple of learning, with pure

vestments, and with hands unstained with a bribe. It has been suggested that if the stipends of the professors were made dependent upon the number of pupils, the strong motive of personal interest, added to the higher incentives which they are expected to feel, would increase their efficiency by stimulating their zeal and activity. They would be anxious to achieve a reputation for the college which would enable it to command students. This argument proceeds upon a hypothesis which, I am ashamed to say, my own experience pronounces to be false. In the state of things in this country there is a constant conflict between the government of the college and the candidates for its privileges, the one attempting to raise and the other to lower the standard of admission, and every effort of the faculty in the right direction is met with a determined resistance. It is not to be presumed that young men, at the age of our undergraduates generally, should have any steady and precise notions of the nature of education. A college is a college, and when they are debating the question, whither shall they go, the most important items in the calculation are not the efficiency, but the cheapness of the place and the shortness of the time within which a degree may be obtained. The consequence is that no college can resist the current unless its teachers are independent. In that case they may stand their ground, and, though they can never hope to equal feebler institutions in numbers, they will still accomplish a great work and confer a lasting benefit on society. The South Carolina College has raised her standard. She has proclaimed her purpose to be to educate well, and I should deplore any measure that might remotely tend to drive her from this position. The true security for the ability of the professional corps is not to be sought in starving them, or in making them scramble for a livelihood, but in the competency, zeal, and integrity of the body that appoints them, and in the strict responsibility to which they are held. An impartial board of overseers to elect faithful and turn out incompetent men, a board that has the nerve to do its duty, will be a stronger check upon indolence and inefficiency than an empty larder. The motive of necessity may lead them to degrade instruction to increase their fees; the motive of responsibility to a board that can appreciate their labors will always operate in the right direction. "Let this ground, therefore," says Bacon, "be laid, that all works are overcome by amplitude of reward, by soundness of direction, and by the conjunction of labors. The first multiplieth endeavor, the second preventeth error, and the third supplieth the frailty of man. But the principal of these is direction." So far as the undergraduates are concerned, I think that all these conditions of success are measurably filled in the present arrangement of the college, as much so as the general state of education will allow. No changes in this respect are desirable. But the interests of higher education demand something more than that culture "in passage," as Bacon expresses it, which is all that is contemplated in provisions for undergraduates.

WHERE THE WORK STOPS.

Our work stops with the degree. We have no foundations upon which scholars may be placed "tending to quietness and privateness of life and discharge of cares and troubles." We are wanting in facilities for "conjunctions" of learned men, and, consequently, the only persons whose business it is to keep pace with the higher intelligence of the age are the few professors who are employed in the work of instruction. With only such means we must fall behind in the march of improvement. There must be more competition, more leisure, more freedom from distracting cares. "This I take to be," says the great writer from whom I love to quote, "a great cause that hath hindered the profession of learning, because these fundamental knowledges have been studied but in passage; for if you will have a tree bear more fruit than it hath used to do, it is not anything you can do to the boughs, but it is the stirring of the earth and putting new mould about the roots that must work it." I do not look to the legislature to supply this deficiency. Other demands, more

immediate and urgent must be met, and to meet them adequately will make a heavy draft upon its resources. But I do look to private liberality. Many of the foundations in Oxford and Cambridge have arisen from this source. The Northern colleges are indebted for the largest part of their funds to the same cause. Why should not some portion of the Southern wealth take the same direction? Are we wanting in the love of knowledge, in the spirit of charity, and in zeal for the honor and prosperity of the State? I can not account for this remissness and apathy of our rich planters and merchants and professional men in other way than that this form of generosity has not been the habit of the country. I had hoped that your example and the example of Colonel Hampton would have given an impetus to this matter, and I shall not despair until I see the result of the festival which is proposed to be celebrated in honor of the fiftieth anniversary of the college. A body of learned men devoted to the pursuit of fundamental knowledge is what, more than everything else, is now needed to complete our system. There is wealth enough in private coffers and liberality enough in the hearts of our citizens to supply the want if public interest could only be elicited on the subject. There prevails an impression that the annual appropriations from the legislature are amply sufficient for all the ends of a college. It is forgotten that these appropriations contemplate it entirely as a place of teaching, and not the residence of scholars. In this latter respect we are wholly dependent upon private generosity. The advantages to the college and to the State and to the whole country of such a body of resident scholars can not be estimated. They might in various ways assist in the business of discipline and instruction; they would furnish a constant supply of new materials for professors; they would give tone and impulse to the aspirations and efforts of young men gathered around them, and diffuse an influence which, silently and imperceptibly concurring in the formation of that mysterious and powerful combination of separate elements called public opinion, would tell upon every hamlet in the land. "For if men judge that learning should be referred to action, they judge well; but in this they fall into the error described in the ancient fable, in which the other parts of the body did suppose the stomach had been idle, because it neither performed the office of motion, as the limbs do, nor of sense, as the head doth; but yet, notwithstanding, it is the stomach that digesteth and distributeth to all the rest; so if any man think philosophy and universality to be idle studies, he doth not consider that all professions are from thence served and supplied." This homely illustration sets the question of utility in its true light, and if I could impress upon the community, as it exists in my own mind, the deep and earnest sense of the importance of this feature in the organization of the college, the lack of means would soon cease to be an impediment in keeping pace with the highest culture of the age. It would soon be found that wealth has no more tendency to contract the mind in South Carolina than in Massachusetts and New York, and that there are merchant princes in Charleston as well as in Boston. Who will begin the work? Who shall set the first example of a foundation of \$10,000 or \$20,000 devoted to the support of genius in reflecting light and glory upon the State? It is devoutly to be hoped that something more substantial than echo will answer who.

OBJECTIONS TO THE COLLEGE.

But as there are those who admit, in general, the advantages of a high standard of liberal education, and the consequent importance of such institutions as the college, and yet doubt the wisdom of the policy which directly connects them with the State, a more distinct consideration of this question will not be out of place here. The grounds of doubt are twofold:

First. The college, it is said, is for the benefit of the few, and, therefore, should not be supported by the taxes of the many. What comes from all should be for all; what is for a class should be by a class.

This is the substance of the clamor by which ignorance and vulgar ambition, and, above all, a pretended regard for the rights and interests of the masses, are constantly endeavoring to steal away the hearts of the people from what, justly considered, is the bulwark of their liberties and the strongest safeguard of their honor and respectability. Hence the cry that the college is an aristocratic institution, a resort for the rich, exclusive of the poor.

The other ground is that education, in its very nature, belongs to the church or to private enterprise; that it includes elements which lie beyond the jurisdiction of the State, and that, therefore, the State has no right to interfere with it. These objections, I think, embody the strength of whatever opposition is expressed or felt to the college as a public foundation. In reference to the first, let it be admitted that the number of those who participate in the privileges of the college is, and must necessarily be, limited. It is, of course, impracticable, even if it were desirable, that every young man in the State should receive a liberal education. Some must be excluded. The very notion of their being excluded implies that they do not share in the immediate advantages of the college. But then the question arises, What is the principle of exclusion, so far as the college is concerned? If that principle is directly based upon difference in fortune, then there is ground of complaint; otherwise, none. Does the college reject any because they are poor? Does it admit any because they are rich? Does it recognize any distinction between rich and poor? Who will venture upon such an allegation? And yet it is only by making wealth the ground of admission, and poverty the ground of exclusion, that the college can be justly charged with aristocratic tendencies. It is notorious that the only question which the college asks as to the qualification for admission to its immunities, is in relation to the fitness of the candidates to enter upon its pursuits. All who are prepared to comply with its requisitions are welcomed to its halls, whether rich or poor. Poverty may, indeed, be a remote and accidental cause of exclusion, as it incapacitates for acquiring the fitness which the college exacts, and which is absolutely indispensable to the end it has in view. But in these cases it is not the poverty which the college considers, but the ignorance and want of preparatory training. There are also expenses incident to a college course which put it out of the power of those who are absolutely without funds to pursue it. A man must be fed and clothed and warmed, and the comforts of life do not usually come without money; and if he can not afford the necessary expenses himself, and his friends will not afford them for him, all that can be said is, that Providence has cut him off from a liberal education. He is not in a condition to reap the advantages of personal residence within the college walls.

THE POOR MAN'S COLLEGE.

But the principle of exclusion, so far as the college is concerned, is not a class principle, but one which necessarily results from the nature and end of its institution. It is founded exclusively for a certain kind and degree of education, and it opens its doors to all, without exception, who are prepared for its instructions and can sustain expenses necessarily incident to a residence from home. It shuts its doors upon none but upon those who shut them upon themselves or against whom Providence has closed them. A free college means a college absolutely without expense. We must wait for the realization of such a dream until the manifestation of that state in which our bodies shall cease to be flesh and blood, and such homely articles as food, raiment, and fuel be no longer needed. But if an institution is not *ipso facto* aristocratic, because the members of it have to pay for their victuals and clothes, then the South Carolina college is not an aristocratic or class institution. It might not be improper to inquire whether in those institutions whose glory it is to be par excellence institutions for the vulgar, it is pretended that the pupils have absolutely nothing to pay. Can a stark beggar get through them without help? If not, poverty and wealth have the same remote and direct influence in determining who shall participate in

their privileges as they have in the South Carolina college. From a somewhat careful inquiry, too, I am inclined to the opinion that none, however poor, ever fail to get through college who have been enabled either by their own exertions or the assistance of others to prepare for college. I am sure the number is very small. Hence, of all charges that the imagination can conceive, that of educating only the rich is the most idle and ridiculous. Most of our students, as a matter of fact, are from families in moderate circumstances—many are absolutely poor—either expending their whole living upon their minds, or toiling in vacations to acquire the means of defraying their expenses, or sustained by eleemosynary foundations of the college or by the assistance of the college societies, or by private liberality. The public sentiment of the students speaks volumes upon this point. If there were anything in the genius or organization of the institution which distinguished it as the college of the rich, there would be a corresponding pride of aristocracy among the young men, and the poor would be avoided, insulted, or shunned, as a *profanum vulgus*. They would be branded by public opinion as men who were out of their place, as upstarts who were aspiring to the privileges of their betters. This would be necessitated as the common feeling by the organic principle of the body. But what is the truth? I have no hesitation in affirming that if there be a place more than any other where the poor are honored and respected, where indigence, if coupled with any degree of merit, is an infallible passport to favor, that place is the South Carolina college. It may be preeminently called the poor man's college in the sense that poverty is no reproach within its walls, no bar to its highest honors and most tempting rewards, either among professors or students. On the contrary, if there is a prejudice at all it is against the rich; and from long observation and experience I am prepared to affirm that no spirit receives a sterner, stronger, more indignant rebuke within these walls than the pride and vanity of wealth. Let any young man presume upon his fortune and undertake to put on airs, and the whole college pounces down upon him with as little mercy and as much avidity as the jackdaws in the fable upon their aspiring fellow, who was decked in the peacock's feathers. No doubt there are many whose circumstances preclude them from the first steps of a liberal education, and who yet have the capacity to receive it, and who, if educated, might reflect lasting honor upon the State, but, unfortunately, from the imperfect and inefficient condition of the free schools, these poor children can never be distinguished. One advantage of a more adequate scheme of public instruction will be that of bringing indigent merit to the light. For such cases there ought to be the most ample provision. "This, in the words of Cousin, "is a sacred duty we owe to talent, a duty which must be fulfilled even at the risk of being sometimes mistaken." The State should either endow scholarships or extemporize appropriations to meet the cases of those who, when public schools shall have been established, shall be reported as worthy of a liberal education by their earlier teachers; and beyond this, as the same writer observes, it is not desirable that it should provide for the higher instruction of the poor. So much for the limitation of the immediate benefits of the college. They are confined to comparatively a few, simply because it is comparatively a few that are in a condition to receive them.

THE GOOD OF THE STATE AT LARGE.

But then the important point is, and it is a point which ought never to be forgotten, though it is systematically overlooked by those who are accustomed to decry the college, that these benefits are imparted not for the sake of the few but for the interest of the many—the good of the State at large. Those who are educated are educated not for themselves, but for the advantage of the Commonwealth as a whole. Every scholar is regarded as a blessing—a great public benefit—and for the sake of the general influence that he is qualified to exert, the State makes provision for its training. It is because the "proper education of youth contributes greatly to the

prosperity of society" that it "ought to be an object of legislative attention." The many, therefore, are not taxed for the few, but the few are trained for exalted usefulness and extensive good to the many. If the legislature had in view only the interest of those who are educated and expended its funds in reference to their good, considered simply as individuals, there would be just ground of complaint, but when it is really aiming at the prosperity of the whole community, and uses these individuals as means to that end, there is nothing limited or partial in its measures.

