DESCRIPTORS- *TIME FACTORS (LEARNING), *PROGRANMED TEXTS, *LEARNING THEORIES, MATHEMATICS INSTRUCTION, CONVENTIONAL INSTRUCTION, PROGRAMED INSTRUCTION, LEARNING ACTIVITIES, COMPARATIVE ANALYSIS, UICSM UNIT I SERIES

MANIPULATION OF FRAMES WITHIN PROGRAMED MATHEMATICS TEXTS IN ORDER TO STUDY FOUR VARIABLES YIELDED, IN A PREVIOUSLY REPORTED PAPER, CORRELATIONAL DATA (FOR RELATIVELY SMALL TREATMENT GROUPS) THAT ARE PRESENTED HERE. FIRST, THE ORDER OF PRESENTATION OF PROGRAMED MATERIAL (BEFORE, AFTER, AND WITHOUT CONVENTIONAL INSTRUCTION) HAD NO EFFECT ON ACHIEVEMENT. (THE CONDITION OF "CONVENTIONAL INSTRUCTION ONLY" WAS ABSENT.) SECOND, AN INTERMEDIATE PRACTICE TASK WAS FELT TO CONTRIBUTE MORE THAN EITHER A STIMULUS OR A RESPONSE COMPONENT TO LEARNING EVEN THOUGH STATISTICAL ANALYSIS SHOWED THAT ALL THREE TREATMENT GROUPS WERE EQUAL. THIRD, CONTRARY TO HYPOTHESIS, LEARNING FROM A RANDOM FRAME SEQUENCE WAS SIGNIFICANTLY SUPERIOR TO LEARNING FROM A LOGICAL SEQUENCE, BUT LEARNING TIME WAS ABOUT THE SAME FOR BOTH GROUPS. FINALLY, BY OMITTING SELECTED FRAMES IN AN ATTEMPT TO VARY SIZE OF STEP, IT WAS FOUND THAT LEARNING WAS EQUAL FOR LARGE AND SMALL STEP SEQUENCES. ALTHOUGH THE LARGE STEP SEQUENCE HAD A TIME-SAVING EFFECT, TIME PER PAGE WAS ABOUT EQUAL FOR BOTH GROUPS. (LH)

July, 1964
A Description of Variables and Their Implementation
in Studies of Principles for the Programming of High School Algebra

Ellen F. Rosen and Lawrence M. Stolurow

In order to study the variables important in programming, certain manipulations were performed on selected programmed textbooks from the UICSM Unit I series. These manipulations resulted in new forms of the textbooks which were then used in studies aimed at the formulation of general guidelines for writing such textbooks. The purpose of this report is to further clarify what these variables are by operationally describing the manipulations performed and to present representative examples and some data relating to their effectiveness.

The data presented are from a study performed in the Champaign school system in the fall of 1963 (See L. M. Stolurow and M. Beberman, Comparative Studies of Principles for Programming Mathematics in Automated Instruction. Urbana, Ill: Univer. of Illinois, USOE Contr. No. 711151.01, Quarterly Reports 9 and 19, June - December, 1963.). They consist of item difficulties of each of the sample frames and the point biserial correlation coefficient of success on the item with score on the end test. This report is intended as a supplement to the studies which were performed and as a guide both for people interested in this type of research and for those already engaged in such research who wish to compare the outcomes of their studies with those of this series.
The general format of this report is (a) to present a description of the variable, then (b) to present sample frames with related descriptive statistics, and where possible (c) to indicate some effects of the variable on learning.

The topics covered are as follows:

1. Conventional instruction followed by programed instruction or the reverse order.
2. The implementation of discovery.
3. The lack of association.
4. The size of the step between frames.

Variable: The Sequential Relationships -- Either Conventional followed by Programed Instruction or the Reverse.

The study of this variable requires a good teacher, a good programed text, both of which teach the same topic. The positioning of teacher-led lectures and program-guided study in time is manipulated. In our series (See Stolurow and Beberman, 1963, Quarterly Report 9 and 10, Chapters, 8 and 9.) the textbook selected was Part 104 of the UICSM programed mathematics materials which presents the multiplication of real numbers. The teacher either covered the same material before the booklet was used (program-following condition), after the student had studied the topic via the booklet (program-lead condition), or the teacher did not present the
material at all and the topic was presented only via the programed version (pure condition).

