DESCRIPTORS *EXCEPTIONAL CHILD RESEARCH; *TESTS; *COMMUNICATION (THOUGHT TRANSFER); *AURALIY HANDICAPPED; DEAF, MANUAL COMMUNICATION, LANGUAGE TESTS, TEST CONSTRUCTION, LIPREADING, ADOLESCENTS, AUDITORY EVALUATION, CHILDREN, COMMUNICATION SKILLS, DEAF CHILDREN, EVALUATION TECHNIQUES, FINGER SPELLING, LISTENING SKILLS, RATING SCALES, SIGN LANGUAGE, ILLINOIS COMMUNICATION SCALE.

THE ILLINOIS COMMUNICATION SCALE WAS DEVELOPED ON 16 MM COLOR FILM TO ASSESS THE RECEPTIVE COMMUNICATION ABILITIES OF DEAF CHILDREN BETWEEN 6 AND 14 YEARS. FORMS WERE CONSTRUCTED TO MEASURE (1) AUDITORY RECEPTION, (2) LIPREADING AND LISTENING, (3) LIPREADING ONLY, (4) FINGERSPELLING, AND (5) LANGUAGE OF SIGNS. EACH FORM HAD 5 SUBPARTS (1) VOCABULARY, (2) SIMPLE SENTENCES, (3) STORIES, (4) NARRATIONS, AND (5) RANDOM SENTENCES AND PHRASES. THE SCALE (WITH THE EXCEPTION OF THE FIRST FORM WHICH COULD NOT BE ADMINISTERED AS A GROUP TEST) WAS GIVEN TO 417 SUBJECTS. RELATIONSHIPS BETWEEN TEST RESULTS AND AGE, NUMBER OF YEARS IN SCHOOL, IQ, ACHIEVEMENT TEST SCORES, PARAGRAPH MEANING SCORES, DEAFNESS OF RELATIVES, STATUS OF HEARING LOSS, AND SCHOOL ENTRANCE AGE WERE INVESTIGATED. TEST RESULTS WERE COMPARED WITH TEACHER RATINGS AS A CRITERION MEASURE. TWO VARIMAX ROTATED FACTOR MATRICES WERE OBTAINED FROM EACH OF THE TWO SCHOOLS IN THE STUDY. ONE USED THE SUBTESTS AS FACTORS. THE OTHER USED THE TOTAL SCALE FOR THE ENTIRE FORM AS A FACTOR. RESULTS INDICATED THAT THE TWO LIPREADING FORMS WERE VALID USING THE CRITERION OF TEACHERS' RATINGS. HOWEVER, THE "LIPREADING ONLY" FORM WAS NOT FOUND TO BE SIGNIFICANTLY DIFFERENT FROM THE "LIPREADING AND LISTENING" FORM. THE AUTHOR RECOMMENDED ELIMINATING THE FORMER. PERFORMANCE ON THE FINGERSPELLING AND LANGUAGE OF SIGNS FORMS WAS MORE CLOSELY RELATED TO AGE, YEARS IN SCHOOL, AND ACHIEVEMENT TEST SCORES THAN TO TEACHER RATINGS. IT WAS SUGGESTED THAT BETTER CRITERIA FOR RATING ABILITY IN FINGERSPELLING AND THE LANGUAGE OF SIGNS BE FOUND SINCE TEACHER RATINGS OF THESE ITEMS WERE MORE HIGHLY CORRELATED WITH AGE, YEARS IN SCHOOL, AND DEAFNESS OF RELATIVES THAN WITH PERFORMANCE ON THESE ITEMS. ANALYSIS OF DATA INDICATED THAT SUBPARTS ONE, TWO, AND FIVE WERE EVALUATING THE SAME FACTOR AND PARTS THREE AND FOUR ANOTHER. IT WAS RECOMMENDED THAT PARTS ONE, TWO, AND FIVE BE COMBINED AND THAT EITHER PART THREE OR PART FOUR BE ELIMINATED. NO RELIABILITY INFORMATION IS AVAILABLE AS YET. FIGURES, TABLES, AND TEST ITEMS ARE INCLUDED IN THE APPENDICES. THERE ARE 6 REFERENCES. (HK)

ACKNOWLEDGEMENTS

The project director wishes to express his grateful acknowledgment and appreciation for the administrative support received on this project from Cyril H. Winking, Director, Department of Children and Family Services, State of Illinois, and Dr. Kenneth R. Mangan, Superintendent, Illinois School for the Deaf; as well as to the following individuals who made such a significant contribution and without whose help this project would not have been possible:

ANDERSON, ROBERT; Teacher, Illinois School for the Deaf, Jacksonville, Illinois

BUCK, CAROLINE M.; Audiologist, Illinois School for the Deaf, Jacksonville, Illinois

ELLIOTT, Ph.D., LOIS L.; Research Associate, Central Institute for the Deaf, St. Louis, Missouri

HUBER, THEODORE; Audiologist, Illinois School for the Deaf, Jacksonville, Illinois

STANGARONE, JAMES; Audiologist, Illinois School for the Deaf, Jacksonville, Illinois

QUIGLEY, Ph.D., STEPHEN P.; Institute for Research on Exceptional Children, University of Illinois, Urbana, Illinois
INTRODUCTION

The Problem

The educator and the clinician both need a tool for assessing the deaf child's ability to receive communication. An assessment of these abilities would enable them to more effectively place him in the appropriate educational unit and to provide the proper diagnostic care. The research worker needs a tool for assessing progress in various methods of instruction. It is critical for him to be able to evaluate the child's ability to communicate.

The deaf child may use speech and lipreading, fingerspelling, or the language of signs to communicate his ideas. In addition to these more formal modes, he may also use pantomime, gestures, or other manipulative means of communication and, in some instances, he may resort to writing and reading. He may use a combination of any or all of these modes. He may be equally proficient in all, or he may be significantly superior in one.

Such an assessment then of these communicating abilities would be a complex undertaking since the mode of communication must be considered in relation to the language development of the child. This complexity exists because most deaf children use multiple modes of communication.

Objectives

The objective of the proposed Illinois Communication Scale is to measure the child's receptive communication skills in each of the formal methods of communication. The specific objectives of this study were to...

1. Develop a receptive communication scale for the use of deaf children. The scale should assess the child's ability to lipread and listen; his ability to lipread without sound; his ability to receive fingerspelling, and his ability to receive the language of signs.

2. Validate this scale against the teacher's estimate of the pupil's receptive communication skills.

3. Investigate the relationship between receptive communication abilities and factors such as age, number of years in school, I.Q., achievement test scores, paragraph meaning scores, deafness of relatives, status of hearing loss, and the age started to school.
Related Research

The concept of a film test of receptive communication abilities is not a new one. Investigators such as Jean Utley(6) have previously used films for test purposes. The Utley test of 1949 is perhaps the best known of these tests. It was constructed primarily for use with adults; however, it has been used at times with children. The Utley test is composed of three sections...

1. Thirty-six words from Thorndike Teacher's Word List.
2. Thirty-one sentences composed of idiomatic phrases and common expressions.
3. Several dramatized conversational interludes, each followed by five questions about the conversational content.

The Utley test has been analyzed by numerous investigators. Postore's analysis(3) of several tests of lipreading proficiency (Morkovin and Moore, Rosenbaum, Keister, and the Deshon General Hospital) pointed out that, in formulating a test, the following criteria should be used:

(a) Conditions should be kept as nearly normal and constant as possible. (The use of colored movie film best fits this qualification.)

(b) At least two speakers should be used...one male and one female.

(c) A minimum of two equivalent forms of the same test should be made available.

(d) A wide range of difficulty should be incorporated.

(e) There should be ease of discrimination and ease of scoring.

An analysis of the Utley test by DeCarlo et al.(2) has suggested that sentences were judged to be statistically better indices of the lipreading ability than either isolated words or the questions following the dramatized stories.

Previous film tests have been concerned with assessing lipreading abilities. However, Quigley and Frisina(4) used the sentence portion of the Utley test to assess the ability of students to receive
fingerspelling. They filmed "Form A" as a speechreading test, and "Form B" as a test of reading fingerspelling. They used a single speaker and a single speller in their tests. Also, they used black and white rather than colored film.

Craig(1) has recently developed a test for lipreading, using words and sentences. This test is on 16mm, color, sound film. Responses are multiple choice, and the subject is instructed to circle the correct picture on the answer sheet. Previous research has not attempted to develop equivalent forms of receptive tests for lip-reading, fingerspelling and the language of signs.
METHOD

Stimuli

A vocabulary list was collected from such sources as the Thorndike-Lorge Word List\(^5\) and the CIP Language Outline. A number of sentences were constructed from these lists. The Word List and sentences were then given to fifty teachers of the deaf to rate on a five-point scale of difficulty for their pupils. The rating ranged from "I would always expect the pupils in my class to be able to understand and/or know this sentence" to "None of the pupils in my class would understand or know this sentence."