It is great weakness to suppose that nothing can contribute to the general good the immediate ends of which are not realized in the case of every individual. Are light-houses constructed only for the safety of the benighted mariner, who may be actually lighted, guided by their lamps, or are they raised for the security of navigation, the interest of commerce, and, through these, the interest of society at large? There is no way of evading the force of this argument but by flatly denying that an educated class is a public good. And if there are any among us who are prepared to take this ground and to become open advocates of barbarism, I have nothing to say to them, but for the sake of those who may be seduced by sophistry which I can not disentangle, I offer a few reflections.

THE REAL ELEMENTS OF PROGRESS.

In the first place the educated men in every community are the real elements of steady and consistent progress. They are generally in advance of their generation; light descends from them to their inferiors, and by a gradual and imperceptible influence emanating from the solitary speculations, it may be of their secret hours, the whole texture of society is modified, a wider scope is given to its views and a loftier end to its measures. They are the men who sustain and carry forward the complicated movements of a refined civilization; the real authors of changes which constitute epochs in the social elevation of the race. Pitt could not understand and Fox refused to read the masterly speculations of Adam Smith upon the "Wealth of nations." He was ahead of his age. The truth gradually worked its way, however, into the minds of statesmen and legislators, and now no one is held to be fit for any public employment who is not imbued with the principles of political economy. The thoughts of a retired thinker once set in motion, if they have truth in them, have a principle of life that can never be extinguished. They may for a season be repressed and confined, but they finally, like disengaged gases, acquire an intensity and power which defy all opposition. They spread through society, leavening first its leading members and extend in the shape of results or maxims or practical results to every fire-side in the land. The solitary scholar wields a lever which raises the whole mass of society. It is a high, general education which shapes the minds and controls the opinions of the guiding spirits of the age; it is this which keeps up the general tone of society; it is at once conservative and progressive. The conservative tendency requires to be a little more distinctly pointed out.

The case is this: The universal activity which general intelligence imparts to mind must be prolific in schemes and theories, and these are likely to be sound or hurtful according to the completeness of the instruction or the narrowness of the views on which they are founded. A half truth or a truth partially apprehended always has the effect of a lie. A higher order of culture, with occasional exceptions (for profound thinkers are sometimes eccentric), is a security against the ill-digested plans and visionary projects which they are peculiarly tempted to originate whose vision is confined to a contracted horizon and who are deceived simply because they do not perceive the bearing of a principle in all its applications. An educated class expands the field of vision and serves as a check to the regular impulses and the impetuous innovations of minds equally active, but less enlarged. It protects from rashness, from false maxims, from partial knowledge. It is a security for public order which can hardly be overestimated; it is the regulator of the great clock of society. Gen-

eral intelligence without high culture to keep it in check will exemplify the maxim of Pope, "a little learning is a dangerous thing," and will prove a greater curse to the State than absolute ignorance. It is not ignorance that is full of whims and crotchets; they prey upon impulse and fanaticism, and are the parent of restless agitation and ceaseless change. It is in the constant play of antagonistic forces, the action and reaction of the higher and lower culture, that the life, health, and reign of society consists. General intelligence checks the stagnation of ignorance, and a thorough education checks the rashness of empiricism. Where this prevails there is all the inspiration without the contortions of the Sibyl.

ELEVATION OF THE MASSES.

In the next place, it should not be admitted that general education is the true source of the elevation of the masses and of the demand for popular instruction. Every educated man is a center of light, and his example and influence create the consciousness of ignorance and the sense of need from which elementary schools have sprung. Defective culture is never conscious of itself until it is brought into contact with superior power. There may be a conviction of ignorance in reference to special things and a desire of knowledge as a means of accomplishing particular ends, but the need of intellectual improvement on its own account never is awakened spontaneously. We never lament our inferiority to angels. The reason is we are not brought into contact with them, and are, consequently, not sensible of the disparity that exists. If we had examples before us of angelic amplitude of mind, the contrast would force upon us a lively impression of the lowness of our intellectual level. If we had never been accustomed to any other light but that of the stars, we should never have dreamed of the sun nor felt the absence of his rays as any real evil. The positive in the order of thought is before the privative. We must know the good in order to understand the evil; we must be familiar with the day to comprehend night and darkness. Hence it is that civilization never has been and never can be of spontaneous growth among a people. It has always been an inheritance or an importation. If men had been originally created savages, they would all have been savages to-day.

Those ingenious theories which undertake, from principles of human nature, to explain the history of man's progress from barbarism to refinement are nothing better than speculative romances. They are contradicted by experience as well as by the laws of the human mind. Philosophy coincides with the Bible—man was created in the image of God, and the rudeness and coarseness of uncivilized communities are states of degradation into which he has apostatized and sunk, and not his primitive and original condition. Civilization has migrated from one center to another, has found its way among barbarians and savages, and restored them to something of their forfeited inheritance, but in every such instance it has been introduced from without, it has never developed itself from within. Where all is darkness, whence is the light to spring? What planet is the source of the rays that shine on it? Hence it is knowledge which creates the demand for knowledge, which causes ignorance to be felt as an evil; and hence it is the education, in the first instance, of the few which has awakened the strong desire for the illumination of the many. Let knowledge, however, become stagnant, let no provision be made for the constant activity of the highest order of minds in the highest sphere of speculation, and the torpor would be communicated downward until the whole community was benumbed.

THE PROGRESS OF SOCIETY.

The thinkers in the most abstract departments of speculation keep the whole of society in motion, and upon its motion depends its progress. Scholars, therefore, are the real benefactors of the people, and he does more for popular education who founds a university than he who institutes a complete and adequate machinery of

common schools. The reason is obvious—the most potent element of public opinion is wanting where only a low form of culture obtains. The common schools, having no example of anything higher before them, would soon degenerate and impart only a mechanical culture, if they did not—which I am inclined to think would be the case, from their want of life—permit the people to relapse into barbarism. Colleges, on the other hand, will create the demand for lower culture, and private enterprise, under the stimulus imparted, would not be backward in providing for it. The college will diffuse the education of principles, of maxims, a tone of thinking and feeling which are of the last importance without the schools. The schools could never do it without the college. If we must dispense with one or the other, I have no hesitation in saying that on the score of public good alone it were wiser to dispense with the schools. One sun is better than a thousand stars.

There never was, therefore, a more grievous error than that the college is in antagonism to the interests of the people. Precisely the opposite is the truth; and because it is preeminently a public good, operating directly or indirectly to the benefit of every citizen in the State, the legislature was originally justified in founding, and in still sustaining, this noble institution. It has made South Carolina what she is; it has made her people what they are; and from her mountains to her seaboard there is not a nook or corner of the State that has not shared in its healthful influence. The very cries which are coming up from all quarters for the direct instruction of the people, cries which none should think of resisting, are only echoes from the college walls. We should never have heard of them if the state of things had continued among us which existed when the college was founded. The low-country would still have sent its sons to Europe or the North, and the up-country would have been content with its fertile lands and invigorating hills.

EDUCATION LIVES ON CHARITY.

The second ground of objection does not deny or diminish the importance of the college or the general advantages of higher education. It only affirms that the State is not the proper body for dispensing them. The advocates of this negative opinion divide themselves into two classes—one maintaining that colleges should support themselves, the other that they should be supported by endowments under the control of private or ecclesiastical corporations. The first was the doctrine of Adam Smith, who may be reckoned among the ablest opponents of the policy of public education in the higher branches of learning. He lays down the thesis that the demand will infallibly create the supply; that in science, literature, and the arts, as in the commodities which minister to the physical comfort and conveniences of man, what is wanted will be procured. The double operation of private interest, on the one hand to obtain and on the other to furnish, will present inducements enough to originate all the schools that may be needed to teach all the arts that may be desired. This ingenious reasoner forgot that in the matter of education, as Sir William Hamilton justly remarks, “Demand and supply are necessarily coexistent and coextensive; that it is education which creates the want which education alone can satisfy.” “Those again,” says the same writer, “who, conceding all this, contend that the creation and supply of this demand should be abandoned by the State to private intelligence and philanthropy, are contradicted both by reasoning and fact.”

The expensiveness of the machinery which is necessary to put in motion a higher seminary of learning renders it hopelessly impossible to make such institutions self-supporting bodies, and the attempt to do so would have no other effect than to degrade them into professional or scientific schools, in which knowledge is the end and not the instrument. Hence there is not a college or university worthy the name, either in Europe or in America, that is capable of sustaining, much less of having founded, its various departments of instruction by the patronage it receives. Education has always lived on charity. Foundations and endowments, partly from individuals,

partly from the State, have always been its reliance to supply the apparatus with which the machinery is kept in motion. As to private corporations, it is certain that the degree of interest which is taken in learning for itself will never be adequate to meet the exigencies of higher education. There must be some higher principle at work, and impulse more general and pervading, in order to touch the chords of private liberality and awaken a responsive thrill. There may be extraordinary efforts of single men, but these spasmodic contributions will be too rare, besides that they may be hampered by unwise restrictions and limitations to answer the ends of a college.

DOES EDUCATION BELONG TO CHURCH OR STATE?

The only principle which has vitality and power enough to keep the stream of private charity steadily turned in the direction of education is the principle of religion. And hence the true and only question is, Does education belong to the church or state. Into the hands of one or the other it must fall or perish. This, too, is the great practical question among us. The most formidable war against the college will be that waged on the principle of its existence. I respect the feeling out of which jealousy of State institutions has grown. A godless education is worse than none, and I rejoice that the sentiment is well nigh universal in this country that a system which excludes the highest and most commanding, the eternal interests of man, must be radically defective, whether reference be had to culture of the individual or to his prosperity and influence in life. Man is essentially a religious being, and to make no provision for this noblest element of his nature, to ignore and preclude it from any distinct consideration is to leave him but half educated. The ancients were accustomed to regard theology as the first philosophy, and there is not a people under the sun whose religion has not been the chief inspiration of their literature. Take away the influence which this subject has exerted upon the human mind, destroy its contributions to the cause of letters, the impulse it has given to the speculation of philosophy, and what will be left after these subtractions will be comparatively small in quantity and feeble in life and spirit. We must have religion if we would have and reach the highest forms of education. This is the atmosphere which must surround the mind and penetrate all its activities in order that its development may be free, healthful and vigorous. Science languishes, letters pine, refinement is lost wherever and whenever the genius of religion is excluded. Experience has demonstrated that, in some form or other, it must enter into every college and pervade every department of instruction. No institution has been able to live without it.

But what right, it is asked, has the State to introduce it? What right, we might ask in return, has the State to exclude it? The difficulty lies in confounding the dogmatic peculiarities of sects with the spirit of religion. The State, as such, knows nothing of sects but to protect them, but it does not follow that the State must be necessarily godless; and so a college knows nothing of denominations, except as a feature in the history of the human race, but it does not follow that a college must be necessarily atheistic or unchristian. What is wanted is the pervading influence of religion as a life, the habitual sense of responsibility to God and of the true worth and destiny of the soul, which shall give tone to the character and regulate all the pursuits of the place. The example, temper, and habitual deportment of the teachers, cooperating with the dogmatic instructions which have been received at the fireside and in the church, and coupled with the obligatory observance (except in cases of conscientious scruple) of the peculiar duties of the Lord's day, will be found to do more in maintaining the power of religion than the constant recitation of the catechism or the ceaseless inculcation of sectarian peculiarities. The difficulty of introducing religion is, indeed, rather speculative than practical. When we propose to teach religion as a science and undertake, by precise boundaries and exact statutory provisions, to define what shall and what shall not be taught, when

by written schemes we endeavor to avoid all the peculiarities of sect and opinion without sacrificing the essential interests of religion, the task is impossible. The residuum, after our nice distinctions, is zero.

RELIGIOUS, BUT NOT SECTARIAN.

But why introduce religion as a science? Let it come in the character of the professors, let it come in the stated worship of the sanctuary, and let it come in the vindication of those immortal records which constitute the basis of our faith. Leave creeds and confessions to the fireside and church, the home and the pulpit. Have Godly teachers and you will have comparatively a Godly college. But what security have we that a State college will pay any attention to the religious character of its teachers? The security of public opinion, which, in proportion as the various religious denominations do their duty in their own spheres, will become absolutely irresistible. Let all the sects combine to support the State college, and they can soon create a sentiment which, with the terrible certainty of fate, shall tolerate nothing unholy or unclean in its walls. They can make it religious without being sectarian. The true power of the church over these institutions is not that of direct control, but of moral influence, arising from her direct work upon the hearts and consciences of all the members of the community.

