THE NEED TO PROVIDE COLORADO'S MODERN LANGUAGE TEACHERS WITH A STATE INSERVICE PROGRAM TO HELP THEM RELATE LINGUISTIC THEORIES AND FINDINGS TO CLASSROOM TECHNIQUES RESULTED IN THE PUBLICATION OF THIS STUDY GUIDE FOR SPANISH TEACHERS BY THE COLORADO STATE DEPARTMENT OF EDUCATION. DESIGNED FOR USE BY INDEPENDENT STUDY GROUPS, THE GUIDE STRESSES AN AUDIOLINGUAL APPROACH AND CONTAINS SECTIONS ON (1) THE NATURE OF LANGUAGE, (2) THE APPLICATION OF LINGUISTICS TO LANGUAGE TEACHING, (3) TEACHING PROCEDURES, (4) DRILLS FOR TEACHING PRONUNCIATION, (5) SYNTACTIC DRILLS, (6) THE USE OF THE LANGUAGE LABORATORY, (7) READING AND WRITING INSTRUCTION, (8) TESTING, (9) CULTURE, (10) TEXTBOOKS, (11) VOCABULARY DEVELOPMENT, AND (12) PLANNING THE LEVELS OF THE FOREIGN LANGUAGE SEQUENCE. LISTS OF DISCUSSION TOPICS AND RECOMMENDED READINGS ACCOMPANY EACH SECTION, AND THOSE SECTIONS DEALING WITH TECHNIQUES CONTAIN SAMPLE DRILLS. THIS DOCUMENT IS ALSO AVAILABLE FROM TITLE III NDEA SECTION, COLORADO DEPARTMENT OF EDUCATION, DENVER, COLORADO 80203, FOR $1.25. (AM)

FOREWORD

The "subject-matter" and "professional" programs of teacher preparation must be coordinated if the most recent advances in learning theory and teaching methods are to be applied successfully in language classrooms. Gains made by National Defense Education Act language institutes in combining theory and practice can be maintained if teacher preparation programs are based on cooperation. However, many of the teachers already in service have had little opportunity to understand and apply the newer practices in the teaching of modern foreign languages. Fewer than twenty-five percent of the Colorado foreign language teachers have been trained in NDEA institutes.

These guides are published to meet the needs of the large majority of foreign language teachers. The purpose of the guides—one each for Spanish, French, and German—is to relate the latest classroom techniques with the latest findings of linguistic science. Printed in pamphlet form to promote discussion, the guides are the core of a "package" which includes films on language teaching techniques. In addition, the Department's publication, Learning by Discussing, will be used to introduce efficient techniques of group discussion.

The inservice program, designed for independent group study, provides an orientation for an audio-lingual approach to language teaching, and demonstrates how it may be applied in the classroom. This format has been used successfully in the inservice course, "Mathematics for the Elementary School," and should again prove to be a rewarding way to increase competence in the teaching field.

Byron W. Hansford
Commissioner of Education

INTRODUCTION

The "Declaration of Asilomar," adopted by the Foreign Language Association of Northern California on November 14, 1959, is a succinct and powerful statement of the basic philosophy underlying modern foreign language teaching at its best. The declaration is as follows:

I. A modern language is mainly a spoken form of communication.

II. The best way to learn a foreign language is:
   A. As to place, the country where the language is spoken.
   B. As to time, when the learner is a young child.
   C. As to method, by understanding the spoken language and speaking it before reading and writing it.

III. The best way of teaching a foreign language to those who are neither in the country in which the language is spoken nor young children is:
   A. To recreate in so far as possible the language learning environment of the foreign country.
   B. To train the learner to regain his childhood faculty of learning by ear.
   C. To train the learner to understand the spoken language and to speak it before reading and writing it.

IV. In learning a foreign language outside the foreign country the most important single factor is the good teacher and not the foreign language laboratory.

V. A good teacher of a foreign language speaks like a native of the foreign country and teaches by the audio-lingual method.

VI. The foreign language laboratory serves as an aid to the teacher by intensifying the same instruction given directly by a good teacher.

Although each year since 1959 has witnessed great improvements in the techniques and materials for achieving the goals stated in the Declaration of Asilomar, we are still far from universal success in fulfilling them. Moreover, at the same time that the imperatives of the Declaration are for many teachers new and "revolutionary," no single, unified methodology has yet been devised to make of each and every interested and dedicated instructor an effective and efficient model of a modern language teacher.

There has always been a wide variety of methods of teaching foreign languages in the United States. Yet at no time in the history of language teaching has the profession been as besieged by so many new concepts as it is today. Furthermore, public interest in foreign language education is now at a level unequaled in history. It is hardly surprising, then, that the teacher new to the field finds the task of teaching a foreign language immensely complicated and feels unable to function efficiently in the face of recent curriculum changes.

Precisely this feeling of "inadequacy" in preparation on the part of many teachers, which is the result of this deluge of materials, techniques, and mechanical aids, has been of positive value in that language teachers today are being trained more rigorously than ever and given opportunities for inservice training unheard of but ten years ago. But what of the language teacher who up to now has not had the linguistic training needed for mastery of the newest techniques?

For this teacher, the principal objective of our study is an orientation to the audio-lingual approach, first by considering what it implies then by applying its concepts (and a heavy emphasis is placed on the term "application") in the teaching situation. An impressive objective, indeed; and for such an inclusive goal our time is admittedly inadequate. But we hope that our material will provide each teacher with a basis for more thorough study, either through inservice training, such as is available through the NDEA Summer Language Institute program, or in advanced graduate study.
The study of language (man's first and most important invention) as a set of cultural habits became central. What linguists and anthropologists set out to do, then, is the foundation of all modern linguistic investigation: to discover the nature of communication in culture groups and to examine minutely, without puristic bias, the structure of language as it was spoken, as it was used to communicate. This made it necessary first to transcend the literary and historical aspects of language, which had previously been central to most philological investigation, and then to establish the study on a firm scientific basis. It was within the framework of this rapidly expanding study of human communication that linguists began to direct attention to the teaching of a given system of communication to people who used a different system; that is, the teaching of one language to speakers of another.

Basic to this new pedagogy was an idea which has, by incessant repetition in the last few years, become almost a platitude: human linguistic activity is first of all, and basically, spoken, and only secondarily written. Nevertheless, no matter how many times we repeat it, and even recognize its truth from an abstract intellectual point of view, we still often find it difficult to apply in practice.

It is all too easy for us to give lip-service to the oral nature of language and then to relapse into essentially written-language approaches. This almost universal confusion between speech and writing is today the principal obstacle to a clear understanding of the nature and function of language. Language—the spoken language—precedes writing. We must constantly remind ourselves that spoken language is as old as man himself. Writing, quite to the contrary, has a history of at most a few thousand years. The distinction is a critical one. Speech is prior to writing in every sense, but the unhappy confusion between language and writing continues to be universal among all literate societies, in which reading and writing are the basic attributes of the "educated man." Our concern throughout this course is teaching the spoken language.

The history of foreign language teaching in the United States has been summarized elsewhere. Major ethnic groups in the colonial and immediate post-colonial periods provided sporadic instruction for their own children in the languages of their own national origins, such as the French Catholic missionaries in what is now northern New England, the Spanish-speaking Catholic missionaries in what is now the American Southwest, and the German-speaking settlers in Pennsylvania. French and German did not join the trio of "classical" languages, Latin, Greek, and Hebrew, in the academies and universities until the Eighteenth Century. Even though French and German were modern spoken languages, the emphasis was as unrelentingly literary as in the case of the "classical" languages, focusing solely on the development of reading, writing, and translating abilities in the students.

The "natural" and "direct:" methods, imported from Europe, did succeed in introducing some oral techniques in foreign language teaching as early as 1866, but neither approach was able to counterbalance the established weight of the "grammar-translation" tradition in American schools.

Thus, the first century-and-a-quarter of American national educational life saw little basic change either in the selection of languages taught in schools and colleges or in the fundamental approach to teaching them.

Despite the massive exposure of Americans to Europe during World War I, language teaching in the period between the two wars continued to limit its objectives to providing a "reading knowledge" of a foreign language. A two-year exposure was generally considered sufficient. Little progress had been made in expanding the number of languages taught: Latin, French, and Spanish predominated in the schools; the same, plus Greek and German, in the colleges. Opportunities for studying other languages did exist, of course, but they were severely limited in number and few students were able to take advantage of them.

The outbreak of World War II and the attack on Pearl Harbor in 1941 occasioned the creation of new methods of foreign language teaching. It was realized that very quickly large numbers of American soldiers would be sent to various parts of the world where they would have need for fluency in a great many languages. Moreover, the need was for persons who would be able to speak and understand the languages, often under difficult conditions. Since the schools and colleges had produced a dearth of persons cap-

---

able of communicating orally in even the most familiar languages, the armed services determined to begin an intensive and extensive program of language training different from any as yet known in the United States.

A model for this undertaking was provided by the Intensive Language Program, established in 1941 by the American Council of Learned Societies, in which the underlying principle was that a sound linguistic analysis of each language should be made, followed by the elaboration of learning materials based on that analysis.

In 1943 the first courses of the Army Specialized Training Program (ASTP) were begun, and within a few months 27 languages were being taught in special programs in 55 colleges and universities, utilizing a variety of new materials. The most outstanding of these were the manuals of the "Spoken Language" series.

William G. Moulto has listed five linguistic principles which formed the bases for these manuals and have become the tenets of all audio-lingual materials:

1) "Language is speech, not writing." Since language learning had traditionally been associated with reading and writing, the average American assumed that language learning and learning to read and write were two inseparable aspects of the same process. The linguists resolved, however, that the student should first learn to speak the language; reading and writing pose widely divergent problems and should be undertaken only after the learner has acquired a reasonable oral proficiency. After all, the child is a relatively fluent speaker of his own native language long before he encounters reading and writing instruction. But since some kind of spelling system is a valuable adjunct for the adult literate learner, a system of phonemic transcription was devised to give the student a better guide to the language itself than the conventional orthography of that language; however, the student was never expected to learn to write in this system.

2) "A language is a set of habits." The ordinary speaker is unaware of the mechanisms of speech—syntax, phonology, etc. These are produced "out of awareness" of what he says and not how he says it. Therefore, the language learner must develop his skill in the new language "out of awareness." Syntactic elements, sounds, etc. must become matters of habit, and these habits may be acquired only by imitation, repetition, drill and memorization. Thus the process became known as "mimicry-memorization."

3) "Teach the language, not about the language." Traditional methods of teaching foreign languages had required the student to learn not only the language itself, but also its grammar, so that he could talk about the language. The linguists considered this a waste of valuable time, since grammar should never be more than a means to an end. Contrary to some misconceptions, the new materials contained a great deal of structural grammar, but as soon as it had served to establish the forms as matters of habit in the learner, it was no longer considered necessary.

4) "A language is what its native speakers say, not what someone thinks they ought to say." This new concept no longer allowed books (on pronunciation, grammar, etc.) to be considered as primary sources of information about a language, but rather insisted that the only true source was the native speaker and established the informant as the model whom the students should imitate.

5) "Languages are different." With this statement the linguists expressed their firm belief that traditional grammatical categories of Latin and Greek cannot be applied, without distortion, to all languages. Each language should be analyzed in terms of its own grammatical structure. This ideal likewise dealt a death blow to the role of translation, in either direction, in language instruction. Realizing the impossibility of word-to-word equivalents in two languages, it was deemed more valid merely to present to the student a familiar situation which he should elaborate in the foreign language, without the obstacle of puzzle-solving involved in direct translation.

With these concepts, the linguists designed a system which successfully produced a practical speaking knowledge in as short a time as possible. It was never claimed that there are not other aspects of language learning (structure of the language, composition, literature) which might be considered as primary sources of information about a language, but rather insisted that the only true source was the native speaker and established the informant as the model whom the students should imitate.

Since the war, large numbers of our colleagues have been at work, here and abroad, preparing materials for the American classroom. Among them, as among ourselves, there is substantial agreement on the basic point that the initial stages of learning a foreign language must focus on aural-oral, or what we shall call from now

on audio-lingual practice. The reason this kind of practice is important, beyond the fact already established that language is spoken, is that language is a set of habits. The ability to use and understand a language depends on the instant and accurate habitual comprehension and production of sounds, sentence-patterns, and vocabulary.

In conversation the words follow one another so rapidly that there is no time to recall and apply rules to what is being said. The student must respond at once. The native speaker of a language has, of course, acquired his habits in childhood, through long practice, correction, more practice and more correction. By the time he is ten or eleven all the complicated processes which our students must learn are second nature to him. He is not even aware of them. But the learning of a foreign language cannot duplicate the slow, natural pace of a child learning to speak his native tongue. Even though the order of the formation of language habits is the same, it must be accomplished in hours instead of years of daily exercise. Only a well-informed teacher and intelligently designed materials can succeed.

Inherent in the design of such materials is the recognition of certain facts of language learning. In simplest terms, these are as follows:

First step: The learner hears a new utterance. We use the term utterance to refer to any spoken sequence, sentence, word, or phrase.

Second step: He recognizes a part of the meaning. He manages this in one of three ways: (1) he has already encountered some of its components; (2) he guesses from the context; (3) someone tells him.

Third step: He grasps the meaning of the whole utterance by associating the parts with the structure that is being studied. (If he fails in this, the teacher immediately prompts him.)

Fourth step: He imitates meaningfully, after the model. Continued imitation reinforces the assurance with which he utters something whose meaning is known to him. Now he must form a habit, that is, he must learn to use the newly acquired form without error. Habit calls for repetition, now guided by his own memory rather than as an echo of an outside model. Whenever his repetition, his memory, is imperfect, he must revert to direct imitation of the outside model, before repeating further.

Fifth step: As soon as repetition has made the habit secure, variation drills are introduced. Such drills vary one component or another of the model utterance to produce other expressions. Such variations explore the patterns of similarity and difference tolerated by the language.

Once a reliable habit has been formed in this way, the learner will understand the model form and related utterances automatically and rapidly. The process is in no way limited to single words or idiomatic expressions, however. It is just as valid, if not more so, for the meaningful use of all grammatical forms.

Again it is the work of the linguistic analysts which has made us aware of the incredible amount and kind of practice needed to make these recognitions, variations, and selections truly automatic and habitual, and therefore usable. Indeed, a great part of the strategy behind the intelligently designed materials we have been discussing is to make them so efficient that there will be time in class to ensure the necessary repetitions of the essential patterns.

As we become aware of these facts of language learning, we cannot but conclude that oral practice is the one vehicle for the early stages of language learning. And simply from the practical point of view of time, a model utterance can be imitated and repeated far more often orally than in writing, to say nothing of its variation and correction for oral accuracy. An entire class can repeat a model many times under the immediate supervision of the teacher. Mistakes are caught on the spot and the correct form is supplied and drilled at once. The dual advantage of greater intensity in guided practice, and immediate correction, makes oral practice the logical classroom procedure.

Many teachers hesitate to try the oral approach, for any number of reasons. Perhaps the teacher has been unable to go abroad and feels that he is not fluent enough, or that his pronunciation is faulty. Perhaps he was not trained specifically as a language teacher, and feels insecure in his practical control of the grammar. Perhaps he is used to a more "traditional" approach and feels unprepared to meet the needs of an orally conducted class. But there is no need to assume that the qualifications needed for good beginning-language teaching can be acquired only through complete retraining. The function of the teacher in a beginning language class is to help the pupils acquire reliable, correct, firmly practiced habits in the language. It would be impossible, anyway, for the teacher to chat with the students at length in the foreign language about general topics before the students have learned the fundamentals of the language itself. To establish these habits, the teacher must lead the students, through intensive drill, to a control of a limited part of the foreign language as a foundation for their later progress.

What, then, are the indispensable qualifica-
tions of a competent teacher at this beginning level?

First, he serves as an oral model for his pupils' imitation. For this, he must know how to pronounce the material his students will be using and to control the structures in which they are contained. Part of every teacher's professional advancement depends on constantly improving that control and keeping well aware of what is being taught in class; but no one not already a native speaker can ever achieve complete mastery of a language, and this need not be a cause of discouragement, for the teacher who keeps learning is the one who best understands the problems of his students.

If the teacher's own pronunciation is faulty, he must rely upon prepared tapes or discs to serve as models for his students. Although there is no real substitute for a well-trained teacher, such audio aids can always be used successfully.

Second, the teacher is the judge of his students' accuracy. He must be able to detect mistakes. His knowledge of the points of conflict of the pupils' native language habits and the structure of the foreign language (an important part of Chapter 2) will help him to foresee and understand the pupils' difficulty, as well as to determine the appropriate kind and intensity of remedial practice.

Third, and finally, the teacher is a drillmaster. The textbook may provide the raw material, but conducting a vigorous drill is an art. To make sure that all participate, that individuals are singled out when they need to be, that the delicate balance between too much and too little is maintained, are all a part of the work of a successful drillmaster.

One important part of our work will be to examine in detail what makes for success in each of the three areas we have just mentioned.

TOPICS OF DISCUSSION

Discuss each of the following assertions in the light of the material presented in this chapter, your own experience, and the practical requirement of foreign language teaching in public schools.

1. How do the facts of language learning mentioned thus far support the view that the oral approach is the most successful vehicle for beginning language studies?
2. In what ways is the line of separation between the principal factors inherent to all intensive audio-lingual methods and the traditional methods clearly defined?
3. Which conditions existing in the traditional language program today prevent the average student from acquiring adequate audio-lingual skills in the regular four-semester high school language course? Refer whenever possible to the program in which you teach.
4. Should a phonemic transcription of the target language be avoided in the beginning text since it might be more confusing to the language learner than a phonetic transcription or traditional orthography would be? Which alternate solutions exist?
5. To what extent do problems inherent to the teaching of reading and writing skills make it advisable to postpone them until after the learner has acquired a reasonable oral proficiency in the language?

ADDITIONAL READINGS

Chapter 2

APPLICATION OF LINGUISTICS TO LANGUAGE TEACHING

The audio-lingual approach which we have been discussing is largely the product of the findings of modern linguistic analysis. For some years now it has been held that these findings should be better known by teachers of foreign languages, and that these techniques should be applied more effectively in textbooks and in the classroom. To facilitate understanding of these techniques it will be worthwhile to analyze further the nature of language learning, to restate and expand some of the ideas suggested in the preceding chapter in order to explain the basis upon which the linguist was able to construct the analyses from which the new approach of teaching evolved.

It is essential that we accept as paramount the premise that language is speaking, that it is something which we do, and not something we think or talk about. It is a skill, and like any skill, it is best learned by practice. For years our teaching, except in rare instances, has kept the student locked away from understanding by ear and from responding by tongue. We have learned a second language first as something to read, then as something to write, and if time permitted, as something to speak.

Of course, if language is communication, then the total communicative experience requires simultaneous use of all the language skills. We communicate by understanding, which comes from hearing; and by responding, which comes from speech. However, for language to be fully known and enjoyed, the printed word is vital; it provides the knowledge of the structure and background of a language and its culture.

One of the most interesting descriptions of the language learning process, and a program which reflects it, is that elaborated by Nelson Brooks, who suggests that any discussion of what is involved in a good program of language learning for communication (one which emphasizes the progressive development of the four language skills—comprehension, speaking, reading and writing—in that order) may be made clearer and briefer by first listing what it does not include.1

Language learning is not the matching of an isolated word in one language with a word in another, for this is the job of the maker of dictionaries. It is not the learning of lists of names of persons and places memorized out of context, for anyone who knows geography can name places, just as anyone who knows music can name composers. But the converse of these statements is not necessarily true. Nor is language learning the memorization of X number of isolated words, since words and idiomatic expressions are truly learned only in context. It is therefore the student's first task to learn the structure of a language rather than its vocabulary. Only after a knowledge of sounds, word order and forms has been achieved is an increase in vocabulary an important objective.

Modern approaches to language learning do not permit the student to use the mother tongue whenever he wishes; neither do they allow the student to have recourse to a printed script at all times, for separate functions of the ear and eye in language learning must be recognized. The theory that language learning improves as the number of senses involved increases does not hold true in the early stages of sound language learning.

The study of a language is not the exhaustive exploration of rules of grammar, for while such rules may be of some help to some students in understanding how the new language works, they can easily inhibit advance in the use of the new language by focusing the student's attention on the rule itself. Nor is the repetition of paradigms (verb conjugations) of any real value, since language in use does not contain paradigms any more than arithmetic problems contain numbers in series.

No amount of talk about the language can replace talk in the language, just as no amount of discussion about the piano will enable the learner to play the instrument. The skill of the pianist is acquired only by touching the keys; the skill of the language learner comes only from the use of his tongue.

Language learning is not an attempt to decode a foreign language into English, for the foreign language is a system fully adequate for communication in its own right and should not be studied as something from which it is to be extracted. A good program does not include insistence upon talk in complete sentences, for such practice violates normal communication. The unit of speech is the utterance (a thought), while a sentence is a creation of the printed page and not the unit utilized by word of mouth. It is not the prolonged series of questions and answers, for oral communication takes place only to a limited degree in this form. The most common form of communication is that of an utterance and a rejoinder (reply): “What a beautiful day.” “It certainly is.”

Effective language teaching and learning is not a solo performance by the teacher. It is important that the teacher model the learnings expected of the student, but he must establish student-teacher and student-student communication, and the ultimate objective has not been reached until the teacher can withdraw from the process and observe.

And finally, language learning is not the transfer of the teacher's entire knowledge to the student. The old idea of the master and his disciple is out of place, for the student comes to the language class to learn to communicate in the new language at his own level of proficiency; he does not come, for the time being at least, with the idea of becoming a language teacher, a linguist, nor an expert on the culture of the countries associated with the language under study.

By the listing we have made of all the things which the program of language learning for communication is not, we may arrive at a rather brief statement of what it is. It is based on broad professional agreement about objective, methods, materials, and tests.

The major objective is to learn to understand and speak the language as it is used in its culture. In these terms, the roles of English, translation, grammar rules and the textbook itself are reduced to very modest proportions. The cultural objective should remain, and the literary objective is retained, for the development of language competence cannot fail to strengthen the study of literature. Selected samples of good literature, in suitable amounts, are important in language study from the beginning—in order to acquaint the learner with them and with the characteristics which lift them above language to the level of fine arts.

It is with these fundamental principles that the linguist's contribution to language teaching begins and from which the audio-lingual approach has evolved. It behooves the present-day teacher of foreign languages to be familiar with these principles, but many teachers who have conscientiously tried to understand them, have been hindered in their attempts by the specialized nature of most linguistic studies; the unfamiliar themes and technical terminology make them hard to understand. It remains for us here to take a new look at linguistics and to try to bring its concepts to where they may be incorporated into our work. We shall find that there is no need to be uneasy about linguistic science, once we have discovered that it is not so austere nor so inaccessible as it has frequently been made to seem.

"Linguistics is simply the objective, systematic analysis of the facts of language, as it is habitually used by human beings in their relationships with one another.... The linguistic analyst is concerned, above all, with observing what people do when they interact by means of language.... The linguistic analyst's task is to discover, in whatever language he is studying, as much system as there is in it, and to describe that system as effectively as he can."

The linguist's attempts to analyze the target language systematically have led him to a number of conclusions which are of immense help to the teacher of foreign languages in preparing materials and in presenting and drilling them in the classroom and laboratory. The first and most important conclusion has to do with significant contrasts: significant contrasts within the language being taught (the target language), and significant contrasts between the target language and the native language of those who are learning it (the source language). Significant contrasts are the differences in the way people speak which cause their hearers to perceive different meanings. An example of a significant contrast within Spanish would be the difference between gate and rate; the contrast between the sound represented by g and that represented by r causes the hearer or reader to perceive a difference in meaning. In discovering significant contrasts, the linguistic analyst breaks down his material (on all levels of language structure—sounds, forms, and combinations of forms) into minimum meaningful units. To designate these units, he uses the suffix -eme, added to various Greek roots:

---

1 "Linguistics and Language Teaching," in *Reports of the Working Committee, 1912 Northeast Conference on the Teaching of Foreign Languages*.

must recognize that linguistics itself is not a way
the totality
spoken forms.
just the pronunciation of Spanish sounds, but
pronunciation problems from the beginning (not
spoken language, systematic analysis and Orin on
points of real difficulty. Furthermore, linguistic
construct, quite systematically, teaching and test-
difficulties for the learner. We are thus able to
of the target language with those of the source
upon which the teaching and learning of languages
a valuable technique which can furnish the most
of learning languages, nor a method of teaching
speech is fundamental, and that his more preten-
brought us to realize that 1., ts ordinary, everyday
mentioned in Chapter 1, linguistics, in studying
well, and the student learns it consistently. As we
unimportant, so long as the teacher controls it
Castilian, Mexican, etc., of Spanish we teach is
Spanish shall we teach." The specific dialect,
have an answer to the old problem of "what
the application of linguistic principles. First, we
learned more simply and economically than is
analysis enables us to describe the language to be
accurate and the most efficiently formulated data
upon which the teaching and learning of languages
can be built. By comparing the points of contrast
of the target language with those of the source
language, we highlight and predict the major
difficulties for the learner. We are thus able to
construct, quite systematically, teaching and test-
ing materials which will give emphasis to the
points of real difficulty. Furthermore, linguistic
analysis enables us to describe the language to be
learned more simply and economically than is
done in conventional grammars. Finally, since
linguistic analysis is concerned first with the
spoken language, systematic analysis and drill on
pronunciation problems from the beginning (not
just the pronunciation of Spanish sounds, but
intonation and phrase rhythm as well) lead
students to an early and broad mastery of the
spoken forms.

The language teacher and the learner gain a
great number of collateral advantages through
the application of linguistic principles. First, we
have an answer to the old problem of "what
Spanish shall we teach." The specific dialect,
Castilian, Mexican, etc., of Spanish we teach is
unimportant, so long as the teacher controls it
well, and the student learns it consistently. As we
mentioned in Chapter 1, linguistics, in studying
the totality of man's language behavior, has
brought us to realize that h.s ordinary, everyday
speech is fundamental, and that his more preten-
tious, "best-behavior" speech is really based on his
everyday speech. Although the study of stylistics
is fascinating, it is properly the concern of the
third and fourth years of the high school course
and does not really belong in elementary and
intermediate work. What we must attempt to do
is to introduce the beginning student to the
ordinary usage of normal people in real-life situ-
ations. Our goal must be, for the initial stages, a
good command of a normal, everyday variety of
the language, as it is spoken by ordinary, educated
people.

Another collateral realization that has come to
the aid of the language teacher through linguistics
is that language is not just a series of words,
individual words which one first acquires and
then learns how to put together in sentences.
By emphasizing the conversational nature of
language, linguistics has shown that when humans
speak, it is normally in sentence and dialog
form. Psychologists have shown, incidentally, that
even when we "think to ourselves" it is more
often than we realize in dialog form, either in
conversation with ourselves or with an imaginary
interlocutor. Thus, the most economical and
realistic way in which we can present new mate-
rial to our students is in dialog form, with
sentences carefully constructed to reflect, as
realistically as possible—considering, of course,
graded grammar and vocabulary—the kind of
conversation that might be heard among native
speakers of the language. Exercise in formal
expository prose, poetry, songs, and the like,
admittedly have their place, but normally not in
the very beginning stages.

Up to now we have been discussing the
advantages to the teacher. Linguistic principles
can be useful directly to the student. Any person
of high school age is mentally mature enough to
make his own inferences, and unless properly
guided has an alarming tendency to reach wrong
conclusions. This imposes two conditions on
the teacher and the textbook-writer: (1) to encourage
correct generalization (or induction) by making
sure that the examples of a construction cover it
adequately, but do not overreach it—i.e., that the
"rule" will almost shine through of itself; and
(2) to leave nothing to chance, but after the
student has tentatively framed his own generali-
ization to give him the right one, succinctly and
accurately stated.

But aren't these "generalizations" really the
same as the grammar explanations which we have
always used? In the sense that they are presenta-
tions of the facts of the language, yes. The
problem is that many grammatical "rules" do not
accord with the facts of the language as it is
spoken today. Many are based on usage of past
centuries and many attempt to prescribe rules on
the basis of an imagined cultured language which
does not exist in anyone's speech. For example,
in many parts of Spanish America, students are taught to use a labiodental [v] in words like *vaca, lavo*, envío. This is an invention of the schools (making the well-known mistake that we have already mentioned, of confusing writing with speech) which has never been the habit of speakers of Spanish, cultured or otherwise, and, consequently, insisting on it is purposeless. Furthermore, the very term "grammar" has meant so many different things in the last two centuries that it really needs to be abandoned or redefined. For some, "grammar" has meant an obedience to a priori rules, especially those based on Latin. For others, it has meant either an insistence on correct spelling, or drills on paradigmatic forms. For yet others, it has meant an avoidance of supposedly socially disfavored terms, such as ain't.

Mostly, these meanings of "grammar" have been picked up not in foreign language classrooms but in English classes—that is, in classes where the student is being taught to "improve" his own speech and writing, to adopt a more elevated dialect of his own language. (We say this as no disparagement of the poor English teacher—she has her hands full—who, unhappily, has too often been guided by texts that teach the sins to avoid, rather than the virtues to pursue.) To the linguist, and to the foreign language teacher, "grammar" means something different: it is simply the structure of the language, and, far from throwing it out of the window (as might be appropriate, sometimes, with grammar in the other sense), we ought to teach it with a vengeance, even—or especially—in the audio-lingual approach in which the student will be unable to learn without knowing the structural facts and how to manipulate them. Call the explanation of these facts grammar, structural analysis, generalizations, or anything else; what matters is that we not be misled by the traditional misconceptions of what a grammatical explanation should be.

To list here the many facts of the language which are apparent in the spoken system, but masked by orthographic conventions, would be fruitless, since we shall become aware of such cases as our work progresses. Suffice one: whole areas of extremely important and meaningful speech behavior, such as stress and intonation, tend to be left out of consideration because they are only imperfectly—and sometimes not at all—indicated in the orthographic system. Yet, intonation and "tone of voice" are highly important in determining the emotional attitudes of those with whom we are conversing. Many speakers of Spanish have, from the outset, a hostile reaction toward North Americans, because the latter seem to be always "overemphasizing" everything they say, as when a North American says "¡Yo no comprendo lo que usted dice!" or intones a question such as "¿Cómo se llama usted?" as follows:

Wrong:

\[ ¿Cómo se llama usted? \]

Right:

\[ ¿Cómo se llama usted? \]

This is due to the carrying over of American English stress and intonation patterns into Spanish. Such structural features must be given our very special attention in teaching, first, because they are masked by the writing system; second, because the student is largely unaware of the intonation patterns in his native language; and, third, because few materials, except the very newest, contain drills of any kind on stress and intonation.

Until very recently, the presentation of all but the most obvious syntactic features has been hampered by the absence of an effective analytical technique. It has long been considered impossible to describe such phenomena as the position of modifiers [like *bueno, pobre*, and *mal (o)*] or the order of words in the sentence except in terms of vague "affective" meanings. In the last few years, however, extensive procedures for describing syntactic structures have been developed, and, with these modern developments, there is no longer any excuse for filling to extend our grammatical treatment to the totality of the language we are teaching, and to the totality of its differences from the total:ty of English structure.

Now, what of drills? Their main purpose is to hammer home points of structure that cause difficulty. Obviously, they must be constructed carefully with this in view and must be graded from the simple to the complex. They must also be provided in profusion since, as we saw in Chapter 1, to form a linguistic habit, to reinforce it, and finally to control it, infinite repetition is needed. The newest materials contain pattern drills of this type and in the suggested quantity already built in. However, as a second-best solution, it is always possible to adapt and amplify existing texts by supplying new drill material, provided that whoever makes the drill material has the necessary competence.

"The person doing the job must have a thorough command of three skills: he or she must know the target language itself well; must understand its structure and be able to identify the crucial points where it differs from the learner's language; and must know how to construct substi-

---

1To be discussed in Chapter 4.

2This is treated fully in Chapter 9.
tution and variation drills so that the student can practice the appropriate patterns." Needless to say, any drills created by non-natives can always profit from inspection by a native speaker to insure naturalness.