This rated material was used as a pool for the construction of the items that appeared on the scale. Fifty words were selected for the vocabulary part (Part I) of the scale. Fifty sentences were selected for use in Part II; and, fifty random sentences and phrases were selected for Part V of the scale. All of the material selected had been rated by the teachers as very likely to be known by their children as far as language was concerned.

It was then assumed that language would be a minor factor in scores and that the mode of communication would be the major variable tested.

Parts III and IV were questions about stories presented to the pupils. There were ten questions on each form of the test. These questions were carefully selected so that they would be comparable from form to form. A comparable story was filmed for Part III of each form and ten questions were asked about each. These stories had a little girl finding a container such as a purse, suitcase, wastebasket, or box. The subsequent action, to elicit responses to multiple choices, was about the child playing with the items from the containers. Each story used the following question forms:

<table>
<thead>
<tr>
<th>How many</th>
<th>?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Where was</td>
<td>?</td>
</tr>
<tr>
<td>Where was</td>
<td>?</td>
</tr>
<tr>
<td>What happened when</td>
<td>?</td>
</tr>
<tr>
<td>What was</td>
<td>?</td>
</tr>
<tr>
<td>Who</td>
<td>?</td>
</tr>
<tr>
<td>What did</td>
<td>do?</td>
</tr>
<tr>
<td>What color was</td>
<td>?</td>
</tr>
<tr>
<td>How many</td>
<td>?</td>
</tr>
<tr>
<td>Did</td>
<td>?</td>
</tr>
</tbody>
</table>

4
Part IV of each sub-test was a story where approximately half of the information was contained in narration (refer to Appendix B), and the rest in cartoon-type illustrations. Again, ten questions were asked about the story. The same question forms were used on each form of the scale.

<table>
<thead>
<tr>
<th>Question</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>Did</td>
<td>Who</td>
</tr>
<tr>
<td>When</td>
<td>What color</td>
</tr>
<tr>
<td>Where</td>
<td>What was</td>
</tr>
<tr>
<td>What did</td>
<td>Name?</td>
</tr>
<tr>
<td>Who</td>
<td>How many?</td>
</tr>
</tbody>
</table>

A certain number of nonsense items were included in each of the forms of the test. This enabled the test to maintain a certain interest level for the children. The use of nonsense sentences helped equate the kinds of material from one form to another. An example may be found in Part II of the task...a tree in a bathtub. This did maintain a high level of interest in the children, and it did tend to assess the receptive communication ability in which we were interested, rather than the language ability of the child.

Responses

Each child had a score sheet (refer to Appendix C) on which to record his responses. Parts I and II required that the pupil circle the correct picture. This basically was a pictorial multiple-choice response with four pictures to choose from. Parts III and IV were answers to questions. Again, the response was multiple-choice, with four answers given and a blank choice if the pupil wanted to give another possible answer. Part V was a multiple-choice response where the pupil simply chose the phrase or sentence said in the stimuli.

Parts I and II could be answered by children who did not read whereas Parts III, IV, and V required that the pupil be able to read.

Test Forms

Five forms of the scale were constructed. Each form was designed to assess one mode of receptive communication:

Form A: Auditory reception only
Form B: Lipreading and listening
Form C: Lipreading without sound.
Form D: Fingerspelling
Form E: Language of signs.

Five sub-parts of each form of the receptive communication scale were established:

PART I
consisted of ten simple words. Consideration was given to the phonemic and/or visual structure of the words with respect to the lipreadibility or the ability to read them in fingerspelling, or the ability to read them in the language of signs.

Comparable words were used in each of the different forms. Attention was given to assimilating the information to go into the test to assure that there would be words and vocabulary comparable in difficulty across the modes of communication. Words that were homophonous in nature were used in the lipreading section; and, words that might have a possibility of confusion with respect to finger configurations were used in the fingerspelling section. An attempt was made to do the same thing in terms of items used in the form for the language of signs.

PART II
consisted of sentences that could be graphically presented. Simple sentence forms were used in this section of the test. A carrier phrase of "Circle the______" was used for each of the stimulus.