No sample frames are presented for this variable since no manipulation of the programed material was necessary. The law of repetition applied to this study states that the program lead and follow conditions should produce better learning since the student has more chance for practice and gets more reinforcement. However, in the Champaign studies with Part 104, no difference was found ($F < 1$).

**THE IMPLEMENTATION OF DISCOVERY**

This study involved the use of UICSM programed mathematics materials, Parts 106 and 107. Part 107 was used intact. Part 106 is an introduction to Part 107; thus, variations in that which is taught in Part 106 should affect subsequent learning of the task presented in Part 107. Part 106 and 107 teach the conventions of grouping and simplification of punctuated and unpunctuated expressions.

The variable of interest here is the effect of either response, stimulus, or mediator practice (Part 106R, 106S, or 106M, respectively) upon the learning of a task (Part 107). The response component of the task in this case, was simplification or finding the value of the expression; the stimulus component was familiarity with the symbols involved, the operation and the punctuation used in expressions; and the mediator component was the rules
and practice of the punctuation of sentences. The following sample frames from these three variable booklets were chosen to show how the groups were given practice with the component assigned to their condition.

Tables 1 through 5 give descriptive statistics for the subsequent frames.

The condition which was felt to be best for later learning of the task was the mediator condition. However, all groups were equal ($F < 1$).

Bill was asked to find out how many seats there were in Room 207. He reported to the class that there were \(2 + 8 \times 5\) seats in Room 207. He wrote the following on the board:

\[2 + 8 \times 5\]

and said that the class could check his computation.

Steve objected. He said that when he worked it out, he got \((2+8) \times 5\).

Here is the floor plan for Room 207, the room Bill went to.

Who was right, Bill or Steve?
Circle the answer on your work sheet.
Check your answer.

Bill was right because there are 2+8*5 seats in Room 207.

Record your result.

Bill was asked to find out how many seats there were in Room 207. He reported to the class that there were 42 seats in Room 207. He wrote the following on the board:

\[ 2 \times (8 + 5) \]

and said that the class could check his computation.

Steve objected. He said that when he worked it out, he got 50. He justified his answer in the following manner:

"First, I found the sum of 8 and 5. Then I multiplied that sum by 2."

Fill the blanks on your work sheet to complete the sentences.

**Turn to PAGE 2.**
Check your answers.

Bill claimed that there were 42 seats in Room 207.
\[2 + (8 \times 5) = 42.\]

Steve said that \((2 + 8) \times 5 = 50.\)

Steve first found the sum of 2 and 8, and then he multiplied this sum by 5.

Record your results.

= \{ 32 + \, -2 \} = 30

(3) \[ (9 \times 3) + (5 + 13) ] = [ 27 + 18 ] = 45

(4) \[ (3 + 5) \times (4 + 7) ] = [ 8 \times 11 ] = 88

(5) \[ (16 + 7) \times 5 ] = [ 23 \times 5 ] = 115

Record your results.

***
**THE WEB OF ASSOCIATION**

In this study Part 110.5 was used. It covers the notion of logical consequence, the difference between truth and validity, the recognition and discrimination of the principles of multiplication by one and zero and the principles of adding zero for numbers of arithmetic and real numbers.

A web of association is the associative network or set of "bonds" relating particular stimuli to responses. Conventional texts have always been written with some logical development but while they are organized they do not necessarily have a "built in" capability of producing a "web of associations" which the student necessarily learns and uses. Thus, any logical ordering of frames in a program attempts to build up a web for the student, but different orderings presumably produce different webs. Conversely, any nonlogical or near chance presentation of frames in a program makes no attempt to build up such a web; thus, it is left for the student to either develop the inter-relationships himself or to take things frame by frame and not attempt such associations.

Thus, the modified booklet (Part 110.5) is an essentially random sequence of frames (pages) of the sequence developed by the UICSM staff (Part 110.5). The first ten frames from both booklets and some descriptive statistics about those frames are presented here as a sample.

Tables 6 through 25 give descriptive statistics for the subsequent frames.

The logical version (Part 110.5) should produce better learning. If it does not produce better learning, then the students who have the random sequence should take more time to finish the booklet since they must do their
own integration. The data gathered indicated a significant sequence effect
\((F = 4.59)\) at .05 level (random group superior) with the random group
taking about the same amount of time per page to finish the booklet.