A great deal of public and professional interest has been aroused in the audio-lingual approach by recent progress in the field of equipment, especially the language laboratory. While such interest is always helpful, there is danger that the language laboratory may be used unwisely. Bad materials are not improved by putting them on tape. One hears reports of teachers making recordings in an atrocious accent, or merely committing to tape the exercises or readings from older texts, or even reciting grammar rules. Some go to the extreme of holding classes in the language laboratory without making any use of the mechanical aids at all. As we shall see in our lesson on language laboratories, the purpose of the laboratory is pattern reinforcement and drill. Whereas many of the new texts come with drill tapes already prepared, a teacher who is stuck with an old-fashioned text now must know some of linguistic analysis if he is to supplement the text with well-made dialogs and drills for laboratory use.

These, then, are the principal areas in which the findings of linguistic science are indisputably of great importance. By approaching each of the problems presented in this course with the attitude that the findings of linguistics can be understood by any intelligent person and that they can be applied to the classroom situation with great effect by any teacher with a good command of the language, we shall be able to take advantage of them to improve our teaching.

**SAMPLE SKELETON AUDIO-LINGUAL UNIT**

Although format and procedure may vary, most of the basic audio-lingual materials provide the same types of learning activities for all students. All audio-lingual units at beginning levels consist of two main features: dialogs and pattern drills. Other kinds of learning exercises complete the unit and various mechanical devices (tapes, transparencies, films, etc.) may be employed to their fullest extent, as long as all efforts are carefully integrated to the learning process involved at the moment.

I. **Basic dialog.** The heart of the audio-lingual lesson, to be memorized by the student. The dialog should represent a true-to-life situation, real and enjoyable. The language is authentic, contemporary and informal—that which would be used in equivalent circumstances by native speakers of the same age as the learner.

   A. Situational presentation, with students’ books closed, to convey the meanings of the dialog with minimal or no recourse to English translation.
   B. Backward build-up with choral and individual echo of component words and phrases.
   C. Use of mechanical aids to reinforce presentation.

II. **Cultural notes.**

III. **Phonetic drills.** Isolation of the most difficult problems in pronunciation which an English-speaking person will have in learning the foreign language. These drills are usually found in the teacher’s manual, rather than in the student textbooks. They are necessary to offer special help and correction when pronunciation difficulties arise—there certainly are problems since many students do not automatically pronounce as well as their model.

   A. In class.
   B. Coordinated in the language laboratory.

IV. **Dialog adaptation.** Relates the dialog sentences and situation to the personal experience of the student and aids in memorization.

   A. Consists of questions and answers, to be used as soon as the corresponding part of the basic dialog has been well learned.
   B. These questions and answers are varied, but only within the limits of the students’ learned vocabulary and structure.
   C. No new vocabulary or structure is introduced.
   D. The purpose of the dialog adaptation is to use known words and patterns in a different context and in more personal situations.

V. **Supplementary materials.** Vocabulary, idioms and expressions (dates, weather, etc.) suggested in the basic dialog, which may be learned and practiced easily as part of the daily routine.

   A. They are taught by repetition and learned by rote.

VI. **Grammatical (structure or pattern) drills.** Exercises which drill certain grammatical points of the language in terms of the language itself. The purpose of these drills is to present an utterance which exemplifies a particular grammatical point. It is to be manipulated in such a way that the items illustrating this point are varied without changing the essential structure of the utterance. Therefore, the students’ attention is focused
on the slot where the changes are to be made; he learns to manipulate properly the items that can be substituted in the slot, and gradually develops an awareness and understanding of the pattern he is handling.

A. Identification of the point to be drilled.

B. Examples, in Spanish only, for choral and individual echo, divided into as many groups as deemed necessary by morphological considerations (tense, mood, gender, etc.).

C. Extrapolation. Diagram or chart of the construction involved (Spanish only) to show the process involved. No further comment.

D. Notes.

E. Drills. Beginning with simple substitution (item substitution) drills, then proceeding to as many variations as desired.'

F. Discussion of pattern (descriptive generalization).

G. Reinforcement drills. Generally these are not necessary, but if used, the best is the combined replacement drill.

VII. Recombination Drills. Brief narratives or conversations (directed dialogs, conversation stimuli) which recombine the materials of the preceding units and this unit in a new form. Slight variations in structure and some new vocabulary may appear.

VIII. Readings (in later units)

A. In written form, for reading comprehension.

B. On tape in laboratory, or in class by teacher, to check auditory comprehension.

IX. Responsible drills based on readings.

A. In written form for orthographic practice.

B. In laboratory, or in class with tape, for oral practice.

As a model of Section VI above, we shall take the chapter on shortened adjectives from Bolinger, et al., Modern Spanish, pp. 145 ff.

I. Examples:

A. 1. ¿Que buen café es éste!
   2. Para café bueno, no hay como este lugar.
   3. Buena idea.

B. 1. Tuve un mal día.
   2. El suyo siempre tiene algo malo.
   3. ¡Que mala cara traes!

'C. 1. Fue un gran filósofo.
   2. Como gran cosa me concedieron hasta manana.
   3. Ayer hubo una reunión muy grande.

D. 1. ¿Desea dejar algún recado?
   2. ¿Quiieres traerme algún buen libro?
   3. Alguno de Uds. trajo plata?
   4. Hay que pensar en progresar alguna vez.

E. 1. Ningún extranjero puede.
   2. No es ninguna molestia.

F. 1. Cualquier día te matas.
   2. ¿Cuál desea Ud.?—Cualquiera—

<table>
<thead>
<tr>
<th>Before singular noun</th>
<th>Elsewhere</th>
</tr>
</thead>
<tbody>
<tr>
<td>MASC</td>
<td>FEM</td>
</tr>
<tr>
<td>bueno</td>
<td>buena</td>
</tr>
<tr>
<td>mal</td>
<td>mala</td>
</tr>
<tr>
<td>gran</td>
<td></td>
</tr>
<tr>
<td>algun</td>
<td>alguna</td>
</tr>
<tr>
<td>ningun</td>
<td>ninguna</td>
</tr>
<tr>
<td>un</td>
<td>una</td>
</tr>
<tr>
<td>primer</td>
<td>primera</td>
</tr>
<tr>
<td>tercer</td>
<td>tercera</td>
</tr>
</tbody>
</table>

Note: Except for grande, the shortening takes place only in the masculine singular when the adjective precedes the noun and nothing more than another adjective intervenes.

<table>
<thead>
<tr>
<th>Before noun, M or F</th>
<th>Elsewhere</th>
</tr>
</thead>
<tbody>
<tr>
<td>SING</td>
<td>PLU</td>
</tr>
<tr>
<td>cualquier</td>
<td>cualesquier</td>
</tr>
<tr>
<td>cualquiera</td>
<td>cualesquiera</td>
</tr>
</tbody>
</table>

Besides being shortened like the other adjectives, this one has an interior plural.

II. Item substitution drill:

1. Aquí no hay ninguna profesora.
   (profesor, tijeras, frijoles)
2. ¿Desea dejar algún recado?
   (cosa, libros, herramientas)
3. ¿Qué buena carne!
   (café, frijoles, verduras)
4. Tuve una mala idea.
   (día, preguntas, exámenes)
5. Aquí hay un médico.
   (planta, funcionarios, refinerías)
6. No puedo venir la primera semana.
   (día, tarde, mes)
7. ¿Dónde está el tercer libro?
   (noticia, documento, cuenta)
8. Es un gran filósofo.
   (señora, jefes, profesores)
9. Deme cualquier libro de éstos.
   (cartera, libros, carteras)
10. No es una señorita cualquiera.
    (señor, señoras, señores)

III. Grammatical generalization
IV. Combined pattern replacement drill
TOPICS FOR DISCUSSION

Discuss each of the following assertions in the light of the material presented in this chapter, your own experience, and the practical requirement of foreign language teaching in public schools.

1. The findings of linguistic science can be of service to language teachers, whatever method they use to teach the language.
2. Grammar as it is presented in the audio-lingual lesson is considerably different from the normative (prescriptive) grammar taught in the traditional classroom.
3. The comparative structure of the source and target language can be of great benefit to even an experienced teacher.
4. The teacher who is not a native-speaker should rely strictly on existing materials for drill in class.
5. In an audio-lingual course the teacher must assume a secondary role.
6. A teacher accustomed to traditional methods will have little to change in converting to the audio-lingual approach.
7. The "generalization" presented in an audio-lingual lesson is superficial since the "extrapolation" has already presented the structure being drilled.
8. The teacher should never provide, or encourage the students to make, a vocabulary list to accompany an audio-lingual lesson since it would be contrary to the principles upon which audio-lingual learning is based.
9. One disadvantage of the audio-lingual lesson is that the students' responses are completely controlled.

ADDITIONAL READINGS

Dwight L. Bolinger, "Are We Playing Fair with Our Students Linguistically?", Hispania 34 (1951) 131-136.

Although there are many books currently available which are advertised as audio-lingual in approach, the teacher must examine carefully a wide variety of such texts before deciding which will best suit the needs of the program in which he teaches. Below are seven of the better-known audio-lingual texts.

A "LINGUISTIC" TEACHING PROCEDURE

Now that we have examined briefly the scope and shape of the audio-lingual method in its theoretical foundation, let us look more closely into the organization of representative audio-lingual materials and see how these theoretical concepts are put to work.

Central to the teaching of the spoken language is a principle known as "guided imitation." Some teachers prefer to call it the "mim-mem" method, referring to mimicking the model and then memorizing the pattern. Like so many of the basic concepts of the audio-lingual method, guided imitation may appear to be new, but has actually been known to teachers for many years. Certain European language teaching centers discovered its value in the nineteenth century! Its goal, like that of all audio-lingual techniques, is to teach one to speak easily, fluently, with very little non-native accent, and to do all of this without conscious effort.

The success of the guided imitation technique depends to a very large extent upon the student learning a relatively small body of material so well that it requires very little effort to produce it. This is what happens when one learns to speak one's own language and is the goal of the learner of a second language. This process is familiar to us from our education courses and is known as overlearning. It is axiomatic that, if a student overlearns every dialogue and drill as he moves through the course, he will almost certainly progress rapidly. The success of the technique also depends upon the student's attention to exact imitation of the model. His goal is to manipulate the sound, sequences, and patterns of the language as accurately as possible. This implies a great responsibility for the teacher: the model that the student imitates must be a model of Spanish as people really speak it in actual conversations. Besides, the teacher must know how to guide and correct the student as he learns to imitate accurately. Above all, the normal tempo of pronunciation must be the classroom standard; slowing down is, for our purposes, distortion.

The teacher must, therefore, be confident that what he presents to the class is a model of standard conversational Spanish. If the teacher is not confident of the excellence of his Spanish, he should, out of fairness to the students, make use of the tape recorder. Many of the latest audio-lingual texts, such as Modern Spanish, A-LM, Entender y Hablar, and others, come with sets of tapes containing all the exercise materials recorded, under careful supervision, by native speakers. Most modern tape recorders come equipped with a manual or pedal on-off and reverse switch at the end of a control wire. Thus, the teacher can start and stop the tape as he moves about the room. In this way, the students imitate an accurate model, but at the same time profit from the immediate correction and suggestion of the teacher if they fail to imitate the model accurately. We must repeat that there is no real substitute for the fluent teacher, but it is always wiser to use the tape model if one's own pronunciation is doubtful.

The guided imitation technique has been developed in many cases (notably by the Foreign Service Institute, in Washington, D.C., where the emphasis is on fluency in the shortest possible time) to the extent of 60 units, which equals roughly four high school years of Spanish. Instruction time is considered to be about 600 hours.

In almost all audio-lingual materials, the very first lessons are devoted to pronunciation problems. Drills on other aspects of the language are postponed deliberately because of the importance of developing good pronunciation habits from the very beginning. Pronunciation control is the only, the ONLY, basis of real fluency. We now know that a person is readily able to understand anything that he can meaningfully say himself, provided that the correlation between the way he hears it and the way he says it is reasonably close. But we must also emphasize that pronunci-
ation practice never ceases to be a primary concern of the language teacher. Every drill, no matter what structural point may be at issue, is also a drill on pronunciation. In short, at every step of the way, from the first year to the fourth, the teacher must be alert for faulty pronunciation habits.

The student's model for all pronunciation is the teacher, or the tape, if its use has become necessary. The fundamental classroom procedure for learning new material according to the audio-lingual method is by direct and immediate imitation of the model. Depending upon the type of drill (and we shall look into the various types in a later lesson), the repetition technique will vary. The most commonly used repetition technique is: teacher, student-in-chorus, teacher, individual student, teacher. The basic formula may be varied, but inherent in all repetition technique are two axioms. First, no student is asked to imitate another. If an imitation drill is in progress, the teacher must repeat the model for each student. If he does not, the students rely upon each other as a model and mistakes are compounded as students recite one after the other. If the student is being called upon to respond with an entire phrase to a cue of perhaps one word, then, of course, he himself generates his own phrase on the basis of what he has been taught. Second, after each corrected response to either an imitation drill or a cued response drill, the teacher should repeat the correct phrase so that the student who has recited can compare his imitation or answer with an authoritative model and so that the entire class (in chorus) can have an opportunity to practice each response. The purpose of having the class imitate new items in chorus before individuals are singled out is so that the negative influence of nervousness or the desire not to make a mistake can be minimized. The choral repetition permits individual students to have a "dry run" before they are called on to perform individually.

Although we will discuss drills at greater length further on, it would be well to mention here that part of a successful drill is the rhythmic manner in which it is conducted. Corrections during drills should be limited to supplying the correct form and carrying on. Detailed corrections which imply structural generalizations or special drill should be postponed until after the drill in progress has terminated.

Also within the scope of remarks on rapid drills is the matter of indicating how the students are to respond: in chorus or individually. This means that learning a set of unmistakable gestures is necessary for the teacher and the students. A set of suggested gestures will be discussed later in this chapter.

One of the problems inherent to the use of gestures stems from the size of the classroom and the arrangement of the seats. The ideal arrangement of the language classroom is that in which the seats are placed in a horseshoe fashion with the seats in the second and third rows slightly elevated. This is not possible in many cases, of course; therefore it behooves the teacher to move about the room or station himself in a place where his gestures may be clearly seen by all students.

For large classes particularly, calling the student to recite by name may be impractical, since any hesitation on the part of the teacher breaks the rhythm of the exercise. Some teachers have suggested a number system, but others reject it either because they have no specific seating plan or because they feel it is too impersonal.

The use of gesture may be impeded by a large and heavy textbook which cannot be carried easily in one hand, leaving the other free for gesture. Some teachers use a portable music stand which holds the book firmly in place and leaves both hands free for cueing. The stand can be placed in the center, or at the side, of the class, whichever cuts to a minimum the distance between the teacher and the farthest corner of the room. Often, however, the teacher remains "anchored" to the stand. Perhaps the best suggestion, however, is that the teacher write the exercises for: the day on 3 x 5 cards. These may be handled easily, allow the teacher to move about the room, and may be held in the hand while gesturing is being done. Some modern texts include such preprinted cards among the materials distributed with the teacher's manual.

All imitative drill is easier for younger children than for older ones. If a person is fortunate enough to have begun his study of a second language before the age of eight or ten, the powers of imitation are normally sufficient to insure excellent results in pronunciation without resorting to technical explanations of what happens to various parts of the vocal apparatus. Most older children and adults require more specific guidance based on the awareness of the particular problems of producing particular sounds. Therefore the drills and explanations regarding pronunciation which are taken up first are devoted to the specific problems an English speaker with his English habits of pronunciation will have in accurately imitating the sounds and sequences of sounds in Spanish.

Speakers of English are, as a group, highly literate: that is, they are used to thinking of language, erroneously, as a written form. If it weren't for this characteristic, it might be possible to teach effectively without reference to any written symbolization. Most students, however, are more comfortable when some kind of representation in visual form of what they are imitating
is also available. There is, of course, the traditional writing system which Spanish uses. As these systems go, Spanish is quite adequate for providing visual cues for persons who already speak the language. For the learner, however, many problems result. First, Spanish uses a variety of symbols (e, s, and z) to represent the sound /s/, but there is no orthographic distinction between the /z/ sound in esgrimir and the /s/ sound in esclavo. The letters b and v are especially confusing, since at the beginning of a breath-group both represent a consonant b, whereas between vowels they both represent a fricative b. There are many, many more of such examples which might be cited here. Suffice the foregoing to establish the point that the standard spelling system of Spanish is apt to be quite confusing to the beginning learner. The reason it is not helpful is that first, it does not adhere to a sufficiently strict principle of one symbol for each sound. Second, the student quite easily pronounces a letter such as d in Spanish the same way he does in English, resulting in a faulty accent. To minimize the probability of such errors, many of the newest materials make use of a device known as "respelling." The purpose of respelling is to achieve a one-to-one correspondence between the sounds of the language and the written symbols that represent them, for example: [b] to represent the breath-group initial letters b and v, and [j] to represent the inter-vocalic b and v. But wouldn't a student still pronounce the "respelled" b like a b in English? Yes, he might. The only way to avoid any possibility of transfer would be to use a respelling which had nothing whatever in common with the English alphabet. Some phoneticians have adopted the idea, believing that the very unfamiliarity of the symbols is a healthy reminder that none of the English sounds are exact duplicates of the Spanish sounds to be mastered. All systems of respelling are based on the scientific analysis of the sounds of Spanish and we shall discuss both that analysis and suggest some of the more practical respellings devised up to now.

In any case, most of the new audio-lingual materials use the principle of respelling to some degree in their presentation. Some texts use the phonetic respelling throughout (such as the Foreign Service Institute course and the Agard, et al., book), while others prefer to limit it to the very first lesson or two.

Another of the advantages of the phonetic respelling arrangement is that important phonological features which are almost universally neglected but which are of vital importance in achieving a near-native accent, such as intonation, can be shown. We shall discuss major intonation types in a later lesson and will discover then that there are certain major types which constitute the "normal" patterns of the language. These patterns can be indicated graphically by a variety of methods, among which are the following:

1. A musical staff with musical notes or dots on it:

```
/seaportalobyen/ (¿Se ha portado bien?)
```

2. A series of dots or "accent marks" written at varying heights above the written line:

```
/seaportalobyen/
```

3. An ascending and descending wavy line described above the phrase:

```
/seaportalobyen/
```

4. A "block" line above the written phrase:

```
/seaportalobyen/
```

5. A series of numbers written slightly above the written phrase:

```
2 1 1 2
```

Another immediate advantage of the respelling system is that its symbolization will allow for a consistent interpretation of the pronunciation of any dialect area of the Spanish-speaking world. For example, we may teach that the respelled symbol /s/ is to be interpreted as the [s] in Spanish American or as the [θ] in Central Spain. Many regional features of pronunciation can be marked similarly.

The acquisition of a good pronunciation is, first of all, the result of careful listening and imitation, plus whatever help can be obtained from initial pronunciation drills and description, as well as from the respelling devices.

The typical (although by no means only) organization of an audio-lingual lesson, in most current materials, is as described at the end of the last chapter, beginning with a basic situational dialogue with a few pertinent notes. You will notice that any notes are relegated to a position where they do not distract the students' attention from the dialogue itself. Most of the "notes" are of a cultural nature, such as the ones here. This is followed by material basically devoted to phonological and grammatical drills (also called "pattern drills") and discussion. Discussion, in this sense, as we shall soon see, means a particular type of grammatical explanation (sometimes also called "generalization") which follows the exercises. It is important to note, however, that

--- 17 ---
discussion always FOLLOWS the exercises, and students are not expected to generalize until after they have mastered the pattern. The sections are generally concluded by a set of drills or narratives which put together the same material as originally appeared in the basic dialogues and drills, but in a slightly different way. Readings are introduced as a part of each lesson about one-third of the way through the complete course.

The real core or heart of each unit is the basic dialogue. At best, these dialogues are re-creations of real situations a student is most likely to encounter, and the vocabulary and sentences are those he is most likely to need. They are written in the most standard and authentic manner possible. While most texts grade the dialogues progressively throughout the course, others simply ask natives to prepare them without regard for the progressive difficulty of the material. Since only certain focuses are drilled in each unit, these unedited dialogues simply footnote a form which is not to be drilled. They have achieved a certain success. Some texts like to keep a continuing train of thought throughout the course. The Foreign Service Institute sets its dialogues in a mythical South American country called Surlandia, which is described as a "typical" Latin American country, insofar as it is possible to extract common features from among the various Latin American republics. Since their course is designed for Foreign Service personnel, as much cultural information as is practical is included in the dialogue materials. A similar program has been adopted in Modern Spanish, but with the focus on the American high school or college student who is traveling abroad.

At first, ALL new vocabulary and constructions are introduced in the basic dialogue. Later on, new items may be introduced in the drill sections, but only when it is either not the focus of the exercise or when its meaning is obvious, as in the case of cognates. Many audio-lingual texts emphasize the new items in the dialogue by isolating them for repetition before the actual phrase in which they are used; for example:

pass (to pass, to hand) pase (pasar)

pass me páseme

the book el libro

Pass me the book. Páseme el libro.

It is impractical to introduce each new word of construction more than once, so the student must be cautioned to master them as they occur. Since the drill material of each lesson is based on the dialogue, a student's failure to master the dialogue will inevitably result in poor performance in the exercises. In most of the new materials, pains have been taken to see that each word introduced will reappear many times later in the course, to help the student assimilate it in a variety of contexts.

Should these words be learned by memory at the outset? Yes, but always in context. It can be important for the student to learn the literal meaning of certain items, but such literal learning should always be followed by learning the meaning of the form in following context. The student should not be concerned if the meaning in context is strikingly different from the literal meaning. In the new materials, the teacher must bear in mind, the dialogue was prepared in English. The English is simply a post hoc equivalent and not a literal translation. The sooner the student is made aware that the English and Spanish will not necessarily "follow" one another, the better.

The basic dialogue is commonly printed in the textbook. As we shall see later on, this simple fact has proved to be the largest single detriment to the correct learning of the dialogue. The four most common formats in which these dialogues are laid out on the pages of the textbook are: 1) in two parallel columns, Spanish orthography on the one side and English on the other; 2) back-to-back, with Spanish on the recto and English on the verso; 3) Spanish only in the lesson, English only in the notes at the rear of the book; and 4) in three parallel columns, Spanish on the left, phonetic transcription in the middle, and English on the right.

All four concepts share two immense and immediate drawbacks. First, the presence of standard Spanish orthography is detrimental, as we have seen earlier in this chapter. Second, the availability of an English translation is a negative feature, be the translation on the same page or at some distance from the Spanish. Sooner or later, the classical problem of "translation" vs. "equivalent" will succeed in complicating the process of learning the dialogue. One example will illustrate this point. "La mesa está servida" is announced. The English "translation" would be: The table is 'served' and make no sense. The English "equivalent" would read: 'Lunch (dinner) is ready' and make excellent sense, except that the student will associate the Spanish and English word-by-word: 'La (the) mesa (lunch) está (is) servida (ready)', and then risk incorrect analogical formations such as 'Estoy servido' for 'I am ready.'

As for the phonetic respelling of Type 4 above, we may applaud the device as a means of retaining a visual aide-memoire, without resorting to the standard orthography, yet many students experience difficulties in learning the transcription and thus a new impediment is introduced at a moment in which it can least be afforded.

Much of the success of the dialogue as a learning experience depends upon the presentation. Done correctly, the presentation can also remove the need for line-by-line "translation" or "equivalents." First, the books are taken from the
students; they will not see them until the dialogue sequence is complete—perhaps four days hence. Then the teacher describes what the dialogue is about. This description may be done in English or in Spanish. It is a short prose summary. Visual aids are referred to from the beginning. In some cases these will be pen-and-ink drawings of a rough nature done by the teacher himself. In others, they will be the printed charts that sometimes accompany the textbook in use. In yet others, they will be color drawings or magazine clippings collected by the teacher.

The purpose of the initial description is to make certain that the students understand the context in which the dialogue is to take place. Perhaps the description will require repetition; perhaps the teacher will want to ask a question or two of individual students to ascertain that the description is understood, even if it has been done in English.

Now we are ready to model the dialogue itself. Referring to the same visual aids as in the description, in order to recall the situation vividly to the students, the teacher reads the dialogue (or uses the tape). Three readings usually suffice. Then students are called to the front of the room and, as the teacher or tape repeats the dialogue, the students selected "walk through" their parts. They do not speak. They then return to their seats and the dialogue is read once again.

Now that the situation is vividly clear, both by explanation and by dramatization, the teacher is ready to begin the presentation of the dialogue for memorization by the class. The following procedures have been used with considerable success:

1) Modeling. It is suggested that the teacher model the line three times before calling for any choral echo. He must use the same speed and intonation as the speaker on the tape (if the tapes are not available and the teacher is not certain of the intonation, he should consult a native speaker), and free use should be made of authentic kinesics (facial expression, bodily movements, etc.) and the visual aids to recall meanings established earlier. The gesture suggested to indicate that the students are only to listen is that of the arms extended, with palms of the hands facing the students.

2) Backward buildup. Prior to the class the teacher has analyzed the line and has divided it into logical utterances, thought groups and intonation patterns. As an example, let us take the first line of the dialogues in A-LM, Unit 8: "Tu eres de la Argentina, ¿verdad, Domingo?" This line would be divided: "Tu eres / de la Argentina / ¿verdad, Domingo?"

For backward buildup on this line the teacher will model ¿verdad, Domingo? with proper intonation, two or three times, then elicit choral repetition an equal number of times, always repeating the utterance between the choral echoes. The gesture to indicate that the entire group is to echo is the sign commonly used for "come here", done slowly with both hands. Choral response is continued until no blatant pronunciation errors are heard. Then, using the same gesture, with only one hand, the teacher indicates several different individuals who should echo the utterance. It must always be modeled by the teacher between the individual echoes, just as it was between the choral echoes.

The learning of this line will be completed with two more steps, in which the procedures outlined above are used, first with the phrase "de la Argentina, ¿verdad, Domingo?" and finally with "Tu eres de la Argentina, ¿verdad, Domingo?" The same procedure is used in presenting the second line. When this has been mastered, the teacher returns to drill the first two lines together, then adds the third for thorough drill, returns to drill the first three lines together, adds the fourth, and so on.

Correction in pronunciation is never made by stopping the individual student and insisting that he repeat until he has mastered it. If a student pronounces incorrectly, the teacher immediately models the utterance, calls for full choral echo, models again, proceeds to another student, models again, and then returns to the student who made the original echo.

The merit of the backward buildup technique lies in the fact that the oral memory is considerably shorter than the visual memory. That is, if a learner is attempting to memorize a line of some length given orally, he tends to remember what he heard first and to forget what he heard last. Therefore, once the entire line has been modeled, the emphasis for repetition should begin on the utterance with which the line concludes and slowly build backwards. This method also serves to strengthen correct intonation, for the teacher is always modeling each phrase with the intonation which it has in that sentence, no matter how strange it may seem when isolated.

A number of other techniques have proven highly successful in reinforcing the learning of the dialogue and in adding variety and interest. These may be introduced as soon as two or three lines of the dialogue have been thoroughly presented as indicated above.

1) Role playing: teacher-class. Teacher gives the first line, students in chorus add the second, which the teacher immediately models. The teacher then proceeds to the third line, students give the fourth, which the teacher models, etc. It is important that the roles be reversed in this process so that the class has opportunity to say each line several times.

2) Role playing: class only. One half the class, or some indicated group (such as all the girls or
all the boys) gives the first line, which the teacher models, followed by the next line given in chorus by the other group. Reversing roles is also necessary in this procedure.

3) Role playing: teacher-individual student. Teacher plays one role and asks different student to add the next line. Teacher will always model the rejoinder of the student and elicit, by gesture, full choral echo when errors have been made.

4) Role-playing: students. Roles played by individual students, with teacher modeling after each student performance and calling for full choral echo when necessary.

5) Chain drills. Teacher starts the dialogue and proceeds around the class with each successive student adding the next line. For variety the teacher may start the dialogue and then by gesture, (in this case, merely pointing) indicate students, not in their order of seating, to give the next line.

While it is necessary to follow the vertical sequence of the dialogue in the early stages of its learning, it is worthwhile to introduce a different technique involving horizontal learning once the students have a reasonable command of the material. That is, the teacher gives line 3, let us say, and the student is to respond with line 4. This avoids the danger of the student feeling that he can only give line 4 if he has heard the dialogue from the beginning, as he memorized it, just as the student who has been forced to memorize and drill verb paradigms finds it difficult to produce the form hablé unless he first thinks or says to himself “hablé, hablaste,” the two preceding forms in the paradigm.

This horizontal concept may also be used in the chain drills. That is, the first student gives any line he chooses, and the next must give the appropriate rejoinder. The third student then gives any line he chooses and the following line must be given by the next student. Of course, the teacher will always model each line and each response after the students give them.

The amount of repetition necessary will depend on the length of the utterance and the difficulty of pronunciation involved. It is absolutely essential that the teacher follow the text of the dialogue religiously, or better yet, that he memorize the dialogue beforehand so that he will never deviate from his “score” and thus add confusion to the procedure. The value of having the dialogue written on 3 x 5 cards for teacher use (which do not obstruct the system of gestures) has been mentioned earlier.

Once the teacher has presented the dialogue, utilizing the above procedures, the student is told that he must now memorize the dialogue, or portion of it, by heart as his homework. He may take advantage of the language laboratory for drill with the tapes, or he may practice at home with the take-home records. If the text is accompanied by such records, the students may be asked to purchase them, or in some instances, the school has a supply of the records which are made available to the students for home study through a library system.

If the school has not provided a language laboratory, it is suggested that the various teachers take their turn at staying in their rooms one-half hour after school, with a tape recorder which is available to the students. Most modern texts are accompanied by tapes which may be purchased or borrowed from the publisher for duplicating purposes. If none are available by these means, then the teacher should have a native colleague in the school or district make the necessary tapes.

After the students have memorized their performance on the materials in one or all of the following ways: (1) having students stand before the class, or at their seats, facing each other, and present the dialogue as a living situation, (2) using chain drills discussed earlier, or (3) utilizing the directed dialogue drills provided in many texts. If these dialogues are committed perfectly to rote memory, the following drills will go easily and rapidly and produce the best results. As much as half the time available for a given unit can be invested in perfecting the basic dialogue without distorting the presentation of the unit.

Two other techniques are frequently used but are not recommended: elicit a written response or reproduce the dialogue by giving cues in English, which is indeed the easiest and fastest way of checking. Neither of these, however, is in accord with the approach presented in this book and is not necessary if the dialogue has been presented as outlined above.

Once the entire dialogue has been memorized from oral stimuli, the textbooks are returned to the students and they are permitted to see the printed text. The use of the dialogues for purposes of learning reading and writing will be discussed in a later chapter.

The basic dialogue is followed by drills. Patterns of the structure of the language which have been learned in the basic dialogues are expanded and manipulated in the drills. As we progress in the course, we will come to meet a variety of drill types. Most, varied as they may be with regard to format, focus either on the systematic variation of selected basic sentences within the structure and vocabulary the student has already learned, or on the structure of the language to provide a systematic coverage of all important patterns.

All drills are planned to be answered rapidly. They are best done orally with only the teacher’s book open, although some, because of their complicated nature, may be done with the students’ books open. Generally, the manner of presenting the drill is obvious from the format of the text.
Sometimes, however, the teacher will be wise to do a “pre-run” at home before presenting the drill in class. Some texts provide the answers to drills for the teacher’s convenience and for the student to refer to when studying outside of class. Generally, if a drill is found to be hard, it is because the student did not adequately master the dialogue and possibly also the preceding drills. Audio-lingual drills reject any similarity to mathematical drills in that they are not to be puzzled out. The emphasis is on doing them rather than on figuring them out. They do not contain tricks and they are not intended as tests (although some may be used as such after they have been done in class). The balance of this discussion may be followed by referring to the sample skeleton unit which appeared at the end of the preceding chapter.

After the drills themselves, there is a more detailed discussion of the pattern drilled. These descriptions are written in a condensed and somewhat technical fashion. In some materials these are called grammatical explanations; others prefer the terms generalizations, descriptions, etc. An effort is always made to keep these explanations accessible, clear, and readable. But it must be recognized that a description of a language is a technical sort of thing and simplification is attained only by sacrificing comprehensiveness and accuracy. The student is actually acquiring through these discussions a set of analytical tools which should serve him through the balance of his career as a language learner. Therefore, our goal is always to present explanations which will not need to be revised at each step of development.

