ABSTRACT

Purpose: The purpose of this study is to determine the level of the teacher's voice, and to examine the relationships between voice, five-factor personality traits and psychological safety.

Research Method: The study was conducted with a correlational survey model. The sample of the study consisted of 475 teachers in public primary schools. Three instruments were applied in the study; Employee Voice Scale, Quick Big Five Personality Test, and Psychological Safety Scale.

Findings: Results showed that the level of teachers voice was at level "Often", and there were significant and positive correlations between agreeableness,

extraversion, emotional stability and openness to experience, and teacher's voice; and also between psychological safety and teacher's voice; and lastly, between psychological safety and agreeableness and emotional stability.

Implications for Research and Practice: Significant and positive relationships were found between teacher voice, and psychological safety and personality while the strength of the relationships was low. Therefore, future studies might focus on other individual and organizational factors related to the teacher's voice.

Introduction

As traditional management thinking and practice have evolved over the last century, superior-subordinate communication types, management styles, mutual sharing and achievement become important in institutional structures for employees and employers in terms of organizational structures, motivations, and sustainability. In this respect, the decision-making process, production and development of strategies are not carried out only by the employers, but with the participation of employees. Employee input is an essential information source to take precaution for potential problems or to improve organizations. It is also important for employees to be able to voice their ideas, opinions, suggestions, and criticisms about work-related issues. In the literature, employee voice is defined as employees' voicing personal ideas and opinions on work-related matters and their involvement levels in organizational decision-making processes to improve the workplace (Van Dyne & LePine, 1998; Folger & Martin, 1986). Morrison (2011) states that employee voice involves improving an organization, resolving an organizational or business-related problem, opposing injustice or mismanagement, providing feedback on an important strategic issue or expressing different opinions arising from the perspectives of individuals. The results of studies on organizational effects of employee voice show that employees' voluntary contributions to the organization with ideas and information on learning and improvement prevent problems arising from not having enough knowledge of top-management (Tangirala & Ramanujam, 2008). From an individual perspective, individual reduces stress by increasing auto-control and job motivation (Parker, 1993), and their belief that problems can be solved positively affects their attitudes towards their jobs (Morrison & Milliken, 2000) when they are able to express problems and concerns about the work comfortably. These results indicate that employee voice is an important concept for both individuals and organizations.

On the other hand, employees might not share their opinions in their workplace. Employees avoid explaining their ideas for certain reasons (Morrison & Milliken, 2000), and silence of the employees can be negative in terms of organizational performance (Edmondson & Roloff, 2009). Furthermore, their health might be affected both psychologically and physically when they cannot talk about the problems related to their jobs (Cortina & Magley, 2003), and these adverse effects may threaten organizational performance. Thus, it is stated that employee voice making superior-subordinate communication possible within the organization is important to develop an organizational decision making and a good error detection system. The presence of employee voice seems positive for organizations while the lack of it might be harmful to organizations and employees.

For educational organizations, voice predicts the autonomy of teachers and students as it is a form of communication that reflects a democratic culture in the organizational structure. In this respect; knowledge, opinions, suggestions, criticisms and observations of teachers as employees of educational organizations are valuable resources for democratic organizational culture. Furthermore, sharing existing information is as important as a source of information within an organization; however, it is often difficult to share information in organizations (Yeniceri & Demirel,

2007). Since knowledge-sharing is significant for both improving the organization and resolving existing problems, the lack of knowledge-sharing and communication problems may threaten educational organizations and teachers as employees from many aspects. When teachers are not able to voice work-related opinions or information to the management, managers might be too late to solve the organizational problems, teachers might become demotivated and dissatisfied; thus, the educational quality and performance of schools might diminish. Since employee voice prevents these adverse situations, it is an organizationally desired behavior. Employees also have their own individual aims. For organizational performance, harmony between individual and organizational aims is important. According to the study conducted by Dundar and Tabancali (2012), teachers with experience of 1-5 years cannot adapt to their workplace. It is very common that teachers lose their teaching motivations in a few years, which has a negative impact on the success of the schools. The solution to deal with these problems may be a successful communication with the school administrations by making them aware of ideas, opinions, suggestions and desires of the teachers. Therefore, voice can be very effective to tackle these problems; thus, to find out to what extent the teachers' voice, and which factors are related to teacher's voices are vital issues for school administrations.