It is alleged that experience presents us with mournful examples of State institutions degenerating into hotbeds of atheism and impiety. It may be promptly replied that the same experience presents us with equally mournful examples of church institutions degenerating into hotbeds of the vilest heresy and infidelity. And what is more to the point, a sound public opinion has never failed to bring the State institutions back to their proper moorings, while the church institutions have not unfrequently carried their sects with them and rendered reform impossible. In the case of State institutions, the security for religion lies in the public opinion of the whole community; in the case of church institutions, in the public opinion of a single denomination; and as the smaller body can more easily become corrupt than a larger, as there is a constant play of antagonisms which preserves the health in the one case, while they are wanting in the other, it seems clear that a State college, upon the whole and in the long run, must be safer than any sectarian institution. As long as the people preserve their respect for religion, the college can be kept free from danger.

The principle, too, on which the argument for church supervision is founded proves too much. It is assumed that wherever a religious influence becomes of primary importance there the church has legitimate jurisdiction. "This," it has been well said, "puts an end to society itself, and makes the church the only power that can exist, since all that is necessary is for any officer or any power to be capable of moral effects or influences in order to put it under the dominion of the church. The moral influences of governors, judges, presidents—nay, even sheriffs, coroners or constables—is as real and may be far more extensive than that of schoolmasters. The moral influence of wealth, manners, taste, is immense; that of domestic habits, even personal habits, often decisive." The truth is, this species of argument would reduce every argument under the sun to the control of the church. It is just the principle on which the authority of the Pope over kings and states has been assumed and defended. The argument, moreover, is one that can be very easily refuted. If, because education has a religious element it must fall within the jurisdiction of the church, a fortiori, because it has multiplied secular elements it must fall within the jurisdiction of the state. The church is a distinct corporation, with distinct rights and authority. She has direct control over nothing that is not spiritual in its matter and connected with our relations to Jesus Christ. She is His kingdom, and her functions are limited to this work as the mediator of the covenant and the saviour of the lost; and if education in its secular sense is not a function of grace, but of

nature—if it belongs to man, not as a Christian, but simply as a man—then it no more falls within the jurisdiction of the church than any other secular work. The duties of the state are civil, not sacred, the duties of the church are sacred, not civil. To exclude the church from the control of general education and to exempt it from the duty of providing the means thereof it must be shown that education is of the nature of religious things, and that the duty of superintending it is in its nature spiritual. Is not a man bound to educate himself as an individual person? Is not every family bound to educate each other, and the head of the family peculiarly bound to educate the members? If so, are these obligations, which arise out of our individual personality and out of our family relations, in any degree at all, or do they spring solely and chiefly out of our obligations as members of Christ? Is a Christian more bound, or is he chiefly bound, or is he exclusively bound—they are three degrees of the same proposition—to acquire and impart knowledge which has nothing to do with religion, but much to do with temporal success and temporal usefulness, all the positive sciences, for example, simply or mainly as a Christian or because he is a Christian? Or is he bound chiefly or at all to do so from any consideration drawn from the individual position or his relations to his family or his country? These are considerations, and there are many more like them, that require to be deeply pondered before we arrive at the sweeping generalities which assume and assert that denominational education is only the safe and true conclusion of this “high argument.”

SECTARIAN COLLEGES.

Apart from the principle involved, I have other objections to sectarian education. I say sectarian education, for the church catholic is one, in the present condition of things, not visible and corporate. What she does can only be done through the agency of one or more of the various fragments into which she has been suffered to split. In the first place, it is evident from the feebleness of the sects that these colleges can not be largely endowed. In the next place, they are likely to be numerous. From these causes will result a strenuous competition for patronage, and from this two effects may be expected to follow: First, the depression of the standard of general education, so as to allure students to their halls; and next, the preference of what is ostentatious and attractive in education to what is solid and substantial. It is true that there can be no lofty flight, as Bacon has suggested, “without some feathers of ostentation:” but it is equally true there can be no flight at all where there are not bone, muscle, and sinew to sustain the feathers. It is also a serious evil that the State should be habitually denounced as profane and infidel. To think and speak of it in that light is the sure way to make it so; and yet this is the uniform representation of the advocates of church education. They will not permit the State to touch the subject because its fingers are unclean. Can there be a more certain method to uproot the sentiment of patriotism and to make us feel that the Government of the country is an enormous evil, to which we are to submit, not out of love, but for conscience’ sake? Will not something like this be the inevitable effect of the declamation and invective which bigots and zealots feel authorized to vent against the commonwealth that protects them, in order that they may succeed in their narrow scheme? Instead of clinging around the State as they would cling to the bosom of a beloved parent, and concentrating upon her the highest and holiest influences which they are capable of exerting; instead of teaching their children to love her as the ordinance of God for good, to bless her for her manifold benefits, and to obey her with even a religious veneration, they repel her to a cold and cheerless distance, and brand her with the stigma of divine reprobation. The result must be bad. The fanaticism which despises the State, and the infidelity which contemns the church, are both alike the product of ignorance and folly. God has established both the church and the state. It is as clearly our duty to be loyal and enlightened citizens as to be faithful and earnest Christians.

A BOND OF UNION.

I think, too, that the tendency of sectarian colleges to perpetuate the strife of sects, to fix whatever is heterogeneous in the elements of national character, and to alienate the citizens from each other is a consideration not to be overlooked. There ought surely to be some common ground on which the members of the same state may meet together and feel that they are brothers; some common ground on which their children may mingle without confusion or discord, and bury every narrow and selfish interest in the sublime sentiment that they belong to the same family. Nothing is so powerful as a common education and the thousand sweet associations which spring from it and cluster around it to cherish the holy brotherhood of men. Those who have walked together in the same paths of science and taken sweet counsel in the same halls of learning; who went arm in arm in that hallowed season of life when the foundations of all excellence are laid; who have wept with the same sorrows or laughed at the same joys; who have been fired by the same ambition, lured with the same hopes, and grieved at the same disappointments—these are not the men, in after years, to stir up animosities or to foment intestine feuds. Their college life is a bond of union which nothing can break—a divine poetry of existence which nothing is allowed to profane. Who can forget his college days and his college companions, and even his college dreams? Would you make any commonwealth a unit, educate her sons together. This is the secret of the harmony which has so remarkably characterized our State. It was not the influence of a single mind, great as that mind was; it was no tame submission to authoritative dictation. It was the community of thought, feeling, and character, achieved by a common education within these walls. Here it was that heart was knit to heart, mind to mind, and that a common character was formed. All these advantages must be lost if the sectarian scheme prevails. South Carolina will no longer be a unit, nor her citizens brothers. We shall have sect against sect, school against school, and college against college; and he knows but little of the past who has not observed that the most formidable dangers to any State are those which spring from divisions in its own bosom, and that these divisions are terrible in proportion to the degree in which the religious element enters into them.

I shall say no more upon the college. I have spoken of its end, its organization, and its defects, and have vindicated the policy upon which it was founded. What I have said I believe to be true, and I am sure that it is seasonable; and nothing would delight me more, as a man, as a Christian and a patriot, than to see all jealousies laid aside, all sectarian schemes abandoned, and the whole State, as one man, rally to its support. It would find ample employment for all the funds which private liberality is pouring into the coffers of other institutions; and when charity had done its utmost and the Government still more freely unlocked its treasury we should have a splendid institution without doubt, but one which was still not perfect. Education is a vast and complicated interest, and it requires the legacies of ages and generations past, as well as the steady contributions of the living, to keep the stream from subsiding. Let it roll among us like a mighty river, whose ceaseless flow is maintained by the springs of charity and the great fountain of public munificence. Let us have a college which is worthy of the name, to which we can invite the scholars of Europe with an honest pride, and to which our children may repair from all our borders, as the States of Greece to their Olympia or the chosen tribes to Mount Zion. How beautiful it is for children to dwell together in unity.

THE FREE SCHOOLS.

II. The next part of our system in the order of legislation is the free schools. And here I am sorry to say that the law is not only inadequate, but there is a very extraordinary discrepancy between the law and the practice which increases the difficulty, and has added to the inefficiency of the standing appropriation. It is

clear from the face of it that the act of 1811 was designed as the first step toward the establishment of a system of common schools that should bring the means of elementary education within the reach of every child in the State. It was not intended to be a provision for paupers. Throughout our statutes free schools mean public schools, or schools which are open to every citizen. The first act in which I find the expression is that of the 8th of April, 1710, entitled "An act for the founding and erecting of a free school for the use of the inhabitants of South Carolina." This act created and incorporated a board of trustees for the purpose of taking charge of such funds as had already been contributed, or might afterwards be contributed, for public instruction in the province. In it the epithet free is synonymous, not with pauper, but public or common. The same is the case in the act of the 7th of June, 1712, entitled, "An act for the encouragement of learning." Although the school was a free school every pupil was obliged to pay for his tuition. But the meaning of the phrase is made still clearer by the extended act of the 12th December of the same year. There the school was manifestly open to all. Special inducements were held out to patronize and encourage it, and provisions made for educating a certain number free of expense. The act of 1811, which is the basis of our present system, is so clear and explicit as to the kind of schools to be founded that I am utterly unable to account for the partial and exclusive interpretation which has been put upon its words. The third section provided "that every citizen of this State shall be entitled to send his or her child or children, ward or wards, to any free school in the district where he or she may reside, free from any expense whatever on account of tuition; and where more children shall apply for admission at any one school than can be conveniently educated therein, a preference shall always be given to poor orphans and children of indigent and necessitous parents."

I have no doubt that if this act had been executed according to its true intent and meaning, and public schools had been established in every district of the State corresponding to the number of members in the House of Representatives, the advantages would have been so conspicuous that the legislature could not have stopped until the means of instruction had been afforded to every neighborhood, to every family, and to every child. The law was wise. It was strictly tentative and provisional, but its benevolent intention has been defeated by a singular misconception of its meaning. As a provisional law it was defective in unity of plan. The commissioners in each district were absolutely independent and irresponsible. There was no central power which could correct mistakes, and which could infuse a common spirit and a common life into the whole scheme. The consequence is that, after all our legislation and all our expenditures, we have not even the elements in practical operation of a system of public schools. We have the whole work to begin anew.

You will permit me to suggest a few reasons why we should begin it heartily and at once, and then to imitate the nature and extent of our incipient efforts.

In the first place, it is the duty of the State to provide for the education of its citizens. Even Adam Smith, who, we have seen, was opposed to the direct interference of the Government in the higher or liberal education, is constrained to admit that the education of the common people forms an exception to his principle. He makes it the care of the Government, upon the same general ground of the cultivation of a martial spirit. We should be as solicitous that our citizens should not be ignorant as that they should not be cowards. The whole passage is so striking that you will excuse me for quoting it in full:

THE DUTY OF THE STATE.

But a coward, or a man incapable either of defending or revenging himself, evidently wants one of the most essential parts of the character of a man. He is as much mutilated and deformed in his mind as another is in his body who is either

deprived of one of his most essential members or has lost the use of them. He is evidently the more wretched and miserable of the two, because happiness and misery, which reside altogether in the mind, must necessarily depend more upon the healthful or unhealthful, the mutilated or entire state of the mind, than upon that of the body. Even though the martial spirit of the people were of no use toward the defense of the society, yet to prevent that sort of mental mutilation, deformity, and wretchedness which cowardice necessarily involves in it, from spreading themselves through the great body of the people, which still deserve the most serious attention of Government, in the same manner as it would deserve its most serious attention to prevent a leprosy or any other loathsome or offensive disease from spreading itself among them; though, perhaps, no other public good might result from such attention besides the prevention of so great a public evil.

The same thing may be said of the gross ignorance and stupidity which, in a civilized society, seems so frequently to benumb the understanding of all the inferior ranks of people. A man without the proper use of the intellectual faculties of a man is, if possible, more contemptible than even a coward, and seems to be mutilated and deformed in a still more essential part of the character of human nature. Though the State was to derive no advantage from the instruction of the inferior ranks of the people, it would still deserve its attention that they should not be altogether uninstructed. The State, however, derives no inconsiderable advantages from their instruction. The more they are instructed, the less liable they are to the delusions of enthusiasm and superstition, which, among ignorant nations, frequently occasion the most dreadful disorders. An instructed and intelligent people, besides, are always more decent and orderly than an ignorant and stupid one. They feel themselves more respectable and more likely to obtain the respect of their lawful superiors, and they are, therefore, more disposed to respect those superiors. They are more disposed to examine, and more capable of seeing through the interested complaints of faction and sedition; and they are, upon that account, less apt to be misled into any wanton or unnecessary opposition to the measures of government. In free countries where the safety of government depends very much upon the favorable judgment which the people may form of its conduct, it must surely be of the highest importance that they should not be disposed to judge rashly or capriciously concerning it.

If the community wish to have the benefit of more knowledge and intelligence in the laboring classes, says Say, it must dispense it at the public charge. This object may be obtained by the establishment of primary schools of reading, writing, and arithmetic. These are the groundwork of all knowledge, and are quite sufficient for the civilization of the lower classes. In fact one can not call a nation civilized, nor consequently possessed of the benefits of civilization, until the people at large be instructed in these three particulars. Till then it will be the partially reclaimed from barbarism.