Later units have conversation and reading selections, as we have mentioned. The conversation part is designed to help the student bridge the gap between the more or less mechanical stimulus-response activity of the drills and the skill of free conversation, which is the ultimate aim of the audio-lingual course. These so-called recombinations extend the abilities of the student into ever more natural situations. The recombination narratives are usually an anecdote type of description of an event or situation which is sometimes further recast as a directed dialogue in which the teacher acts as a prompter for students who take the various parts as actors. The prompter gradually withdraws his help so that in the end the conversation is carried on freely. Reading selections are designed in most new materials to provide interesting information about the culture of the Spanish-speaking peoples. At the outset, these reading selections do not present words or structures that the student has not already met in the dialogues and drills. About halfway through the course, however, reading selections may be used to expand the students’ vocabularies.

Topics for Discussion
Discuss each of the following in the light of the material presented in this chapter, your own experience, and the practical requirements of modern foreign language teaching in the public schools.

1. Since the students will seldom have the opportunity in real-life conversation to use the exact lines of any dialogue given in an audio-lingual lesson, why is it essential that these dialogues be memorized perfectly?
2. Since intensive choral response can become monotonous for the students and provide no opportunity for the teacher to hear individual errors, should it be kept to a minimum in the audio-lingual lesson?
3. Can the judicious use of the tape recorder in the classroom make modeling by the teacher unnecessary?
4. Is the use of pictorial aids in presenting the dialogues useful only to those teachers whose histrionic abilities do not permit them to present the material effectively without the aids?
5. Does the method of correcting students’ errors suggested in this chapter have any intrinsic value? Is it based on sound principles of language learning?
6. Can the teacher who is not provided with a language laboratory or portable tape or disc recorders expect to teach effectively in the audio-lingual approach?
7. Does the organization of the audio-lingual lesson correspond to the principles of language learning outlined in Chapters I and II?

Chapter 4

SIGNIFICANT CONTRASTS AND THE TEACHING OF PRONUNCIATION

We have previously mentioned the confusion between speech and writing, and we have taken the positive stand that the study of a spoken language cannot effectively be approached through writing. Rather, the spoken language must be considered per se, for language is primarily an oral-aural system of communication and sounds are the stuff of which it is made. It therefore behooves the language teacher to have a familiarity with, or better yet, a working knowledge of, sounds—how they are made by our organs of speech, how they are classified, and how they are used in the particular language of his interest. In one of his books, Robert A. Hall Jr., has provided a clear and logical explanation of the system used to describe sounds, which, although summarized in the following paragraphs, should eventually be used in its entirety by the serious student.

If there were any assurance of scientific objectivity in it, a simple system for describing sounds could be evolved based on auditory impressions—the effect of each sound on the listener's ear. But what one person might describe as a "flat, harsh sound" may not be understood as such by another person, since terms such as "flat, broad, harsh, etc." are too relative to have any objective reality. It would be like trying to describe chemical elements in terms of their smells.

As the use of sound spectrography becomes more widespread, linguists are growing better able to record and chart characteristics of sound-waves as they occur in speech and to analyze more profitably the intensity, frequency and other acoustic features of the sounds. For the non-specialist, however, a highly effective system is now in use, based on the description of sounds, not according to their auditory impressions or acoustic characteristics, but in terms of the organs of the body used in producing them. Thus we may classify the sounds of a given language according to the speech organs involved and the specific ways in which they are used. This study is known as articulatory phonetics, since the analysis made is of the physiology of articulation.

To work with this system demands a knowledge of the organs of speech which are diagrammed below:

The organs of speech include essentially all the human respiratory tract. Air is drawn into and expelled from the lungs, which expand and contract under the influence of the diaphragm. As the breath moves to and from the lungs, it passes through the mouth, nasal cavity, pharynx and trachea. These and other closely related parts of the body (such as the tongue and lips) are the organs customarily used in speech. The air passes in and out of the lungs in a stream or column, called the breath-stream. The diagram above gives a cross-section of the human head and neck, showing the route that the breath-stream follows on its way to and from the lungs, and the main organs of speech.

Within the area of the mouth, the organs of articulation are divided into two general categories: active articulators include those organs

--- 23 --- PRECEDING PAGE BLANK - NOT FILMED
which actually move during the articulation of the sounds of the language: the tongue, the velum, and the lips. The passive articulators are those organs which do not move, but with which the active articulators often come in contact: the palate and the teeth. By moving the active articulators, or by placing one or another of them in contact with specific passive articulators, as the breath-stream passes through them, all the sounds of a given language can be produced.

Among all the sounds which the human organs of speech can produce there is a basic division:

a) Those sounds which can be made exclusively by forming resonance chambers in the mouth by changing the position of the tongue. These are the sounds traditionally termed vowels.
b) Those sounds produced by obstructing the breath-stream by the use of the active and passive organs of speech to produce audible friction. These are traditionally labelled consonants.

It is important to remember that here we are not speaking of the traditional orthographic vowels (a, e, i, o, u,) and consonants (all the rest of the letters of the alphabet), but of vowel sounds and consonant sounds.

In making both type of sounds, we utilize variations in position of the organs of speech from the vocal cords upward. Three main factions are responsible for differences in sound:

a) The activity of the vocal cords.
b) The place or position in the mouth where a sound is articulated.
c) The manner in which it is articulated.

For every sound, we also distinguish three stages in its pronunciation: the onset, or time in which the organs of speech assume the position of its pronunciation; the peak, or time during which they are in that position; and the coda, or time in which they leave that position. In some languages some sounds differ only in the length of hold, or in the time of release.

After leaving the lungs, the breath-stream passes between the vocal cords—two movable membranes which can either lie along the side of the larynx without making any sound (thus producing what are termed voiceless sounds, such as English and Spanish p, t, f, s), or may be brought together, either partially or completely, to set up sound waves and produce what are known as voiced sounds (usually all vowels and many consonants, like English and Spanish b, d, m, l).

Once it has passed the vocal cords on its way out of the lungs, the breath-stream passes through various points in the pharynx, nose and mouth where the column of air may be further modified.

In the nasal cavity there are no points at which an obstruction or other change in the breath-stream can be made, but the whole nasal cavity can be brought into play as a resonance chamber (producing nasalization) or may be shut off from the course of the breath-stream by the velum (whose movable tip is known as the uvula).

However, in the mouth (oral cavity) there are a number of ways the breath-stream can be modified. The most active organ in these processes is undoubtedly the tongue, since it can be raised varying degrees at the front, middle or back of its entire extension.

For vowel sounds the tongue does not come directly in contact with the roof of the mouth, but assumes various positions inside the mouth to form cavities that serve as resonance chambers, conditioning the specific quality of the vowel sound. Two main factors determine the quality of the vowel: the position of the tongue in the front or back of the mouth, and the height to which it is raised in the mouth. (Occasionally lip-rounding and/or nasalization are also factors to be considered.)

Vowels, therefore, are usually classified by phoneticians in two main categories: tongue position (front, central, back) and tongue-height (high, mid, low).

The tongue is also the main factor in the pronunciation of consonants, but here other organs of speech (vocal cords, velum, uvula, soft palate, hard palate, alveolar ridge, lips and teeth) are also called into play. There are a number of special adjectives commonly applied to describe sounds articulated at these various points:

<table>
<thead>
<tr>
<th>Term</th>
<th>Refers to:</th>
<th>Example (Spanish)</th>
</tr>
</thead>
<tbody>
<tr>
<td>uvular</td>
<td>uvula</td>
<td>j between back vowels: ojo</td>
</tr>
<tr>
<td>velar</td>
<td>velum</td>
<td>g (gato); e (cola)</td>
</tr>
<tr>
<td>palatal</td>
<td>palate, especially the hard palate</td>
<td>ch, ñ</td>
</tr>
<tr>
<td>alveolar</td>
<td>alveolar (gum) ridge</td>
<td>s, n, r</td>
</tr>
<tr>
<td>dental</td>
<td>teeth</td>
<td>t, d</td>
</tr>
<tr>
<td>labio-dental</td>
<td>lips and teeth</td>
<td>f</td>
</tr>
<tr>
<td>bilabial</td>
<td>lips</td>
<td>p, m</td>
</tr>
</tbody>
</table>

In addition to describing the position in which a sound is made, the linguist also distinguishes the manner in which it is articulated, since there are a number of ways in which the vocal cords, tongue, palate, etc. can obstruct the breath-stream, either shutting it off completely or directing its passage through one kind of channel or another. The stream of breath may be stopped completely, as in English or Spanish p, t, k; or it may be forced through a channel. This channel may take the form of a narrow slit, as in English f, v; or of a trough or depression (a rill) in the center of the tongue, as in English s. The air may also pass over the depressed sides of the tongue, as in some kinds of l. It may be modified by a single or
repeated flap of some movable organ, like the lips (in the interjection usually written brrrr), the tongue (in the Spanish r) or the uvula (as in the Spanish j). Or the breath-stream may be checked entirely and held while the nasal cavity is used as a resonance chamber, as in the English m, n, and the sound we write with the letters ng (in singing). Types of release may differ: a sound may be released with a little explosion (like English p, t, k), with the tongue assuming position to form a rill (as in English ch) or to make a slit.

For these reasons another set of adjectives is used to describe the various manners of articulation:

<table>
<thead>
<tr>
<th>Term</th>
<th>Refers to sound pronounced with:</th>
<th>Example (Spanish)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stop or occlusive</td>
<td>Complete stoppage of breath-stream</td>
<td>X b (bola), d (dar)</td>
</tr>
<tr>
<td>Affricate</td>
<td>Release involving fricative (slit-type channel)</td>
<td>p (pes), g (gota)</td>
</tr>
<tr>
<td>Continuants or spirants, made up of the following types:</td>
<td>No complete stoppage of breath-stream</td>
<td>c (hueco)</td>
</tr>
</tbody>
</table>

Fricative: Slit-type channel
   - b [b] (sabe);
   - g [g] (ilegan);
   - d [d] (ruido);

Sibilant: Rill-type channel
   - s

Lateral: Channel(s) over sides of tongue
   - r, rr

Trill(ed): One or more flaps of movable organ
   - n, m

Nasal: Nose used as resonance chamber

While the stream of breath is being modified, at a given point and in a given manner, as illustrated above, still other things may be happening at the same time. A puff of air may be sent out immediately after a consonant and produce a sound known as aspirated. The sound may be sent into the nose for a fraction of a second before a consonant is articulated, coinciding with the onset of the sound, which is then called a pre-nasalized consonant. If the tongue is raised close to the palate at the same time the consonant is pronounced, the consonant is palatalized.

Furthermore, sounds are pronounced with different degrees of intensity of air being expelled from the lungs. This intensity is termed stress and is of great significance since a change of stress may change the meaning of an utterance.

With the frame of reference elaborated thus far, the phonetician can describe and classify the sounds of any language. He might describe a sound as a "high tense front unrounded vowel" (for what we usually write ee in English or i in Spanish) or as "voiceless dental fricative" (for what we normally spell th as in thing or what many Spaniards say for z in caza).

The phonetician found that this terminology, though it was the only scientific and universal way of describing a sound, was somewhat cumbersome. As chemistry had already shown, specific symbols could be assigned to represent elements, so the phoneticians devised a set of symbols, a one-to-one correspondence with each sound to be represented; this came to be known as a phonetic transcription. Each symbol was to stand for only one sound and each sound should be represented by only one symbol. Our traditional English and Spanish spelling systems or alphabets, based on the Roman alphabet, are inadequate to serve for phonetic transcription since the twenty-six letters could not begin to represent all the possible sounds. As a result, many systems of phonetic transcription were devised, such as Bell's "Visible Speech" and Pike's "Functional Alphabetic Symbolism" which abandoned all use of Roman alphabet. However, most widely-used phonetic transcriptions, such as the International Phonetic Alphabet (IPA) use the traditional Roman alphabet as a base and introduce new letters or alterations in shape of familiar letters when the need arises. Those interested in phonetic symbols will find them readily available in a variety of books.

The scientific reliability of the symbol in representing a sound and the ease with which the symbol may be used, made a phonetic transcription an essential tool for all work dealing with sounds. Between the years 1870 and 1920 phoneticians amassed a great body of knowledge for describing the pronunciation of sounds and for symbolizing them in transcription. Many beginning language textbooks included full phonetic transcription of the sounds of that language which the students were expected to master and to reproduce, sometimes to the confusion of the student, such as indeed was the case with one of the authors of this text who naively thought, in his first weeks of studying French as a youth, that he was actually writing French orthography when he was producing a phonetic transcription!

From 1920 on, however, after the research of men such as Edward Sapir and Leonard Bloomfield, linguists began to see that sounds are important only as they perform a specific function in the language by differentiating the meaning of words. Research was then concentrated on discovering and symbolizing not only speech-sounds as such, but those functional units of speech-sound that are significant, i.e., that make a difference in meaning. For such functional units of sound, the term phoneme was adopted.

In English, for instance, the words bit and pit each contain three significant units of sound, or phonemes, but differ from each other only in the
first phoneme (Cf. beso and peso in Spanish). Similarly bit and beat each have three phonemes and differ only in the second phoneme (Cf. Spanish peso, pesa). By this method of contrasting pairs of words, specifically called minimal pairs, the linguist can establish a series of meaningful differences among words and each difference serves to set up a pair of contrasting phonemes.

For an individual sound functioning as part of a unit of sound, the term allophone (or positional variant) issued. As an example, let us take the two sounds in many types of American English which are normally written as I, but are phonetically quite different: the alveolar variety found at the beginning of a syllable in words such as lead and look and the velar variety at the end of the syllable, in words like wool and fool. These sounds are represented by different phonetic symbols [I] and [Y] and the difference is easily audible, but after studying the distribution patterns of these sounds within words, the linguist finds that [I] always occurs at the beginning of a syllable while [Y] is always found at the end of a syllable. Therefore these two sounds never make a difference in meaning between two words in English (Cf. initial d in Spanish dama and inter-vocalic d in nada). He therefore finds the sounds represented by [I] and [Y] to be merely positional variants or allophones of the same phoneme which are not significant functional units of sound since they do not make a difference of meaning in auditory perception.

The stage of analysis described above is known as phonemics and has now been accepted by all forward-looking linguists as an essential part of linguistic analysis. The symbolic representation of the phonemic analysis is known as phonemic transcription and the symbols are normally placed between slant lines: / / to distinguish them from phonetic transcription, which uses brackets [ ], or from ordinary spelling.

Phonemics does not in any way supplant phonetics, but simply builds further on the results obtained in phonetics, with a change of emphasis. In essence, it is a simplification of the analysis of the sound system and represents a shift in aim—from that of representing every identifiable sound to that of representing only functionally significant units of sound. It has the advantage of not being cluttered up with non-essentials.

Since each language has its own organization, its own economy, the phonemes of one language are not the same as those of another. We find that the sounds of each language fall into a distinctive pattern and we have no right to expect one language to have the same patterns as another. Any feature of sound may be highly significant in one language and completely without phonemic significance in another.

In general, more mature speakers of one language can hear and imitate without special training only those phonemic distinctions which their own language has taught them to be attentive to (the difference between bad and bed, important to the speaker of English, is scarcely perceptible to a Spaniard). In order to hear and make unfamiliar phonemic distinctions, we normally need to have our attention specially called to them and often have to be carefully instructed in the means of producing them.

With this in mind, the following chart of significant sounds of Spanish, the phonemes and allophones, has been prepared, utilizing the descriptive terms presented earlier in this chapter. The terms which appear in the vertical column at the left indicate the manner in which the sound is articulated. The terms in the horizontal row across the top of the diagram indicate the point at which the sound is articulated. Thus we identify the sound /p/ as a stop, as a bilabial, since it is produced by stopping the flow of air from the lungs by bringing the lips together.

With the aid of the information presented in this diagram the teacher will be able to utilize the principles of phonemics (significant contrasts) in presentation and correction of pronunciation.

`Voiceless  Voiced`

— 26 —
A system of charting, similar to the one we have used for the consonants, is used for the vowels. Note again how the vertical categories refer to the relative height of the tongue, while the horizontal categories refer to the area of the mouth in which the vertical feature occurs. To illustrate this further, we may super-impose the diagram of the upper and lower jaws over the vowel chart:

![Vowel Chart Diagram]

There are five simple (phonemic) vowels in Spanish. They are /i e a o u/, and we can demonstrate them to our classes in words such as piso, peso, paso, poso, and puso. English, on the other hand, has at least nine, and none of the nine English vowels corresponds very closely to any of the five Spanish vowels. Traditionally, of course, a student seeing the written form pese might well have been expected to pronounce it using the nearest English equivalents, the result being a form like [pe:zow]. Since we have now developed a teaching technique whereby the student does not meet the written representation of sounds until he already knows them, this kind of "spelling pronunciation" will be less frequent. The tendency still remains, however, for the English-speaking student to pronounce a Spanish vowel sound with the nearest English equivalent; or, in other words, to transfer his English habits into his Spanish pronunciation.

We have all heard our students pronounce the Spanish [i] in fin either like the [ij] of English meat, or like the [I] of English mit. Neither one of the English vowels is an exact equivalent. Spanish /i/ falls somewhere between the two English vowels. In a similar way, the student will very likely replace the Spanish vowel /e/ with the English [E] of met or with the [ej] of bay. The same kind of error will most likely be repeated with all stressed vowels. Unstressed vowels and the consonants are subject to the same kind of transfer of habits.

The point is simply that there are no exact equivalents in the vowels and perhaps only two or three close approximations in the consonants of the two languages and that the student cannot often rely directly upon English analogies. When our older textbooks begin a chapter on Spanish pronunciation by saying that the /i/ sound of Spanish piso is the same as the /i/ sound of English machine, we know that, since the two sounds are not really alike, this is misleading to the student and may well destroy the student's chances of acquiring a more authentic accent.

How, then, can the principles of significant contrasts help us to take a more realistic view of teaching pronunciation? First, we must know what muscular actions are involved in producing the sounds of Spanish. Although we do not need to have a physiologist's knowledge of speech organs, we must know the approximate position and shape of the lips and tongue, and whether the vocal cords are vibrating (for voiced sounds) or are not (for voiceless sounds). Second, we must have recourse to a competent analysis of the sounds of both English and Spanish to see which English sounds the English-speaking student will
attempt to substitute for somewhat similar Spanish sounds.\(^5\)

Once we have this information, we are ready to proceed to the technique itself. In general, the procedure is the same for teaching vowels and consonants: a pronunciation drill containing four steps, one of which, as we shall indicate, is optional depending upon how well the students learn the sounds from the beginning.

1. Present the sound in a context, usually a word. Thus, if the sound to be taught is /i/, present it to the students in a list of forms, such as: pisa, lise, quiso, mito, etc. Of course, the students will repeat after the teacher’s oral model (or a tape recording) and will not see the corresponding written symbols. The contextual presentation adheres to an important principle of the audio-lingual approach, which is to present forms in context—here, sounds in a context of actual Spanish words. Besides, however, the student is unconsciously practicing the pronunciation of the adjacent sounds. The method of repetition is as we have suggested before: teacher, students-in-chorus, teacher, students-in-chorus, teacher, individual student, teacher.

2. Present the sound in minimal contrast with another sound of the same class (vowel or consonant). Thus, if we continue with /i/, we shall ask the students to repeat pairs of utterances: piso/peso; piso/paso; piso/puso, etc. This enables the student, not only to hear the difference, but also to feel the changed position of the articulatory organs. The method of repetition is as suggested above.

3. Present the sound in a more complex context. Continuing with /i/, hide it in a larger phrase, such as ‘el no vino.’ This helps us to make sure that the student has really mastered the sound and that, when he is forced to articulate a longer chain of sounds, his correct response is really automatic.

4. Because of the tendency to transfer English speech habits into Spanish, which we have already discussed, a few students will still substitute a near-English sound for the Spanish sound, even after the above three steps are completed. Such students need an exercise in contrasting the English sound with the desired Spanish one. Such a contrastive exercise generally suffices to make the student aware of the physical difference (the difference in the organs and muscles he uses) that causes the differences in sound which his ear had failed to detect before (during the earlier exercises). This exercise again uses minimal pairs, but, now, one member of the pair is Spanish and the other, English: sin/sin, son/son, que/Kay, etc. If necessary, the teacher can explain which speech organs are involved and how they are placed. With the consonants, the problems may be different, but the same four-step technique we have been discussing gives good results. Here, we have visual devices and little demonstrations to help out and to reinforce practice. For example, we know that English /p/ is aspirated, but Spanish /p/ is not. We can explain to the student that “aspirated” means an articulation followed by a breath of air, but some students find the concept easier to grasp when the teacher holds a piece of onion-skin paper in front of his mouth (with the paper touching the top of his nose) and says the English word papa. The paper will flutter when the two p's are sounded. The Spanish word papa, with unaspirated /p/’s, will not cause the paper to move. Many teachers have devised ingenious methods of demonstrating these phonetic concepts and any such visual aid is helpful, provided that it is based on sound phonological principles.

To help you build a small file of dependable phonological exercises, a small project is suggested for which you will need a packet or two of 4 x 6 cards. For each of the phonological contrasts on the next pages, make your own set of ten minimal pairs on one card. The heading on each card, upper right, should indicate the contrast being illustrated, according to the following diagram. The cards can then be filed and used in class for an introductory pronunciation drill, or to re-drill the class whenever pronunciation errors recur.

Outline of Principal Significant Contrasts for Drill

I. Vowel contrasts.
A. Stressed. (An accent mark in these lists refers to a stressed vowel and does not necessarily correspond to the orthographic accent.)

1. In isolation. (example)

<table>
<thead>
<tr>
<th>/i/</th>
<th>/é/</th>
</tr>
</thead>
<tbody>
<tr>
<td>piso</td>
<td>peso</td>
</tr>
</tbody>
</table>

---28---
Contrasted with one another.

/i/ vs. /é/  piso vs. peso
/i/ vs. /ó/  piso vs. pozo
/i/ vs. /á/  piso vs. paso
/e/ vs. /a/  peso vs. paso
/e/ vs. /o/  peso vs. pozo
/a/ vs. /o/  paso vs. pozo
/o/ vs. /u/  pozo vs. puso

2. Contrasted with one another.

/i/ vs. /é/  ligar vs. leer
/i/ vs. /o/  mirar vs. morar
/i/ vs. /á/  ligar vs. lagar
/e/ vs. /a/  legar vs. levar
/e/ vs. /o/  posar vs. posar
/a/ vs. /o/  lagar vs. lugar
/o/ vs. /u/  morar vs. murar

B. Unstressed. (in actual drill, we must be extremely careful not to let the natural tendency to highlight the vowel in question cause us to stress them. It is well to warn the students about this as well.)

1. In isolation.

/i/  piso
/e/  pesó
/a/  pasó
/o/  posó
/u/  puso

2. Contrasted with one another.

/i/ vs. /e/  ligar vs. leer
/i/ vs. /o/  mirar vs. morar
/i/ vs. /á/  ligar vs. lagar
/e/ vs. /a/  legar vs. levar
/e/ vs. /o/  posar vs. posar
/a/ vs. /o/  lagar vs. lugar
/o/ vs. /u/  morar vs. murar

C. Diphthongs.

/é/ vs. /ej/  le vs. ley
/á/ vs. /aj/  bala vs. baila
/ó/ vs. /oj/  o vs. hoy
/á/ vs. /aw/  ala vs. aula
/e/ vs. /ew/  dedo vs. deudo

D. English interference.

1. English diphthong for Spanish vowel.

/ej/ /e/  lay for le
/ow/ /o/  low for lo
/iU/ /i/  seen for sin
/uw/ /u/  too for tú

2. English diphthong for Spanish diphthong.

/ey/ /ey/  lay for ley
/aj/ /aj/  eye for hay

3. English /æ/ for Spanish /a/.

4. English /a/ for Spanish /o/.

5. English /i/ for Spanish /u/.

II. Consonant contrasts.

A. Little apparent difficulty, therefore minimum drill.

/m/ /f/ /z/ /b/ /g/
me fé mismo ¡Basta! ¡Go!

B. The following consonants are articulated at approximately the same points in English and Spanish. The problem is that the English consonants are aspirated and the Spanish are not. Therefore, contrastive drill is indicated.

English consonant vs. Spanish consonant

/p/ /p/  pan vs. pan
/k/ /k/  cone vs. con

C. In the following two consonants the manner of articulation is the same as in English, but the place is slightly different.

English consonant vs. Spanish consonant

/n/ /n/  no vs. no
/d/ /d/  den vs. den
/č/ /č/  cheat vs. chito
/y/ /y/  yoyo vs. yoyote
/ny/ /ñ/  canyon vs. caña

D. In the pronunciation of the following consonants, both the place and manner of articulation change from Spanish to English.

English contrast vs. Spanish contrast

/t/ /t/  ten vs. ten
/č/ /x/  Sarah vs. cera
/l/ /l/  lead vs. lid

E. The following Spanish consonants are best taught in isolation.

b  cabó
b  cabó
g  vago
d  cada
R  carro
x  faja

Additional material to complete your sets may be found in Bowen and Stockwell, Patterns of Spanish Pronunciation (see Bibliography), and Modern Spanish, and the Teacher's Manual accompanying the A-LM texts.

TOPICS FOR DISCUSSION

Discuss each of the following assertions in the light of the material presented in this chapter, your own experience, and the practical require-
ments of modern foreign language teaching in the secondary school.

1. The principal pedagogical value of describing the sounds of a language in terms of their point and manner of articulation is that it eliminates reference to spelling.

2. The sounds of Spanish can be taught effectively by relating each sound to an equivalent, or nearly equivalent, sound in English, e.g. Spanish /a/ in pato with English /a/ in father.

3. The respiratory, oral and nasal organs are of equal importance in the articulation of the sounds of Spanish.

4. The only advantage in the classification of sounds into phonemes is the economy of writing only one symbol for each sound rather than possibly two or three symbols for one sound, as occurs in standard orthography, e.g. /s/ for the initial sound in seso, ceso, or /k/ for caso, queso.

5. The principle of "significant contrasts" may be considered important as a vocabulary-building device.

Do the following:

6. Pinpoint the ways in which the English vocalic system interferes in learning directly the pronunciation of Spanish vowels.

7. Make a list of 19 Spanish consonants and describe the articulatory features that pertain to each one. For example:

   /p/ voiceless bilabial stop.

8. The tendency to transfer the English phonemic system into Spanish causes problems we can anticipate. Name at least 5 such specific problems and indicate by what techniques we may resolve them.

Chapter 5
SYNTACTIC DRILLS

The audio-lingual approach to the teaching of syntax centers about two features: carefully constructed dialogues into which the syntactic patterns are woven and which the students are expected to memorize, and drills of rather definite types which embody the patterns and make them habitual by varying them in systematic ways. Of course, even with the more traditional textbook, these same kinds of drills still give excellent results; so it is well to know how to make and use them, regardless of the textbook being used.

The structural focuses of any given unit in the audio-lingual text are determined by the structure embodied in the dialogue of the same unit. The point of departure for each syntactic (or pattern or structure) drill is, then, always the basic dialogue in which it occurred. In this way, the drill becomes an inductive learning experience in which the student, after having practiced, memorized, and habituated the basic sentence in which a particular syntactic structure has appeared in natural, native context, learns how to manipulate the same structure in different analogous situations. Note that we do not attempt to generalize a "rule"; rather, we allow the pattern to emerge by conditioned variation within an understandable context.

The reader may wish to review Section VI of the Sample Skeleton Audio-Lingual Unit presented in Chapter 2, in which we deal with drills. The grammatical point being presented is manipulated in such a way that the items illustrating the point are varied without changing the essential structure of the utterance. Therefore, the student's attention is focused on the slot where the changes are to be made; he learns to handle the item that can be substituted in the slot and gradually develops an understanding of the pattern being drilled.

Let us now examine the fundamental method by which syntactic drills of the type we are discussing are built:

First, the audio-lingual structure drill begins with a model utterance or "frame" which the class always repeats in chorus after the teacher's model, at the beginning of the exercise. For example, the frame "el niño corre" can form a point of departure for the verb-form exercise:

Teacher (model) : El niño corre.
Class (echo) : El niño corre.
Teacher (cue) : Los Niños corren.
Class (response) : Yo corro.

In reverse, the same frame serves as a point of departure for the singular and plural subject exercise:

Teacher (model) : El niño corre.
Class (echo) : El niño corre.
Teacher (cue) : Los Niños corren.
Class (response) : Yo corro.

Obviously, in the syntactical points illustrated above, there is no difference between this structure in English and in Spanish. The student quickly grasps the syntactical point since the structure in English would produce an identical frame: "The children run." The difference is only in the words that occupy the positions in the frame. At the other extreme are utterances like "I like to read" and "me gusta leer." Here the frames are in contrast, and this is readily apparent through the frame approach. Naturally the drills used to demonstrate points of similarity will be short (remember how the same criterion was applied to the "significant contrasts" of the sound system), and those drills which teach more complex differences will be longer, to avoid foreign-sounding phrases or perhaps even a breakdown in communication.

We now turn to the various types of drills and frames. We shall begin with a simple frame,
such words as Maria, Eduardo, Celia, and the verb and substitute the verb form in the second:

The name "slot" is given to the position occupied by each word in the basic frame. Frame A therefore has two slots. Then if one slot is held constant, and substitution is made in the other slot, using forms presented in the dialogue, we may construct drills such as:

- Teacher (model): Juan habla.
- Class (echo): Juan habla.
- Teacher (cue): Maria
- Class (response): Maria habla.
- Teacher (cue): Eduardo
- Class (response): Eduardo habla.
- Teacher (cue): Juan
- Class (response): Juan habla.
- Teacher (cue): come
- Class (response): Juan come.
- etc.

Or we may maintain constant the first slot and substitute the verb form in the second:

- Teacher (model): Juan habla.
- Class (echo): Juan habla.
- Teacher (cue): escribe, come, lee.
- Class (response): Juan escribe, come, lee.
- etc.

The simple substitution drill may be elaborated into a progressive substitution drill, where the same frame is used, but the constant slot and the variation slot are alternated, such as the following drill found on page 27 of Modern Spanish, Second Edition:

Teacher (model): Yo no hablo inglés.
Class (echo): Yo no hablo inglés.
Teacher (cue): Nosotros
Class (response): Nosotros no hablamos inglés.
Teacher (cue): El
Class (response): El no habla inglés.
Teacher (cue): Ellas
Class (response): Ellas no hablan inglés.

The frame from 2) above could also be used to drill vocabulary, by holding the first slot constant and varying the object slot (in the example below, the names of languages):

Teacher (model): Yo no hablo inglés.
Class (echo): Yo no hablo inglés.
Teacher (cue): alemán.
Class (response): Yo no hablo alemán.
Teacher (cue): francés.
Class (response): Yo no hablo francés.

The drills presented above are examples of the simple substitution drill.

The simple substitution in one or another slot in a given frame offers a wide variety of drills in which the syntactic structure of the frame is not changed. Below are further illustrations:

1) Substitution of noun, drilling use of definite article:

- Teacher (model): Estamos con el cónsul.
- Class (echo): Estamos con el cónsul.
- Teacher (cue): hermano.
- Class (response): Estamos con el hermano.
- Teacher (cue): papá
- Class (response): Estamos con el papá.
- Teacher (cue): tía.
- Class (response): Estamos con la tía.
- Teacher (cue): mamá.
- Class (response): Estamos con la mamá.

2) Substitution involving person and number of verbs:

- Teacher (model): Yo no hablo inglés.
- Class (echo): Yo no hablo inglés.
- Teacher (cue): Nosotros
- Class (response): Nosotros no hablamos inglés.
- Teacher (cue): El
- Class (response): El no habla inglés.
- Teacher (cue): Ellas
- Class (response): Ellas no hablan inglés.

The purpose of the foregoing exercise is to drill the student in the use of the masculine and feminine definite article. But the same type of progressive substitution drill can easily be adapted to, let us say, a verb and object exercise, alternating the variation slot:

Teacher (model): Yo no hablo inglés.
Class (echo): Yo no hablo inglés.
Teacher (cue): Tú
Class (response): Tú no hablas inglés.
Teacher (cue): El
Class (response): El no habla francés.
Teacher (cue): Ellas
Class (response): Ellas no hablan francés.