<sup>a</sup> These data relate to the program frames indicated and reproduced on the following page.

<sup>b</sup> var. (item) = 0.00
One day Mr. Witsan, the history teacher, was telling his class about some famous American authors. Vera wrote these statements in her notebook to help her remember what Mr. Wilson said:

- The author of *Huckleberry Finn* is Samuel Clemens.
- The author of *Tom Sawyer* is Mark Twain.
- Mark Twain is the same person as Samuel Clemens.
- Samuel Clemens is an American author.

Later, she read *Tom Sawyer* and wrote a book report about it. Here are some of the statements in her report.

1. Samuel Clemens is the author of *Tom Sawyer*.
2. Mark Twain is an American author.
3. The author of *Tom Sawyer* is also the author of *Huckleberry Finn*.
4. *Tom Sawyer* was written before *Huckleberry Finn*.

Look at each of these statements from Vera’s book report and decide whether she could have known it without any more information than her notes from Mr. Wilson’s history class which we showed you. That is, decide whether or not the statements (1), (2), (3), and (4) are logical consequences of the four statements from Vera’s history-class notes. [Write ‘yes’ or ‘no’ on your work sheet.]

$\text{var. (item) = 0.00}$

**Significant at the .05 level with appropriate degrees of freedom (number of students minus two).
Check your answers and record your results.

The statements in Vera's history class notes are:

The author of *Huckleberry Finn* is Samuel Clemens.
The author of *Tom Sawyer* is Mark Twain.
Mark Twain is the same person as Samuel Clemens.
Samuel Clemens is an American author.

(1) **Yes** A logical consequence of the above statements is:
Samuel Clemens is the author of *Tom Sawyer*.
because the statements in Vera's notes tell us that
the author of *Tom Sawyer* is Mark Twain,
and he is the same person as Samuel Clemens.

(2) **Yes** Another logical consequence of these statements is:
Mark Twain is an American author.
because
Mark Twain is the same person as Samuel Clemens,
and this person is an American author.

(3) **Yes** This statement from Vera's book report:
The author of *Tom Sawyer* is also the author of *Huckleberry Finn*.
is another logical consequence of her history class notes because
they tell us that
the author of *Tom Sawyer* is Mark Twain, who is the same
person as Samuel Clemens, who is the same person as the
author of *Huckleberry Finn*.

(4) **No** The statement:
*Tom Sawyer* was written before *Huckleberry Finn*.
is not a logical consequence of just what is given in Vera's history
class notes. That is, you would need to know more in order to conclude it.

* * *

There is exactly one statement in Vera's notes at the top of this page such
that, if it had been deleted, none of the statements in her book report would
have been a logical consequence of the remaining statements. Write that
statement on your work sheet. [Reread the answer discussions if you need
help.]

Check your answers.

The statements about Zabranchburg High School tell us that the following titles name the same person:

Richard

Student Council President

the chairman of the Assemblies Committee

the band major at each pep rally

Therefore,

(1) [Yes] the statement:

Richard is the band major at each pep rally.

is a logical consequence of the given statements. And furthermore,

(2) [Yes] the statement:

The band major at each pep rally is Richard.

is also a logical consequence. However,

(3) [No] the statement:

Richard was elected by the majority of the students.

is not a logical consequence, regardless of how we might feel about Richard and the election.

Record your results.

* * *

One more statement may be added to those already given about Zabranchburg High School, so that the statements in (3), above:

Richard was elected by the majority of the students.

will be a logical consequence of the statements about Zabranchburg.

Here is the start of such a statement. Finish it on your work sheet.

The Student Council president _________

\textsuperscript{a}These data relate to the program frames indicated and reproduced on the following page.
Check your answers and record your results.

Here are the statements about numbers of arithmetic:

\[
\begin{align*}
87 \times 4899 \times 79 &= 79 \times 87 \times 4899 \\
79 \times 87 \times 4899 &= 6783 \times 4899 \\
6783 \times 4899 &= 33,229,917
\end{align*}
\]

(1) [No.] The statement:
87 \times 4899 \times 79 = 79 \times 4899 \times 87

is not a logical consequence of just these statements shown above.