As it is seen, voice is vital for the sustainability and success of schools, so factors related to voice become an important field for researchers. Employees' beliefs about the efficacy of their voicing and concerns about risk due to voicing are critical to whether they voice (Morrison, 2011). Employees search for some contextual cues to decide on how proper to the voice in that organization (Dutton, Ashford, Lawrence & Miner-Rubino, 2002). For the development and sustainability of organizations, factors affecting voice are important. In the related literature, there are some studies that examine mechanisms enhancing or alleviating voice (Ashford & LeCroy, 2009; Detert & Burris, 2007; Dutton, Ashford, Lawrence & Miner-Rubino, 2002; LePine & Van Dyne, 2001; Milliken, Morrison & Hewlin, 2003; Morrison & Milliken, 2000; Morrison, 2011; Near & Miceli, 2008; Stamper & Van Dyne, 2001; Tangirala & Ramanujam, 2008). Still, employee voice concept seems ignored compared to other related concepts such as employee participation since it does not symbolize the exact outcomes such as influence or power-sharing (Wilkinson, Gollan, Kalfa & Xu, 2018). According to voice literature, the preliminary motive for voice is assumed to improve the performance of organizations or to provide collective benefits (Ashford & LeCroy, 2009). According to Morrison (2011), the factors related to voice are categorized as individual and contextual factors. Individual factors are summarized as the personality of employees, and attitude towards their duties; and contextual factors are summarized as organizational structure, organizational culture, and collective beliefs. While there are some studies examining factors related to voice, there are few studies examining teacher voice in school settings. However, it is a must to examine the teacher's voice, and related factors to voice to understand the nature of voice at schools to be able to develop the success of schools so that education improves. The aim of this study is to contribute to existing literature, to attract attention to teacher voice concept, and to fill the research gap by providing a better understanding of teacher voice concept. Therefore, the present study aims to find out the level of teachers' perceptions of voice

and whether there is a significant relationship between teacher voice, and personality and psychological safety. The research questions of the study are as follows:

1. What is the level of teacher voice?
2. Is there a correlation between psychological safety and teacher voice?
3. Is there a correlation between five factor personality traits and teacher voice?
4. Is there a correlation between psychological safety and five factor personality traits?

Method

Research Design

The study is a quantitative study based on the relational survey model. It examines the relationship between two or more different variables (Creswell, 2014). The variables examined in the study are employee voice, psychological safety and personality.

Research Sample

The study was carried out on the European side of Istanbul in the Fall and Spring semesters of the 2017-2018 academic year. The statistics of the National Ministry of Education shows that there are 22.272 teachers working in public primary schools (Istanbul Provincial Directorate of National Education, 2017). It is assumed that 377 teachers with a 95% confidence level represent the population stated above (Cingi, 2009). For this reason, 475 teachers were selected through simple random sampling from teachers in public primary schools in 25 districts on the European Side of İstanbul. Before the study was applied, the teachers were informed about the purposes of the study, and only volunteer teachers took part in the study.

77.1% of the participants were female while the rest 22.9% were male. As for their education level, 88.2% of the participants held a bachelor's degree, 11.4% master's degree, and 0.4% doctorate degree. Concerning their years of teaching, 28.2% of the participants had a working experience of 1-5 years, 22.1% 6-10 years, 20% 11-15 years, 12.6% 16-20 years, and 16.2% 21 years or more than 21 years. In terms of their years of working at the current school, 23,6% worked for less than 1 year, 52,8% for 1-5 years, 15,4% for 6-10 years, and 8,2% for 10 years or more than 10 years at the current school.

Research Instruments and Procedures

The quantitative data gathered through three different instruments, which were Employee Voice Scale, Quick Big Five Personality Test and Psychological Safety Scale. Employee voice was measured using The Employee Voice Scale developed by Van Dyne and LePine (1998). The scale was adapted to the Turkish language by Cetin and Cakmakci (2012). The scale consisted of six items, and the participants responded to a five-point Likert scale ranging from 1 "never" to 5 "always".

Exploratory and Confirmatory Factor Analysis was used to test the structural validity of the scale (Cetin & Cakmakci, 2012). To determine the construct validity of the scale, exploratory and confirmatory factor analyses were employed, and the analyses revealed only one factor. The factor loadings of the items were found above 0.70. The variance explained was 62%. The reliability coefficient was calculated as 0.874, and item-total correlations were above 0.56. These values show that the scale is acceptable, and the scale will provide valid and reliable results (Cetin & Cakmakci, 2012). When the reliability coefficients of the six-item Employee Voices Scale were examined, Cronbach's Alpha value of the general scale perceptions was calculated as 0.883. In the social sciences, it represents valuable, moderate security between 0.60 and 0.80 (Kalayci, 2009). Accordingly, the calculated reliability value indicates that the scale is reliable.