PART III
consisted of a story dramatized by a young girl. Each of the stories had a girl finding some type of container (purse, suitcase, wastebasket, etc.) and doing something with the items contained therein. No verbal contact was used in the presentation of this visual action experience for the child. This constituted the stimuli for the sub-part of the test. No carrier phrase was used. Ten questions were asked about the activities portrayed by the girl in each sequence.

PART IV
consisted of a narrated story supplemented by three cartoon-type pictures interspersed in the narration. It was thought by the test designer that about half of the information was carried in the narration and half in the cartoon pictures. No carrier phrase was used. Ten questions were asked about these stories.
PART V

consisted of random phrases and sentences with no visual clues as to the sentence or phrase.

Procedure

All stimuli were presented via 16mm motion picture projector. The test items were presented on the screen. A still framer stopped the projector with the test stimuli on the screen. In Part I, the test items consisted of four pictures...the child had a rough sketch of these four pictures on his score sheet (Refer to Appendix C), and was instructed to circle the one indicated by the tester. The same procedure was used for Part II of the test...again, pictures roughly matching the pictures held on the still frame on the screen were sketched on his score sheet. In these two parts of the test, the child was allowed to continue to view the test material on the screen at the same time that he equated them to the test material on the score sheet. The score sheets were purposely not presented at a high level of artistic sophistication since the pictures were before the child on the screen. The lined drawings were sufficient for the child to make his responses.

Parts III, IV, and V required that the child be able to read. All of these were given multiple-choice answers.

Form B was given to normally-hearing children to assess the memory factor in the test. It was found that third grade children (or children at approximately 9-1/2 years of age) were able to do this test with about 95% accuracy. It was, therefore, considered that the memory task involved was not one out of range of the nine year old deaf child.

Subjects

The subjects for this experiment were all of the children between the ages of six and fourteen at the Illinois School for the Deaf and the Indiana School for the Deaf. This gave us approximately two hundred students at each institution. Data such as I.Q., achievement test scores, reading test scores, etc. were also available from both of these institutions. The Missouri School for the Deaf was included; however, these children were eliminated from the final statistical treatment since the data with respect to psychologicals, hearing tests, etc. was not considered to be adequate for our particular purposes.

Rating Scales

 Ratings were obtained on each subject as a criteria for lip-reading, fingerspelling, and language of signs abilities. Three teachers, who had knowledge of each subject's abilities, were asked
to rate the subject for lipreading, fingerspelling and the use of
the language of signs (Refer to Appendix A). The rating scale was
a five-point scale. The three ratings were averaged together to
provide a lipreading rating, a fingerspelling rating, and a language
of signs rating.

School Records

The following information was obtained from the school records:

1. Age
2. Years in school
3. I.Q.
4. Achievement test scores
5. Paragraph meaning scores
6. Hearing loss: Average loss for the better
   ear at 500, 1000 and 2000 cps.
   (If no response was made at a given frequency,
   then the limits of the audiometer for that
   frequency were used to calculate the average.)
7. Shape of the audiogram: The shape of the
   audiometric curve was coded on a 6-point basis:
   (1) Rising
   (2) Flat
   (3) No response beyond 500 cps
   (4) U-shaped
   (5) Falling greater than 12 db per octave
   (6) Falling less than 12 db per octave
8. Age started to school
9. Deafness of immediate relatives (mother, father,
   and siblings.)
RESULTS

All forms of the Illinois Communication Scale, with the exception of Form A, were given to the pupils between the ages of 5.7 and 14.6 years at the Illinois School for the Deaf and the Indiana School for the Deaf. Form A was excluded for the purposes of this study since it quickly became apparent that it could not be administered as a group test. It has, however, been used as an individual test through a speech audiometer.

Table I is a rank order of correct responses for each item on the scale. A comparison of these responses indicate that items in Form E were somewhat easier for the subjects than the other forms. This is most apparent in Parts I and II. Although there appears to be a rather wide range of difficulty within each sub-test, the ranges between sub-tests appear to be comparable.

Figure 1 illustrates the responses for Part I (Vocabulary) as a function of age. Obviously, the language of signs is easier for the pupils throughout the age range studied. The two lipreading curves are comparable to one another. The fingerspelling curve is most interesting in that it basically starts lower than lipreading and continues lower until age ten where it crosses the lipreading score and accelerates very rapidly thereafter with age. It is also interesting to note that the language of signs scores are reaching a maximum at age ten.