I might multiply authorities to an indefinite extent, showing it is the general opinion of political philosophers that popular instruction is one of the most sacred duties of the Commonwealth. The opinion obviously rests upon two grounds—the importance of education in itself and in its relation to the State, and the impossibility of adequately providing for it without the assistance of the legislature. The alternative is either that the education of the people must be abandoned as hopeless or the Government must embark in the work. Surely, if this be really the state of the case, South Carolina can not hesitate a moment as to which branch of the proposition she will choose.

THE FOLLY OF INDIVIDUAL EFFORT.

When it is remembered that education makes the citizen as well as the man, that it is precisely what fits a human being to be a living member of a Commonwealth, we can not hesitate as to whether our people shall be ciphers or men. And that this is the alternative is clear, both from the nature of the case and from fact. Whoever considers what it is to provide an adequate system of instruction for all the children of a country; the amount of funds necessary to erect schoolhouses, to found libraries, to procure the needful apparatus, to pay teachers, and to keep the machinery once set in motion in steady and successful operation, will perceive the folly of intrusting such a task to the disjointed efforts of individuals, or the conflicting efforts of religious denominations. In either case there will be no unity of plan, no competency of

means. What is done must be done partially, and, because partially, must be done amiss.

All experience [says Sir William Hamilton] demonstrates the necessity of State interference. No countries present a more remarkable contrast in this respect (in regard to popular education) than England and Germany. In the former the State has done nothing for the education of the people and private benevolence, more than has been attempted elsewhere. In the latter the Government has done everything and left to private benevolence almost nothing to effect. The English people are, however, the lowest, the German people the highest in the scale of knowledge. All that Scotland enjoys of popular education above the other kingdoms of the British Empire she owes to the State, and among the principalities of Germany, from Prussia down to Hesse Cassel, education is uniformly found to prosper exactly in proportion to the extent of interference and to the unremitting watchfulness of the Government.

The experience of the last half century in Germany has, indeed, completely set at rest the question. For thirty years no German has been found to maintain the doctrine of Smith. In their generous rivalry the Governments of that country have practically shown what a benevolent and prudent policy could effect for the university, as well as for the school, and knowing what they have done, who is there now to maintain that for education, as for trade, the State can present evil but can not originate good?

There are those among us who admit that no complete system of popular education can be instituted without the intervention of the State, and yet maintain that the true method of intervention is simply to supplement individual exertions; that is, they would have those who are able to do so educate their children in schools sustained by themselves, and solicit the aid of the legislature only for paupers. It is obvious, in the first place, that in this there is no system at all; the schools are detached and independent; they have no common life, and the State knows nothing of the influences which may be exerted within them. Education is too complicated an interest, and touches the prosperity of the Commonwealth in too many points, to be left in reference to the most important class of its subjects absolutely without responsibility to the Government. The homogeneousness of the population can only be sustained by a general system of public schools.

In the next place, the scheme is invidious; it makes a reproachful distinction betwixt the children of the Commonwealth, and in the last place it must, from this very circumstance, be inefficient. Parents will scorn a favor rather than permit their children to be stigmatized as the condition of receiving it. The true policy of the State is to recognize no distinction between the rich and poor; to put them all upon the same footing; to treat them all upon the same footing; to treat them simply as so many minds whose capacities are to be unfolded and whose energies are to be directed. The rich and the poor in the schoolhouse, as in the house of God, should meet together upon the ground of their common relations, and the consequences of this promiscuous elementary training would soon be felt in harmonizing and smoothing all the unevenness, harshness, and inequalities of human life.

In the second place, the State should make some speedy provision for popular education in consequence of the unusual demand which, in some form or other, is indicated as existing in every section of the country.

THE DEMAND FOR SCHOOLS.

There never was a greater cry for schools; the people are beginning to appreciate their importance, and at no period within my recollection have such strenuous efforts been made to establish and support them. The extraordinary exertions of the various sects—exertions, too, which deserve all praise when considered as attempts to satisfy an acknowledged public want, and the success which has attended them—are proofs that public opinion is rife in South Carolina for the interference of the legislature; and if it should not speedily interfere, this great and mighty interest will pass com-

pletely out of its hands, and be beyond its regulation and control. It is a critical period with us in the history of education. The people are calling for schools and teachers, and if the State will not listen to their cries they will be justified in adopting the best expedients they can, and in acceding to the provisions which religious zeal proposes to their acceptance. Our people are not, as a body, in favor of sectarian education. They prefer a general and inclusive system, and if they adopt the narrower one, it will be because their own Government has been inattentive to their interests. I sincerely hope that the legislature may be duly sensible of the delicate posture of this subject. To my mind it is clear as the noonday sun that if anything is to be done it must be done at once. Now or never is the real state of the problem.

In the third place, the State should take the subject in hand, because this is the only way by which consistency and coherence can be secured in the different departments of instruction. Education is a connected work, and its various subdivisions should be so arranged that while each is a whole in itself it should be at the same time a part of a still greater whole. The lower elementary education should, for example, be complete for those who aspire to nothing more; it should likewise be naturally introductory to a higher culture. It should be a perfect whole for the one class and a properly adjusted part for the other. So, also, the higher elementary education—that of the grammar school—should be complete for those who are looking to liberal education, and yet, in relation to others, subsidiary to the college or the scientific schools. This unity in the midst of variety can not be secured without a common center of impulse and of action. There must be one presiding spirit, one head, one heart. Education will become a disjointed and fragmentary process if it is left to individuals, to private corporations, and religious sects. Each will have his tongue and his psalm, and we shall have as many crotchets and experiments as there are controlling bodies. The competition excited will be a competition not for efficiency in instruction, but for numbers. Each will estimate success by the host that can be paraded at its annual festivals or the pomp and pretension of a theatrical pageant, played off under the name of an examination. This is not the language of reproach; it is a result which, from the principles of human nature, will be inevitably necessitated by the condition in which they shall find themselves placed.

Let me add, in this place, that public education is recommended by considerations of economy. Absolutely it is the cheapest of all systems. It saves the enormous expense of boarding schools, or the still heavier expense of domestic tutors, one of which must be encountered when it is left to private enterprise to supply the means of education. If the amount which is annually expended in South Carolina upon the instruction of that portion of her children who are looking to a liberal education could be collected into one sum we would be amazed at the prodigality of means in comparison with the poverty of the result. The same sum judiciously distributed would go very far toward supplying every neighborhood with a competent teacher. From the want of system there is no security that with all this lavish expenditure efficient instructors shall be procured. Those who employ the teachers are not always competent to judge of their qualifications, and the consequence is that time and money are both not infrequently squandered in learning what has afterwards to be unlearned. The danger, too, of sending children from home at an early age, the evil of exemption from parental influence and discipline, are not to be lightly hazarded. The State should see to it that the family is preserved in its integrity and enabled to exert all its mighty power in shaping the character of the future citizens of the Commonwealth. Comparatively public education is cheap, as general intelligence contributes to general virtue, and general virtue diminishes expenditures for crimes. It is cheap, as it develops the resources of the country and increases the mass of its wealth. It is not labor, but intelligence, that creates new values; and public education is an outlay of capital that returns to the coffers of the State with

an enormous interest. Not a dollar, therefore, that is judiciously appropriated to the instruction of the people will ever be lost. The five talents will gain other five; and the two talents other two, while to neglect this great department of duty is to wrap the talent in a napkin and bury it in the bowels of the earth.

THE REAL DIFFICULTY.

But, after all, the practical question is one of real difficulty. What shall the State do? This is a point of great delicacy, and demands consummate wisdom. Nothing should be done abruptly and violently. No measures should be adopted that are not likely to recommend themselves—no attempt made to force an acquiescence into any provisions, however salutary they may have proved elsewhere, which are not founded in the habits and predilections of the people or obviously indispensable to elevate and improve them. The public mind should be prepared for every great movement before it is begun. Popular enthusiasm should, if possible, be awakened by addresses and disputations, which, like pioneers, prepare the way for the law by making rough places plain and the crooked straight. Above all, we should guard against attempting to make our system too perfect at the outset. The words of Cousin are as applicable to us now as they were to France at the time he wrote them: "God grant that we may be wise enough to see that any law on primary instruction passed now must be a provisional and not a definite law; that it must of necessity be reconstructed at the end of ten years, and that the only thing now is to supply the most urgent wants and to give legal sanction to some incontestable points." *Festina lente* contains a caution which it becomes States as well as individuals to respect.

What we first need is a collection of the facts from which the data of a proper system must be drawn. We must know the number of children in the State of the ages at which children are usually sent to school, the kind and degree of education demanded, the relative distances of the residences of parents, the points at which schoolhouses may be most conveniently erected, the number of buildings required, the number of teachers, and the salaries which different localities make necessary to a competent support. Facts of this sort must constitute the groundwork. In possession of these we may then proceed to compare different systems, adopting from among them that which seems to be best adapted to our own circumstances, or originate a new one if all should prove unsatisfactory.

All, therefore, that in my judgment the legislature should undertake at present is to acquire this preliminary information, including the accumulation of facts, the comparison of different common-school systems, and the digest of a plan suited to the wants of our own people. This can be done by the appointment of a minister of public instruction, who shall be regarded as an officer of the Government, compensated by a large salary, and who shall give himself unreservedly to this great interest. Let him be required to traverse the State, to inspect the condition of every neighborhood, and from personal observation and authentic testimony let him become acquainted with the number, the extent, and the circumstances of the children. Let him be prepared to say where schoolhouses can be most conveniently erected, the distance at which they should be removed from each other, the kind of teacher needed in each neighborhood, and let him indicate what sections of the State are unprepared for schools in consequence of the dispersion of their inhabitants. Let him be able to give some probable estimate of the expenses incident to the successful operation of an adequate scheme. In the next place it should be his duty to master the existing systems, whether in this country or in Europe, and to lay before the legislature a succinct account of their fundamental provisions. Let him propose the scheme which he thinks ought to be adopted here, and let his report be referred to an able and learned commissioner, charged with the final preparation of such a scheme as we may be ready to enact into law.

I shall not disguise from Your Excellency that upon many points connected with details of any and every scheme my own opinion has long ago been definitely settled. The extent or degree of elementary education, the best mode of securing competent teachers, the principle which should regulate their salaries, the introduction of religion into the schools—these, and many other similar topics, I have investigated to my own satisfaction. But, in the present condition of the whole subject, it would be obviously premature to express the opinions of any individual. The minister of public instruction should have the whole subject before him, and whatever discussions may take place upon details should be consequent upon and not prior to this report. All, therefore, which I would now press upon Your Excellency is to have public instruction erected into a department of the Government. That is the first and indispensable step, and until that is done there never can be a plan adequate, consistent, successful. I have only to add here that this is substantially the recommendation which I had the honor to make in concert with the Bishop of Georgia some fourteen or fifteen years ago, 1838, and time and observation have only strengthened my convictions of the wisdom and necessity of the measure.

MILITARY SCHOOLS.

The third and last part of our system is the military schools. What I have to suggest in regard to them is that they be made to supply a want which is constantly increasing as the country advances in trade and the arts. It is a great evil that there should be nothing intermediate between the grammar school and the college, and that all who wish to acquire nothing more than the principles of physical science, on account of their application to various branches of industry, should be compelled to purchase this privilege by bearing what to them is the heavy burden of liberal education. They do not want Latin, Greek, and philosophy, and it is hard that they can not be permitted to get a little chemistry, a little engineering, or a little natural philosophy, without going through Homer and Virgil, Aristotle and Locke. “Two great evils” (I use the words of Cousin, who is deploring a similar state of things in France)—“two great evils are the consequence. In general these boys, who know they are not destined to any very distinguished career, go through their studies in a negligent manner; they never get beyond mediocrity; when at about 18 they go back to the habits and the business of their fathers. As there is nothing in their ordinary life to recall or to keep up their studies, a few years obliterate every trace of the little classical learning they acquired. On the other hand, these young men often contract tastes and acquaintances at college which render it difficult, nay, almost impossible, for them to return to the humble way of life to which they are born; hence a race of men restless, discontented with their position, with others, and with themselves; enemies of a state of society in which they feel themselves out of place, and with some acquirements, some real or imagined talent, and unbridled ambition, are ready to rush into any career of servility or revolt.” Our colleges ought, without doubt, to remain open to all who can pay the expenses of them, but we ought by no means to force the lower classes into them; yet this is the inevitable effect of having no intermediate establishment between the primary schools and college.

The remedy, as I have already shown, is not to change the construction of the college, but to employ the elements which we confessedly have, and which are essentially suited to the purpose.