Frames need not be limited to two slots only. The frame 'Juan habla español' for simple substitution gives us three possible variants, i.e., holding

--- 32 ---
two slots constant and varying one. Thus, with the first slot varied:

- Juan habla español.
- María habla español.
- Celia habla español.

With the second slot varied:

- Juan habla español.
- Juan estudia español.
- Juan es español.

With the third slot varied:

- Juan habla español.
- Juan habla alemán.
- Juan habla chino.

The same frame for progressive substitution gives us the ability to alternate the two constant slots and one varied slot:

- Juan es español.
- Juan es francés.
- Carlos es francés.
- Carlos habla francés.

Using the same frame as in the above drill, an elaborate progressive substitution drill (sometimes called a combined pattern replacement drill) can be made dealing with vocabulary, person and number of verbs, and gender of adjectives:

Teacher (model) : Juan es español.
Class (echo) : Juan es español.
Teacher (cue) : ..................... habla ..................
Class (response) : Juan habla español.
Teacher (cue) : Yo .....................
Class (response) : Yo hablo español.
Teacher (cue) : ..................... estudio ..................
Class (response) : Yo estudio español.
Teacher ( cue) : Mis amigos ..................
Class (response) : Mis amigos estudian español.
Teacher (model) : ..................... alemán.
Class (echo) : ..................... alemán.
Teacher (cue) : Mi .....................
Class (response) : Mi amigo estudiant alemán.
Teacher (cue) : ..................... es ..................
Class (response) : Mi amigo es alemán.
Teacher ( cue) : ..................... alemanes.
Class (response) : Mis amigos son alemanes.
Teacher (cue) : Pablo ..................
Class (response) : Pablo es alemán.
Teacher (model) : María ..................
Class (response) : María es alemana.

In progressive substitution drills, care must be taken not to provide a cue that can fit more than one slot. For example, in a frame such as María ve a Susana, the cue Celia could fit either the subject or the object slot, making two responses possible. Progressive substitution drills are especially valuable at the end of a given unit of study, as a review, or as a test.

The last two examples given above are substitution drills, but they are also what are known as correlation drills. A correlation drill involves aligning the words that go into the slots so as to make them “agree.” A word of explanation is in order here to show how correlation drills differ from simple substitution drills. In ‘Juan habla,’ we have a normal frame, which might equally well be represented by ‘María habla’ or by ‘Pablo canta.’ This is because the category of words represented by Juan (and María, el hombre, etc.) can “co-occur” with the category of words represented by habla (and canta, trabaja, etc.)—which is simply to say that nouns can co-occur with verbs. This kind of co-occurrence of compatibility within a frame is called “construction co-occurrence.” Sometimes, individual words will not match up with other individual words—for example, while we might say ‘El dinero habla,’ we would not normally say ‘el acero habla’ (we use the asterisk to indicate that the utterance so marked is not a normal Spanish sequence); but this is a matter of individual co-occurrence, not of construction co-occurrence. Within each of the categories, however, there are formal changes that must also be controlled to make them match—we can say ‘El hombre habla,’ but not “Los hombres habla,” in spite of the fact that hombre is a noun and habla is a verb, and nouns can occur with verbs. Here, what has gone wrong is what Bolinger terms a matter of “flexional co-occurrence”—singular calls for singular, and plural for plural. Here is an example of a simple correlation drill with the lexical item in position 2 “correlated” with position 1:

Teacher : Federico lee.
Students : Federico lee.
Teacher : Los niños ..................
Students : Los niños leen.

This parallels the technique of the simple substitution drill. There our parallel ends, however, since, in the case of the simple correlation drill dealing with concord, the word in position 1 (in this case the subject of the verb, determines or “governs” the word in position 2 (the verb), but not vice versa. In other words, a simple correlation drill involves changing the “governing” rather than the “governed” word. Replacement of the “governed” words leads us back to the simple substitution drill. The correlation drill, as we have seen, has the effect of conjugating a tense for verbs. And the more forms a tense has, the more valuable the simple correlation drills for practice in correlating person, gender, and number between verb-forms and subjects. In the first correlation drill demonstrated, we correlated the lexical items in position 2 with that in position 1. In the following drill, a progressive correlation drill, lexical items in position 1 are progressively correlated with lexical items in position 2.
When we want to have students practice the conjugation of one tense of one verb, we use the simple correlation drill. When we want to give the student practice in one or more tenses of one or more verbs, we use the progressive correlation drill.

We are in no way limited to one tense, either. A progressive correlation drill may be constructed to give a synopsis of one verb in several tenses. First, we correlate lexical items in position 1 with items in position 2:

Teacher : Adolfo canta.
Students : Adolfo canta.

Second, we may correlate items in position 2 with those in position 1, thus drilling several verbs, varying both in number and in tense:

Teacher : Camilo llora.
Students : Camilo llora.

This last example raises the question of what kind of item can be substituted in a slot. As you can see, the single word Gustavo has been replaced by the conjunctive phrase Alberto y Margarita. This does not violate any principle of drill construction, since the slots themselves remain intact and the frame is unaffected. But it does mean that we should call attention to the different kinds of substitutions that can be made. They are a replacement, and expansion, an alteration, or a reduction.

1) A replacement involves the substitution of one or more words which differ completely in form from the original entry. Thus we say we "replace" Juan by Alberto, el hombre, or él; or habla by llora, lee, or canta, in frames A and B below.

A. Teacher (model) : Juan habla.
   Class (echo) : Juan habla.
   Teacher (cue) : Alberto habla.
   Class (response) : Alberto habla.
   Teacher (cue) : El hombre habla.
   Class (response) : El hombre habla.

B. Teacher (model) : Juan habla.
   Class (echo) : Juan habla.
   Teacher (cue) : Juan llora.
   Class (response) : Juan llora.
   Teacher (cue) : Juan lee.
   Class (response) : Juan lee.
   Class (response) : Juan canta.

2) An expansion involves adding modifiers to, or otherwise extending the length of, the slot. Thus, los consejos, los buenos consejos and sus muy buenos consejos are simply expansions of the word consejos in the frame Nos dió consejos. Each of the three slots filled by a single word in the frame Roberto habla francés may be expanded to include two or more words, such as is done with the subject slot in the following examples:

Teacher (model) : Roberto habla francés.
Students (echo) : Roberto habla francés.
Teacher (cue) : El hombre habla francés.
Students (response) : El hombre habla francés.
Teacher (cue) : El dueño habla francés.
Students (response) : El dueño habla francés.
Teacher (cue) : El dueño simpático habla francés.
Students (response) : El dueño simpático habla francés.
Teacher (cue) : El dueño simpático de la tienda habla francés.
Students (response) : El dueño simpático de la tienda habla francés.
Teacher (cue) : El dueño simpático de la tienda que fuma un cigarillo habla francés.
Students (response) : El dueño simpático de la tienda que fuma un cigarillo habla francés.

The expanded subject in the above drill is the same basic syntactical structure whose drill was begun by the simple frame Roberto habla francés. In the example below slots 1, 2, and 3 are progressively replaced and expanded:

Teacher (model) : Roberto habla francés.
Students (echo) : Roberto habla francés.
Teacher (cue) : El aprendió idiomas.
Students (response) : El aprendió idiomas.
Teacher (cue) : El aprendió idiomas.
Students (response) : El aprendió idiomas.
Teacher (cue) : El aprendió idiomas.
The processes of replacement, expansion, reduction, and alteration are combined in both simple and progressive drills to meet the needs of specific drill focuses.

One further example will illustrate these combinations:

Teacher (model): Roberto trabaja.
Class (echo): Roberto trabaja.
Teacher (cue): Roberto construye.
Class (response): Roberto construye la casa.
Teacher (cue): Roberto construye la casa.
Class (response): Roberto construye la casa.
Teacher (cue): Roberto construye así.
Class (response): Roberto y Juan construyen de esta manera.
Teacher (cue): Roberto y Juan construyen de esta manera.
Class (response): Roberto y Juan construyen esta cabaña.

Up until now we have been considering various kinds of cued drill procedures designed to produce a regularly alternating single structural change in some frame used as a base. Substitution and correlation drills were best suited for these purposes. Now we shall present several drill procedures which use a different sentence as a base for every step in the drill. These drills fall into three general categories: transformation drills, question-answer drills, and translation drills. The term "transformation" is used here as a name of a specific drill and should not be confused with "transformation grammar".

(1) Transformation Drills. Below are a very few of the many possible transformation drills:

a) A verb in the present indicative tense transformed into simple past tense:

Teacher’s cues: Roberto se acuesta temprano.
Student’s transformation: Luisa mira a su papá.
Misa amigos me escriben. Mis amigos me escribieron.
Voy a la fiesta. Fui a la fiesta.

In the preceding drill it will be observed that the verbs in the present tense have been deliberately selected to provide a variety of past tense forms. This type of advanced exercise assumes that regular and irregular forms have been practiced separately in substitution and correlation drills.

b) Possessive adjective transformed to the long form as predicate adjective:

Teacher’s cues: Este es mi espejo.
Student’s transformation: Este espejo es mío.
Esa es tu cartera. Esa cartera es tuya.
Estas son sus cosas. Esas cosas son suyas.

The last steps of this drill involved the expansion of the complement from idiomas to varios idiomas and finally to varios idiomas difíciles.

3) Reduction. The same drill given above could be done in reverse by starting with the last sentence and progressively reducing by replacement until we have returned to the basic frame: Roberto habla francés.

4) An alteration is a change in the ending of the original entry: e.g., llora for llora in the frame Adolfo llora.

It is important to realize that any drill may utilize a combination of these structures without violating the syntactical pattern established in the basic frame. Below we observe an example of a simple substitution drill involving replacement and expansion:

Teacher (model): Eliseo habla turco.
Students (echo): Eliseo habla turco.
Teacher (cue): El...
Students (response): El habla turco.
Teacher (cue): El hombre...
Students (response): El hombre habla turco.
Teacher (cue): El alcaldén...
Students (response): El alcaldén habla turco.
Teacher (cue): El buen alcáide...
Students (response): El buen alcáide habla turco.
Teacher (cue): El buen alcalde...
Students (response): El buen alcalde habla turco.
Teacher (cue): El buen alcaldé...
Students (response): El buen alcaldé de nuestra ciudad...

Here is another example of a three-part progressive substitution drill involving replacement and expansion:

Teacher (model): Eliseo habla turco.
Students (echo): Eliseo habla turco.
Teacher (cue): El...
Students (response): El habla turco.
Teacher (cue): El aprendi...turco.
Students (response): El aprendió turco.
Teacher (cue): El nuevo director...
Students (response): El nuevo director aprendió muchas lenguas.

The processes of replacement, expansion, reduction, and alteration are combined in both simple and progressive drills to meet the needs of specific drill focuses.

One further example will illustrate these combinations:

Teacher (model): Roberto trabaja.
Class (echo): Roberto trabaja.
Teacher (cue): Roberto construye.
Class (response): Roberto construye.
Teacher (cue): Roberto construye.
Class (response): Roberto construye la casa.
Teacher (cue): Roberto construye la casa.
Class (response): Roberto construye la casa.
Teacher (cue): Roberto construye así.
Class (response): Roberto y Juan construyen de esta manera.
Teacher (cue): Roberto y Juan construyen de esta manera.
Class (response): Roberto y Juan construyen esta cabana.

(1) Transformation Drills. Below are a very few of the many possible transformation drills:

a) A verb in the present indicative tense transformed into simple past tense:

Teacher’s cues: Roberto se acuesta temprano.
Student’s transformation: Luisa mira a su papá.
Misa amigos me escriben. Mis amigos me escribieron.
Voy a la fiesta. Fui a la fiesta.

In the preceding drill it will be observed that the verbs in the present tense have been deliberately selected to provide a variety of past tense forms. This type of advanced exercise assumes that regular and irregular forms have been practiced separately in substitution and correlation drills.

b) Possessive adjective transformed to the long form as predicate adjective:

Teacher’s cues: Este es mi espejo.
Student’s transformation: Este espejo es mío.
Esa es tu cartera. Esa cartera es tuya.
Estas son sus cosas. Esas cosas son suyas.

Senor, este es su armario. Señor, este armario es suyo.
Este es nuestro coche. Este coche es nuestro.

c) Word substitution transformations of direct or indirect object pronouns:

Teacher's cues: Student's transformation:

<table>
<thead>
<tr>
<th>Teacher's cues</th>
<th>Student's transformation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Llamamos a Maria.</td>
<td>La llamamos.</td>
</tr>
<tr>
<td>Doy el libro a Pablo.</td>
<td>Lo doy a Pablo.</td>
</tr>
<tr>
<td>Doy el libro a Pablo.</td>
<td>Se lo doy.</td>
</tr>
</tbody>
</table>

(2) Question-answer drills. These drills are divided into two categories: those containing questions which elicit the response yes or no, and those eliciting a response other than yes or no.

a) Questions eliciting yes or no:

Instructor asks: Student responds:

¿Quiere Vd. ir a la fiesta? Sí, quiero ir.
Sí, quiero ir a la fiesta. No, no quiero.

¿Has visto a Maria? Sí, la he visto. 
Sí, la vi ayer.

¿Le gustan las tortillas? Sí, me gustan mucho. 
No, no me gustan las tortillas.

b) The question-answer drills which elicit a response other than yes or no are further divided into three groups:

1) Information questions, free response:

Instructor asks: Student responds:

¿Adónde fueron Vds. anoche? Fuimos al teatro, etc.
¿Cuándo llegarán tus abuelos? Llegarán el sábado.
¿Por qué no vino Alberto a la clase? Estará enfermo. 
Debe de estar en casa.

2) Controlled-response questions:

Instructor asks: Student responds:

¿Prefiere Vd. pan o tortillas? Prefiero pan.
¿Quiere Vd. que me marche o que me quede? Quiero que se marche.
¿Compraste los guantes o la cartera? Compré la cartera.

The student may either respond with a free choice of one or the other, or may be cued by the use of hand signals to indicate that he should answer with the first or the second choice.

3) Cued-response questions:

Instructor asks: Student responds:

(la revista) ¿Qué quieres leer? Quiero leer la revista.
(el cine) ¿Adónde van Vds. esta noche? Vamos al cine.
(mis hermanos) ¿Quiénes llegaron ayer? Mis hermanos llegaron.

(3) Translation Drills. These drills may be of several types. Extreme caution must be used in deciding those few cases in which translation drills are useful. Their over-use is contrary to the audio-lingual approach.

a) They may be used to point out differences in structure between the source and target languages, such as:

Instructor says: Student responds:

Me gusta bailar. I like to eat. Me gusta comer.
We like to talk. Nos gusta hablar. Le gusta leer.
He likes soup. Le gusta la sopa. Nos gusta el apartamento.
We like the apartment. No, no me gustan las tortillas. 
Nos gustan los trajes. I like the suits.

Translation drills are one of the only approaches to the problem of word order variation in a Spanish utterance to convey meanings which in English are accomplished by intonation variation:

Instructor says: Student responds:

There goes the new maid. Allá va la nueva criada.
There goes the new maid. Allá va la criada nueva.
There goes the brand-new car. Allá va el coche nuevo.
It's his only suit. Es su único traje.
It's his one and only suit. Es su traje único.
It's pure air (nothing but air). Es puro aire.
It's pure air (uncontaminated). Es aire puro.
What are they drinking, just milk? ¿Qué toman? ¿Pura leche?
What are they drinking, pure milk? ¿Qué toman? ¿Leche pura?

The following drill appears in A-LM, Level II, p. 268, at the conclusion of the unit dealing with the use of subjunctive in noun clauses after certain verbs to point up how English uses an infinitive construction where a dependent clause is required in Spanish:

Instructor says: Student responds:

Le he pedido a mi hermano que nos lleve. Le he pedido a mi hermano que nos llame.
I've asked my brother to call us. Le he pedido al mozo que nos traiga la cuenta.
I've asked the waiter to bring us the check. Le he pedido al portero que nos consiga un taxi.
I've asked the doorman to get us a taxi. Le he pedido al policía que no nos multe.
I've asked the policeman not to fine us. Le he pedido al profesor que me dé mis notas.
I've asked the professor to give me my grades.

b) Translation drills may also be used to reinforce patterns learned through (progressive) substitution drills. For instance, after drills on comparison of equality have been completed, the following translation drill appears in A-LM, Level II, p. 196:
No es tan mimada como su hermana.
She's not as serious as

No es tan flaca como su hermana.
She's not as thin as her sister.

No es tan chica como su hermana.
She's not as cute as her sister.

No es tan aburrida como su hermana.
She's not as boring as her sister.

No es tan formada como su hermana.
She's not as pretty as her sister.

Four additional pattern drill types (essentially variations of the major types we have been discussing) appear frequently in audio-lingual texts and are used for specific types of learning objectives:

1. REPETITION DRILL.

In this drill, students repeat individually or in chorus exactly what has been modelled. We use this drill especially for dialogue presentation or for the establishment of a new pattern:

Teacher (model) : Estamos en casa.
Students (echo)  : Estamos en casa.

2. COMBINATION DRILL.

In this drill, two independent clauses are compressed (or combined) into a single sentence.

Teacher (model) : La muchacha se pone el abrigo. La muchacha es inteligente.
Students (echo)  : La muchacha se pone el abrigo. La muchacha es inteligente.

Teacher (cue) : (hand signal)
Students (respond): La muchacha inteligente se pone el abrigo o La muchacha que se pone el abrigo es inteligente.

3. REJOINDER DRILL.

There are two types of rejoinder drills: directed rejoinder and free rejoinder. In the former, the student is told what he is to do (directed dialogue). In the latter, the student is free to respond in any stylistically appropriate manner.

A. Directed rejoinder drill:

Teacher : Pablo, pregúntele a Juan qué hizo durante las vacaciones.
First Student : Juan, ¿qué hiciste durante las vacaciones?
Teacher : Juan, digale que fue de viaje.
Second Student : Fui de viaje.

B. Free rejoinder drill:

Teacher : Me duelen los pies.
Student : (Here he might answer “¡Qué lastima!,” “Lo siento or whatever is appropriate)

4. QUESTION FORMATION DRILL.

Here, and especially useful in Spanish where word order is affected by interrogation, we teach the student to form a question from a declarative cue:

Teacher (cue) : Juan compró un libro para su hermana ayer,
Student : ¿Quién compró un libro para su hermana ayer?
Teacher : Juan compró un libro para su hermana ayer.
Student : ¿Qué compró Juan para su hermana ayer?

To be successful, drills impose two requirements, the first having to do with their preparation, the second with their use. As to preparation, it must be emphasized again that there is no substitute for drills prepared under the guidance of a trained linguist and double-checked for idiomatic authenticity by a native speaker. Whenever possible, traditional materials should be discarded in favor of audio-lingual materials. Where it is impossible to do so, and the teacher wishes to update his traditional text, it is always wiser to “borrow” drills from prepared audio-lingual materials, such as Modern Spanish, A-LM, Modern Approach to Spanish, etc. The teacher inexperienced in drill-making must proceed with extreme caution in creating his own drills until he has had the opportunity to practice extensively under critical guidance.

As to how best to use the drills, we must remember that it is vital that every student participate. The beauty of audio-lingual drills is their adaptability to either choral or individual recitation, and we must take advantage of this to make sure that everyone takes part. The fact that a drill has only eight items in no way limits it to eight individuals in the class. It is always assumed that a drill will be repeated over and over until every student has a chance to vary all the slots requested to be changed. The object of these drills (as is the object of all audio-lingual drills) is fluency. The drill is to be repeated until the entire class can perform it flawlessly (including an authentic accent). In some classes, an exercise will be performed perfectly after only a few minutes of practice. In others, nearly half a period must be spent on a relatively brief exercise. Only the perfect performance of a drill indicates that the drill has ended. Class time can be saved, of course, by having the student practice ahead of time in the language laboratory with tapes of the exercises done by native speakers.
No exercises is considered “done,” until perfection is reached in classroom recitation.

We shall have more to say about the additional uses to which these drills may be put in our chapter on the language laboratory. For a somewhat technical explanation of the grammatical principles which underlie these drill types, the interested student may consult the Belasco manual.¹

Chapter 6

THE LANGUAGE LABORATORY

Much of the current interest in foreign language programs in the secondary school centers around the language laboratory. The laboratory has almost simultaneously been touted as a panacea for all types of language learning problems and denounced as useless, once the student loses interest in the "novelty" of the mechanical devices employed in the lab. A realistic view, as we might expect, is somewhere between these two extremes. As most linguistic analysts with experience in dealing with beginning language studies will agree, the laboratory is not the only way to gain proficiency in a language. The audio-lingual approach does not depend entirely upon the laboratory for its success, although its effectiveness is generally enhanced by using the lab. While many of us as language teachers have had good students who do not use, and apparently do not need to use, laboratory facilities to acquire proficiency, evidence also indicates that the low-aptitude (yet motivated) student will gain much from the use of lab tapes, often exceeding, by hard work and concentrated laboratory practice, the achievements of high-aptitude students. The laboratory, like the audio-lingual approach itself, is largely the product of experience gained in the World War II Army language training programs. In these programs, which we discussed in Chapter 1, the learning of a foreign language was treated as the acquisition of a skill, which could be acquired only through the "overlearning" of material until it became a part of the learner's automatic speech habits. This was accomplished by intensive practice sessions in which dialogues and pattern drills were done and redone under the supervision of a native-speaking instructor. As this amount of student-teacher contact was impossible in the school systems, the laboratory was seen as one way to provide this guided, programmed instruction without the physical presence of the teacher. The laboratory in today's secondary school serves to help the student assimilate speech patterns by overlearning until they become his own habits of expression. In this sense, the student has, in a self-contained listener-speaker situation, the opportunity for audio-lingual practice and aural experience with authentic materials.

Because the student in the language laboratory is isolated both from his group and from external distractions, he is able to give maximum attention to the taped materials. This "individual" experience also makes the student less self-conscious when he is required to repeat after the tape, reducing the inhibition factor so detrimental to effective language learning.

Another physical advantage of the laboratory is that the student is able to speak individually for an entire lab period, whereas in class each student is fortunate to speak for a minute or two in a whole hour (except in repetition drills, etc., of course). This is making efficient use of the student's time since he is spending every minute in active production of language.

Psychologically, the laboratory is an "all business" environment and in some cases actually increases the attentiveness of some students. We might also mention that a well-equipped language laboratory provides the student with a high fidelity of sound reproduction through his earphones, free from external interference to which he is subjected in class, including the inevitable influence of the imperfect pronunciation of adjacent students in the classroom. Although it is a good idea, as the student advances, to expose him to muffled speech or noisy environments in order to accustom him to everyday speech situations in which street noises and the like do "blur" conversation, beginning and intermediate students will profit from the clear reproduction of the acoustic image by high-fidelity equipment.

The student is allowed to proceed at his own optimum rate of learning by the procedure of self-pacing with programmed lab materials. Thus the lab is also a way for students to make up an
occasional lesson missed due to absence, or to provide the superior student with the opportunity to work ahead with greater challenge.

Because the language laboratory is still a somewhat revolutionary phenomenon in language teaching, not all teachers agree as to how it should be used, what goals should be set for it, what results can be expected, and how the teacher's responsibilities toward it should be distributed. Consequently, a new methodology has been developed (or rather, is evolving) toward finding ways to couple this radically different teaching device to the older ones with which we are already familiar.

Is the laboratory simply a classroom with electronic equipment? No. The laboratory has its own set of functions which it performs in addition to, and not in place of, the regular classroom teaching program. Misuses of the laboratory are due in part to misunderstandings concerning its proper role and to a less-than-complete consideration of all the implications of these functions.

As a collection of equipment the lab does nothing by itself and because it is at its weakest when superimposed on traditional instructional practice, it is vital that the physical layout of the lab and its position in the foreign language program in each school be considered as inseparable, with the prime voice in the final decision being that of the foreign language faculty of the school concerned. From the outset, matters of staffing the lab and keeping it open at the time when it will best serve the needs of the program which it is an integral part is as urgent an issue at the laboratory and its position in the foreign language program of the laboratory itself (Cf. items 1 through 9 in the Do's and Don'ts at the end of this chapter).

Since, as we have said, the purpose of the laboratory is to provide the student with the practice he needs to make the patterns he has learned a part of his speech habits, only material which has first been presented to him and subjected to the teacher's correction in class is fit material for the lab. This does not mean that material which is a variation on that presented in class (such as recombination narratives of dialogue materials, as discussed in Chapter III) is not proper lab fare, but rather that the lab is not the place for the presentation of new material.

The class drills and their counterparts in the laboratory should be designed so as to accent especially the points of conflict between the source and target languages. Everything that is new to the student, suggests George Scherer, should be brought to the "safety level" in class first by the teacher before the students are sent to the laboratory for overseeing the same material. The "safety level" is that level of accomplishment which insures that every student is hearing what he should be hearing, and that he is echoing the material accurately, not only in chorus, but alone.

Recordings of songs, plays, and recitations are useful in the lab only when the student is already familiar with the vocabulary and structure patterns which form the basis of these materials. (It is understood, of course, that the student is expected to be able to induce meanings and functions from familiar vocabulary and structure items.) Pierre Delattre suggests that there are three goals for which language laboratories were created: (1) to develop natural speed in conversation response, without reflections as to the grammar rules involved; (2) to learn the patterns of a language orally, without reference to a spelling that would mask the linguistic truth; and (3) to acquire habits of correct pronunciation and fluent aural comprehension.

The function of the laboratory, then, is to supplement the classroom procedure by providing the student with an opportunity for extensive, planned, individual practice, with authentic materials. In this sense, the idea that every classroom should be at once a classroom and a laboratory (the so-called electronic classroom) is neither necessary nor even recommended as long as the laboratory is made available to the students for extra practice along lines we shall suggest below.

Despite a great deal of literature which tends to dispute the principle of the language laboratory as a supplementary program, the vast majority of experts in the field adhere to the approach we are supporting.

The obvious implication in the concept of the laboratory as an adjunct to the classroom is that it is to be used beyond the language class hours. This does not mean that it is entirely an after-school arrangement, for it is possible to make the laboratory available during the lunch hour and those hours when students, in many schools, at least, have the opportunity to decide about the wise use of their time during certain "free" periods.

Certainly the laboratory can be nothing more than a novelty for the students as long as the once-or-twice-weekly migration (classroom to laboratory and back) system, or the mistaken use of the laboratory as a classroom are tolerated. It is wasteful to pre-empt the teacher's time pushing buttons instead of teaching. These practices are due, in part, to the difficult problem of scheduling so that appropriate outside-of-class use of the laboratory would be possible.

There is no easy way around it—there will be extra hours of work required by the effective use of the laboratory and released time for a teacher.

other employee, or the use of a teacher-aide must be planned from the outset.

The equipment to be found in secondary school laboratories varies with the use that the school plans for it and with the funds available for the purchase of equipment. This is an extremely serious matter in that if the equipment does not fully meet the exact specifications of the program in which it is to be used, it can easily ruin that program. Fundamental to all effective installations is this dual need: (1) the student must be able to listen to, and (2) record his own voice. Less necessary, but still desirable is a monitoring device so that the teacher can, if he chooses, listen in on his students as they practice.

To be effective in its role as a supplementary practice center, the laboratory must be a room separate and distinct from the classroom. The concept of the electronic classroom, which doubles as laboratory and classroom, is often erroneously viewed as a means of eliminating a separate language laboratory with resulting financial economies. But if we compare the four major functions of the electronic classroom [(1) the immediate shifting from live to tape presentation and back, as in dialogue presentations; (2) the immediate accessibility of a native model of dialogue and drill material in the text; (3) the conservation of the teacher's voice in certain kinds of drills; (4) the limited testing of listening comprehension], with these and the many more which can be accomplished in the laboratory, we realize that the electronic classroom may be a desirable adjunct to, but never a replacement for, a well-designed laboratory.

We shall only outline here some of the more universal features of the efficient laboratory. The teacher may consult the references given at the end of this chapter for more detailed information, remembering that it is not the size of the laboratory, but rather the quality of the equipment it contains, that ultimately determines its value.

We divide the laboratory into three main sections:

I. Administrative
   A. Master console
   B. Repair and maintenance counter
   C. Supervisor's desk and master tape storage unit

II. Instructional
   A. Student booths
   B. Library shelves of student tapes

III. Preparational
   A. Recording "studio"

Let us now consider each of these sections in the light of the foregoing discussion.

First, the administrative area. The master console, in addition to the master power switch for the whole laboratory, should also provide for:

1) Playing a particular recorded program to any number or combination of student positions without necessarily pre-empting all positions;
2) Dubbing several copies of tapes from the master played at the console to decks in the student booths;
3) Monitoring any given student position while it is in use.

The monitoring function is actually optional, since monitoring is a technique with an unconvincing history of success. After all, teacher time is more profitably spent in the classroom. Only one booth can be monitored by a single person at one time, and the amount of attention thus given each student is relatively insignificant. Besides, it is often quite unnerving for the student suddenly to hear his program—to which he is supposedly paying close attention—abruptly interrupted by the voice of the unseen monitoring teacher.

If we eliminate the monitoring function, the master console should contain one or more playback machines (for dubbing or generating a master program), a disc turntable and pickup, a master microphone which can replace any other program source at any time, and program selector switches which allow the teacher or supervisor to control the distribution when more than one program source is in use. A small workbench with a locked cabinet should be provided for the repair of minor breakdowns. A desk, locked file, and bulletin board should be provided for the laboratory supervisor. A large locked cabinet should also be provided in the administrative area for the storage of master and virgin tapes.

The instructional area consists primarily of student positions. These should be booths with acoustically-treated side panels, glass front and open back (where the student sits). The transparent front is important so that the supervisor can see any student at work at any time. Each booth should be equipped with facilities for the student to hear the program, respond to it, and either hear his response simultaneously or record it for playback comparison, and to control the rate of presentation of the program by lengthening the pauses in it.

The equipment might ideally consist of a headset-microphone combination, a 2-track record-playback tape deck with individual volume and on/off controls, and a pause pedal. Although no one student may put all these facilities to use at a given moment, we feel that the well-designed laboratory will provide all the features we are describing if it is to achieve maximum flexibility and effectiveness. The headset-microphone plus the record-playback equipment at each student booth provide the possibilities of audio-passive, audio-active, and audio-active-evaluative learning experiences. Audio-passive refers to equipment...
which provides only facilities for listening; audio-active adds the possibility of the student hearing his own voice through the earphones in response to the stimuli; audio-active-evaluative indicates that equipment which includes the foregoing plus the possibility of the student recording his response for immediate or delayed playback and comparison.

The pause control adds the important dimension of “self-pacing” essential to individual programmed work in a library-style laboratory. When “self-pacing” is not desired, the master console, as we have described it, provides for the predetermined pacing of a given program in any one booth, combination of booths, all booths. The accessibility of open shelves where the student tapes for the particular program used in the foreign language sequence and for supplementary work are available guarantees maximum realization of the laboratory’s use potential without adding the “check in/check out” task to the supervisor’s duties.

The recording “studio” is, at best, a separate room with a highly sensitive microphone and recording equipment with which the foreign language faculty may prepare new teaching materials. Where a separate room is not possible, a well-insulated student-type booth with the appropriate recording equipment may be substituted.

The laboratory room itself should be acoustically treated, well lighted and ventilated, and appropriately wired.

In the planning of all these features, the foreign language faculty should seek the aid of a qualified consultant not committed to the interests of any single equipment manufacturer. The consultant must be a specialist in language laboratory construction and use; the local physics teacher or audio-visual technician is rarely sufficiently trained in these specific areas of concern to function adequately as consultant.

Material for use in the laboratory is usually divided into two types: (1) prerecorded, commercially-produced tapes to accompany particular textbooks; and (2) tapes recorded by individual teachers or specially-hired native speakers to supplement course work. Because these tapes serve the students as models of dictation, it is important that the speakers possess pleasing tonal quality, ample range, and extremely clear pronunciation. The greater the variety of accents and voice types represented on the tapes, as long as they are unquestionably native, the better, since the variations will help prepare the student for the natural variations encountered in the countries where the target language is spoken.