Five-Factor Personality Model is a quantitative way to assess personality traits, and the model is seen as a highly accepted way to assess personality by the researchers. It is conceptualized as five personality traits which are extraversion, agreeableness, emotional stability, conscientiousness and openness to experience and those five personality traits represent personality at the highest extent in organizations (Goldberg, 1993). By using five-factor personality traits, The Quick Big Five Personality Test was developed by Vermulst and Gerris (2005; as cited in Morsunbul, 2014). The scale was adapted to the Turkish language by Morsunbul (2014). It consists of 30 items with five dimensions which are extraversion, agreeableness, emotional stability, conscientiousness and openness to experience. The participants responded to a seven-point Likert scale ranging from 1 "Very untrue of me" to 7 "Very true of me".

Confirmatory Factor Analysis was used to test the structural validity of the scale (Morsunbul, 2014). χ^2 / sd ratio was calculated as 3.76 with DFA and the proposed model is compatible with the data according to these values. The Goodness of fit index was 0.91 and the comparative fit index value was 0.92; the Normed Fit Index was 0.91; the Not-Normed Fit Index was calculated as 0.91 and the Root Mean Square Error of Approximation was 0.08. These values show that the five dimensions of the scale which are agreeableness, extraversion, conscientiousness, emotional stability and openness to experience are acceptable and the scale will provide valid and reliable results (Morsunbul, 2014). Cronbach's Alpha value for each dimension was measured. 0.60-0.80 values show considerable reliability, and values which are 0.80 and above show high reliability in social sciences (Kalayci, 2009). Cronbach's Alpha value of Extraversion was 0,825, Cronbach's Alpha value of agreeableness was 0,740, Cronbach's Alpha value of emotional stability was 0,792, Cronbach's Alpha value of conscientiousness was 0,792 and Cronbach's Alpha value of openness to experience was 0,759. These values show that the test is reliable.

Psychological safety was measured using Psychological Safety Scale developed by Edmondson (1999; as cited in Yener, 2015). The scale was adapted to the Turkish language by Yener (2015). It consists of 7 items with two dimensions which are toleration and initiative. The participants responded to a seven-point Likert scale ranging from 1 "Strongly disagree" to 5 "Strongly agree".

Confirmatory Factor Analysis was used to test the factor structure of the scale (Yener, 2015). χ^2 /sd ratio was calculated as 2.80 with DFA and the proposed model was compatible with the data according to these values. The Goodness of fit index was 0.95 and the comparative fit index value was 0.95; the Normed Fit Index was 0.92 and the Root Mean Square Error of Approximation was 0.10 (Yener, 2015). These values show that the scale is acceptable, and the scale provides valid and reliable results. Cronbach's Alpha value for each dimension was measured; Cronbach's Alpha value of toleration was 0,607 and Cronbach's Alpha value of initiative was 0,684. Generally, Cronbach's Alpha value of studies was supposed to be above 0.70. However, according to Kalayci (2009), in social sciences, 0.40-0.60 values show low reliability, 0.60-0.80 values show considerable reliability, and values which are 0.80 and above show high reliability. These values show that the scale is reliable.

Data Analysis

The data were analyzed with SPSS 21 packet program. Since the population of the study was more than 30, Kolmogorov-Smirnov normality analysis was applied to determine whether the distribution of the data displayed normality. Pearson correlation analysis was used to analyze the relationship and the degree of relationship. Cronbach Alpha value test was used to evaluate the reliability of the scale (Kalayci, 2009).

Table 1

Normal Distribution Test Results

Scale	Statistic	df	p	Skewness	Kurtosis	Mean	Median
Psychological Safety	0,077	475	0,00	-0,480	0,346	3,40	3,42
Quick Big Five Personality Test	0,034	475	0,20	-0,022	-0,397	5,27	5,30
Employee Voice	0,105	475	0,00	-0,712	0,271	3,96	4,00

According to the results of Kolmogorov-Smirnov normality analysis, it was decided that the distribution of the data did not deteriorate from the normality although the data did not display normal distribution ($p < 0.05$), since the kurtosis and skewness were between ± 2.0 (George & Mallery, 2010), the mean and the media were close to each other, and the number of participants was above 30 due to the central limit theorem. As a result, it was decided to use parametric analyses.