I shall trespass upon the patience of Your Excellency no longer. In all that I have said, I have had an eye to the prosperity and glory of my native State. Small in territory and feeble in numbers, the only means by which she can maintain her dignity and importance is by the patronage of letters. A mere speck compared with several other States in the Union, her reliance for the protection of her rights and her full and equal influence in Federal legislation must be the genius of her states-

men and the character of her people. Let her give herself to the rearing of a noble race of men, and she will make up in moral power what she wants in votes. Public education is the cheap expedient for uniting us among ourselves and rendering us terrible abroad. Mind, after all, must be felt, and I am anxious to see my beloved Carolina preeminently distinguished for the learning, eloquence, and patriotism of her sons. Let us endeavor to make her in general intelligence what she is in dignity and independence of character—the brightest star in the American constellation. God grant that the time may soon come when not an individual born within our borders shall be permitted to reach maturity without having mastered the elements of knowledge.

I am, with considerations of the highest respect,

J. H. THORNWELL.

CHAPTER VII.

THE ORGANIZATION AND DEVELOPMENT OF THE AMERICAN COMMON SCHOOL IN THE ATLANTIC AND CENTRAL STATES OF THE SOUTH, 1830 TO 1860.

By A. D. MAYO, LL. D.

In Chapter XVI, Part I, of the Report of the United States Commissioner of Education for 1893-94 the author of the present essay has traced the history of popular education in the original colonies of the southern Atlantic coast from Maryland to Georgia. It was there shown that, while the leading class of these six important provinces, including Virginia—at the opening of the Revolutionary period the most populous and prominent of the entire thirteen—were not indifferent to the education of their own families by the methods then in vogue in Great Britain, and by other expedients adapted to a new and sparsely populated country, there was still nothing that could be regarded as a system of public school instruction for the majority of the plain white people, and the negro population was shut off from all save occasional personal schooling through books. It is unnecessary here to do more than refer to the causes that prevented the establishment of the common schools of New England in all the provinces beyond the Hudson River until a generation after the close of the war of independence. These were the cosmopolitan quality of the original population of those colonies; their obstinate differences in nationality, language, and manners, and especially the variety of religious and educational beliefs and habits brought from the Old World.

In the Southern colonies the more decided prevalence of the system of slave labor was an active social barrier to general elementary education, which increased in importance until the close of the great civil war. There are few reliable statistics of white illiteracy in these provinces during the more than 175 years from the settlement at Jamestown, Virginia, till the establishment of the United States Government; but that the results of the British system of education in the colonies was the same as at home—in leaving a large proportion of the population destitute even of the most elementary schooling—can not be disputed.

But we have also shown that the great uprising in behalf of political independence in these colonies was accompanied with a very decided awakening to the importance of general education. The labors especially of the Presbyterian settlers that occupied the uplands of several of these States could be mentioned. Attention should also be called to the efforts of Thomas Jefferson and a group of like-minded statesmen, especially in Virginia, among whom were Washington, Cabell, and Madison, to establish in the new State of Virginia as a part of its organized public life a system of schools, even including the emancipation and educational training of the negro slaves, so complete that, if adopted, it would at once have given to that colony the leadership in education which it so long retained in politics. In the scheme of Jef-

person we trace the direct influence of his acquaintance with the great French, German, and Swiss educators, as the New England schools bore the marks of the English and Scottish methods then in operation at home.

But this movement among the foremost minds of these States, including the establishment of a national university at Washington, so dear to the heart of the Father of his Country, came at once too late and too early to be adopted by the Southern people. The plantation type of rural life had already been so established by the leading class that nothing like the New England common school was possible; and the separation of classes inevitable from this aristocratic organization of society more and more told against the schooling of the children of the whole people together, until the final breaking up of the old order by the abolition of slavery as the crowning result of the civil war.

But one result of this agitation of the general education of the people as a training for the new American civilization appeared in a measure not inferior in importance to the direct acceptance of the scheme of Jefferson by the six colonies of the South. This was the remarkable union of the Southern with the Northern members of the congress of the confederation in the passage of the ordinance of 1787 by the unanimous votes of the eight colonies there represented, and its subsequent adoption by the First Congress of the United States in 1789. By this act the people of the South and North virtually accepted the New England and Jeffersonian idea of general education in the consecration of one thirty-sixth of the vast public domain already ceded to the nation to the elementary and superior schooling of the whole people of all States hereafter to be added to the Republic. Under that beneficent act all, save the original thirteen States of the Union, have been endowed with a magnificent outfit for the training of the children and youth for American citizenship. One result of this act, unprecedented in the previous history of mankind, was the saving of the Union in 1860-1865, largely by the great Commonwealths of the Northwest, whose people had been educated at once into intelligence in letters and loyalty to the Republic. And it was no less a pledge to the Southern people that, in the fullness of time, they, too, should be permitted to enjoy the complete establishment of the American system of general education for the training in American citizenship in which, to-day, every Southern State participates for both races and all classes, to an extent even surpassing the prophetic idea of Jefferson and Washington at the dawn of the nation's life.

A radical characteristic of the Anglo-Saxon aristocratic form of society is the slow growth of popular and liberal practice in the details of a proper democracy. Nowhere has this tendency been more apparent than in the gradual, steady growth of the common-school idea in all the fifteen States which in 1860 were known as Southern from their peculiar organization of the system of slave labor. It is, perhaps, an inevitable, though a painful, result of the overwhelming interest among public men in the superficial changes of political and their absorption in the material interests of the country that no biographer of Thomas Jefferson and his illustrious Southern compeers has seemed to comprehend the influence which this supreme interest of education awakened in his mind; apparent even on the face of all his published writings. And no American historian has yet given to this element in the development of civilization in our Southern States the prominence it deserves.

The educator who traces the beginning and progress of the American educational idea from its appearance in the colonial through every decade of the national life will see that never for a moment was it absent from the profound consideration of the foremost minds of the South. There is no record that any Southern statesman of the first class for two generations was ever found in open hostility to the education of the whole white population. A most instructive volume could be compiled from the official deliverances of the most eminent public men of all these States, again and again setting forth the dangers of popular illiteracy, and with a more

forcible, even pathetic, eloquence urging on legislators the absolute need of action. And although these efforts met with but fitful and partial response, even when not treated with absolute neglect, yet the good seed thus providentially scattered abroad fell into good ground.

Every generation witnessed the steady growth of a real educational public in all these Commonwealths. The first decided results of this movement were the establishment of the State universities, really the head of a public-school system, in the majority of these States and the gathering of State funds in several of them for the general education of the entire white population during the first half century of the national life. There was also a sincere and to a certain extent successful effort in several of these Commonwealths to establish a system of elementary schooling for the plain white people, in some respects resembling the present system in England, even before the great revival of the common school from 1830 to 1860.

A detailed account of these efforts as late as 1830 will be found in Chapter VII, Volume 2, of the Report of the United States Commissioner of Education for 1894-95. The most significant feature of this record is not the discouraging fact of the constant failure of these experiments, even of the most promising, especially in Virginia, the Carolinas, Louisiana, and Tennessee. This only proves that from the original structure of Southern society the successful establishment of the American common-school system, outside of a few of the larger cities and favored districts, was almost an impossibility. But it is deeply interesting to note the profound conviction of the importance of general education in numbers of the foremost educators, divines, and publicists in all these States. And equally notable is the growing desire among the masses of the Southern white people to participate in the advantages already enjoyed by the more favored class, while, at the same time, the poor substitute of the "old field school" offered to their children was like the crumbs of the feast spread for their betters.

It is for this reason that in proposing, for the first time, to give a connected account of the remarkable development of the American free public school in the sixteen Southern American Commonwealths from the year 1865, the close of the civil war, to the close of the century, we begin at a period thirty years earlier; the important era already treated in this series of papers as "The great revival of the American common school." It is true that the results of this important movement, which virtually lifted up the old-time country and city district school of the North to the present system of graded free elementary, grammar, and high, State and city normal schools, with the free State and city university and their ample environment of an atmosphere of general culture for all sorts and conditions of the people, were in no corresponding measure realized in the States now under consideration. Still, the educational public of the South, already an important element in its superior life, was profoundly stirred during the thirty years before 1860 by what was going on with such prodigious impetus on the other side of Mason and Dixon's line. Horace Mann and Henry Barnard were honored names in every educational center of these States. Many of the leading educational people of the new West were of Southern origin—like Thomas H. Benton in Missouri and Abraham Lincoln in Illinois—and their influence was potent. Henry Barnard frequently visited the South, and in Charleston and New Orleans his wise counsel was heeded. Horace Mann sent Mr. J. A. Shaw, of Massachusetts, to New Orleans, who established the first successful arrangement for public schooling in that city. The third United States Commissioner of Education, Hon. N. H. R. Dawson, dated his interest in education from a correspondence between his father, in Alabama, and Horace Mann, then president of Antioch College, in Southern Ohio. Mr. Mann, at Antioch, was brought directly in contact with many ambitious and able students from the border Southern States of Kentucky and Virginia.

But it was not alone or perhaps chiefly from the influence of this great Northern

movement that the thoughtful people of the South persisted, in their own moderate way, in the effort toward the final establishment of the people's common school. Indeed during this eventful period the political and social estrangement of the influential classes of the free and slave States, which was to culminate in the revolt of eleven Commonwealths in 1861, was a great barrier to the adoption of anything that suggested an imitation of Northern educational institutions. It will therefore be interesting here to briefly trace the progress of the Southern mind in respect to the whole question of general elementary education during the years from 1830 to 1860, and the efforts made to enlarge the boundaries of their educational system in the direction of a practical school system. For in no other way can the surprising unanimity with which all classes of the Southern people welcomed the gift of the Peabody educational fund, the coming of Dr. Barnas Sears and Dr. Eben Stearns, even during the turbulent period of the "Reconstruction," and the immediate entrance upon the most notable movement in modern times for the establishment of a working system of public schooling be accounted for. The student will thus understand the work of these formative years in the building up of a widespread common-school sentiment which, like one of the great underground rivers of the Southern limestone region, at last forced its way from the hidden caves of the uplands to its afflux into the open Gulf.

But before we proceed to treat of this movement in the different States of the South, it will be important to do a late justice to one element of the educational life of all these States which, almost from the first, kept alive in a partial but still effectual way the central idea of the American common school. The central idea which is the very soul of the entire system—that the whole people shall establish, organize, support and supervise the educational training of all children and youth for American-Republican life—was of course in conflict with much in the constitution of Southern society. But the history of the "Old Field Schools" of the South, so well pictured in the delightful sketches of the humors and eccentricities of Southern country life by the facile pen of the late Mr. Richard Malcolm Johnston, in successive Reports of the national Bureau of Education, has been revealed to the educational public of the country as the actual beginning, from the earliest period of the colonial life, of what is now everywhere known as the Southern country district public school for all classes and both races of people.

The early settlements of the Southern colonies were, even more than in the North, entirely rural. The establishment of the plantation system of agriculture, including the social features of the landed proprietor and county magistrate of Old England, made anything like the New England system of town and district common schooling an impossibility. The more wealthy families were able to employ a private tutor or governess. Many of the most eminent men of the North, like Dr. William Ellery Channing, William H. Seward, James G. Blaine, and great numbers of others only less celebrated, spent a portion of their early post-graduate years in teaching in the South. It was also a habit of the same class of families to send their sons, and to a less extent their daughters, to the academies and colleges of the North, or even to Europe, for a liberal and professional education. But the majority of the families, even of the respectable class, found a more convenient and less expensive method of giving a desirable schooling by the adoption of a private neighborhood arrangement, including as many pupils as could be conveniently brought in reach of a central schoolhouse.

In time this method, at first adopted as a neighborhood convenience, grew into something like a general system of schooling. The teachers in the more remote districts were often of the peculiar sort described in the entertaining stories of the old field schools in the writings of Col. Johnston. On the appearance of the wandering pedagogue the families interested, after satisfying themselves of his character and capacity, built a log or frame schoolhouse, as in New England, as near the center of

the school community as possible; furnished it according to the "rough and ready" fashion of the day, and placed therein the master to "work out his salvation," often with fear and trembling, as the "guide, philosopher, and friend" of the group of boys and girls intrusted to his charge. The "good old idea" of absolute submission to parental authority at all hazards, reenforced by the salutary apprehension of the rod, still prevailed. The record of these schools, established all through the South, and existing till they were supplanted by the present system of public-school instruction, is one of the most interesting features of the old-time Southern life.