Figure 2 which illustrates the responses for Part II (Sentences) has comparable curves to the vocabulary scores. Again, the language of signs is superior to the other modes of communication. The fingerspelling curve again crosses the lipreading curve at age ten.

Figures 3, 4, and 5 illustrate the story narration and random sentence parts of the scale. These figures illustrate the trend for the language of signs to be the superior mode of communication, with the lipreading only part being inferior. However, there is possibly no real significance between the performance in communicating with this more difficult material.

Varimax Rotated Factor Matrix

The two schools used in this study were examined separately. Two factor matrices were obtained on each school. One used only the sub-tests as factors, while the second used the total score for the entire form as a factor.

10
Table 2 is the matrix for the subtests for the Illinois School. The first factor in this matrix could be considered lipreading plus other minor factors. Factor 2 is age, achievement test score and paragraph meaning. The third factor appears to be age. The fourth factor is I.Q. and the fifth factor is hearing loss.

If we look at Table 3 which uses only the total scores as factors we find that age and years in school appear to be the first factor. The second factor is I.Q. and the third factor is lipreading.

Table 4 is the matrix for the Indiana School using the subtests as factors. The first factor here appears to be narrated material. The second factor is lipreading. The third factor is fingerspelling and the language of signs. The fourth factor is the rating of fingerspelling and the language of signs. The fifth factor is hearing loss. The sixth factor is I.Q. and the seventh factor is age started to school.

Table 5 represents the matrix that uses the total scores as factors. The first factor in this matrix is age and years in school. The second factor is lipreading. The third is deafness of relatives. The fourth is hearing loss and the fifth is age started to school.

DISCUSSION AND CONCLUSIONS

The results of this study indicate that the population of the Illinois School for the Deaf and the Indiana School for the Deaf are two slightly different populations. There was a clear indication in both schools that the lipreading forms (B and C) were valid tests using the teacher's rating as the criteria.

The performance on the fingerspelling and language of signs forms (D and E) seemed to be more closely related to such factors as age, years in school, and achievement test scores. It is interesting to note that at the Indiana School the rating of fingerspelling and language of signs were most closely related to deafness of relatives whereas in the Illinois School these appeared to be most highly correlated with age and years in school.

In the matrix for the Indiana School, using the sub-tests as factors, an interesting first factor was found. This factor appeared to be connected materials, i.e. the story and narration parts of the scale. In this population these sub-parts seemed to transcend the modes of communication and have a high correlation one to the other. This same factor did not appear in the Illinois group. It is interesting, however, that most of these same variables were found for this group in the lipreading-plus factor.

In general, we concluded that the two lipreading forms (B and C) assessed lipreading ability based upon our criteria of teacher ratings. Secondly, we probably assessed two aspects of lipreading rather than the five outlined in the sub-parts of the scale. Vocabulary, simple sentences and random sentences seemed to assess essentially the same factor. The story and narration parts of the scale also assessed another factor.

In view of our findings, we concluded that the teacher rating of fingerspelling and the language of signs is more highly correlated with age, years in school, and deafness of relatives rather than with performances on these forms. Another reason for this conclusion is that, because of a lack of skill in evaluating these areas, teachers cannot adequately rate them. We assumed this to be the case since many teachers commented on the fact that these ratings were more difficult than for lipreading.

Recommendations

Reliability studies, at this writing, have not been done on this scale. Therefore, it is our recommendation that a test (re-test) study be done to establish the scale's reliability.
RECOMMENDATIONS

At this writing reliability studies have not been done with this scale. Therefore, it is our recommendation that a reliability test (retest) study) be done to establish the scale's reliability.

Since there were no significant differences in forms B and C it is recommended that form C be eliminated.

It is recommended that the scale is ready at this time to be further refined by assimilating parts 1, 2, and 5 into one 20 item subpart and that either parts 3 or 4 be used without the other.

It is also recommended that the items in this scale could be used to establish two separate comparable scales with the above-mentioned revision in subparts.

It is our finding that the Illinois Communication Scale in its present form can be used as a crude clinical tool which provides a profile as to the most effective means of communication received by the child. It does not at this time in its present form lend itself to complete standardization.
SUMMARY

A receptive communication scale was developed on 16mm colored film to assess the receptive communication abilities of deaf children between the ages of six to fourteen on lipreading and listening, lipreading only, fingerspelling, and the language of signs. The vocabulary and language used in the scale were rated by teachers with respect to the likelihood of it being understood by deaf children. From this pool of rated material five sub-parts (1) vocabulary, (2) simple sentences, (3) stories, (4) narration, and (5) random sentences and phrases were developed for each form. The sub-parts were assumed to form a progression of difficulty.