It is stated that if the p-value is less than 0.05, it is interpreted that results are statistically significant. If the p-value is greater than 0.05, results are interpreted as statistically insignificant. If r value is between 0.70 and 1.00, it presents a high level of relationship. If the r-value is between 0.70 and 0.30, it presents a moderate relationship. If it is between 0.30 and 0.00, it presents a low relationship (Buyukozturk, Kilic Cakmak, Akgun, Karadeniz & Demirel, 2012).

Results

This part includes the analysis of the level of teacher voice and correlations between the variables. To find out the level of teacher's voice, mean and standard deviation values for each item are analyzed, described and explained in Table 2.

Table 2

The Level of Teacher Voice

Items		Never	Rarely	Sometimes	Often	Always	\bar{x}	s.s
1. I make suggestions about issues concerning the institution I work for.	n	13	54	131	136	141	3,71	1,09
	%	2,74	11,37	27,58	28,68	29,68		
5. I try to contribute to issues that may affect the quality of the work environment.	n	4	21	52	208	190	4,18	0,85
	%	0,84	4,42	10,95	43,79	40,00		
Mean = 3,97								

The level of the teacher's voice was at level "Often" ($\bar{x}=3.97$). The item with the highest mean the participants perceived was "I try to contribute to the issues that may affect the quality of my work environment." ($\bar{x}= 4.18$) while the item with the lowest mean was "I make suggestions about issues concerning the institution I work for." ($\bar{x}= 3.71$).

To find out the level of teachers' psychological safety perception, mean values for each dimension are analyzed, described and explained in Table 3.

Table 3

Mean Values for two Dimensions of Psychological Safety

Dimensions	\bar{x}
Toleration	3,48
Initiative	3,34
Mean = 3,41	

When the level of teachers' psychological safety perception was examined; it was determined that the level of perception on the dimension of toleration was at the level of "Agree" ($\bar{x}=3.48$). Teachers' level of perception on the dimension of the initiative was found to be "Neither agree nor disagree" ($\bar{x}= 3.34$). It was determined that their perception of psychological safety was at the level of "Agree" ($\bar{x}= 3.41$).

Table 4 shows the relationship between psychological safety, the dimensions of psychological safety and teacher voice.

Table 4

Correlation between Psychological Safety and Teacher Voice

	Teacher Voice	Toleration	Initiative	Psychological Safety
Teacher Voice	1	,180**	,275**	,261**
Toleration		1	,584**	,863**
Initiative			1	,914**
Psychological Safety				1

It was observed that there was a positive and low correlation between psychological safety and teacher voice ($p < 0.01$, $p = 0,000$, $r = 0,261$). As for its dimensions, similarly, it was observed that there was positive correlations between toleration and teacher voice ($p < 0.01$, $p = 0,000$, $r = 0,180$), and between initiative and teacher voice ($p < 0.01$, $p = 0,000$, $r = 0,275$) while the strength of the relationships was low.

Table 5 shows the mean values for each dimension to find out the level of teachers' five-factor personality traits perception.

Table 5

Mean Values for five Dimensions of Personality

Dimensions	\bar{x}
Agreeableness	6,05
Extraversion	4,75
Conscientiousness	5,35
Emotional stability	4,70
Openness to experience	5,50

When the levels of teachers' personality perception were examined; it was determined that the level of perception on the dimension of agreeableness was "Very true of me" ($\bar{x} = 6.05$). Teachers' level of perception on the dimension of extraversion was found to be "Somewhat true of me" ($\bar{x} = 4.75$). It was determined that their perception to the dimension of responsibility was "Very true of me" ($\bar{x} = 5.35$). It was

determined that their perception of the dimension of emotional balance was at the level of "Somewhat true of me" (\bar{x} =4.70). Their perception of the dimension of openness to experience was found to be "True of me" (\bar{x} =5.50).

As can be seen in Table 6, significant correlations were found between some personality traits and the teacher's voice.

Table 6

Correlations between Five-Factor Personality Traits and Teacher Voice

	Teacher voice	Agreeableness	Extraversion	Conscientiousness	Emotional stability	Openness to experience	Personality
Teacher voice	1	,309**	,295**	,089	,172**	,338**	,358**
Agreeableness		1	,235**	,277**	,233**	,487**	,622**
Extraversion			1	,028	,477**	,493**	,677**
Conscientiousness				1	,152**	,136**	,546**
Emotional stability					1	,250**	,690**
Openness to experience						1	,681**
Personality							1

There were positive correlations between agreeableness and teacher voice ($p < 0.01$, $p = 0,000$, $r = 0,309$), between extraversion and teacher voice ($p < 0.01$, $p = 0,000$, $r = 0,295$), between emotional stability and teacher voice ($p < 0.01$, $p = 0,000$, $r = 0,172$), and lastly, between openness to experience and teacher voice ($p < 0.01$, $p = 0,000$, $r = 0,338$). The strength of all the correlations was low.