(2) [No.] The statement:
79 \times 4899 \times 87 = 33,229,917

is not a logical consequence of these statements, either.

(3) [Yes] The statement:
(\#) 87 \times 4899 \times 79 = 6783 \times 4899

is a logical consequence of the first two given statements. That is:
87 \times 7899 \times 79 is the same as 79 \times 87 \times 4899,
which is the same as 6783 \times 4899.

\*

Let us reexamine the three statements at the top of this page. Mark each one to show whether you think it is 'True', 'False', or '?' [If you are not sure whether it is a true or a false statement]

(1) 87 \times 4899 \times 79 = 79 \times 87 \times 4899

(2) 79 \times 87 \times 4899 = 6783 \times 4899

(3) 6783 \times 4899 = 33,229,917

Next, fill the blanks in the following sentence on your work sheet:
The statement from Exercise 3, above:
(\#) 87 \times 4899 \times 79 = 6783 \times 4899

? a logical consequence of the statements (1), (2), and (3).

[is/is not]

Turn to PAGE 7.
Table 12\textsuperscript{a}

Descriptive Statistics for Items on Page 7 of Part 110.5

Proportion Correct and Correlation with End Test

<table>
<thead>

<td>undefined\textsuperscript{b}</td>
</tr>
<tr>
<td>Program Following (Conventional followed by programed instruction)</td>
<td>12</td>
<td>.916</td>
<td>-.073</td>
</tr>
</tbody>
</table>

\textsuperscript{a}These data relate to the program frames indicated and reproduced on the following page.

\textsuperscript{b} var. (item) = 0.00.

**Significant at the .05 level with appropriate degrees of freedom (Number of students minus two).
Check your answers.

We asked you to mark what you THOUGHT about each of the statements:

1. $87 \times 4899 \times 79 = 79 \times 87 \times 4899$
2. $79 \times 87 \times 4899 = 6783 \times 4899$
3. $6783 \times 4899 = 33,229,917$

You are correct if you answered what you THOUGHT. But, regardless of whether you thought statements (1), (2), and (3) were true or false, the statement:

4. $87 \times 4899 \times 79 = 6783 \times 4899$

is a logical consequence of the statements (1) and (2), above.

Record your results.

* * *

You may be surprised at what we discovered about the statements above.

1. $87 \times 4899 \times 79 = 79 \times 87 \times 4899$ [True]
2. $79 \times 87 \times 4899 = 6783 \times 4899$ [False]
3. $6783 \times 4899 = 33,229,917$ [True]

Here is why statement (2) is false.

```
79
×87
553
632
6873
```

[not '6783' as shown in (2): $79 \times 87 \times 4899 = 6783 \times 4899$]

Does this discovery now mean that it is FALSE to say that the statement:

4. $87 \times 4899 \times 79 = 6783 \times 4899$

is a logical consequence of statements (1) and (2), above? [Yes/No]

Turn to PAGE 8.

</table>

These data relate to the program frames indicated and reproduced on the following page.
You can decide whether or not a given statement is a logical consequence of other statements just by observing the forms of the statements. The truth or falsity of the statements has nothing to do with it [except that a false statement will never be a logical consequence of true ones].

Record your result.

* * *

Here is a statement:

\[ (\star) \quad 9853 + 1582 = 4831 + 6524 \]

and here is another statement:

\[ (\phi) \quad 4831 + 6524 = 9853 + 1582 \]

Now, answer the following questions on your work sheet.

(1) Is (\phi) a logical consequence of (\star)?

(2) Is (\star) a logical consequence of (\phi)?

Turn to PAGE 9.
## Table 14a

Descriptive Statistics for Items on

Page 9 of 110. 5

Proportion Correct and Correlation with End Test

<table>
<thead>
<tr>
<th>Mode</th>
<th>Number of Students</th>
<th>Proportion Correct</th>
<th>Point Biserial Correlation of item score with test score</th>
</tr>
</thead>
<tbody>
<tr>

<td>18</td>
<td>.333</td>
<td>.216</td>
</tr>
<tr>
<td>Program Leading (Program followed by conventional instruction)</td>
<td>7</td>
<td>.428</td>
<td>-.139</td>
</tr>
<tr>
<td>Program Following (Conventional followed by programmed instruction)</td>
<td>12</td>
<td>.500</td>
<td>.242</td>
</tr>
</tbody>
</table>

*These data relate to the program frames indicated and reproduced on the following page.*
Check your answers.

\[
\begin{aligned}
(\phi) \text{ is a logical consequence of } (\star).