Directions to the secondary school student on how to use tapes are clearest when presented in three phases: (1) as a part of the assignment given in the classroom, (2) on a written sheet which the student either keeps in his notebook or is given as he enters the laboratory, and (3) repeated at the beginning of the tape. These directions should be clear and succinct. Where they are unusually long or complex, they should be repeated. Students should be given sufficient time, also, to adjust to the directions; this sometimes calls for pauses within the recorded instructions. If the tape consists of exercises to be done in conjunction with a text, then page, paragraph, and line numbers should be given. Students and laboratory technicians always appreciate knowing exactly where specific exercises end. A simple “End of Exercise X,” said on the tape, is generally sufficient.

Among other technical considerations before making tapes is one of time. Since the laboratory is essentially a device for reinforcement, optimum results are obtained when the assignments are relatively brief and intensive. A tape which can be repeated three times during the laboratory period is considered to be of adequate length. Time is also an important factor in exercises which the student is asked to repeat after a model. To allow for the pupil’s hesitation and slower rate of reproduction, the pauses allowed for his repetition should be approximately 30 percent to 50 percent longer than the time it took for the native to record the utterance. Sometimes a cue, such as a click or a snap, will speed up the pupil’s response.

The content of tapes depends largely upon the needs of the students, but is also determined by the fact that the language laboratory is most effective in promoting speaking and comprehension skills. Drills to improve pronunciation and intonation may be specially devised for the production of individual sounds, sound sequences, or intonation patterns. Exercises, such as are found in many texts, are helpful, when taped, in focusing the pupils’ attention on specific pronunciation problems; but it is well to remember that pronunciation and intonation accuracy will also be improved through laboratory practice with the structural patterns from dialogues or pattern practice sessions.

Special precautions are needed in the early months when students have not yet acquired the awareness necessary to recognize subtle discrepancies between the model and their reproduction of it. For this reason, early laboratory assignments are best limited exclusively to duplicating rather than expanding material already presented in class. Later, as students learn to discriminate, they may train themselves in self-monitoring which is, after all, a major goal of laboratory practice.

The basic format of all laboratory tapes which is adhered to by the best commercially-produced materials and which should be scrupulously ob-
served by persons creating new materials for use in the laboratory is as follows:

1. The exercises on the tapes are designed to make the pupil either echo—that is, imitate—which he has heard, or to make him respond—in other words, create the new grammatical pattern requested.

2. The listen-and-respond exercises work on the Skinnerian principle of Stimulus-Response-Reinforcement. That is, the pupil first hears a stimulus, such as a word or a sentence. Then there is a pause in which he is to say what is requested of him. Immediately afterward he hears the correct response so that he may know right away whether he was right or wrong. Then the model echoes the correct response for reinforcement. Finally, a new stimulus is presented.

<td>Model echoes etc.</td>
<td>Correct response</td>
</tr>
<tr>
<td>etc.</td>
<td>etc.</td>
<td>etc.</td>
</tr>
</tbody>
</table>

Cycle 2. If a strictly-controlled space for the student's response is required, then the appropriate space must be provided on the tape. However, if a response to be made at a specific rate of speed is not required, then no space is provided on tape, but rather merely an auditory signal (bell or buzzer) to indicate that the student should activate the pause control to provide enough time to form the correct response.

Cycle 4. Here again, if no space has been provided on the tape for the student's echo, then as soon as he has listened to the correct response in Cycle 3, he activates the pause control again while echoing the correct response. If the pupil responded correctly in Cycle 2, repeating the response in Cycle 4 will reinforce his mastery of the pattern. If, however, he has said it incorrectly, echoing the correct response will help learn it.

3. After completing the first practice using the pause control, the pupil rewinds and goes through the tape again without the pause control. This will help build up speech reflexes to the point of automaticity that comes only with much practice. The pupil should go over the drill again and again until he can do it perfectly and correctly in the pause provided on the tape. Once the pupil has mastered each item, it should not take him any longer to make his responses than the time provided on the tape.

The teacher should, as a general practice, listen to all tapes to be used as laboratory assignments so that he may eliminate from his own modeling of the utterances which the student will later use in the laboratory, any disparity between his oral production and that of the taped model.

Syntactic drills, like the phonetic drills we have been discussing, are best suited for laboratory purposes when the target item is not long and remains predictably consistent throughout the exercise. Thus, almost all of the pattern-drill types discussed in Chapter V are potentially useful for the laboratory. Translation drills, combined pattern replacement drills, and free rejoinder drills are better reserved exclusively for classroom use. Exactly as in the creation of classroom drills, a sufficient amount of content should be provided in the given form; the resulting target change should represent only the desired variation. Concise drills, scheduled so that the entire tape can be done at least three times in a given laboratory period, will produce the best results.

In addition to pronunciation and syntactic drills, oral-aural comprehension-reproduction drills are useful in the laboratory. In these exercises, designed for more advanced pupils, narrative phrases demonstrating more subtle pronunciation and intonation patterns, conditioned by longer and more complex sentences, are presented for repetition. The student responds without benefit of written text. For the purposes of such drills, tapes can be prepared from existing recordings of contemporary theater or from class materials. Dialogue from the theater is always the preferred literary form for audio-lingual drill since it comes closest to normal speech. Poetry is discouraged since formal poetic recitation is not usually representative of standard speech. Again, these materials should be introduced only after the basic structure and vocabulary contained have been presented in class.

The development of an accurate and meaningful testing program for the language laboratory is a continuing concern. Only recently have successful tests been devised to correspond to the two skills that may best be developed in the laboratory: listening-comprehension and speaking. We shall discuss the construction of specific tests in Chapter 8. Our purpose below is merely to describe the most successful areas of testing which may be carried out in the laboratory.

Tests of speaking ability should parallel as closely as possible the format of laboratory lessons. That is, the test must expect the student to make spoken responses to auditory or visual stimuli at a rate of speed that, while permitting him sufficient time to respond, does not allow time for reflection about the grammar rules involved. Pattern drills are, in themselves, as we have mentioned, speaking tests, in that they are done orally. In this sense, they make good foundations for laboratory tests. It might be added that
a speaking test should always include a part specifically covering correct pronunciation and intonation. Again, the same pronunciation drill format from daily laboratory lessons will serve as an adequate test, provided that the scope of the drill-test is broad enough to include all the material that needs to be included.

Some schools have found laboratory testing to be impractical, and have abandoned it in favor of personal interviews, including aural-oral sections in regular classroom tests or using a tape-recorder in the classroom. Bolinger suggests several important drawbacks to laboratory testing which should be eliminated or compensated for, before proceeding. Among them are, first, the fact that not all students are equally adept at manipulating laboratory machinery introduces the extraneous factor of manual dexterity into the test. Second, there is the question of mechanical failure which, even in the case of a single position, can invalidate an entire test. Third, laboratory tests, in which everybody is required to say the same answer at the same time, create a confusing din and also may permit the unprepared student to overhear the correct answer from his neighbor, thus invalidating the examination as a reliable evaluation of what that student knows.

Scheduling students for laboratory sessions, both during the school day and after school, is a difficult matter, and one that can be resolved as we have said only as each institution takes into account the number of positions available, the length of the school day, the number of students required to use the laboratory, the length of the laboratory session itself, the availability of technical assistants and faculty supervisors, etc. Some researchers feel that laboratory sessions of more than 30 minutes each are counterproductive, in that the attention span of most pupils does not exceed 30 minutes of intensive drill. Sloppy work in the laboratory, of course, encourages the habituation of inaccurate responses, so care should be exercised not to overload the pupil in the laboratory. It is generally advisable to insist that all students make use of the laboratory for a specified length of time each day. This avoids the "punitive" atmosphere that has evolved in some schools in which "better" students are exempted from laboratory exercises.

Tape loan programs have helped many institutions solve some of their scheduling problems. The program involves dubbing the master tape for a given practice session on a pupil's own tape. Enough students have access to a tape recorder at home to make this a practical way of increasing listening time and cutting down the load on the laboratory itself. It is cheaper to dub a tape than to install additional positions.

Precautions must be taken, however, regarding the use of copyrighted materials in the laboratory and making them available for dubbing. Although many schools do lend tapes by considering them extensions of the laboratory exercises, it is well to secure direct information from the publishers concerning your school's rights in dubbing and loaning tapes.

Detailed suggestions for day-to-day procedures for operating the laboratory and for the ordering, recording, dubbing, labelling, and storing of tapes will be found in the sources referred to in the brief bibliography and appendices at the end of this chapter.

Planning and Operating A Language Lab
Or an Electronic Classroom
In A High School
A Dozen Do's and Don'ts

1. DO hire a consultant (not employed by a lab equipment manufacturer), to help you plan, evaluate bids, do the final checking of installed equipment.

2. DO define your teaching objectives first and then choose equipment that will implement them.

3. DO see at least three different types of successful installations in operation before you decide on your equipment.

5. DO urge each teacher who is to use the lab to study the growing literature on the subject and take a workshop course.

6. DO write exact specifications into your contract and accept delivery as completed only when the equipment tests up to specifications and functions smoothly for a full month and when there are adequate provisions for servicing.

7. DO build an expandable and flexible lab to handle future increases in demand and new improvements in equipment and methods.

5. DON'T expect the foreign-language teacher to teach and operate the lab at the same time; hire a technician to assist him.

6. DON'T forget Murphy's Law of Electronics: Anything that can go wrong will.

7. DON'T overlook the alternative of electronic equipment in each foreign-language classroom instead of a single lab.
8. DO provide for regular preventive maintenance, with an annual budget of 3 percent to 5 percent of your total initial cost.

9. DO insist that the lab work be an integral part of the foreign-language course.

10. DO plan for short lab sessions; 20 minutes of active daily use is the ideal.

11. DO arrange your seating and equipment with provision for viewing, as well as hearing and speaking.

12. DO cut in half the teaching load of the lab director and allow released time for all teachers who prepare lab materials.

8. DON'T forget to budget for tapes, discs, and other expendable equipment.

9. DON'T impose the lab program on unwilling or unprepared foreign-language teachers; start with one beginning course taught by an enthusiast, make it a success, then add other courses one at a time.

10. DON'T expect all your equipment to function all the time; provide 10 percent to 20 percent spare parts or use only 80 percent to 90 percent of capacity.

11. DON'T accept inferior sound; it should be free of extraneous noise, and as natural and full-ranged as a live voice.

12. DON'T expect the lab to reduce the teacher's work; it will increase it, redistribute it, reorient it, and make it more effective.

6. Keeps laboratory open before and after school for work by individual students (absentees, slow students, gifted students, etc.)

SPECIFIC:

1. Opens language laboratory and closes it at designated time.

2. Plans and maintains a daily work sheet.

3. Operates tape recorders, players, and record players used in the laboratory.

4. Places tapes and records on players according to requests of instructors and students using the language laboratory.

5. Prepares equipment for use by instructors and students.

6. Checks and examines players, earphones, and microphones before each lab period to insure that they are in good working condition.

7. Makes copies of instructor-made tapes, duplicates commercial materials (when permitted), and accumulates individual student recordings on tapes; cuts, splices, and repairs tapes, inserts leaders and labels properly.

8. Catalogues, files, issues, receives, and maintains tapes, records, scripts, and other instructional materials and supplies.

10. Types and maintains lists, inventories, schedules, charts, and similar records.

11. Checks attendance of students.

12. Cleans earphones and microphones frequently.

13. Maintains and makes minor repairs to equipment used in the laboratory; cleans, demagnetizes, and lubricates tape heads, guides and runners; cleans capstans and guides, lubricates motors in tape decks as recommended by manufacturer; polishes heads; checks and replaces needles on turn-table arms; checks and replaces rubber drive belts; adjusts speed for tape decks; cleans and dusts equipment. (Call repairman for major repairs).

14. Turns off power and locks all equipment, windows, and doors before leaving for the day.

15. Performs other work as required.

Useful Accessories for Making Tapes

by Gustave Mathieu

1. Leader and Timing Tape. Splice two to three feet to each end of the tape. Leader tape protects against damage and breakage to the ends of the tape. It also allows to record right to the end of your tape and start the tape at the precise point. Leader
tape can also be used to insert it between selections for easy identification. Lastly, pertinent data (speed, selection, etc.) can be written on the leader tape with pen or pencil.

2. Splicing Tape. Do not use ordinary scotch tape for splicing! Use only splicing tape.

3. Automatic Tape Splicer. The latter will permit you to splice tape quickly, easily and professionally.

5. Self-Adhesive Labels. Handy to identify a reel of tape in case it becomes separated from its jacket. Use self-sticking label.

6. Pen or Pencil. Needed to write data on the stick-on label and the jacket. (Selection, course length or playing time, speed, date, etc.)

8. Power Cord. Needed when transferring material from one tape to another or from record to tape.

9. Stop Watch. An important accessory for timing your tape or individual selections. It should have a stop-and-start button in case you are interrupted while recording the tape.

10. Bulk Eraser. Handy for erasing a recorded tape in a few seconds without having to run it through the tape recorder.

Tips for Making A Good Master Tape

1. Always work from a written script. Rehearse script before recording.

2. Bring your microphone as close as possible to your voice—within 2 to 4 inches.

3. Make sure that your recording indicator provides a good recording level, not too high and not too low.

4. Do not speak directly into microphone but past it. This will reduce the "puff" sound in plosives like p and the hissing sound in sibilants like s.

5. Suspend microphone if possible or place it on separate table. This will prevent the microphone from picking up vibrations made by the tape recorder.

6. Place your script on a reading stand. This way you will be able to speak without lowering your head.

7. The microphone should be placed at least four feet from the nearest wall unless this wall is sound-proofed. This will prevent the sound waves from bouncing off the wall.

8. Always work with a tape recorder that has an instantaneous pause button with lock. It will make you feel at ease because you know that you can stop and start the tape instantly without having to stop and restart the entire mechanism—but without recording a click.

9. Be sure to turn off fans or any other apparatus that makes noises which can be picked up by the microphone.

10. Have a glass of water ready to "lubricate" your voice.

11. When rewinding, remove tape from head.

12. Proof-listen your master tape.

Note: A sound-proofed recording cabin is most useful, but not essential. One of its chief advantages is that the teacher will be able to make master tapes while other activities are going on in the laboratory or the school.

TOPICS FOR DISCUSSION

Discuss each of the following in the light of the material presented in this chapter, your own experience, and the practical requirements of modern foreign language teaching in the secondary school:

1. Why is taking a class to the laboratory for a given portion of the class period each day or two less profitable than making the lab assignment for an after-school or "free-hour" period, often in lieu of homework?

2. Your district plans to spend $10,000 for electro-mechanical language teaching devices in your school. Your faculty is given its choice of three electronic classrooms or one audio-active-evaluative lab. Discuss the advantages and disadvantages of a choice of either of the alternatives.

3. Assuming that the laboratory has provisions for self-pacing, should a limitation be put on the fast learner to keep him from progressing rapidly without really having mastered each step along the way? How will good students, taking advantage of self-pacing to advance more rapidly, affect the rhythm of your classroom procedures? Can the foregoing be considered a conclusive argument for or against a laboratory with provisions for self-pacing?

4. What arguments can you give in favor of and against monitoring in the laboratory by the teacher?

5. What are the advantages of the audio-active-evaluative lab over one which is simply audio-active?

6. If you have a language laboratory in your school, describe it and the uses to which it is put, suggesting where it might be improved. If your school does not have one, discuss the problems of setting one up, scheduling its use, and programming materials for it.
Chapter 7

Reading and Writing in the Audio-Lingual Approach

There can be no doubt that the abilities to read a foreign language with comprehension and enjoyment, and to write it, both without reference to English, are skills which form an important part of foreign language education. The audio-lingual approach, despite a false impression to the contrary, does not eschew these skills, but simply moves them to a different place in the sequence of learning. Furthermore, the audio-lingual approach re-evaluates the function of both these skills and has brought us new understanding of how much time should be devoted to teaching reading and writing, and of what our goals should be.

The belief that skill in speaking the language is the only real measure of fluency leads the audio-lingual teacher to conclude that reading, whether it is basic or supplementary, must provide satisfaction to the learner. It may be undertaken as part of one's studies or to gain information, for pleasure or for an appreciation of literature or culture. In this sense, reading in the foreign language has the same general purpose as does reading in the native language of the learner.

We have seen that the audio-lingual approach duplicates in its teaching program the order of steps in "natural" language learning: speak only that which has been heard; read only that which has been heard and spoken; write only that which has been heard, spoken, and read. Thus, it is only after the audio-lingual foundation has been laid that reading should be undertaken.

As Charles C. Fries has pointed out, learning to read is learning to do something, and achievement in this skill should be evaluated on the efficiency of performance which can be achieved only through habit-forming practice. Reading is a kind of linguistic response which depends upon the language control achieved by each particular individual reader, and must therefore begin with, and build on, habits of language response already existing for the learner at that time.

The process of learning to read a language is the process of transfer from the auditory language signals, which have already been learned, to the new visual signs used to represent those same auditory signals, or the transfer from signals represented by auditory patterns to those same language signals represented by patterns of graphic shapes. One can "read" in so far as he can respond to the language signals, now represented by contrastive spelling patterns as completely and efficiently as he has learned to respond to the same language signals formerly represented by contrastive sound patterns.

Dr. Fries reminds the reader that this process of transfer is not the learning of the language code, nor is it the learning of a new or different set of language signals. It is not the learning of new "words," new grammatical structure, or new meanings. These are all language signals which the learner has mastered so well in the pre-reading phase of instruction that he is no longer conscious of their use. With more experience he will continue to develop his language capacity in the variety and number of lexical signals he can control. But this continual growth in meaning and in language signals must not draw attention away from the main business of the "transfer stage" of learning to read. During this period of learning to respond rapidly to the patterns of graphic shapes, the language materials used must be only those already well-controlled audio-lingually by the pupil. The "transfer" stage is not the time to strive for the development of additional language mastery.

The learning of reading, then, consists pri-

--- 51 ---

Preceding page blank-not filmed
marily in recognizing graphic shapes in recurrent contrastive patterns and establishing a connection between these patterns and portions of the oral language signals. It is interesting to note, however, that written materials contain fewer language signals than does talk, for intonation, stress and pause are not systematically represented in spelling. Professor Fries suggests one sentence as an example of the many whose meaning changes with a different positioning of stress in speech, but which is not evident in the writing system:

When did he come?
When did he come?
When did he come?
When did he come?

Productive reading, then, is achieved when the reader is able to supply those portions of significant signals not represented graphically and to respond to them automatically. This is the second stage in reading, in which the graphic shapes themselves sing below the threshold of attention and the reader is able to supply those portions of the signals which are not in the graphic representation.

The third stage begins when the reading process is so automatic that reading is used even more than the spoken language to stimulate vivid imagination and develop new experiences.

Reading may be intensive, extensive, or supplementary; oral or silent. By “intensive” reading is meant that the student not only comprehends the ideas of what he has read, but also examines and studies new vocabulary and structure. “Extensive” reading minimizes detailed study and aims most often at “reading for content.” “Supplementary” reading involves the “extensive” reading of material related to cultural or linguistic information which arises in the study of the language itself. These supplementary readings are sometimes done in English in the early stages.

It stands to reason, then, that emphasis should be placed on intensive reading during the beginning semesters, but should be decreased gradually as the student passes the third semester. By then, a general facility in reading simple texts should have been acquired and extensive reading can be introduced. By the final year (seventh and eighth semesters), the extensive and supplementary reading program becomes paramount and much of it is accomplished independently. Although many teachers successfully introduce some sight reading in the earlier semesters, this appears to be of very limited value.

The content of all reading material—for whatever purpose—should be linguistically and culturally authentic. Works written by persons who are not native speakers of the target language and works in carelessly edited versions should be avoided from the very beginning. While it is often a good idea, in selecting reading material, to cater somewhat to the interests of students—to amuse them or to entertain them—this should never be done at the sacrifice of linguistic or cultural authenticity.

The purpose of intensive reading is to develop the ability to understand the written foreign language without recourse to English. In this way active vocabulary is reinforced and recognition vocabulary is increased. Besides, these early intensive readings build the pupil’s appreciation of language patterns and style.

How do we introduce reading in the audio-lingual approach? Despite widely-held misconceptions, the audio-lingual approach generally initiates the students in intensive reading almost from the beginning. These initial readings are simply the same dialogues which form the core of the audio-lingual lesson. After the student has mastered and memorized the dialogue through classroom and laboratory practice, he is ready to see the written text for his first association with the written symbolization of what he has learned. This order of procedure is dictated by the desire to avoid interference from written symbols until after the student has acquired the foundation of good audio-lingual habits.

Alfred S. Hayes discusses the nature of interference from the native language in the Teachers Manual accompanying A-LM Spanish, Level I.3 To understand these interferences it is necessary to understand the relationship which the educated native speaker of English perceives between the sounds of language and the graphic symbols used to represent them on paper. There is a constant interplay between words and sentences as heard and words and sentences as printed. What he hears said and what he sees written have become the same thing for him, resulting from a long training process during which he built up a whole system of automatic responses to letters and words on the printed page. These responses are so deeply ingrained that they become to him the only possible responses. As Hayes points out, the secondary-school student has been exposed to such training for a shorter time than has the “educated native”; but as he seeks to acquire the different habits of a new language, it should be no surprise that native language habits frequently interpose themselves.

Just as speaking is hindered by the tendency to produce native sounds rather than foreign ones and to form sentences according to native rather than foreign models, so when written symbols are introduced, a powerful interference is at hand. Students of Spanish are already familiar with the

Roman alphabet and have established relationships between these symbols and English sounds, words and sentences. It is now their task to learn to associate Spanish sounds, still relatively new to them, with these same alphabet symbols, and the tendency will be strong to let English responses prevail.

Unless the teacher is persistently vigilant, the new habits of speech carefully acquired early in the audio-lingual course will be noticeably set back when the written symbol is introduced. It is not only the established association of sounds and single letters which interferes, but also groups of letters, whole words and even sentences. Obvious examples are those printed words which contain combinations of letters which could occur easily in English or in Spanish: general, canal, probable, etc.

The A-LM Teacher’s Manual (p.56) offers the following suggestions to minimize interference when the written symbol is introduced:

1. Explain briefly to the class the nature of the problem. Caution them to be on guard at all times against the tendency to respond in a typically English fashion. Instill in them a pride to keep their hard-won Spanish speaking habits intact.
2. Insist on the same high standards of pronunciation that prevailed throughout the course.
3. When you name sounds or letters, be very sure to make clear which of these you are talking about. Sounds are what is heard; letters are marks on paper. Form the habit of saying that a given sound is represented in a certain way, that a given letter or sequence of letters represents a certain sound.
4. Always use the Spanish names of the letters of the alphabet.

“Reading” implies two meanings: 1) to pronounce words and sentences aloud in response to a stimulus of a printed word, and 2) to follow printed or written sequences rapidly for comprehension with the eye scanning whole groups of words or sentences at a time. It is clear that the student must control the sound-letter correspondences of the new language if he is to acquire the first basic skill mentioned above. It is equally clear that other techniques will be required to lay the foundation for the long-range reading skill—rapid reading for comprehension. Extensive practice is required for both, and specific drills have been devised:

1. Mass association practice. This requires the reading aloud of material already mastered audio-lingually.
2. Interference drill. This drill elicits an oral response to Spanish letters or letter sequences which signal something quite different to the native speaker of English, such as h, j, z, r, v.

3. Graphic minimal pairs. The difference to the eye between gue and giue, for example, is two dots. The student accustomed to reading English does not readily attach significance to this written distinction. By pairing words containing gu with words containing gi and eliciting an oral response, the visual cue is emphasized.

4. Graphic representation of difficult sound contrasts. Partially overlapping with the third type of reading drill, this drill elicits oral responses to the paired graphic representations of difficult sound contrasts in Spanish, such as d/z, or e/ie. It is to be expected that the student will still have pronunciation difficulties here, and special drill on the written differences should help to focus the students’ attention on the corresponding difference in sound.

But let us return to the use of the dialogue of the audio-lingual lesson for intensive reading. As was said before, the students are ready to see the written text after they have mastered the dialogue orally. They are then led to repeat the dialogue several times with the written text before them, associating the oral with the written form. During this process, known as the “mass association practice,” the teacher must take care not to analyze the written form in any way. Some methodologists suggest a third step, which is to have the pupils repeat the dialogues silently to themselves several times as a reinforcement. Others, perhaps more wisely, suggest that reinforcement be done, but aloud to the stimulus of the laboratory tape, with the written text of the dialogue open before them.

The next stage in intensive reading corresponds to the longer stretches of prose which are generally added fairly early in the first year (cf. samples of early reading selection in Modern Spanish, 2nd edition, p. 73, and in A-LM, Level I, p. 122). The recommended procedure for presenting these readings is for the teacher (or tape) first to read the selection, while pupils listen but do not look at any printed material. In the second step, the teacher (or tape) reads again, while the students follow the printed text silently. The third step is a rereading by the teacher in short phrases with appropriate pauses, so that the students can repeat in chorus the phrase just heard. It is often recommended that at the conclusion of the repetition of a group of sentences or a paragraph, the teacher ask short and simple questions eliciting short answers from the students. These short answers are then expanded by the teacher to form complete utterances which are modelled and echoed by the class as a reinforcement of the original choral repetitions. Fourth, the teacher
and students read together the entire selection chorally without pauses, approximating normal speed. As pupils demonstrate proficiency, and as time permits, either in the classroom or in the laboratory, they may read aloud individually for reinforcement.

After the fourth or fifth reading done as suggested above, the procedures for intensive reading are gradually changed. Oral presentation by teacher or tape will decrease bit by bit. Eventually, the teacher or tape will read the selection to the students only once and choral repetitions will be limited to certain more difficult sections of the selection. A new set of problems arises, however, which must be met by anticipation drills. When readings from sources other than the initial audio-lingual text are introduced in the third and fourth semesters, pupils will encounter more and more material which they have not directly experienced audio-lingually; steps must, therefore, be taken to anticipate any special difficulties. Generally, this takes the form of noting the new material and drilling it intensively as above. The more the reading program progresses, the more new material is going to be met and the more necessary becomes this type of anticipatory drilling.

One technical point remains for us in our discussion of the intensive reading phase: testing. In many audio-lingual texts, a set of questions accompanies the intensive reading selections (cf. A-LM, Level I, p. 156) which serves as an adequate checkup. Where such questionnaires are not available, the teacher should prepare something of the sort—in the form of multiple-choice questions or sentences to be completed with the newly introduced words and phrases—comprehensive enough to test the students' understanding. Question-and-answer practice after each selection helps fix the content in the pupils' minds and crystallize salient points of the story as it progresses, if it is continued over several units. True-false statements or direct-content questions are also useful. But it must be remembered that true-false statements are statistically inadequate for testing purposes.

The third year, especially as it leads into the fourth, sees the intensive reading program diminish in favor of extensive reading. In this period, intensive reading will be more and more limited to passages selected for special interest or for the importance of the structural elements they present, and oral reading will be dropped. Silent reading is, after all, the most useful form for the pupil and it is in the third year that it becomes a major goal. The emphasis now shifts to the rapid, extensive reading of a wide range of material containing elements for enriching the students' knowledge of culture and literature. This is the stage which Dr. Fries has called that of "vivid imaginative realization." It is the stage in which reading process becomes so automatic that the reader uses reading as fully as the spoken language in acquiring and assimilating new experiences. Reading of this kind also fulfills the "literary purpose," in which language is used not simply to communicate facts and information but to provide vivid imaginative realizations of actions, emotions and values. The literary artists carry a capacity for vivid impressions into man's experience and make it possible, as DeWitt H. Parker¹ suggests, for the reader to fulfill the secret longing for the actions, thoughts and emotions which slumber in his soul.

The ability to respond to artistic materials of literature presented in Spanish is achieved only by constant practice, by learning the linguistic material included in the "code" of literature, by learning to identify particular meanings in particular situations, by discussing the cultural implications in the use of the language, by analyzing, in a gradually more complex fashion, the style of the author, the characters of the literary personalities, by discussing in Spanish the cultural content, the plot, etc. Periodicals and newspapers should also be included. The very nature of the skill being acquired implies independence, but the teacher must take care to provide selections within the pupils' linguistic powers and should continue to train them in rapid reading for comprehension.

The best audio-lingual materials, from A-LM to Modern Spanish, provide reading selections as a part of each lesson, so that the student is ready to proceed to the reading of edited texts as a next step. Assuming that language instruction is begun in the seventh grade, with audio-lingual materials, the transition from intensive reading to extensive silent reading should be accomplished during the second semester of the eighth grade. By the ninth grade, the pupil is generally ready to begin the extensive reading program. Here, the junior high school teacher has a greater problem than has his high school counterpart, for junior high school readings must take into account the different psychology of the pupil. In this sense, reading selections should be of a length to be completed in a reasonably short time. Reading content should include approximately equal doses of cultural information and literary content. The choice of appropriate literary material is, therefore, a vital one.

The oral approach has shown plays to be the most satisfactory first extensive readings, since these adapt themselves equally well to silent or oral reading. Students should demonstrate pro-

ficiency with plays, before being advanced to novels (perhaps with short stories in between). Poetry may be used at all levels, provided it is straightforward and easily understood, given in small doses. Poems give a good opportunity for oral reading and, if short enough, can easily be memorized. Such memorization is enjoyed by many pupils and gives them a sense of satisfaction and achievement. Periodicals can also be used toward the end of the ninth grade, but the special nature of “journalese” makes even simple articles difficult to read.

There should be a small reference collection, including dictionaries and a reference grammar, in the classroom. Students should be encouraged to acquire a dictionary for their own use, but need to be carefully instructed in how to use it. The more compendious ones often give too little information, and the more comprehensive ones often give more than the student will know how to use unless he is guided.

In the three-year high school, the above comments apply to the 11th grade, where first instruction was begun in the 10th grade. The 12th grade program in such schools puts the emphasis on literary works and periodicals. A good supply of Spanish language newspapers and magazines should be available in the classroom. (Some of the more easily-acquired might include: El mundo hispánico, Visión and Hoy, for magazines, and the newspapers Excélsior from Mexico City, ABC from Madrid and La Nación from Buenos Aires.) Literary works should be selected from Spanish-American and Spanish classics in competent editions. As students progress, the works should become steadily more difficult. They may be correlated for topics for oral reports, etc. In systems in which a six-year sequence, from grade 7 to grade 12, is maintained, the 11th and 12th years call for extensive reading of literary and cultural works, with attention to literary style, the author’s biographer and his place in literature, the technique of the work, the author’s purpose, and his philosophy.

Throughout the six years, whether split into two non-consecutive, three-year segments or treated as a whole, reading performs the function of a supplement to the audio-lingual program. Only in the last year of a six-year program should reading be the primary component of the course. Even then, the readings also serve as a basis for audio-lingual activity, as we shall see in Chapter 11.

Writing is the fourth of the skills presented in the audio-lingual approach and is the last to be introduced. For this reason, the writing skill is based primarily on what pupils can say and partly on what they can read. From the practical viewpoint of using the language, writing is probably the skill for which students will find the least demand. Still, it is important in reinforcing what has been learned audio-lingually and also in giving the pupils a chance for self-expression. Some linguistic analysts have also suggested that pupils learn to observe the intricacies and the overall structure of the language most accurately through composition. Of course, the goal of writing in the audio-lingual approach is free and creative composition, expressing the pupil’s individuality. The goal is reached, however, through a process of writing practice which is both guided and imitative.

Generally, imitative writing is introduced shortly after reading. The first step is for the pupil to write the very same material that he mastered during his audio-lingual practice. Practice in the exact writing of a few authentic phrases is most helpful. Thus, he continues the use of meaningful word-groups and avoids recourse to English. This phase can be accomplished as homework.

The first type of imitative writing exercise which is normally used is dictation. Its value lies in the many aspects of language learning involved in its performance. The student must listen intently so as to differentiate sounds properly, and distinguish words and speech groups. He must, of course, understand meaning, and this involves the recognition of form and structure. Furthermore, he must understand the spelling system, including the use of diacritical marks, and the use of capitals and punctuation marks. The teacher, in preparing and reading the dictation, should be careful to base the exercise upon material which the student has already heard and seen. It is well to remember that short dictations done at frequent intervals have been shown to give better results than lengthy ones at longer intervals. The following is a procedure recommended for administering dictation:

**DICTATION PROCEDURE**

I. Preliminaries
A. Tell students exactly how you will proceed.
B. Make sure students are acquainted with the terminology of punctuation in the target language.
C. Be sure that the material for dictation is of reasonable length (100 words, approximately).
D. Be sure that the material for dictation is already familiar or easily analogizable from aural-oral experience.