But, with all these crudities and hindrances, it is easy to perceive in this arrangement some of the most characteristic features of the American common-school system. The "old field school" was the only place, outside the home, where the people of the South had their hands on the schooling of the children. The college and the academy, except the State university and an occasional private, corporate, or family organization, were of the denominational religious order, generally under the control of the distinctively ecclesiastical authorities, often taught by clergymen and churchmen and almost entirely removed from popular influence or supervision. But here, with no such combination, the people kept their own hands on the entire arrangement. They built the schoolhouse, hired the teacher, furnished the children, paid the bills, and left the big boys to decide on the necessity of holidays. The schools were generally coeducational, in this respect resembling those of New England. The text-books were miscellaneous. The subjects of study were essentially those found under corresponding circumstances in the Northern schools of fifty years ago. And although the wandering teacher was sometimes a crank, a vagrant, or even a drunkard and a blackguard, often a foreign brother who had seen better days, yet in the more populous and cultivated neighborhoods he was often a student from a Northern college—frequently a young man whose name afterwards became a national household word. Andrew Jackson, James K. Polk, and Andrew Johnson had all "kept school" in this way, as several of the Presidents of the United States from the North and West had likewise done. Not unfrequently a scholar of good attainments was found in the chair of the "old field school" teacher, who could give to the boys an outfit for college, and whose school work showed a genuine enthusiasm for good learning. There can be no doubt that in this habit of personal, private, and neighborhood schooling must be found the explanation of the singular preparation of the Southern people of the superior classes for the establishment of the common schools, even extended to the children of the freedmen immediately after the close of the civil war.

Attention is now invited to a review of the efforts of the friends of the common school in behalf of its establishment for the white race in the South between 1830 and 1865. The new State of West Virginia made the first public successful movement for the introduction of the Northern system of common schools in 1864; but the detailed record of the progress of this new Commonwealth must be deferred to a possible future treatment of the development of the Southern States school systems during the past thirty-five years.

VIRGINIA.

The history of the American common school in the fifteen Southern States of the Union from the year 1830 until the close of the civil war in 1865 is to be understood not so much by the results actually achieved as by the steady growth of the idea of general education in the American sense in all those Commonwealths. The deeply interesting story of the beginnings of this movement for popular education in Virginia, always the most powerful, cultivated, and influential of these States, up to the period of the great revival of the common school, from 1830 to 1860, will be found in the Reports of the national Bureau of Education for 1893-94 and 1895-96. It now remains to continue this record through the forty years from 1830 to the final establishment of the present common-school system of Virginia in 1870.

But the history of popular education in the Old Dominion will be incomprehensible to the reader who does not keep his attention fixed on the drift of the idea of the education of the entire white people, which from the days of Thomas Jefferson went on with a movement as deliberate and decisive as the operations of nature, till its final triumph at the close of the civil war. The great work of Jefferson at the establishment of the State government in the abolition of primogeniture, the separation of state and church, and the corresponding changes in methods of legislative and judicial administration, left in the State a powerful body of enemies, who were only prevented by the absorbing perils of the war of independence and the overwhelming interest of the establishment of the National Government from forcing the sharp issue of "the classes versus the masses" in a declaration of political war to the death against the great democratic statesman. But there were still left two questions even more vital than either—the abolition of negro slavery and the education of the masses for the new American citizenship. Both these were a vital part of Jefferson's plan of State organization—indeed, were the foundation stones of his ideal of an American democratic commonwealth. Neither of these was accepted, although the majority of the leading Virginians of that epoch were to a greater or less extent in harmony with the young leader of the national democracy. These two fundamental questions furnished the battle ground on which the plain people of Virginia were successfully held at bay, notwithstanding the steady growth of the complete American idea of education, until the conflict of two hundred and seventy-five years was finally solved by the triumph of the Union in 1865.

Under the great enthusiasm inspired by the call to arms for colonial independence and the creation of the new Republic, it was possible for Jefferson, in 1796, to swing the general assembly of the State into a nominal adoption of a portion of his scheme for popular education. Joseph Cabell, the "right-hand man" of the great statesman through the thirty years' wearisome conflict for the schooling of the white people of Virginia, relates that when this proposition came before the general assembly the committee on education was unanimous in approval. But the representatives of the opposition most effectually carried their point in the passage of a general law, with the provision that its organization and enforcement were to rest with the judges of the several county courts. The one thing these excellent gentlemen did not intend to do was to set up in the Virginia of 1796 the common school for all white people that lay in the mind of the great agitator, Jefferson. He declared that this feature of the statute was fatal to its enforcement. His own absence from Virginia, by his connection with the administration at Washington and subsequent election to the Presidency, and his preoccupation by the many exciting questions that occupied the attention of the National Government during its early years, was improved by the opponents of popular education in keeping its public consideration as much as possible out of sight.

But meanwhile the progressive element of the Commonwealth, including an eminent body of its leading statesmen and private citizens, were by no means inclined to have this subject entirely buried out of sight or postponed by indirection to an indefinite future. Dr. William H. Ruffner, first State superintendent of education in Virginia, in 1876 declared that he could not recall the name of a single Virginia statesman of national reputation who had openly opposed the education of the people. Governor Monroe in 1801, Cabell in 1806-1808, Tyler in 1809-10 had urged this fundamental question upon the attention of the legislature. James Barbour and Charles Fenton Mercer led in the establishment of the literary fund in 1810. This fund, by the addition of moneys received from the General Government, had reached the sum of \$1,000,000 in 1818; a valuation much greater in its relative importance than in 1900.

In the Report of the national Bureau of Education for 1893-94 will be found an account of the educational movement under the leadership of Governor Nicholas.

After a wide investigation of the school systems of other States—not then so far advanced that there could be found much in addition to the original plan of Jefferson, action was taken. Joseph Cabell, still the right-hand of the movement of which Jefferson was the soul, informs us that “A strong party in the legislature was in favor of a regular district-school system, but that body was induced to first establish the university with the understanding that the free-school question should be pressed as an independent movement under the leadership of William C. Rives and himself.” The statement was made to the Clarksburg Western Virginia Association of Teachers, in 1840, that the members of the legislature from that part of the State beyond the mountains—the present southwestern Virginia and West Virginia—voted for the university under the distinct promise that a competent system of common-school education should be given to the Commonwealth for the use of its entire white population.

The original movement of Jefferson and his coworkers, even before the establishment of the Union, although “side-tracked” in Virginia, had scored a victory in the virtual adoption of the common-school idea by the Congress of the Confederation and of the new Republic, in the clasping hands by South and North under the leadership of Massachusetts and Virginia, for the consecration of a substantial portion of the public lands of the nation to the schooling of the children of all States thereafter to be admitted to the companionship of the old thirteen. It is not too much to say that this great national new departure in the interest of universal education, more than any other influence, prevented the final disruption of the Republic, and is responsible for the present status of the Union among the nations of the earth.

The second victory of the Jeffersonian educational idea was the establishment of the University of Virginia in 1820. This enterprise, so dear to the heart of the old statesman, absorbed his attention during his closing years and somewhat consoled him for the deep sorrow of the wreck of his private affairs and the postponement of his larger plan for the schooling of all the white children and youth of the State. But with a skill born of the training of more than two centuries in the political science of “how not to do it,” the enemies of the common-school system of the North favored the plan of the primary school for the poor, which held on with a death grasp fifty years longer, until its grip was broken by the abolition of negro slavery and the consequent downfall of the entire order of society founded upon it by the issue of the civil war.

The plan of the movement of 1820 was the proposition, in addition to the establishment of the University of Virginia by a generous loan, afterwards made a gift, from the literary fund, to appropriate a certain annual subsidy for its support and \$45,000 annually to the schooling of “the children of the poor” in reading, and writing, and arithmetic to the rule of three. The administration of the plan was intrusted to the judges of the county courts, who had so effectually shelved the common school of Jefferson more than twenty years before, in 1796. These authorities, by law, appointed the twelve hundred commissioners to whom was intrusted the management of the fund, as distributed in sums varying from \$300 to, in one instance, \$3,000 annually among the school districts into which the counties were divided. This subsidy, distributed at the rate of 4 cents a day for each pupil—\$2.50 to \$5 per year in the districts—provided for the schooling of as many poor children as could be obtained in such common, private, denominational, or even extemporized Sunday schools as were available.

This scheme did not even contemplate a system of popular education for the masses of children, who amounted in 1840 to 200,000 of the white race between the ages of 5 and 15. The theory was that all people above the pauper class could be trusted to school their own children, leaving to the State, on the one hand, the partial support of the university and military school, and, on the other, the school-

ing of the children of the "indigent population." The essential features of the scheme are well stated in the report of the legislative committee on education in 1841, in response to the memorial educational convention held in Richmond. They were:

(1) Its discrimination of "the poor" from all other classes of people. (2) The inevitable revolt of the "indigent class" against this discrimination, although made in behalf of their own children. (3) The whole scheme was separated from the influence of public opinion through the appointment of the commissioners who administered it by the county courts. (4) It made no demand on the personal effort of the people. (5) Only four counties had accepted the amended plan of 1820, by which a free district school could be established by a vote of four-fifths of the people, accessible to all classes of white children, supported largely by local taxation or subscription.

In 1820 the law of 1818 was supplemented by a permissive section, authorizing the people of towns and counties to establish a school open to all classes of white children, supported by local effort. But, as already stated, only four counties ever accepted it, and it only served as a clumsy device to mitigate the deep disappointment of the educational public and the unwillingness of the "poor class" to proclaim themselves as paupers by the acceptance of the meagre boon thrown down to them from above.

Under this apology for a genuine people's common school, the State went on for twenty years longer, till 1860. During the first few years not more than 8,000 of the children for whose benefit this fund was distributed could be gathered in. The commissioners did not attempt, save in rare instances, to establish schools, but paid tuition to such organizations as were accessible. The funds at best, in one case, would furnish \$9 $\frac{2}{3}$ for 27 children. The average school term was seventy-two days. Something better was proposed under a statute of 1829, which attempted a reform of the cumbersome method of the original law. In 1832 it was reported that 16,000 children had been schooled for \$46,892. The free district schools, authorized by the law of 1829, in 1832 contained but 1,475 pupils in the State, of whom 300 were "poor." The following years saw the whole number at school increased to 17,080, 18,006, and 19,000. In 1839 the amount appropriated by the State reached the sum of \$77,180; the national surplus revenue income assigned to the State being added to that of the literary fund, 20,000 children having at different times been in attendance during that year. In 1840, 26,732 poor children were enumerated, of whom 446 attended the district free schools, and the entire cost of the elementary education to the State was \$87,920.

By these figures it is seen that despite the numerous defects in the method of schooling the "poor children" the system had a steady growth during the first twenty years of its existence. The reports of the second auditor of the State abound with evidences of his own deep solicitude for the education of the children, and his untiring efforts prove the shiftless methods of administration that robbed the system of half the efficacy to which it might have attained. Every year he returns to his open condemnation of the indifference of the courts in the appointment of commissioners who only give to one-half the poor children a school for three months of the year. And this scanty opportunity was so abridged by irregularity of attendance and the useless teaching that was too often found in the unattractive and even repulsive schoolhouses, that it was in many cases a mockery of education. Gov. John R. Thompson well remarked, in 1850, that "no more painful reading to an educated Virginian could be found than the reports by the second auditor of the State on the condition of the literary fund, with the accompanying proceedings of the school commissioners through the Commonwealth." These reports were made by Mr. John Brown, jr., who for many years occupied the position which was the only tie which held the State of Virginia to the education of the masses of its people. In addition

to the details of the distribution and use of the original \$45,000, afterwards somewhat augmented by the income from the surplus revenue and other sources, by the 1,200 commissioners of the several counties and districts, it appeared that, in 1829, 11,799 poor children were educated at an expense of \$39,948, averaging about \$3.33 per capita. In 1830 the number of pupils had risen to 14,169, receiving \$39,948—\$2.82 per capita. In the beginning of the system the expenses were much larger, owing to the inefficient management by the commissioners, often appointed from the class least interested in what they were set to do. The report also reveals the fearful incapacity of many of the teachers, the practical impossibility of persuading the graduates of the university, colleges, and academies of the State to take up the work of instructing the poor and needy, and the natural pride of the humbler class at proclaiming themselves, as it were, thrust off into a corner to feed on the crumbs of knowledge that fell from the tables of their superiors. Great numbers of these people refused to send their children to school under these conditions, preferring that they should grow up in ignorance to standing before the country as pauper recipients of the scant charity of the State. Still in some of the districts the schools appear to have been passably good and attended by the children of the better-off families. And beyond the mountains in western Virginia they were frequently the only schools accessible to anybody.

Almost numberless were the devices proposed by the good auditor and the more earnest commissioners for the improvement of the system. The great difficulty of obtaining competent teachers was more apparent as the attendance increased and the demands on the schools were more stringent. It was suggested that the academies and colleges should be subsidized to take a certain number of the more promising of the poorer children and train them for this work. The commissioners were required to make special arrangements for children in sparsely populated counties. But, meanwhile, the people of the State were asking the reason why the indigent classes did not correspondingly decrease. On the one hand, the illiteracy of the Old Dominion was being demonstrated by the awkward revelations of the census, and there was a decided reaction of the rising public opinion of the country already by 1840 greatly agitated by the influence of the general movement of the educational public at home. It was in vain that the auditor and the commissioners dwelt on the perpetual increase in the school attendance and the good done even in this way; especially the fact that one of the greatest uses of the present system was the educating of public opinion for something better. The foremost minds of the State were not content with the schools, and the elements were evidently gathering for a movement that, at last, would insure the development of a better order of affairs.