(\star) \text{ is a logical consequence of } (\phi).
\end{aligned}
\]

(\star) says that 9853 + 1582 is the same thing as 4831 + 6524, and (\phi) says that 4831 + 6524 is 9853 + 1582.

If you are given (\star), you may logically conclude (\phi); and if you are given (\phi), you may logically conclude (\star).

Record your results.

* * *

Consider the following statement:

\[
(\star) \quad (1846 + 93) + 75 = 1846 + (93 + 75)
\]

As you know, (\star) is an instance of the associative principle for addition because it fits the pattern-sentence. Since (\star) is an instance, (\star) is a logical consequence of the apa.

Now look at:

\[
(\phi) \quad 1846 + (93 + 75) = (1846 + 93) + 75
\]

(1) Is (\phi) an instance of the apa?

(2) Is (\phi) a logical consequence of (\star)?

(3) Is (\star) a logical consequence of the apa?

(4) Is (\phi) a logical consequence of the apa?

Turn to PAGE 10.
Table 15\textsuperscript{a}

Descriptive Statistics for Items on
Pages 10 and 11 of Part 110.5

Proportion Correct and Correlation with End Test

<table>
<thead>
<tr>
<th>Mode</th>
<th>Number of Students</th>
<th>Proportion Correct</th>
<th>Point Biserial Correlation of item score with test score</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pure (Program only)</td>
<td>18</td>
<td>.944</td>
<td>-.092</td>
</tr>
<tr>
<td>Program Leading (Program followed by conventional instruction)</td>
<td>7</td>
<td>.857</td>
<td>.372</td>
</tr>
<tr>
<td>Program Following (Conventional followed by programed instruction)</td>
<td>12</td>
<td>.916</td>
<td>-.182</td>
</tr>
</tbody>
</table>

\textsuperscript{a}These data relate to the program frames indicated and reproduced on the following page.
Check your answers.

\[(\star) (1846 + 93) + 75 = 1846 + (93 + 75)\]
\[(\ddagger) 1846 \div (93 + 75) = (1846 \div 93) + 75\]

(1) \(\times\); \(\ddagger\) is not an instance of the apa. But,

(2) \(\times\); \(\ddagger\) is a logical consequence of \((\star)\), and

(3) \(\times\); \((\star)\) is a logical consequence of the apa. (An instance of a principle is a logical consequence of that principle.) So,

(4) \(\times\); \((\phi)\) is a logical consequence of the apa because

\((\phi)\) is a logical consequence of \((\star)\) as stated in Exercise (2), and

\((\star)\) is a logical consequence of the apa as stated in Exercise (3).

Record your results.

\[\star \star \star\]

Here is a pattern-sentence for the distributive principle for multiplication over addition:

\[\text{___} \times \text{_____} + \text{____} \times \text{____} = (\text{___} + \text{____}) \times \text{____} \]

Now, consider the following statements:

\[(\star) (5 \times 8) + (7 \times 8) = (5 + 7) \times 8\]
\[(\phi) (5 + 7) \times 8 = (5 \times 8) + (7 \times 8)\]

Only one of the statements \((\star)\) and \((\phi)\) is an instance of the dpma. Which one is it?

Turn to PAGE 11.
Check your answer.

Just by looking at the two statements:

(★) \((5 \times 8) + (7 \times 8) = (5 + 7) \times 8\)

(△) \((5 + 7) \times 8 = (5 \times 8) + (7 \times 8)\)

you can easily see that statement (★) fits the pattern-sentence for the dpma, but (△) does not. Here is the pattern-sentence for the dpma:

\[ \text{□□} \times \ldots + \text{□□} \times \ldots = (\text{□□} + \text{□□}) \times \ldots \]

So, (★) is an instance of the dpma and (△) is not.

Record your result.

aThese data relate to the program frames indicated and reproduced on the following page.
One day Mr. Wilson, the history teacher, was telling his class about some famous American authors. Vera wrote these statements in her notebook to help her remember what Mr. Wilson said:

The author of *Huckleberry Finn* is Samuel Clemens.
The author of *Tom Sawyer* is Mark Twain.
Mark Twain is the same person as Samuel Clemens.
Samuel Clemens is an American author.