Significant correlations were found between psychological safety and some personality traits in Table 7.

Table 7

Correlation between Psychological Safety and Five-Factor Personality Traits

	Toleration	Initiative	Psychological safety	Agreeableness	Extraversion	Conscientiousness	Emotional stability	Openness to experience	Personality
Toleration	1	,584**	,863**	,075	,063	-,010	,167**	-,012	,092*
		,000	,000	,104	,170	,822	,000	,795	,045
Initiative			,914**	,149**	,065	,009	,201**	,058	,144**
			,000	,001	,159	,840	,000	,207	,002
Psychological safety				1	,130**	,072	,000	,208**	,030
					,004	,118	,993	,000	,515
Agreeableness						1	,235**	,277**	,233**
							,000	,000	,000

									,000
									,000
Emotional stability									
									1
									,250**
									,690**
Openness to experience									
									,000
									,000
Personality									
									1

Agreeableness was positively correlated with psychological safety ($p < 0.01$, $p = 0,000$, $r = 0,130$). Emotional stability was positively correlated with psychological safety ($p < 0.01$, $p = 0,000$, $r = 0,208$). The strength of both correlations was low. It was found that there was no significant relationship between psychological safety and extraversion, conscientiousness and openness to experience.

When it comes to the dimensions of psychological safety, similar correlations were found. There were positive correlations between initiative and agreeableness ($p < 0.01$, $p = 0,000$, $r = 0,149$), and between initiative and emotional stability ($p < 0.01$, $p = 0,000$, $r = 0,201$) while the strength of the relationships was low. It was found that there was no significant relationship between toleration and five-factor personality traits.

Discussion, Conclusion and Recommendations

The study was conducted to determine the level of the teacher's voice. It also examined the relationships between voice, five-factor personality traits and psychological safety. This section includes a discussion of the findings.

The first aim of this study was to determine the level of employee voice of teachers. The level of the voice of teachers was found as "Often", which is consistent with related research (Cetin, 2013, Bulut & Bayramlik, 2015; Sagnak, 2017). Since teachers are the most important source to express possible problems to school management (Smylie, 1992), teacher participation can be a way to create a culture of innovation and a prerequisite for improvement of school (Detert & Edmondson, 2006), and institutions encouraging, and rewarding employee voice is close to achieving their organizational aims (Honningh & Hooge, 2014); thus, teachers' high perceptions towards voice seem a positive development for schools. Furthermore, according to Ashford and LeCroy, (2009), the main motive for employee voice is the desire to develop organizational performance and collective benefit. Based on the finding that teachers often voice their ideas, opinions and suggestions, teachers in Turkey seem willing to develop the performance of schools they work.

The second aim was to examine the relationship between psychological safety and voice. The results showed that there was a significant and positive relationship between two variables, which seems consistent with the related literature. Kahn (1990) states psychological safety diminishes the perception of risk of employees because of voicing, and, similarly, Eggers (2011) states that psychological safety climate encourages employees to say their opinions or ideas to the top management by taking a calculated risk so that organizational learning and changing stage start. The literature on employee voice shows that concerns about the risk on negative effects of their voice have a significant effect on their decision to voice (Morrison, 2011). Expectancy Theory assumes that individuals decide how to act by making predictions on the future and evaluating the social systems they are in (Vroom, 1964 as cited in Hoy & Miskel, 2015). A high level of psychological safety might make the evaluation of social systems more positive, and it might raise the possibility of the employee to voice. Thus, schools with a high level of psychological safety encourage teachers to voice, which affects schools positively.

Relationships among colleagues matter when it comes to a psychologically safe climate. Kahn (1990) found that psychological safety enhances when interpersonal relationships are supportive and reassuring, and Hoy and Miskel (2015) state that the climate of schools is mainly about collective beliefs of teachers, and perception of social

support helping to speak up their opinions freely is effective to deal with problems involving schools. Teachers with a higher level of psychological safety might feel that their relationships with their colleagues are more positive, and they have social support. Thus, their risk perception as a result of voicing might decrease, and they might have a more positive attitude towards speaking up. However, they avoid expressing themselves in their workplace when they do not feel free and safe (Cheng, Chang, Kuo & Lu, 2014). For example, according to the study conducted Prouska and Psychogios (2018), an economic crisis as in Greece which threatens job safety might avoid voicing since they are afraid of futility or danger of voicing, and the researchers found out economic context matters for voicing when it is thought negative psychological and economic effects resulted from negative economic context such as a long-term crisis. As for Turkey, teachers have a public employee status (Buyukgoze, 2015). Therefore, they might not worry about the negative results of voicing since they already have job security.