In 1840 the population of Virginia was 740,858 white; free negroes, 49,852; negro slaves, 449,087; total, 1,239,797. The system of subsidizing all varieties of schools for poor children, at a cost of \$2.50 to \$4 per capita, through the expenditure of \$45,000 to \$75,000, under the administration of 1,200 commissioners appointed by the county courts, "with power to act" practically limited only to the amount intrusted to their discretion, reporting to the second auditor of the State, the only tie between the education of 200,000 children and youth and the Commonwealth, had now been more than twenty years in operation. The net result appears, as set forth by Gov. David Campbell, one of the most eminent of the governors of the State, in his message to the legislature, January 9, 1839. The governor shows that by a test of the signatures of the men called to sign their own marriage certificates, in 1817, the year before the establishment of the then existing school system, in round numbers one-fourth (1,127 out of 4,682) were unable to write their names. Ten years later, in 1827, the proportion had somewhat decreased, 1,116 out of 5,048; and in 1837, 1,047 out of 4,614.

In view of this condition of affairs the governor remarks, "it appears there still exists a deplorable extent of ignorance, and, in truth, it is hardly less than it was

thirty years ago when the school fund was created. * * * The education of females, it is to be feared, is in a condition of much greater neglect. * * * In the State there are 200,000 children (white) between 5 and 15; 40,000 report as 'poor children,' only one-half of whom are attending school. It is also to be feared that a large number of the more favored are growing up in ignorance for lack of convenient school facilities. Many at school derive little benefit from the inefficiency of teachers. * * * Thus the number likely to remain uninstructed and to grow up without good perception of their duties—religious, social, and political—is really of appalling magnitude, such as to appeal with affecting earnestness to a parental legislature."

President Henry Ruffner, of Washington College, one of the foremost educators of the State, is even more explicit, since his declarations are not influenced by an official political position. He writes to one of the conventions called in the interest of popular education: "More than 50,000 adult white persons were returned by the late census in Virginia as unable to read and write. These returns, beyond question, come far short of the truth. Not less than 150,000 of the adult white population are in a state of debasing ignorance—more than one-third of the 377,000 citizens over 20 years of age." Horace Mann declared that the statistics of illiteracy in the census of the United States at this period should be increased by one-third to include the large class of persons in the States who were reported as literate on the strength of some faint ability to make out "plain reading," but were practically unable to and never did read.

This important testimony from the head of the political class and from one of the most earnest of the educators was confirmed by a prominent citizen who, writing to the convention of friends of education at Clarksburg, W. Va., says: "The late reassessment of lands in the State shows an enormous decline in their value, and there are more persons at this time who can not read and write than there were ten or twelve years ago, although our white population has diminished." He looks to "the West" (now southwestern Virginia and West Virginia) for the movement in favor of the education of the masses, and "despairs of" the legislature, which seems unable to rise above the influence of local and neighborhood influences to deal with the general questions.

These declarations from the highest authorities were not so much the cause as the result of a movement predicted by the State auditor in his reports to the State legislature. He maintains that the schooling of the lowest strata of the people is the true beginning of educational reform; compelling every class above to respond to its effort to rise higher in the scale of opportunity. Especially was it evident that the movement must come from the undeveloped and sparsely populated region west of the Blue Ridge and the Alleghany Range, including all of the thirteen counties of the present southwestern Virginia and the entire area of the present State of West Virginia. The six colleges of the State, with one exception, were located on the eastern slope of the great dividing mountain range, as were the large majority of the fifty academies. The financial condition of the western Virginia people, far less implicated in the system of slave labor than those of the eastern part of the State, was such that the expense of schooling by tutors, or by family, private, or academical schools was not available for the great majority of the people. Hence the schools that depended on the meager subsidy of the literary fund were often attended by all classes of the population, while thousands of children living in the sparsely settled open country among these mighty hills and valleys were growing up outside the schoolhouse.

Here was the secret of the revolt against the "pauper system" of schooling then in vogue. It was shown that in many counties even the small sums doled out by the State were not used, and the "unexpended balance" was always left at the disposal of the disbursing official. It was suggested, and even at one time put into a

statute, that this supplementary fund be distributed through the academies and colleges of the State; but the revolt from below compelled the authorities to ignore the suggestion and finally refuse to act, and forced the legislature to increase the sum appropriated to the education of the "indigent" until it reached the neighborhood of 75,000, and at last of \$100,000. It was declared also that this condition of affairs was in itself a great hindrance to the efficiency of the colleges and higher class of academies, since these were all compelled to receive students really in need of primary schooling.

This may partially explain the claim sometimes made that, even at that day, a larger proportion of the boys of Virginia and the South than of New England and the North were receiving a "college education." The word "college," beyond the Hudson River, including the Central, Western, and Southern States, until a very recent date, and to some extent to-day, has practically covered a vast system of primary and secondary "university extension" that really corresponded to the public graded school of to-day; to say nothing of the fact that the enrollment of such a variety of pupils, compelled by the imperious mental necessities of the community, forced upon the ablest teachers of the higher seminaries an amount of distasteful work which seriously interfered with the efficiency of instruction in the higher departments.

The messages of Governor Campbell from 1837 to 1849, like a bugle call, evoked a hearty response from the educational public in every portion of the Old Dominion. There is no better proof of the steadily growing influence of the educational public than the class of delegates attending the remarkable series of conventions—four in number—that within the ensuing four years summoned the old Commonwealth to its duty to the children of the masses with a vigor of utterance and a weight of ability prophetic of the final organization of general education in Virginia thirty years later, in 1870.

The first of these important assemblies represented that portion of the State at once most neglected and most in earnest, which was known in Virginia as "the West." It was held at Clarksburg, now in West Virginia, on September 8, 1841, and was composed of 113 delegates from sixteen counties of the northwestern and Shenandoah Valley regions. It was presided over by Governor H. Lee, of Harrison County. Judge Drew (?) and President Henry Ruffner, of Washington College, sent important communications; the latter an elaborate plan of common-school reform. Two committees were appointed to prepare an address to the people of the State and a memorial to the legislature.

The legislature of Virginia at that period had fallen into a habit of not regarding the appeals and petitions of this portion of the State. The next convention, October 2, 1841, took a long stride over the great mountains to Lexington, in the Shenandoah Valley, the seat of Washington College and the Virginia Military Institute. The able presidents of these institutions, Drs. Ruffner and Smith, were both committed to educational reform. This assembly was composed largely of delegates from the rich and beautiful valley of the Shenandoah. Here was presented the most valuable document on general education issued in Virginia since the early days of Thomas Jefferson, viz, an elaborate plan for the organization of an entire educational system of public instruction in Virginia by President Henry Ruffner, of Washington College.

Dr. Henry Ruffner was born in the eastern part of the State in 1789, but in his childhood was carried by his father to the valley of the Great Kanawha, near Charleston, W. Va., where he was one of the pioneers in the manufacture of salt, at one time a leading interest in that locality. He was a graduate of Washington College, at Lexington, Va., in 1817, at the mature age of 28, and served for two years as a tutor in Mercer County. He studied theology under Doctor Baxter, president of his alma mater, was "licensed to preach" in 1819, and the same year was appointed a professor in Washington College. For thirty years he remained in this institution, filling

every professor's chair, and in 1836 was elected president, which position he held until 1848, when he was compelled by ill health to resign. His administration is said to have largely increased the popularity and advanced the solid reputation of the college. He combined, after the fashion of the day, his college presidency with church missionary work as a clergyman in the neighborhood. In 1849 he returned to his old home in Kanawha County, following the professions of farmer and preacher, until his death in 1861, at the age of 72. From Princeton and Washington colleges he received the academical and theological degrees of LL. D. and D. D. He was a constant contributor to the religious press of the day, and the author of several works, literary and moral. To the Northern public of forty years ago he was best known through the wide publication of a powerful essay on the eve of the civil war, originally read as a college club paper in Lexington, in opposition to negro slavery.

But his most important publication, probably little known to-day even in his native State, was his plan for the organization of a system of public-school education in Virginia, presented to the Lexington convention in 1841. This remarkable paper by President Ruffner, the most conspicuous leader of the progressive educational public of the South at that early day, has been reprinted in a preceding chapter of this Report (Chapter VI).

The next assembly was held at the capital of the State, Richmond, in October of the same year. One hundred and twenty-nine delegates from thirty-seven counties, besides members of the legislature, were present. The presiding officer was Hon. James M. Garrett. Reports were made from the committees on all classes of schools. The committee on popular education recommended a district free school system. The plan was adopted by the convention, with a memorial to the legislature and an address to the people. The general assembly responded by an educational bill which disappeared from view after its second reading. Mr. Thomas Ritchie, one of the most eminent journalists of the country and editor of the Richmond Enquirer, was an active spirit in this convention and chairman of the committee which presented its memorial to the legislature.

But four years more of the "patient waiting" and the "hope deferred" that not only "maketh the heart sick" but now and then furnishes the most decisive record of a waking up of the temper and a "doubling of the fist" of the mind in the formation of an obstinate will, brought the most inspiring of all these demonstrations of the rising educational public in the memorable convention held in Richmond in 1845. This assembly, pronounced by Dr. W. H. Ruffner, first State superintendent of education in old Virginia, in 1876, "as fine a representation of the best class of Virginians as could have been found," met in the house of delegates and adjourned to the Third Baptist Church by invitation of the famous Dr. Jeter of that important religious denomination. It was presided over by Governor McDowell. This distinguished orator and publicist was already noted for his interest in the cause of education. He was for many years a trustee of a Virginia college and greatly interested in all matters connected with the higher development of the State. In 1843, as governor, he had presented to the legislature a plan for educational reform prepared by President Smith, of the Virginia Military Institute, accompanied by a vigorous message, in which he declares that "one in twelve of the white inhabitants of Virginia can neither read nor write. This indisputable fact, which was brought to light by the census, declares a state of common education which appeals to our public authorities for immediate redress through these humiliating figures with a point and urgency of persuasion to which nothing can be added by words. If sixty days' tuition to half of the 'indigent children' of the State is the grand result which our present system is able to accomplish after so many years of persevering effort to enlarge and perfect its capacity, it is little more than a costly, delusive nullity, which ought to be abolished as worthless and a better one established in its place."

This convention, after long and interesting deliberations, prepared a memorial to

the legislature, and chose a local committee at Richmond to present it and watch its effect on the legislative fathers of the State.

The result was a report prepared by the committee on education in the general assembly and the preparation of a bill for a revised scheme of general education. The report of the legislative committee was one of the ablest documents of this period of eloquent and broad-minded declarations of the educational public of the State. It faces the question in such decisive language as this: "No measure of indulgence can cover the lamentable disparity between the promises and the results of the present system of primary education." In 1840, out of 48,198 "poor children" (probably an underestimate) only 27,349 were educated at all. The fact that out of 740,000 white people in the State of all ages, 58,732 persons of mature age are illiterate, shows that "the present plan has both failed of its ends and is also condemned upon public principles." In six counties of the State the white illiteracy "exceeds the whole number of illiterates to be found in entire States of the North." The unexpended balance of the literary fund showed that even what was distributed was not used. The praise of the system by some of its commissioners reads like "disguised satire." In forty counties not one-half the poor children were schooled. After a sharp arraignment of the system for its central defects, the committee thus report, rather as "devising a scheme which might carry with it a principle of self-progression and serve as a nucleus for further reforms than as the construction of any project with the delusive appearance of full and perfected proportions."

The first proposition is the constitution of a new department of public instruction with a State superintendent whose first business shall be agitation until the waters of the great deep, beneath which the all-absorbing and exhausting factions of party has submerged much of the noble zeal for education, shall have been broken up and the almost lifeless slumber of the people shall have yielded to the healthful appearance of an active enthusiasm. (2) It is proposed to transfer the appointment of school commissioners from the courts to their election by the people; to divide the counties into districts, each of which shall elect its commissioners for four years, out of whom the general body of the county school board is to be composed. (3) The sum of \$500,000, half of which shall be raised by taxation, the local tax to be laid by the commissioners, who shall be intrusted with the distribution of the State funds. (4) A rate bill for all save the poor. (5) Frequent visits and inspection of schools by commissioners. (6) The State superintendent to appoint a commission for inspection of schools with the local officials. (7) The State superintendent to be on the move among the people and visit the local authorities. (8) Certain State colleges to be established in which promising scholars may be trained for teachers. The committee cited the schools of New York, and had been in communication with Horace Mann and Henry Barnard.