Later, she read *Tom Sawyer* and wrote a book report about it. Here are some of the statements in her report.

(1) Samuel Clemens is the author of *Tom Sawyer*.
(2) Mark Twain is an American author.
(3) The author of *Tom Sawyer* is also the author of *Huckleberry Finn*.
(4) *Tom Sawyer* was written before *Huckleberry Finn*.

Look at each of these statements from Vera’s book report and decide whether she could have known it without any more information than her notes from Mr. Wilson’s history class which we showed you. That is, decide whether or not the statements (1), (2), (3), and (4) are logical consequences of the four statements from Vera’s history-class notes. [Write ‘yes’ or ‘no’ on your work sheet.]

<sup>a</sup>These data relate to the program frames indicated and reproduced on the following page.
Check your answers and record your results.

The statements in Vera's history class notes are:

The author of *Huckleberry Finn* is Samuel Clemens.
The author of *Tom Sawyer* is Mark Twain.
Mark Twain is the same person as Samuel Clemens.
Samuel Clemens is an American author.

(1) Yes A logical consequence of the above statements is:
Samuel Clemens is the author of *Tom Sawyer*.
because the statements in Vera's notes tell us that
the author of *Tom Sawyer* is Mark Twain,
and he is the same person as Samuel Clemens.

(2) Yes Another logical consequence of these statements is:
Mark Twain is an American author.
because
Mark Twain is the same person as Samuel Clemens,
and this person is an American author.

(3) Yes This statement from Vera's book report:
The author of *Tom Sawyer* is also the author of *Huckleberry Finn*.
is another logical consequence of her history class notes because
they tell us that
the author of *Tom Sawyer* is Mark Twain, who is the same
person as Samuel Clemens, who is the same person as the
author of *Huckleberry Finn*.

(4) No The statement:
*Tom Sawyer* was written before *Huckleberry Finn*.
is not a logical consequence of just what is given in Vera's history
class notes. That is, you would need to know more in order to conclude it.

* * *

There is exactly one statement in Vera's notes at the top of this page such
that, if it had been deleted, none of the statements in her book report would
have been a logical consequence of the remaining statements. Write that
statement on your work sheet. [Reread the answer discussions if you need
help.]

*These data relate to the program frames indicated and reproduced on the following page.*
Check your answers.

The statements about Zabranburg High School tell us that the following titles name the same person:

Richard

Student Council President
the chairman of the Assemblies Committee
the band major at each pep rally

Therefore,

(1) [Yes] the statement:
Richard is the band major at each pep rally.
is a logical consequence of the given statements. And furthermore,

(2) [Yes] the statement:
The band major at each pep rally is Richard.
is also a logical consequence. However,

(3) [No] the statement:
Richard was elected by the majority of the students.
is not a logical consequence, regardless of how we might feel about Richard and the election.

Record your results.

* * *

Simplify:

\[ \pi \times 34 + \pi \]

**Significant at the .05 level with appropriate degrees of freedom (number of students minus two).**
Check your answers.

Here is a proof of the statement:

\[(25 \times 50) \times (4 \times 2) = (25 \times 4) \times (50 \times 2)\]

1. \[(25 \times 50) \times (4 \times 2) = [25 \times (50 \times 4)] \times 2\]
2. \[\left(\frac{25 \times 50 \times 4}{2}\right) \times 2 = [25 \times (50 \times 4)] \times 2\]
3. \[\left(\frac{25 \times (50 \times 4)}{2}\right) \times 2 = [25 \times (50 \times 4)] \times 2\]
4. \[\left(\frac{25 \times (4 \times 50)}{2}\right) \times 2 = [25 \times (4 \times 50)] \times 2\]
5. \[\left(\frac{25 \times (4 \times 50)}{2}\right) \times 2 = (25 \times 4) \times (50 \times 2)\]

Therefore,

\[(25 \times 50) \times (4 \times 2) = (25 \times 4) \times (50 \times 2)\]

Record your results.