The third aim was to examine the relationship between five-factor personality traits and voice. Results show that there is a significant and positive relationship between extraversion, agreeableness, emotional stability and openness to experience, and voice, which is compatible with Cetin (2013) examining the teacher's voice. Also, Morrison (2014) and LePine and Van Dyne (2001) suggest that extraversion is a motivating personality trait for voicing, and Nikolau, Vakola and Bourantas (2008) find out that emotional stability is one of the important predictors of voice. Extraverted individuals are more comfortable while communicating with others (LePine & Van Dyne, 2001). Therefore, they might not be afraid of risks as a result of their attempt to challenge the status quo, and they might be willing to voice. Moreover, according to Constructive Communication Theory (CCT), voicing itself is not enough for creating an effect; high communication skills also matter for the efficiency of voice (Ozyilmaz & Taner, 2018). Extraverted people are more prone to have better communication skills (LePine & Van Dyne, 2001). That is why; they might be more inclined to speak up by believing the efficiency of their voicing. Agreeable people are expected to be inclined to maintain the status quo, and to obey the group norms; and thus, they may not be inclined to voice (Van Dyne & LePine, 1998), which conflicts with the result of this study. According to Cetin (2013), the Turkish primary school context does not make teachers think their voicing might be harmful to their interpersonal relationships with their colleagues so that they will not avoid challenging the status quo by voicing. The difference in context might explain the relationship between variables.

Individuals low in emotional stability are inclined to feel nervous while they are speaking or stating their opinions about changing while ones high in emotional stability have high-level perceptions of self-trust and efficiency, so they will not be anxious to create a change in their organization (LePine & Van Dyne, 2001). That reasonability could explain the positive relationship between voice and emotional stability. People with openness to experience are inclined to be flexible and creative, and they are ready to change and adapt to different circumstances easily and look at the issues from a different perspective. Therefore, they are willing to voice since they

could come up with solutions to problems of schools, and they could help schools to adapt to changing circumstances.

The fourth aim of the study was to examine the relationship between psychological safety and five-factor personality traits. Emotional stability was found to be positively related to psychological safety, which is consistent with the study of Edmondson and Mogelof (2005). They found out that there is a negative relationship between emotional instability and psychological safety; some employees may be prone to suspect their colleagues and see their workplace hostile since employees with a high level of emotional instability tend to feel negative emotions such as anxiety, inferiority and shame for a longer time. In addition, the results showed that there was a significant and positive relationship between agreeableness and psychological safety. According to McShane and Von Glinow (2011), employees with a high level of agreeableness are more successful at dealing with their problems. Thus, they become more adept at solving the problem when they face with a condition that threatens their psychological safety. In their study, Edmondson and Mogelof (2005) found out that extraversion and openness to experience are correlated with psychological safety while the results of this study do not show a significant relationship between them. These different results might be derived from the contextual differences.

The study showed that teachers working at Turkish public primary schools are often eager to voice their ideas, opinions, and suggestions to the management. Thus, this result seems very positive when thought positive effects of voice such as promoting organizational learning, change and innovation on individuals and organizations. The study proves the importance of individual traits for psychological safety and voice by finding out correlations between some personality traits, psychological safety and teacher's voice. Furthermore, the study shows the significance of context for employee voice. Teachers tend to speak up when the climate of a school is perceived as psychologically safe. Thus, as a practical implication, it is significant that school administrations create a supportive climate for teachers and develop upward communication channels to improve the employee voice at schools. The study supports employee voice literature stating that employees track some contextual clues to voice in the organizations. However, the strength of the correlation between employee voice, and personality and psychological safety is low, which implies that employee voice includes complicated processes, and there are other individuals and organizational factors related to voice.

Lastly, the legal status of teachers seems relevant to the teacher's voice since it determines job security. When a civil servant status of public-school teachers in Turkey is thought, the results might be explicated within Turkish public schools - context. As a theoretical contribution, the study contributes to existing literature and fills the research gap by providing a better understanding of the teacher voice concept.