II. Dictation
A. Read selection at normal (“broadcast”) speed.
B. Read selection again, pausing at each breath-group (5-cycle format with choral repetition).
C. Read selection again at normal speed.
D. Read selection in breath-groups, students write in each pause.
E. Read selection at normal speed, students check what they have written.

Immediate correction is vital in all dictation. Perhaps the best means of providing this immediate correction, while still permitting the teacher to collect the student's written work is the following: each student is provided with two sheets of paper stapled together with a piece of carbon in between. The first page is blank. The upper half of the second page is blank, but the lower half contains the correct version of the dictation. The students write the dictation on the upper half of the first page, tear it off and hand it in. The second page then permits an immediate comparison between what they wrote and the correct version.

As the pupils demonstrate proficiency in handling the dictation exercises, a further step can be taken, which is still a form of writing from aural comprehension. There are several possibilities which can be used in any order or mixed together, as the pupil's progress permits. First, a passage is read twice at normal speed. It is a passage selected, like the dictations, from material with which the pupils are already familiar, aurally and visually. Several short questions on the material are asked orally, each question repeated twice. The passage and questions are then read a third time for double-checking. As a variation, the teacher makes incomplete statements about the selection read, instead of asking questions about it. Pupils are required to complete the statement in Spanish. For more sophisticated groups, instead of questions or incomplete statements, students are required to restate the passage either in their own words or in another person or tense. It must be remembered throughout that the real meaning of diacritical markings and punctuation will become clearer through this phase of instruction.

When students are able to perform adequately in the foregoing exercises, the transition to free composition can be initiated through a “guided” composition phase. The first step is for students to write exercises involving drill patterns reviewed in class. Thus, after doing, say, Unit 2 of Modern Spanish, Second Edition, (pp. 17-33), Exercise B of the Substitution Drills on p. 31, with the column marked “Teacher” duplicated and given to the students, makes an adequate drill. Choice-question response drills (such as in Modern Spanish, Second Edition, p. 93, or A-LM, Level I, p. 129, form the basis for another variation, in which students write answers to a series of carefully formulated questions (already familiar to them audio-lingually) which contain speech patterns that provide a basis for the answers.

Pupils progress from this “guided” writing stage to a “controlled” writing stage. Here, pupils change passages from one tense or person to another, change dialogue to narrative or the reverse, summarize passages, etc., with the teacher gradually lessening the controls. Students are also required to formulate a connected passage to dramatize or describe a “situation” which the teacher suggests. Gradually, students may be allowed to progress to full freedom in writing original and individual compositions. In all cases, the linguistic content will have been familiar to the student, both audio-lingually and visually, prior to the time of the writing exercise, thus preserving the prescribed order of hearing, speaking, reading, and writing.

It is impossible to lay down positive rules for correlating the successive periods of writing with particular courses and levels; too much depends upon the success of the course and the achievement of the students. Writing is, perhaps, that phase of the audio-lingual approach which must depend upon the progress of the individual pupil. Thus, any indication of grade or level can be only approximate. Generally, the phase of writing from aural comprehension lasts for roughly the first year. The second year is devoted to guided writing, an occasional exercise in writing from aural comprehension, ending with, perhaps, some controlled writing. Controlled writing, leading to controlled composition, is the chief concern of the writing portion of the third year program. Free composition, to be truly profitable, requires a linguistic sophistication found for the most part only in advanced students, i.e., those of the fourth year.

Again, some sections of the third year course in a given school may be ready for free composition. All in all, a considerable degree of flexibility must be maintained in the writing program.

ADDITIONAL READINGS

In Working Reports of the 1963 Northeast Conference on the Teaching of Foreign Languages.

TOPICS FOR DISCUSSION

1. Discuss the function of supplementary reading in the audio-lingual approach.

2. Contrast intensive and extensive reading, and specify their respective uses in the audio-lingual approach.

3. Discuss the principal aims of the writing program in the audio-lingual approach.

4. Which are the preliminary steps to be taken before the pupil is permitted to write a free composition? Describe how each step fulfills a basic need in the pupil's skills to prepare him for free composition.

5. Discuss the point at which reading and writing become a part of the audio-lingual program.

6. Show how reading selections can be presented to the student audio-lingually.

7. To what extent is it important that a reading selection reflect contrastive aspects of the culture of which the target language is an expression?

8. How long do edited texts have to be continued before it is possible to use material that has not been edited or adapted at all?

9. What remedial steps can be used to cope with frequently recurring errors in written composition?
Chapter 8

TESTING AND EVALUATION

The aim of testing in the audio-lingual program is to permit the teacher to judge pupils' ability, progress, and achievement by frequent, systematic, and purposeful tests. Although this definition bears a close resemblance to the principles of an effective teaching program as developed in other fields, evaluation of progress in a foreign language involves special considerations which we shall discuss here. It has often been said that, because each drill in the audio-lingual lesson is designed so that the student must have mastered preceding material, no testing program is needed beyond the correct daily performance of the drills and exercises. While this is partly true, it fails to recognize important aspects of testing other than immediate achievement. Long-range achievement, deficiencies, placement, and diagnosing the program itself are all quantities which must be measured by group and individual testing of a nature more comprehensive than that of the simple audio-lingual drill.

Thus, the overall “theory” of testing in the audio-lingual approach is not only to measure the skills and knowledge taught, but thereby also to motivate the student to better learning and to point up weak spots in the program itself. The test results provide the teacher with a basis for generalization and comparison necessary for the measurement of progress.

Throughout our discussion, we have said that the audio-lingual course is divided into four separate units: listening, speaking, reading, and writing. Although we now know that all of these skills are tied closely together in the program itself and frequently overlap, it is often convenient to divide them and deal with them separately in methodological discussion, as we have been doing. In testing, likewise, all four skills should be tested, both collectively and individually. Collective measurement gives us a practical index of achievement for communication goals so long as that complex of skills required on the examination is natural in normal language behavior.

Among other “ground rules” of language testing, our examination of the audio-lingual approach leads us to conclude that the question-answer technique in the foreign language is useful for testing speaking and listening skills, in addition to its common use for testing the manipulation of structure. But we must remember that the spoken answer to an aurally-perceived question or the written answer to a visually-perceived question automatically involve the simultaneous correct functioning of their separate skills: hearing and speaking, and reading and writing, respectively. In measuring skills individually questions must be designed to eliminate as much as possible the use of other skills. The skills tested should be based upon those taught in class as part of normal language behavior in the area tested. Thus, idioms, vocabulary, and structures should be tested in context in active uses. Cultural items should be tested in a situationally and linguistically authentic context.

Many teachers prefer to avoid using incorrect forms on a test in the belief that the “correcting” of incorrect forms is a test type best reserved for students who have already mastered the language and are learning to teach it. If the correction was the only purpose in presenting incorrect items on a test, these objections would be valid. However, where a test item involves the pupils selecting a “best” form out of several possible forms, some of which might be incorrect, one cannot find fault. The decisive factor in exercising this judgment is in the definition of the term “incorrect.” If by “incorrect” we mean a misspelled or structurally impossible, or erroneous form, then the injunction against their use is valid, for we risk focusing the student's attention on faulty usage. If it is a
matters of more vs. less appropriate forms, all of which are possible but only one of which is likely to be used in this context by educated natives, then the inclusion of the less appropriate form is valid, since the exercise serves to test the pupil’s “feeling” for the language. The teacher must be careful, however, always to warn the pupil in advance when to expect items on an examination that may be incorrect in this sense.

Translation is a tricky matter in testing. Translation from target to source language has no place except on the most advanced types of tests where the focus is on the pupil’s ability to render accurately into English material of a specialized nature, such as technical articles, foreign correspondence, or directions; or material of a literary nature which he must render into good English style. Clearly, these are not the goals of the high school language program. Nor are translations from English into the target language recommended as a testing device. However, in the best audio-lingual texts, translation drills have been judiciously employed to point out the differences of structure between the target and the source languages. Such drills may serve for purposes of testing (Cf. p. 36). Their use is, at best, limited to situations in which only the direct comparison of the English form with the target language will elicit the correct answers or will determine, in limited circumstances, whether or not the student has succeeded in putting aside the influence of his native-language structure, for example: ‘He isn’t a loyal friend’ vs. ‘He isn’t a loyal friend’ to get the answers ‘no es un leal amigo’ vs. ‘no es un amigo leal’ (from Modern Spanish, Second Edition, pp. 192-93), or the contrast between like and gustar.

Within these general limits, the preparation of the tests themselves can begin. Instructions to the student should be made clear and succinct. Directions may be given in the foreign language, although this is not totally necessary. When the directions cannot easily be understood by the students, they should be given in English. Where necessary, a model of the item and its target might be supplied (as is done in the drills, v.g., Modern Spanish, Drill 10, p. 48). It is frequently helpful to read test instructions aloud with the students before the test itself begins. Test results are frequently invalidated when students who know the material are delayed or confused by complicated instructions.

The sampling of items should be representative. The audio-lingual pattern drills themselves often serve as good test focuses for specific structural points. In the larger tests, it is wise to select from a broad stock of structural items. This is not to deny, however, that the relative weights of questions should be distributed relative to the importance of the skill or knowledge measured. Economy is achieved in selecting test items by choosing those which represent the most efficient evaluation per unit of pupil time spent. The complaint about “unfair testing” is often motivated by a failure to match the testing emphases with the major language-learning activities in the classroom. If, let us say, we are in the phase of instruction in which a majority of the time is spent on oral drill, dialogue memorization and adaptation, and the like, then the aural and oral skills are those which should figure most prominently in the tests and around which the tests should be constructed.

Pupils should always have experience with question types before being tested. If a test question type is to be used which the students do not know from their daily class work, practice should be conducted in class prior to the test, to acquaint them with the operation.

In the discussion that follows, we shall consider seven skills which are commonly tested as a part of the audio-lingual program.

I. Testing the Listening Skills

In testing listening skills it is imperative that the teacher clearly distinguish, in the preparation of the test, between the testing of the sound patterns of the language and the testing of meanings associated with the sounds. While these two aspects will be fused into one skill as the learner advances, it is best that they be treated separately at the beginning levels since the effective comprehension of meanings is dependent upon a thorough training in recognition of contrastive sounds.

A. Recognition of sounds. The general technique in the testing of this skill is simple: the teacher (or tape) reads aloud one or more utterances and checks the students, who may respond in a variety of ways, to see if they have recognized the problem sound or contrast. This type of test is ideal for the language laboratory, in which the high fidelity of reproduction and the comparative isolation of the student in each booth aid to better performance. There are a number of ways to accomplish this, some of which are discussed by Robert Lado in Language Testing.5

1. Sound to sound, in which the student is asked to compare one sound with another sound and to indicate if they are the same or different. One method commonly used is that in which the teacher reads minimal pairs (e.g., peso/peso, pero/perro) and the student indicates S for “same” and D for “different.” Another is that in which

the teacher reads groups of 3 or 4 words and the students indicate (by writing 1, 2, 3, or 4) which ones have the same initial phorème, i.e., (1) peso (2) paso (3) besa (4) pozo. It is also possible to ask the student to indicate that he perceives the difference between a sound in the target language and a similar sound in the source language (e.g., English low vs. Spanish le). For this exercise, pre-printed answer sheets, containing columns of letters or numbers, may be provided.

Often the student is provided with an answer sheet which has the words listed under each item and he is to mark the written word or phrase that matches what the model will say. For example, the stimulus lee is given by the model; with the following written choices on the student's paper: lee, lei, ley, lea. As we have said elsewhere, however, this technique is questionable in the early stages of language learning, since the student is being asked to make the transition from sound to graphic symbol, thereby involving, in a small but meaningful way, the additional skills of reading and/or writing.

Intonation patterns can also be tested in the ways suggested above. Here the student is asked to distinguish between contrastive patterns within the language. For example, he is to indicate (by writing 1, 2, or 3 on his paper) which of the following utterances is a question:

(1) ‘Van al centro hoy?’;
(2) ‘Van al centro hoy’;
(3) ‘¡Van al centro hoy!’

Or the student may be asked to distinguish which of the following utterances indicates that the sentence is not complete:

(1) ‘Pablo viene a casa’;
(2) ‘Pablo viene a casa’;
(3) ‘Pablo, ¿viene a casa?’

B. Recognition of meanings. It is important to mention again that testing for listening comprehension at the beginning levels must not depend on the co-functioning of another skill. The student must not be expected to produce an oral response to an item on a comprehension test, for he is then faced with the double task of understanding the item and producing a response; he may, in his nervousness, be unable to respond well, orally or in writing, even though he has understood the stimulus perfectly. In other words, testing for comprehension is not testing for production of the language. (This criterion invalidates such tests as those in which the teacher reads a series of questions which the students are to take down as a dictation, then instructs the students to write answers to these questions. The resulting confusion frequently means that the student is doubly penalized, for if he cannot accurately associate graphic symbols with the sounds of the stimulus, then it is impossible to write a correct response!)

Some of the more common ways of testing recognition are:

1. True-false test. The teacher reads a number of true-false statements based on a passage which the students have heard twice. The students respond by circling Sí or No, which are provided on the answer sheets. A variation of this test is one in which the statement is not based on any particular narrative, but merely general information (based on specific vocabulary), such as ‘El árbol tiene dos ojos,’ ‘Hay helado de postre,’ ‘El perro vive en el agua,’ etc., the first and third eliciting the No response, the second eliciting Sí.

2. Multiple-choice tests: Rejoinders. Tests involving suitable rejoinders (Cf. Teacher’s Manual, A-LM, Spanish, Level I, pp. 166-167) are familiar to most teachers. The teacher reads a statement twice (not always a question); three or four possible replies or rejoinders are read and the student indicates (by circling A, B, C, D, on his answer sheet) which is most suitable. For example:

¡Qué frío hace!
(A) Sí, menos mal que hace calor.
(B) Bueno, vamos a clase.
(C) Justamente por eso no quiero salir.
(D) No sé. ¿Qué hace Ud.?

3. Multiple-choice tests: Completion. A statement is read, which is not complete, with the teacher indicating by some gesture where the “blank” in the statement is. Three or four possible short completions are then read and the student indicates his choice. For example:

Yo soy el único hijo. No tengo
(A) primos
(B) hijos
(C) años
(D) hermanos

In composing the last two types of tests, care must be taken not to make the alternatives structurally impossible or ridiculous in meaning so that the student is able to isolate the correct completion by process of elimination only.

After reading and writing skills have become a more significant part of the course, these same multiple-choice tests may be used to measure aural comprehension through visual recognition of the correct answer to an oral stimulus. In this case the student is provided with an answer sheet containing the four alternatives for each item. He hears the stimulus, then marks on his sheet the rejoinder or completion of his choice.

4. Student performs in response to a cue. When the student’s vocabulary is adequate to permit a variety of command cues, a test may be composed in which he is given a series of rapid
II. Testing Speaking Skill: Production Tests.

As we mentioned in our discussion of the language laboratory, more experimenting has been done with the problems encountered in giving speaking tests than with any other. This has led to the establishment of a fairly uniform set of goals in giving speaking tests. First, we test the pupils' ability to reproduce the individual allophones of the foreign language, as well as longer sequences and relevant intonation patterns. Second, we test their ability to express their thoughts in the foreign language, in response either to a question or to some other stimulus. Third, we test their oral control of one or several of the structure patterns or of the vocabulary of the foreign language through appropriate questions or pattern drills. Although the teacher may choose to test for one or another aspect of the speaking skill, it is also possible to combine all three.

The simplest of all speaking tests is the echo test. The pupil simply repeats as accurately as he can whatever the teacher (or tape) says. A variation on this is the "build-up" echo test, in which pupils repeat sentences whose length is progressively increased. Such tests are difficult to score. The teacher should prepare in advance a check-list of the specific phonological problems he wishes to measure, limiting the number of different items to be measured on a given test. The teacher then assigns a rating for each focus. This type of scoring has two major advantages: it may be used just as easily for other types of speaking tests to measure sound production, and it also allows the teacher to keep a cumulative chart to measure achievement and progress in phonological reproduction for each pupil. A sample of this type of scoring sheet is given at the end of this chapter.

As the course progresses, more variations of testing become suitable. Some of the types used for testing comprehension may now be adapted, such as that involving completion (i.e., "En casa desayunamos _____________.") The student may, of course, respond in several ways: "él siente," "en el comedor," "muy poco," etc.). The free-rejoinder type may be used to give the student some choice within the limits of his ability. For example, to the cue: "Enrique está en el hospital," the student could reply correctly: "¿Qué le ha pasado?", "Sí, tiene una pierna quebrada," etc.

No mention need be made of the validity of the traditional question-and-answer type test here. A variation of this, however, somewhat more difficult, is that test in which the student is given a statement and instructed to phrase a question for which that statement is a possible answer.

Other techniques of testing speaking production are: student discussion of a picture, retelling narrative which he has just heard, summarizing a story he has read, composing a dialogue about a situation, or a picture, presented to him, and the directed dialogue.

III. Testing Grammatical Structure.

The testing criterion here is the student's ability to formulate a specific pattern in situational contexts. The older test types in which we focused our attention on translation from one language to the other, or in which we required forms to be identified with regard to grammatical nomenclature, do not perform this function and are, consequently, no longer useful to us.

Many of the standard audio-lingual drill forms may be used as test items, thus minimizing our dependence upon specific "test" types. Some pattern drill types actually began as test types, especially the integration (combination) forms. (Cf. also Chapter V.) In these the students are required to combine two utterances in order to test their ability to use certain structures, such as relative forms and adverbial phrases. Thus to the cue "María es bonita. Luisa es bonita también," the student responds with the combined form: "Luisa es tan bonita como María." Similarly, "Aquí viene nuestro amigo. El trae los libros" is combined into: "Aquí viene nuestro amigo que trae los libros," and if the student is instructed to use al-plus-infinitive, he will combine "Escribió la lección. Se le acabó la tinta." into "Al escribir la lección se le acabó la tinta."

The "directed dialogue" type of drill can also be useful in testing grammatical structure. For example, in testing command forms, the cue "Digale a Juan que debe venir pronto" will elicit the response: "Juan, ven pronto." To the statement: "Pregúntele a Luisa si le gusta cantar" the student will reply: "Luisa, ¿te gusta cantar?", etc.

Professor Lado discusses the use of pictures with specific content and instructions which pre-determine the structure to be used and tested. For example, a series of pictures could present a girl eating various things, playing with her dog, talking with her teacher, etc. Some of the possible instructions which could elicit responses with specific structural items are: a) "Tell me what you see" (to test complete sentences with present times); b) "This happened yesterday. Tell me what happened" (for the use of the past tenses); c) "This was happening yesterday. Tell me what was happening" (to test use of the progressive forms); d) "What happened to the girl?" (for the use of the passive voice, i.e. "She was bitten by the dog").

Language Testing, pp. 171-75.
Responses of could, would, might could be tested with a more complex picture showing a fence and a tree, with a cat on one side of the fence, a rat on the other. The instruction is: "Describe all the possibilities for the rat if the cat were to jump over the fence." Possible responses would include remarks such as: "If the cat jumped over the fence, he would eat the rat; ... the rat would climb the tree; ... the rat would run around the fence," etc.

A picture might contain several images in a situation and the student is instructed to reproduce the conversation which presumably takes place.

With a bit of imagination and possibly the help of the art teacher, the Spanish teacher can develop a series of pictures which may be used for several years for a variety of purposes, since the same picture will often serve to test various structures, vocabulary, etc., at different times in the testing program.

IV. Testing Vocabulary and Idioms.

Testing for mastery of vocabulary and idiomatic expressions may be accomplished either actively or passively. It is imperative that the use of English always be avoided in testing vocabulary. The many possibilities provided by the use of pictures has been discussed or implied above. In addition to asking questions about the pictures, the teacher may utilize fully the question-answer type pertaining to general situations or information involving the vocabulary under study, or he may vary the format by constructing completion-type items, such as "¿Cómo se llama el hombre que cocina el pan?" (el panadero). In more advanced sections, the above procedure may be reversed. That is, the teacher gives the word panadero and elicits a short definition in response.

A picture might contain several images in a situation and the student is instructed to reproduce the conversation which presumably takes place.

The most widely-used forms of tests for passive testing of vocabulary are:

1. Associating ideas in a column with ideas in another:

   **Completion**
   
   **A**
   
   Llevo guantes en ( ) los pies
   ( ) la cabeza
   ( ) las manos
   ( ) los hombros

   **B**
   
   El primer mes del año 1. tío
   El hombre que cocina pan 2. presidente
   El hermano de mi padre etc.
   3. enero
   4. panadero
   5. diciembre
   6. zapatero

   (It is always important in this type of matching test that more items be given in Column B than are necessary to complete the set in Column A, this avoiding the students' responding by the process of elimination.)

   2. Associating synonyms and antonyms:

   **A**
   
   Trabajador
   ( ) perezoso
   ( ) aplicado
   ( ) bonachón
   ( ) tacaño

   **B**
   
   El trabajador
   1. el liberal
   2. el optimista
   3. el pesimista
   4. el conservador

   **V. Testing Reading.**

   As we have seen, reading plays a part in other tests already mentioned, but it can also be tested directly through a wide variety of question types. The most frequent is the question-and-answer. Variations include supplying the students with a written version of the reading passage, as opposed to having them hear it, and requiring them to answer, in complete sentences, questions put to them. The whole test is done in the foreign language. Caution must be exercised so that the questions asked will require a real understanding of the material and not just the copying of parts of the reading passage to form the answer.

   A single reading passage can be the source of several question types. Thus, a paragraph can form the basis for multiple-choice completion questions, multiple-choice answering questions, sentence completion, true-false questions, and even English equivalents. The latter makes use of equivalencies in which the meaning of a passage is given in English; we are not speaking of translation here.

   **VI. Testing of Writing.**

   The dictations, guided writing, and composition techniques discussed in Chapter 7 form the basis of most measurements.

   Another widely-used test type to test writing is that in which the students respond in writing to a passage read orally. The passage should be read twice. The questions should be read twice; the pupils should answer in Spanish. The passage and questions can then be reread for checking. There are two popular variations on this passage-type of test: (A) A passage based on material familiar to the students is read twice by the teacher (or tape). The pupils then restate the passage in their own words or in another person or tense. (B) Written answers to multiple-choice questions presented orally. The question is read as an incomplete statement with four (or more) possible completions. Pupils select and then write
the proper answer, e.g., 'Las ciudades más grandes de Latino-América son . . . .' (a) Rio de Janeiro y México, (b) Santiago y Buenos Aires, (c) Buenos Aires y México, (d) Caracas y Bogotá.

VII. Testing of Cultural Information

Where this is skillfully worked into the audio-lingual text or elsewhere, it need not constitute a separate unit of study. It can be tested in both a linguistic and a situational context. This can be accomplished in several ways, of which the two more widely preferred are the multiple-choice completion items based on a resumptive reading selection (that is, a reading selection combining in new ways material already learned by the pupils) and a rearranging or matching exercise in which the student reorganizes the sentences in a paragraph to demonstrate his control of the material.

Those teachers who have a civilization-culture course in the last year of their sequences would do well to consult books on language testing, such as that by Robert Lado, whose section on testing of cross-cultural understanding suggests several testing techniques including the following multiple-choice format:

Situation: A soccer match is in progress in Spain. There is a moment of fast action in front of one of the goals. Most of the spectators stand up and WHISTLE LOUDLY. They are:

(1) showing enthusiastic approval of the play.
(2) showing displeasure.
(3) showing relief after a moment of danger.
(4) asking for a repetition; more of the same.
(5) signaling the end of the game.

Frequent short testing of specific skills (one at a time), tightly linked to the lesson plan, is more productive than widely-spaced all-encompassing tests. Any test loses its value for the student unless it is corrected immediately. Immediate correction can sometimes be achieved by the carbon paper technique mentioned in Chapter 7, by the use of the overhead projector, by going over the test orally, or by giving each student a corrected copy.

When skills are mixed on a test, it is difficult to grade accurately and to weigh the parts of the test so they are proportionate to the emphasis given the skill in class work. Therefore, when tests are desired which test all skills, it is better to use those prepared (and statistically scored) by competent agencies such as the MLA, ETS, and CEEB, all of which have national norms. These tests, the use of which has been too limited in high schools to date, will be mentioned again in Chapter 11.

Where a school is unable to obtain such prepared examinations and seeks to devise its own, the following type of examination, which has been used successfully, may be a useful model. For such examination, an entirely new kind of test item had to be devised. It was nearly impossible to compress even so little as a single question on each of the 140-odd grammatical focuses of a first-level audio-lingual text (not to mention the pronunciation drills, cultural readings, etc.) into a two- or three-hour examination given at one time or spread over two or three days. First, it was generally agreed to test the students' speaking ability separately in the laboratory prior to the final examination, for reasons we have already touched upon above.

The remaining skills, reading, writing, and comprehension are left for the comprehensive examination. The test is divided into two parts, one involving the tape recorder and the other, straightforward writing. The first part is subsequently sub-divided into two equal halves. The first half consists of a series of questions read twice at normal speed on the tape by native speakers (as many different dialects as possible are represented, and male and female voices are used), for which the students are required to choose the best of four possible answers (given in their test booklets). The second half reverses the procedure, and the taped portion consists of statements read twice. The students are to choose which of the four questions given in their booklets most likely would elicit the answer they just heard. Within each of these two halves of the first part of the test, the items are so constructed that in approximately two-thirds of them the correct answer differs from the incorrect ones for structural reasons. Of course, all items are in "correct" Spanish; three choices simply do not answer the question. In the other third of the items in each half, the correct answer is determined by the cultural content. Thus, aural comprehension and understanding of cultural material, and the passive recognition of structure and the ability to read rapidly and accurately are tested in a single set of items.

The second part of the test is entirely written. The items are of the "pattern drill" type, in which students are required to demonstrate their active control of structural patterns and their ability to read the language.

For the individual high school teacher, however, such a procedure of test construction and administration is very difficult. His solution to the resumptive or comprehensive testing problem lies in the judicious selection of "key" structural and cultural points to be tested. Then he may proceed to the careful construction of test items on these points.
TOPICS FOR DISCUSSION

1. Discuss what you understand by "normal language behavior" in the following statement made in this chapter: "Collective measurement (all four skills) gives us a practical index of achievement for communication goals so long as that complex of skills required on the examination is natural in normal language behavior."

2. Discuss the advantages and disadvantages of short tests of specific skills as opposed to the more comprehensive tests.

3. In Chapter 6 there is a list of "do's and don'ts" for the use of the language laboratory. Prepare a list, for discussion, of the "don'ts" in the preparation of audio-lingual tests.

4. Why is the immediate correction of a test in keeping with the principles upon which the audio-lingual approach is based?

5. Discuss the advantages and disadvantages of the use of standardized national tests such as those suggested in this chapter.

6. Discuss the use of English in foreign language testing.

7. What testing techniques may be used to replace the traditional translation questions?

8. What special characteristic of the structural behavior of por and para makes it difficult to test students on their active control of these forms, without resorting to translation? Do you think the testing of the comparative usage of these two forms might be accomplished by one or another of the vocabulary and idiom test patterns? Why or why not? Construct a brief por vs. para quiz on this basis. Can you think of other structural items that may be better tested as vocabulary items? Why?

SAMPLE ECHO TEST

The echo test consists of two parts: (1) a taped passage to be repeated, phrase by phrase, by the student on the "record" track of the tape, and (2) a set of evaluative criteria by which the teacher judges the student's performance. The taped passage is best selected from the reading materials used during the semester. It should be spoken at normal speed, preferably by a native speaker. The evaluative criteria need not all be applied at once to a given reading. Thus, the teacher may prefer to evaluate the student on his performance in only one or two of the areas at a time.

The following are the major evaluative criteria:

1. Inaccurate formation of vowel sounds (possibly English influences as in [I] for [I], etc.)
2. Lengthening of stressed syllables
3. Diphthongizing Spanish vowels under stress ([léy] for [le])
4. Dissolution of diphthongs
5. Deformation of semi-vowels and semi-consonants by giving them the character of hiatus groups ([bendió] for [bendjó])
6. Retrolfection of consonants
7. Aspiration of stops
8. Incorrect vocalization ([présénte] for [présénte])
9. Labiodental [v] for [b] or [y]
10. Omissions
11. Incorrect syllabication (breaths between words instead of between phonological phrases)
12. Incorrect accentuation ([el lo isó] for [eloisó] 'el lo hizo')

Different numerical or letter grade values may be assigned to the criteria being used during a given testing. It is frequently helpful to determine the number of potential errors of a given type in a given passage and then to grade in the form of a fraction made up of the student's errors over the number of possible errors, e.g., 15 stressed syllables of which the student lengthened 6, yielding the grade of 6/15. In this way, the same test given at specific intervals throughout the semester will give the teacher a good idea of the progress a student may be making in pronunciation.

ADDITIONAL READINGS

SELECTING AND ADAPTING AUDIO-LINGUAL TEXTBOOKS

Despite the fact that the first widespread commercial appearance of textbooks implementing the audio-lingual approach took place shortly after the war, when the intensive training texts developed for the military were adapted for college use and released, the current deluge of supposedly audio-lingual texts was largely triggered by the experience of many teachers in the NDEA summer institute programs. The result is that, while today's foreign language teacher has a wider variety of modern materials to choose from than ever before, he is confronted with a far more serious and complex problem of selection.

Many teachers, after deciding to adopt the audio-lingual approach, have selected what was touted as an audio-lingual textbook, only to find their efforts and sometimes the success of their entire programs undermined by inconsistent and frequently unteachable texts. Upon closer examination, the text is often recognized either as a traditional one, hurriedly and superficially revised to give the appearance of implementing audio-lingual instruction, or as a new production, prepared by writers who are well-meaning, but insufficiently experienced in audio-lingual techniques. Still others have found themselves in the difficult position of having to teach along audio-lingual lines with purely traditional materials. Thus, the modern language teacher is confronted with a dual problem with regard to textbooks: knowing the significant points involved in selecting one for use in the audio-lingual class, and knowing how to adapt a traditional text for such use when no modern text is available.

Selecting an audio-lingual text

As a matter of principle, where possible, it is always better to acquire a text especially designed for audio-lingual instruction than to adapt unsuitable ones.

The exact set of criteria by which any textbook is judged varies from school to school and from teacher to teacher. Frequently, a major consideration is the number of units needed to present a certain percentage of the course, so that it may be completed within a semester, year, or other length of time. Other considerations may reflect the need for more pictures and “fun” content for junior high school pupils, as opposed to a more direct approach for the high school pupil. Thus, it would be impossible for us to give here a universal list of requirements a text should fulfill in order to be useful in the audio-lingual approach. In general, we may say that the most successful text is likely to be the one which most closely corresponds to the organization of the audio-lingual lesson, as we have described and discussed it in earlier chapters. The center of any audio-lingual text is its drills. Therefore, the bulk of a unit should be made up of a variety of drills covering the major grammatical focuses in the lesson. The criteria established for meaningful syntactical drills in Chapter 5 should be applied rigorously in evaluating the pattern drill sections of each unit. The two consistent questions must be:

1) does this drill do the job?
2) are there sufficient drills to make this structure automatic in this student?

At least one example of all structural types, and of new vocabulary items and idioms to be drilled, should be presented to the student in the form of a dialogue at the beginning of the unit. Sometimes, especially in more advanced stages, a prose selection is used in place of a dialogue. Although a book which prefers the reading selection to the dialogue is not always to be discounted on that consideration alone, the dialogue performs specific, unique functions (as we have discussed)
important that its omission at least at the beginning level, is a serious defect. The linguistic and cultural authenticity of each dialogue and reading selection must be beyond question. Explanations of grammar should follow the inductive drills. Students should be provided with a recombination of dialogue or dialogue adaptation at the end of the unit, or a combiner pattern replacement drill, to serve as a means of tying the lesson together. Extensive use of prose passages to be translated, vocabulary and idiom lists, and exercises requesting the pupil to use forms out of context (verb conjugations, declensions, etc.), or the use of half-Spanish, half-English utterances, are general indications that a book is unsuitable for the audio-lingual program.