***

Use the associative principle for addition of real numbers to simplify the following:

1. \((-75 + +9) + +91\)
2. \((-50 + -33) + +67\)
3. \((-31 + -34) + +134\)
4. \((-287 + -25) + +24\)
5. \(-28 + (+28 + -75)\)
6. \(-25 + (+50 + +75)\)
7. \(+397 + (+189 + -397)\)
8. \((-237 + +626) + (-626 + +237)\)

Turn to PAGE 17
Part 110.5

Check your answers.

(1) \((-75 + 9) + 91 = 75 + (9 + 91)\)  
\[= 160\]

(2) \((50 + 33) + 67 = 50 + (33 + 67)\)  
\[= 150\]

(3) \((31 + 34) + 134 = 31 + (34 + 134)\)  
\[= 198\]

(4) \((-287 + 25) + 24 = -287 + (25 + 24)\)  
\[= -288\]

(5) \(-28 + (28 + 75) = (-28 + 28) + 75\)  
\[= 75\]

(6) \(-25 + (-50 + 75) = (-25 + 50) + 75\)  
\[= 75\]

(7) \(397 + (189 + -397) = 397 + (397 + 189)\)  
\[= (397 + 397) + 189\]  
\[= 1689\]

(8) \((237 + 626) + (626 + 237) = [(237 + 626) + 626] + 237\)  
\[= [237 + (626 + 626)] + 237\]  
\[= [626 + 626] + 237 + 237\]  
\[= 0 + 0\]

Record your results.

* * *

Turn to PAGE 12.
THE SIZE OF THE STEP BETWEEN FRAMES

In theory, the size of the step between frames is an easy variable to manipulate, by simply omitting intervening frames in an already existant program. The difficult part is to determine whether, in fact, the size of the step has been changed. The large step size version (Part 112L) and the small step size version (Part 112) in this series were produced by the method of simple omission of non essential frames. To find out whether step size actually had been changed, item difficulties were compared. To determine the effect of step size upon learning, the end test scores of students who had different booklets were compared.

The portions selected for presentation here are corresponding in that each covers a segment. They are the same except for the fact that the 112 segment has a few more frames. The item difficulties here have special significance. The interested reader is referred to L. M. Stolurow and M. Beberman, Comparative Studies of Principles for Programming Mathematics in Automated Instruction. Urbana, Ill: Univer. of Illinois, USOE Contr. No. 711151.01, Quarterly Reports 9 and 19, June - December, 1963, for more details and to the forthcoming final report.

Tables 26 through 38 give descriptive statistics for the subsequent frames.

The small step sequence (112) should produce learning which is at least as good as that produced by the large step size sequence (112L). However, if learning is equal, there should be a time saving in the use of the 112L book since it is shorter. Learning was found to be equal ($F = 1.68$, $df = 1,72$) and the large step version produced a time saving, however, time per page was about equal for both groups.

Check your answers.

(1) The principle for subtraction tells us how to convert a problem in subtracting a real number into a problem in adding the opposite of that real number.

(2) No; it is not possible to solve each problem in subtracting a number of arithmetic.

Record your results.

* * *

Here is a problem in subtracting a number of arithmetic.

3 - 8 = ?

This problem can't be solved. Let's see why. Subtracting the number 8 of arithmetic is the inverse of adding the number 8 of arithmetic. So, to solve this problem, amounts to finding the number of arithmetic to which we can add 8 and get 3. Is there such a number of arithmetic? [Answer 'yes' or 'no' on your work sheet.]

*a* These data relate to the program frames indicated and reproduced on the following page.
Check your answers.

(1) \(-23 - (-30) = -23 + 30 = \text{?}\)  
(2) \(+7 - (-20) = +7 + 20 = \text{?}\)

(3) \(-19 - +69 = -19 - 69 = \text{?}\)  
(4) \(+19 - -69 = +19 + 69 = \text{?}\)

(5) \(\text{?} - -11 = -6\)  
[Check: \(-17 - -11 = -17 + 11 = -6\)]

(6) \(-5 - +\text{?} = -6\)  
[Check: \(-5 + 1 = -5 + 1 = -6\)]

Record your results.

* * *

Fill in the blanks on your work sheet.

(1) \(-2 - -19 = \text{?}\)
(2) \(\text{?} - -7 = -10\)
(3) \(-14 - \text{?} = -20\)
(4) \(-6 - +16 = \text{?}\)
(5) \(\text{?} - +8 = +4\)
(6) \(-7 - \text{?} = +10\)