School administrators might develop upward communication channels to create a psychologically safe climate at school settings so that teacher voice can be encouraged based on the positive relationship between psychological safety and teacher voice found by the study. The same subject might be re-examined at private schools to make

an extensive evaluation of teacher's voices, and results might be compared based on significant relationships between teacher voice, and personality and psychological safety at public schools. Furthermore, the teacher's voice of UN countries might be examined to boost the generalizability of the study when it is thought teachers' different status compared to Turkey. Based on the result of the study that the relationships between the variables are low, which shows there are other factors related to employee voice concept, future studies might focus on other related factors to understand motives behind voicing better. Also, qualitative and quantitative studies examining individual and organizational factors might be carried out to enlighten the psychological mechanisms of voice.

Öğretmenlerin Kişilik Özellikleri, Psikolojik Güvenlik Algıları ile Öğretmen Sosliliđi Arasındaki İlişkiler

Atf:

Bas, S., & Tabancali, E. (2020). Correlations between teachers' personality, psychological safety perception and teacher voice. *Eurasian Journal of Educational Sciences*, 85, 185-204, DOI: 10.14689/ejer.2020.85.9

Özet

Problem Durumu: Klasik yönetim anlayışının deđişim geçirmesiyle, örgütlerde etkileşim, başarıma kültürü ve etkileşim önem kazanmıştır. Bununla beraber, örgütlerde karar verme kültürü de evrimleşmeye başlamış ve karar verme sadece yöneticilerin sorumluluđu deđil, kurumsal yapıdaki çalışanların sorumluluđu olmaya başlamıştır. Bu nedenle, çalışanların yönetime fikir, düşünce ve önerilerini önermesi anlamına gelen çalışan sosliliđi, örgütler açısından önemli bir davranış olarak öne çıkmıştır.

Çalışan sosliliđi, çalışanların çalıştıkları kurumla ilgili fikir ve görüşlerini yönetime ifade edip örgütsel karar verme süreçlerine katılmalarını ifade etmektedir. Çalışan sosliliđi kavramı kurumu geliştirme, kurumsal problem çözme, kurumdaki uygulamaları veya haksızlıkları yönetime iletme gibi boyutlardan oluşmaktadır. Alan yazın incelendiğinde, çalışan sosliliđinin hem bireyin hem örgütün performansını geliştirdiđi hem de çalışanlar tarafından gönüllü gerçekleştirilen bir davranış olduđu için örgütsel öğrenmeye katkıda bulunduđu görülmektedir. Benzer olarak, çalışan sosliliđinin düşük olduđu kurumlarda, örgütsel performansın düştüđu ve bireyin psikolojik veya fiziksel sađlıđının kötü etkilendiđi gözlemlenmektedir.

Görüldüđu gibi, çalışan sosliliđi örgütlerin devamlılıđı ve başarısı için önemlidir. Bu nedenle, çalışan sosliliđi ile ilgili faktörler araştırmacılar için önemli bir çalışma alanı olmuştur. Diđer yandan, bir örgütte çalışan sosliliđi davranışının var olması, demokratik kurum kültürünün bir göstergesi olabilir. Eğitim kurumlarında sosliliđin var olması, öğretmenin ve öğrencinin özerk olması ile ilgilidir; ancak bu şekilde eğitim kurumlarının demokratikliđinden bahsedilebilir. Çalışan sosliliđi düzeyinin az olduđu okullarda, öğretmenlerin motivasyonu olumsuz etkilenebilir ve kurumdaki problemler zamanında çözülemeyebilir, bu nedenle eğitim ve öğretim kalitesi olumsuz etkilenebilir. Bu nedenle, çalışan sosliliđi, eğitim kurumlarında var olması istenilen, önemli bir davranıştır.

Alan yazında soslilik ile ilgili araştırmalar olsa da çok azı okullarda yapılmıştır. Ancak, öğretmen sosliliđi ve ilgili faktörleri incelemek, okullardaki soslilik olgusunun anlaşılması ve eğitim-öğretim süreçlerinin geliştirilip eğitimde başarının artması için önemlidir. Bu araştırmanın amacı, öğretmen sosliliđi kavramının önemine dikkat çekmek ve öğretmen sosliliđinin daha iyi anlaşılmasının sađlayıp alan yazına katkıda bulunmaktır. Bu yüzden, araştırma öğretmen sosliliđi düzeyini ve öğretmenlerin

kişiliği ve psikolojik güvenlik algıları ile öğretmen sesliliği arasındaki ilişkileri incelemektedir.

Araştırmanın Amacı: Araştırmanın amacı, İstanbul Avrupa Yakasındaki resmi ilkokullardaki öğretmen sesliliği algı düzeylerini tespit etmek ve psikolojik güvenlik ve beş faktör kişilik özellikleri ile öğretmen sesliliği arasındaki ilişkileri incelemektir.