Some texts are published with tapes of the dialogues and drill material. Modern Spanish, for example, comes with filmed versions of the dialogues. Others have correlated visual aids. Bull’s Visual Grammar may be acquired to provide visual accompaniment to almost any audio-lingual text. Yet these audio-visual aids are not totally necessary, since, as we have seen in earlier discussions, the teachers in any school can create a great many useful audio-visual aids themselves, provided they have access to carefully-prepared source material.

The presence of a teacher's manual is very important. In these handbooks we find invaluable suggestions for the implementation of each lesson, the transition from skill to skill, lesson plans, suggested testing routines, and suggestions for classroom procedures. The manuals accompanying the A-LM series are excellent, as is the teacher's edition of the Entender y Hablar series.

Each unit of the prospective text should contain each of the elements of the audio-lingual lesson as described on pp. 11, 12. If a book is deficient in any one of the areas represented in the outline, the teacher risks reduced efficiency in the program in which the book is to be used.

Many texts come with accompanying workbooks. If the printed lesson in the main text is incomplete, however, the workbook may not always be a sufficient supplement for real teaching efficiency. Ideally, the workbook, if present, should provide the student with extra opportunities for reinforcement, practice, and advancement at home and in the laboratory, rather than take the place of the fundamental drills which each unit in the text should otherwise provide.

Adapting a traditional text

For many teachers, however, the problem is less one of choosing among several new, audio-lingual texts and evaluating their relative merits, than one of having to make do in an audio-lingual program with a traditional text, or a slipshod "audio-lingual" text, which suffers from many, if not all, the defects we have just mentioned.

Now let us consider the steps to be taken in order to adapt such a deficient text to the needs of the truly audio-lingual class.

1. The “hear-speak-read-write” order. This is the underlying principle of sequential learning and must never be lost sight of. Regardless of how the textbook presents its material, adapting it to the audio-lingual classroom implies strict adherence to that order.

2. Aural presentation vs. audio-lingual presentation. Too often, the conscientious teacher, in his efforts to present a traditional text audio-lingually, will read the patterns to be studied to his class, making the students listen and give some evidence of comprehension. This is an inadequate presentation, because it is wholly aural and denies the pupil the opportunity for immediate spoken practice with what he has just heard. The audio-lingual presentation always implies that the student participates actively in the hearing-speaking exercise. We shall discuss the method of achieving this participation below.

Some teachers devote a period of weeks—or even an entire semester—to the “pre-reading phase” (“pre-reading phase” as opposed to a “textbook phase” using the former term to refer to the period of time spent on presenting the structures in the traditional textbook aurally to the students and requiring them to practice them audio-lingually and memorize them). During this pre-reading period the student does not see the textbook, but performs all language activity from the basis presented orally by the teacher in class. This technique can be truly satisfactory only when the material used comes from a scientifically designed, audio-lingual text. Only in such texts can the teacher be assured of the careful structuring of material, so that the correct percentages of new material, review, drill, etc., are present to sustain a semester of purely aural-oral linguistic experience. Despite widespread belief to the contrary, it is safer for the teacher who still must use a less than adequate text to make use of a pre-reading phase, as suggested above, preliminary to each unit to be studied, rather than to prepare a pre-reading semester or year from inadequate materials.

3. Reworking the text. Because most traditional texts make no attempt to present the patterns to be studied in any kind of contextual dialogue, the teacher’s first responsibility is to provide the pupils with a substitute. This is what is often meant by the “pre-reading phase” of each unit or chapter. To begin with, the teacher must make a careful inventory of the structural and lexical content of each chapter. This inventory most often takes the form of a list, including the grammatical points to be taught in the lesson; the associated vocabulary, idioms, and common ex-
pressions; and cultural points to be induced. At the same time, the teacher must make an estimate of the amount of time that can be spent on the lesson within the scope of the semester. Of that total time, approximately 40 percent to 50 percent should be spent on the pre-reading phase of each lesson throughout the first two years. When authentic basic dialogues are not present.

The teacher must then select from the text, or compose, basic pattern sentences which contain all the structural items used in the body of the lesson for drill. It is always better to select items from prepared materials, however, for reasons we have discussed. Vocabulary, because there is usually so much of it in a lesson, should not constitute individual focuses for pattern sentences (idioms excluded), but as much of the new vocabulary as possible should be worked into the pattern sentences. This is a large and complex task, best accomplished when a "committee" of all the teachers of the various sections of the course work together. It is always necessary to submit these pattern sentences to native speakers to insure their colloquial authenticity. As we have said before, these pattern sentences should be incorporated into a brief dialogue consisting of approximately 10 utterances involving two or three speakers as a satisfactory minimum. These utterances are to be memorized and treated as would be the dialogue in the audio-lingual text. Where the teacher's command of the target language is obviously non-native, he should attempt to have a native speaker record the dialogue on tape for use in class. If the teacher is unable to construct a natural dialogue, then the following slightly less effective alternative is suggested. Basic pattern sentences can be presented in no particular order for the purpose of audio-lingual drill. The sentences would be memorized. The first practice goal would be to elicit action responses to nonverbal cues, followed by reworking into questions and answers. Then responses to a directed dialogue in a progressive development of structure and vocabulary would be required.

4. Dialogue-drill sequence. It should be noted that, since the dialogues suggested above are short, it may take three or four separate dialogues to present all the structures of a given unit. If this is the case, it is well to drill the structures presented in each dialogue after it is learned. Since the purpose of the dialogue is to present the patterns for drill, the drills must not be postponed for long after the basic sentences are memorized and drilled. Thus, each day's lesson must be planned as a unit for presentation, including a check-up, exercises, and review of the memorized dialogue and some drill on at least one, and preferably two or three, of the basic pattern sentences. The result may well be that the revised lesson will not correspond to any lesson divisions in the original source text. A systematic review of the dialogues should be scheduled at fairly frequent intervals, perhaps every fifth meeting. The more difficult constructions should reappear most frequently in the dialogues and should be the object of recurring review drills.

5. Improvised warm-up. This "all business" approach may need to be modified somewhat for the junior high school and for certain high school classes by the judicious use of supplementary material. The purpose of such supplementary material is to provide more of what might be called a "foreign language atmosphere." It serves to condition the pupils somewhat to "tune in" on the target language. The most economical way of achieving this is by teaching the students a set of daily routine phrases, such as greetings, simple and often-used instructions, and the like. For some pupils, the use of Spanish names is helpful in promoting a predisposition for speaking in Spanish. Other classes react favorably to a few moments at the beginning of the period devoted to describing what one member of the class is wearing or a picture placed in front of the class. The dangerous element here is simply that too much time (more than 5 minutes) spent on this activity robs the pupils of their opportunity to learn the language. Consequently, such activities should be used only where necessary for the specific purpose of setting a mood for the serious business of the hour.

6. The pattern drill phase. Once a unit has been introduced through dialogue and practice with the basic sentences, the student must be drilled on the use of the structures presented. This involves a process of selection, since non-audio-linguily-oriented texts tend to present various aspects of a single structural phenomenon widely separated and fail to make clear the application of the "rules" they give. Almost always, the generalization precedes the exercises, and often the only exercises included in a series of units are translations from Spanish into English and the reverse.

Thus, the teacher faces two important tasks from the very beginning: one, to select the content of each day's lesson with a view toward fixing the basic speech habits most essential for developing audio-lingual competence; and two, to recognize much of that material. As the course progresses, the content of the structural patterns presented becomes more complex. Generally, the rate of introduction of new vocabulary and idioms increases as the lessons progress. As this happens, a constantly growing percentage of that material is required for reading recognition or aural comprehension only. In this way, a transition is achieved from an emphasis on aural-oral skills to one on reading and writing. The difficulty is that,

--- 69 ---
whereas in audio-lingual texts this transition is accomplished only after aural-oral competence has been thoroughly established, in many traditional texts the reading and writing skills become paramount and are led into after perhaps only three or four lessons. The teacher faced with the problem of adapting such materials will have to convert many of the early reading-writing portions of the traditional text to audio-lingual presentation and drill.

In the secondary school, most Spanish programs never get around to considering such things as style. Thus, for the purposes of adapting a text for audio-lingual use, the teacher must be certain to include the most often re-occurring structures, high-frequency vocabulary items, and idioms. This task is made even more difficult by the absence of an up-to-date scientific study indicating the range and frequency of the most commonly used words and structures in modern spoken Spanish. Of those studies which are available, the following five are the more reliable:

4. Hayward Keniston, A Standard List of Basic Words and Idioms, Heath, Boston, 1941.

It is on the basis of the range and frequency tabulation in these works that the initial order of presentation and subsequent reappearances of structures and words are based. If, for the high school teacher who must accomplish this tabulation quickly, this procedure is too complicated, then the items and order of presentation can be taken from Modern Spanish, A-LM, etc., which have a similarly carefully selected vocabulary count.

Once it is decided that a given vocabulary or structural item is to be presented in an audio-lingual lesson, the teacher must select a set of expressions incorporating them. These expressions must be restricted to the important items of the lesson, must be presentable through pattern drills or conversational sequences that are challenging to the level of the student—and therefore representative of progression in the learning process—yet must be understandable to him within the context of the lesson (and, of course, what has gone before). Such a selected item should then be presented in a series—generally a dialogue—in accordance with principles we have already studied. Of course, important new words can be used with review structures and new structures with review vocabulary or idioms, but always within the restriction that the meaning of these new forms can be inferred. We shall have more to say about the techniques of teaching students to infer meaning in Chapter 12.

Frequently, the more recently published traditional texts utilize the dialogue form in conversational sequences. (Such use of dialogue is, as we have seen, no sure indication that the rest of a text is audio-lingually designed.) Where this is the case, the basic pattern sentences may generally be taken directly from the text. In general, though, traditional texts do not provide a comprehensive set of pattern sentences. Moreover, they often list much low-frequency vocabulary and dated or highly restricted regional idioms. In these instances, basic pattern sentences in situational context will have to be composed by the teacher.

There is really no single prescribed manner to present all structure and vocabulary audio-lingually. For structural exercise, recourse must be had to the various drills we discussed in Chapter 5. Vocabulary and idioms from the new lessons may be presented audio-lingually when their meanings can be illustrated or inferred. It is best when the teacher is able to assist such inference by visual aids. The presentation may be combined with the structure drills for that particular lesson or may take the form of a series of drills, perhaps beginning with a repetition drill and followed by transformation, substitution, or completion drills.

**TOPICS FOR DISCUSSION**

1. Discuss in detail the specific criteria you would use to select an audio-lingual text for your school’s Spanish program. Base your judgment on the earlier chapters of this book as well as the present one. If possible, bring with you an audio-lingual text of the type you would choose and illustrate your conclusions with it.

2. If you are now using an audio-lingual text, discuss those features in it which correspond to the criteria suggested in this chapter. Also discuss the advantages of those features which are not among those described here. If you now use a traditional text, discuss the possibilities of re-writing it for audio-lingual use.

3. Discuss how the presence of a correlated tape or visual program for a given text does not in itself guarantee that the text is audio-lingually conceived.

4. Discuss the relative advantages of withholding the printed text from the pupils during specific phases of instruction at the beginning level.

5. Discuss how the authors of audio-lingual books systematically add new vocabulary and idioms to correspond to the linguistic needs of each successive unit, while at the same time building toward the broad active and passive vocabulary required for free conversation, free composition, and extensive reading.
Chapter 10
THE CULTURAL FOCUS IN THE AUDIO-LINGUAL APPROACH

Although speaking a foreign language fluently is our major goal in the foreign language program, it is still not all we aim to teach. In addition, the pupil needs to know something of the way of life and the intellectual and artistic products of the culture whose language he is studying. This should be one of the results of the pupil's experience in the foreign language course. It is important to tell the student clearly that, not only do the phonology, morphology, and syntax of the language he is studying differ from his own, but also that the images which these forms call up for the native speaker are totally different. This is one of the most important functions of the total language program.

Does the audio-lingual approach minimize cultural information in the classroom, as is sometimes claimed, and, therefore, fail to fulfill this larger function of language teaching? The conflict is more apparent than real. It is based on a misinterpretation of the phrase “total language program.” The audio-lingual approach teaches us that the hearing, speaking, reading, and writing skills must be perfected before the student may turn his attention from manipulating forms to reading and discussion of cultural concepts. We have learned that in the complex matter of language it is essential to divide language into separate parts, or “skills,” so as to teach each one thoroughly, yet not lose sight of the innate relationship among them and of the overriding fact that people talk and write in order to communicate ideas.

The modern approach recognizes that a genuine understanding of Hispanic culture—a sympathetic comprehension of the problem of its people, and a familiarity with their cultural patterns, based upon a background of factual information—is an integral part of the total language program, but that pedagogical emphases vary at different points within that total program. Thus, our very first concern is to teach the language skills. We never lose sight of the social context in which the forms are presented and drilled, but our major emphasis at first must be on the skills themselves. Then, to an ever-increasing degree as the student acquires greater fluency, our emphasis shifts to the cultural aspect of what the student speaks and writes about.

In the audio-lingual approach, the language itself, from the very beginning, is an intimate manifestation of culture, since it is at once the means of communication among the people who speak it and the fabric of which their very thoughts are formed. Thus, in equal degrees, the linguistic elements of culture are taught as part of language learning and nonlinguistic aspects of culture are used as vehicles for language learning. What we shall discuss in this chapter will be how we may most successfully integrate “language” and “culture” for the eventual purpose of teaching the student the total language, or as much of it as the finite learning situation in the secondary school will permit.

During the first two or three years of language instruction, the emphasis is on acquiring language skills. Thus, the same “inductive approach” that we use in presenting and drilling these skills is used for introducing the pupil to culture.

The first step in this inductive presentation of culture is achieved through the classroom environment itself. The Spanish classroom should set the stage for the serious business of language learning by focusing the student's attention as far as possible on things Spanish. Pictures, posters, objects d'art, and other visual material appropriate to the course (including visual aids which accompany many audio-lingual texts) help to achieve this purpose. These visual aids should represent both historical and contemporary features of Spanish and Hispanic-American culture.
Pupils who have collected or made materials of this sort should be encouraged to display them. In this way, an atmosphere conducive to a "Spanish frame of mind" is created, and a small but significant opportunity to begin the inductive approach to culture is given, without taking time from the beginning class in its fundamental work of acquiring the language skills. Where it is at all possible to set aside classrooms exclusively for use by Spanish classes, more elaborate permanent displays can be prepared. A congenial atmosphere for language learning seems to be best achieved when language classes are not required to migrate from one end of the building to another or to share the scenery with library periodical racks or dead frogs.

Second, the well-designed audio-lingual textbook is, from the first lesson on, an experience in both language and culture. The basic dialogue, as we have mentioned before, is a lesson in culture as well as language because it is an authentic example of the foreign language in context. Such context is by definition an authentic culture pattern. Any dialogue picked from Modern Spanish, Second Edition, for example, will illustrate this point. Dialogue 13 (pp. 205-206) is typical. The grammatical focuses of the dialogue include prepositional pronouns, negation by negative adverbs, comparison with que, and the like. But its cultural content is no less significant. Here, the pupil is introduced to one of the most striking features of Latin-American civilization: student concern for national politics. The American pupil can compare his own interest in sports with his Latin-American contemporary's interest in politics. He discovers that students in Latin America learn to play politics as they engage in group actions, strikes, and other manifestations. There are national political organizations for students who wish to join. There is a close relationship between students and faculty along party lines. In this way, a pupil assigned to memorize Dialogue 13 for pattern drill has also memorized an important feature of Spanish-American culture. Few pupils fail to have their curiosities aroused by such material and they seem to have little difficulty in retaining the information, even without prompting.

The answer to the supposed "anti-cultural" bias of the audio-lingual approach is that this cultural material is not "incidental." The dialogues are planned from the first with the cultural aspect clearly in mind. A set of cultural footnotes (e.g., Modern Spanish, Second Edition, p. 207, and our own Chapter 2), follows the dialogue, so that the cultural focuses need not be discussed in class, if the teacher chooses. The cultural "point" of the dialogue is still obvious. Should the teacher care to make a more pointed lesson of these notes, three or four minutes may be spent either during the situational presentation of the dialogue, at the end of the dialogue, or during the "check-up" on cultural matters.

The third step in the cultural presentation comes after the pupil has learned the dialogue. When the teacher conducts the "check-up" session to make sure that the dialogue has been memorized and understood, several questions concerning the cultural content of the dialogue should be included. The questions must, of course, be kept within the linguistic grasp of the student at the moment; yet they should be to the point and should help him to isolate the significant features of Latin-American culture contained in the dialogue. An occasional brief remark in English is also possible. Here, the well-informed teacher can make use of linguistic cues from the dialogue itself. The use of "formal" and "informal" address reveals a culturally significant view of Hispanic society—one worth mention from the outset. Forms of greetings, farewells, presentations, and the like are equally significant.

Organization is important. The mere mention of facts that happen to be related to a current activity is ineffective as a device for teaching culture. Cultural matter should form a specific body of information within which knowledge, attitude, and appreciation are incorporated. Here, again, the traditional textbook fails us. It either concentrates on one cultural feature to the detriment of all other values or is inconsistent in its cultural approach.

Many texts, both traditional and modern, present distorted views of Hispanic-American and Peninsular culture, focusing undue attention on "colorful" folkways which, in the urban centers, are regarded by native residents as "quaint" and which are, even from the urban native's point of view, as strange to him as to the American student learning Spanish. Industrialization, complex economic development, housing, transportation, public health, immigration, and education are far more serious preoccupations in Spain and Latin America today than the amorous nocturnal serenades, tortilla-and frijoles meals, romantic gauchito life, and adobe villages which have for so long been the chief cultural concern of Spanish textbooks. Soccer, skiing, cockfighting, as well as horseback riding, tennis, and swimming, are as important to most Spanish-speaking peoples as bullfighting. While it is true that study of more complex social questions in the Spanish-speaking world cannot be undertaken during the four-year sequence in most secondary schools, it is urgent that those cultural focuses we do present be scrupulously accurate and representative.

The carefully planned audio-lingual text is as systematically organized in its treatment of culture as in its treatment of language. If it appears
to devote comparatively fewer pages to cultural phenomena, it is only because at the beginning level, as we have said, the primary emphasis is necessarily on the language skills.

During the first two years, it is possible to present cultural material in Spanish as a part of the regular program of language learning. But, as pupils develop, their own cultural interest (music, art, government, literature, science, etc.) transcends their linguistic facility and a widening breach becomes evident between their real interests and their ability to learn about them and discuss them in Spanish.

![Diagram](image)

In the foregoing diagram, we see a cross section showing the ability to handle cultural material in Spanish. The first bulge shows the first broadening of linguistic skill before the cultural interest begins to grow. The narrow section corresponding roughly to the end of the second semester represents the relative burst of cultural interest which overloads the linguistic ability. The final continuing rise of both lines shows the steady increase in cultural interest and in the linguistic ability to handle it.

By the third and fourth years of language study, the pupils' linguistic competence gradually catches up with their cultural interests, making it possible to introduce significant doses of cultural material in Spanish in the classroom, laboratory, and homework program. Educationally, of course, we do not want to limit the pupils' field of inquiry and yet, because the chief objective of the first two years is to teach communication skills, the best method of developing these skills may not always include a primary concentration on cultural content.

It is at this point that many of our colleagues permit the use of English for outside readings on cultural topics. Essentially, there can be no complaint about such projects during the first two years, so long as we are always careful to devote class time first and foremost to audio-lingual drill. Probably, English-language cultural activities are best treated as outside projects, graded or not, with—at the very most—an occasional summary in class. If a summary can simply be in the form of a map, chart, or picture to be posted in class, so much the better. The pupils' cultural aware-

ness will be enriched and the overall "Hispanic" look of the room itself will be enhanced at no cost of precious class time.

The map is conceded to be the best stimulus to such outside cultural activities at the beginning levels. Students can use desk outline maps or make their own. On them they can draw boundaries, outline countries where Spanish is the official language, show principal products of Spanish-speaking nations, or illustrate the geographical spread of ethnic groups. Such information is readily found in encyclopedias, geographies, and other books generally available in school libraries. Both the research and actual drawing may be done at home, scheduled so as not to interfere with dialogue memorization and other linguistic activities.

Celebration of holidays is another exercise which is popular and not too time-consuming. Still other activities include hunting for Spanish words or expressions used in newspapers, radio, television, books and magazines; gathering names of Spanish and Spanish-American foods, identifying them, finding when and where they are eaten; learning songs; collecting prints or pictures of famous paintings, statues, or buildings, and preparing brief descriptions in Spanish.

Professor Howard Nostrand has suggested the following as valuable cultural experiences within the context of the language-learning sequence.

1. Situation dialogues—controlled, for elementary instruction, and candid for more advanced teaching, but all preferably on film. Existing materials well illustrate the kinds of situation that are worth presenting—between age mates, host and guest, neighbors, persons of unequal social status. Students need more guidance, however, in formulating what each situation illustrates of the foreign behavior patterns.

2. Programmed audio materials, designed for self-instruction, expounding aspects of the culture, social system, or history of a country.

3. Spoken descriptions of museum materials, such as paintings, handicrafts, model villages, to accompany pictures of the objects. Before visiting a temporary exhibit at a museum, students can listen to the 'acoustiguides' commentary in the language lab, looking meanwhile at a printed catalogue of the materials.

4. Literature taught in its relation to the culture and society. Recitations of poems, brief prose narratives, and monologues, accompanied by cultural commentary to be read by the students, or listened to in the language laboratory, or presented by the teach-

---73---
er in the class discussion. Recitations by contemporary or recent authors of selections from their writings.

5. Songs significant of a way of life. Film can show how work songs, festival songs, etc., are used in the country; a booklet can present to the teacher or students the generalizations that confer significance upon the example.

6. The motion picture as art form and social document. Margaret Mead suggests that students see half of a 'movie' film and test their understanding of the foreign culture's art forms by guessing how the story will end. A check sheet of types of behavior pattern to look for, with some preliminary instruction, enables students to discover in a motion picture (or documentary film) a wealth of paralinguistic, kinesic, and social patterns which open up a new world for observations.

7. Filmed or taped interviews of social types significant in the country, and excerpts from talks given by political and other leaders, could well be more extensively used at a more advanced stage of language learning when long works of literature cannot yet be read at a fast enough pace to become engaging.

8. Testing understanding and the ability to communicate. The language laboratory can present, on film or tape, excerpts of such materials as have been suggested, calling for a response that will indicate the student's understanding and/or his ability to react acceptably. The learner's ability to follow an informal conversation with ease, for example, gives one indication of his acquaintance with the foreign way of life. His nearness to native proficiency in understanding discourse could be measured still more exactly by refinements such as the 'cloze procedure' in which words are blanked out, at regular or random intervals.

A certain amount of outside reading is implicit in the activities we have mentioned. Formal reading assignments, however, present a more complex problem. Extensive reading in English has no place in the Spanish language curriculum, yet it may become necessary for students to do some outside cultural reading in English. To make such reading a meaningful linguistic experience as well, it is necessary to insist that students summarize or dramatize in Spanish the content of what they read in English. At all events, it is best to avoid such English reading as much as possible. Music, art, and other cultural activities should be indulged in only when they do not take time from the audio-lingual practice, which is the heart of the first two years.

Some teachers have found that devoting the first five minutes of the hour to the singing of Spanish or Spanish-American songs "limbers up" the voice for intensive oral drill, relaxes the students, puts them in a more "Spanish" frame of mind, and is time well-spent. Furthermore, teachers maintain that the effort of memorizing the lyrics has a beneficial linguistic effect as well. There can be no serious objection to such activities when the teacher finds that better language learning takes place because of them and when the time devoted to them is strictly limited.

In most schools, teachers in charge of advanced courses have fulfilled this cultural need mostly through reading. In Chapter 7, we discussed the general position of reading in the audio-lingual approach. Now, we shall discuss in more detail the things to be read and the goals to be set. Too often, we tend to think that cultural readings in the advanced course must be literary (generally plays and novels, for example). Actually, literature is only one subdivision of the total possible cultural content of our courses. The following general outline shows that a wide variety of cultural topics is suitable. So long as the works being read are written by native speakers, are carefully edited, and are accurate in what they say, they are grist for the mill.

I. The Hispanic World Today
   1. the Spanish language
   2. Spanish influences in the United States
   3. relations between Spanish America and the United States

II. Area Information (Spain and Spanish America)
   1. geography
   2. topography
   3. ethnography
   4. products and trade

III. Cultural Patterns (varying, of course, from country to country)
   1. family life
   2. dress and diet
   3. recreation
   4. music and the arts
   5. holidays and festivals
   6. religion
   7. customs
   8. occupations
   9. education etc.

IV. History of the Hispanic World
A. Spain
   1. Spain before the Romans
   2. Roman Spain

-75-
Section V of the outline is best presented in
the final year of the four-year sequence and in
the last two years of the six-year sequence. Here
occurs the desired correlation between audio-
linguistic experience (which has continued through-
out the program) and the study of culture. The
goal is the ability to converse fluently in Spanish
with a native speaker on several important topics
of contemporary life. And this final stage is the
one in which the student is best equipped to read
and appreciate a novel in all its social and histori-
 cal contexts.

TOPICS FOR DISCUSSION

1. Discuss how the cultural focus is integrated
into the various levels of audio-lingual lan-
guage instruction.
2. Discuss how the "inductive" approach to cul-
ture is achieved in the beginning levels of in-
struction.
3. Which cultural features of Hispanic civilization
should be emphasized in the language problem?
4. How is it possible to avoid the traditional and
erroneous equation of culture and literature in
language instruction?
5. By which means can pupils' attention be drawn
to the cultural content of the linguistic ma-
terial of the language lesson without consuming
valuable skill-learning time?
6. Discuss the best means of and materials for
achieving a realistic and up-to-date view of
Hispanic culture in the secondary school FL
curriculum, both from the teacher's and pupils' viewpoints.
7. Discuss the most productive uses of audiovisual presentations in the teaching of culture. Tie these in wherever possible with concomitant language-teaching objectives, for culture and language learning are not separate, unrelated goals in the integrated or "total" language program.

8. Discuss how viewing a Spanish-language motion picture can be developed into a meaningful cultural and linguistic learning experience.

Culture in Language Learning, in Reports of the Working Committees of the 1960 Northeast Conference on the Teaching of Foreign Languages.

PLANNING THE FOUR- AND SIX-YEAR SEQUENCES

The solid foundation we lay in the beginning years through the audio-lingual approach may easily be undone by reverting to the familiar alternation between review grammars and readers during the following years. At one time, when enrollments in advanced courses were small and generally made up of especially-interested students, the dangers of poorly-coordinated classes were limited. Now that a steadily growing number of pupils are enrolling in advanced courses, it has become important to consider the continuity within our advanced courses of the approach with which we began in the first years.

As we have mentioned in preceding chapters, the four- or six-year sequence constitutes a "total language program" in which the skills of hearing, speaking, reading, and writing are not only presented, but perfected throughout the entire sequence. This means that however much the emphases may change from skill to skill in a given semester or year, no skill is ever absent from the program. Thus, the integrity of the total language program is never lost, although the percentage of time and attention devoted to one or another skill may vary.

Before we can sensibly proceed to a consideration of what kind of audio-lingual drill is most profitable in the advanced years and of how it can be integrated with the extensive cultural content of advanced courses, we must first consider the relative balance of time allotted to each phase of language instruction throughout the four- or six-year sequence.

Because the exact percentages of time devoted to each aspect of language instruction will vary according to the requirements of each school district, the following figures are intended merely to suggest relative percentages of time to be allotted to each skill. Cultural material, because its preparation most often involves reading and writing, is considered in the following diagrams to be a part of the reading and writing phases.

From the following diagrams, we can observe that, although there is a steadily increasing or decreasing degree of emphasis placed upon each skill at a specific level, all four skills have an important place in the total program at any given level.

'he have already observed that at the beginning levels of language instruction, a wide variety of syntactic drills (cf. Chapter 5) can be employed to teach the student how to manipulate the structures that he first encountered in the pattern dialogue. The purpose was to drill, one by one, each of the new structures that the pupil met. By the end of the first two years, using scientifically-designed materials and the audio-lingual approach, most pupils have met and learned to use the fundamental structures of the language. During the third year and beyond, however, the purpose of audio-lingual drill is to perfect the pupil's control of the structures he has already met, and to present and drill for the first time some of the less frequent structures in the language or optional constructions, i.e., such as the choice between clause or infinitive after dejar and hacer.

During the first two years, we presented the new forms to be studied in the pattern dialogue. The dialogue had to be carefully created to focus attention on the new patterns and to include a controlled quantity of new vocabulary, unusual verb forms, idioms, and the like. From the third year on, however, the pupil has a sufficient control of the basic constructions of the language to read standard prose and not to be so confused by the presence of new forms that he cannot make sense out of it. Many textbook writers hold, moreover, that the abandonment of the dialogue in favor of prose selections at the advanced level aids in achieving the transition to reading and provides for a variety of more “colorful” uses of the language than could be possible in a realistic and believable dialogue. For the purposes of audio-lingual drill at advanced levels, there is little significant difference between pattern dialogues and literary or other cultural readings as a presentation of new material on which the pupil will expand his recognition and working vocabulary and in which he will observe new variations in structural usage. In this way, the very reading material which forms the central part of the advanced course acts as did the pattern dialogue in the early years to present in context the structures to be learned.

The syntactic drill patterns we discussed in Chapter 5 are just as useful for advanced drills as they are for elementary exercises and no new prototypes need be created to achieve the desired results.

Once it has been decided, for example, that in a given advanced class approximately 25 percent of total class time will be devoted to audio-lingual practice, the teacher faces four immediate problems:

1. How shall the 25 percent of class time be divided? One class per week? Fifteen minutes each day? One week per month? etc.
2. Shall audio-lingual practice be performed in class only, or can the laboratory be used? If so, should it be used during the class hour or as reinforcement in addition to the classroom drill?
3. How shall the appropriate material be drawn from the readings?
4. How can the most effective grammatical generalization be made after the drills are completed?

First, let us consider how best to divide class time. The 25 percent figure refers not only to an amount of classroom time, but also to the same relative percentage of homework time. Thus, audio-lingual experiences in the fourth year of a four-year program should take up approximately one quarter of all time (classroom, laboratory, and homework) devoted to the course. Here we note again how the language laboratory remains a key instructional device even at the advanced level. Its use in the cultural, literary, and testing phases of the advanced program is perhaps the area in which the language laboratory is least understood. Because, at the advanced level, it is just as necessary as at the beginning level to drill new structures as soon after encountering them as possible, approximately one quarter of each class hour should be devoted to audio-lingual drill. The manner of presentation does not differ from the sample lesson formula presented in Chapter 2 (pp. 11-12): (1) present pattern, (2) drill pattern, (3) generalization. Because the end of an audio-lingual drill is reached only when fluent responses are received from all pupils, it may well be that
no more than one structure can be satisfactorily drilled in a given class period. This need not be alarming, however, since pupils are supposed to have mastered the high-frequency structure and vocabulary in the first years, so that there is less urgency in the advanced courses about the number of structures to be drilled in a given class hour.

It would be unrealistic, however, to assume that all students in an advanced class have mastered the fundamental language structures presented in earlier courses. This is due in part to a lack of uniformity among districts, schools, and even individual teachers in the way in which given levels of the language sequence are taught, and in part to the different learning abilities and retention potentials of each student. Therefore, the teacher must not be surprised if students stumble over an advanced structure drill because of incomplete mastery of the fundamental drills on the same structure presented one or two semesters before. It often happens that a student has considerable difficulty with a lesson on the uses of the imperfect subjunctive because he did not completely master the lesson on the forms of the imperfect subjunctive in previous semesters. For this reason, many teachers index their copies of the first level materials by structural focus and then bring these first-level books to their third- and fourth-level classes. When a student, such as the one referred to above in the subjunctive problem, stumbles in his performance of a drill because of faulty recall of the earlier lesson, the teacher may send him to the laboratory for additional practice by assigning him the taped drill from the earlier lesson. If several student fail in the same drill for a similar reason, the earlier drill can be done on the spot before continuing.