The entire scale was given to the six to fourteen year old populations of the Illinois School for the Deaf and the Indiana School for the Deaf. This provided a sample of 417 subjects: 18 six year olds, 18 seven year olds, 37 eight year olds, 51 nine year olds, 43 ten year olds, 57 eleven year olds, 58 twelve year olds, 67 thirteen year olds, and 68 fourteen year olds. There were 206 subjects from Indiana and 211 from Illinois.

An item analysis of the scores was performed on 100 randomly selected subjects. There were ten items on each part of the scale or 50 items on each form. The score was written in terms of the percent of correct responses. There was a progression in the percentage of increased responses over age. On the lipreading and listening, form B, the range was 16% at age six to 63% at age fourteen. On the lipreading only, form C, the range was from 17% at age six to 61% at age fourteen. On the fingerspelling, form D, the range was from 26% at age six to 74% at age fourteen and on the language of signs, form E, the range was from 24% to 81% over these ages.

Teachers at each school were asked to rate the subjects on lipreading, fingerspelling and ability in receiving the language of signs. These ratings were used as a validity criteria.

Additional information such as I.Q., achievement test scores, hearing loss and other items were obtained from school records.

Each school population was statistically treated with a
Two separate varimax rotated factor matrices were obtained on the data for each school. One used sub-parts of each form as variables, and the other used the total score for each form as a variable.

These results indicate that the criterion for validity of lipreading was acceptable. The criteria for fingerspelling and the language of signs were more closely correlated with age and deafness of relatives than any other factor.

These factor matrices also indicated that the Parts I, II, and V were probably assessing the same factor and Parts III and IV were assessing another factor.

No reliability information has been collected as yet on this scale.

The scale in its present status should be refined and re-grouped to provide two completely comparable scales. Form C should be eliminated since lipreading only is not significantly different from lipreading and listening. Parts I, II, and V should be combined into a single part and Parts III and IV can be used interchangeably. These revisions would reduce the time required to administer the scale and yield essentially the same information as the full scale.

Consideration should be given to finding a better criteria for rating the ability in the use of fingerspelling and the language of signs. The rating scale used in this study was less effective than the one used in the area of lipreading.

The scale in its present form can be used as a gross indication of receptive communication abilities of deaf children and will provide a profile across lipreading, fingerspelling, and the language of signs. It does not provide a refined measure within each form at the present time.

Form A

One warm spring day Tom, Bill and Mary fixed a surprise for their grandmother. They put it in a yellow basket and walked over to their grandmother's house. They lived next door to her. Bill knocked on the door and she let them in. They all shouted. "We have a surprise for you. Can you guess what it is? (pause) We have one of our puppies for you." Grandmother was very pleased that the children brought her the puppy.

Form B

One windy day Pam and Melvin wanted to fly kites. They asked their mother for some money to buy kites. They went to the store and bought a red kite and a blue one. Their mother gave them some old rags to make tails for their kites. After they finished putting their kites together, they went to the park and began to fly them. The string on Melvin's kite broke and it fell into a tree.

Form C

One cold rainy day Pat and Dave's mother gave them some balloons to play with. Pat blew the big red balloon up. Mother went out to the kitchen to fix lunch. The boys began to play with the balloon. Their dog, Pepper, began to jump at the balloon. Suddenly Pepper's sharp claws hit the balloon and it burst with a loud "bang." The boys were very mad at Pepper for breaking their balloon.
Form D

One cold winter day John and Betty wanted to clean the snow off of their sidewalk. They could not find their snow shovel. John had an idea. They began to make big snowballs. They made three big snowballs. Betty said, "Look, the sidewalk is clean and we have three big snowballs. Let's make a snowman." Their neighbor, Mr. Brown, came over to see the snowman. He laughed and said, "You two had fun making your snowman, and you cleaned off your sidewalk at the same time. You are smart kids."

Form E

One summer day Frank's mother gave him 25¢. He went down to the bakery and bought five large cookies. The lady in the bakery put the cookies in a paper bag. On the way home he met two friends. He put the bag down on a tree stump and he gave each of his friends two cookies, and ate one himself. Then they played tag for awhile. When Frank started for home, he picked up the bag of cookies, then he looked inside and found that it was empty.