Araştırmanın Yöntemi: Araştırma ilişkisel tarama modeline dayalı nicel bir araştırmadır. Araştırmanın örneklemini, 2017-2018 Eğitim ve Öğretim yılında İstanbul Avrupa Yakasında resmi ilkokullarda çalışan 475 öğretmen oluşturmaktadır. Araştırmada Çalışan Sesliliği, Hızlı Beş Büyük Kişilik Testi ve Psikolojik Güvenlik olmak üzere üç ölçek kullanılmıştır. İstatistiksel analiz için SPSS 21 kullanılmıştır.

Araştırmanın Bulguları: Araştırma bulgularına göre, ilkokuldaki öğretmen sesliliği algı düzeyi ortalamanın üstünde ve “Genellikle” seviyesindedir. Uyumluluk, dışadönüklük, duygusal denge ve deneyime açıklık kişilik özellikleri ile öğretmen sesliliği arasında anlamlı ve pozitif bir ilişki bulunmuştur. Psikolojik güvenlik ile duygusal denge ve uyumluluk arasında anlamlı ve pozitif bir ilişki bulunmuştur. Son olarak, psikolojik güvenlik ile öğretmen sesliliği arasında anlamlı ve pozitif bir ilişki bulunmuştur.

Araştırmanın Sonuçları ve Önerileri: Araştırma sonucuna göre, ilkokulda öğretmen sesliliği algısı “Genellikle” seviyesindedir ve ortalamanın üstündedir. Bu sonuç, Türkiye’deki resmi ilkokullarda çalışan öğretmenlerin fikirlerini, düşüncelerini ve önerilerini idareye sunmaları için istekli olduklarını göstermesi açısından dikkat çekicidir. Çalışan sesliliğinin örgütsel öğrenme, değişimi ve inovasyon ortamlarını geliştirmesi gibi pozitif etkileri düşünüldüğünde, öğretmen sesliliğinin yüksek olması olumlu bir sonuç olarak görülebilir. Diğer bir bulguya göre, öğretmenler okullarının iklimlerini psikolojik olarak güvenli algıladıklarında, konuşmaya meyilli olurlar. Öğretmenlerin psikolojik güvenlik algıları, kişilik özellikleri ile de ilgilidir, araştırmaya göre, uyumlu ve duygusal olarak dengeli öğretmenler, içlerinde bulunduğu ortamı psikolojik olarak güvenli olarak algılamaya daha çok meyillidir. Ayrıca uyumlu, dışadönük, deneyime açık ve duygusal olarak dengeli olan öğretmenler fikirlerini, düşüncelerini ve önerilerini daha çok seslendirmektedir. Araştırma sonucu bulunan bütün ilişkiler anlamlı ve pozitif olmakla beraber, ayrıca bütün ilişkilerinin düşük seviyede olduğu görülmüştür. Sonuçların da kanıtlandığı üzere, kişilik ve psikolojik güvenliğe ek olarak, çalışan sesliliği başka bireysel ve örgütsel faktörleri de ilgili olan karmaşık süreçleri içeren bir davranıştır. Ayrıca, çalışanların örgütlerinde ses vermek için bağlamsal ipuçları takip ettiği ve bazı kişilik özelliklerinin çalışanları ses vermeleri için cesaretlendirdiği veya onların cesaretlerini kırdığını ifade eden ve çalışan sesliliği alan yazınında yer alan çalışmalar, mevcut araştırma tarafından desteklenmiştir. Bu nedenle araştırma sonuçları, öğretmen sesliliğine ışık tutması açısından değerlidir.

Çalışan sesliliği birey ve örgütler açısından karmaşık süreçleri içeren önemli bir örgütsel davranıştır. Bu nedenle, mevcut araştırmanın değişkenleri olan öğretmen sesliliği, psikolojik güvenlik ve kişilik arasındaki ilişki, farklı kademelerdeki özel veya devlet okullarında çalışan öğretmenler üzerinde tekrar araştırılabilir. Ayrıca, seslilik

davranışının arkasında olan psikolojik mekanizmaları daha iyi anlamak için, ses verme ile ilgili olabilecek bireysel veya örgütsel faktörler karma araştırmalarda incelenebilir, hatta gelecek araştırmalar öğretmenlerin seslilik davranışlarının yordayıcılarını araştırarak okul yöneticilerine rehberlik edilmesini sağlayabilir.

Anahtar Kelimeler: Dikey iletişim, eğitim örgütü, çalışan donanımı, insan kaynakları yönetimi