In all these declarations of the leaders of the movement and the reports of committees, we are reminded that the elevated ideas and schemes of Jefferson had not died with him but, like good seed cast into strong and obstinate ground, had been ripening into even a broader and more practical view of public instruction than even he had contemplated. One is impressed with the broad intelligence, the irresistible logic, and the powerful statements of all these documents; not inferior, in their way, to the most notable deliverances of Mann, Barnard, and the leaders of the educational movement through the nation. Altogether, the public expression of these remarkable papers by a large number of the most distinguished publicists and educators of the State forms a body of educational literature honorable to the Commonwealth and deserving of perpetuation in a permanent form.

The result of all this agitation in influential quarters was seen in a new school law, giving the authority to all the counties to establish a system of public schools. But the statute had the fatal defect of the permissive element, which for so many years held back the common-school system of several of the most powerful States from

success. Many counties seemed to have dallied with it. The number of children who attended school increased, and their opportunities were enlarged. "More had been done for primary education during the fifteen years previous to 1860 than at any period in the history of the State." But in the words of Dr. Ruffner, "The new law was poorly devised, its enemies were active, and the results were not satisfactory anywhere." The chronic weakness of the old order of society for any public reform was closely bound up with the difficulty from the growing excitement over the condition of this portion of the country drifting toward the great collision between the sections, which was precipitated by the election of Abraham Lincoln to the Presidency in 1860.

But, despite all discouragements, the good work went on. In 1850 the new constitution of the State contained this provision in section xxiv: "A capitation tax, equal to the tax assessed on land to the value of \$200, shall be levied on every white inhabitant who has attained the age of 21 years; and the equal moiety of the capitation tax upon white persons shall be applied to the purposes of education in primary and free schools; but nothing herein contained shall prevent exemption of taxable polls in cases of bodily infirmity." This provision was accepted by the people in the vote confirming the new constitution in 1851. In 1850 public schools were established in the city of Norfolk, in four districts, governed by commissioners, and in 1858 a new schoolhouse was built in each district. In 1860 the general school attendance of the State is reported as 102,000. During these years there had been a gradual gain over the illiteracy of the State. But the fearful experience of the war, which involved more than half the area of the Commonwealth and left old Virginia a scarred and ravaged battlefield, told with fearful effect on the cause of the children. Even five years after the breaking out of the war, only 59,792 white and 11,048 colored children were in school; and in 1869, "probably a majority of the 140,000 of school age were unable to read."

But the baleful influence of the coming war was felt during the entire eight years from the adoption of the new constitution till the election of Abraham Lincoln to the Presidency, in 1860. The enemies of the common school now found their most potent ally in the growing estrangement of the great sections of the republic and the popular hostility to all institutions characteristic of the Northern type of civilization. According to Dr. W. H. Ruffner, "After that we hear little more of public education until the smoke of war had cleared away." In 1856 the sluggish waters were again stirred by the memorable address of Hon. Henry A. Wise on his retirement from the Congress of the United States as representative of the Accomac district, to accept the position of minister to Brazil. This document is characteristic of the man and the time, and is important as furnishing evidence of progress in public education in Virginia up to 1860. A considerable portion of it will be found reprinted in a previous chapter of this Report (Chapter VI).

In 1850 there were reported in Virginia 12 colleges, with 73 teachers and 1,343 students, maintained at an expense of \$162,574; 317 academies, with 547 teachers and 9,068 pupils, and an annual income of \$357,087; 2,930 public schools, with 29,937 teachers and 67,353 pupils, including the schools for the children of the poor. There were 77,000 white adult and, altogether, 88,000 illiterates, almost entirely of native birth. There were 14 libraries, with 60,000 volumes. The population was 894,800 white, 54,333 free negroes, and 472,528 negro slaves; 1,421,661 in all. There were 87 newspapers, with a circulation of 89,134.

In 1854 the available literary fund was \$1,588,020. Seventy-five thousand dollars was appropriated to the schooling of the poor, \$15,000 to the university and \$1,500 to the State Military Institute. There were the remains of several of the original public funds, amounting to \$39,106. One hundred and nine thousand nine hundred dollars was expended annually for all public educational and charitable purposes by the State. In the forty years since the establishment of the university, some

\$800,000 had been invested by Virginia in the education of some 3,000 graduates of various orders. The University of Virginia was, doubtless, then at the head of the higher Southern education; indeed, several of the Southern colleges and universities had been organized on its peculiar type of dispensing with the president and arranging its course of instruction on the assumption that the standard was of the proper university grade. Although Harvard University, Massachusetts, and to a less extent the University of Pennsylvania, were in a way connected with the State, yet the University of Virginia, perhaps more than any single institution, set the pitch to the present system of American State universities, established, largely supported, and governed by the Commonwealth. In this respect, for a second time, the educational movement of Thomas Jefferson attained greater results outside the Old Dominion than at home; and more than one of the Southern and the new Western States had moved in this direction.

MARYLAND.

In the Report of the United States Commissioner of Education, Volume 2, 1894-95, the condition of public school education in Maryland previous to 1825 is briefly recorded. Some of the friends of education maintain that the two original "free schools," afterwards developed into colleges, founded in 1696, were the logical outcome of the system of American common schooling by the Commonwealth. While these and the subsequent "free academies," established under the colonial and State governments up to 1825, were chartered and, to a limited extent, subsidized by public authority, and at first were doubtless regarded sufficient, with the aid of private enterprise, for the schooling of the people, still there was little in their administration to encourage the friends of popular education. Much of the energy and zeal in behalf of general elementary education was dissipated in the struggle to divert the small public funds from the colleges to the academies, and afterwards to the primary schools. Indeed, until 1825, what was called a public school in Maryland was little more than an adaptation of the old English system of "free schools," meagerly subsidized by the Government, but in fact private institutions, under the absolute control of a close corporation.

The first genuine movement in Maryland for the schooling of the entire white population was made in 1825. At that time the area of the State was some 10,000 square miles, and the population, later, in 1830, 291,108 white, 52,938 free negroes, and 102,994 negro slaves; total, 447,040. The common school law of 1825 was framed in obedience to the vigorous demand of an educational public, formed by the pressing necessity that additional provision should be made for the general instruction of the people. Even twenty-five years later, 1850, 27,539 white persons were reported by the United States census as illiterate, and in 1840 1 in every 26.9 were reported as under this disability. The committee on education in the legislature of 1825 reported in favor of dividing the State into 400 school districts of 5 miles square each. The white population outside the towns and cities was estimated at 20 to the square mile; 6 children and youth of school age; 30 per cent of the people between the ages of 5 and 15. This would give an average of 150 children to a district. The average cost of the teacher was \$300, which gave \$156,000 for the education of the entire white school population in town and country, by the Lancasterian method, in which one teacher sufficed for 300 children, the laboring oar of instruction being assumed by the "raw hands," in the persons of "pupil teachers." The committee also urged the organization of the colleges and the county academies as a portion of the general school system, and the normal training of teachers through this agency; also an agricultural college. No provision was made for the 50,000 free and slave colored children, and not until the abolition of slavery and the establishment of the present public school system in 1865-1867 had this large body of children and youth any save the charitable and church parochial arrangements for instruction in letters.

The legislature responded to the report of its committee by establishing the first system of public schools in the State in 1825. It proposed the appointment of a State superintendent of education charged with the responsibility of administering a great organization, and performing the many duties of that office. The justices of the court of levy were empowered to appoint nine commissioners of schools for every county, and an additional board of eighteen to act as examiners of teachers, general inspectors, and visitors of the schools. The commissioners were authorized to divide the counties into school districts of suitable size and attend to the distribution of the school moneys of the State. A tax could be enforced on the districts for building and furnishing schoolhouses.

Mr. Teackle was appointed State superintendent of education, and held the office until the system was abolished, dependent on the vote of the county. It was adopted by only 13 counties. In 1828 the governor pronounced it a practical failure and the law was repealed.

From that time until the close of the civil war, in 1865, the effort in the direction of primary and secondary education seems to have been largely by the incorporation of private neighborhood schools, subsidized in a very moderate way by State funds, their support being eked out by tuition fees and personal contributions. The State school funds in 1831 amounted to \$142,963.76, of which \$47,293.66 belonged to the department burdened with the education of the children of "indigent parents;" \$5,000 was also appropriated to what was then known as the "University of Maryland;" \$13,800 to other colleges and academies, and \$3,500 to the education of the deaf and dumb. By 1850 the educational facilities of the Commonwealth were estimated at 13 "colleges," with 98 teachers and 1,129 students, with an income of \$122,000; 223 academies, with 503 teachers and 10,787 pupils, supported at a cost of \$239,000; and 898 primary schools, not under State control, chiefly private, corporate, and those subsidized for the poor, with 986 teachers, 33,111 pupils, and \$221,000 expended; in all other schools there were 45,000 pupils. There were 135 libraries, containing 104,730 volumes, 68 newspapers of all sorts, with a circulation of 124,247. The "conclusion of the whole matter" seems to have been reached by the decision of the legislature in 1856, that the system of public schools established in the city of Baltimore was in a state of the most utter and hopeless prostration.

The only vital spot in organized popular education during the thirty-five years subsequent to the repeal of the school law of 1825 was found in the city of Baltimore. Indeed it was largely at the instigation of the friends of common schools for the white race there that the law of 1825 was actually passed, and during this entire period that city expended more for common school education than all the rest of the Commonwealth. The law authorizing the establishment of common schools in Baltimore was passed in 1825, accepted by the city authorities in 1827, and entered upon practical operation in 1829. But until the establishment of the high school for boys, ten years later, it was a day of small things for the common school in the Monument city. In 1828 a board of six commissioners of schools was appointed, of which the mayor of the city was chairman, and several of the foremost citizens members. The first school opened in the basement of a church under the charge of Master W. H. Coffin. John Reeve had been the pioneer of the movement; "first to suggest the establishment of the common school and vote for it in the city council and one of the first of the city school commissioners." "He showed his faith by his works"—in defiance of the prejudice of the well-to-do class against the movement—by sending his own boy and urging his brother commissioners to "go and do likewise."

The number soon increased to seven, who were instructed in the school primer, speller, and definer, Murray's grammar, and Randolph's arithmetic. The off-day, Saturday, was devoted to a "battle royal" between the "number one" scholars and the "Old Town boys." At first there was a great reluctance among the people to sending their daughters to the new common schools as late as 1835, only 72 of the

402 pupils being girls. There was only \$1,431 available from the State funds at the beginning. This enabled the commissioners to attempt the establishment of 6 male and 6 female schools. In fact, the 4 schools were opened in 1829 in rented rooms. The schools were free, with the exception of \$1 paid by each pupil above the "indigent class" for books and stationery. A salary of \$400 for male and \$200 for female teachers was allowed. The attendance in the first year was only 269 for three months, and the expenses \$767.35, of which \$221.50 was collected from the small rate bills and other sources. By 1835 the number of scholars had increased to 402, with \$2,323 expended and \$1,260 received, \$3,000 having been appropriated for schoolhouses. The schools were conducted on the Lancasterian system of New York, the principal teacher being held responsible for every 300 pupils, although the head master "never heard the pupils recite a lesson."

Until 1839 there was no attempt at the proper grading of the schools, all under the high-school department being included in the general title "primary." The real history of the Baltimore system of public schools begins in 1839, when the Boys' High School, afterwards known as the Baltimore City College, was opened in a rented room with 46 pupils, and the worn-out Lancasterian method of instruction abandoned. The Bible, with a provision for the use of the Douay version by the children of Catholic parents, was used as a reading book. In 1840 the number of pupils in the public schools had risen to 1,823 and the amount expended to \$12,342—\$6.73 per capita.

In 1843 vocal music was introduced. In 1844 two high schools for girls were founded, which in time were housed in large buildings crowded with students. The schools were not fully graded until 1847. In 1849 the treasurer of the system was authorized to perform the duties of superintendent, and this arrangement held until 1866. In 1850 there was 1 central and 2 female high, 21 grammar, and 9 primary schools, with 119 teachers and 7,000 pupils, supported at an expense of \$45,653—\$6.38 per capita—and receipts of \$19,166. In 1851 arrangements were made in the girls' high schools for the normal instruction on Saturday of such as proposed to qualify as teachers in the city schools, and this arrangement continued until the foundation of the State Normal College in Baltimore in 1866. Evening schools were also established in 1852, with military drill and instruction in seamanship on the U. S. receiving ship *Ontario*. (?)

In 1860 the Baltimore public schools contained 305 teachers and 13,809 pupils, educated at an expense of \$148,000—\$8.49 per capita. Previous to 1867 there was no provision for the public schooling of colored children, although the Catholic and other churches and benevolent people had made some provision for that class in private and parochial schools.

DELAWARE.