Second, should audio-lingual drill at the advanced level be a classroom exercise only? No. As we have come to appreciate the value of audio-lingual drill beyond the first level class, we have discovered that the language laboratory, too, has a significant place in advanced audio-lingual drill. Just as we use the laboratory for reinforcement in the fundamental classes, so should laboratory practice be required in advanced classes to reinforce and overlearn advanced patterns. Each pupil, of course, will have different time requirements for mastery of a given structure, so no average laboratory time figure will be equally applicable for all. Generally, at the advanced level, 30 minutes of laboratory drill for each 15 minutes of audio-lingual practice in class will serve to reinforce the structures. Of course, where it is not possible to insist on daily sessions of 30 minutes each in the language laboratory, such drill time as is possible will have to suffice. Ideally, the library-style laboratory is the most advantageous for these purposes. In no case, however, should students be required to practice at home without an authentic Spanish model. Here, the tape-loan program mentioned in Chapter 6 may help ease the load on the laboratory and permit pupils to do their reinforcement exercises at home with their own tape recorder. Of course, those advanced texts which have their structure drills on take-home tapes and records provide an opportunity for such practice.

Third, how do we select advanced audio-lingual material? Some materials, such as A-LM, Entender y hablar, Spanish for Secondary Schools, and others, now provide sequential audio-lingual instructional materials sufficient to cover the entire secondary-school language sequence. The teacher's manuals which accompany these texts describe in some detail how the advanced units are to be used. But many schools prefer texts which do not yet have follow-up units for a complete four-year sequence. Teachers in these schools are usually obliged to use a combination of readers and review grammars (in the main not audio-lingual in design) in the advanced semesters. The dangers inherent in the use of many such readers have already been commented on in Chapter 10. The reference or review grammar usually fails to carry the student much beyond the vocabulary and structure he was to have learned in the first level of audio-lingual instruction, provides little well-designed structure drill, and offers little opportunity for oral practice. If the teacher is to achieve results with the advanced class without the aid of sequential texts, then the following procedure should be followed:

The teacher must first scan the reading material for the semester. The object of this scanning is to make a list of constructions which were not studied during the first two years. These constructions, then, will form the basis of the semester's audio-lingual drill. A quick comparison of the scanning list and the topical index of the textbook used during the first two years will quickly yield a final list of constructions which will be new to the advanced student and which will, consequently, be the forms to be drilled. The exact list of constructions will depend upon which book was used in the first two years and which is being used in the advanced course. Among the most frequently encountered "new" structures are: the more detailed use of the imperfect subjunctive; future perfect for probability in past time; reflexives of unplanned occurrences; collective nouns; use of tener, haber, and estar without complements; etc.

Once the list of such constructions is formulated, the work of creating pattern drills to teach them begins. Such books as Modern Spanish, the Foreign Service Institute Course, A-LM, and others are frequently helpful in providing ready-

— 81 —
made drills. In the case of some constructions, the teacher will have to formulate his own, in accordance with the principles outlined in Chapter 5.

Each day's agenda of structural drill will depend upon which constructions have appeared in that day's reading assignment. It is generally not difficult to maintain a balance in the number of structures to be drilled from day to day, if the teacher is careful to note which of the constructions reoccur in the readings and can be drilled at a later date, as well as which constructions can be drilled together, as we shall see below.

Fourth, the grammatical generalization. The problem here is less one of locating the "explanation" in a reference grammar than of presenting the generalization in a truly descriptive, rather than prescriptive or normative, way. This can be accomplished as long as we bear in mind that the purpose of the generalization is to describe to the student what he has been doing as he has performed the drills.

Examining a sample advanced drill may give us a clue as to what is expected. The use of the past perfectives (hubo hecho and habia hecho) is a frequent problem in advanced readers, and is therefore a likely subject for advanced audio-lingual drill. If a suitable drill cannot be found already prepared in an audio-lingual textbook, one must be created. Most up-to-date reference grammars will tell us honestly that the past anterior (hubo hecho) is not distinguished from the pluperfect (habia hecho) by most contemporary speakers of Spanish. Where a distinction is made, it is generally a question of style rather than prescriptive or normative, way. This can be accomplished as long as we bear in mind that the purpose of the generalization is to describe to the student what he has been doing as he has performed the drills.

The generalization which follows such drill should emphasize the familiar parts the students have already learned. A comparison with the present perfect of both Spanish and English should be helpful. The statement that the pluperfect tells "what already had happened at a given past time" is usually all the explanation pupils will require.

Audio-lingual drill is not limited to these uses alone, however. If a play is being read, many teachers have the roles acted out, once the content and structure of the acts are understood and drilled. Then, using a form similar to the sample echo evaluation in Chapter 8, the pupils are evaluated on their oral production. Classroom drill on their errors then follows, along the lines we suggested in Chapter 4. Because many of the best Spanish plays are recorded, many teachers select a play on the basis of the availability of a good recording of it. Students are then assigned to prepare the lessons on the play in the language laboratory while listening to the recording.

Reading aloud from texts other than plays is also useful, although less representative of the spoken language. In this way, the same readings are used for cultural, structural, and phonological purposes, resulting in a far more economical and profitable use of class time. If a school has funds to acquire, or personnel to create, tapes of the readings used in class, pupils may then be required to reinforce their classroom exercises in pronunciation by using the tapes as models in the language laboratory. Where a laboratory has adequate dubbing facilities and personnel, the master tape of the reading selection can be re-dubbed, broken into phrases for repetition by the pupils. Otherwise, pupils may be taught to manipulate the pause control on their laboratory equipment and given a marked manuscript of the work to indicate where they should stop the tape in order to repeat the phrase they have just heard.

Some teachers prefer to test pupils in the language laboratory for their understanding of what they have read. To do this, three or four passages (generally of 100 words each) are selected and approximately 10 multiple-choice questions on each passage are devised. Pupils have before them only an answer sheet with letters or numbers corresponding to the various choices. They see neither the text of the passage nor the questions and answer choices. Through their earphones in the laboratory (or from a high-fidelity tape recorder in the classroom, if a laboratory is not available), the pupils hear the passage read twice, at normal speed. The questions are then read twice, each time followed by the answer choices. Through this approach to testing for comprehension, many teachers feel that the pupil has not only profited from the reading
material itself, but also has gained more auditory proficiency. Of course, there are many variations on this activity. Some teachers prefer to allow students to choose from written questions and answers after they have heard the passage. Others present the passage and questions orally, but permit pupils to choose from among written answers. There are disadvantages, however, in these variations and there is some question as to their validity as testing procedures. Asking the student to master the content of a passage presented orally, but to respond to the written language for his test questions on the passage is an unsound and confusing mixture of skills. Oral comprehension is best tested by having the students respond, either orally or in writing, to an oral stimulus. We are, of course, in no way limited to the multiple-choice answer here. Almost any of the comprehension tests mentioned in Chapters 7 and 8 are adaptable for this activity and good results have been obtained in experiments with them.

Now that we have an idea of what kinds of advanced audio-lingual experiences are possible, we can begin to formulate a broad outline for the six- and four-year sequences.

First, the six-year sequence. The audio-lingual phase (observing the approximate time distribution discussed at the beginning of this chapter) in grades 7 and 8 consists of the memorization of pattern dialogues; oral drill on pronunciation and structure; and an admixture of simple poems, songs, and recitations to stimulate interest and participation. The reading phase consists of learning to read the dialogue which have been memorized and of recombination narratives based on the vocabulary and structure already learned audio-lingually from the dialogues. In the final semester of the eighth grade, depending upon the general progress of the class, reading material not previously presented in class may be used, in small quantities. During both these years, all writing activity is guided. It begins by having pupils learn to write, both from memory and from dictation, the material they have already drilled audio-lingually in class. During the final semester of the eighth grade, however, simple transformations of audio-lingual material may be given. Pupils may be asked, during this final semester, to write out brief answers to dialogue questions which have already been drilled audio-lingually and read. The New York State manual suggests that vocabulary building exercises may be included, in small doses, within this writing phase, through labeling familiar objects and making picture dictionaries. Again, the inherent danger of wasting too much class time on such activities militates against making more than very occasional use of them. At this stage, the cultural content must be developed almost exclusively through the dialogues. Some of the most elementary cultural activities suggested in Chapter 10 may be employed only if the class has demonstrated its proficiency in the other skills and, of course, must be limited to a small percentage of the total course time.

In grades 9 and 10, audio-lingual experiences remain the prime objective. All structures are presented and drilled audio-lingually. Vocabulary and idioms are also presented and drilled orally. Because a general increase in reading activity begins in this phase, a gradual coordination of reading experiences and audio-lingual practice is begun, as suggested earlier in this chapter. In the 10th grade, oral reporting on topics from the readings, followed by pronunciation drill, is a valuable activity. During this period, extensive reading is introduced and then expanded. It has been found that, as mentioned in Chapters 7 and 10, the reading experience is much more profitable when a wide variety of printed forms (literary works, geography and history books, and newspapers and periodicals) is used as the basis for the selection of reading materials. The writing phase continues to represent what pupils can already say and read. As the audio-lingual and reading activities increase, so does the scope of the writing phase. Dictations, recombinations of already learned patterns, answers to questions, writing of all drill patterns, and, if progress is satisfactory, some letter writing on familiar topics are used. (cf. Chapter 7).

In grades 11 and 12, the audio-lingual phase is integrated with all course activities along the lines discussed earlier. The reading phase is essentially extensive and produces best results when reading selections are chosen from a wide variety of printed sources. Toward the end of the 12th grade, however, intensive reading of literary works in different forms is suggested. The authors selected should provide the student with material for a minimum understanding of an epoch in Hispanic literary development. Attention may be paid to style, historical context, etc. Audio-lingual activity should accompany the reading program throughout. The writing phase is expanded to include both controlled and free composition (cf. Chapter 7). Toward the end of the 12th grade, summarizing an paraphrasing of lectures, tapes, and books should be encouraged and note-taking in Spanish, practiced.

Because many school districts have evolved excellent programs of instruction in Spanish in the elementary schools, some special thought must be given to the sequences in the secondary schools of these districts. While it is not our intent to discuss the FLES programs, the number of stu-[Spanish for Secondary Schools, Albany, New York: New York State Department of Education, 1961.]

—83—
Students entering the secondary schools with previous exposure to Spanish will steadily grow with the increased nationwide emphasis on FLES. This will necessitate a modification of the proposed six- or four-year sequence discussed here, since what is proposed for 8th grade may be accomplished in the 7th, and so on. The obvious result is the opportunity to affect a truly advanced course in civilization and culture in the 12th grade in which a wide variety of materials, historical, literary, and artistic may be used for reading and discussion, and supplemented with a generous amount of films, reports, etc. Those schools which are located in the area of a college or university, and are fortunate enough to have a television hook-up with the college, may well be able to allow the students to observe the lectures of the college class in civilization and culture, via T.V., for three days of the week, keeping the remaining two days for discussion and other activities in the high school classroom. In some cases the high school seniors may be allowed to attend the classes at the college during this year and while they are receiving credit for the course as part of their high school career, they are also profiting by the fact that this credit may be used for an Advanced Placement program when they enter college.

It cannot be overemphasized that in those districts having a good program of foreign language instruction in the elementary and junior high schools, it is very necessary and profitable for the secondary teachers to hold periodic meetings with the teachers in the lower schools for purposes of articulation in order to assure the smooth transition of the students progressing through the various stages of the sequence, to guard against waste of effort on part of the teachers at various levels in the program, and to assure the student the maximum of achievement in the given number of years in the sequence.

The same general lines of development are observed in the four-year sequence: grade 9 corresponds roughly to the activities of grades 7 and 8 in the six-year sequence; grade 10 corresponds roughly to grades 9 and 10 in the six-year sequence; grades 11 and 12 correspond generally to their counterparts in the six-year sequence. This implies that the intensity and single-mindedness of objectives in the first two years of the four-year sequence must be greater than in the longer program. This is partly mitigated by the greater maturity of the ninth-grade student who may be more ready to accept an intensive program than is his seventh-grade counterpart.

A recent development in some progressive district has produced programs, tailored to the abilities and motivations of the students, eliminating the current system of semester courses, with a passing grade in first semester guaranteeing promotion to the second semester, etc. In its place, the courses are offered by level. Regardless of the grade received in Level I, admission to Level II depends on a certain minimum score of a diagnostic examination (preferably the MLA tests or some such instrument of measurement which has national norms and/or norms established in the local situation). This means, of course, that the more gifted student could be allowed to progress to Level II within the same semester or year, while the slow learner may be required to take one extra semester to finish the prescribed work before passing the test required for promotion.

Eventually, and ideally, one could even have a two-semester course for slow learners doing one semester's regular work, and a one-semester course for fast learners doing two-semesters' work. The following chart suggests a pattern which might be followed in programs which allow some flexibility of this type.

| Level IV | Summary: 8 semesters with 2 units of credit | Summary:
Such a program must, of course, have the provision that any student may move in either direction, to join another group at the level for which he is prepared after successfully completing the required test. A slower learner may be so motivated as to join the average group, or the average student may move up the pace of the fast learner and thereby be able to work toward the advanced placement course.

The division into grades which we have observed in our discussion corresponds to the standard semester divisions in most school systems. It would be most satisfactory, of course, to permit pupils to progress to the succeeding phase just as soon as they demonstrate genuine proficiency. Some schools have used the MLA proficiency test in Spanish skills to determine whether or not pupils are ready to be advanced by skipping a semester. This can be only partly satisfactory, however, since the end of the semester in a given school system may not totally coincide with the acquisition of proficiency in a given skill sufficient to warrant omission of the following semester.

TOPICS FOR DISCUSSION
1. The chart presented in this chapter suggesting percentages of time to be devoted to various skills shows a marked decrease from 80 percent to 17 percent, between the first and sixth years, in the emphasis on hearing and speaking. Discuss this apparent "abandonment" of the teaching or oral skills as the sequence progresses.
2. What is the comparative value of using, in the advanced courses, drills from the lower level courses as opposed to new drills on materials learned in previous semesters?
3. The opponents of the audio-lingual approach are strong in their feeling that the audio-lingual procedures cannot be maintained beyond the first, or possibly the second, year. How can you refute this?
4. Would it be possible and plausible to introduce free composition, prepared speeches, etc. earlier than the last year of a four-year sequence? Why?
5. What is the place of readings, reports, films, etc. in English in a course devoted to Hispanic civilization and culture in the final year of a six-year sequence?
6. Discuss the possibility of initiating and administering a program for slow learners and fast learners at your school, as suggested in this chapter.
7. A twelfth-grade Spanish class is assigned a novel and a play as required textbooks. In addition, one hour each week is devoted to current-event reports in Spanish. Songs are occasionally learned and time is taken for the celebration of the Spanish holidays. The homework assignments consists of "understanding 10 pages of the texts." In class, the teacher double checks the assignment by asking the pupils questions about the content and to translate passages. Comment on the positive and negative aspects of this approach, mention the probable results of this approach on the various phases of pupils' proficiency in linguistic skills and cultural awareness, and suggest modifications for the expansion of the course to cover all the necessary skills.

ADDITIONAL READINGS
Many times throughout preceding chapters, it has been repeated that language learning activities which present forms for "memorization" out of context are contrary to the principles of language pedagogy as we have been discussing them. Admittedly, there is a point beyond which lack of time makes it impractical to present new vocabulary items in pattern dialogue and to drill them, one by one, in contextual structure drills until they become habitual, regardless of the obvious advantages. For this reason, we must look briefly at techniques for vocabulary building by inferring meanings.

Our concern throughout, except for our remarks concerning reading and culture, has been oriented toward the development of the pupil's active linguistic abilities, i.e., his ability to reproduce and recombine linguistic patterns according to the structure of the language. We have discussed teaching him to express himself intelligibly, albeit simply, in spoken and written form. In this chapter, we shall turn our attention to what is an essentially passive linguistic experience: grasping meaning, even when some element is unknown. We have discussed extensive reading, of course, in which the pupil is expected to come across words and structures he does not know and which he must "look up" and "learn." Here, we shall consider building the pupil's intuition about the target language that will serve him when it is not convenient to look up items.

Some methodologists suggest that this is a "self-solving" problem in that, as their cultural interests grow, pupils will repeat the fundamental vocabulary relating to their interests so often that they will add these words to their automatic active vocabularies without further drill. Any other terms must be looked up in the dictionary. After all, they maintain, no one ever fully outgrows his need for the dictionary. Others disagree. The latter do not deny that everyone who is not a native speaker will have to refer to the dictionary, and perhaps frequently. They do maintain, however, that pupils can be shown a systematic way in which to increase their passive (recognition) vocabulary and, at the same time, to increase their linguistic intuition—a prime factor in fluency.

Classroom teachers have not ignored the problem. Since most pupils who complete the four- or six-year sequences do so in order to gain college admission, some way must be found to expand vocabulary, if they are to succeed in their courses in culture and civilization, literature, and advanced language structure. Thus, most teachers recognize the need for some kind of vocabulary-building activity, especially in the final year of high school, but are handicapped by a lack of prepared materials. Yet this is such an important activity that we cannot afford to overlook it or leave it to the pupil to do on his own.

We can begin most easily by recognizing that vocabulary building can be systematized into a series of carefully constructed drills, not unlike those we have discussed, in order to achieve specific results. The goal of this sort of classroom drill is to teach the pupil what is involved in applying all he knows about the Spanish language and his own life experiences to guessing the meaning of words by inferring from context. But is this not something the pupil has been doing, perhaps unconsciously, since he began his language studies? Of course it is, but on a hit-or-miss basis.

We can say, of course, that the memorization of each pattern dialogue from the very first lesson on was an exercise in vocabulary building. The introduction of a systematic effort to increase...
vocabulary, however, belongs to the reading phase
discussed in Chapter 7. Two of the most popular
vocabulary-building techniques based on readings
have been used by most teachers from the begin-
ned semester on. First, we have long taught
students to associate words with specific objects.
The idea, here, is to fix the "vision" of the object
firmly in the pupil's mind in such a way that the
thought of it calls up its Spanish name, without
reference to English. The obvious limitations of
this technique—above all, its comparative uselessness
in teaching forms other than substantives—
usually prevent its continued use as an intensive
drill device in the advanced years. Second, we
have also made use of cognates by calling our
pupils' attention to the many exact and near
cognates in English and Spanish. This activity
is generally a valuable one, but caution must be
exercised to warn pupils about what the French
call *faux amis*, that is, apparent cognates which
differ in meaning from language to language, such as
English *sensible*, meaning having, using, or
showing good sense, as opposed to Spanish sensi-
ble, with the idea of sensitive.2

But to stop here, as many teachers have felt
they must for lack of materials, is wrong. First,
there are many limits to these cognate and cognate-type exercises. Most easily recognizable
cognates are not words for which the student is
apt to have much use—they tend to be infrequent
and technical or scientific. Furthermore, pupils
tend to think of cognates as "Hispanified" English
words, and revert to thinking in English phonolo-
gical and structural terms when they try to
learn these new items. Thus, while starting off
with cognates frequently instills an air of confi-
cidence in the pupil (for he apparently recognizes
a thousand or so Spanish forms, immediately,
through his knowledge of English), his increased
fluency and ease of comprehension will still de-
pend rather upon his ability to deal with Spanish
on its own terms, inferring the meaning of the
Spanish form from the context of the Spanish phrase itself, without regard for possible similarities
to English. We have all heard our students
pronounce *nacional* as /naˈsoŋal/, *tradición* as
/tradɪˈkʃən/, or *animal* as /əˈnɪməl/.

As pupils advance we carry our exercises one
step further by illustrating the great number of
Spanish and English forms which differ from one

1) Del verbo casar viene el sustantivo *casi-
miento*.
   (pensar, llamar, mandar, acompañar, le-
vantar, mejorar).
2) Del verbo *imaginar* viene el sustantivo
   imaginación.

Another by suffix or prefix. This process is known
as *derivation* and most modern textbooks make
some attempt at providing systematic exercises in
derivation, although none really carries the study as far as might be desired.

Derivation is the name given to the gram-
matical process of composing new forms with
new meanings by the addition of prefixes or suf-
fixes to already existing "root" forms, such as in
atomic from *atom*, *hardness* from *hard*. We can
rapidly increase both the active and passive voca-
bularies by teaching the pupil to recognize the
meanings of the various derivational suffixes and
prefixes. Here, of course, we must assume that
the pupil already controls the "root" forms.

But many teachers feel that this emphasis on
known roots or stems restricts their early deriv-
ations lessons only to known vocabulary, and then
drop the matter and never take it up again when
the pupil's vocabulary has expanded. This is
really uneconomical, since the more expensive
the pupil's vocabulary, the greater the number of
root forms he will recognize.

Most audio-lingual texts include exercises on
derivation. Below are examples taken from *Mod-
ern Spanish* (Second Edition, pp. 375ff). Naturally,
the unit in the text contains more extensive drills
and an appropriate structure generalization at the
end of the lesson which is not included in the
following excerpt:

<table>
<thead>
<tr>
<th>Verb</th>
<th>Noun</th>
</tr>
</thead>
<tbody>
<tr>
<td>cooperar</td>
<td>cooperación</td>
</tr>
<tr>
<td>organizar</td>
<td>organización</td>
</tr>
<tr>
<td>mejorar</td>
<td>mejoramiento</td>
</tr>
<tr>
<td>sentir</td>
<td>sentimiento</td>
</tr>
<tr>
<td>ganar</td>
<td>ganancia</td>
</tr>
<tr>
<td>importar</td>
<td>importancia</td>
</tr>
</tbody>
</table>

The suffix -al is used to
derive adjectives from
nouns.

<table>
<thead>
<tr>
<th>Adjective</th>
<th>Noun</th>
</tr>
</thead>
<tbody>
<tr>
<td>enfermo</td>
<td>enfermedad</td>
</tr>
<tr>
<td>seguro</td>
<td>seguridad</td>
</tr>
</tbody>
</table>

The suffix -dad is used to
derive nouns from adjectives.

The following are selected drills on the derivations
presented above, in which the students are in-
structed to substitute the items listed for the word
emphasized:

1) Del verbo *imaginar* viene el sustantivo
   imaginación.
   (pensar, llamar, mandar, acompañar, le-
vantar, mejorar).
2) Del verbo *casar* viene el sustantivo
   *casi-miento*.
We know that, in most cases, word meanings are guessed correctly because the phrase in which they are framed serves to define them in some way. Returning to the example, "Give me a fryx to sweep the room with," the reader infers that a fryx must be something used to sweep with, hence a broom or something similar to a broom. Along these same lines, some of the unknown forms are so closely associated with the surrounding context that their meaning could easily be inferred even if they were omitted entirely, e.g., "We heard the rain ___ on the roof." In this phrase, the reader will almost unerringly choose the term "patter" or a close synonym, since the fundamental meaning is almost predetermined by the surrounding context. Thus, if the same phrase appeared as, "We heard the rain kadder on the roof," we should expect a similar degree of intuitive correctness in the guessed meaning.

The next step involves phrases containing forms which can be derived from deduction from relationships implied within the phrase. In these cases, the pupils infer the meanings by associating the phrases with their own life-experience with "how things act." In a phrase of the type, "He kroded the fire with a bucket of sand," the pupil can generally rightly infer that kroded must mean something like "put out" or "doused," since he knows from his own experiences that a bucket of sand thrown on a fire extinguishes it.

The pupils rapidly become aware that their guesses can be only approximate. Some of the more advanced pupils feel "cheated" because they have not looked up a "precise dictionary definition." They must be reminded that the inference of the general idea of what is being said is frequently more helpful than a precise definition, and, of course, that the whole idea of the exercise is to learn to understand what is being said or read "on the spot." Of course, the simple inference of general meaning is admitted insufficient when dealing with scientific literature or conversation which must be understood exactly. For purposes of general conversation, however, it is sometimes of no help at all to know the exact meaning of a word. In the phrase, "I zorred the furniture with a cloth," we cannot be sure if the meaning of zorred is cleaned, wiped, dusted, polished, or something synonymous; but it is relatively certain that, if the student infers the idea of "cleaning," further refinements will add significantly to his understanding only if it is important to distinguish among various types of cleaning, e.g., if one were giving specific instructions to a maid. In the phrase, "The wheat was no good this year, for it ackerspired and sprouted in the ear," Seibert and Crocker call attention to the Welsh term ackerspire.

Despite the high percentage of correct guessing, most pupils do not know by what process they inferred the correct meanings. The purpose of the exercise is to introduce them to some of the more frequent clues to meaning and how to spot them.

(exagerar, terminar, instalar, organizar, cooperar, participar, formar, invitar, felicitar, importar, presentar, eliminar, celebrar, investigar, significar).

3) Del adjetivo relativo viene el sustantivo relatividad.
   sinceramente, oportunamente, tranquilamente, nerviosamente, rápidamente, seguro.

4) Del verbo ganar viene el sustantivo ganancia.
   (importancia, creencia, sugerencia, existencia, insistencia, preferencia).

5) Lo que es de la profesión se llama profesional.
   (nación, educación, materia, policía, presidencia, fruta, idea, medicina, secretaría, persona, semana).

6) Lo contrario de orden es desorden.
   (acuerdo, honor, nivel, unión, ventaja, apego, empleo).

7) Lo contrario de dependiente es independiente.
   (directo, exacto, necesario, perfecto, personal, posible, puntual, tranquilo).

Yet neither of these two activities of cognates and derivation begins to encompass the total scope of inferring meaning from contextual situation. For this reason, it is necessary to devise ways in which to duplicate as closely as possible in the target language the means by which the native speaker expands his own understanding. The best way in which to start the pupil on this is to show him how accurately and instinctively he does it in English. This can be done by selecting a stretch of English prose with a considerable number of technical or dialectal terms, or by inventing a stretch of standard prose and adding words of your own invention at frequent intervals. Examples of such invented phrases are, "Give me a fryx to sweep the room" or "Give me a broom to plyod the room." The pupils are then asked to guess the meaning of the underlined words. If they cannot find an exact equivalent, then they may give a brief definition or description of the term. They must be cautioned, however, to replace given grammatical forms with forms of the same class, i.e., a verbal expression for a verbal expression, an adjective for an adjective, etc. Most pupils will do surprisingly well from the very first. Of course, there will be terms which will be impossible to guess because of inconclusive contextual clues, but this should not be cause for discouragement.

We know that, in most cases, word meanings are guessed correctly because the phrase in which they are framed serves to define them in some way. Returning to the example, "Give me a fryx to sweep the room with," the reader infers that a fryx must be something used to sweep with, hence a broom or something similar to a broom. Along these same lines, some of the unknown forms are so closely associated with the surrounding context that their meaning could easily be inferred even if they were omitted entirely, e.g., "We heard the rain ___ on the roof." In this phrase, the reader will almost unerringly choose the term "patter" or a close synonym, since the fundamental meaning is almost predetermined by the surrounding context. Thus, if the same phrase appeared as, "We heard the rain kadder on the roof," we should expect a similar degree of intuitive correctness in the guessed meaning.

The next step involves phrases containing forms which can be derived from deduction from relationships implied within the phrase. In these cases, the pupils infer the meanings by associating the phrases with their own life-experience with "how things act." In a phrase of the type, "He kroded the fire with a bucket of sand," the pupil can generally rightly infer that kroded must mean something like "put out" or "doused," since he knows from his own experiences that a bucket of sand thrown on a fire extinguishes it.

The pupils rapidly become aware that their guesses can be only approximate. Some of the more advanced pupils feel "cheated" because they have not looked up a "precise dictionary definition." They must be reminded that the inference of the general idea of what is being said is frequently more helpful than a precise definition, and, of course, that the whole idea of the exercise is to learn to understand what is being said or read "on the spot." Of course, the simple inference of general meaning is admitted insufficient when dealing with scientific literature or conversation which must be understood exactly. For purposes of general conversation, however, it is sometimes of no help at all to know the exact meaning of a word. In the phrase, "I zorred the furniture with a cloth," we cannot be sure if the meaning of zorred is cleaned, wiped, dusted, polished, or something synonymous; but it is relatively certain that, if the student infers the idea of "cleaning," further refinements will add significantly to his understanding only if it is important to distinguish among various types of cleaning, e.g., if one were giving specific instructions to a maid. In the phrase, "The wheat was no good this year, for it ackerspired and sprouted in the ear," Seibert and Crocker call attention to the Welsh term ackerspire.

For purposes of general conversation, however, it is sometimes of no help at all to know the exact meaning of a word. In the phrase, "I zorred the furniture with a cloth," we cannot be sure if the meaning of zorred is cleaned, wiped, dusted, polished, or something synonymous; but it is relatively certain that, if the student infers the idea of "cleaning," further refinements will add significantly to his understanding only if it is important to distinguish among various types of cleaning, e.g., if one were giving specific instructions to a maid. In the phrase, "The wheat was no good this year, for it ackerspired and sprouted in the ear," Seibert and Crocker call attention to the Welsh term ackerspire.
From the sentence we gather that when the wheat "ackerspires" it is no good, and that this condition is caused by too much rain; but unless we know . . . what effect an excess of rain has on wheat we will not know exactly the meaning of . . . "ackerspire," even should we find its technical translation in a dictionary.  

The student must content himself, even with the help of a dictionary, with knowing that when wheat "ackerspires," it is spoiled in some way. Thus, these exercises provide the student with techniques and tools useful to him even when he does have access to reference books.

Not infrequently, the juxtaposition of synonyms or antonyms in a written phrase gives a clue as to the meaning of a form. In a phrase of the type, "He stood there brasted, at a loss for words one might say"; the pupil may assume that brasted and "at a loss for words" describe approximately the same attitude. In phrases of the type, "Though the leaves were still green then, soon they would snig," snig is assumed to represent a condition opposed in some way to green. The student would probably guess without difficulty, that snig was an antonym of green in this sense and suggests brown, withered, fallen, or dead, etc.

The final step in the initial presentation of inference in English is to give the pupil longer contexts, in which he is required to check and compare his early guesses with repetitions of the same forms in later context. In this way, he learns to follow discussions, to make intelligent guesses as he goes along, and then to amend automatically what he has guessed, as more context is known.

Now the pupil is ready to proceed to target language texts. He now has a general idea of what his inferential process is in English and is ready to apply it to Spanish problems. The initial English presentation may have taken one or two class hours. The expansion into Spanish will require much more time, perhaps one or two class hours for each of the subdivisions of the initial English lesson we mentioned above. On the time distribution diagram for the advanced class, presented in Chapter 11, inference of meaning activities belong to the extensive reading portion of the block of time recommended for reading. Thus, if inference exercises are to be done regularly during an entire academic year, then one class hour in ten is a comfortable minimum. If they are to be limited to the final semester, they should occupy one class hour in five. A reader designed for fourth-year use (or a second-year college reader) should be used as a corpus for the exercises. This assumes a basic vocabulary of approximately 3,000 words. Investigators for French have shown that a basic vocabulary of only 2,000 words appears to be sufficient for successful exercises in inferring meaning. The teacher then can extract sections of three to four pages, underlining terms which he considers to be apt targets. The pupils, who should not be forewarned or allowed to prepare themselves in any way, are then required to give an equivalent or descriptive definition of each of the terms. Following this, in class discussion, a justification for each choice should be given, in order to point up the process of inference that has taken place. It is unwise to select contexts from literary materials and the like, since students slow themselves down by trying to remember clues from foregoing chapters, the plot, characterization, and the like.

In cases where no guess approximates the meaning of a form, the teacher should supply the correct definition. There should be no translation into English. The exercise is meant to develop the pupil's ability to infer in the target language. Where English is introduced in this activity, it tends to produce an effect counter to the purpose. Some teachers have attempted to use editions of daily newspapers in Spanish for these exercises, but have found that contexts in journalistic style are unusually difficult, except for the most promising students.

TOPICS FOR DISCUSSION

1. Why must the powers of inference be developed in our pupils, even when they have access to dictionaries and reference grammars?

2. How does the inference of meaning, as we have suggested here, parallel features of "natural" language learning, i.e., the way in which one learns one's native language?

3. Why do we suggest that an introduction to the inference of structural meaning (meaning conveyed by the position, inflection, and relationships of words) should precede stylistic meaning (meaning conveyed by the "sense" of the utterance)?

4. How important is the precise dictionary definition of passive vocabulary items in the learning of a second language?

5. Discuss the negative values implicit in the students' use of bilingual dictionaries.

6. Select an appropriate reading passage and develop a lesson of the type described in the penultimate paragraph of this chapter.
